The definition of a frame varies by multimedia device. For display media, a frame is one still image.

Step (see page 2330)

39.1.2.5.20 TMediaPlayer.Length Property

Specifies the length of the medium in the open multimedia device.

Pascal

```
property Length: Longint;
```

C++

```
__property Longint Length;
```

Description

Length is specified using the current time format, which is specified by the TimeFormat (see page 2362) property.

See Also

TimeFormat (see page 2362)

39.1.2.5.21 TMediaPlayer.Mode Property

Indicates the state of the currently open multimedia device.

Pascal

```
property Mode: TMPModes;
```

C++

```
__property TMPModes Mode;
```

Description

Mode specifies the current state or mode of the currently open multimedia device.

The TMPModes (see page 2380) type defines the modes for a multimedia device used with a TMediaPlayer (see page 2305).

See Also

OnNotify (see page 2375)

39.1.2.5.22 TMediaPlayer.Notify Property

Determines whether an OnNotify (see page 2375) event is generated.

Pascal

```
property Notify: Boolean;
```

C++

```
__property Boolean Notify;
```

Description

Notify determines whether the next call to a media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), StartRecording (see page 2329), Resume (see page 2327), Rewind (see page 2328), Step (see page 2330), or Stop (see page 2330)) generates an OnNotify (see page 2375) event when

the method has completed.

If Notify is true, the next media control method generates OnNotify (see page 2375) event upon completion and stores the notification message in the NotifyValue (see page 2351) property. If Notify is false, the method does not generate an OnNotify (see page 2375) event and NotifyValue (see page 2351) remains unchanged.

Notify affects only the next call to a media control method. After an OnNotify (see page 2375) event, Notify must be reset to affect any subsequent media control methods.

By default, Play (see page 2323) and StartRecording (see page 2329) function as if Notify is true. Set Notify to false before calling Play (see page 2323) or StartRecording (see page 2329) to prevent an OnNotify (see page 2375) event from being generated when playing or recording has finished. By default, all other media control methods function as if Notify is false.

Tip: Set Notify to true if the next media control is expected to take a long time, so the application is notified when the media control method has completed. If Notify is set to true, it is recommended to set Wait (see page 2365) to false so that control returns to the application before the media control method is finished.

Note: When trying to resume a device that doesn't support Resume (see page 2327), the device is resumed as if the Play (see page 2323) method was called. If Notify was assigned true before calling Resume (see page 2327) (or any other media control method), Notify doesn't affect the call to Resume (see page 2327). Resume (see page 2327) does not generate an OnNotify (see page 2375) event upon completion, and NotifyValue (see page 2351) remains unchanged.

See Also

NotifyValue (see page 2351)

OnNotify (see page 2375)

Resume (see page 2327)

Wait (see page 2365)

39.1.2.5.23 TMediaPlayer.NotifyValue Property

Indicates the result of the last media control method that requested a notification.

Pascal

```
property NotifyValue: TMPNotifyValues;
```

C++

```
__property TMPNotifyValues NotifyValue;
```

Description

NotifyValue reports the result of the last media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), StartRecording (see page 2329), Resume (see page 2327), Rewind (see page 2328), Step (see page 2330), or Stop (see page 2330)) that requested a notification.

To request notification, set Notify (see page 2350) to true before calling a media control method.

See Also

OnNotify (see page 2375)

Notify (see page 2350)

39.1.2.5.24 TMediaPlayer.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

39.1.2.5.25 TMediaPlayer.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

39.1.2.5.26 TMediaPlayer.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
```

```
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

OnContextPopup

39.1.2.5.27 TMediaPlayer.Position Property

Specifies the current position within the currently loaded medium.

Pascal

```
property Position: Longint;
```

C++

```
__property Longint Position;
```

Description

The value of Position is specified according to the current time format, which is specified in the TimeFormat (see page 2362) property.

Position defaults to the beginning of the medium. If the medium supports multiple tracks, Position defaults to the beginning of the first track.

See Also

TimeFormat (see page 2362)

39.1.2.5.28 TMediaPlayer.Shareable Property

Determines whether more than one application can share a multimedia device.

Pascal

```
property Shareable: Boolean;
```

C++

```
__property Boolean Shareable;
```

Description

If Shareable is false, no other components or applications can access the device. If Shareable is true, more than one component or application can access the device. Shareable defaults to false.

Be sure to set Shareable before opening a device.

Some devices are not shareable. If Shareable is set to true for a device that isn't shareable, the Open (see page 2319) method fails and the error code is returned to the Error (see page 2346) property.

See Also

Error (see page 2346)

Open (see page 2319)

39.1.2.5.29 TMediaPlayer.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

39.1.2.5.30 TMediaPlayer.Start Property

Specifies the starting position within the currently loaded medium.

Pascal

```
property Start: Longint;
```

C++

```
__property Longint Start;
```

Description

Start is the beginning of the medium for devices that don't use tracks, or the beginning of the first track for devices that use tracks. Start is defined when a multimedia device is opened with the Open (see page 2319) method. Start is specified according to the current time format, which is stored in the TimeFormat (see page 2362) property. Start is read-only at runtime and is unavailable at design time.

See Also

Open (see page 2319)

TimeFormat (see page 2362)

39.1.2.5.31 TMediaPlayer.StartPos Property

Specifies the position within the currently loaded medium from which to begin playing or recording.

Pascal

```
property StartPos: Longint;
```

C++

```
__property Longint StartPos;
```

Description

StartPos is specified using the current time format, which is specified in the TimeFormat (see page 2362) property.

The StartPos property affects only the next Play (see page 2323) or StartRecording (see page 2329) method called after setting StartPos. Reset must be set to StartPos to affect any subsequent calls to Play (see page 2323) or StartRecording (see page 2329).

StartPos does not affect the current position of the medium (specified in the Position (see page 2357) property) until the next Play (see page 2323) or StartRecording (see page 2329) method is called.

See Also

Play (see page 2323)

StartRecording (see page 2329)

TimeFormat (see page 2362)

39.1.2.5.32 TMediaPlayer.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

39.1.2.5.33 TMediaPlayer.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

39.1.2.5.34 TMediaPlayer.TimeFormat Property

Determines the format used to specify position information.

Pascal

```
property TimeFormat: TMPTimeFormats;
```

C++

```
__property TMPTimeFormats TimeFormat;
```

Description

TimeFormat determines how the StartPos (see page 2360), Length (see page 2350), Position (see page 2357), Start (see page 2360), and EndPos (see page 2345) properties are interpreted. For example, if Position (see page 2357) is 180 and TimeFormat is tfMilliseconds, the current position is 180 milliseconds into the medium. If Position (see page 2357) is 180 and TimeFormat is tfMSF, the current position is 180 minutes into the medium.

Not all formats are supported by every device. When trying to set an unsupported format, the assignment is ignored.

The current timing information is always passed in a 4-byte integer. In some formats, the timing information returned is not really one integer, but single bytes of information packed in the long integer.

See Also

EndPos (see page 2345)

Length (see page 2350)

Position (see page 2357)

Start (see page 2360)

StartPos (see page 2360)

39.1.2.5.35 TMediaPlayer.TrackLength Property

Reports the length of the track.

Pascal

```
property TrackLength [TrackNum: Integer]: Longint;
```

C++

```
__property Longint TrackLength[int TrackNum];
```

Description

TrackLength reports the length of the track specified by the TrackNum index.

The value of TrackLength is specified according to the current time format, which is specified in the TimeFormat (see page 2362) property.

See Also

TimeFormat (see page 2362)

Tracks (see page 2363)

39.1.2.5.36 TMediaPlayer.TrackPosition Property

Reports the starting position of the track.

Pascal

```
property TrackPosition [TrackNum: Integer]: Longint;
```

C++

```
__property Longint TrackPosition[int TrackNum];
```

Description

TrackPosition reports the starting position of the track specified by the TrackNum index.

The value of TrackPosition is specified according to the current time format, which is specified in the TimeFormat (see page 2362) property.

See Also

TimeFormat (see page 2362)

Tracks (see page 2363)

39.1.2.5.37 TMediaPlayer.Tracks Property

Specifies the number of playable tracks on the open multimedia device.

Pascal

```
property Tracks: Longint;
```

C++

```
__property Longint Tracks;
```

Description

Tracks indicates how many of playable tracks are available on the open multimedia device.

Tracks is undefined for devices that don't use tracks.

39.1.2.5.38 TMediaPlayer.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
```

```
    PageControl1Change(Sender);
end;
```

VisibleChanging

39.1.2.5.39 TMediaPlayer.VisibleButtons Property

Indicates which of the buttons on the media player are visible.

Pascal

```
property VisibleButtons: TButtonSet;
```

C++

```
__property TButtonSet VisibleButtons;
```

Description

VisibleButtons determines which buttons on the media player that are visible. If a button is not made visible with VisibleButtons, it does not appear on the media player control. By default, all buttons are visible when a media player component is added to a form.

ColoredButtons (see page 2337)

EnabledButtons (see page 2343)

39.1.2.5.40 TMediaPlayer.Wait Property

Determines whether a media control method returns control to the application only after it has been completed.

Pascal

```
property Wait: Boolean;
```

C++

```
__property Boolean Wait;
```

Description

Wait determines whether a media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), StartRecording (see page 2329), Resume (see page 2327), Rewind (see page 2328), Step (see page 2330), or Stop (see page 2330)) returns control to the application only after it has been completed.

Wait is unavailable at design time.

If Wait is true, the media player component waits until the next media control method has completed before returning control to the application. If Wait is false, the application won't wait for the next media control method to finish before continuing.

Wait affects only the next media control method called after setting Wait. Wait must be reset to affect any subsequent call to a media control method.

By default, Play (see page 2323) and StartRecording (see page 2329) function as if Wait is false. Wait must be set to true

before calling Play (see page 2323) or StartRecording (see page 2329) to prevent control from returning to the application before playing or recording has finished. By default, all other media control methods function as if Wait is true.

Note: Wait is usually set to false only if the next media control is expected to take a long time, so that the application can execute other code before the media control method has completed. If Wait is set to false, you should set Notify (see page 2350) to true so the application is notified when the media control method completes.

Notify (see page 2350)

39.1.2.6 TMediaPlayer Events

The events of the TMediaPlayer class are listed here.

Published Events

	Name	Description
	OnClick (see page 2366)	Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.
	OnContextPopup (see page 2367)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnEnter (see page 2368)	Occurs when a control receives the input focus.
	OnExit (see page 2370)	Occurs when the input focus shifts away from one control to another.
	OnMouseEnter (see page 2374)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2374)	Occurs when the user moves the mouse outside of a control.
	OnNotify (see page 2375)	Occurs upon the completion of a media control method.
	OnPostClick (see page 2375)	Occurs after the OnClick (see page 2366) event handler is called.

39.1.2.6.1 TMediaPlayer.OnClick Event

Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.

Pascal

```
property OnClick: EMPNotify;
```

C++

```
__property EMPNotify OnClick;
```

Description

When the media player control has focus and the Spacebar is pressed, the user can use the Left Arrow or Right Arrow keys to select which control button to click.

The EMPNotify (see page 2384) type is a method pointer that is called when an OnClick event for a TMediaPlayer (see page 2305) components occurs. The Button argument can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

The default value of the event handler's DoDefault argument is true. If DoDefault is true, the media player control calls the method that corresponds to the clicked button. For example, if the user clicks the Play (see page 2323) button (btPlay), the Play (see page 2323) method is called.

If DoDefault is false, the user must write code that executes when a media player control button is clicked in the OnClick event handler. The following table lists the default methods corresponding to the media player control buttons:

Control button	Button value	Method called
Play (see page 2323)	btPlay	Play (see page 2323)
Record	btRecord	StartRecording (see page 2329)
Stop (see page 2330)	btStop	Stop (see page 2330)
Next (see page 2318)	btNext	Next (see page 2318)
Prev	btPrev	Previous (see page 2327)
Step (see page 2330)	btStep	Step (see page 2330)
Back (see page 2313)	btBack	Back (see page 2313)
Pause (see page 2322)	btPause	Pause (see page 2322)
Eject (see page 2315)	btEject	Eject (see page 2315)

See Also

Click (see page 2313)

39.1.2.6.2 TMediaPlayer.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

PopupMenu

AutoPopup (see page 1437)

39.1.2.6.3 TMediaPlayer.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
```

```
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.

39.1.2.6.4 TMediaPlayer.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // initialize the maskedit boxes to contain the empty string
  MaskEdit1->Text = "";
  MaskEdit2->Text = "";
  MaskEdit3->Text = "";

OnEnter

ActiveControl

39.1.2.6.5 TMediaPlayer.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

39.1.2.6.6 TMediaPlayer.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

39.1.2.6.7 TMediaPlayer.OnNotify Event

Occurs upon the completion of a media control method.

Pascal

```
property OnNotify: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnNotify;
```

Description

OnNotify occurs upon the completion of a media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), Resume (see page 2327), Rewind (see page 2328), StartRecording (see page 2329), Step (see page 2330), or Stop (see page 2330)) when the Notify (see page 2350) property is set to true before the call to the media control method. After an OnNotify event, the Notify (see page 2350) property must be reset to true for the next OnNotify event to occur.

DoNotify (see page 2315)

MMNotify (see page 2318)

Notify (see page 2350)

39.1.2.6.8 TMediaPlayer.OnPostClick Event

Occurs after the OnClick (see page 2366) event handler is called.

Pascal

```
property OnPostClick: EMPPostNotify;
```

C++

```
__property EMPPostNotify OnPostClick;
```

Description

OnPostClick is generated after the code of the OnClick (see page 2366) event handler has been called. If Wait (see page 2365) is true when the media player was clicked, OnPostClick won't be called until the completion of the OnClick (see page 2366) code. If Wait (see page 2365) is false, control can return to the application before completion of the OnClick (see page 2366) code; therefore, the OnPostClick event may occur before the actions initiated by the OnClick (see page 2366) event have completed.

For example, if the user clicks the Play (see page 2323) button and the DoDefault parameter of the OnClick (see page 2366) event handler for the media player is true, the media is played. If the media is long enough, it will still be playing when the OnPostClick event is generated if Wait (see page 2365) is true. If Wait (see page 2365) is false, however, OnPostClick won't occur until the media has finished playing.

OnClick (see page 2366)

PostClick (see page 2326)

Wait (see page 2365)

39.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMPBtnType (see page 2376)	TMPBtnType defines the possible buttons in a TMediaPlayer (see page 2305) component and TButtonSet (see page 2385) represents a set of those buttons.
	TMPDevCaps (see page 2378)	TMPDevCaps defines the capabilities of a TMediaPlayer (see page 2305) component and TMPDevCapsSet (see page 2385) represents a set of those capabilities.
	TMPDeviceTypes (see page 2378)	TMPDeviceTypes identifies a multimedia device.
	TMPGlyph (see page 2380)	This is record MPlayer.TMPGlyph.
	TMPModes (see page 2380)	TMPModes identifies the state of a TMediaPlayer (see page 2305) component.
	TMPNotifyValues (see page 2381)	TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 2305) component.
	TMPTimeFormats (see page 2382)	TMPTimeFormats indicates the format a media player uses to indicate position.

Records

	Name	Description
	TMPButton (see page 2377)	This is record MPlayer.TMPButton.

39.2.1 MPlayer.TMPBtnType Enumeration

TMPBtnType defines the possible buttons in a TMediaPlayer (see page 2305) component and TButtonSet (see page 2385) represents a set of those buttons.

Pascal

```
TMPBtnType = (
  btPlay,
  btPause,
  btStop,
  btNext,
  btPrev,
  btStep,
  btBack,
  btRecord,
  btEject
);
```

C++

```
enum TMPBtnType {
  btPlay,
  btPause,
  btStop,
  btNext,
  btPrev,
  btStep,
  btBack,
  btRecord,
  btEject
};
```

File

MPlayer

Description

TMPBtnType represents the type of a media player button. TButtonSet (see page 2385) is a set of button types for the media player.

Each button type has an associated action on the media player. The following table lists the button types and their associated actions:

Value	Action
btPlay	Plays the media player.
btRecord	Starts recording.
btStop	Stops playing or recording.
btNext	Skips to the next track, or to the end if the medium doesn't use tracks.
btPrev	Skips to the previous track, or to the beginning if the medium doesn't use tracks.
btStep	Moves forward a number of frames.
btBack	Moves backward a number of frames.
btPause	Pauses playing or recording. If already paused when clicked, resumes playing or recording.
btEject	Ejects the medium.

TSpeedButton

39.2.2 MPlayer.TMPButton Record

Pascal

```
TMPButton = record
  Visible: Boolean;
  Enabled: Boolean;
  Colored: Boolean;
  Auto: Boolean;
  Bitmaps: array[TMPGlyph] of TBitmap;
end;
```

C++

```
struct TMPButton {
  Boolean Visible;
  Boolean Enabled;
  Boolean Colored;
  Boolean Auto;
  array[TMPGlyph] of TBitmap Bitmaps;
};
```

File

MPlayer

Description

This is record MPlayer.TMPButton.

39.2.3 MPlayer.TMPDevCaps Enumeration

TMPDevCaps defines the capabilities of a TMediaPlayer (see page 2305) component and TMPDevCapsSet (see page 2385) represents a set of those capabilities.

Pascal

```
TMPDevCaps = (
  mpCanStep,
  mpCanEject,
  mpCanPlay,
  mpCanRecord,
  mpUsesWindow
);
```

C++

```
enum TMPDevCaps {
  mpCanStep,
  mpCanEject,
  mpCanPlay,
  mpCanRecord,
  mpUsesWindow
};
```

File

MPlayer

Description

TMPDevCaps represents the capabilities of a media player control. TMPDevCapsSet (see page 2385) is a set of TMPDevCaps values.

The following table lists the possible TMPDevCaps values:

Value	Capability
mpCanEject	Can eject media
mpCanPlay	Can play media
mpCanRecord	Can record media
mpCanStep	Can step forward or backward within media
mpUsesWindow	Uses a window for displaying output

See Also

TMediaPlayer (see page 2305)

39.2.4 MPlayer.TMPDeviceTypes Enumeration

TMPDeviceTypes identifies a multimedia device.

Pascal

```
TMPDeviceTypes = (
  dtAutoSelect,
  dtAVIVideo,
  dtCDAudio,
  dtDAT,
  dtDigitalVideo,
  dtMMMovie,
  dtOther,
  dtOverlay,
  dtScanner,
  dtSequencer,
  dtVCR,
  dtVideodisc,
  dtWaveAudio
);
```

C++

```
enum TMPDeviceTypes {
  dtAutoSelect,
  dtAVIVideo,
  dtCDAudio,
  dtDAT,
  dtDigitalVideo,
  dtMMMovie,
  dtOther,
  dtOverlay,
  dtScanner,
  dtSequencer,
  dtVCR,
  dtVideodisc,
  dtWaveAudio
};
```

File

MPlayer

Description

TMPDeviceTypes type identifies the multimedia device types that can be opened by a TMediaPlayer (see page 2305) component.

The following table lists the possible values:

Value	Meaning
dtAutoSelect	the device type is determined by the file extension.
dtAVIVideo	AVI clip
dtCDAudio	Audio CD recording
dtDAT	DAT file
dtDigitalVideo	Digital video recording
dtMMMovie	MM recording
dtOther	media type not identified by other categories
dtOverlay	Overlay
dtScanner	scanner
dtSequencer	sequencer
dtVCR	VCR

dtVideodisc	Videodisc
dtWaveAudio	.wav file

See Also

TMediaPlayer (see page 2305)

39.2.5 MPlayer.TMPGlyph Enumeration

Pascal

```
TMPGlyph = (
  mgEnabled,
  mgDisabled,
  mgColored
);
```

C++

```
enum TMPGlyph {
  mgEnabled,
  mgDisabled,
  mgColored
};
```

File

MPlayer

Description

This is record MPlayer.TMPGlyph.

39.2.6 MPlayer.TMPModes Enumeration

TMPModes identifies the state of a TMediaPlayer (see page 2305) component.

Pascal

```
TMPModes = (
  mpNotReady,
  mpStopped,
  mpPlaying,
  mpRecording,
  mpSeeking,
  mpPaused,
  mpOpen
);
```

C++

```
enum TMPModes {
  mpNotReady,
  mpStopped,
  mpPlaying,
  mpRecording,
  mpSeeking,
  mpPaused,
  mpOpen
```

```
};
```

File

MPlayer

Description

TMPModes type identifies the state of a media player. The following table lists the possible values:

Value	Mode
mpNotReady	Not ready
mpStopped	Stopped
mpPlaying	Playing
mpRecording	Recording
mpSeeking	Seeking
mpPaused	Paused
mpOpen	Open

See Also

TMediaPlayer (see page 2305)

39.2.7 MPlayer.TMPNotifyValues Enumeration

TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 2305) component.

Pascal

```
TMPNotifyValues = (
  nvSuccessful,
  nvSuperseded,
  nvAborted,
  nvFailure
);
```

C++

```
enum TMPNotifyValues {
  nvSuccessful,
  nvSuperseded,
  nvAborted,
  nvFailure
};
```

File

MPlayer

Description

The TMPNotifyValues type defines the notification values for a multimedia device used with a TMediaPlayer (see page 2305). The possible values for the TMPNotifyValues type are as follows.

Value	Meaning
nvSuccessful	Command completed successfully
nvSuperseded	Command was superseded by another command

nvAborted	Command was aborted by the user
nvFailure	Command failed

See Also

TMediaPlayer (see page 2305)

39.2.8 MPlayer.TMPTimeFormats Enumeration

TMPTimeFormats indicates the format a media player uses to indicate position.

Pascal

```
TMPTimeFormats = (
  tfMilliseconds,
  tfHMS,
  tfMSF,
  tfFrames,
  tfSMPTE24,
  tfSMPTE25,
  tfSMPTE30,
  tfSMPTE30Drop,
  tfBytes,
  tfSamples,
  tfTMSF
);
```

C++

```
enum TMPTimeFormats {
  tfMilliseconds,
  tfHMS,
  tfMSF,
  tfFrames,
  tfSMPTE24,
  tfSMPTE25,
  tfSMPTE30,
  tfSMPTE30Drop,
  tfBytes,
  tfSamples,
  tfTMSF
};
```

File

MPlayer

Description

The TMPTimeFormats type defines the time formats for a multimedia device used with a TMediaPlayer (see page 2305). The following table lists the possible values for the TMPTimeFormats type:

Value	Time format
tfMilliseconds	Milliseconds are stored as a 4-byte integer variable.
tfHMS	Hours, minutes, and seconds packed into a 4-byte integer. From least significant to most significant byte, the data values are
Hours (least significant byte)	
Minutes	

Seconds	
Unused (most significant byte)	
tfMSF	Minutes, seconds, and frames packed into a 4-byte integer. From least significant to most significant byte, the data values are
Minutes (least significant byte)	
Seconds	
Frames	
Unused (most significant byte)	
tfFrames	Frames are stored as a 4-byte integer variable.
tfSMPTE24	24-frame SMPTE packs values in a 4-byte variable. From least significant to most significant byte, the data values are
Hours (least significant byte)	
Minutes	
Seconds	
Frames (most significant byte)	
SMPTE (Society of Motion Picture and Television Engineers) time is an absolute time format expressed in hours, minutes, seconds, and frames. The standard SMPTE division types are 24, 25, and 30 frames per second.	
tfSMPTE25	25-frame SMPTE packs data into a 4-byte variable in the same order as 24-frame SMPTE.
tfSMPTE30	30-frame SMPTE packs data into the 4-byte variable in the same order as 24-frame SMPTE.
tfSMPTE30Drop	30-drop-frame SMPTE packs data into the 4-byte variable in the same order as 24-frame SMPTE.
tfBytes	Bytes are stored as a 4-byte integer variable.
tfSamples	Samples are stored as a 4-byte integer variable.
tfTMSF	Tracks, minutes, seconds, and frames are packed in the 4-byte variable. From least significant to most significant byte, the data values are
Tracks (least significant byte)	
Minutes	
Seconds	
Frames (most significant byte)	

Note that MCI uses continuous track numbering.

Note: Functions provided with MCI to help decoding the 4-byte integer specified in a given time format are documented under MCI Macros for Encoding and Decoding Time Data in the MMSYSTEM.HLP Help file.

TMediaPlayer (see page 2305)

39.3 Types

The following table lists types in this documentation.

Types

Name	Description
EMPNotify (see page 2384)	EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 2305) component.
EMPPostNotify (see page 2384)	EMPPostNotify is the type of a media player's OnPostClick event handler.
TButtonSet (see page 2385)	TButtonSet is a set of TMPBtnType (see page 2376) values.
TMediaDevice (see page 2385)	This is type MPlayer.TMediaDevice.
TMPDevCapsSet (see page 2385)	This is type MPlayer.TMPDevCapsSet.

39.3.1 MPlayer.EMPNotify Type

EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 2305) component.

Pascal

```
EMPNotify = procedure (Sender: TObject; Button: TMPBtnType; var DoDefault: Boolean) of object;
```

C++

```
(Sender: TObject; Button: TMPBtnType; var DoDefault: Boolean) ( EMPNotify)();
```

File

MPlayer

Description

Sender is the TMediaPlayer (see page 2305) component whose button was clicked.

Button indicates the button that was clicked. It can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

DoDefault returns an indication of whether the media player should make its default response after the event handler exits.

See Also

TMediaPlayer (see page 2305)

39.3.2 MPlayer.EMPPostNotify Type

EMPPostNotify is the type of a media player's OnPostClick event handler.

Pascal

```
EMPPostNotify = procedure (Sender: TObject; Button: TMPBtnType) of object;
```

C++

```
(Sender: TObject; Button: TMPBtnType) ( EMPPostNotify)();
```

File

MPlayer

Description

Sender is the TMediaPlayer (see page 2305) component whose button was clicked.

Button indicates the button that was clicked. It can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

See Also

TMediaPlayer (see page 2305)

39.3.3 MPlayer.TButtonSet Type

TButtonSet is a set of TMPBtnType (see page 2376) values.

Pascal

```
TButtonSet = set of TMPBtnType;
```

C++

```
TMPBtnType TButtonSet;
```

File

MPlayer

Description

TButtonSet represents a set of zero or more of the buttons that can appear on a TMPDeviceType control.

39.3.4 MPlayer.TMediaDevice Type

Pascal

```
TMediaDevice = Word;
```

C++

```
Word TMediaDevice;
```

File

MPlayer

Description

This is type MPlayer.TMediaDevice.

39.3.5 MPlayer.TMPDevCapsSet Type

Pascal

```
TMPDevCapsSet = set of TMPDevCaps;
```

C++

```
TMPDevCaps TMPDevCapsSet;
```

File

MPlayer

Description

This is type MPlayer.TMPDevCapsSet.

40 Mtsobj Namespace

This is namespace Mtsobj.

Topics

Name	Description
Classes (see page 2388)	The following table lists classes in this documentation.

Classes

	Name	Description
	TMtsAutoObject (see page 2388)	TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

40.1 Classes

The following table lists classes in this documentation.

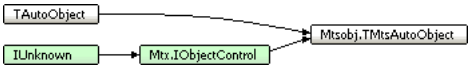
Classes

	Name	Description
	TMtsAutoObject (see page 2388)	TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

40.1.1 TMtsAutoObject Class

TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

Class Hierarchy



Pascal

```
TMtsAutoObject = class(TAutoObject, IObjectControl);
```

C++

```
class TMtsAutoObject : public TAutoObject, public IObjectControl;
```

File

Mtsobj

Description

Use a TMtsAutoObject object as the central repository for all objects in an MTS-enabled application server.

MTS Automation objects are dual-interface Automation servers that implement the IObjectControl (see page 2424) interface. MTS Automation objects are like any Automation server with additional features that encapsulate MTS services such as transaction support and security.

TMtsDataModule (see page 2398)

Writing Applications Using COM

40.1.1.1 TMtsAutoObject Members

The following tables list the members exposed by TMtsAutoObject.

Protected Methods

	Name	Description
	Activate (see page 2389)	This is Activate, a member of class TMtsAutoObject.
	CanBePooled (see page 2390)	This is CanBePooled, a member of class TMtsAutoObject.
	Deactivate (see page 2390)	This is Deactivate, a member of class TMtsAutoObject.

	OnActivate (see page 2393)	This is OnActivate, a member of class TMtsAutoObject.
	OnDeactivate (see page 2393)	This is OnDeactivate, a member of class TMtsAutoObject.

Protected Properties

	Name	Description
	ObjectContext (see page 2394)	This is ObjectContext, a member of class TMtsAutoObject.

Public Methods

	Name	Description
	DisableCommit (see page 2390)	Prevents clients from completing transactions.
	EnableCommit (see page 2391)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 2391)	Indicates whether the current client matches a particular security role.
	IsInTransaction (see page 2392)	Indicates whether the MTS Automation object is running in a transaction.
	IsSecurityEnabled (see page 2392)	Indicates whether security is enabled for the current MTS Automation object instance.
	SetAbort (see page 2393)	Allows the MTS Automation object to be deactivated and aborts any current transactions.
	SetComplete (see page 2393)	Indicates that the MTS Automation object has successfully completed its current task.

Public Properties

	Name	Description
	Pooled (see page 2394)	Indicates whether the object can be pooled when installed under COM+.

40.1.1.2 TMtsAutoObject Methods

The methods of the TMtsAutoObject class are listed here.

Protected Methods

	Name	Description
	Activate (see page 2389)	This is Activate, a member of class TMtsAutoObject.
	CanBePooled (see page 2390)	This is CanBePooled, a member of class TMtsAutoObject.
	Deactivate (see page 2390)	This is Deactivate, a member of class TMtsAutoObject.
	OnActivate (see page 2393)	This is OnActivate, a member of class TMtsAutoObject.
	OnDeactivate (see page 2393)	This is OnDeactivate, a member of class TMtsAutoObject.

Public Methods

	Name	Description
	DisableCommit (see page 2390)	Prevents clients from completing transactions.
	EnableCommit (see page 2391)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 2391)	Indicates whether the current client matches a particular security role.
	IsInTransaction (see page 2392)	Indicates whether the MTS Automation object is running in a transaction.
	IsSecurityEnabled (see page 2392)	Indicates whether security is enabled for the current MTS Automation object instance.
	SetAbort (see page 2393)	Allows the MTS Automation object to be deactivated and aborts any current transactions.
	SetComplete (see page 2393)	Indicates that the MTS Automation object has successfully completed its current task.

40.1.1.2.1 TMtsAutoObject.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TMtsAutoObject.

40.1.1.2.2 TMtsAutoObject.CanBePooled Method

Pascal

```
function CanBePooled: Bool; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class TMtsAutoObject.

40.1.1.2.3 TMtsAutoObject.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class TMtsAutoObject.

40.1.1.2.4 TMtsAutoObject.DisableCommit Method

Prevents clients from completing transactions.

Pascal

```
procedure DisableCommit;
```

C++

```
__fastcall DisableCommit();
```

Description

Call DisableCommit to indicate that the MTS Automation object cannot complete its current transaction or release state information until it receives further method invocations from the client. After calling DisableCommit, the current transaction (if any) cannot be completed until the MTS Automation object calls EnableCommit (see page 2391) or SetComplete (see page 2393).

With transactions that are started automatically when the MTS Automation object's interface is called, DisableCommit is not necessary. These transactions are not committed until the MTS Automation object calls SetComplete (see page 2393). However, when the MTS Automation object is enlisted in a transaction that was started previously, the client controls the transaction and can attempt to commit it before the MTS Automation object has completed its part. Calling DisableCommit prevents the client from prematurely committing a transaction. If a client tries to commit a transaction after the MTS Automation object has called DisableCommit, the transaction aborts.

Tip: Call DisableCommit at the beginning of a method to protect your MTS Automation object from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling EnableCommit (see page 2391) or SetComplete

(see page 2393) reverses this affect and allows the transaction to complete.

See Also

EnableCommit (see page 2391)

SetAbort (see page 2393)

SetComplete (see page 2393)

IsInTransaction (see page 2392)

40.1.1.2.5 TMtsAutoObject.EnableCommit Method

Allows clients to complete transactions without releasing state information.

Pascal

```
procedure EnableCommit;
```

C++

```
__fastcall EnableCommit();
```

Description

Call EnableCommit to indicate that the MTS Automation object can complete its current transaction without releasing state information. Unlike the SetComplete (see page 2393) method (which also signals that the current transaction can be committed), EnableCommit does not allow MTS to deactivate the MTS Automation object. This lets the MTS Automation object preserve state information over multiple interface calls, while still allowing clients that have enlisted the object in a transaction to commit.

By default, transactions can be completed when an interface call ends, unless the DisableCommit (see page 2390) method is called. There is no need to call EnableCommit unless the MTS Automation object has previously called DisableCommit (see page 2390).

Note: Although EnableCommit permits the current transaction to be completed, it does not automatically commit the transaction. The client that enlisted the MTS Automation object must still explicitly commit that transaction. If MTS started the transaction automatically (because the MTS Automation object requires a transaction for its interface calls), the transaction is not committed until the data module calls SetComplete (see page 2393).

See Also

DisableCommit (see page 2390)

SetComplete (see page 2393)

SetAbort (see page 2393)

IsInTransaction (see page 2392)

40.1.1.2.6 TMtsAutoObject.IsCallerInRole Method

Indicates whether the current client matches a particular security role.

Pascal

```
function IsCallerInRole(const Role: WideString): Bool;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR Role);
```

Description

MTS provides role-based security. Each level of access to your application server can be assigned a role. Using the MTS Explorer, administrators can prevent clients from using an interface based on their role. (This is called declarative security.) In addition, however, programs can provide more fine-grained security programmatically. To do this, use IsCallerInRole to provide access to blocks of code based on the caller's security role.

IsCallerInRole checks whether the current client is part of the role named by the Role parameter. It returns true if the client matches the named role, and False otherwise. Use IsCallerInRole to prevent clients from invoking certain blocks of code if they do not have the appropriate security role.

Note: MTS security is not available on servers running Windows95. If the MTS application is running on Windows95, IsCallerInRole always returns true . In addition, IsCallerInRole always returns True if the application is part of an MTS Library package (which runs in the client's process space).

40.1.1.2.7 TMtsAutoObject.IsInTransaction Method

Indicates whether the MTS Automation object is running in a transaction.

Pascal

```
function IsInTransaction: Bool;
```

C++

```
__fastcall Bool IsInTransaction();
```

Description

Call IsInTransaction to determine whether the MTS Automation object is currently running in a transaction. For example, if the MTS Automation object requires a transaction, use IsInTransaction to check that this requirement has not been turned off by an administrator using the MTS Explorer, and to raise an exception if it has.

Note: If IsInTransaction returns False, the EnableCommit (see page 2391) and DisableCommit (see page 2390) methods have no effect.

See Also

EnableCommit (see page 2391)

DisableCommit (see page 2390)

40.1.1.2.8 TMtsAutoObject.IsSecurityEnabled Method

Indicates whether security is enabled for the current MTS Automation object instance.

Pascal

```
function IsSecurityEnabled: Bool;
```

C++

```
__fastcall Bool IsSecurityEnabled();
```

Description

Call IsSecurityEnabled to determine whether the MTS Automation object is currently protected by MTS security services. MTS security is enabled unless the object is running in the client's process. This can happen if the MTS Automation object is configured to run in the client's process space by an administrator using the MTS Explorer, or if the client application is in the same MTS package as the MTS Automation object.

Note: MTS security is not available for servers running on Windows95.

40.1.1.2.9 TMtsAutoObject.OnActivate Method

Pascal

```
procedure OnActivate; virtual;
```

C++

```
virtual __fastcall OnActivate();
```

Description

This is OnActivate, a member of class TMtsAutoObject.

40.1.1.2.10 TMtsAutoObject.OnDeactivate Method

Pascal

```
procedure OnDeactivate; virtual;
```

C++

```
virtual __fastcall OnDeactivate();
```

Description

This is OnDeactivate, a member of class TMtsAutoObject.

40.1.1.2.11 TMtsAutoObject.SetAbort Method

Allows the MTS Automation object to be deactivated and aborts any current transactions.

Pascal

```
procedure SetAbort;
```

C++

```
__fastcall SetAbort();
```

Description

Call SetAbort to indicate that any current transaction that includes the MTS Automation object to abort. If MTS started a transaction automatically, the transaction aborts when the current method call exits. If the MTS Automation object was enlisted in a pre-existing transaction, the client transaction will eventually fail. Usually, SetAbort is called in the except block of a try...except statement.

In addition to aborting any current transaction, SetAbort indicates that the MTS Automation object can be deactivated when the current interface call exits. This means that state information is not preserved for the next time and the client calls the Automation object's interface. To prevent transactions from committing successfully without losing state information, use the DisableCommit (see page 2390) method instead.

Tip: Call SetAbort at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling SetComplete (see page 2393) reverses this affect and allows the transaction to complete.

40.1.1.2.12 TMtsAutoObject.SetComplete Method

Indicates that the MTS Automation object has successfully completed its current task.

Pascal

```
procedure SetComplete;
```

C++

```
__fastcall SetComplete();
```

Description

Call SetComplete to indicate that the MTS Automation object no longer needs to maintain state information. After calling SetComplete, the MTS Automation object is deactivated when the current method call exits.

If the MTS Automation object is part of a transaction, SetComplete indicates that this part of the transaction can commit. If MTS started the transaction automatically when the client called the MTS Automation object's methods, MTS tries to commit the transaction when the current method exits.

Note: This transaction may still fail if the current transaction included another MTS object that called SetAbort (see page 2393) or DisableCommit (see page 2390).

See Also

EnableCommit (see page 2407)

40.1.1.3 TMtsAutoObject Properties

The properties of the TMtsAutoObject class are listed here.

Protected Properties

	Name	Description
	ObjectContext (see page 2394)	This is ObjectContext, a member of class TMtsAutoObject.

Public Properties

	Name	Description
	Pooled (see page 2394)	Indicates whether the object can be pooled when installed under COM+.

40.1.1.3.1 TMtsAutoObject.ObjectContext Property

Pascal

```
property ObjectContext: IObjectContext;
```

C++

```
__property IObjectContext ObjectContext;
```

Description

This is ObjectContext, a member of class TMtsAutoObject.

40.1.1.3.2 TMtsAutoObject.Pooled Property

Indicates whether the object can be pooled when installed under COM+.

Pascal

```
property Pooled: Boolean;
```

C++

```
__property Boolean Pooled;
```

Description

Set Pooled to indicate whether instances of the MTS Automation object can be pooled when installed under COM+. The MTS Automation object uses the Pooled property when implementing the IObjectControl (see page 2424) method CanBePooled (see page 2390). This instructs COM+ that the object can be moved to an object pool when deactivated, so that the single instance is shared by all clients.

Warning: Do not set Pooled to True unless the MTS Automation object is stateless.

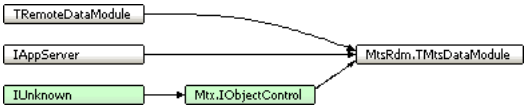
41.1.1 TMtsDataModule Class

TMtsDataModule encapsulates the objects and interfaces of a transactional application server.

Class Hierarchy



Pascal

```
TMtsDataModule = class(TRemoteDataModule, IAppServer, IObjectControl);
```

C++

```
class TMtsDataModule : public TRemoteDataModule, public IAppServer, public IObjectControl;
```

File

MtsRdm

Description

Use a TMtsDataModule object as the central repository for all objects in a transactional application server that is written in Delphi. MTS data modules can contain any nonvisual components. . Typically these are data access components, such as datasets and the provider components that handle communication between these datasets and client applications. MTS data modules can also contain other nonvisual components, such as TTimer, or TImageList.

MTS data modules are dual-interface Automation servers that implement the IAppServer interface. Connection components on client applications are designed to look for this interface. The methods in this interface, however, do not call the SetComplete (see page 2410) method, so the MTS data module is not transactional. You may want to expand the MTS data module's interface to provide alternate versions of these methods that use the MTS data module's transaction.

The default interaction between a client dataset and an MTS data module does not rely on state information, so it is safe to use the MTS data module with just-in-time activation. However, you may need to provide a mechanism for communicating persistent state information to take advantage of some features such as incremental fetches.

To create an MTS data module at design time, choose File|New|Other, and select Transactional Data Module from the multitier page of the new items dialog. If you are writing the application server in Delphi, the Transactional Data Module Wizard then creates a new descendant of TMtsDataModule that supports an interface that descends from IAppServer.

Writing Applications Using COM

41.1.1.1 TMtsDataModule Members

The following tables list the members exposed by TMtsDataModule.

Protected Methods

	Name	Description
	Activate (see page 2400)	This is Activate, a member of class TMtsDataModule.
	AS_ApplyUpdates (see page 2401)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 2401)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 2402)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 2403)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 2404)	Returns a list of all the available providers on the remote data module.
	AS_GetRecords (see page 2404)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 2405)	Returns information from a specified record of the provider's dataset.
V	CallComplete (see page 2406)	This is CallComplete, a member of class TMtsDataModule.
V	CanBePooled (see page 2406)	This is CanBePooled, a member of class TMtsDataModule.
	Deactivate (see page 2406)	This is Deactivate, a member of class TMtsDataModule.

Protected Properties

	Name	Description
R	ObjectContext (see page 2411)	This is ObjectContext, a member of class TMtsDataModule.

Public Methods

	Name	Description
V	Create (see page 2399)	Creates an MTS data module instance.
	DisableCommit (see page 2407)	Prevents clients from completing transactions.
	EnableCommit (see page 2407)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 2408)	Indicates whether the current client fits into a particular security role.
	IsInTransaction (see page 2408)	Indicates whether the MTS data module is running in a transaction.
	IsSecurityEnabled (see page 2409)	Indicates whether security is enabled for the current MTS data module instance.
	SetAbort (see page 2409)	Allows the MTS data module to be deactivated and aborts any current transactions.
	SetComplete (see page 2410)	Indicates that the MTS data module has successfully completed its current task.

Published Events

	Name	Description
	OnActivate (see page 2412)	Occurs when an instance of TMtsDataModule (see page 2398) is activated.
	OnDeactivate (see page 2412)	Occurs when an instance of TMtsDataModule (see page 2398) is deactivated.

Published Properties

	Name	Description
	AutoComplete (see page 2411)	Specifies whether the IAppServer methods are transactional.
	Pooled (see page 2412)	Indicates whether the data module can be pooled when installed under COM+.

41.1.1.2 TMtsDataModule.Create Constructor

Creates an MTS data module instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMtsDataModule(TComponent * AOwner);
```

Description

Most applications do not need to call the constructor for TMtsDataModule (see page 2398). Instead, add a remote data module to a server application using the transactional data module wizard on the multi-tier page of the new items dialog.

AOwner specifies the component that is responsible for freeing the remote data module (typically the application).

41.1.1.3 TMtsDataModule Methods

The methods of the TMtsDataModule class are listed here.

Protected Methods

	Name	Description
	Activate (see page 2400)	This is Activate, a member of class TMtsDataModule.
	AS_ApplyUpdates (see page 2401)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 2401)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 2402)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 2403)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 2404)	Returns a list of all the available providers on the remote data module.
	AS_GetRecords (see page 2404)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 2405)	Returns information from a specified record of the provider's dataset.
	CallComplete (see page 2406)	This is CallComplete, a member of class TMtsDataModule.
	CanBePooled (see page 2406)	This is CanBePooled, a member of class TMtsDataModule.
	Deactivate (see page 2406)	This is Deactivate, a member of class TMtsDataModule.

Public Methods

	Name	Description
	DisableCommit (see page 2407)	Prevents clients from completing transactions.
	EnableCommit (see page 2407)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 2408)	Indicates whether the current client fits into a particular security role.
	IsInTransaction (see page 2408)	Indicates whether the MTS data module is running in a transaction.
	IsSecurityEnabled (see page 2409)	Indicates whether security is enabled for the current MTS data module instance.
	SetAbort (see page 2409)	Allows the MTS data module to be deactivated and aborts any current transactions.
	SetComplete (see page 2410)	Indicates that the MTS data module has successfully completed its current task.

41.1.1.3.1 TMtsDataModule.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TMtsDataModule.

41.1.1.3.2 TMtsDataModule.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server. ProviderName specifies the name of the provider component that manages the update operation. Delta is a Variant containing the updated, inserted, and deleted records to write to the database. MaxErrors indicates the maximum number of errors to permit before rolling back the update operation; ErrorCount returns the actual number of errors encountered during the update operation. OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler. It is passed to the provider's BeforeAS_ApplyUpdates event handler and returned from the provider's AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates The AS_ApplyUpdates_result parameter returns a Variant that is a data packet containing all records that could not be applied.

Note: Applications can only call the protected AS_AS_ApplyUpdates method using the TRemoteDataModule interface. To apply updates directly in code from the application server, use the provider component's AS_ApplyUpdates method.

Providers

IAppServer

41.1.1.3.3 TMtsDataModule.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This

method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value AS_DataRequest_result parameter, which is returned to the caller.

Note: Applications can only call the protected AS_AS_DataRequest method using the TRemoteDataModule interface.

OnDataRequest (see page 3124)

Providers

DataRequest

IAppServer

41.1.1.3.4 TMtsDataModule.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

Note: AS_AS_Execute should only be called for a provider whose dataset represents a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a table or stored procedure that replaces the provider's underlying database table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams method.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

Note: Applications can only call the protected AS_AS_Execute method using the TRemoteDataModule interface. To execute a dataset in code from the application server, use the dataset component directly.

Options (see page 3087)

41.1.1.3.5 TMtsDataModule.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_GetParams to retrieve the current parameter values from the dataset associated with a provider. The ProviderName parameter specifies the name of the provider component whose dataset has the parameters. The OwnerData represents custom information that originates in a client dataset's BeforeGetParams event handler and returns information that is passed to the client dataset's AfterGetParams event handler.

GetParams_resultAS_GetParams returns the parameters, encoded as a Variant array, or, if the provider does not support parameter fetching, GetParams_resultAS_GetParams returns a Null Variant. Use the UnpackParams procedure to convert parameter values returned by AS_GetParams to a TParams object.

AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, obtain output parameters using the AS_Execute method handler instead.

Note: Applications can only call the protected AS_GetParams method using the TRemoteDataModule interface.

41.1.1.3.6 TMtsDataModule.AS_GetProviderNames Method

Returns a list of all the available providers on the remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all registered providers available from a remote data module. These values indicate the possible values for the ProviderName property of a client dataset that connects to the remote data module. When calling any of the remote data modules through the TRemoteDataModule interface, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

Note: Applications can only call the protected AS_AS_GetProviderNames method using the TRemoteDataModule interface.

See Also

ProviderName

Providers

IAppServer

Exported (see page 3115)

41.1.1.3.7 TMtsDataModule.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the

GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a table or stored procedure that replaces the provider's underlying database table or stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variant parameter, AS_GetRecords_result.

Note: Applications can only call the protected AS_AS_GetRecords method using the TRemoteDataModule interface. To fetch records directly in code from the application server, use the provider component's AS_GetRecords method.

Providers

IAppServer

41.1.1.3.8 TMtsDataModule.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
```

```
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet.

Note: Applications can only call the protected AS_AS_RowRequest method using the TRemoteDataModule interface.

41.1.1.3.9 TMtsDataModule.CallComplete Method

Pascal

```
procedure CallComplete(Complete: Boolean); virtual;
```

C++

```
virtual __fastcall CallComplete(Boolean Complete);
```

Description

This is CallComplete, a member of class TMtsDataModule.

41.1.1.3.10 TMtsDataModule.CanBePooled Method

Pascal

```
function CanBePooled: Bool; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class TMtsDataModule.

41.1.1.3.11 TMtsDataModule.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class TMtsDataModule.

41.1.1.3.12 TMtsDataModule.DisableCommit Method

Prevents clients from completing transactions.

Pascal

```
procedure DisableCommit;
```

C++

```
__fastcall DisableCommit();
```

Description

Call DisableCommit to indicate that the MTS data module can't complete its current transaction or release state information (properties) until it receives further method invocations from the client. After calling DisableCommit, the current transaction (if any) can't be completed until the MTS data module calls EnableCommit (see page 2407) or SetComplete (see page 2410).

With transactions that are started automatically when the MTS data module's interface is called, DisableCommit is not necessary. These automatically generated transactions are not committed until the MTS data module calls SetComplete (see page 2410). However, when the MTS data module is enlisted in a transaction that was started previously, the client controls the transaction and can attempt to commit it before the MTS data module has completed its part. Calling DisableCommit prevents the client from prematurely committing a transaction. If a client tries to commit a transaction after the MTS data module has called DisableCommit, the transaction aborts.

Tip: Call DisableCommit at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling EnableCommit (see page 2407) or SetComplete (see page 2410) reverses this affect and allows the transaction to complete.

See Also

EnableCommit (see page 2407)

SetComplete (see page 2410)

SetAbort (see page 2409)

IsInTransaction (see page 2408)

41.1.1.3.13 TMtsDataModule.EnableCommit Method

Allows clients to complete transactions without releasing state information.

Pascal

```
procedure EnableCommit;
```

C++

```
__fastcall EnableCommit();
```

Description

Call EnableCommit to indicate that the MTS data module can complete its current transaction without releasing state information (properties). Unlike the SetComplete (see page 2410) method (which also signals that the current transaction can be committed), EnableCommit does not allow the data module to be deactivated. This lets the MTS data module preserve state information over multiple interface calls, while still allowing clients that have enlisted the data module in a transaction to commit.

By default, transactions can be completed when interface calls finish, unless the DisableCommit (see page 2407) method is

called. There is no need to call EnableCommit unless the MTS data module has previously called DisableCommit (see page 2407).

Note: Although EnableCommit permits the current transaction to be completed, it does not automatically commit the transaction. The client that enlisted the MTS data module in a transaction must still explicitly commit that transaction. If the transaction was started automatically (because the MTS data module requires a transaction for its interface calls), the transaction is not committed until the data module calls SetComplete (see page 2410).

See Also

DisableCommit (see page 2407)

SetComplete (see page 2410)

SetAbort (see page 2409)

IsInTransaction (see page 2408)

41.1.1.3.14 TMtsDataModule.IsCallerInRole Method

Indicates whether the current client fits into a particular security role.

Pascal

```
function IsCallerInRole(const Role: WideString): Bool;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR Role);
```

Description

MTS provides role-based security. Each level of access to the application server can be assigned a name, called a role. Using the MTS Explorer or COM+ administrator, administrators can prevent clients from using an interface based on their role. (This is called declarative security.) In addition, however, programs can provide more fine-grained security programmatically. To do this, use IsCallerInRole to provide access to blocks of code based on the caller's security role.

IsCallerInRole checks whether the current client is part of the role named by the Role parameter. It returns true if the client fits the named role, and false otherwise. Use IsCallerInRole to prevent clients that do not have the appropriate security roles from invoking certain blocks of code.

Note: MTS security is not available on servers running Windows95. If the application server is running on Windows95, IsCallerInRole always returns true. In addition, IsCallerInRole always returns true if the application server is part of an MTS Library package (which runs in the client's process space).

See Also

IsSecurityEnabled (see page 2409)

Using Transactional Data Modules

41.1.1.3.15 TMtsDataModule.IsInTransaction Method

Indicates whether the MTS data module is running in a transaction.

Pascal

```
function IsInTransaction: Bool;
```

C++

```
__fastcall Bool IsInTransaction();
```

Description

Call IsInTransaction to determine whether the MTS data module is currently running in a transaction. For example, if the MTS data module requires a transaction, use IsInTransaction to check that this requirement has not been turned off using the MTS Explorer or COM+ administrator, and to raise an exception if it has.

Note: If IsInTransaction returns false, the EnableCommit (see page 2407) and DisableCommit (see page 2407) methods have no effect.

See Also

EnableCommit (see page 2407)

DisableCommit (see page 2407)

SetComplete (see page 2410)

SetAbort (see page 2409)

41.1.1.3.16 TMtsDataModule.IsSecurityEnabled Method

Indicates whether security is enabled for the current MTS data module instance.

Pascal

```
function IsSecurityEnabled: Bool;
```

C++

```
__fastcall Bool IsSecurityEnabled();
```

Description

Call IsSecurityEnabled to determine whether the MTS data module is currently protected by MTS or COM+ security services. MTS or COM+ security is enabled unless the object is running in the client's process. This can happen if an administrator configures the MTS data module to run in the client's process space (for example, an MTS Library package), or if the client application is in the same MTS package as the MTS data module.

Note: MTS security is not available for servers running on Windows95.

See Also

IsCallerInRole (see page 2408)

41.1.1.3.17 TMtsDataModule.SetAbort Method

Allows the MTS data module to be deactivated and aborts any current transactions.

Pascal

```
procedure SetAbort;
```

C++

```
__fastcall SetAbort();
```

Description

Call SetAbort to indicate that any current transaction that includes the MTS data module should abort. If MTS or COM+ started a transaction automatically (because the data module requires one), that transaction aborts when the current method call exits. If the MTS data module was enlisted in a pre-existing transaction, the client transaction will eventually fail. Usually, SetAbort is called in the except block of a try..exceptstatement.

In addition to aborting any current transaction, SetAbort indicates that the MTS data module can be deactivated when the current

interface call exits. This means that state information is not preserved for the next time the client calls the data module's interface. To prevent transactions from committing successfully without losing state information, use the DisableCommit (see page 2407) method instead.

Tip: Call SetAbort at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling SetComplete (see page 2410) reverses this affect and allows the transaction to complete.

See Also

SetComplete (see page 2410)

DisableCommit (see page 2407)

EnableCommit (see page 2407)

IsInTransaction (see page 2408)

41.1.1.3.18 TMtsDataModule.SetComplete Method

Indicates that the MTS data module has successfully completed its current task.

Pascal

```
procedure SetComplete;
```

C++

```
__fastcall SetComplete();
```

Description

Call SetComplete to indicate that the MTS data module no longer needs to maintain state information. After calling SetComplete, the MTS data module is deactivated when the current method call exits.

If the MTS data module is part of a transaction, SetComplete indicates that this part of the transaction can commit. If MTS or COM+ started the transaction automatically when the client called the MTS data module's method (because the MTS data module requires a transaction), it tries to commit the transaction when the current method exits.

Note: This transaction may still fail if the current transaction included another MTS or COM+ object that called SetAbort (see page 2409) or DisableCommit (see page 2407).

See Also

SetAbort (see page 2409)

Extending the Interface of the Application Server

41.1.1.4 TMtsDataModule Properties

The properties of the TMtsDataModule class are listed here.

Protected Properties

	Name	Description
	ObjectContext (see page 2411)	This is ObjectContext, a member of class TMtsDataModule.

Published Properties

	Name	Description
	AutoComplete (see page 2411)	Specifies whether the IAppServer methods are transactional.
	Pooled (see page 2412)	Indicates whether the data module can be pooled when installed under COM+.

41.1.1.4.1 TMtsDataModule.AutoComplete Property

Specifies whether the IAppServer methods are transactional.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete controls whether calls made using the IAppServer interface end in a call to SetComplete (see page 2410) or SetAbort (see page 2409). By calling SetComplete (see page 2410) or SetAbort (see page 2409), the MTS data module indicates that no state information needs to be preserved when the call exits. This allows any MTS transactions to complete (or roll back) and allows COM+ or the MTS proxy to deactivate the MTS data module.

When AutoComplete is true, all IAppServer methods call SetComplete (see page 2410) when they are done with two exceptions:

AS_ApplyUpdates (see page 2401) calls SetAbort (see page 2409) if an exception is raised or if the error count exceeds the specified maximum.

AS_DataRequest (see page 2401) doesn't call either SetComplete (see page 2410) or SetAbort (see page 2409). You must add the appropriate call to the OnDataRequest event handler.

Set AutoComplete to false if the MTS data module needs to preserve state information (such as the current record in a dataset) after an IAppServer call exits. When AutoComplete is false, you must add your own interface methods that call SetComplete (see page 2410) or SetAbort (see page 2409) when the MTS data module can be safely deactivated.

See Also

IAppServer

SetComplete (see page 2410)

SetAbort (see page 2409)

41.1.1.4.2 TMtsDataModule.ObjectContext Property

Pascal

```
property ObjectContext: IObjectContext;
```

C++

```
__property IObjectContext ObjectContext;
```

Description

This is ObjectContext, a member of class TMtsDataModule.

41.1.1.4.3 TMtsDataModule.Pooled Property

Indicates whether the data module can be pooled when installed under COM+.

Pascal

```
property Pooled: Boolean;
```

C++

```
__property Boolean Pooled;
```

Description

Set Pooled to indicate whether instances of the MTS data module can be pooled when installed under COM+. The MTS remote data module uses the Pooled property when implementing the IObjectControl (see page 2424) method CanBePooled (see page 2406). This instructs COM+ that the object can be moved to an object pool when deactivated, so that the single instance is shared by all clients.

Warning: Do not set Pooled to True unless the MTS data module is stateless.

41.1.1.5 TMtsDataModule Events

The events of the TMtsDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 2412)	Occurs when an instance of TMtsDataModule (see page 2398) is activated.
	OnDeactivate (see page 2412)	Occurs when an instance of TMtsDataModule (see page 2398) is deactivated.

41.1.1.5.1 TMtsDataModule.OnActivate Event

Occurs when an instance of TMtsDataModule (see page 2398) is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to take specific action when COMN+ or the MTS proxy activates the MTS data module. This is the point when any database connections should be established. Database connections must not opened before the MTS data module is activated.

Note: In traditional MTS or COM+ programming, objects acquire their context object when they are activated. However, TMtsDataModule (see page 2398) handles this task automatically.

See Also

OnDeactivate (see page 2412)

41.1.1.5.2 TMtsDataModule.OnDeactivate Event

Occurs when an instance of TMtsDataModule (see page 2398) is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to take specific action when COM+ or the MTS proxy releases an instance of the MTS data module. Use this method to close any database connections that were opened when the MTS data module was activated. Database connections must not be left open after the MTS data module is deactivated.

Note: In traditional COM+ and MTS programming, objects release their context object when they are deactivated. However, TMtsDataModule (see page 2398) handles this task automatically.

See Also

OnActivate (see page 2412)

42 Mtx Namespace

This is namespace Mtx.

Topics

Name	Description
Interfaces (see page 2417)	The following table lists interfaces in this documentation.
Functions (see page 2437)	The following table lists functions in this documentation.
Constants (see page 2442)	The following table lists constants in this documentation.

Constants

Name	Description
CLASS_SharedPropertyGroupManager (see page 2442)	This is constant Mtx.CLASS_SharedPropertyGroupManager.
CLASS_TransactionContext (see page 2442)	This is constant Mtx.CLASS_TransactionContext.
CLASS_TransactionContextEx (see page 2443)	This is constant Mtx.CLASS_TransactionContextEx.
LockMethod (see page 2443)	This is constant Mtx.LockMethod.
LockSetGet (see page 2443)	This is constant Mtx.LockSetGet.
mtsErrCtxAborted (see page 2444)	This is constant Mtx.mtsErrCtxAborted.
mtsErrCtxAborting (see page 2444)	This is constant Mtx.mtsErrCtxAborting.
mtsErrCtxActivityTimeout (see page 2444)	This is constant Mtx.mtsErrCtxActivityTimeout.
mtsErrCtxNoContext (see page 2445)	This is constant Mtx.mtsErrCtxNoContext.
mtsErrCtxNoSecurity (see page 2445)	This is constant Mtx.mtsErrCtxNoSecurity.
mtsErrCtxNotRegistered (see page 2445)	This is constant Mtx.mtsErrCtxNotRegistered.
mtsErrCtxOldReference (see page 2446)	This is constant Mtx.mtsErrCtxOldReference.
mtsErrCtxRoleNotFound (see page 2446)	This is constant Mtx.mtsErrCtxRoleNotFound.
mtsErrCtxTMNotAvailable (see page 2446)	This is constant Mtx.mtsErrCtxTMNotAvailable.
mtsErrCtxWrongThread (see page 2447)	This is constant Mtx.mtsErrCtxWrongThread.
Process (see page 2447)	This is constant Mtx.Process.
Standard (see page 2447)	This is constant Mtx.Standard.

Functions

	Name	Description
	CreateSharedPropertyGroup (see page 2437)	Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.
	CreateSharedPropertyGroupManager (see page 2438)	Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.
	CreateTransactionContext (see page 2438)	Starts an MTS transaction.

	CreateTransactionContextEx (see page 2439)	Instantiates a TransactionContextEx object, which marks the beginning of a transaction.
	GetObjectContext (see page 2440)	Fetches the IObjectContext (see page 2420) interface for the current thread.
	SafeRef (see page 2440)	Returns a reference to a transactional object that is safe to pass outside its context.

Interfaces

	Name	Description
	IEnumNames (see page 2417)	This is class Mtx.IEnumNames.
	IGetContextProperties (see page 2419)	This is class Mtx.IGetContextProperties.
	IObjectContext (see page 2420)	This is class Mtx.IObjectContext.
	IObjectContextActivity (see page 2423)	This is class Mtx.IObjectContextActivity.
	IObjectControl (see page 2424)	This is class Mtx.IObjectControl.
	ISecurityProperty (see page 2425)	This is class Mtx.ISecurityProperty.
	ISharedProperty (see page 2427)	This is class Mtx.ISharedProperty.
	ISharedPropertyGroup (see page 2429)	This is class Mtx.ISharedPropertyGroup.
	ISharedPropertyGroupManager (see page 2431)	This is class Mtx.ISharedPropertyGroupManager.
	ITransactionContext (see page 2433)	This is class Mtx.ITransactionContext.
	ITransactionContextEx (see page 2435)	This is class Mtx.ITransactionContextEx.

42.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IEnumNames (see page 2417)	This is class Mtx.IEnumNames.
	IGetContextProperties (see page 2419)	This is class Mtx.IGetContextProperties.
	IObjectContext (see page 2420)	This is class Mtx.IObjectContext.
	IObjectContextActivity (see page 2423)	This is class Mtx.IObjectContextActivity.
	IObjectControl (see page 2424)	This is class Mtx.IObjectControl.
	ISecurityProperty (see page 2425)	This is class Mtx.ISecurityProperty.
	ISharedProperty (see page 2427)	This is class Mtx.ISharedProperty.
	ISharedPropertyGroup (see page 2429)	This is class Mtx.ISharedPropertyGroup.
	ISharedPropertyGroupManager (see page 2431)	This is class Mtx.ISharedPropertyGroupManager.
	ITransactionContext (see page 2433)	This is class Mtx.ITransactionContext.
	ITransactionContextEx (see page 2435)	This is class Mtx.ITransactionContextEx.

42.1.1 IEnumNames Interface

Class Hierarchy

Pascal

```
IEnumNames = interface(IUnknown);
```

C++

```
__interface IEnumNames : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IEnumNames.

42.1.1.1 IEnumNames Members

The following tables list the members exposed by IEnumNames.

Public Methods

	Name	Description
	Clone (see page 2418)	This is Clone, a member of class IEnumNames.
	Next (see page 2418)	This is Next, a member of class IEnumNames.
	Reset (see page 2418)	This is Reset, a member of class IEnumNames.
	Skip (see page 2418)	This is Skip, a member of class IEnumNames.

42.1.1.2 IEnumNames Methods

The methods of the IEnumNames class are listed here.

Public Methods

	Name	Description
	Clone (see page 2418)	This is Clone, a member of class IEnumNames.
	Next (see page 2418)	This is Next, a member of class IEnumNames.
	Reset (see page 2418)	This is Reset, a member of class IEnumNames.
	Skip (see page 2418)	This is Skip, a member of class IEnumNames.

42.1.1.2.1 IEnumNames.Clone Method

Pascal

```
function Clone(out enm: IEnumNames): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Clone(IEnumNames enm);
```

Description

This is Clone, a member of class IEnumNames.

42.1.1.2.2 IEnumNames.Next Method

Pascal

```
function Next(celt: UINT; out rgname: WideString; out pceltFetched: UINT): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Next(UINT celt, BSTR rgname, UINT pceltFetched);
```

Description

This is Next, a member of class IEnumNames.

42.1.1.2.3 IEnumNames.Reset Method

Pascal

```
function Reset: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Reset();
```

Description

This is Reset, a member of class IEnumNames.

42.1.1.2.4 IEnumNames.Skip Method

Pascal

```
function Skip(celt: UINT): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Skip(UINT celt);
```

Description

This is Skip, a member of class IEnumNames.

42.1.2 IGetContextProperties Interface

Class Hierarchy

Pascal

```
IGetContextProperties = interface(IUnknown);
```

C++

```
__interface IGetContextProperties : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IGetContextProperties.

42.1.2.1 IGetContextProperties Members

The following tables list the members exposed by IGetContextProperties.

Public Methods

	Name	Description
	Count (see page 2419)	This is Count, a member of class IGetContextProperties.
	EnumNames (see page 2420)	This is EnumNames, a member of class IGetContextProperties.
	GetProperty (see page 2420)	This is GetProperty, a member of class IGetContextProperties.

42.1.2.2 IGetContextProperties Methods

The methods of the IGetContextProperties class are listed here.

Public Methods

	Name	Description
	Count (see page 2419)	This is Count, a member of class IGetContextProperties.
	EnumNames (see page 2420)	This is EnumNames, a member of class IGetContextProperties.
	GetProperty (see page 2420)	This is GetProperty, a member of class IGetContextProperties.

42.1.2.2.1 IGetContextProperties.Count Method

Pascal

```
function Count: Integer; safecall;
```

C++

```
__fastcall int Count();
```

Description

This is Count, a member of class IGetContextProperties.

42.1.2.2.2 IGetContextProperties.EnumNames Method

Pascal

```
function EnumNames: IEnumNames; safecall;
```

C++

```
__fastcall IEnumNames EnumNames();
```

Description

This is EnumNames, a member of class IGetContextProperties.

42.1.2.2.3 IGetContextProperties.GetProperty Method

Pascal

```
function GetProperty(const name: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR name);
```

Description

This is GetProperty, a member of class IGetContextProperties.

42.1.3 IObjectContext Interface

Class Hierarchy

Pascal

```
IObjectContext = interface(IUnknown);
```

C++

```
__interface IObjectContext : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectContext.

42.1.3.1 IObjectContext Members

The following tables list the members exposed by IObjectContext.

Public Methods

	Name	Description
	CreateInstance (see page 2421)	This is CreateInstance, a member of class IObjectContext.
	DisableCommit (see page 2421)	This is DisableCommit, a member of class IObjectContext.
	EnableCommit (see page 2422)	This is EnableCommit, a member of class IObjectContext.
	IsCallerInRole (see page 2422)	This is IsCallerInRole, a member of class IObjectContext.
	IsInTransaction (see page 2422)	This is IsInTransaction, a member of class IObjectContext.
	IsSecurityEnabled (see page 2422)	This is IsSecurityEnabled, a member of class IObjectContext.
	SetAbort (see page 2422)	This is SetAbort, a member of class IObjectContext.
	SetComplete (see page 2423)	This is SetComplete, a member of class IObjectContext.

42.1.3.2 IObjectContext Methods

The methods of the IObjectContext class are listed here.

Public Methods

	Name	Description
	CreateInstance (see page 2421)	This is CreateInstance, a member of class IObjectContext.
	DisableCommit (see page 2421)	This is DisableCommit, a member of class IObjectContext.
	EnableCommit (see page 2422)	This is EnableCommit, a member of class IObjectContext.
	IsCallerInRole (see page 2422)	This is IsCallerInRole, a member of class IObjectContext.
	IsInTransaction (see page 2422)	This is IsInTransaction, a member of class IObjectContext.
	IsSecurityEnabled (see page 2422)	This is IsSecurityEnabled, a member of class IObjectContext.
	SetAbort (see page 2422)	This is SetAbort, a member of class IObjectContext.
	SetComplete (see page 2423)	This is SetComplete, a member of class IObjectContext.

42.1.3.2.1 IObjectContext.CreateInstance Method

Pascal

```
function CreateInstance(const cid: TGUID; const rid: TGUID; out pv): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const TGUID cid, const TGUID rid,  pv);
```

Description

This is CreateInstance, a member of class IObjectContext.

42.1.3.2.2 IObjectContext.DisableCommit Method

Pascal

```
procedure DisableCommit; safecall;
```

C++

```
__fastcall DisableCommit();
```

Description

This is DisableCommit, a member of class IObjectContext.

42.1.3.2.3 IObjectContext.EnableCommit Method

Pascal

```
procedure EnableCommit; safecall;
```

C++

```
__fastcall EnableCommit();
```

Description

This is EnableCommit, a member of class IObjectContext.

42.1.3.2.4 IObjectContext.IsCallerInRole Method

Pascal

```
function IsCallerInRole(const bstrRole: WideString): Bool; safecall;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR bstrRole);
```

Description

This is IsCallerInRole, a member of class IObjectContext.

42.1.3.2.5 IObjectContext.IsInTransaction Method

Pascal

```
function IsInTransaction: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool IsInTransaction();
```

Description

This is IsInTransaction, a member of class IObjectContext.

42.1.3.2.6 IObjectContext.IsSecurityEnabled Method

Pascal

```
function IsSecurityEnabled: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool IsSecurityEnabled();
```

Description

This is IsSecurityEnabled, a member of class IObjectContext.

42.1.3.2.7 IObjectContext.SetAbort Method

Pascal

```
procedure SetAbort; safecall;
```

C++

```
__fastcall SetAbort();
```

Description

This is SetAbort, a member of class IObjectContext.

42.1.3.2.8 IObjectContext.SetComplete Method

Pascal

```
procedure SetComplete; safecall;
```

C++

```
__fastcall SetComplete();
```

Description

This is SetComplete, a member of class IObjectContext.

42.1.4 IObjectContextActivity Interface

Class Hierarchy

Pascal

```
IObjectContextActivity = interface(IUnknown);
```

C++

```
__interface IObjectContextActivity : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectContextActivity.

42.1.4.1 IObjectContextActivity Members

The following tables list the members exposed by IObjectContextActivity.

Public Methods

	Name	Description
	GetActivityId (see page 2424)	This is GetActivityId, a member of class IObjectContextActivity.

42.1.4.2 IObjectContextActivity Methods

The methods of the IObjectContextActivity class are listed here.

Public Methods

	Name	Description
	GetActivityId (see page 2424)	This is GetActivityId, a member of class IObjectContextActivity.

42.1.4.2.1 IObjectContextActivity.GetActivityId Method

Pascal

```
function GetActivityId: TGuid; safecall;
```

C++

```
__fastcall TGuid GetActivityId();
```

Description

This is GetActivityId, a member of class IObjectContextActivity.

42.1.5 IObjectControl Interface

Class Hierarchy

Pascal

```
IObjectControl = interface(IUnknown);
```

C++

```
__interface IObjectControl : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectControl.

42.1.5.1 IObjectControl Members

The following tables list the members exposed by IObjectControl.

Public Methods

	Name	Description
	Activate (see page 2425)	This is Activate, a member of class IObjectControl.
	CanBePooled (see page 2425)	This is CanBePooled, a member of class IObjectControl.
	Deactivate (see page 2425)	This is Deactivate, a member of class IObjectControl.

42.1.5.2 IObjectControl Methods

The methods of the IObjectControl class are listed here.

Public Methods

	Name	Description
	Activate (see page 2425)	This is Activate, a member of class IObjectControl.
	CanBePooled (see page 2425)	This is CanBePooled, a member of class IObjectControl.
	Deactivate (see page 2425)	This is Deactivate, a member of class IObjectControl.

42.1.5.2.1 IObjectControl.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class IObjectControl.

42.1.5.2.2 IObjectControl.CanBePooled Method

Pascal

```
function CanBePooled: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class IObjectControl.

42.1.5.2.3 IObjectControl.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class IObjectControl.

42.1.6 ISecurityProperty Interface

Class Hierarchy

Pascal

```
ISecurityProperty = interface(IUnknown);
```

C++

```
__interface ISecurityProperty : public IUnknown;
```

File

Mtx

Description

This is class Mtx.ISecurityProperty.

42.1.6.1 ISecurityProperty Members

The following tables list the members exposed by ISecurityProperty.

Public Methods

	Name	Description
	GetDirectCallerSID (see page 2426)	This is GetDirectCallerSID, a member of class ISecurityProperty.
	GetDirectCreatorSID (see page 2426)	This is GetDirectCreatorSID, a member of class ISecurityProperty.
	GetOriginalCallerSID (see page 2426)	This is GetOriginalCallerSID, a member of class ISecurityProperty.
	GetOriginalCreatorSID (see page 2427)	This is GetOriginalCreatorSID, a member of class ISecurityProperty.
	ReleaseSID (see page 2427)	This is ReleaseSID, a member of class ISecurityProperty.

42.1.6.2 ISecurityProperty Methods

The methods of the ISecurityProperty class are listed here.

Public Methods

	Name	Description
	GetDirectCallerSID (see page 2426)	This is GetDirectCallerSID, a member of class ISecurityProperty.
	GetDirectCreatorSID (see page 2426)	This is GetDirectCreatorSID, a member of class ISecurityProperty.
	GetOriginalCallerSID (see page 2426)	This is GetOriginalCallerSID, a member of class ISecurityProperty.
	GetOriginalCreatorSID (see page 2427)	This is GetOriginalCreatorSID, a member of class ISecurityProperty.
	ReleaseSID (see page 2427)	This is ReleaseSID, a member of class ISecurityProperty.

42.1.6.2.1 ISecurityProperty.GetDirectCallerSID Method

Pascal

```
function GetDirectCallerSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDirectCallerSID(PSID sid);
```

Description

This is GetDirectCallerSID, a member of class ISecurityProperty.

42.1.6.2.2 ISecurityProperty.GetDirectCreatorSID Method

Pascal

```
function GetDirectCreatorSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDirectCreatorSID(PSID sid);
```

Description

This is GetDirectCreatorSID, a member of class ISecurityProperty.

42.1.6.2.3 ISecurityProperty.GetOriginalCallerSID Method

Pascal

```
function GetOriginalCallerSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetOriginalCallerSID(PSID sid);
```

Description

This is GetOriginalCallerSID, a member of class ISecurityProperty.

42.1.6.2.4 ISecurityProperty.GetOriginalCreatorSID Method

Pascal

```
function GetOriginalCreatorSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetOriginalCreatorSID(PSID sid);
```

Description

This is GetOriginalCreatorSID, a member of class ISecurityProperty.

42.1.6.2.5 ISecurityProperty.ReleaseSID Method

Pascal

```
function ReleaseSID(sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ReleaseSID(PSID sid);
```

Description

This is ReleaseSID, a member of class ISecurityProperty.

42.1.7 ISharedProperty Interface

Class Hierarchy

Pascal

```
ISharedProperty = interface(IDispatch);
```

C++

```
__interface ISharedProperty : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedProperty.

42.1.7.1 ISharedProperty Members

The following tables list the members exposed by ISharedProperty.

Public Methods

	Name	Description
	Get_Value (see page 2428)	This is Get_Value, a member of class ISharedProperty.
	Set_Value (see page 2428)	This is Set_Value, a member of class ISharedProperty.

Public Properties

	Name	Description
	Value (see page 2429)	This is Value, a member of class ISharedProperty.

42.1.7.2 ISharedProperty Methods

The methods of the ISharedProperty class are listed here.

Public Methods

	Name	Description
	Get_Value (see page 2428)	This is Get_Value, a member of class ISharedProperty.
	Set_Value (see page 2428)	This is Set_Value, a member of class ISharedProperty.

42.1.7.2.1 ISharedProperty.Get_Value Method

Pascal

```
function Get_Value: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_Value();
```

Description

This is Get_Value, a member of class ISharedProperty.

42.1.7.2.2 ISharedProperty.Set_Value Method

Pascal

```
procedure Set_Value(pVal: OleVariant); safecall;
```

C++

```
__fastcall Set_Value(OleVariant pVal);
```

Description

This is Set_Value, a member of class ISharedProperty.

42.1.7.3 ISharedProperty Properties

The properties of the ISharedProperty class are listed here.

Public Properties

	Name	Description
	Value (see page 2429)	This is Value, a member of class ISharedProperty.

42.1.7.3.1 ISharedProperty.Value Property

Pascal

```
property Value: OleVariant;
```

C++

```
__property OleVariant Value;
```

Description

This is Value, a member of class ISharedProperty.

42.1.8 ISharedPropertyGroup Interface

Class Hierarchy

Pascal

```
ISharedPropertyGroup = interface(IDispatch);
```

C++

```
__interface ISharedPropertyGroup : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedPropertyGroup.

42.1.8.1 ISharedPropertyGroup Members

The following tables list the members exposed by ISharedPropertyGroup.

Public Methods

	Name	Description
	CreateProperty (see page 2430)	This is CreateProperty, a member of class ISharedPropertyGroup.
	CreatePropertyByPosition (see page 2430)	This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.
	Get_PropertyByName (see page 2430)	This is Get_PropertyByName, a member of class ISharedPropertyGroup.
	Get_PropertyByPosition (see page 2430)	This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.

Public Properties

	Name	Description
R	PropertyByName (see page 2431)	This is PropertyByName, a member of class ISharedPropertyGroup.
R	PropertyByPosition (see page 2431)	This is PropertyByPosition, a member of class ISharedPropertyGroup.

42.1.8.2 ISharedPropertyGroup Methods

The methods of the ISharedPropertyGroup class are listed here.

Public Methods

	Name	Description
	CreateProperty (see page 2430)	This is CreateProperty, a member of class ISharedPropertyGroup.
	CreatePropertyByPosition (see page 2430)	This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.
	Get_PropertyByName (see page 2430)	This is Get_PropertyByName, a member of class ISharedPropertyGroup.
	Get_PropertyByPosition (see page 2430)	This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.

42.1.8.2.1 ISharedPropertyGroup.CreateProperty Method

Pascal

```
function CreateProperty(const Name: WideString; out fExists: WordBool): ISharedProperty;
safecall;
```

C++

```
__fastcall ISharedProperty CreateProperty(const BSTR Name, WordBool fExists);
```

Description

This is CreateProperty, a member of class ISharedPropertyGroup.

42.1.8.2.2 ISharedPropertyGroup.CreatePropertyByPosition Method

Pascal

```
function CreatePropertyByPosition(Index: Integer; out fExists: WordBool): ISharedProperty;
safecall;
```

C++

```
__fastcall ISharedProperty CreatePropertyByPosition(int Index, WordBool fExists);
```

Description

This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.

42.1.8.2.3 ISharedPropertyGroup.Get_PropertyByName Method

Pascal

```
function Get_PropertyByName(const Name: WideString): ISharedProperty; safecall;
```

C++

```
__fastcall ISharedProperty Get_PropertyByName(const BSTR Name);
```

Description

This is Get_PropertyByName, a member of class ISharedPropertyGroup.

42.1.8.2.4 ISharedPropertyGroup.Get_PropertyByPosition Method

Pascal

```
function Get_PropertyByPosition(Index: Integer): ISharedProperty; safecall;
```

C++

```
__fastcall ISharedProperty Get_PropertyByPosition(int Index);
```

Description

This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.

42.1.8.3 ISharedPropertyGroup Properties

The properties of the ISharedPropertyGroup class are listed here.

Public Properties

	Name	Description
	PropertyByName (see page 2431)	This is PropertyByName, a member of class ISharedPropertyGroup.
	PropertyByPosition (see page 2431)	This is PropertyByPosition, a member of class ISharedPropertyGroup.

42.1.8.3.1 ISharedPropertyGroup.PropertyByName Property

Pascal

```
property PropertyByName [const Name: WideString]: ISharedProperty;
```

C++

```
__property ISharedProperty PropertyByName[BSTR const Name];
```

Description

This is PropertyByName, a member of class ISharedPropertyGroup.

42.1.8.3.2 ISharedPropertyGroup.PropertyByPosition Property

Pascal

```
property PropertyByPosition [Index: Integer]: ISharedProperty;
```

C++

```
__property ISharedProperty PropertyByPosition[int Index];
```

Description

This is PropertyByPosition, a member of class ISharedPropertyGroup.

42.1.9 ISharedPropertyGroupManager Interface

Class Hierarchy

Pascal

```
ISharedPropertyGroupManager = interface(IDispatch);
```

C++

```
__interface ISharedPropertyGroupManager : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedPropertyGroupManager.

42.1.9.1 ISharedPropertyGroupManager Members

The following tables list the members exposed by ISharedPropertyGroupManager.

Public Methods

	Name	Description
	CreatePropertyGroup (see page 2432)	This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.
	Get__NewEnum (see page 2432)	This is Get__NewEnum, a member of class ISharedPropertyGroupManager.
	Get_Group (see page 2433)	This is Get_Group, a member of class ISharedPropertyGroupManager.

Public Properties

	Name	Description
R	_NewEnum (see page 2433)	This is _NewEnum, a member of class ISharedPropertyGroupManager.
R	Group (see page 2433)	This is Group, a member of class ISharedPropertyGroupManager.

42.1.9.2 ISharedPropertyGroupManager Methods

The methods of the ISharedPropertyGroupManager class are listed here.

Public Methods

	Name	Description
	CreatePropertyGroup (see page 2432)	This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.
	Get__NewEnum (see page 2432)	This is Get__NewEnum, a member of class ISharedPropertyGroupManager.
	Get_Group (see page 2433)	This is Get_Group, a member of class ISharedPropertyGroupManager.

42.1.9.2.1 ISharedPropertyGroupManager.CreatePropertyGroup Method

Pascal

```
function CreatePropertyGroup(const Name: WideString; var LockMode: Integer; var RelMode:
Integer; out fExists: WordBool): ISharedPropertyGroup; safecall;
```

C++

```
__fastcall ISharedPropertyGroup CreatePropertyGroup(const BSTR Name, int LockMode, int
RelMode, WordBool fExists);
```

Description

This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.

42.1.9.2.2 ISharedPropertyGroupManager.Get__NewEnum Method

Pascal

```
function Get__NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown Get__NewEnum();
```

Description

This is Get__NewEnum, a member of class ISharedPropertyGroupManager.

42.1.9.2.3 ISharedPropertyGroupManager.Get_Group Method

Pascal

```
function Get_Group(const Name: WideString): ISharedPropertyGroup; safecall;
```

C++

```
__fastcall ISharedPropertyGroup Get_Group(const BSTR Name);
```

Description

This is Get_Group, a member of class ISharedPropertyGroupManager.

42.1.9.3 ISharedPropertyGroupManager Properties

The properties of the ISharedPropertyGroupManager class are listed here.

Public Properties

	Name	Description
	_NewEnum (see page 2433)	This is _NewEnum, a member of class ISharedPropertyGroupManager.
	Group (see page 2433)	This is Group, a member of class ISharedPropertyGroupManager.

42.1.9.3.1 ISharedPropertyGroupManager._NewEnum Property

Pascal

```
property _NewEnum: IUnknown;
```

C++

```
__property IUnknown _NewEnum;
```

Description

This is _NewEnum, a member of class ISharedPropertyGroupManager.

42.1.9.3.2 ISharedPropertyGroupManager.Group Property

Pascal

```
property Group [const Name: WideString]: ISharedPropertyGroup;
```

C++

```
__property ISharedPropertyGroup Group[BSTR const Name];
```

Description

This is Group, a member of class ISharedPropertyGroupManager.

42.1.10 ITransactionContext Interface

Class Hierarchy

Pascal

```
ITransactionContext = interface(IDispatch);
```

C++

```
__interface ITransactionContext : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ITransactionContext.

42.1.10.1 ITransactionContext Members

The following tables list the members exposed by ITransactionContext.

Public Methods

	Name	Description
	Abort (see page 2434)	This is Abort, a member of class ITransactionContext.
	Commit (see page 2434)	This is Commit, a member of class ITransactionContext.
	CreateInstance (see page 2435)	This is CreateInstance, a member of class ITransactionContext.

42.1.10.2 ITransactionContext Methods

The methods of the ITransactionContext class are listed here.

Public Methods

	Name	Description
	Abort (see page 2434)	This is Abort, a member of class ITransactionContext.
	Commit (see page 2434)	This is Commit, a member of class ITransactionContext.
	CreateInstance (see page 2435)	This is CreateInstance, a member of class ITransactionContext.

42.1.10.2.1 ITransactionContext.Abort Method

Pascal

```
procedure Abort; safecall;
```

C++

```
__fastcall Abort();
```

Description

This is Abort, a member of class ITransactionContext.

42.1.10.2.2 ITransactionContext.Commit Method

Pascal

```
procedure Commit; safecall;
```

C++

```
__fastcall Commit();
```

Description

This is Commit, a member of class ITransactionContext.

42.1.10.2.3 ITransactionContext.CreateInstance Method

Pascal

```
function CreateInstance(const pszProgId: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant CreateInstance(const BSTR pszProgId);
```

Description

This is CreateInstance, a member of class ITransactionContext.

42.1.11 ITransactionContextEx Interface

Class Hierarchy

Pascal

```
ITransactionContextEx = interface(IUnknown);
```

C++

```
__interface ITransactionContextEx : public IUnknown;
```

File

Mtx

Description

This is class Mtx.ITransactionContextEx.

42.1.11.1 ITransactionContextEx Members

The following tables list the members exposed by ITransactionContextEx.

Public Methods

	Name	Description
	Abort (see page 2436)	This is Abort, a member of class ITransactionContextEx.
	Commit (see page 2436)	This is Commit, a member of class ITransactionContextEx.
	CreateInstance (see page 2436)	This is CreateInstance, a member of class ITransactionContextEx.

42.1.11.2 ITransactionContextEx Methods

The methods of the ITransactionContextEx class are listed here.

Public Methods

	Name	Description
	Abort (see page 2436)	This is Abort, a member of class ITransactionContextEx.
	Commit (see page 2436)	This is Commit, a member of class ITransactionContextEx.
	CreateInstance (see page 2436)	This is CreateInstance, a member of class ITransactionContextEx.

42.1.11.2.1 ITransactionContextEx.Abort Method

Pascal

```
function Abort: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Abort();
```

Description

This is Abort, a member of class ITransactionContextEx.

42.1.11.2.2 ITransactionContextEx.Commit Method

Pascal

```
function Commit: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Commit();
```

Description

This is Commit, a member of class ITransactionContextEx.

42.1.11.2.3 ITransactionContextEx.CreateInstance Method

Pascal

```
function CreateInstance(const cid: TGUID; const rid: TGUID; out pv): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const TGUID cid, const TGUID rid,  pv);
```

Description

This is CreateInstance, a member of class ITransactionContextEx.

42.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateSharedPropertyGroup (see page 2437)	Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.
	CreateSharedPropertyGroupManager (see page 2438)	Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.
	CreateTransactionContext (see page 2438)	Starts an MTS transaction.
	CreateTransactionContextEx (see page 2439)	Instantiates a TransactionContextEx object, which marks the beginning of a transaction.
	GetObjectContext (see page 2440)	Fetches the IObjectContext (see page 2420) interface for the current thread.
	SafeRef (see page 2440)	Returns a reference to a transactional object that is safe to pass outside its context.

42.2.1 Mtx.CreateSharedPropertyGroup Function

Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.

Pascal

```
function CreateSharedPropertyGroup(const Name: WideString): ISharedPropertyGroup;
```

C++

```
ISharedPropertyGroup CreateSharedPropertyGroup(const BSTR Name);
```

File

Mtx

Description

CreateSharedPropertyGroup returns an interface to a new shared property group. If a property group of the specified name exists, it returns a reference to the existing shared property group. Use this function to create and access the shared properties of a shared property group.

CreateSharedPropertyGroup sets up a SharedPropertyGroup with the default values of LockSetGet (see page 2443) for locking (isolation) mode, and Process (see page 2447) for release mode. LockSetGet (see page 2443) locks a property during every get or set operation on a shared property, making each operation atomic. This ensures that two clients cannot read or write to the same property at the same time, but it does not prevent other clients from concurrently accessing other properties in the same group. The Process (see page 2447) release mode ensures that the property group is not destroyed until the process in which it was created has terminated. (Objects that hold references on a property group must still call Release on their references).

To override these defaults, call CreateSharedPropertyGroupManager (see page 2438) and use the resulting interface to create a property group.

ISharedPropertyGroup (see page 2429) has several methods that can be used to share state among multiple objects in a server process. See ISharedPropertyGroup (see page 2429) in the MTS documentation for a list of methods.

By using shared property groups, you eliminate name collisions because they establish unique name spaces for the shared

properties they contain. The Shared Property Manager also implements locks and semaphores to protect shared properties from simultaneous access, which could result in lost updates and could leave the properties in an unpredictable state.

Note: Only objects running in the same process can share properties. If you want instances of different components to share properties, you have to install the components in the same MTS package. Because there is a risk that administrators will move components from one package to another, it's safest to limit the use of a shared property group to instances of components that are defined in the same DLL.

See Also

CreateSharedPropertyGroupManager (see page 2438)

42.2.2 Mtx.CreateSharedPropertyGroupManager Function

Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.

Pascal

```
function CreateSharedPropertyGroupManager: ISharedPropertyGroupManager;
```

C++

```
ISharedPropertyGroupManager CreateSharedPropertyGroupManager();
```

File

Mtx

Description

Call CreateSharedPropertyGroupManager before creating shared property groups if you are not using the CreateSharedPropertyGroup (see page 2437) function. The ISharedPropertyGroupManager (see page 2431) interface lets you create and access shared properties with more control that is provided by CreateSharedPropertyGroup (see page 2437).

By using shared property groups, you eliminate name collisions because they establish unique name spaces for the shared properties they contain. The Shared Property Manager also implements locks and semaphores to protect shared properties from simultaneous access, which could result in lost updates and could leave the properties in an unpredictable state.

For more information about the ISharedPropertyGroupManager (see page 2431) interface, see the MTS documentation.

See Also

CreateSharedPropertyGroup (see page 2437)

42.2.3 Mtx.CreateTransactionContext Function

Starts an MTS transaction.

Pascal

```
function CreateTransactionContext: ITransactionContext;
```

C++

```
ITransactionContext CreateTransactionContext();
```

File

Mtx

Description

CreateTransactionContext allows client applications to control MTS transactions. CreateTransactionContext returns an interface to the new transaction context. Use this interface to enlist MTS server objects in the transaction, and to commit or roll back the transaction when done.

See Also

CreateTransactionContextEx (see page 2439)

TMtsAutoObject (see page 2388)

TMtsDataModule (see page 2398)

42.2.4 Mtx.CreateTransactionContextEx Function

Instantiates a TransactionContextEx object, which marks the beginning of a transaction.

Pascal

```
function CreateTransactionContextEx: ITransactionContextEx;
```

C++

```
ITransactionContextEx CreateTransactionContextEx();
```

File

Mtx

Description

MTS base clients use CreateTransactionEx to combine the work of one or more MTS objects into an atomic transaction and to commit or abort the transaction. Clients initiate a transaction by instantiating a CreateTransactionEx object. Clients end a transaction by calling Complete or Abort on the object.

Method	Description
Abort	Aborts the work of all MTS objects participating in the current transaction. The transaction is completed on return from this method.
Commit	Attempts to commit the work of all MTS objects participating in the current transaction. If any of the MTS objects participating in the transaction call SetAbort or DisableCommit, or if a system error occurs, the transaction is aborted. Otherwise, the transaction is committed. In either case, the transaction is completed on return from this method.
CreateInstance	Instantiates another MTS object. If the component that provides the object is configured to support or require a transaction, then the new object runs under the transaction of the TransactionContextEx object.

See Also

CreateTransactionContext (see page 2438)

TMtsAutoObject (see page 2388)

TMtsDataModule (see page 2398)

42.2.5 Mtx.GetObjectContext Function

Fetches the IObjectContext (see page 2420) interface for the current thread.

Pascal

```
function GetObjectContext: IObjectContext;
```

C++

```
IObjectContext GetObjectContext();
```

File

Mtx

Description

When a COM object is created as part of the MTS environment or of a COM+ package (that is, a transactional object), a corresponding context object is also created. This context object exists for the entire lifetime of its transactional object, across one or more reactivation cycles. The object context keeps track of the object during deactivation. Call GetObjectContext to obtain an IObjectContext (see page 2420) interface pointer for the context object associated with the current thread.

Pass a pointer that receives the IObjectContext (see page 2420) interface pointer as ppInstanceContext.

GetObjectContext returns S_OK if it returns a pointer to the context object. Otherwise, it returns an error code.

Note: C++Builder automatically fetches the IObjectContext (see page 2420) interface when a transactional object is activated. The interface pointer is stored as the m_spObjectContext member of the transactional object's class.

Warning: When writing a transactional object that uses VCL classes, use the Get_ObjectContext method of TMtsDll instead. ComSvcs.h defines GetObjectContext using a macro so that it calls COM+ or MTS, depending on the system you use to build the transactional object. This macro interferes with the GetObjectContext method of some VCL classes, and so it is undefined when you include the VCL headers.

42.2.6 Mtx.SafeRef Function

Returns a reference to a transactional object that is safe to pass outside its context.

Pascal

```
function SafeRef(const rid: TGUID; Unk: IUnknown): Pointer;
```

C++

```
void * SafeRef(const TGUID rid, IUnknown Unk);
```

File

Mtx

Description

SafeRef encapsulates the SafeRef MTS function that passes in

a reference to the interface ID of the interface (rid) that the current object wants to pass to another object or client

and

a reference to an interface on the current object (pUnk).

SafeRef returns a pointer to the interface specified in the rid parameter that is safe to pass outside the current object's context.

When using COM+, it is always safe to pass a self-reference to a client or other object. Thus, when you call SafeRef in an application that is running under a version of Windows that implemnts COM+, SafeRef simply returns the pointer passed as pUnk. Thus, it is not necessary to call SafeRef for COM+ applications. It will, however, do no harm in an application that is used under both MTS and COM+.

Under MTS, and should always call SafeRef before passing a self-reference to a client or other object and then pass the reference returned by this call. Under MTS, it is not safe for an object to pass a self pointer (Delphi) or this pointer (C++), or a self-reference obtained through an internal call to QueryInterface, to a client or to any other object. Once such a reference is passed outside the object's context, it is no longer a valid reference.

Calling SafeRef on a reference that is already safe returns the safe reference unchanged, except that the reference count on the interface is incremented.

When a client calls QueryInterface on a reference that is safe, MTS automatically ensures that the reference returned to the client is also a safe reference.

An object that obtains a safe reference must release the safe reference when it is finished with it.

Under MTS, safe references have different pointer values than their unsafe counterparts. For example, self or this and the safe version of self or this do not have the same value. It is important to be aware of this when testing whether two pointers refer to the same object. Calling QueryInterface for IID_IUnknown on each of the pointers and comparing the value of the returned pointers may result in the wrong conclusion. It is possible that both pointers refer to the same object, but that one is a safe reference and the other is not. If both references are safe references, they can be compared in the usual way. This is only a consideration for MTS objects, because clients should never have access to unsafe references.

Note: When writing a transactional object that may be installed under either MTS or COM+, use the SafeRef method of TMtsDll instead. TMtsDll automatically checks the current environment and returns the appropriate reference.

42.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CLASS_SharedPropertyGroupManager (see page 2442)	This is constant Mtx.CLASS_SharedPropertyGroupManager.
CLASS_TransactionContext (see page 2442)	This is constant Mtx.CLASS_TransactionContext.
CLASS_TransactionContextEx (see page 2443)	This is constant Mtx.CLASS_TransactionContextEx.
LockMethod (see page 2443)	This is constant Mtx.LockMethod.
LockSetGet (see page 2443)	This is constant Mtx.LockSetGet.
mtsErrCtxAborted (see page 2444)	This is constant Mtx.mtsErrCtxAborted.
mtsErrCtxAborting (see page 2444)	This is constant Mtx.mtsErrCtxAborting.
mtsErrCtxActivityTimeout (see page 2444)	This is constant Mtx.mtsErrCtxActivityTimeout.
mtsErrCtxNoContext (see page 2445)	This is constant Mtx.mtsErrCtxNoContext.
mtsErrCtxNoSecurity (see page 2445)	This is constant Mtx.mtsErrCtxNoSecurity.
mtsErrCtxNotRegistered (see page 2445)	This is constant Mtx.mtsErrCtxNotRegistered.
mtsErrCtxOldReference (see page 2446)	This is constant Mtx.mtsErrCtxOldReference.
mtsErrCtxRoleNotFound (see page 2446)	This is constant Mtx.mtsErrCtxRoleNotFound.
mtsErrCtxTMNotAvailable (see page 2446)	This is constant Mtx.mtsErrCtxTMNotAvailable.
mtsErrCtxWrongThread (see page 2447)	This is constant Mtx.mtsErrCtxWrongThread.
Process (see page 2447)	This is constant Mtx.Process.
Standard (see page 2447)	This is constant Mtx.Standard.

42.3.1 Mtx.CLASS_SharedPropertyGroupManager Constant

Pascal

```
CLASS_SharedPropertyGroupManager: TGUID = '{2A005C11-A5DE-11CF-9E66-00AA00A3F464}';
```

C++

```
TGUID CLASS_SharedPropertyGroupManager = '{2A005C11-A5DE-11CF-9E66-00AA00A3F464}';
```

File

Mtx

Description

This is constant Mtx.CLASS_SharedPropertyGroupManager.

42.3.2 Mtx.CLASS_TransactionContext Constant

Pascal

```
CLASS_TransactionContext: TGUID = '{7999FC25-D3C6-11CF-ACAB-00A024A55AEF}';
```

C++

```
TGUID CLASS_TransactionContext = '{7999FC25-D3C6-11CF-ACAB-00A024A55AEF}';
```

File

Mtx

Description

This is constant Mtx.CLASS_TransactionContext.

42.3.3 Mtx.CLASS_TransactionContextEx Constant

Pascal

```
CLASS_TransactionContextEx: TGUID = '{5CB66670-D3D4-11CF-ACAB-00A024A55AEF}';
```

C++

```
TGUID CLASS_TransactionContextEx = '{5CB66670-D3D4-11CF-ACAB-00A024A55AEF}';
```

File

Mtx

Description

This is constant Mtx.CLASS_TransactionContextEx.

42.3.4 Mtx.LockMethod Constant

Pascal

```
LockMethod = $00000001;
```

C++

```
LockMethod = 0x00000001;
```

File

Mtx

Description

This is constant Mtx.LockMethod.

42.3.5 Mtx.LockSetGet Constant

Pascal

```
LockSetGet = $00000000;
```

C++

```
LockSetGet = 0x00000000;
```

File

Mtx

Description

This is constant Mtx.LockSetGet.

42.3.6 Mtx.mtsErrCtxAborted Constant

Pascal

```
mtsErrCtxAborted = $8004E002;
```

C++

```
mtsErrCtxAborted = 0x8004E002;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxAborted.

42.3.7 Mtx.mtsErrCtxAborting Constant

Pascal

```
mtsErrCtxAborting = $8004E003;
```

C++

```
mtsErrCtxAborting = 0x8004E003;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxAborting.

42.3.8 Mtx.mtsErrCtxActivityTimeout Constant

Pascal

```
mtsErrCtxActivityTimeout = $8004E006;
```

C++

```
mtsErrCtxActivityTimeout = 0x8004E006;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxActivityTimeout.

42.3.9 Mtx.mtsErrCtxNoContext Constant

Pascal

```
mtsErrCtxNoContext = $8004E004;
```

C++

```
mtsErrCtxNoContext = 0x8004E004;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNoContext.

42.3.10 Mtx.mtsErrCtxNoSecurity Constant

Pascal

```
mtsErrCtxNoSecurity = $8004E00D;
```

C++

```
mtsErrCtxNoSecurity = 0x8004E00D;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNoSecurity.

42.3.11 Mtx.mtsErrCtxNotRegistered Constant

Pascal

```
mtsErrCtxNotRegistered = $8004E005;
```

C++

```
mtsErrCtxNotRegistered = 0x8004E005;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNotRegistered.

42.3.12 Mtx.mtsErrCtxOldReference Constant

Pascal

```
mtsErrCtxOldReference = $8004E007;
```

C++

```
mtsErrCtxOldReference = 0x8004E007;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxOldReference.

42.3.13 Mtx.mtsErrCtxRoleNotFound Constant

Pascal

```
mtsErrCtxRoleNotFound = $8004E00C;
```

C++

```
mtsErrCtxRoleNotFound = 0x8004E00C;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxRoleNotFound.

42.3.14 Mtx.mtsErrCtxTMNotAvailable Constant

Pascal

```
mtsErrCtxTMNotAvailable = $8004E00F;
```

C++

```
mtsErrCtxTMNotAvailable = 0x8004E00F;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxTMNotAvailable.

42.3.15 Mtx.mtsErrCtxWrongThread Constant

Pascal

```
mtsErrCtxWrongThread = $8004E00E;
```

C++

```
mtsErrCtxWrongThread = 0x8004E00E;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxWrongThread.

42.3.16 Mtx.Process Constant

Pascal

```
Process = $00000001;
```

C++

```
Process = 0x00000001;
```

File

Mtx

Description

This is constant Mtx.Process.

42.3.17 Mtx.Standard Constant

Pascal

```
Standard = $00000000;
```

C++

```
Standard = 0x00000000;
```

File

Mtx

Description

This is constant Mtx.Standard.

43 ObjAuto Namespace

This is namespace ObjAuto.

paEAX (see page 2463)	This is constant ObjAuto.paEAX.
paECX (see page 2463)	This is constant ObjAuto.paECX.
paEDX (see page 2464)	This is constant ObjAuto.paEDX.
paStack (see page 2464)	This is constant ObjAuto.paStack.

Functions

	Name	Description
	CreateMethodPointer (see page 2453)	This is function ObjAuto.CreateMethodPointer.
	CreateMethodPointer (see page 2453)	This is function ObjAuto.CreateMethodPointer.
	GetInvokeInstance (see page 2454)	This is function ObjAuto.GetInvokeInstance.
	GetMethodInfo (see page 2454)	This is function ObjAuto.GetMethodInfo.
	GetMethods (see page 2454)	This is function ObjAuto.GetMethods.
	ObjectInvoke (see page 2455)	This is function ObjAuto.ObjectInvoke.
	ReleaseMethodPointer (see page 2455)	This is function ObjAuto.ReleaseMethodPointer.

Interfaces

	Name	Description
	IMethodHandler (see page 2451)	This is class ObjAuto.IMethodHandler.

Structs, Records, Enums

	Name	Description
	TCallingConvention (see page 2456)	This is record ObjAuto.TCallingConvention.
	TMethodInfoHeader (see page 2456)	This is record ObjAuto.TMethodInfoHeader.

	TParameters (see page 2457)	This is record ObjAuto.TParameters.
	TParamInfo (see page 2457)	This is record ObjAuto.TParamInfo.
	TReturnInfo (see page 2458)	This is record ObjAuto.TReturnInfo.

Types

Name	Description
PMethodInfoHeader (see page 2459)	This is type ObjAuto.PMethodInfoHeader.
PParameters (see page 2459)	This is type ObjAuto.PParameters.
PParamInfo (see page 2460)	This is type ObjAuto.PParamInfo.
PPointer (see page 2460)	This is type ObjAuto.PPointer.
PReturnInfo (see page 2460)	This is type ObjAuto.PReturnInfo.
PWord (see page 2461)	This is type ObjAuto.PWord.
TDynamicInvokeEvent (see page 2461)	This is type ObjAuto.TDynamicInvokeEvent.
TMethodInfoArray (see page 2461)	This is type ObjAuto.TMethodInfoArray.
TParamFlags (see page 2462)	This is type ObjAuto.TParamFlags.

43.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IMethodHandler (see page 2451)	This is class ObjAuto.IMethodHandler.

43.1.1 IMethodHandler Interface

Class Hierarchy

ObjAuto.IMethodHandler

Pascal

```
IMethodHandler = interface;
```

C++

```
__interface IMethodHandler;
```

File

ObjAuto

Description

This is class ObjAuto.IMethodHandler.

43.1.1.1 IMethodHandler Members

The following tables list the members exposed by IMethodHandler.

Public Methods

	Name	Description
	Execute (see page 2452)	This is Execute, a member of class IMethodHandler.
	InstanceToVariant (see page 2452)	This is InstanceToVariant, a member of class IMethodHandler.

43.1.1.2 IMethodHandler Methods

The methods of the IMethodHandler class are listed here.

Public Methods

	Name	Description
	Execute (see page 2452)	This is Execute, a member of class IMethodHandler.
	InstanceToVariant (see page 2452)	This is InstanceToVariant, a member of class IMethodHandler.

43.1.1.2.1 IMethodHandler.Execute Method

Pascal

```
function Execute(const Args: array of Variant): Variant;
```

C++

```
__fastcall Variant Execute(const array of Variant Args);
```

Description

This is Execute, a member of class IMethodHandler.

43.1.1.2.2 IMethodHandler.InstanceToVariant Method

Pascal

```
function InstanceToVariant(Instance: TObject): Variant;
```

C++

```
__fastcall Variant InstanceToVariant(TObject * Instance);
```

Description

This is InstanceToVariant, a member of class IMethodHandler.

43.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateMethodPointer (see page 2453)	This is function ObjAuto.CreateMethodPointer.
	CreateMethodPointer (see page 2453)	This is function ObjAuto.CreateMethodPointer.
	GetInvokeInstance (see page 2454)	This is function ObjAuto.GetInvokeInstance.
	GetMethodInfo (see page 2454)	This is function ObjAuto.GetMethodInfo.
	GetMethods (see page 2454)	This is function ObjAuto.GetMethods.
	ObjectInvoke (see page 2455)	This is function ObjAuto.ObjectInvoke.
	ReleaseMethodPointer (see page 2455)	This is function ObjAuto.ReleaseMethodPointer.

43.2.1 ObjAuto.CreateMethodPointer Function

Pascal

```
function CreateMethodPointer(const MethodHandler: IMethodHandler; TypeData: PTypeData):
TMethod; overload;
```

C++

```
TMethod CreateMethodPointer(const IMethodHandler MethodHandler, PTypeData TypeData);
```

File

ObjAuto

Description

This is function ObjAuto.CreateMethodPointer.

43.2.2 ObjAuto.CreateMethodPointer Function

Pascal

```
function CreateMethodPointer(const ADynamicInvokeEvent: TDynamicInvokeEvent; TypeData:
PTypeData): TMethod; overload;
```

C++

```
TMethod CreateMethodPointer(const TDynamicInvokeEvent ADynamicInvokeEvent, PTypeData TypeData);
```

File

ObjAuto

Description

This is function ObjAuto.CreateMethodPointer.

43.2.3 ObjAuto.GetInvokeInstance Function

Pascal

```
function GetInvokeInstance(MethodPointer: TMethod): TObject;
```

C++

```
TObject * GetInvokeInstance(TMethod MethodPointer);
```

File

ObjAuto

Description

This is function ObjAuto.GetInvokeInstance.

43.2.4 ObjAuto.GetMethodInfo Function

Pascal

```
function GetMethodInfo(Instance: TObject; const MethodName: ShortString): PMethodInfoHeader;
```

C++

```
PMethodInfoHeader GetMethodInfo(TObject * Instance, const ShortString MethodName);
```

File

ObjAuto

Description

This is function ObjAuto.GetMethodInfo.

43.2.5 ObjAuto.GetMethods Function

Pascal

```
function GetMethods(ClassType: TClass): TMethodInfoArray;
```

C++

```
TMethodInfoArray GetMethods(TClass ClassType);
```

File

ObjAuto

Description

This is function ObjAuto.GetMethods.

43.2.6 ObjAuto.ObjectInvoke Function

Pascal

```
function ObjectInvoke(Instance: TObject; MethodHeader: PMethodInfoHeader; const ParamIndexes:
array of Integer; const Params: array of Variant): Variant;
```

C++

```
Variant ObjectInvoke(TObject * Instance, PMethodInfoHeader MethodHeader, const array of
Integer ParamIndexes, const array of Variant Params);
```

File

ObjAuto

Description

This is function ObjAuto.ObjectInvoke.

43.2.7 ObjAuto.ReleaseMethodPointer Function

Pascal

```
procedure ReleaseMethodPointer(MethodPointer: TMethod);
```

C++

```
ReleaseMethodPointer(TMethod MethodPointer);
```

File

ObjAuto

Description

This is function ObjAuto.ReleaseMethodPointer.

43.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCallingConvention (see page 2456)	This is record ObjAuto.TCallingConvention.

Records

	Name	Description
	TMethodInfoHeader (see page 2456)	This is record ObjAuto.TMethodInfoHeader.
	TParameters (see page 2457)	This is record ObjAuto.TParameters.
	TParamInfo (see page 2457)	This is record ObjAuto.TParamInfo.
	TReturnInfo (see page 2458)	This is record ObjAuto.TReturnInfo.

43.3.1 ObjAuto.TCallingConvention Enumeration

Pascal

```
TCallingConvention = (
  ccRegister,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
);
```

C++

```
enum TCallingConvention {
  ccRegister,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
};
```

File

ObjAuto

Description

This is record ObjAuto.TCallingConvention.

43.3.2 ObjAuto.TMethodInfoHeader Record

Pascal

```
TMethodInfoHeader = packed record
  Len: Word;
  Addr: Pointer;
```

```
    Name: ShortString;
  end;
```

C++

```
  struct TMethodInfoHeader {
    Word Len;
    void * Addr;
    ShortString Name;
  };
```

File

ObjAuto

Description

This is record ObjAuto.TMethodInfoHeader.

43.3.3 ObjAuto.TParameters Record

Pascal

```
  TParameters = packed record
    Registers: array[paEDX..paECX] of Cardinal;
    Stack: array[0..1023] of Byte;
  end;
```

C++

```
  struct TParameters {
    array[paEDX..paECX] of Cardinal Registers;
    array[0..1023] of Byte Stack;
  };
```

File

ObjAuto

Description

This is record ObjAuto.TParameters.

43.3.4 ObjAuto.TParamInfo Record

Pascal

```
  TParamInfo = packed record
    Flags: TParamFlags;
    ParamType: ^PTypeInfo;
    Access: Word;
    Name: ShortString;
  end;
```

C++

```
  struct TParamInfo {
    TParamFlags Flags;
    ^PTypeInfo ParamType;
    Word Access;
    ShortString Name;
  };
```

File

ObjAuto

Description

This is record ObjAuto.TParamInfo.

43.3.5 ObjAuto.TReturnInfo Record

Pascal

```
TReturnInfo = packed record
  Version: Byte;
  CallingConvention: TCallingConvention;
  ReturnType: ^PTypeInfo;
  ParamSize: Word;
end;
```

C++

```
struct TReturnInfo {
  Byte Version;
  TCallingConvention CallingConvention;
  ^PTypeInfo ReturnType;
  Word ParamSize;
};
```

File

ObjAuto

Description

This is record ObjAuto.TReturnInfo.

43.4 Types

The following table lists types in this documentation.

Types

Name	Description
PMethodInfoHeader (see page 2459)	This is type ObjAuto.PMethodInfoHeader.
PParameters (see page 2459)	This is type ObjAuto.PParameters.
PParamInfo (see page 2460)	This is type ObjAuto.PParamInfo.
PPointer (see page 2460)	This is type ObjAuto.PPointer.
PReturnInfo (see page 2460)	This is type ObjAuto.PReturnInfo.
PWord (see page 2461)	This is type ObjAuto.PWord.
TDynamicInvokeEvent (see page 2461)	This is type ObjAuto.TDynamicInvokeEvent.
TMethodInfoArray (see page 2461)	This is type ObjAuto.TMethodInfoArray.
TParamFlags (see page 2462)	This is type ObjAuto.TParamFlags.

43.4.1 ObjAuto.PMethodInfoHeader Type

Pascal

```
PMethodInfoHeader = ^TMethodInfoHeader;
```

C++

```
^TMethodInfoHeader PMethodInfoHeader;
```

File

ObjAuto

Description

This is type ObjAuto.PMethodInfoHeader.

43.4.2 ObjAuto.PParameters Type

Pascal

```
PParameters = ^TParameters;
```

C++

```
^TParameters PParameters;
```

File

ObjAuto

Description

This is type ObjAuto.PParameters.

43.4.3 ObjAuto.PParamInfo Type

Pascal

```
PParamInfo = ^TParamInfo;
```

C++

```
^TParamInfo PParamInfo;
```

File

ObjAuto

Description

This is type ObjAuto.PParamInfo.

43.4.4 ObjAuto.PPointer Type

Pascal

```
PPointer = ^Pointer;
```

C++

```
^Pointer PPointer;
```

File

ObjAuto

Description

This is type ObjAuto.PPointer.

43.4.5 ObjAuto.PReturnInfo Type

Pascal

```
PReturnInfo = ^TReturnInfo;
```

C++

```
^TReturnInfo PReturnInfo;
```

File

ObjAuto

Description

This is type ObjAuto.PReturnInfo.

43.4.6 ObjAuto.PWord Type

Pascal

```
PWord = ^Word;
```

C++

```
^Word PWord;
```

File

ObjAuto

Description

This is type ObjAuto.PWord.

43.4.7 ObjAuto.TDynamicInvokeEvent Type

Pascal

```
TDynamicInvokeEvent = procedure (Params: PParameters; StackSize: Integer) of object;
```

C++

```
(Params: PParameters; StackSize: Integer) ( TDynamicInvokeEvent)();
```

File

ObjAuto

Description

This is type ObjAuto.TDynamicInvokeEvent.

43.4.8 ObjAuto.TMethodInfoArray Type

Pascal

```
TMethodInfoArray = array of PMethodInfoHeader;
```

C++

```
array of PMethodInfoHeader TMethodInfoArray;
```

File

ObjAuto

Description

This is type ObjAuto.TMethodInfoArray.

43.4.9 ObjAuto.TParamFlags Type

Pascal

```
TParamFlags = set of (pfVar, pfConst, pfArray, pfAddress, pfReference, pfOut, pfResult);
```

C++

```
(pfVar, pfConst, pfArray, pfAddress, pfReference, pfOut, pfResult) TParamFlags;
```

File

ObjAuto

Description

This is type ObjAuto.TParamFlags.

43.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
paEAX (see page 2463)	This is constant ObjAuto.paEAX.
paECX (see page 2463)	This is constant ObjAuto.paECX.
paEDX (see page 2464)	This is constant ObjAuto.paEDX.
paStack (see page 2464)	This is constant ObjAuto.paStack.

43.5.1 ObjAuto.paEAX Constant

Pascal

```
paEAX = Word(0);
```

C++

```
paEAX = Word(0);
```

File

ObjAuto

Description

This is constant ObjAuto.paEAX.

43.5.2 ObjAuto.paECX Constant

Pascal

```
paECX = Word(2);
```

C++

```
paECX = Word(2);
```

File

ObjAuto

Description

This is constant ObjAuto.paECX.

43.5.3 ObjAuto.paEDX Constant

Pascal

```
paEDX = Word(1);
```

C++

```
paEDX = Word(1);
```

File

ObjAuto

Description

This is constant ObjAuto.paEDX.

43.5.4 ObjAuto.paStack Constant

Pascal

```
paStack = Word(3);
```

C++

```
paStack = Word(3);
```

File

ObjAuto

Description

This is constant ObjAuto.paStack.

44 ObjBrkr Namespace

This is namespace ObjBrkr.

Topics

Name	Description
Classes (see page 2466)	The following table lists classes in this documentation.

Classes

	Name	Description
	EBrokerException (see page 2466)	EBrokerException is the exception raised by simple object brokers when they can't locate an available server.
	TServerCollection (see page 2466)	TServerCollection is a collection of TServerItem (see page 2470) objects.
	TServerItem (see page 2470)	TServerItem describes an application server for a simple object broker.
	TSimpleObjectBroker (see page 2475)	TSimpleObjectBroker maintains a list of available application servers for a connection component.

44.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EBrokerException (see page 2466)	EBrokerException is the exception raised by simple object brokers when they can't locate an available server.
	TServerCollection (see page 2466)	TServerCollection is a collection of TServerItem (see page 2470) objects.
	TServerItem (see page 2470)	TServerItem describes an application server for a simple object broker.
	TSimpleObjectBroker (see page 2475)	TSimpleObjectBroker maintains a list of available application servers for a connection component.

44.1.1 EBrokerException Class

EBrokerException is the exception raised by simple object brokers when they can't locate an available server.

Class Hierarchy

Pascal

```
EBrokerException = class(Exception);
```

C++

```
class EBrokerException : public Exception;
```

File

ObjBrkr

Description

EBrokerException is raised when a simple object broker can't locate an available server.

See Also

TSimpleObjectBroker (see page 2475)

TServerCollection (see page 2466)

44.1.2 TServerCollection Class

TServerCollection is a collection of TServerItem (see page 2470) objects.

Class Hierarchy

Pascal

```
TServerCollection = class(TOwnedCollection);
```

C++

```
class TServerCollection : public TOwnedCollection;
```

File

ObjBrkr

Description

TSimpleObjectBroker (see page 2475) uses TServerCollection to represent the set of available application servers to which a client application can connect. Use the properties and methods of TServerCollection to manage the set of servers. For example, you can add items as new server systems come on line, disable server items when the corresponding system is temporarily out of commission, and so on.

See Also

TServerItem (see page 2470)

TSimpleObjectBroker (see page 2475)

44.1.2.1 TServerCollection Members

The following tables list the members exposed by TServerCollection.

Public Methods

	Name	Description
	Create (see page 2467)	Creates and initializes a TServerCollection (see page 2466) object.
	FindServer (see page 2468)	Returns the server from the Items (see page 2470) property array that has a specified computer name.
	GetBalancedName (see page 2468)	Returns the ComputerName property of a randomly chosen server from the Items (see page 2470) property array.
	GetNextName (see page 2469)	Returns the ComputerName property of the first available server in the Items (see page 2470) property array.

Public Properties

	Name	Description
	Items (see page 2470)	Lists the TServerItem (see page 2470) objects in the collection.

44.1.2.2 TServerCollection.Create Constructor

Creates and initializes a TServerCollection (see page 2466) object.

Pascal

```
constructor Create(AOwner: TComponent);
```

C++

```
__fastcall TServerCollection(TComponent * AOwner);
```

Description

Applications should not need to instantiate TServerCollection (see page 2466). The simple object broker that uses TServerCollection (see page 2466) to manage its list of available servers creates this object from its own constructor.

See Also

Servers (see page 2481)

44.1.2.3 TServerCollection Methods

The methods of the TServerCollection class are listed here.

Public Methods

	Name	Description
	FindServer (see page 2468)	Returns the server from the Items (see page 2470) property array that has a specified computer name.
	GetBalancedName (see page 2468)	Returns the ComputerName property of a randomly chosen server from the Items (see page 2470) property array.
	GetNextName (see page 2469)	Returns the ComputerName property of the first available server in the Items (see page 2470) property array.

44.1.2.3.1 TServerCollection.FindServer Method

Returns the server from the Items (see page 2470) property array that has a specified computer name.

Pascal

```
function FindServer(const ComputerName: string): TServerItem;
```

C++

```
__fastcall TServerItem FindServer(const UnicodeString ComputerName);
```

Description

Call FindServer to locate a server in the items property array given its ComputerName property. The ComputerName parameter specifies this computer name. Usually, this value is obtained by a previous call to GetBalancedName (see page 2468) or GetNextName (see page 2469).

Note: FindServer returns the first item it finds with the given ComputerName property. Unlike the GetBalancedName (see page 2468) and GetNextName (see page 2469) methods, it does not ignore servers that have failed or been disabled (HasFailed is true, or Enabled is false).

See Also

GetBalancedName (see page 2468)

GetNextName (see page 2469)

ComputerName (see page 2472)

Items (see page 2470)

Enabled (see page 2473)

HasFailed (see page 2474)

44.1.2.3.2 TServerCollection.GetBalancedName Method

Returns the ComputerName property of a randomly chosen server from the Items (see page 2470) property array.

Pascal

```
function GetBalancedName: string;
```

C++

```
__fastcall UnicodeString GetBalancedName();
```

Description

Call GetBalancedName to get the name of an available server. Servers in the Items (see page 2470) property array are considered available when no connection attempts have failed (HasFailed is false) and their Enabled property has not been set to false. GetBalancedName selects an available TServerItem (see page 2470) at random from the Items (see page 2470) property array and returns its ComputerName property.

See Also

Items (see page 2470)

LoadBalanced (see page 2480)

ComputerName (see page 2472)

HasFailed (see page 2474)

Enabled (see page 2473)

GetNextName (see page 2469)

44.1.2.3.3 TServerCollection.GetNextName Method

Returns the ComputerName property of the first available server in the Items (see page 2470) property array.

Pascal

```
function GetNextName: string;
```

C++

```
__fastcall UnicodeString GetNextName();
```

Description

Call GetNextName to get the name of an available server. Servers in the Items (see page 2470) property array are considered available when no connection attempts have failed (HasFailed is false) and their Enabled property has not been set to false. GetNextName selects the first available TServerItem (see page 2470) in the Items (see page 2470) property array and returns its ComputerName property.

Note: GetNextName always returns the same name as long as the servers' HasFailed and Enabled properties do not change. To choose an available server at random, use GetBalancedName (see page 2468) instead.

See Also

Items (see page 2470)

ComputerName (see page 2472)

HasFailed (see page 2474)

Enabled (see page 2473)

GetBalancedName (see page 2468)

44.1.2.4 TServerCollection Properties

The properties of the TServerCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 2470)	Lists the TServerItem (see page 2470) objects in the collection.

44.1.2.4.1 TServerCollection.Items Property

Lists the TServerItem (see page 2470) objects in the collection.

Pascal

```
property Items [Index: Integer]: TServerItem;
```

C++

```
__property TServerItem Items[int Index];
```

Description

Use Items to access individual TServerItem (see page 2470) objects maintained by TServerCollection (see page 2466).

Note: In Delphi, Items is the default property of TServerCollection (see page 2466), so the name of the Items property can be left off when using this property. Thus the line

```
TSimpleObjectBroker1.Servers.Items[I].Enabled := False;
```

can be written

```
TSimpleObjectBroker1.Servers[I].Enabled := False;
```

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

See Also

Enabled (see page 2473)

GetBalancedName (see page 2468)

GetNextName (see page 2469)

FindServer (see page 2468)

44.1.3 TServerItem Class

TServerItem describes an application server for a simple object broker.

Class Hierarchy

Pascal

```
TServerItem = class(TCollectionItem);
```

C++

```
class TServerItem : public TCollectionItem;
```

File

ObjBrkr

Description

Use TServerItem to describe an application server to which client applications can connect. TSimpleObjectBroker (see page 2475) maintains a list of these descriptions. Then, when a connection component needs to open a connection, it can use the information stored in a server item to identify an available application server.

See Also

TSimpleObjectBroker (see page 2475)

TRemoteDataModule

TDispatchConnection (see page 1290)

44.1.3.1 TServerItem Members

The following tables list the members exposed by TServerItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 2472)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Create (see page 2471)	Creates and initializes a TServerItem (see page 2470) instance.

Public Properties

	Name	Description
	HasFailed (see page 2474)	Indicates whether a connection attempt to the associated server machine has failed.

Published Properties

	Name	Description
	ComputerName (see page 2472)	Identifies the machine where the application server resides.
	Enabled (see page 2473)	Enables or disables the server item.
	Port (see page 2474)	Specifies the port number for the associated server application.

44.1.3.2 TServerItem.Create Constructor

Creates and initializes a TServerItem (see page 2470) instance.

Pascal

```
constructor Create(AOwner: TCollection); override;
```

C++

```
virtual __fastcall TServerItem(TCollection AOwner);
```

Description

Do not call Create directly to add a new server item to a server collection. Instead, use the Add or Insert method of the TServerCollection (see page 2466) object.

The AOwner parameter specifies the server collection that manages the newly created server item.

After calling the inherited constructor, Create initializes the Enabled (see page 2473) property to true, the HasFailed (see page 2474) property to false, and the Port (see page 2474) property to 211.

See Also

Add

Insert

Port (see page 2474)

HasFailed (see page 2474)

Enabled (see page 2473)

44.1.3.3 TServerItem Methods

The methods of the TServerItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 2472)	Returns the name of the collection item as it appears in the collection editor.

44.1.3.3.1 TServerItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName

GetNamePath

44.1.3.4 TServerItem Properties

The properties of the TServerItem class are listed here.

Public Properties

	Name	Description
	HasFailed (see page 2474)	Indicates whether a connection attempt to the associated server machine has failed.

Published Properties

	Name	Description
	ComputerName (see page 2472)	Identifies the machine where the application server resides.
	Enabled (see page 2473)	Enables or disables the server item.
	Port (see page 2474)	Specifies the port number for the associated server application.

44.1.3.4.1 TServerItem.ComputerName Property

Identifies the machine where the application server resides.

Pascal

```
property ComputerName: string;
```

C++

```
__property UnicodeString ComputerName;
```

Description

Set ComputerName to a string that identifies the machine where the application server resides. The value of this string depends on the type of connection component that requests this value from its object broker.

If the connection component is a TDCOMConnection (see page 1284) object, ComputerName is the Windows computer name. (This value can be found in the Control panel under network settings.)

If the connection component is a TSocketConnection object, ComputerName is either the host name or IP address of the system running the application server. Socket connection components parse this string to determine which it is.

If the connection component is a TWebConnection or TSoapConnection object, ComputerName is the URL of the dispatcher (httpsrvr.dll or soapsrvr.dll (running on the system with the application server.

See Also

GetBalancedName (see page 2468)

GetNextName (see page 2469)

Port (see page 2474)

ComputerName (see page 1287)

Address

Host

ObjectBroker (see page 1300)

44.1.3.4.2 TServerItem.Enabled Property

Enables or disables the server item.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Set Enabled to indicate whether the server should made available in the simple object broker. When Enabled is true, the ComputerName (see page 2472) property can be supplied to connection components by the object broker's GetComputerForGUID or GetComputerForProgID methods. When Enabled is false, the server item is not returned.

Note: Even when the server item is disabled, it is still returned by TServerCollection (see page 2466)'s FindServer method.

See Also

GetComputerForGUID (see page 2477)

GetComputerForProgID (see page 2477)

HasFailed (see page 2474)

FindServer (see page 2468)

44.1.3.4.3 TServerItem.HasFailed Property

Indicates whether a connection attempt to the associated server machine has failed.

Pascal

```
property HasFailed: Boolean;
```

C++

```
__property Boolean HasFailed;
```

Description

When connection components can't successfully open a connection to an application server, they inform the object broker by calling SetConnectStatus. The simple object broker, in turn, records this fact by setting the HasFailed property to true.

When HasFailed is false, the ComputerName (see page 2472) property can be supplied to connection components by the object broker's GetComputerForGUID or GetComputerForProgID methods. When HasFailed is true, the server item is not returned.

Once a server has failed it is presumed to be down until the application explicitly resets the HasFailed property to false.

Do not use HasFailed to disable server items. Instead, use the Enabled (see page 2473) property to disable servers for any reason other than a failed connection.

Note: Even when HasFailed is true, the server item is still returned by TServerCollection (see page 2466)'s FindServer method.

See Also

SetConnectStatus (see page 2479)

Enabled (see page 2473)

GetComputerForGUID (see page 2477)

GetComputerForProgID (see page 2477)

FindServer (see page 2468)

44.1.3.4.4 TServerItem.Port Property

Specifies the port number for the associated server application.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Read Port to obtain a port number when using the server item to supply information for connecting using TCP/IP. This value is returned by the GetPortForComputer method of the simple object broker.

By default, the value of Port is 211, which is the default port number for the socket dispatcher application ScktSrvr.exe. If the server listens on a different port, change this property to indicate the listening port.

Note: Server items that supply a Port number should specify the server system's IP address or host name as the value of ComputerName (see page 2472).

See Also

ComputerName (see page 2472)

44.1.4 TSimpleObjectBroker Class

TSimpleObjectBroker maintains a list of available application servers for a connection component.

Class Hierarchy

Pascal

```
TSimpleObjectBroker = class(TCustomObjectBroker);
```

C++

```
class TSimpleObjectBroker : public TCustomObjectBroker;
```

File

ObjBrkr

Description

TSimpleObjectBroker maintains a list of servers, all of which run the application server for a multi-tiered application. When a connection component requests a server, the simple object broker passes the name of one of the available servers in the list. This process allows client applications to locate server systems dynamically at runtime. If there are redundant server systems, this allows client applications to continue functioning when a server goes down.

TSimpleObjectBroker can randomize the selection of servers from among the currently available servers in its list to provide a simple system of load balancing.

See Also

TDispatchConnection (see page 1290)

TServerCollection (see page 2466)

44.1.4.1 TSimpleObjectBroker Members

The following tables list the members exposed by TSimpleObjectBroker.

Public Methods

	Name	Description
	Create (see page 2476)	Creates and initializes a simple object broker.
	Destroy (see page 2476)	Destroys an instance of TSimpleObjectBroker (see page 2475).
	GetComputerForGUID (see page 2477)	Returns a string that identifies an available server machine.
	GetComputerForProgID (see page 2477)	Returns a string that identifies an available server machine.
	GetPortForComputer (see page 2478)	Returns a port number for connecting to a specified remote server.
	LoadFromStream (see page 2479)	Sets the value of the Servers (see page 2481) property from a stream.
	SaveToStream (see page 2479)	Saves the value of the Servers (see page 2481) property to a stream.
	SetConnectStatus (see page 2479)	Records whether a connection was established to a specified server.

Public Properties

	Name	Description
	ServerData (see page 2481)	Encapsulates the list of servers as an OleVariant.

Published Properties

	Name	Description
	LoadBalanced (see page 2480)	Specifies how the simple object broker picks a server from its list.
	Servers (see page 2481)	Maintains the list of servers that can be provided to connection components.

44.1.4.2 TSimpleObjectBroker.Create Constructor

Creates and initializes a simple object broker.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSimpleObjectBroker(TComponent * AOwner);
```

Description

Call Create to instantiate a simple object broker at runtime.

After calling the inherited constructor, Create initializes the LoadBalanced (see page 2480) property to false and creates the TServerCollection (see page 2466) that implements the Servers (see page 2481) property.

See Also

Create

Servers (see page 2481)

LoadBalanced (see page 2480)

44.1.4.3 TSimpleObjectBroker.Destroy Destructor

Destroys an instance of TSimpleObjectBroker (see page 2475).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSimpleObjectBroker();
```

Description

Do not call Destroy directly. Instead, call Free, which verifies that the simple object broker is not nil, and only then calls Destroy.

See Also

System::TObject::Free

44.1.4.4 TSimpleObjectBroker Methods

The methods of the TSimpleObjectBroker class are listed here.

Public Methods

	Name	Description
	GetComputerForGUID (see page 2477)	Returns a string that identifies an available server machine.
	GetComputerForProgID (see page 2477)	Returns a string that identifies an available server machine.
	GetPortForComputer (see page 2478)	Returns a port number for connecting to a specified remote server.
	LoadFromStream (see page 2479)	Sets the value of the Servers (see page 2481) property from a stream.
	SaveToStream (see page 2479)	Saves the value of the Servers (see page 2481) property to a stream.
	SetConnectStatus (see page 2479)	Records whether a connection was established to a specified server.

44.1.4.4.1 TSimpleObjectBroker.GetComputerForGUID Method

Returns a string that identifies an available server machine.

Pascal

```
function GetComputerForGUID(GUID: TGUID): string; override;
```

C++

```
virtual __fastcall UnicodeString GetComputerForGUID(TGUID GUID);
```

Description

Call GetComputerForGUID to obtain the name of an available server machine. The GUID parameter (which specifies the global unique identifier of the desired server interface) is ignored.

GetComputerForGUID returns the ComputerName property of an available server from the Servers (see page 2481) property. If the LoadBalanced (see page 2480) property is true, this server is chosen at random from available servers. If the LoadBalanced (see page 2480) property is false, this server is the first available server listed in the Servers (see page 2481) property. If no servers are available, GetComputerForGUID raises an EBrokerException (see page 2466) exception.

A server is considered available if its Enabled property is true and its HasFailed property is false. The broker automatically sets HasFailed to false when it is notified of a connection failure for that server.

See Also

GetComputerForProgID (see page 2477)

ComputerName (see page 2472)

LoadBalanced (see page 2480)

EBrokerException (see page 2466)

Enabled (see page 2473)

HasFailed (see page 2474)

SetConnectStatus (see page 2479)

44.1.4.4.2 TSimpleObjectBroker.GetComputerForProgID Method

Returns a string that identifies an available server machine.

Pascal

```
function GetComputerForProgID(const ProgID): string; override;
```

C++

```
virtual __fastcall UnicodeString GetComputerForProgID(const  ProgID);
```

Description

Call GetComputerForProgID to obtain the name of an available server machine. The ProgID parameter (which specifies the desired server interface) is ignored.

TSimpleObjectBroker (see page 2475) returns the ComputerName property of an available server from the Servers (see page 2481) property. If the LoadBalanced (see page 2480) property is true, this server is chosen at random from available servers. If the LoadBalanced (see page 2480) property is false, this server is the first available server listed in the Servers (see page 2481) property. If no servers are available, GetComputerForGUID (see page 2477) raises an EBrokerException (see page 2466) exception.

A server is considered available if its Enabled property is true and its HasFailed property is false. The broker automatically sets HasFailed to false when it is notified of a connection failure for that server.

See Also

GetComputerForGUID (see page 2477)

ComputerName (see page 2472)

LoadBalanced (see page 2480)

EBrokerException (see page 2466)

Enabled (see page 2473)

HasFailed (see page 2474)

SetConnectStatus (see page 2479)

44.1.4.4.3 TSimpleObjectBroker.GetPortForComputer Method

Returns a port number for connecting to a specified remote server.

Pascal

```
function GetPortForComputer(const ComputerName: string): Integer; override;
```

C++

```
virtual __fastcall int GetPortForComputer(const UnicodeString ComputerName);
```

Description

Socket connection components call GetPortForComputer to get a value for their Port property. The ComputerName parameter specifies a Host name or IP address that was returned by GetComputerForGUID (see page 2477) or GetComputerForProgID (see page 2477). This value is used to identify a server in the list maintained by the Servers (see page 2481) property.

There are no connection components that explicitly use a Port number except on the Windows product. GetPortForComputer is included in TCustomObjectBroker (see page 1281) to allow for the possibility of connection components that use an explicit Port number. The ComputerName parameter is a Host name or IP address that is returned by the GetComputerForGUID (see page 2477) or GetComputerForProgID (see page 2477) method. This value is used to identify a server in the list maintained by the Servers (see page 2481) property.

See Also

GetComputerForProgID (see page 2477)

GetComputerForGUID (see page 2477)

Port

ComputerName (see page 2472)

Port (see page 2474)

44.1.4.4.4 TSimpleObjectBroker.LoadFromStream Method

Sets the value of the Servers (see page 2481) property from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load a list of available servers that has been previously saved using the SaveToStream (see page 2479) method.

See Also

SaveToStream (see page 2479)

ServerData (see page 2481)

44.1.4.4.5 TSimpleObjectBroker.SaveToStream Method

Saves the value of the Servers (see page 2481) property to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the list of available servers. The servers can be restored later by calling the LoadFromStream (see page 2479) method.

See Also

LoadFromStream (see page 2479)

ServerData (see page 2481)

44.1.4.4.6 TSimpleObjectBroker.SetConnectStatus Method

Records whether a connection was established to a specified server.

Pascal

```
procedure SetConnectStatus(ComputerName: string; Success: Boolean); override;
```

C++

```
virtual __fastcall SetConnectStatus(UnicodeString ComputerName, Boolean Success);
```

Description

After calling GetComputerForGUID (see page 2477) or GetComputerForProgID (see page 2477), connection components use the returned value to open a connection to the identified server. They then call SetConnectStatus to inform the broker of whether the connection was successfully opened.

SetConnectStatus sets the HasFailed property of the corresponding server to true if the connection was unsuccessful. It sets the HasFailed property to false if the connection was successful.

When the HasFailed property of a server is true, that server is ignored when the GetComputerForGUID (see page 2477) or GetComputerForProgID (see page 2477) method looks for available connections.

See Also

GetComputerForGUID (see page 2477)

GetComputerForProgID (see page 2477)

44.1.4.5 TSimpleObjectBroker Properties

The properties of the TSimpleObjectBroker class are listed here.

Public Properties

	Name	Description
	ServerData (see page 2481)	Encapsulates the list of servers as an OleVariant.

Published Properties

	Name	Description
	LoadBalanced (see page 2480)	Specifies how the simple object broker picks a server from its list.
	Servers (see page 2481)	Maintains the list of servers that can be provided to connection components.

44.1.4.5.1 TSimpleObjectBroker.LoadBalanced Property

Specifies how the simple object broker picks a server from its list.

Pascal

```
property LoadBalanced: Boolean;
```

C++

```
__property Boolean LoadBalanced;
```

Description

Set LoadBalanced to true to indicate that the simple object broker should supply computer names randomly from the available servers listed in the Servers (see page 2481) property. When LoadBalanced is false, GetComputerForGUID (see page 2477) and GetComputerForProgID (see page 2477) always return the first available server.

If the simple object broker is used by multiple connection components in the client application, it is preferable to set LoadBalanced to true in order to distribute the work among available servers.

When there is only a single connection component, there is no need to randomize the selection of servers, because only one connection will be used at a time. However, when deploying client applications, you may want to reorder the Servers (see page 2481) list in the simple object broker for each client, so that different clients give preference to different servers.

See Also

Servers (see page 2481)

GetComputerForGUID (see page 2477)

GetComputerForProgID (see page 2477)

44.1.4.5.2 TSimpleObjectBroker.ServerData Property

Encapsulates the list of servers as an OleVariant.

Pascal

```
property ServerData: OleVariant;
```

C++

```
__property OleVariant ServerData;
```

Description

Reading ServerData returns the value of the Servers (see page 2481) property stored in the internal component format. Writing ServerData sets the value of the Servers (see page 2481) property from an OleVariant that was saved previously.

Use the ServerData property to provide a mechanism for loading and saving the list of servers represented by the Servers (see page 2481) property. For example, An application can write the value of ServerData to an .ini file or the system registry. Later, it can read the value it saved as an OleVariant, and set ServerData to restore the Servers (see page 2481) property to the value that was saved.

Note: The implementation of ServerData uses the SaveToStream (see page 2479) method to encode the Servers (see page 2481) property as an OleVariant and the LoadFromStream (see page 2479) method to decode that OleVariant and restore the Servers (see page 2481) property.

See Also

Servers (see page 2481)

LoadFromStream (see page 2479)

SaveToStream (see page 2479)

44.1.4.5.3 TSimpleObjectBroker.Servers Property

Maintains the list of servers that can be provided to connection components.

Pascal

```
property Servers: TServerCollection;
```

C++

```
__property TServerCollection Servers;
```

Description

Use Servers to specify the list of servers that the simple object broker can return from the GetComputerForProgID (see page 2477) and GetComputerForGUID (see page 2477) methods.

Each item in the collection keeps track of whether the last connection attempt to that server was successful, and if not, the simple object broker ignores that server. In addition, individual servers in the collection can be disabled so that the simple object broker ignores them until they are re-enabled.

See Also

ServerData (see page 2481)

GetComputerForProgID (see page 2477)

GetComputerForGUID (see page 2477)

TServerItem (see page 2470)

45.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TObjectDispatch (see page 2484)	This is class ObjComAuto.TObjectDispatch.

45.1.1 TObjectDispatch Class

Class Hierarchy

Pascal

```
TObjectDispatch = class(TInterfacedObject, IDispatch);
```

C++

```
class TObjectDispatch : public TInterfacedObject, public IDispatch;
```

File

ObjComAuto

Description

This is class ObjComAuto.TObjectDispatch.

45.1.1.1 TObjectDispatch Members

The following tables list the members exposed by TObjectDispatch.

Protected Methods

	Name	Description
V	GetMethodInfo (see page 2486)	This is GetMethodInfo, a member of class TObjectDispatch.
V	GetObjectDispatch (see page 2486)	This is GetObjectDispatch, a member of class TObjectDispatch.
V	GetPropInfo (see page 2487)	This is GetPropInfo, a member of class TObjectDispatch.

Protected Properties

	Name	Description
R	Instance (see page 2488)	This is Instance, a member of class TObjectDispatch.

Public Methods

	Name	Description
	Create (see page 2485)	This is Create, a member of class TObjectDispatch.
V	Destroy (see page 2485)	Disposes of an object instance.
V	GetIDsOfNames (see page 2486)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.

	GetTypeInfo (see page 2487)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2487)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2488)	Invoke performs a call to a late-binded property or method.

45.1.1.2 TObjectDispatch.Create Constructor

Pascal

```
constructor Create(Instance: TObject; Owned: Boolean = True);
```

C++

```
__fastcall TObjectDispatch(TObject * Instance, Boolean Owned = True);
```

Description

This is Create, a member of class TObjectDispatch.

45.1.1.3 TObjectDispatch.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TObjectDispatch();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free

45.1.1.4 TObjectDispatch Methods

The methods of the TObjectDispatch class are listed here.

Protected Methods

	Name	Description
	GetMethodInfo (see page 2486)	This is GetMethodInfo, a member of class TObjectDispatch.
	GetObjectDispatch (see page 2486)	This is GetObjectDispatch, a member of class TObjectDispatch.
	GetPropInfo (see page 2487)	This is GetPropInfo, a member of class TObjectDispatch.

Public Methods

	Name	Description
	GetIDsOfNames (see page 2486)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 2487)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2487)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2488)	Invoke performs a call to a late-binded property or method.

45.1.1.4.1 TObjectDispatch.GetIDsOfNames Method

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HRESULT; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int
NameCount, int LocaleID, void * DispIDs);
```

Description

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name. GetIDsOfNames is used primarily to obtain dispatch identifiers for the late-binded methods exposed by the COM object through the IDispatch interface.

See Also

GetTypeInfoCount

GetTypeInfo

Invoke

45.1.1.4.2 TObjectDispatch.GetMethodInfo Method

Pascal

```
function GetMethodInfo(const AName: ShortString; var AInstance: TObject): PMethodInfoHeader;
virtual;
```

C++

```
virtual __fastcall PMethodInfoHeader GetMethodInfo(const ShortString AName, TObject *
AInstance);
```

Description

This is GetMethodInfo, a member of class TObjectDispatch.

45.1.1.4.3 TObjectDispatch.GetObjectDispatch Method

Pascal

```
function GetObjectDispatch(Obj: TObject): TObjectDispatch; virtual;
```

C++

```
virtual __fastcall TObjectDispatch GetObjectDispatch(TObject * Obj);
```

Description

This is GetObjectDispatch, a member of class TObjectDispatch.

45.1.1.4.4 TObjectDispatch.GetPropInfo Method

Pascal

```
function GetPropInfo(const AName: string; var AInstance: TObject; var CompIndex: Integer):
PPropInfo; virtual;
```

C++

```
virtual __fastcall PPropInfo GetPropInfo(const UnicodeString AName, TObject * AInstance, int
CompIndex);
```

Description

This is GetPropInfo, a member of class TObjectDispatch.

45.1.1.4.5 TObjectDispatch.GetTypeInfo Method

GetTypeInfo returns the object's type information.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo returns the type information for a specified index. The index is previously obtained by a call to the GetTypeInfoCount method. If the method returns S_OK, the `TypeInfo` parameter is set to point to the requested type information; otherwise an error code is returned.

See Also

GetTypeInfoCount

GetIDsOfNames

Invoke

45.1.1.4.6 TObjectDispatch.GetTypeInfoCount Method

GetTypeInfoCount returns the count of type information interfaces.

Pascal

```
function GetTypeInfoCount(out Count: Integer): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount returns the count of type information interfaces supported by the implementing COM object. If the method returns S_OK, the `Count` parameter is set to the number of type information interfaces, which is either 1 (if the object supports

type information) or 0 (if the object does not support type information). A return value of E_NOTIMPL means that the method is not implemented in the COM object.

See Also

GetTypeInfo

GetIDsOfNames

Invoke

45.1.1.4.7 TObjectDispatch.Invoke Method

Invoke performs a call to a late-binded property or method.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HRESULT; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word
Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke actually calls a method or a property exposed by the COM object through IDispatch. Invoke requires a previously obtained dispatch identifier. The identifier uniquely identifies a method, a property, and a list of parameters to be passed to the called method and exception information. The dispatch identifier of a method or property (also known as **dispid**) can be obtained by a calling the GetIDsOfNames method.

45.1.1.5 TObjectDispatch Properties

The properties of the TObjectDispatch class are listed here.

Protected Properties

	Name	Description
	Instance (see page 2488)	This is Instance, a member of class TObjectDispatch.

45.1.1.5.1 TObjectDispatch.Instance Property

Pascal

```
property Instance: TObject;
```

C++

```
__property TObject * Instance;
```

Description

This is Instance, a member of class TObjectDispatch.

45.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateMethodPointer (see page 2489)	This is function ObjComAuto.CreateMethodPointer.
	CreateMethodPointer (see page 2489)	This is function ObjComAuto.CreateMethodPointer.
	ReleaseMethodPointer (see page 2490)	This is function ObjComAuto.ReleaseMethodPointer.

45.2.1 ObjComAuto.CreateMethodPointer Function

Pascal

```
function CreateMethodPointer(const Instance: IDispatch; DispID: Integer; TypeInfo: PTypeInfo):
TMethod; overload;
```

C++

```
TMethod CreateMethodPointer(const IDispatch Instance, int DispID, PTypeInfo TypeInfo);
```

File

ObjComAuto

Description

This is function ObjComAuto.CreateMethodPointer.

45.2.2 ObjComAuto.CreateMethodPointer Function

Pascal

```
function CreateMethodPointer(const Instance: IDispatch; const MethodName: string; TypeInfo:
PTypeInfo): TMethod; overload;
```

C++

```
TMethod CreateMethodPointer(const IDispatch Instance, const UnicodeString MethodName,
PTypeInfo TypeInfo);
```

File

ObjComAuto

Description

This is function ObjComAuto.CreateMethodPointer.

45.2.3 ObjComAuto.ReleaseMethodPointer Function

Pascal

```
procedure ReleaseMethodPointer(MethodPointer: TMethod);
```

C++

```
ReleaseMethodPointer(TMethod MethodPointer);
```

File

ObjComAuto

Description

This is function ObjComAuto.ReleaseMethodPointer.

45.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDispatchKind (see page 2491)	This is record ObjComAuto.TDispatchKind.

Records

	Name	Description
	TDispatchInfo (see page 2491)	This is record ObjComAuto.TDispatchInfo.

45.3.1 ObjComAuto.TDispatchInfo Record

Pascal

```
TDispatchInfo = record
  Instance: TObject;
  Kind: TDispatchKind;
  case TDispatchKind of
    dkMethod: (MethodInfo: PMethodInfoHeader;);
    dkProperty: (PropInfo: PPropInfo;);
    dkSubComponent: (Index: Integer;);
end;
```

C++

```
struct TDispatchInfo {
  TObject * Instance;
  TDispatchKind Kind;
  PMethodInfoHeader MethodInfo;
  PPropInfo PropInfo;
  int Index;
};
```

File

ObjComAuto

Description

This is record ObjComAuto.TDispatchInfo.

45.3.2 ObjComAuto.TDispatchKind Enumeration

Pascal

```
TDispatchKind = (
  dkMethod,
  dkProperty,
  dkSubComponent
);
```

C++

```
enum TDispatchKind {
  dkMethod,
  dkProperty,
  dkSubComponent
};
```

File

ObjComAuto

Description

This is record ObjComAuto.TDispatchKind.

45.4 Types

The following table lists types in this documentation.

Types

Name	Description
TDispatchInfos (see page 2493)	This is type ObjComAuto.TDispatchInfos.

45.4.1 ObjComAuto.TDispatchInfos Type

Pascal

```
TDispatchInfos = array of TDispatchInfo;
```

C++

```
array of TDispatchInfo TDispatchInfos;
```

File

ObjComAuto

Description

This is type ObjComAuto.TDispatchInfos.

46 OleAuto Namespace

This is namespace OleAuto.

Topics

Name	Description
Classes (see page 2497)	The following table lists classes in this documentation.
Functions (see page 2513)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2521)	The following table lists structs, records, enums in this documentation.
Types (see page 2523)	The following table lists types in this documentation.
Variables (see page 2524)	The following table lists variables in this documentation.
Constants (see page 2525)	The following table lists constants in this documentation.

Classes

	Name	Description
	EOleError (see page 2497)	This is class OleAuto.EOleError.
	EOleException (see page 2497)	This is class OleAuto.EOleException.
	EOleSysError (see page 2499)	This is class OleAuto.EOleSysError.
	TAutoDispatch (see page 2500)	This is class OleAuto.TAutoDispatch.
	TAutomation (see page 2504)	This is class OleAuto.TAutomation.
	TAutoObject (see page 2507)	This is class OleAuto.TAutoObject.
	TRegistryClass (see page 2511)	This is class OleAuto.TRegistryClass.

Constants

Name	Description
MaxDispArgs (see page 2525)	This is constant OleAuto.MaxDispArgs.

Functions

	Name	Description
	ClassIDToProgID (see page 2513)	This is function OleAuto.ClassIDToProgID.
	ClassIDToString (see page 2513)	This is function OleAuto.ClassIDToString.
	CreateOleObject (see page 2514)	Instantiates an Automation (see page 2524) object.
	DispInvoke (see page 2515)	This is function OleAuto.DispInvoke.
	DispInvokeError (see page 2516)	This is function OleAuto.DispInvokeError.
	DllCanUnloadNow (see page 2516)	This is function OleAuto.DllCanUnloadNow.
	DllGetClassObject (see page 2516)	This is function OleAuto.DllGetClassObject.
	DllRegisterServer (see page 2517)	This is function OleAuto.DllRegisterServer.

	DllUnregisterServer (see page 2517)	This is function OleAuto.DllUnregisterServer.
	GetActiveOleObject (see page 2517)	This is function OleAuto.GetActiveOleObject.
	OleCheck (see page 2518)	This is function OleAuto.OleCheck.
	OleError (see page 2518)	This is function OleAuto.OleError.
	ProgIDToClassID (see page 2518)	This is function OleAuto.ProgIDToClassID.
	StringToClassID (see page 2519)	This is function OleAuto.StringToClassID.
	VarFromInterface (see page 2519)	This is function OleAuto.VarFromInterface.
	VarToAutoObject (see page 2519)	This is function OleAuto.VarToAutoObject.
	VarToInterface (see page 2520)	This is function OleAuto.VarToInterface.

Structs, Records, Enums

	Name	Description
	TAutoClassInfo (see page 2521)	This is record OleAuto.TAutoClassInfo.
	TAutoClassInstancing (see page 2521)	This is record OleAuto.TAutoClassInstancing.
	TStartMode (see page 2522)	This is record OleAuto.TStartMode.

Types

Name	Description
TAutoClass (see page 2523)	This is type OleAuto.TAutoClass.
TLastReleaseEvent (see page 2523)	This is type OleAuto.TLastReleaseEvent.

Variables

Name	Description
Automation (see page 2524)	Automation is for backward compatibility.

46.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOleError (see page 2497)	This is class OleAuto.EOleError.
	EOleException (see page 2497)	This is class OleAuto.EOleException.
	EOleSysError (see page 2499)	This is class OleAuto.EOleSysError.
	TAutoDispatch (see page 2500)	This is class OleAuto.TAutoDispatch.
	TAutomation (see page 2504)	This is class OleAuto.TAutomation.
	TAutoObject (see page 2507)	This is class OleAuto.TAutoObject.
	TRegistryClass (see page 2511)	This is class OleAuto.TRegistryClass.

46.1.1 EOleError Class

Class Hierarchy

Pascal

```
EOleError = class(Exception);
```

C++

```
class EOleError : public Exception;
```

File

OleAuto

Description

This is class OleAuto.EOleError.

46.1.2 EOleException Class

Class Hierarchy

Pascal

```
EOleException = class(EOleError);
```

C++

```
class EOleException : public EOleError;
```

File

OleAuto

Description

This is class OleAuto.EOleException.

46.1.2.1 EOleException Members

The following tables list the members exposed by EOleException.

Public Methods

	Name	Description
	Create (see page 2498)	This is Create, a member of class EOleException.

Public Properties

	Name	Description
R	ErrorCode (see page 2498)	This is ErrorCode, a member of class EOleException.
R	HelpFile (see page 2499)	This is HelpFile, a member of class EOleException.
R	Source (see page 2499)	This is Source, a member of class EOleException.

46.1.2.2 EOleException.Create Constructor

Pascal

```
constructor Create(const ExcepInfo: TExcepInfo);
```

C++

```
__fastcall EOleException(const TExcepInfo ExcepInfo);
```

Description

This is Create, a member of class EOleException.

46.1.2.3 EOleException Properties

The properties of the EOleException class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 2498)	This is ErrorCode, a member of class EOleException.
R	HelpFile (see page 2499)	This is HelpFile, a member of class EOleException.
R	Source (see page 2499)	This is Source, a member of class EOleException.

46.1.2.3.1 EOleException.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class EOleException.

46.1.2.3.2 EOleException.HelpFile Property

Pascal

```
property HelpFile: string;
```

C++

```
__property UnicodeString HelpFile;
```

Description

This is HelpFile, a member of class EOleException.

46.1.2.3.3 EOleException.Source Property

Pascal

```
property Source: string;
```

C++

```
__property UnicodeString Source;
```

Description

This is Source, a member of class EOleException.

46.1.3 EOleSysError Class

Class Hierarchy

Pascal

```
EOleSysError = class(EOleError);
```

C++

```
class EOleSysError : public EOleError;
```

File

OleAuto

Description

This is class OleAuto.EOleSysError.

46.1.3.1 EOleSysError Members

The following tables list the members exposed by EOleSysError.

Public Methods

	Name	Description
	Create (see page 2500)	This is Create, a member of class EOleSysError.

Public Properties

	Name	Description
	ErrorCode (see page 2500)	This is ErrorCode, a member of class EOleSysError.

46.1.3.2 EOleSysError.Create Constructor

Pascal

```
constructor Create(ErrorCode: Integer);
```

C++

```
__fastcall EOleSysError(int ErrorCode);
```

Description

This is Create, a member of class EOleSysError.

46.1.3.3 EOleSysError Properties

The properties of the EOleSysError class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 2500)	This is ErrorCode, a member of class EOleSysError.

46.1.3.3.1 EOleSysError.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class EOleSysError.

46.1.4 TAutoDispatch Class

Class Hierarchy

Pascal

```
TAutoDispatch = class(IDispatch);
```

C++

```
class TAutoDispatch : public IDispatch;
```

File

OleAuto

Description

This is class OleAuto.TAutoDispatch.

46.1.4.1 TAutoDispatch Members

The following tables list the members exposed by TAutoDispatch.

Public Methods

	Name	Description
	AddRef (see page 2502)	This is AddRef, a member of class TAutoDispatch.
	Create (see page 2501)	This is Create, a member of class TAutoDispatch.
	GetAutoObject (see page 2502)	This is GetAutoObject, a member of class TAutoDispatch.
	GetIDsOfNames (see page 2502)	This is GetIDsOfNames, a member of class TAutoDispatch.
	GetTypeInfo (see page 2502)	This is GetTypeInfo, a member of class TAutoDispatch.
	GetTypeInfoCount (see page 2502)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2503)	This is Invoke, a member of class TAutoDispatch.
	QueryInterface (see page 2503)	This is QueryInterface, a member of class TAutoDispatch.
	Release (see page 2503)	This is Release, a member of class TAutoDispatch.

Public Properties

	Name	Description
	AutoObject (see page 2504)	This is AutoObject, a member of class TAutoDispatch.

46.1.4.2 TAutoDispatch.Create Constructor

Pascal

```
constructor Create(AutoObject: TAutoObject);
```

C++

```
__fastcall TAutoDispatch(TAutoObject AutoObject);
```

Description

This is Create, a member of class TAutoDispatch.

46.1.4.3 TAutoDispatch Methods

The methods of the TAutoDispatch class are listed here.

Public Methods

	Name	Description
	AddRef (see page 2502)	This is AddRef, a member of class TAutoDispatch.
	GetAutoObject (see page 2502)	This is GetAutoObject, a member of class TAutoDispatch.
	GetIDsOfNames (see page 2502)	This is GetIDsOfNames, a member of class TAutoDispatch.
	GetTypeInfo (see page 2502)	This is GetTypeInfo, a member of class TAutoDispatch.
	GetTypeInfoCount (see page 2502)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2503)	This is Invoke, a member of class TAutoDispatch.
	QueryInterface (see page 2503)	This is QueryInterface, a member of class TAutoDispatch.
	Release (see page 2503)	This is Release, a member of class TAutoDispatch.

46.1.4.3.1 TAutoDispatch.AddRef Method

Pascal

```
function AddRef: Longint; override;
```

C++

```
virtual __fastcall Longint AddRef();
```

Description

This is AddRef, a member of class TAutoDispatch.

46.1.4.3.2 TAutoDispatch.GetAutoObject Method

Pascal

```
function GetAutoObject: TAutoObject; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall TAutoObject GetAutoObject();
```

Description

This is GetAutoObject, a member of class TAutoDispatch.

46.1.4.3.3 TAutoDispatch.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const iid: TIID; rgszNames: POleStrList; cNames: Integer; lcid: TLCID;
rgdispid: PDispIDList): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetIDsOfNames(const TIID iid, POleStrList rgszNames, int cNames,
TLCID lcid, PDispIDList rgdispid);
```

Description

This is GetIDsOfNames, a member of class TAutoDispatch.

46.1.4.3.4 TAutoDispatch.GetTypeInfo Method

Pascal

```
function GetTypeInfo(itinfo: Integer; lcid: TLCID; var tinfo: ITypeInfo): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetTypeInfo(int itinfo, TLCID lcid, ITypeInfo tinfo);
```

Description

This is GetTypeInfo, a member of class TAutoDispatch.

46.1.4.3.5 TAutoDispatch.GetTypeInfoCount Method

GetTypeInfoCount returns the count of type information interfaces.

Pascal

```
function GetTypeInfoCount(var ctinfo: Integer): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetTypeInfoCount(int ctinfo);
```

Description

GetTypeInfoCount returns the count of type information interfaces supported by the implementing COM object. If the method returns S_OK, the `Count` parameter is set to the number of type information interfaces, which is either 1 (if the object supports type information) or 0 (if the object does not support type information). A return value of E_NOTIMPL means that the method is not implemented in the COM object.

See Also

GetTypeInfo

GetIDsOfNames

Invoke

46.1.4.3.6 TAutoDispatch.Invoke Method

Pascal

```
function Invoke(dispIDMember: TDispID; const iid: TIID; lcid: TLCID; flags: Word; var
dispParams: TDispParams; varResult: PVariant; excepInfo: PExcepInfo; argErr: PInteger):
HResult; override;
```

C++

```
virtual __fastcall HRESULT Invoke(TDispID dispIDMember, const TIID iid, TLCID lcid, Word
flags, TDispParams dispParams, PVariant varResult, PExcepInfo excepInfo, PInteger argErr);
```

Description

This is Invoke, a member of class TAutoDispatch.

46.1.4.3.7 TAutoDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const iid: TIID; var obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TIID iid,  obj);
```

Description

This is QueryInterface, a member of class TAutoDispatch.

46.1.4.3.8 TAutoDispatch.Release Method

Pascal

```
function Release: Longint; override;
```

C++

```
virtual __fastcall Longint Release();
```

Description

This is Release, a member of class TAutoDispatch.

46.1.4.4 TAutoDispatch Properties

The properties of the TAutoDispatch class are listed here.

Public Properties

	Name	Description
	AutoObject (see page 2504)	This is AutoObject, a member of class TAutoDispatch.

46.1.4.4.1 TAutoDispatch.AutoObject Property

Pascal

```
property AutoObject: TAutoObject;
```

C++

```
__property TAutoObject AutoObject;
```

Description

This is AutoObject, a member of class TAutoDispatch.

46.1.5 TAutomation Class

Class Hierarchy

OleAuto.TAutomation

Pascal

```
TAutomation = class;
```

C++

```
class TAutomation;
```

File

OleAuto

Description

This is class OleAuto.TAutomation.

46.1.5.1 TAutomation Members

The following tables list the members exposed by TAutomation.

Public Events

	Name	Description
	OnLastRelease (see page 2507)	This is OnLastRelease, a member of class TAutomation.

Public Methods

	Name	Description
	Create (see page 2505)	This is Create, a member of class TAutomation.
V	Destroy (see page 2505)	This is Destroy, a member of class TAutomation.
	RegisterClass (see page 2505)	This is RegisterClass, a member of class TAutomation.
	UpdateRegistry (see page 2506)	This is UpdateRegistry, a member of class TAutomation.

Public Properties

	Name	Description
R	AutoObjectCount (see page 2506)	This is AutoObjectCount, a member of class TAutomation.
	IsInprocServer (see page 2506)	This is IsInprocServer, a member of class TAutomation.
R	StartMode (see page 2507)	This is StartMode, a member of class TAutomation.

46.1.5.2 TAutomation.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TAutomation();
```

Description

This is Create, a member of class TAutomation.

46.1.5.3 TAutomation.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAutomation();
```

Description

This is Destroy, a member of class TAutomation.

46.1.5.4 TAutomation Methods

The methods of the TAutomation class are listed here.

Public Methods

	Name	Description
	RegisterClass (see page 2505)	This is RegisterClass, a member of class TAutomation.
	UpdateRegistry (see page 2506)	This is UpdateRegistry, a member of class TAutomation.

46.1.5.4.1 TAutomation.RegisterClass Method

Pascal

```
procedure RegisterClass(const AutoClassInfo: TAutoClassInfo);
```

C++

```
__fastcall RegisterClass(const TAutoClassInfo AutoClassInfo);
```

Description

This is RegisterClass, a member of class TAutomation.

46.1.5.4.2 TAutomation.UpdateRegistry Method

Pascal

```
procedure UpdateRegistry(Register: Boolean);
```

C++

```
__fastcall UpdateRegistry(Boolean Register);
```

Description

This is UpdateRegistry, a member of class TAutomation.

46.1.5.5 TAutomation Properties

The properties of the TAutomation class are listed here.

Public Properties

	Name	Description
	AutoObjectCount (see page 2506)	This is AutoObjectCount, a member of class TAutomation.
	IsInprocServer (see page 2506)	This is IsInprocServer, a member of class TAutomation.
	StartMode (see page 2507)	This is StartMode, a member of class TAutomation.

46.1.5.5.1 TAutomation.AutoObjectCount Property

Pascal

```
property AutoObjectCount: Integer;
```

C++

```
__property int AutoObjectCount;
```

Description

This is AutoObjectCount, a member of class TAutomation.

46.1.5.5.2 TAutomation.IsInprocServer Property

Pascal

```
property IsInprocServer: Boolean;
```

C++

```
__property Boolean IsInprocServer;
```

Description

This is IsInprocServer, a member of class TAutomation.

46.1.5.5.3 TAutomation.StartMode Property

Pascal

```
property StartMode: TStartMode;
```

C++

```
__property TStartMode StartMode;
```

Description

This is StartMode, a member of class TAutomation.

46.1.5.6 TAutomation Events

The events of the TAutomation class are listed here.

Public Events

	Name	Description
	OnLastRelease (see page 2507)	This is OnLastRelease, a member of class TAutomation.

46.1.5.6.1 TAutomation.OnLastRelease Event

Pascal

```
property OnLastRelease: TLastReleaseEvent;
```

C++

```
__property TLastReleaseEvent OnLastRelease;
```

Description

This is OnLastRelease, a member of class TAutomation.

46.1.6 TAutoObject Class

Class Hierarchy

Pascal

```
TAutoObject = class(TObject);
```

C++

```
class TAutoObject : public TObject;
```

File

OleAuto

Description

This is class OleAuto.TAutoObject.

46.1.6.1 TAutoObject Members

The following tables list the members exposed by TAutoObject.

Protected Methods

	Name	Description
	CreateAutoDispatch (see page 2510)	This is CreateAutoDispatch, a member of class TAutoObject.
	GetExceptionInfo (see page 2510)	This is GetExceptionInfo, a member of class TAutoObject.

Public Methods

	Name	Description
	AddRef (see page 2509)	This is AddRef, a member of class TAutoObject.
	Create (see page 2508)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 2508)	Disposes of an object instance.
	Release (see page 2510)	This is Release, a member of class TAutoObject.

Public Properties

	Name	Description
	AutoDispatch (see page 2510)	This is AutoDispatch, a member of class TAutoObject.
	OleObject (see page 2511)	This is OleObject, a member of class TAutoObject.
	RefCount (see page 2511)	This is RefCount, a member of class TAutoObject.

46.1.6.2 TAutoObject.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TAutoObject();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy

System::TObject::Free

46.1.6.3 TAutoObject.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAutoObject();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

46.1.6.4 TAutoObject Methods

The methods of the TAutoObject class are listed here.

Protected Methods

	Name	Description
	CreateAutoDispatch (see page 2510)	This is CreateAutoDispatch, a member of class TAutoObject.
	GetExceptionInfo (see page 2510)	This is GetExceptionInfo, a member of class TAutoObject.

Public Methods

	Name	Description
	AddRef (see page 2509)	This is AddRef, a member of class TAutoObject.
	Release (see page 2510)	This is Release, a member of class TAutoObject.

46.1.6.4.1 TAutoObject.AddRef Method

Pascal

```
function AddRef: Integer;
```

C++

```
__fastcall int AddRef();
```

Description

This is AddRef, a member of class TAutoObject.

46.1.6.4.2 TAutoObject.CreateAutoDispatch Method

Pascal

```
function CreateAutoDispatch: TAutoDispatch; virtual;
```

C++

```
virtual __fastcall TAutoDispatch CreateAutoDispatch();
```

Description

This is CreateAutoDispatch, a member of class TAutoObject.

46.1.6.4.3 TAutoObject.GetExceptionInfo Method

Pascal

```
procedure GetExceptionInfo(ExceptObject: TObject; var ExcepInfo: TExcepInfo); virtual;
```

C++

```
virtual __fastcall GetExceptionInfo(TObject * ExceptObject, TExcepInfo ExcepInfo);
```

Description

This is GetExceptionInfo, a member of class TAutoObject.

46.1.6.4.4 TAutoObject.Release Method

Pascal

```
function Release: Integer;
```

C++

```
__fastcall int Release();
```

Description

This is Release, a member of class TAutoObject.

46.1.6.5 TAutoObject Properties

The properties of the TAutoObject class are listed here.

Public Properties

	Name	Description
	AutoDispatch (see page 2510)	This is AutoDispatch, a member of class TAutoObject.
	OleObject (see page 2511)	This is OleObject, a member of class TAutoObject.
	RefCount (see page 2511)	This is RefCount, a member of class TAutoObject.

46.1.6.5.1 TAutoObject.AutoDispatch Property

Pascal

```
property AutoDispatch: TAutoDispatch;
```

C++

```
__property TAutoDispatch AutoDispatch;
```

Description

This is AutoDispatch, a member of class TAutoObject.

46.1.6.5.2 TAutoObject.OleObject Property

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

This is OleObject, a member of class TAutoObject.

46.1.6.5.3 TAutoObject.RefCount Property

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

This is RefCount, a member of class TAutoObject.

46.1.7 TRegistryClass Class

Class Hierarchy

Pascal

```
TRegistryClass = class;
```

C++

```
class TRegistryClass;
```

File

OleAuto

Description

This is class OleAuto.TRegistryClass.

46.1.7.1 TRegistryClass Members

The following tables list the members exposed by TRegistryClass.

Public Methods

	Name	Description
	Create (see page 2512)	This is Create, a member of class TRegistryClass.
	Destroy (see page 2512)	This is Destroy, a member of class TRegistryClass.
	UpdateRegistry (see page 2512)	This is UpdateRegistry, a member of class TRegistryClass.

46.1.7.2 TRegistryClass.Create Constructor

Pascal

```
constructor Create(const AutoClassInfo: TAutoClassInfo);
```

C++

```
__fastcall TRegistryClass(const TAutoClassInfo AutoClassInfo);
```

Description

This is Create, a member of class TRegistryClass.

46.1.7.3 TRegistryClass.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistryClass();
```

Description

This is Destroy, a member of class TRegistryClass.

46.1.7.4 TRegistryClass Methods

The methods of the TRegistryClass class are listed here.

Public Methods

	Name	Description
	UpdateRegistry (see page 2512)	This is UpdateRegistry, a member of class TRegistryClass.

46.1.7.4.1 TRegistryClass.UpdateRegistry Method

Pascal

```
procedure UpdateRegistry(Register: Boolean);
```

C++

```
__fastcall UpdateRegistry(Boolean Register);
```

Description

This is UpdateRegistry, a member of class TRegistryClass.

46.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ClassIDToProgID (see page 2513)	This is function OleAuto.ClassIDToProgID.
	ClassIDToString (see page 2513)	This is function OleAuto.ClassIDToString.
	CreateOleObject (see page 2514)	Instantiates an Automation (see page 2524) object.
	DispInvoke (see page 2515)	This is function OleAuto.DispInvoke.
	DispInvokeError (see page 2516)	This is function OleAuto.DispInvokeError.
	DllCanUnloadNow (see page 2516)	This is function OleAuto.DllCanUnloadNow.
	DllGetClassObject (see page 2516)	This is function OleAuto.DllGetClassObject.
	DllRegisterServer (see page 2517)	This is function OleAuto.DllRegisterServer.
	DllUnregisterServer (see page 2517)	This is function OleAuto.DllUnregisterServer.
	GetActiveOleObject (see page 2517)	This is function OleAuto.GetActiveOleObject.
	OleCheck (see page 2518)	This is function OleAuto.OleCheck.
	OleError (see page 2518)	This is function OleAuto.OleError.
	ProgIDToClassID (see page 2518)	This is function OleAuto.ProgIDToClassID.
	StringToClassID (see page 2519)	This is function OleAuto.StringToClassID.
	VarFromInterface (see page 2519)	This is function OleAuto.VarFromInterface.
	VarToAutoObject (see page 2519)	This is function OleAuto.VarToAutoObject.
	VarToInterface (see page 2520)	This is function OleAuto.VarToInterface.

46.2.1 OleAuto.ClassIDToProgID Function

Pascal

```
function ClassIDToProgID(const ClassID: TCLSID): string;
```

C++

```
UnicodeString ClassIDToProgID(const TCLSID ClassID);
```

File

OleAuto

Description

This is function OleAuto.ClassIDToProgID.

46.2.2 OleAuto.ClassIDToString Function

Pascal

```
function ClassIDToString(const ClassID: TCLSID): string;
```

C++

```
UnicodeString ClassIDToString(const TCLSID ClassID);
```

File

OleAuto

Description

This is function OleAuto.ClassIDToString.

46.2.3 OleAuto.CreateOleObject Function

Instantiates an Automation (see page 2524) object.

Pascal

```
function CreateOleObject(const ClassName: string): Variant;
```

C++

```
Variant CreateOleObject(const UnicodeString ClassName);
```

File

OleAuto

Description

CreateOleObject creates a single uninitialized object of the class specified by the `ClassName` parameter. `ClassName` specifies the string representation of the Class ID (CLSID). CreateOleObject is used to create an object of a specified type when the CLSID is known and when the object is on a local or in-proc server. Only the objects that are not part of an aggregate are created using CreateOleObject.

Note: In Delphi code, CreateOleObject is called once to create each new single instance of a class. To create multiple instances of the same class, we recommend that you use a class factory.

Tip: As shown in the example, you can release the interface stored in the returned Variant by assigning the Unassigned constant to that Variant.

C++ Examples:

```
/*
The following code shows an example of how to create an Ole Object and how to
perform specific operations.
*/
void __fastcall TMyForm::ButtonClick(TObject *Sender)
{
    OleVariant WordApp, NewDoc;

    /* Creates a Microsoft Word application. */
    WordApp = CreateOleObject("Word.Application");

    /* Creates a new Microsoft Word document. */
    NewDoc = WordApp.OlePropertyGet("Documents").OleFunction("Add");

    /* Inserts the text 'Hello World!' in the document. */
    WordApp.OlePropertyGet("Selection").OleFunction("TypeText", "Hello World!");

    /* Saves the document on the disk. */
    NewDoc.OleFunction("SaveAs", "my_new_document.doc");
```

```
    /* Closes Microsoft Word. */
    WordApp.OleFunction("Quit");

    /* Releases the interface by assigning the Unassigned constant to the Variant variables. */
    NewDoc = Unassigned;
    WordApp = Unassigned;
}
```

Delphi Examples:

```
{
The following code shows an example of how to create an Ole Object and how to
perform specific operations.
}
procedure TForm1.ButtonClick(Sender: TObject);
var
  WordApp, NewDoc: Variant;
begin
  { Creates a Microsoft Word application. }
  WordApp := CreateOleObject('Word.Application');
  { Creates a new Microsoft Word document. }
  NewDoc := WordApp.Documents.Add;
  { Inserts the text 'Hello World!' in the document. }
  WordApp.Selection.TypeText('Hello World!');
  { Saves the document on the disk. }
  NewDoc.SaveAs('my_new_document.doc');
  { Closes Microsoft Word. }
  WordApp.Quit;
  { Releases the interface by assigning the Unassigned constant to the Variant variables. }
  NewDoc := Unassigned;
  WordApp := Unassigned;
end;
```

46.2.4 OleAuto.DispInvoke Function

Pascal

```
procedure DispInvoke(Dispatch: IDispatch; CallDesc: PCallDesc; DispIDs: PDispIDList; Params:
Pointer; Result: PVariant);
```

C++

```
DispInvoke(IDispatch Dispatch, PCallDesc CallDesc, PDispIDList DispIDs, void * Params,
PVariant Result);
```

File

OleAuto

Description

This is function OleAuto.DispInvoke.

46.2.5 OleAuto.DispInvokeError Function

Pascal

```
procedure DispInvokeError(Status: HResult; const ExcepInfo: TExcepInfo);
```

C++

```
DispInvokeError(HRESULT Status, const TExcepInfo ExcepInfo);
```

File

OleAuto

Description

This is function OleAuto.DispInvokeError.

46.2.6 OleAuto.DllCanUnloadNow Function

Pascal

```
function DllCanUnloadNow: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllCanUnloadNow();
```

File

OleAuto

Description

This is function OleAuto.DllCanUnloadNow.

46.2.7 OleAuto.DllGetClassObject Function

Pascal

```
function DllGetClassObject(const CLSID: TCLSID; const IID: TIID; var Obj): HResult; stdcall;
```

C++

```
__stdcall HRESULT DllGetClassObject(const TCLSID CLSID, const TIID IID,  Obj);
```

File

OleAuto

Description

This is function OleAuto.DllGetClassObject.

46.2.8 OleAuto.DllRegisterServer Function

Pascal

```
function DllRegisterServer: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllRegisterServer();
```

File

OleAuto

Description

This is function OleAuto.DllRegisterServer.

46.2.9 OleAuto.DllUnregisterServer Function

Pascal

```
function DllUnregisterServer: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllUnregisterServer();
```

File

OleAuto

Description

This is function OleAuto.DllUnregisterServer.

46.2.10 OleAuto.GetActiveOleObject Function

Pascal

```
function GetActiveOleObject(const ClassName: string): Variant;
```

C++

```
Variant GetActiveOleObject(const UnicodeString ClassName);
```

File

OleAuto

Description

This is function OleAuto.GetActiveOleObject.

46.2.11 OleAuto.OleCheck Function

Pascal

```
procedure OleCheck(Result: HResult);
```

C++

```
OleCheck(HRESULT Result);
```

File

OleAuto

Description

This is function OleAuto.OleCheck.

46.2.12 OleAuto.OleError Function

Pascal

```
procedure OleError(ErrorCode: HResult);
```

C++

```
OleError(HRESULT ErrorCode);
```

File

OleAuto

Description

This is function OleAuto.OleError.

46.2.13 OleAuto.ProgIDToClassID Function

Pascal

```
function ProgIDToClassID(const ProgID: string): TCLSID;
```

C++

```
TCLSID ProgIDToClassID(const UnicodeString ProgID);
```

File

OleAuto

Description

This is function OleAuto.ProgIDToClassID.

46.2.14 OleAuto.StringToClassID Function

Pascal

```
function StringToClassID(const S: string): TCLSID;
```

C++

```
TCLSID StringToClassID(const UnicodeString S);
```

File

OleAuto

Description

This is function OleAuto.StringToClassID.

46.2.15 OleAuto.VarFromInterface Function

Pascal

```
function VarFromInterface(Unknown: IUnknown): Variant;
```

C++

```
Variant VarFromInterface(IUnknown Unknown);
```

File

OleAuto

Description

This is function OleAuto.VarFromInterface.

46.2.16 OleAuto.VarToAutoObject Function

Pascal

```
function VarToAutoObject(const V: Variant): TAutoObject;
```

C++

```
TAutoObject VarToAutoObject(const Variant V);
```

File

OleAuto

Description

This is function OleAuto.VarToAutoObject.

46.2.17 OleAuto.VarToInterface Function

Pascal

```
function VarToInterface(const V: Variant): IDispatch;
```

C++

```
IDispatch VarToInterface(const Variant V);
```

File

OleAuto

Description

This is function OleAuto.VarToInterface.

46.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoClassInstancing (see page 2521)	This is record OleAuto.TAutoClassInstancing.
	TStartMode (see page 2522)	This is record OleAuto.TStartMode.

Records

	Name	Description
	TAutoClassInfo (see page 2521)	This is record OleAuto.TAutoClassInfo.

46.3.1 OleAuto.TAutoClassInfo Record

Pascal

```
TAutoClassInfo = record
  AutoClass: TAutoClass;
  ProgID: string;
  ClassID: string;
  Description: string;
  Instancing: TAutoClassInstancing;
end;
```

C++

```
struct TAutoClassInfo {
  TAutoClass AutoClass;
  UnicodeString ProgID;
  UnicodeString ClassID;
  UnicodeString Description;
  TAutoClassInstancing Instancing;
};
```

File

OleAuto

Description

This is record OleAuto.TAutoClassInfo.

46.3.2 OleAuto.TAutoClassInstancing Enumeration

Pascal

```
TAutoClassInstancing = (
  acInternal,
  acSingleInstance,
  acMultiInstance
);
```

C++

```
enum TAutoClassInstancing {
  acInternal,
  acSingleInstance,
  acMultiInstance
};
```

File

OleAuto

Description

This is record OleAuto.TAutoClassInstancing.

46.3.3 OleAuto.TStartMode Enumeration

Pascal

```
TStartMode = (
  smStandalone,
  smAutomation,
  smRegServer,
  smUnregServer
);
```

C++

```
enum TStartMode {
  smStandalone,
  smAutomation,
  smRegServer,
  smUnregServer
};
```

File

OleAuto

Description

This is record OleAuto.TStartMode.

46.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAutoClass (see page 2523)	This is type OleAuto.TAutoClass.
TLastReleaseEvent (see page 2523)	This is type OleAuto.TLastReleaseEvent.

46.4.1 OleAuto.TAutoClass Type

Pascal

```
TAutoClass = class of TAutoObject;
```

C++

```
TAutoObject TAutoClass;
```

File

OleAuto

Description

This is type OleAuto.TAutoClass.

46.4.2 OleAuto.TLastReleaseEvent Type

Pascal

```
TLastReleaseEvent = procedure (var Shutdown: Boolean) of object;
```

C++

```
(var Shutdown: Boolean) ( TLastReleaseEvent)();
```

File

OleAuto

Description

This is type OleAuto.TLastReleaseEvent.

46.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Automation (see page 2524)	Automation is for backward compatibility.

46.5.1 OleAuto.Automation Variable

Automation is for backward compatibility.

Pascal

```
Automation: TAutomation;
```

C++

```
TAutomation Automation;
```

File

OleAuto

Description

Declarations in the Oleauto unit are provided for backward compatibility with Delphi 2 and C++Builder 1. New implementations of OLE and ActiveX have replaced declarations in the Oleauto unit.

Automation is a global instance of the Automation manager class. It serves as the Automation manager for an OLE Automation server written with early versions of Delphi or C++Builder. The Automation manager handles all interactions between Automation objects that have been registered with it and the OLE Automation API.

46.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MaxDispArgs (see page 2525)	This is constant OleAuto.MaxDispArgs.

46.6.1 OleAuto.MaxDispArgs Constant

Pascal

```
MaxDispArgs = 32;
```

C++

```
MaxDispArgs = 32;
```

File

OleAuto

Description

This is constant OleAuto.MaxDispArgs.

47 OleCtnrs Namespace

This is namespace OleCtnrs.

Topics

Name	Description
Classes (see page 2529)	The following table lists classes in this documentation.
Interfaces (see page 2615)	The following table lists interfaces in this documentation.
Functions (see page 2617)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2618)	The following table lists structs, records, enums in this documentation.
Types (see page 2622)	The following table lists types in this documentation.
Constants (see page 2623)	The following table lists constants in this documentation.

Classes

	Name	Description
	TOleContainer (see page 2529)	TOleContainer embeds or links OLE objects.
	TOleForm (see page 2613)	TOleForm is an object that provides OLE support for a TForm object.

Constants

Name	Description
ovDiscardUndoState (see page 2623)	Specifies to discard the undo state.
ovHide (see page 2624)	Specifies to hide an OLE object.
ovInPlaceActivate (see page 2624)	Specifies the activation of an OLE object.
ovOpen (see page 2625)	Specifies the Open action of an OLE object.
ovPrimary (see page 2625)	Specifies the default action of an OLE object.
ovShow (see page 2626)	Specifies to show an OLE object.
ovUIActivate (see page 2627)	Specifies the activation of the UI(User Interface) of an OLE object.

Functions

	Name	Description
	DestroyMetaPict (see page 2617)	Frees a metafile resource given its handle.

Interfaces

	Name	Description
	IVCLFrameForm (see page 2615)	This is class OleCtnrs.IVCLFrameForm.

Structs, Records, Enums

	Name	Description
	TAutoActivate (see page 2618)	This is record OleCtnrs.TAutoActivate.
	TCreateInfo (see page 2618)	TCreateInfo is used by TOleContainer (see page 2529)'s CreateObjectFromInfo method.
	TCreateType (see page 2619)	TCreateType is an enumerated type that defines values for TCreateInfo (see page 2618)'s CreateType field.
	TObjectState (see page 2620)	This is record OleCtnrs.TObjectState.
	TSizeMode (see page 2621)	This is record OleCtnrs.TSizeMode.
	TVerbInfo (see page 2621)	This is record OleCtnrs.TVerbInfo.

Types

Name	Description
TObjectMoveEvent (see page 2622)	This is type OleCtnrs.TObjectMoveEvent.

47.1 Classes

The following table lists classes in this documentation.

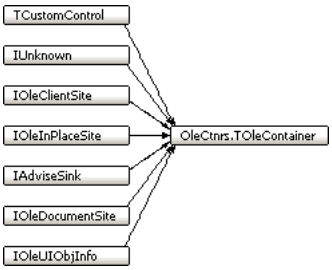
Classes

	Name	Description
	TOleContainer (see page 2529)	TOleContainer embeds or links OLE objects.
	TOleForm (see page 2613)	TOleForm is an object that provides OLE support for a TForm object.

47.1.1 TOleContainer Class

TOleContainer embeds or links OLE objects.

Class Hierarchy



Pascal

```
TOleContainer = class(TCustomControl, IUnknown, IOleClientSite, IOleInPlaceSite, IAdviseSink,
IOleDocumentSite, IOleUIObjInfo);
```

C++

```
class TOleContainer : public TCustomControl, public IUnknown, public IOleClientSite, public
IOleInPlaceSite, public IAdviseSink, public IOleDocumentSite, public IOleUIObjInfo;
```

File

OleCtnrs

Description

Use TOleContainer to handle many of the complexities of OLE 2.0. TOleContainer lets the user choose an OLE object to insert by simply calling the InsertObjectDialog (see page 2543) method. TOleContainer can create either an embedded OLE object or a linked OLE object.

TOleContainer automatically handles menu merging -- the process of combining the container form's menu with that of an in-place activated OLE object's server application. The menu items' GroupIndex property settings control how menus are merged. Those main menu items with GroupIndex values of 0, 2, and 4 remain; TOleContainer merges the server application's menus and replaces the main menu items with GroupIndex values of 1, 3, and 5 (if they exist).

OLE objects that are activated in-place add their server's toolbars directly into the container application's window. Normally, any panels used for toolbars are replaced by the OLE object's server's toolbars. Prevent this by setting a panel's Locked property to true.

When using TOleContainer in an SDI application (the main form's FormStyle property is fsNormal rather than fsMDIForm), place the TOleContainer component inside a panel whose Align (see page 2552) property is set to alClient. TOleContainer replaces an SDI form's toolbars as described above, and using a panel automatically adjusts the amount of space available to the OLE container.

47.1.1.1 TOleContainer Members

The following tables list the members exposed by TOleContainer.

Protected Methods

	Name	Description
	_AddRef (see page 2534)	Called when an application uses a component interface.
	_Release (see page 2535)	Called when an application releases a component interface.
	Changed (see page 2535)	Sends a CM_CHANGED message to the control.
V	CreateParams (see page 2540)	Initializes a window-creation parameter data structure.
V	DblClick (see page 2540)	OnDblClick event dispatcher.
V	DefineProperties (see page 2541)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DoEnter (see page 2542)	Respond to receiving input focus.
V	GetPopupMenu (see page 2543)	Returns the pop-up menu associated with the control.
V	KeyDown (see page 2543)	Respond to key press events.
V	MouseDown (see page 2545)	OnMouseDown event dispatcher.
V	Paint (see page 2546)	Renders the image of a custom control.
V	QueryInterface (see page 2547)	Returns a reference to a specified interface if the object supports that interface.

Public Methods

	Name	Description
	ChangeIconDialog (see page 2535)	Displays the Change Icon OLE dialog box.
	Close (see page 2536)	Deactivates the OLE object.
	Copy (see page 2536)	Copies the OLE object to the Windows clipboard.
V	Create (see page 2532)	Creates and initializes an instance of TOleContainer (see page 2529).
	CreateLinkToFile (see page 2537)	Creates a linked OLE object from the contents of a file.
	CreateObject (see page 2537)	Creates an embedded OLE object given its class name (also known as programmatic identifier).
	CreateObjectFromFile (see page 2538)	Creates an embedded OLE object from the contents of a file.
	CreateObjectFromInfo (see page 2539)	Creates an OLE object matching the specified TCreateInfo (see page 2618) record.
V	Destroy (see page 2533)	Destroys an instance of TOleContainer (see page 2529).
	DestroyObject (see page 2541)	Destroys the container's OLE object.
	DoVerb (see page 2542)	Requests that the OLE object perform some action.

	GetIconMetaPict (see page 2542)	Returns the global memory handle of a metafile containing the OLE object's icon.
	InsertObjectDialog (see page 2543)	Displays the Insert Object OLE dialog box.
	LoadFromFile (see page 2544)	Loads an OLE object from the specified file.
	LoadFromStream (see page 2545)	Loads an OLE object from the specified stream.
	ObjectPropertiesDialog (see page 2546)	Displays the OLE Object Properties property sheet.
	Paste (see page 2546)	Pastes the contents of the Windows clipboard as an embedded object.
	PasteSpecialDialog (see page 2547)	Displays the Paste (see page 2546) Special OLE dialog box.
	Run (see page 2548)	Runs the OLE object's server application, but doesn't open or activate the OLE object itself.
	SaveAsDocument (see page 2548)	Saves the OLE object to the specified file in native OLE Document format.
	SaveToFile (see page 2550)	Saves the OLE object to the specified file.
	SaveToStream (see page 2550)	Saves the OLE object to the specified stream.
	UpdateObject (see page 2551)	Refreshes the OLE object.
	UpdateVerbs (see page 2551)	Refreshes the list of verbs the OLE object can respond to.

Public Properties

	Name	Description
R	CanPaste (see page 2558)	Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.
R	Linked (see page 2567)	Indicates whether the OLE object is linked or embedded.
	Modified (see page 2567)	Indicates whether the OLE object has been modified.
R	NewInserted (see page 2567)	Indicates whether the OLE object was created rather than pasted in or created as a link to a file.
R	ObjectVerbs (see page 2568)	Lists the verbs that the OLE object supports.
R	OleClassName (see page 2569)	Specifies the class name of the OLE object.
R	OleObject (see page 2569)	Represents the OLE object hosted by the OLE container.
R	OleObjectInterface (see page 2569)	Provides access to the IOleObject interface for the OLE object.
R	PrimaryVerb (see page 2576)	Specifies the index of the primary (default) verb for the OLE object.
R	SourceDoc (see page 2579)	Specifies the name of the source document for a linked OLE object.
R	State (see page 2579)	Describes the state of the OLE object.
R	StorageInterface (see page 2579)	Provides access to the IStorage interface for the OLE object.

Published Events

	Name	Description
	OnActivate (see page 2583)	Occurs immediately after the OLE object is activated.
	OnDeactivate (see page 2583)	Occurs immediately after the OLE object is deactivated.
	OnDragDrop (see page 2584)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2587)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 2590)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2591)	Occurs when a control receives the input focus.
	OnExit (see page 2593)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 2597)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2601)	Occurs when a key is pressed.
	OnKeyUp (see page 2602)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2604)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2605)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 2607)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2609)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnObjectMove (see page 2611)	Occurs when the OLE container is notified that the OLE object has moved or resized.
	OnResize (see page 2612)	Occurs immediately after the OLE container window is resized.

	OnStartDrag (see page 2612)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 2552)	Determines how the control aligns within its container (parent control).
	AllowActiveDoc (see page 2556)	Specifies whether the OLE container supports the IOleDocumentSite interface.
	AllowInPlace (see page 2556)	Determines whether the OLE container allows in-place activation.
	Anchors (see page 2557)	Specifies how the control is anchored to its parent.
	AutoActivate (see page 2557)	Determines how the object in an OLE container is activated.
	AutoVerbMenu (see page 2558)	Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.
	BorderStyle (see page 2558)	Determines whether a single line is drawn around the OLE container.
	Caption (see page 2559)	Specifies a text string that identifies the control to the user.
	Color (see page 2561)	Specifies the background color of the control.
	Constraints (see page 2562)	Specifies the size constraints for the control.
	CopyOnSave (see page 2563)	Determines whether the SaveToFile (see page 2550) and SaveToStream (see page 2550) methods first create a copy of the OLE object.
	Ctl3D (see page 2563)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 2564)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 2564)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2566)	Controls whether the control responds to mouse, keyboard, and timer events.
	Iconic (see page 2566)	Determines whether the OLE object is displayed as an icon.
	OldStreamFormat (see page 2568)	Indicates whether the OLE object is loaded and saved using the VCL format.
	ParentColor (see page 2570)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2570)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 2571)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2571)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2577)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SizeMode (see page 2578)	Determines how the OLE object is sized in the OLE container.
	TabOrder (see page 2580)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2580)	Determines if the user can tab to a control.
	Visible (see page 2581)	Determines whether the component appears onscreen.

47.1.1.2 TOleContainer.Create Constructor

Creates and initializes an instance of TOleContainer (see page 2529).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleContainer(TComponent * AOwner);
```

Description

Call Create to instantiate a TOleContainer (see page 2529) object at runtime. OLE containers placed on forms at design time are created automatically.

Pass a component to the constructor to supply the OLE container with an Owner that is responsible for freeing it.

After calling the inherited constructor, Create

Sets ControlStyle to [csClickEvents, csSetCaption, csOpaque, csDoubleClicks].

Sets TabStop (see page 2580) to true.

Sets ParentColor (see page 2570) to false and BorderStyle (see page 2558) to bsSingle.

Sets AllowActiveDoc (see page 2556) and AllowInPlace (see page 2556) to true.

Sets AutoActivate (see page 2557) to aaDoubleClick and AutoVerbMenu (see page 2558) to true.

Sets CopyOnSave (see page 2563) to true.

See Also

AllowActiveDoc (see page 2556)

AllowInPlace (see page 2556)

AutoActivate (see page 2557)

AutoVerbMenu (see page 2558)

BorderStyle (see page 2558)

ControlStyle

CopyOnSave (see page 2563)

ParentColor

TabStop

47.1.1.3 TOleContainer.Destroy Destructor

Destroys an instance of TOleContainer (see page 2529).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleContainer();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TOleContainer (see page 2529) reference is not nil, and only then calls Destroy.Destroy frees the OLE object before calling the inherited destructor.

See Also

DestroyObject (see page 2541)

System::TObject::Free

47.1.1.4 TOleContainer Methods

The methods of the TOleContainer class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2534)	Called when an application uses a component interface.
	_Release (see page 2535)	Called when an application releases a component interface.
	Changed (see page 2535)	Sends a CM_CHANGED message to the control.
V	CreateParams (see page 2540)	Initializes a window-creation parameter data structure.

	DblClick (see page 2540)	OnDblClick event dispatcher.
	DefineProperties (see page 2541)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DoEnter (see page 2542)	Respond to receiving input focus.
	GetPopupMenu (see page 2543)	Returns the pop-up menu associated with the control.
	KeyDown (see page 2543)	Respond to key press events.
	MouseDown (see page 2545)	OnMouseDown event dispatcher.
	Paint (see page 2546)	Renders the image of a custom control.
	QueryInterface (see page 2547)	Returns a reference to a specified interface if the object supports that interface.

Public Methods

	Name	Description
	ChangeIconDialog (see page 2535)	Displays the Change Icon OLE dialog box.
	Close (see page 2536)	Deactivates the OLE object.
	Copy (see page 2536)	Copies the OLE object to the Windows clipboard.
	CreateLinkToFile (see page 2537)	Creates a linked OLE object from the contents of a file.
	CreateObject (see page 2537)	Creates an embedded OLE object given its class name (also known as programmatic identifier).
	CreateObjectFromFile (see page 2538)	Creates an embedded OLE object from the contents of a file.
	CreateObjectFromInfo (see page 2539)	Creates an OLE object matching the specified TCreateInfo (see page 2618) record.
	DestroyObject (see page 2541)	Destroys the container's OLE object.
	DoVerb (see page 2542)	Requests that the OLE object perform some action.
	GetIconMetaPict (see page 2542)	Returns the global memory handle of a metafile containing the OLE object's icon.
	InsertObjectDialog (see page 2543)	Displays the Insert Object OLE dialog box.
	LoadFromFile (see page 2544)	Loads an OLE object from the specified file.
	LoadFromStream (see page 2545)	Loads an OLE object from the specified stream.
	ObjectPropertiesDialog (see page 2546)	Displays the OLE Object Properties property sheet.
	Paste (see page 2546)	Pastes the contents of the Windows clipboard as an embedded object.
	PasteSpecialDialog (see page 2547)	Displays the Paste (see page 2546) Special OLE dialog box.
	Run (see page 2548)	Runs the OLE object's server application, but doesn't open or activate the OLE object itself.
	SaveAsDocument (see page 2548)	Saves the OLE object to the specified file in native OLE Document format.
	SaveToFile (see page 2550)	Saves the OLE object to the specified file.
	SaveToStream (see page 2550)	Saves the OLE object to the specified stream.
	UpdateObject (see page 2551)	Refreshes the OLE object.
	UpdateVerbs (see page 2551)	Refreshes the list of verbs the OLE object can respond to.

47.1.1.4.1 TOleContainer._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

QueryInterface

_Release

_AddRef

47.1.1.4.2 TOleContainer._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

QueryInterface

_AddRef

47.1.1.4.3 TOleContainer.Changed Method

Sends a CM_CHANGED message to the control.

Pascal

```
procedure Changed; dynamic;
```

C++

```
__fastcall Changed();
```

Description

Call Changed after changing the properties of the control in a way that affects the properties of a parent object. Changed sends a CM_CHANGED message back to the control. If the control is a windowed control, this message is bubbled up to the parent so that it can make any necessary adjustments.

See Also

Parent

47.1.1.4.4 TOleContainer.ChangeIconDialog Method

Displays the Change Icon OLE dialog box.

Pascal

```
function ChangeIconDialog: Boolean;
```

C++

```
__fastcall Boolean ChangeIconDialog();
```

Description

Call ChangeIconDialog to let the user choose a different icon (from .ICO, .DLL, and .EXE files) to use when displaying the OLE object as an icon. An OLE object must already be loaded before calling ChangeIconDialog. ChangeIconDialog returns true if the dialog box was successfully displayed and the user chose the OK button. ChangeIconDialog returns false otherwise.

See Also

Iconic (see page 2566)

ObjectPropertiesDialog (see page 2546)

47.1.1.4.5 TOleContainer.Close Method

Deactivates the OLE object.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to deactivate the OLE object and terminate its server application, without removing it from the container. Any changes the user made to the OLE object are automatically saved. After calling Close, the container's State (see page 2579) property is osLoaded.

Note: If Close is called when no OLE object is loaded, TOleContainer (see page 2529) raises an exception.

See Also

OnDeactivate (see page 2583)

State (see page 2579)

47.1.1.4.6 TOleContainer.Copy Method

Copies the OLE object to the Windows clipboard.

Pascal

```
procedure Copy;
```

C++

```
__fastcall Copy();
```

Description

Call Copy to write the OLE object to the clipboard. If there is no OLE object in the container, Copy raises an exception.

See Also

Paste (see page 2546)

PasteSpecialDialog (see page 2547)

SaveToFile (see page 2550)

SaveToStream (see page 2550)

47.1.1.4.7 TOleContainer.CreateLinkToFile Method

Creates a linked OLE object from the contents of a file.

Pascal

```
procedure CreateLinkToFile(const FileName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateLinkToFile(const UnicodeString FileName, Boolean Iconic);
```

Description

Call CreateLinkToFile to create a linked OLE object from the file specified by the FileName parameter. Iconic (see page 2566) specifies whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there is already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateObject (see page 2537)

CreateObjectFromFile (see page 2538)

CreateObjectFromInfo (see page 2539)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.8 TOleContainer.CreateObject Method

Creates an embedded OLE object given its class name (also known as programmatic identifier).

Pascal

```
procedure CreateObject(const OleClassName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateObject(const UnicodeString OleClassName, Boolean Iconic);
```

Description

Call CreateObject to create an OLE object using the class name (also known as programmatic identifier) specified by the OleClassName (see page 2569) parameter. The Iconic (see page 2566) parameter indicates whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateLinkToFile (see page 2537)

CreateObjectFromFile (see page 2538)

CreateObjectFromInfo (see page 2539)

OleClassName (see page 2569)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.9 TOleContainer.CreateObjectFromFile Method

Creates an embedded OLE object from the contents of a file.

Pascal

```
procedure CreateObjectFromFile(const FileName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateObjectFromFile(const UnicodeString FileName, Boolean Iconic);
```

Description

Call CreateObjectFromFile to create an OLE object from the file specified by the FileName parameter. The Iconic (see page 2566) parameter indicates whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

C++ Examples:

```
/*
This example uses an OLE container and a main menu on a form.
When the user clicks the Open or Save options in the main menu,
an open/save dialog is displayed and by default,
the user is required to enter the name of a Word document.
Files with other extensions supported by the OLE container
can also be accessed. An additional test is made to assure that
the file to open exists and that no file overwriting is
going to take place.
*/
void __fastcall TForm1::Exit1Click(TObject *Sender)
{
  Close();
}

void __fastcall TForm1::Open1Click(TObject *Sender)
{
  if (OpenDialog1->Execute())
    if (FileExists(OpenDialog1->FileName))
      OleContainer1->CreateObjectFromFile(OpenDialog1->FileName, false);
    else
      throw(Exception("File not found."));
}

void __fastcall TForm1::Save1Click(TObject *Sender)
{
  if (SaveDialog1->Execute())
    if (FileExists(SaveDialog1->FileName))
      throw(Exception("File already exists. Cannot overwrite."));
  else
    OleContainer1->SaveAsDocument(SaveDialog1->FileName);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenDialog1->Filter = "Documents (*.doc)|*.DOC|Any file (*.*)|*.*";
  SaveDialog1->Filter = "Documents (*.doc)|*.DOC|Any file (*.*)|*.*";
}
```

Delphi Examples:

```
{
This example uses an OLE container and a main menu on a form.
When the user clicks the Open or Save options in the main menu,
an open/save dialog is displayed and by default,
the user is required to enter the name of a Word document.
```

```
  Files with other extensions supported by the OLE container
  can also be accessed. An additional test is made to assure that
  the file to open exists and that no file overwriting is
  going to take place.
  }
  procedure TForm1.Exit1Click(Sender: TObject);
  begin
    Close;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    OpenDialog1.Filter := 'Documents (*.doc)|*.DOC|Any file (*.*)|*.*';
    SaveDialog1.Filter := 'Documents (*.doc)|*.DOC|Any file (*.*)|*.*';
  end;

  procedure TForm1.Open1Click(Sender: TObject);
  begin
    if OpenDialog1.Execute then
      if FileExists(OpenDialog1.FileName) then
        OleContainer1.CreateObjectFromFile(OpenDialog1.FileName, false)
      else
        raise Exception.Create('File not found.');
  end;

  procedure TForm1.Save1Click(Sender: TObject);
  begin
    if SaveDialog1.Execute then
      if FileExists(SaveDialog1.FileName) then
        raise Exception.Create('File already exists. Cannot overwrite.')
      else
        OleContainer1.SaveAsDocument(SaveDialog1.FileName);
  end;
```

See Also

CreateLinkToFile (see page 2537)

CreateObject (see page 2537)

CreateObjectFromInfo (see page 2539)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.10 TOleContainer.CreateObjectFromInfo Method

Creates an OLE object matching the specified TCreateInfo (see page 2618) record.

Pascal

```
procedure CreateObjectFromInfo(const CreateInfo: TCreateInfo);
```

C++

```
__fastcall CreateObjectFromInfo(const TCreateInfo CreateInfo);
```

Description

Call CreateObjectFromInfo to create a linked or embedded OLE object based on the specifications in the CreateInfo parameter. CreateInfo specifies whether the object should be created from a file, from a data transfer object, or from a class identifier, and provides the necessary supporting information. CreateInfo also indicates whether the OLE object should be displayed as an Icon, and allows the icon to be specified. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

Note: The CreateLinkToFile (see page 2537), CreateObject (see page 2537), and CreateObjectFromFile (see page 2538) methods are one-line calls for the most common types of OLE objects. They can be used instead of filling out the

TCreateInfo (see page 2618) record.

See Also

CreateLinkToFile (see page 2537)

CreateObject (see page 2537)

CreateObjectFromFile (see page 2538)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.11 TOleContainer.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle

CreateWnd

AddBiDiModeExStyle

47.1.1.4.12 TOleContainer.DblClick Method

OnDblClick event dispatcher.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick calls any event handler attached to the OnDblClick event. Override DblClick to provide other responses in addition to the inherited event-handler call when the user double-clicks the control.

The DblClick method is triggered by left mouse-button double-click message (WM_LBUTTONDBLCLK) from Windows.

See Also

Click

OnDblClick

47.1.1.4.13 TOleContainer.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

See Also

DefineBinaryProperty

DefineProperty

DefineProperties

IsControl

47.1.1.4.14 TOleContainer.DestroyObject Method

Destroys the container's OLE object.

Pascal

```
procedure DestroyObject;
```

C++

```
__fastcall DestroyObject();
```

Description

Call DestroyObject to destroy the OLE object, discarding any unsaved changes the user made to it.

See Also

Close (see page 2536)

OleObject (see page 2569)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.15 TOleContainer.DoEnter Method

Respond to receiving input focus.

Pascal

```
procedure DoEnter; override;
```

C++

```
virtual __fastcall DoEnter();
```

Description

DoEnter is called automatically when the control receives the input focus. As implemented in TWinControl, DoEnter calls the OnEnter event handler, if defined.

Descendant classes that override DoEnter should always call the inherited method.

See Also

DoExit

OnEnter

47.1.1.4.16 TOleContainer.DoVerb Method

Requests that the OLE object perform some action.

Pascal

```
procedure DoVerb(Verb: Integer);
```

C++

```
__fastcall DoVerb(int Verb);
```

Description

Call DoVerb to request that the OLE object perform one of the actions listed by the ObjectVerbs (see page 2568) property. OLE defines several verbs, such as ovShow (see page 2626) (to display the OLE object) and ovPrimary (see page 2625) (the default action, usually to activate the OLE object). OLE objects can also define their own custom verbs. Use the ObjectVerbs (see page 2568) property to get a list of those custom verbs.

See Also

ObjectVerbs (see page 2568)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.4.17 TOleContainer.GetIconMetaPict Method

Returns the global memory handle of a metafile containing the OLE object's icon.

Pascal

```
function GetIconMetaPict: HGlobal;
```

C++

```
__fastcall HGlobal GetIconMetaPict();
```

Description

Call GetIconMetaPict to obtain a metafile handle for drawing the OLE object's icon on another canvas. Use the global

DestroyMetaPict (see page 2617) procedure to destroy the handle. If the OLE container is empty, GetIconMetaPict raises an exception.

See Also

DestroyMetaPict (see page 2617)

TMetafile

TMetafileCanvas

47.1.1.4.18 TOleContainer.GetPopupMenu Method

Returns the pop-up menu associated with the control.

Pascal

```
function GetPopupMenu: TPopupMenu; override;
```

C++

```
virtual __fastcall TPopupMenu GetPopupMenu();
```

Description

Call GetPopupMenu to find the popup menu associated with the control. Override GetPopupMenu to change which popup menu is associated with the control or to specify different popup menus depending on the state of the control.

GetPopupMenu returns the value of the Popup property.

See Also

PopupMenu

47.1.1.4.19 TOleContainer.InsertObjectDialog Method

Displays the Insert Object OLE dialog box.

Pascal

```
function InsertObjectDialog: Boolean;
```

C++

```
__fastcall Boolean InsertObjectDialog();
```

Description

Call InsertObjectDialog to let the user create an OLE object. The OLE object can be embedded or linked. InsertObjectDialog returns true if the dialog box was successfully displayed and the user chose the OK button. InsertObjectDialog returns false otherwise. If the user chose OK and there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateObjectFromInfo (see page 2539)

ObjectPropertiesDialog (see page 2546)

PasteSpecialDialog (see page 2547)

47.1.1.4.20 TOleContainer.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

47.1.1.4.21 TOleContainer.LoadFromFile Method

Loads an OLE object from the specified file.

Pascal

```
procedure LoadFromFile(const FileName: string);
```

C++

```
__fastcall LoadFromFile(const UnicodeString FileName);
```

Description

Call LoadFromFile to load an OLE object that was saved using the SaveToFile (see page 2550) method. If OldStreamFormat (see page 2568) is true, LoadFromFile loads files saved by an TOleContainer (see page 2529) object as well as files saved using the current format; if OldStreamFormat (see page 2568) is false, LoadFromFile will not load files saved by the library. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

LoadFromStream (see page 2545)

OldStreamFormat (see page 2568)

SaveToFile (see page 2550)

47.1.1.4.22 TOleContainer.LoadFromStream Method

Loads an OLE object from the specified stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load an OLE object from a stream. If OldStreamFormat (see page 2568) is true, LoadFromStream loads OLE objects saved by a TOleContainer (see page 2529) object as well as OLE objects saved using the current format; if OldStreamFormat (see page 2568) is false, LoadFromStream will not load OLE objects saved by the library. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

LoadFromFile (see page 2544)

OldStreamFormat (see page 2568)

SaveToStream (see page 2550)

TStream

47.1.1.4.23 TOleContainer.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

47.1.1.4.24 TOleContainer.ObjectPropertiesDialog Method

Displays the OLE Object Properties property sheet.

Pascal

```
function ObjectPropertiesDialog: Boolean;
```

C++

```
__fastcall Boolean ObjectPropertiesDialog();
```

Description

Call ObjectPropertiesDialog to let the user see and edit the properties of the OLE object. Any changes the user makes in the property sheet are automatically made to the OLE object. ObjectPropertiesDialog returns true if the property sheet was successfully displayed and the user chose the OK button. It returns false otherwise.

If the OLE container is empty, ObjectPropertiesDialog raises an exception.

See Also

DoVerb (see page 2542)

47.1.1.4.25 TOleContainer.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas

PaintWindow

GetDeviceContext

ClipRect

47.1.1.4.26 TOleContainer.Paste Method

Pastes the contents of the Windows clipboard as an embedded object.

Pascal

```
procedure Paste;
```

C++

```
__fastcall Paste();
```

Description

Call Paste to embed the object on the clipboard in the OLE container. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CanPaste (see page 2558)

CreateObjectFromInfo (see page 2539)

PasteSpecialDialog (see page 2547)

47.1.1.4.27 TOleContainer.PasteSpecialDialog Method

Displays the Paste (see page 2546) Special OLE dialog box.

Pascal

```
function PasteSpecialDialog: Boolean;
```

C++

```
__fastcall Boolean PasteSpecialDialog();
```

Description

Call PasteSpecialDialog to let the user control how the contents of the Windows clipboard are pasted into the container. The Paste (see page 2546) Special dialog box lets the user select the format of the data, whether it should be embedded or linked, and whether the OLE object should be displayed as an icon (and if so, to choose a different icon). PasteSpecialDialog returns true if the dialog box was successfully displayed and the user chose the OK button. It returns false otherwise. If the user chose the OK button when there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CanPaste (see page 2558)

InsertObjectDialog (see page 2543)

Paste (see page 2546)

47.1.1.4.28 TOleContainer.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the component supports the interface specified by IID, and if so, returns a reference to that interface as the Obj parameter. If the component does not support the interface, the Obj parameter returns nil (Delphi) or NULL (C++).

Note: For components that act as COM object wrapper, QueryInterface calls the QueryInterface method of the internal COM

object.

See Also

_AddRef

_Release

QueryInterface

47.1.1.4.29 TOleContainer.Run Method

Runs the OLE object's server application, but doesn't open or activate the OLE object itself.

Pascal

```
procedure Run;
```

C++

```
__fastcall Run();
```

Description

Call Run to ensure that the server application is running. Once the server application is running, opening and activating the OLE object happens much more quickly. An OLE object must already be loaded in the container before calling Run, Otherwise, Run raises an exception.

See Also

State (see page 2579)

47.1.1.4.30 TOleContainer.SaveAsDocument Method

Saves the OLE object to the specified file in native OLE Document format.

Pascal

```
procedure SaveAsDocument(const FileName: string);
```

C++

```
__fastcall SaveAsDocument(const UnicodeString FileName);
```

Description

Call SaveAsDocument to save the OLE object in its native OLE Document format. An OLE object must already be loaded in the container before calling SaveAsDocument. Otherwise, SaveAsDocument raises an exception.

Note: Saving an OLE object to a file or a stream limits the ability of another application, such as Word, to open the file, even if it is saved with the correct extension. Saving to a file or a stream loses information necessary to open such a file. Use SaveAsDocument when needing to save files in a native OLE Document format.

C++ Examples:

```
/*
This example uses an OLE container and a main menu on a form.
When the user clicks the Open or Save options in the main menu,
an open/save dialog is displayed and by default,
the user is required to enter the name of a Word document.
Files with other extensions supported by the OLE container
can also be accessed. An additional test is made to assure that
the file to open exists and that no file overwriting is
going to take place.
```

```
*/
void __fastcall TForm1::Exit1Click(TObject *Sender)
{
  Close();
}

void __fastcall TForm1::Open1Click(TObject *Sender)
{
  if (OpenDialog1->Execute())
    if (FileExists(OpenDialog1->FileName))
      OleContainer1->CreateObjectFromFile(OpenDialog1->FileName, false);
    else
      throw(Exception("File not found."));
}

void __fastcall TForm1::Save1Click(TObject *Sender)
{
  if (SaveDialog1->Execute())
    if (FileExists(SaveDialog1->FileName))
      throw(Exception("File already exists. Cannot overwrite."));
  else
    OleContainer1->SaveAsDocument(SaveDialog1->FileName);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenDialog1->Filter = "Documents (*.doc)|*.DOC|Any file (*.*)|*.*";
  SaveDialog1->Filter = "Documents (*.doc)|*.DOC|Any file (*.*)|*.*";
}
```

Delphi Examples:

```
{
This example uses an OLE container and a main menu on a form.
When the user clicks the Open or Save options in the main menu,
an open/save dialog is displayed and by default,
the user is required to enter the name of a Word document.
Files with other extensions supported by the OLE container
can also be accessed. An additional test is made to assure that
the file to open exists and that no file overwriting is
going to take place.
}
procedure TForm1.Exit1Click(Sender: TObject);
begin
  Close;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenDialog1.Filter := 'Documents (*.doc)|*.DOC|Any file (*.*)|*.*';
  SaveDialog1.Filter := 'Documents (*.doc)|*.DOC|Any file (*.*)|*.*';
end;

procedure TForm1.Open1Click(Sender: TObject);
begin
  if OpenDialog1.Execute then
    if FileExists(OpenDialog1.FileName) then
      OleContainer1.CreateObjectFromFile(OpenDialog1.FileName, false)
    else
      raise Exception.Create('File not found.');
end;

procedure TForm1.Save1Click(Sender: TObject);
begin
  if SaveDialog1.Execute then
    if FileExists(SaveDialog1.FileName) then
      raise Exception.Create('File already exists. Cannot overwrite.')
```

```
    else
      OleContainer1.SaveAsDocument(SaveDialog1.FileName);
end;
```

See Also

SaveToFile (see page 2550)

SaveToStream (see page 2550)

47.1.1.4.31 TOleContainer.SaveToFile Method

Saves the OLE object to the specified file.

Pascal

```
procedure SaveToFile(const FileName: string);
```

C++

```
__fastcall SaveToFile(const UnicodeString FileName);
```

Description

Call SaveToFile to save the OLE object. If CopyOnSave (see page 2563) is true, SaveToFile first creates a temporary OLE object that compresses redundant data, saving space in the file that is saved. If OldStreamFormat (see page 2568) is true, SaveToFile writes a file that can be read by a TOleContainer (see page 2529) component.

An OLE object must already be loaded in the container before calling SaveToFile. Otherwise, SaveToFile raises an exception.

See Also

Copy (see page 2536)

CopyOnSave (see page 2563)

LoadFromFile (see page 2544)

OldStreamFormat (see page 2568)

SaveToStream (see page 2550)

47.1.1.4.32 TOleContainer.SaveToStream Method

Saves the OLE object to the specified stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the OLE object. If CopyOnSave (see page 2563) is true, SaveToStream first creates a temporary OLE object that compresses redundant data, reducing the information that must be saved. If OldStreamFormat (see page 2568) is true, SaveToStream writes the object in a format that can be read by a TOleContainer (see page 2529) component.

An OLE object must already be loaded in the container before calling SaveToStream. Otherwise, SaveToStream raises an exception.

See Also

Copy (see page 2536)

CopyOnSave (see page 2563)

LoadFromStream (see page 2545)

OldStreamFormat (see page 2568)

SaveToFile (see page 2550)

47.1.1.4.33 TOleContainer.UpdateObject Method

Refreshes the OLE object.

Pascal

```
procedure UpdateObject;
```

C++

```
__fastcall UpdateObject();
```

Description

Linked (see page 2567) OLE objects and embedded objects that contain linked OLE objects get out of date when the source of the link is updated. UpdateObject rereads the source to ensure that the OLE object has current data. If there is no OLE object loaded in the container, UpdateObject has no effect.

See Also

Linked (see page 2567)

UpdateVerbs (see page 2551)

47.1.1.4.34 TOleContainer.UpdateVerbs Method

Refreshes the list of verbs the OLE object can respond to.

Pascal

```
procedure UpdateVerbs;
```

C++

```
__fastcall UpdateVerbs();
```

Description

TOleContainer (see page 2529) automatically calls UpdateVerbs when the ObjectVerbs (see page 2568) property is first read, but some OLE objects change their verbs when they perform some actions. The Media Clip OLE object, for example, changes its Play verb to Stop while running. Call UpdateVerbs to ensure that the list of verbs is appropriate to the state of the OLE object.

An OLE object must already be loaded in the container before calling UpdateVerbs. Otherwise, UpdateVerbs raises an exception.

See Also

AutoVerbMenu (see page 2558)

ObjectVerbs (see page 2568)

47.1.1.5 TOleContainer Properties

The properties of the TOleContainer class are listed here.

Public Properties

	Name	Description
R	CanPaste (see page 2558)	Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.
R	Linked (see page 2567)	Indicates whether the OLE object is linked or embedded.
	Modified (see page 2567)	Indicates whether the OLE object has been modified.
R	NewInserted (see page 2567)	Indicates whether the OLE object was created rather than pasted in or created as a link to a file.
R	ObjectVerbs (see page 2568)	Lists the verbs that the OLE object supports.
R	OleClassName (see page 2569)	Specifies the class name of the OLE object.
R	OleObject (see page 2569)	Represents the OLE object hosted by the OLE container.
R	OleObjectInterface (see page 2569)	Provides access to the IOleObject interface for the OLE object.
R	PrimaryVerb (see page 2576)	Specifies the index of the primary (default) verb for the OLE object.
R	SourceDoc (see page 2579)	Specifies the name of the source document for a linked OLE object.
R	State (see page 2579)	Describes the state of the OLE object.
R	StorageInterface (see page 2579)	Provides access to the IStorage interface for the OLE object.

Published Properties

	Name	Description
	Align (see page 2552)	Determines how the control aligns within its container (parent control).
	AllowActiveDoc (see page 2556)	Specifies whether the OLE container supports the IOleDocumentSite interface.
	AllowInPlace (see page 2556)	Determines whether the OLE container allows in-place activation.
	Anchors (see page 2557)	Specifies how the control is anchored to its parent.
	AutoActivate (see page 2557)	Determines how the object in an OLE container is activated.
	AutoVerbMenu (see page 2558)	Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.
	BorderStyle (see page 2558)	Determines whether a single line is drawn around the OLE container.
	Caption (see page 2559)	Specifies a text string that identifies the control to the user.
	Color (see page 2561)	Specifies the background color of the control.
	Constraints (see page 2562)	Specifies the size constraints for the control.
	CopyOnSave (see page 2563)	Determines whether the SaveToFile (see page 2550) and SaveToStream (see page 2550) methods first create a copy of the OLE object.
	Ctl3D (see page 2563)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 2564)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 2564)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2566)	Controls whether the control responds to mouse, keyboard, and timer events.
	Iconic (see page 2566)	Determines whether the OLE object is displayed as an icon.
	OldStreamFormat (see page 2568)	Indicates whether the OLE object is loaded and saved using the VCL format.
	ParentColor (see page 2570)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2570)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 2571)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2571)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2577)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SizeMode (see page 2578)	Determines how the OLE object is sized in the OLE container.
	TabOrder (see page 2580)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2580)	Determines if the user can tab to a control.
	Visible (see page 2581)	Determines whether the component appears onscreen.

47.1.1.5.1 TOleContainer.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
```

```
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var

Parent

Anchors

47.1.1.5.2 TOleContainer.AllowActiveDoc Property

Specifies whether the OLE container supports the IOleDocumentSite interface.

Pascal

```
property AllowActiveDoc: Boolean;
```

C++

```
__property Boolean AllowActiveDoc;
```

Description

Set AllowActiveDoc to true to specify that the OLE container can house an ActiveDoc (DocObject). Set AllowActiveDoc to false to limit the OLE container to hosting OLE controls that use the more usual interfaces such as IOleClientSite. ActiveDoc-enabled controls have a slightly different border. Set AllowActiveDoc to false to maintain a consistent appearance in forms that do not need to support the IOleDocumentSite interface.

See Also

AllowInPlace (see page 2556)

47.1.1.5.3 TOleContainer.AllowInPlace Property

Determines whether the OLE container allows in-place activation.

Pascal

```
property AllowInPlace: Boolean;
```

C++

```
__property Boolean AllowInPlace;
```

Description

Set AllowInPlace to specify what happens when the user activates the OLE object. If AllowInPlace is true and Iconic (see page 2566) is false, the OLE object is activated in place. If AllowInPlace is false, the OLE object is activated in a separate window. The default value is true.

See Also

AllowActiveDoc (see page 2556)

AutoActivate (see page 2557)

Iconic (see page 2566)

47.1.1.5.4 TOleContainer.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

47.1.1.5.5 TOleContainer.AutoActivate Property

Determines how the object in an OLE container is activated.

Pascal

```
property AutoActivate: TAutoActivate;
```

C++

```
__property TAutoActivate AutoActivate;
```

Description

Set AutoActivate to specify what actions activate the OLE object. AutoActivate takes one of the values in the following table:

Values	Meaning
aaManual	The OLE object must be activated programmatically by calling DoVerb (see page 2542) (ovShow (see page 2626)).
aaGetFocus	The OLE object is activated when the OLE container gets focus (by clicking on it with the mouse or pressing Tab to move the focus to it).

aaDoubleClick	(Default) The OLE object is activated by double-clicking it or pressing Enter while the container has the focus.

See Also

AllowActiveDoc (see page 2556)

DoVerb (see page 2542)

47.1.1.5.6 TOleContainer.AutoVerbMenu Property

Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.

Pascal

```
property AutoVerbMenu: Boolean;
```

C++

```
__property Boolean AutoVerbMenu;
```

Description

Use AutoVerbMenu to specify whether the OLE object can replace the OLE container's popup menu. If AutoVerbMenu is true (the default), the OLE object replaces any existing PopupMenu (see page 2571) property. If AutoVerbMenu is false, no popup menu is automatically created.

See Also

DoVerb (see page 2542)

ObjectVerbs (see page 2568)

PopupMenu

47.1.1.5.7 TOleContainer.BorderStyle Property

Determines whether a single line is drawn around the OLE container.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to specify whether the OLE container should be framed by a single line. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

See Also

Ctl3D

47.1.1.5.8 TOleContainer.CanPaste Property

Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.

Pascal

```
property CanPaste: Boolean;
```

C++

```
__property Boolean CanPaste;
```

Description

Read CanPaste before trying to paste or paste link an OLE object from the clipboard.

See Also

Paste (see page 2546)

PasteSpecialDialog (see page 2547)

47.1.1.5.9 TOleContainer.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

Note: The Caption property inheritted from TControl is a protected property. Access to the Caption requires casting the class to an inheritted one where Caption is a published or public property.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
```

```
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
```

```
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

47.1.1.5.10 TOleContainer.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

47.1.1.5.11 TOleContainer.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the

ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

OnCanResize

47.1.1.5.12 TOleContainer.CopyOnSave Property

Determines whether the SaveToFile (see page 2550) and SaveToStream (see page 2550) methods first create a copy of the OLE object.

Pascal

```
property CopyOnSave: Boolean;
```

C++

```
__property Boolean CopyOnSave;
```

Description

When CopyOnSave is true, the SaveToFile (see page 2550) and SaveToStream (see page 2550) methods create a temporary OLE object, compressing redundant data to save space. This compressed copy is then saved to the file or stream. When CopyOnSave is false, the OLE object is saved directly to the file or stream without using a temporary copy to compress redundant information.

Set CopyOnSave to false when the container holds very large embedded objects and there might not be enough memory to make the temporary copy. The default value is true.

See Also

OleObject (see page 2569)

SaveToFile (see page 2550)

SaveToStream (see page 2550)

47.1.1.5.13 TOleContainer.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

BorderWidth

47.1.1.5.14 TOleContainer.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

47.1.1.5.15 TOleContainer.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
```

```
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;

Arranging the Order of Persistent Columns

47.1.1.5.16 TOleContainer.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

See Also

Visible

DisableControls

EnableControls

Enabling Mouse

47.1.1.5.17 TOleContainer.Iconic Property

Determines whether the OLE object is displayed as an icon.

Pascal

```
property Iconic: Boolean;
```

C++

```
__property Boolean Iconic;
```

Description

Set Iconic to specify whether the OLE container displays the icon for the server application instead of the image of the object. If Iconic is true, the OLE object is displayed as an icon; if false, it's displayed as it would be in the server application.

See Also

GetIconMetaPict (see page 2542)

47.1.1.5.18 TOleContainer.Linked Property

Indicates whether the OLE object is linked or embedded.

Pascal

```
property Linked: Boolean;
```

C++

```
__property Boolean Linked;
```

Description

Read Linked to determine whether the OLE object is linked to the OLE server. If Linked is true, the OLE object is linked; if false, it's embedded. An OLE object must already be loaded in the container before accessing the Linked property.

See Also

UpdateObject (see page 2551)

47.1.1.5.19 TOleContainer.Modified Property

Indicates whether the OLE object has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use Modified to determine when the OLE object has been modified (including being deleted or replaced by another OLE object). To keep track of incremental changes, set Modified to false and later check it to see if the OLE object has been modified after since Modified was set to false. If there is no OLE object loaded into the container, Modified returns false.

See Also

OleObject (see page 2569)

47.1.1.5.20 TOleContainer.NewInserted Property

Indicates whether the OLE object was created rather than pasted in or created as a link to a file.

Pascal

```
property NewInserted: Boolean;
```

C++

```
__property Boolean NewInserted;
```

Description

Read NewInserted to determine whether the OLE object was newly created via a call to InsertObjectDialog (see page 2543). If there is no OLE object loaded into the container, NewInserted returns false. If NewInserted is true after a call to InsertObjectDialog (see page 2543), call DoVerb (see page 2542)(ovShow (see page 2626)) to let the user edit the object.

See Also

DoVerb (see page 2542)

InsertObjectDialog (see page 2543)

OleObject (see page 2569)

47.1.1.5.21 TOleContainer.ObjectVerbs Property

Lists the verbs that the OLE object supports.

Pascal

```
property ObjectVerbs: TStrings;
```

C++

```
__property TStrings ObjectVerbs;
```

Description

Read ObjectVerbs to determine the verbs that can be used with the OLE object. The verb names can have embedded ampersand (&) characters to indicate shortcut keys. An OLE object must already be loaded in the container before accessing the ObjectVerbs property.

See Also

AutoVerbMenu (see page 2558)

DoVerb (see page 2542)

PrimaryVerb (see page 2576)

TStrings

47.1.1.5.22 TOleContainer.OldStreamFormat Property

Indicates whether the OLE object is loaded and saved using the VCL format.

Pascal

```
property OldStreamFormat: Boolean;
```

C++

```
__property Boolean OldStreamFormat;
```

Description

Set OldStreamFormat to true to read OLE objects that were saved to file using VCL or to save OLE objects that will be used by VCL. If OldStreamFormat is false (the default), the LoadFromFile (see page 2544), LoadFromStream (see page 2545), SaveToFile (see page 2550), and SaveToStream (see page 2550) methods use the newer format that contains extra header information. The extra header information is used to validate a file or stream. This property is provided for backward compatibility only.

See Also

LoadFromFile (see page 2544)

LoadFromStream (see page 2545)

SaveToFile (see page 2550)

SaveToStream (see page 2550)

47.1.1.5.23 TOleContainer.OleClassName Property

Specifies the class name of the OLE object.

Pascal

```
property OleClassName: string;
```

C++

```
__property UnicodeString OleClassName;
```

Description

Read OleClassName to obtain the class name (programmatic identifier) for the OLE object. The class name is a string describing the class of OLE object that is registered in the Windows registry. An OLE object must already be loaded in the container before accessing the OleClassName property.

See Also

OleObject (see page 2569)

47.1.1.5.24 TOleContainer.OleObject Property

Represents the OLE object hosted by the OLE container.

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

Read OleObject to access the OLE object hosted by the OLE container as a variant. To interact with the OLE object using the IOleObject interface, use the OleObjectInterface (see page 2569) property instead. If the OLE object is not loaded in the container before reading OleObject, an EOleError exception is raised.

See Also

EOleError

OleObjectInterface (see page 2569)

47.1.1.5.25 TOleContainer.OleObjectInterface Property

Provides access to the IOleObject interface for the OLE object.

Pascal

```
property OleObjectInterface: IOleObject;
```

C++

```
__property IOleObject OleObjectInterface;
```

Description

Use OleObjectInterface for low-level access to the OLE API. If there is no OLE object loaded into the container, OleObjectInterface returns nil (Delphi) or NULL (C++).

See Also

OleObject (see page 2569)

Creating Clients for Servers That Do Not Have a Type Library

47.1.1.5.26 TOleContainer.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

Color

Parent

ParentFont

ParentShowHint

47.1.1.5.27 TOleContainer.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

47.1.1.5.28 TOleContainer.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

47.1.1.5.29 TOleContainer.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
```

```
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then

  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
```

```
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type

47.1.1.5.30 TOleContainer.PrimaryVerb Property

Specifies the index of the primary (default) verb for the OLE object.

Pascal

```
property PrimaryVerb: Integer;
```

C++

```
__property int PrimaryVerb;
```

Description

Use PrimaryVerb to determine which verb in the ObjectVerbs (see page 2568) list specifies the default action for the OLE object. In a call to the DoVerb (see page 2542) method, DoVerb (see page 2542)(ovPrimary (see page 2625)) is the same as DoVerb (see page 2542)(PrimaryVerb). An OLE object must already be loaded in the container before accessing the PrimaryVerb property.

See Also

DoVerb (see page 2542)

ObjectVerbs (see page 2568)

47.1.1.5.31 TOleContainer.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

47.1.1.5.32 TOleContainer.SizeMode Property

Determines how the OLE object is sized in the OLE container.

Pascal

```
property SizeMode: TSizeMode;
```

C++

```
__property TSizeMode SizeMode;
```

Description

Set SizeMode to specify how the OLE object is fit into the client area of the OLE container. The following table gives the possible values :

Value	Meaning
smClip	(Default)- Displays the OLE object at its normal size, clipping any parts that don't fit within the container.
smCenter	Displays the OLE object at its normal size, centering it within the container.
smScale	Scales or shrinks the view of the OLE object to fit within the container, by scaling width and height proportionally.
smStretch	Scales or shrinks the view of the OLE object to fill the OLE container, without regard to preserving the proportions of the OLE object.
smAutoSize	Displays the OLE object at its normal size and automatically resizes the container to fit the size of the OLE object.

AllowInPlace (see page 2556)

ClientRect

47.1.1.5.33 TOleContainer.SourceDoc Property

Specifies the name of the source document for a linked OLE object.

Pascal

```
property SourceDoc: string;
```

C++

```
__property UnicodeString SourceDoc;
```

Description

Read SourceDoc to obtain the name of the OLE object when it is linked. An OLE object must already be loaded in the container before accessing the SourceDoc property. If the OLE object isn't linked, SourceDoc returns an empty string.

See Also

Linked (see page 2567)

OleClassName (see page 2569)

47.1.1.5.34 TOleContainer.State Property

Describes the state of the OLE object.

Pascal

```
property State: TObjectState;
```

C++

```
__property TObjectState State;
```

Description

Read State to determine the state of the OLE object and its server application. State has one of the following values:

Values	Meaning
osEmpty	There is no OLE object in the container.
osLoaded	There is an OLE object in the container, but its server application isn't currently running.
osRunning	The OLE object's server is running.
osOpen	The OLE object is open in a separate window.
osInPlaceActive	The OLE object is activated in place, but hasn't yet merged its menus or toolbars. This is an intermediate state; the State property will shift to osUIActive as soon as the menus and toolbars have been merged.
osUIActive	The OLE object is activated in place and menus and toolbars have been merged

AllowInPlace (see page 2556)

Iconic (see page 2566)

47.1.1.5.35 TOleContainer.StorageInterface Property

Provides access to the IStorage interface for the OLE object.

Pascal

```
property StorageInterface: IStorage;
```

C++

```
__property IStorage StorageInterface;
```

Description

Use StorageInterface for low-level access to the OLE API. If there is no OLE object loaded into the container, StorageInterface returns nil (Delphi) or NULL (C++).

See Also

OleObjectInterface (see page 2569)

47.1.1.5.36 TOleContainer.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

47.1.1.5.37 TOleContainer.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

47.1.1.5.38 TOleContainer.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
```

```
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin

47.1.1.6 TOleContainer Events

The events of the TOleContainer class are listed here.

Published Events

	Name	Description
	OnActivate (see page 2583)	Occurs immediately after the OLE object is activated.
	OnDeactivate (see page 2583)	Occurs immediately after the OLE object is deactivated.
	OnDragDrop (see page 2584)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2587)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 2590)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnEnter (see page 2591)	Occurs when a control receives the input focus.
	OnExit (see page 2593)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 2597)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2601)	Occurs when a key is pressed.
	OnKeyUp (see page 2602)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2604)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2605)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 2607)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2609)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnObjectMove (see page 2611)	Occurs when the OLE container is notified that the OLE object has moved or resized.
	OnResize (see page 2612)	Occurs immediately after the OLE container window is resized.
	OnStartDrag (see page 2612)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

47.1.1.6.1 TOleContainer.OnActivate Event

Occurs immediately after the OLE object is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to take specific action when the OLE object becomes active.

See Also

AutoActivate (see page 2557)

DoVerb (see page 2542)

OnDeactivate (see page 2583)

State (see page 2579)

47.1.1.6.2 TOleContainer.OnDeactivate Event

Occurs immediately after the OLE object is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to respond when the OLE object is deactivated.

See Also

Close (see page 2536)

OnActivate (see page 2583)

State (see page 2579)

47.1.1.6.3 TOleContainer.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");

TDragObject

47.1.1.6.4 TOleContainer.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
type
  TForm1 = class(TForm)
    Panel1: TPanel;
    Label1: TLabel;
    procedure Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
      State: TDragState; var Accept: Boolean);
    procedure FormDragOver(Sender, Source: TObject; X, Y: Integer;
      State: TDragState; var Accept: Boolean);
    procedure FormDragDrop(Sender, Source: TObject; X, Y: Integer);
  private
    { Private declarations }
  public
    { Public declarations }
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

47.1.1.6.5 TOleContainer.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
```

```
  Status.Caption := S;
end;

DragKind

47.1.1.6.6 TOleContainer.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

OnExit

ActiveControl

OnActivate

Using a Single Navigator for Multiple Datasets

47.1.1.6.7 TOleContainer.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)

OnEnter

ActiveControl

47.1.1.6.8 TOleContainer.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed.

For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).

OnKeyPress

OnKeyUp

47.1.1.6.9 TOleContainer.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
```

```
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyUp

KeyPreview

47.1.1.6.10 TOleContainer.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
```

```
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

OnKeyDown

OnKeyPress

47.1.1.6.11 TOleContainer.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

47.1.1.6.12 TOleContainer.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

OnMouseDown

OnMouseMove

Responding to a Mouse-up Action

47.1.1.6.15 TOleContainer.OnObjectMove Event

Occurs when the OLE container is notified that the OLE object has moved or resized.

Pascal

```
property OnObjectMove: TObjectMoveEvent;
```

C++

```
__property TObjectMoveEvent OnObjectMove;
```

Description

Write an OnObjectMove event handler to respond when the OLE object changes size or position. The Bounds parameter specifies the boundaries of the in-place object in the client coordinates of OLE container. OnObjectMove occurs before the OLE object's image is updated to reflect the change.

See Also

OnResize (see page 2612)

47.1.1.6.16 TOleContainer.OnResize Event

Occurs immediately after the OLE container window is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Write an OnResize event handler to respond to changes in the size of the OLE container window. If SizeMode (see page 2578) is smAutoSize, the container window changes size whenever the OLE object resizes.

See Also

OnObjectMove (see page 2611)

SizeMode (see page 2578)

47.1.1.6.17 TOleContainer.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

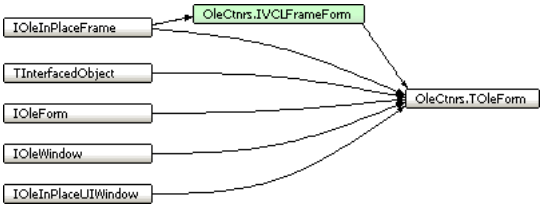
47.1.2 TOleForm Class

TOleForm is an object that provides OLE support for a TForm object.

Class Hierarchy



Pascal

```
TOleForm = class(TInterfacedObject, IOleForm, IOleWindow, IOleInPlaceUIWindow,
IOleInPlaceFrame, IVCLFrameForm);
```

C++

```
class TOleForm : public TInterfacedObject, public IOleForm, public IOleWindow, public
IOleInPlaceUIWindow, public IOleInPlaceFrame, public IVCLFrameForm;
```

File

OleCtnrs

Description

TOleForm implements the IOleForm, IOleWindow, IOleInPlaceUIWindow, and IOleInPlaceFrame interfaces, as well as an interface for internal use. The implementation of the TOleForm object is used internally by the Visual Component Library.

47.1.2.1 TOleForm Members

The following tables list the members exposed by TOleForm.

Public Methods

	Name	Description
	AddContainer (see page 2616)	This is AddContainer, a member of class IVCLFrameForm.
	ClearBorderSpace (see page 2616)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Create (see page 2614)	Create creates a new instance of the TOleForm (see page 2613) object.
	Destroy (see page 2614)	Destroy frees the memory associated with this instance of the TOleForm (see page 2613) object.
	Form (see page 2616)	This is Form, a member of class IVCLFrameForm.
	RemoveContainer (see page 2616)	This is RemoveContainer, a member of class IVCLFrameForm.

47.1.2.2 TOleForm.Create Constructor

Create creates a new instance of the TOleForm (see page 2613) object.

Pascal

```
constructor Create(Form: TCustomForm);
```

C++

```
__fastcall TOleForm(TCustomForm Form);
```

Description

Create is used to create a new instance of the TOleForm (see page 2613) object. Form (see page 2616) is the form upon which to base the new TOleForm (see page 2613) object.

See Also

Destroy (see page 2614)

47.1.2.3 TOleForm.Destroy Destructor

Destroy frees the memory associated with this instance of the TOleForm (see page 2613) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleForm();
```

Description

Do not call Destroy directly. Instead, call Free, which calls Destroy if this instance of the TOleForm (see page 2613) object is not nil.

Destroy frees private objects allocated and used by this instance of the TOleForm (see page 2613) object.

See Also

Create (see page 2614)

47.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IVCLFrameForm (see page 2615)	This is class OleCtnrs.IVCLFrameForm.

47.2.1 IVCLFrameForm Interface

Class Hierarchy

Pascal

```
IVCLFrameForm = interface(IOleInPlaceFrame);
```

C++

```
__interface IVCLFrameForm : public IOleInPlaceFrame;
```

File

OleCtnrs

Description

This is class OleCtnrs.IVCLFrameForm.

47.2.1.1 IVCLFrameForm Members

The following tables list the members exposed by IVCLFrameForm.

Public Methods

	Name	Description
	AddContainer (see page 2616)	This is AddContainer, a member of class IVCLFrameForm.
	ClearBorderSpace (see page 2616)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Form (see page 2616)	This is Form, a member of class IVCLFrameForm.
	RemoveContainer (see page 2616)	This is RemoveContainer, a member of class IVCLFrameForm.

47.2.1.2 IVCLFrameForm Methods

The methods of the IVCLFrameForm class are listed here.

Public Methods

	Name	Description
	AddContainer (see page 2616)	This is AddContainer, a member of class IVCLFrameForm.
	ClearBorderSpace (see page 2616)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Form (see page 2616)	This is Form, a member of class IVCLFrameForm.

	RemoveContainer (see page 2616)	This is RemoveContainer, a member of class IVCLFrameForm.

47.2.1.2.1 IVCLFrameForm.AddContainer Method

Pascal

```
procedure AddContainer(Instance: TOleContainer);
```

C++

```
__fastcall AddContainer(TOleContainer Instance);
```

Description

This is AddContainer, a member of class IVCLFrameForm.

47.2.1.2.2 IVCLFrameForm.ClearBorderSpace Method

Pascal

```
procedure ClearBorderSpace;
```

C++

```
__fastcall ClearBorderSpace();
```

Description

This is ClearBorderSpace, a member of class IVCLFrameForm.

47.2.1.2.3 IVCLFrameForm.Form Method

Pascal

```
function Form: TCustomForm;
```

C++

```
__fastcall TCustomForm Form();
```

Description

This is Form, a member of class IVCLFrameForm.

47.2.1.2.4 IVCLFrameForm.RemoveContainer Method

Pascal

```
procedure RemoveContainer(Instance: TOleContainer);
```

C++

```
__fastcall RemoveContainer(TOleContainer Instance);
```

Description

This is RemoveContainer, a member of class IVCLFrameForm.

47.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DestroyMetaPict (see page 2617)	Frees a metafile resource given its handle.

47.3.1 OleCtnrs.DestroyMetaPict Function

Frees a metafile resource given its handle.

Pascal

```
procedure DestroyMetaPict(MetaPict: HGlobal);
```

C++

```
DestroyMetaPict(HGlobal MetaPict);
```

File

OleCtnrs

Description

Call DestroyMetaPict to free a metafile obtained using the GetIconMetaPict method of TOleContainer (see page 2529).

You do not need to use DestroyMetaPict to free metafiles represented using TMetafile. These are freed automatically when the TMetafile instance is destroyed. However, if you assign a new value to the Handle property of TMetafile, thereby replacing its old metafile, you must free the old metafile by calling DestroyMetaPict.

See Also

TOleContainer (see page 2529)

TMetafile

47.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoActivate (see page 2618)	This is record OleCtnrs.TAutoActivate.
	TCreateType (see page 2619)	TCreateType is an enumerated type that defines values for TCreateInfo (see page 2618)'s CreateType field.
	TObjectState (see page 2620)	This is record OleCtnrs.TObjectState.
	TSizeMode (see page 2621)	This is record OleCtnrs.TSizeMode.

Records

	Name	Description
	TCreateInfo (see page 2618)	TCreateInfo is used by TOleContainer (see page 2529)'s CreateObjectFromInfo method.
	TVerbInfo (see page 2621)	This is record OleCtnrs.TVerbInfo.

47.4.1 OleCtnrs.TAutoActivate Enumeration

Pascal

```
TAutoActivate = (
  aaManual,
  aaGetFocus,
  aaDoubleClick
);
```

C++

```
enum TAutoActivate {
  aaManual,
  aaGetFocus,
  aaDoubleClick
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TAutoActivate.

47.4.2 OleCtnrs.TCreateInfo Record

TCreateInfo is used by TOleContainer (see page 2529)'s CreateObjectFromInfo method.

Pascal

```
TCreateInfo = record
  CreateType: TCreateType;
  ShowAsIcon: Boolean;
```

```
    IconMetaPict: HGlobal;
    ClassID: TCLSID;
    FileName: WideString;
    DataObject: IDataObject;
  end;
```

C++

```
  struct TCreateInfo {
    TCreateType CreateType;
    Boolean ShowAsIcon;
    HGlobal IconMetaPict;
    TCLSID ClassID;
    BSTR FileName;
    IDataObject DataObject;
  };
```

File

OleCtnrs

Description

TCreateInfo represents how TOleContainer (see page 2529)'s CreateObjectFromInfo method should instantiate an OLE object. TCreateInfo's fields are described in the following table:

Fields	Meaning
CreateType	Describes the source of the object. See TCreateType (see page 2619) for details.
ShowAsIcon	Indicates whether the object is shown as an icon (true) or displayed as it would be in the server application (false).
IconMetaPict	Specifies a global memory handle to a metafile picture (TMetaFilePict) to display in place of the OLE object's default icon. IconMetaPict is optional; When set to 0, the object's default icon is used (when ShowAsIcon is true).
ClassID	The class identifier of the OLE object to create. ClassID is only used when CreateType is ctNewObject. You can use the ProgIDToClassID function to get the class identifier for an OLE object's class name (or programmatic identifier).
FileName	The name of a file to link or embed as an OLE object. FileName is only used when CreateType is ctFromFile or ctLinkToFile.
DataObject	An OLE data transfer object. DataObject is only used when CreateType is ctFromData or ctLinkFromData.

See Also

TOleContainer (see page 2529)

47.4.3 OleCtnrs.TCreateType Enumeration

TCreateType is an enumerated type that defines values for TCreateInfo (see page 2618)'s CreateType field.

Pascal

```
  TCreateType = (
    ctNewObject,
    ctFromFile,
    ctLinkToFile,
    ctFromData,
    ctLinkFromData
  );
```

C++

```
enum TCreateType {
  ctNewObject,
  ctFromFile,
  ctLinkToFile,
  ctFromData,
  ctLinkFromData
};
```

File

OleCtnrs

Description

TCreateType defines the possible values for TCreateInfo (see page 2618)'s CreateType field, which is passed to TOleContainer (see page 2529)'s CreateObjectFromInfo method. It is defined as follows:

Values	Meaning
ctNewObject	Creates an embedded OLE object given its class identifier (TCreateInfo.ClassID)
ctFromFile	Creates an embedded OLE object from the contents of the given file (TCreateInfo.FileName).
ctLinkToFile	Creates a linked OLE object from the contents of the given file (TCreateInfo.FileName)
ctFromData	Creates an embedded OLE object from the given data transfer object (TCreateInfo.DataObject)
ctLinkFromData	Creates a linked OLE object from the given data transfer object (TCreateInfo.DataObject)

See Also

TOleContainer (see page 2529)

TCreateInfo (see page 2618)

47.4.4 OleCtnrs.TObjectState Enumeration

Pascal

```
TObjectState = (
  osEmpty,
  osLoaded,
  osRunning,
  osOpen,
  osInPlaceActive,
  osUIActive
);
```

C++

```
enum TObjectState {
  osEmpty,
  osLoaded,
  osRunning,
  osOpen,
  osInPlaceActive,
  osUIActive
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TObjectState.

47.4.5 OleCtnrs.TSizeMode Enumeration

Pascal

```
TSizeMode = (
  smClip,
  smCenter,
  smScale,
  smStretch,
  smAutoSize
);
```

C++

```
enum TSizeMode {
  smClip,
  smCenter,
  smScale,
  smStretch,
  smAutoSize
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TSizeMode.

47.4.6 OleCtnrs.TVerbInfo Record

Pascal

```
TVerbInfo = packed record
  Verb: Smallint;
  Flags: Word;
end;
```

C++

```
struct TVerbInfo {
  Smallint Verb;
  Word Flags;
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TVerbInfo.

47.5 Types

The following table lists types in this documentation.

Types

Name	Description
TObjectMoveEvent (see page 2622)	This is type OleCtnrs.TObjectMoveEvent.

47.5.1 OleCtnrs.TObjectMoveEvent Type

Pascal

```
TObjectMoveEvent = procedure (OleContainer: TOleContainer; const Bounds: TRect) of object;
```

C++

```
(OleContainer: TOleContainer; const Bounds: TRect) ( TObjectMoveEvent)();
```

File

OleCtnrs

Description

This is type OleCtnrs.TObjectMoveEvent.

47.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ovDiscardUndoState (see page 2623)	Specifies to discard the undo state.
ovHide (see page 2624)	Specifies to hide an OLE object.
ovInPlaceActivate (see page 2624)	Specifies the activation of an OLE object.
ovOpen (see page 2625)	Specifies the Open action of an OLE object.
ovPrimary (see page 2625)	Specifies the default action of an OLE object.
ovShow (see page 2626)	Specifies to show an OLE object.
ovUIActivate (see page 2627)	Specifies the activation of the UI(User Interface) of an OLE object.

47.6.1 OleCtnrs.ovDiscardUndoState Constant

Specifies to discard the undo state.

Pascal

```
ovDiscardUndoState = -6;
```

C++

```
ovDiscardUndoState = -6;
```

File

OleCtnrs

Description

ovDiscardUndoState is used as a default item of ObjectVerbs.

ovDiscardUndoState is principally used by the DoVerb method in order to discard the undo state of the OLE object.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovHide (see page 2624)

ovInPlaceActivate (see page 2624)

ovOpen (see page 2625)

ovPrimary (see page 2625)

ovShow (see page 2626)

ovUIActivate (see page 2627)

47.6.2 OleCtnrs.ovHide Constant

Specifies to hide an OLE object.

Pascal

```
ovHide = -3;
```

C++

```
ovHide = -3;
```

File

OleCtnrs

Description

ovHide is used as a default item of ObjectVerbs.

ovHide is principally used by the DoVerb method in order to hide the OLE object.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovShow (see page 2626)

ovInPlaceActivate (see page 2624)

ovOpen (see page 2625)

ovPrimary (see page 2625)

ovDiscardUndoState (see page 2623)

ovUIActivate (see page 2627)

47.6.3 OleCtnrs.ovInPlaceActivate Constant

Specifies the activation of an OLE object.

Pascal

```
ovInPlaceActivate = -5;
```

C++

```
ovInPlaceActivate = -5;
```

File

OleCtnrs

Description

ovInPlaceActivate is used as a default item of ObjectVerbs.

ovInPlaceActivate is principally used by the DoVerb method in order to activate the OLE object in place.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovShow (see page 2626)

ovHide (see page 2624)

ovOpen (see page 2625)

ovPrimary (see page 2625)

ovDiscardUndoState (see page 2623)

ovUIActivate (see page 2627)

47.6.4 OleCtnrs.ovOpen Constant

Specifies the Open action of an OLE object.

Pascal

```
ovOpen = -2;
```

C++

```
ovOpen = -2;
```

File

OleCtnrs

Description

ovOpen is used as a default item of ObjectVerbs.

ovOpen is principally used by the DoVerb method in order to open the application window that the OLE provider registered.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovShow (see page 2626)

ovHide (see page 2624)

ovInPlaceActivate (see page 2624)

ovPrimary (see page 2625)

ovDiscardUndoState (see page 2623)

ovUIActivate (see page 2627)

47.6.5 OleCtnrs.ovPrimary Constant

Specifies the default action of an OLE object.

Pascal

```
ovPrimary = -65536;
```

C++

```
ovPrimary = -65536;
```

File

OleCtnrs

Description

ovPrimary is used as a default item of ObjectVerbs.

ovPrimary is principally used by the DoVerb method in order to send a request for the default action, usually to activate the OLE object.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovShow (see page 2626)

ovHide (see page 2624)

ovInPlaceActivate (see page 2624)

ovOpen (see page 2625)

ovDiscardUndoState (see page 2623)

ovUIActivate (see page 2627)

47.6.6 OleCtnrs.ovShow Constant

Specifies to show an OLE object.

Pascal

```
ovShow = -1;
```

C++

```
ovShow = -1;
```

File

OleCtnrs

Description

ovShow is used as a default item of ObjectVerbs.

ovShow is principally used by the DoVerb method in order to show the OLE object.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovHide (see page 2624)

ovInPlaceActivate (see page 2624)

ovOpen (see page 2625)

ovPrimary (see page 2625)

ovDiscardUndoState (see page 2623)

ovUIActivate (see page 2627)

47.6.7 OleCtnrs.ovUIActivate Constant

Specifies the activation of the UI(User Interface) of an OLE object.

Pascal

```
ovUIActivate = -4;
```

C++

```
ovUIActivate = -4;
```

File

OleCtnrs

Description

ovUIActivate is used as a default item of ObjectVerbs.

ovUIActivate is principally used by the DoVerb method in order to activate the User Interface.

Note: If the OLE provider cannot process this request, an EOleSysError (Not Implemented) is thrown.

See Also

ovShow (see page 2626)

ovHide (see page 2624)

ovInPlaceActivate (see page 2624)

ovOpen (see page 2625)

ovDiscardUndoState (see page 2623)

ovPrimary (see page 2625)

48 OleCtrls Namespace

This is namespace OleCtrls.

Topics

Name	Description
Classes (see page 2631)	The following table lists classes in this documentation.
Functions (see page 2699)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2701)	The following table lists structs, records, enums in this documentation.
Types (see page 2704)	The following table lists types in this documentation.

Classes

	Name	Description
	EOleCtrlError (see page 2631)	EOleCtrlError is the exception class for ActiveX controls.
	TEnumPropDesc (see page 2631)	TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.
	TEventDispatch (see page 2634)	This is class OleCtrls.TEventDispatch.
	TOleControl (see page 2638)	TOleControl is the base class from which ActiveX controls are derived.

Functions

	Name	Description
	EmptyParam (see page 2699)	This is function OleCtrls.EmptyParam.
	FontToOleFont (see page 2699)	Returns a Variant containing an IFontDispatch interface that represents a TFont object.
	OleFontToFont (see page 2700)	Fills in a TFont structure to represent an IFontDispatch.

Structs, Records, Enums

	Name	Description
	TControlData (see page 2701)	This is record OleCtrls.TControlData.
	TControlData2 (see page 2702)	This is record OleCtrls.TControlData2.
	TEnumValue (see page 2702)	This is record OleCtrls.TEnumValue.

Types

Name	Description
PControlData (see page 2704)	This is type OleCtrls.PControlData.
PControlData2 (see page 2704)	This is type OleCtrls.PControlData2.
PEnumValueList (see page 2705)	This is type OleCtrls.PEnumValueList.
TEnumValueList (see page 2705)	This is type OleCtrls.TEnumValueList.

TOleEnum (see page 2705)	Represents enumerated types that must be sent over a COM interface.
TServiceQuery (see page 2706)	This is type OleCtrls.TServiceQuery.

48.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOleCtrlError (see page 2631)	EOleCtrlError is the exception class for ActiveX controls.
	TEnumPropDesc (see page 2631)	TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.
	TEventDispatch (see page 2634)	This is class OleCtrls.TEventDispatch.
	TOleControl (see page 2638)	TOleControl is the base class from which ActiveX controls are derived.

48.1.1 EOleCtrlError Class

EOleCtrlError is the exception class for ActiveX controls.

Class Hierarchy

Pascal

```
EOleCtrlError = class(Exception);
```

C++

```
class EOleCtrlError : public Exception;
```

File

OleCtrls

Description

EOleCtrlError is raised when an application cannot link to an ActiveX control.

See Also

EOleError

48.1.2 TEnumPropDesc Class

TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.

Class Hierarchy

Pascal

```
TEnumPropDesc = class;
```

C++

```
class TEnumPropDesc;
```

File

OleCtrls

Description

Use TEnumPropDesc to interpret the strings used by an OLE control object to represent the values of one of its properties. TEnumPropDesc can provide a list of possible value strings to a callback function, or map between the string names of property values and the values themselves. TEnumPropDesc objects are made available through the GetEnumPropDesc method of an OLE control object.

See Also

TOleControl (see page 2638)

48.1.2.1 TEnumPropDesc Members

The following tables list the members exposed by TEnumPropDesc.

Public Methods

	Name	Description
	Create (see page 2632)	Creates an instance of TEnumPropDesc (see page 2631).
	Destroy (see page 2633)	Destroys an instance of TEnumPropDesc (see page 2631).
	GetStrings (see page 2633)	Calls the callback Proc for each property value string.
	StringToValue (see page 2634)	Maps a string representation of the property value to the integer value.
	ValueToString (see page 2634)	Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

48.1.2.2 TEnumPropDesc.Create Constructor

Creates an instance of TEnumPropDesc (see page 2631).

Pascal

```
constructor Create(DispID: Integer; ValueCount: Integer; const TypeInfo: ITypeInfo);
```

C++

```
__fastcall TEnumPropDesc(int DispID, int ValueCount, const ITypeInfo TypeInfo);
```

Description

Create is called by an OLE control object to create an instance of TEnumPropDesc (see page 2631) to represent the values of one of its properties. Applications should not need to create instances of TEnumPropDesc (see page 2631). When working with OLE properties, get the TEnumPropDesc (see page 2631) objects from the OLE control object.

DispID identifies the property of the OLE object, ValueCount is the number of distinct values the property can take TypeInfo is an ITypeInfo object that the constructor can use to capture the values and their strings.

See Also

GetEnumPropDesc (see page 2656)

48.1.2.3 TEnumPropDesc.Destroy Destructor

Destroys an instance of TEnumPropDesc (see page 2631).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TEnumPropDesc();
```

Description

Do not call Destroy directly in an application. The TOleControl (see page 2638) object that owns the TEnumPropDesc (see page 2631) object will destroy it automatically.

Destroy frees the internal list used to map value strings to property values.

See Also

TOleControl (see page 2638)

System::TObject::Free

48.1.2.4 TEnumPropDesc Methods

The methods of the TEnumPropDesc class are listed here.

Public Methods

	Name	Description
	GetStrings (see page 2633)	Calls the callback Proc for each property value string.
	StringToValue (see page 2634)	Maps a string representation of the property value to the integer value.
	ValueToString (see page 2634)	Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

48.1.2.4.1 TEnumPropDesc.GetStrings Method

Calls the callback Proc for each property value string.

Pascal

```
procedure GetStrings(Proc: TGetStrProc);
```

C++

```
__fastcall GetStrings(TGetStrProc Proc);
```

Description

Use GetStrings to execute code for every property value string represented in the TEnumPropDesc (see page 2631) object. The callback Proc is called for every value, with the S parameter set to a string that gives the integer value followed by the string representation of that value.

For example, consider a TEnumPropDesc (see page 2631) object that represents a color property, with values equal to TColor values. The callback Proc would be called for every built-in color name with strings of the form '255 - clRed'.

See Also

StringToValue (see page 2634)

ValueToString (see page 2634)

48.1.2.4.2 TEnumPropDesc.StringToValue Method

Maps a string representation of the property value to the integer value.

Pascal

```
function StringToValue(const S: string): Integer;
```

C++

```
__fastcall int StringToValue(const UnicodeString S);
```

Description

Use StringToValue to map the string representation of a property value used by an OLE control object to an integer value that is a more accurate representation of the property value. If the property value is not an integer, the integer associated with the string can be a pointer to the value.

See Also

ValueToString (see page 2634)

48.1.2.4.3 TEnumPropDesc.ValueToString Method

Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

Pascal

```
function ValueToString(V: Integer): string;
```

C++

```
__fastcall UnicodeString ValueToString(int V);
```

Description

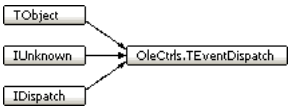
Use ValueToString to map the integer value of a property value to the string representation used by an OLE control object. If the property value is not an integer, the integer associated with the string can be a pointer to the value.

See Also

StringToValue (see page 2634)

48.1.3 TEventDispatch Class

Class Hierarchy



Pascal

```
TEventDispatch = class(TObject, IUnknown, IDispatch);
```

C++

```
class TEventDispatch : public TObject, public IUnknown, public IDispatch;
```

File

OleCtrls

Description

This is class OleCtrls.TEventDispatch.

48.1.3.1 TEventDispatch Members

The following tables list the members exposed by TEventDispatch.

Protected Methods

	Name	Description
	_AddRef (see page 2636)	This is _AddRef, a member of class TEventDispatch.
	_Release (see page 2636)	This is _Release, a member of class TEventDispatch.
	GetIDsOfNames (see page 2636)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 2636)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2637)	GetTypeInfoCount returns the count of type information interfaces.
V	Invoke (see page 2637)	Invoke performs a call to a late-binded property or method.
	QueryInterface (see page 2638)	This is QueryInterface, a member of class TEventDispatch.

Protected Properties

	Name	Description
R	Control (see page 2638)	This is Control, a member of class TEventDispatch.

Public Methods

	Name	Description
	Create (see page 2635)	This is Create, a member of class TEventDispatch.

48.1.3.2 TEventDispatch.Create Constructor

Pascal

```
constructor Create(Control: TOleControl);
```

C++

```
__fastcall TEventDispatch(TOleControl Control);
```

Description

This is Create, a member of class TEventDispatch.

48.1.3.3 TEventDispatch Methods

The methods of the TEventDispatch class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2636)	This is _AddRef, a member of class TEventDispatch.
	_Release (see page 2636)	This is _Release, a member of class TEventDispatch.
	GetIDsOfNames (see page 2636)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 2636)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2637)	GetTypeInfoCount returns the count of type information interfaces.
V	Invoke (see page 2637)	Invoke performs a call to a late-binded property or method.

	QueryInterface (see page 2638)	This is QueryInterface, a member of class TEventDispatch.

48.1.3.3.1 TEventDispatch._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TEventDispatch.

48.1.3.3.2 TEventDispatch._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TEventDispatch.

48.1.3.3.3 TEventDispatch.GetIDsOfNames Method

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name. GetIDsOfNames is used primarily to obtain dispatch identifiers for the late-binded methods exposed by the COM object through the IDispatch interface.

See Also

GetTypeInfoCount

GetTypeInfo

Invoke

48.1.3.3.4 TEventDispatch.GetTypeInfo Method

GetTypeInfo returns the object's type information.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo returns the type information for a specified index. The index is previously obtained by a call to the GetTypeInfoCount method. If the method returns S_OK, the `TypeInfo` parameter is set to point to the requested type information; otherwise an error code is returned.

See Also

GetTypeInfoCount

GetIDsOfNames

Invoke

48.1.3.3.5 TEventDispatch.GetTypeInfoCount Method

GetTypeInfoCount returns the count of type information interfaces.

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount returns the count of type information interfaces supported by the implementing COM object. If the method returns S_OK, the `Count` parameter is set to the number of type information interfaces, which is either 1 (if the object supports type information) or 0 (if the object does not support type information). A return value of E_NOTIMPL means that the method is not implemented in the COM object.

See Also

GetTypeInfo

GetIDsOfNames

Invoke

48.1.3.3.6 TEventDispatch.Invoke Method

Invoke performs a call to a late-binded property or method.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word
Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke actually calls a method or a property exposed by the COM object through IDispatch. Invoke requires a previously obtained dispatch identifier. The identifier uniquely identifies a method, a property, and a list of parameters to be passed to the called method and exception information. The dispatch identifier of a method or property (also known as **dispid**) can be obtained by a calling the GetIDsOfNames method.

See Also

GetTypeInfoCount

GetTypeInfo

GetIDsOfNames

48.1.3.3.7 TEventDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TEventDispatch.

48.1.3.4 TEventDispatch Properties

The properties of the TEventDispatch class are listed here.

Protected Properties

	Name	Description
	Control (see page 2638)	This is Control, a member of class TEventDispatch.

48.1.3.4.1 TEventDispatch.Control Property

Pascal

```
property Control: TOleControl;
```

C++

```
__property TOleControl Control;
```

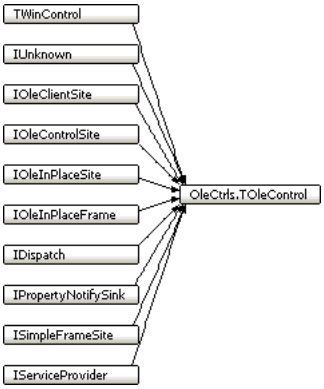
Description

This is Control, a member of class TEventDispatch.

48.1.4 TOleControl Class

TOleControl is the base class from which ActiveX controls are derived.

Class Hierarchy



Pascal

```
TOleControl = class(TWinControl, IUnknown, IOleClientSite, IOleControlSite, IOleInPlaceSite,
IOleInPlaceFrame, IDispatch, IPropertyNotifySink, ISimpleFrameSite, IServiceProvider);
```

C++

```
class TOleControl : public TWinControl, public IUnknown, public IOleClientSite, public
IOleControlSite, public IOleInPlaceSite, public IOleInPlaceFrame, public IDispatch, public
IPropertyNotifySink, public ISimpleFrameSite, public IServiceProvider;
```

File

OleCtrls

Description

TOleControl is derived from TWinControl and handles the interactions with COM necessary for using ActiveX controls. Most application do not need to explicitly derive a component from this class.

TOleContainer (see page 2529)

Code Generated When You Import Type Library Information

Using Component Wrappers

48.1.4.1 TOleControl Members

The following tables list the members exposed by TOleControl.

Protected Methods

	Name	Description
	_AddRef (see page 2646)	Called when an application uses a component interface.
	_Release (see page 2647)	Called when an application releases a component interface.
	_SetColorProp (see page 2647)	Sets a property of an ActiveX control to the specified color.
	_SetTColorProp (see page 2648)	Sets a property of an ActiveX control to the specified color.
	_SetTFontProp (see page 2648)	Sets a property of an ActiveX control to the specified font.
	_SetTOleEnumProp (see page 2649)	Sets a property of an ActiveX control to the specified enumeration value.
	_SetTPictureProp (see page 2649)	Sets a property of an ActiveX control to the specified picture object.
	CanInPlaceActivate (see page 2650)	Checks whether the ActiveX control supports in-place activation.
	ContextSensitiveHelp (see page 2650)	Checks whether the ActiveX control supports context-sensitive help.

	CreateWnd (see page 2651)	Creates the underlying window.
	DeactivateAndUndo (see page 2651)	Deactivates the in-place session and reverts the changes.
	DefineProperties (see page 2652)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DestroyWindowHandle (see page 2652)	Destroys the window created in the CreateWindowHandle method.
	DiscardUndoState (see page 2653)	Discards the undo queue for the ActiveX control.
	EnableModeless (see page 2653)	Enables or disables the modeless dialogs of the ActiveX control.
	GetBorder (see page 2654)	Returns the rectangle in which the ActiveX control can draw toolbars.
	GetByteProp (see page 2654)	Reads a property of an ActiveX control. The property is expected to be of type `Byte`.
	GetColorProp (see page 2655)	Reads a property of an ActiveX control. The property is expected to be of type TColor.
	GetCompProp (see page 2655)	Reads a property of an ActiveX control. The property is expected to be of type `TColor`.
	GetContainer (see page 2655)	Returns a pointer to an `IOleClientSite` OLE interface.
	GetCurrencyProp (see page 2656)	Reads a property of an ActiveX control. The property is expected to be of type `Currency`.
	GetDoubleProp (see page 2656)	Reads a property of an ActiveX control. The property is expected to be of type `Double`.
	GetExtendedControl (see page 2657)	This is GetExtendedControl, a member of class TOleControl.
	GetIDispatchProp (see page 2657)	Reads a property of an ActiveX control. The property is expected to be of type IDispatch.
	GetIDsOfNames (see page 2658)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIntegerProp (see page 2658)	Reads a property of an ActiveX control. The property is expected to be of type `Integer`.
	GetIUnknownProp (see page 2658)	Reads a property of an ActiveX control. The property is expected to be of type IUnknown.
	GetMoniker (see page 2659)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 2659)	Reads a property of an ActiveX control. The property is expected to be of type `TOleBool`.
	GetOleDateProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `TOleDate`.
	GetOleEnumProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum` (see page 2705).
	GetOleVariantProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `OleVariant`.
	GetProperty (see page 2661)	Reads a property of an ActiveX control.
	GetShortIntProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `ShortInt`.
	GetSingleProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `Single`.
	GetSmallintProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `Smallint`.
	GetStringProp (see page 2663)	Reads a property of an ActiveX control. The property is expected to be of type `String`.
	GetTColorProp (see page 2663)	Reads a property of an ActiveX control. The property is expected to be of type TColor.
	GetTDateTimeProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type TDateTime.
	GetTFontProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type TFont.
	GetTOleEnumProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum` (see page 2705).
	GetTPictureProp (see page 2665)	Reads a property of an ActiveX control. The property is expected to be of type TPicture.
	GetTypeInfo (see page 2665)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2665)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 2666)	Reads a property of an ActiveX control.
	GetWideStringProp (see page 2666)	Reads a property of an ActiveX control. The property is expected to be of type `WideString`.

	GetWindowContext (see page 2667)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 2667)	Reads a property of an ActiveX control. The property is expected to be of type `WordBool`.
	GetWordProp (see page 2667)	Reads a property of an ActiveX control. The property is expected to be of type `Word`.
A	InitControlData (see page 2668)	This is InitControlData, a member of class TOleControl.
V	InitControlInterface (see page 2668)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 2668)	This is InsertMenus, a member of class TOleControl.
	Invoke (see page 2668)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 2669)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 2669)	This is InvokeMethod, a member of class TOleControl.
	LockInPlaceActive (see page 2670)	This is LockInPlaceActive, a member of class TOleControl.
	OleControlSite_TranslateAccelerator (see page 2670)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 2670)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 2670)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 2671)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 2671)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 2671)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 2671)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 2672)	This is OnInPlaceActivate, a member of class TOleControl.
	OnInPlaceDeactivate (see page 2672)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 2672)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 2672)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 2672)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 2673)	This is OnUIActivate, a member of class TOleControl.
	OnUIDeactivate (see page 2673)	This is OnUIDeactivate, a member of class TOleControl.
V	PaletteChanged (see page 2673)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PictureChanged (see page 2674)	This is PictureChanged, a member of class TOleControl.
	PostMessageFilter (see page 2674)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 2674)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 2675)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 2675)	This is QueryService, a member of class TOleControl.
	RemoveMenus (see page 2675)	This is RemoveMenus, a member of class TOleControl.
	RequestBorderSpace (see page 2675)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 2676)	This is RequestNewObjectLayout, a member of class TOleControl.
	SaveObject (see page 2676)	Saves the object to persistent storage.
	Scroll (see page 2676)	Scrolls the view by the indicated amount of pixels.
	SetActiveObject (see page 2677)	This is SetActiveObject, a member of class TOleControl.
	SetBorderSpace (see page 2677)	Allocates border space for the ActiveX control.
	SetByteProp (see page 2677)	Sets a property of an ActiveX control to the specified value of type `Byte`.
	SetColorProp (see page 2678)	Sets a property of an ActiveX control to the specified color.
	SetCompProp (see page 2678)	Sets a property of an ActiveX control to the specified value of type `Comp`.
	SetCurrencyProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type `Currency`.
	SetDoubleProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type `Double`.
	SetIDispatchProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type IDispatch.
	SetIntegerProp (see page 2680)	Sets a property of an ActiveX control to the specified value of type `Integer`.
	SetIUnknownProp (see page 2680)	Sets a property of an ActiveX control to the specified value of type IUnknown.
	SetMenu (see page 2680)	Attaches a menu to the in-place activated ActiveX object.
V	SetName (see page 2681)	Sets the name of the control.
	SetOleBoolProp (see page 2681)	Sets a property of an ActiveX control to the specified value of type `TOleBool`.
	SetOleDateProp (see page 2681)	Sets a property of an ActiveX control to the specified value of type `TOleDate`.
	SetOleEnumProp (see page 2682)	Sets a property of an ActiveX control to the specified value of type TOleEnum (see page 2705).
	SetOleVariantProp (see page 2682)	Sets a property of an ActiveX control to the specified value of type `OleVariant`.

	SetParent (see page 2682)	Sets the parent of the control.
	SetProperty (see page 2683)	Sets a property of an ActiveX control to the specified value.
	SetShortIntProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `ShortInt`.
	SetSingleProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `Single`.
	SetSmallintProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `Smallint`.
	SetStatusText (see page 2685)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 2685)	Sets a property of an ActiveX control to the specified value of type `String`.
	SetTColorProp (see page 2685)	Sets a property of an ActiveX control to the specified color.
	SetTDateTimeProp (see page 2686)	Sets a property of an ActiveX control to the specified value of type TDateTime.
	SetTFontProp (see page 2686)	Sets a property of an ActiveX control to the specified font.
	SetTOleEnumProp (see page 2686)	Sets a property of an ActiveX control to the specified enumeration value.
	SetTPictureProp (see page 2687)	Sets a property of an ActiveX control to the specified picture object.
	SetVariantProp (see page 2687)	Sets a property of an ActiveX control to the specified value.
	SetWideStringProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `WideString`.
	SetWordBoolProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `WordBool`.
	SetWordProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `Word`.
	ShowObject (see page 2689)	Makes the enclosed object visible.
	ShowPropertyFrame (see page 2689)	Specifies whether the TOleControl (see page 2638) shows a property sheet.
	StandardEvent (see page 2690)	This is StandardEvent, a member of class TOleControl.
	SuppressException (see page 2690)	SuppressException suppresses OLE exceptions at design time.
	TransformCoords (see page 2690)	Translates a set of coordinates.
	WndProc (see page 2691)	Provides specific message responses for the control.

Protected Properties

	Name	Description
	ControlData (see page 2696)	Specifies the PControlData (see page 2704) associated with TOleControl (see page 2638).

Public Events

	Name	Description
	ServiceQuery (see page 2698)	Specifies the TServiceQuery (see page 2706) associated with this ActiveX control.

Public Methods

	Name	Description
	BrowseProperties (see page 2649)	Notifies the ActiveX control to display its Properties dialog box.
	Create (see page 2643)	Creates a new instance of TOleControl (see page 2638).
	DefaultHandler (see page 2651)	Handles all otherwise-unhandled messages.
	Destroy (see page 2643)	Frees the memory associated with this instance of TOleControl (see page 2638).
	DoObjectVerb (see page 2653)	Notifies the ActiveX control to perform one of its actions.
	GetEnumPropDesc (see page 2656)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 2657)	Retrieves the Help context of a member of the ActiveX control.
	GetObjectVerbs (see page 2659)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetPropDisplayString (see page 2661)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 2661)	Returns the display strings for an interface for the ActiveX control.
	IsCustomProperty (see page 2669)	Indicates whether an interface for the ActiveX control is a custom property.
	IsPropPageProperty (see page 2669)	Indicates whether an interface for the OCX control is a property page property.
	SetBounds (see page 2677)	Sets the boundaries of the ActiveX control.
	SetPropDisplayString (see page 2683)	Sets the display string for an interface for the ActiveX control.
	ShowAboutBox (see page 2689)	Notifies the ActiveX control to display its About box.

Public Properties

	Name	Description
	Anchors (see page 2695)	Specifies how the control is anchored to its parent.
	DefaultDispatch (see page 2696)	The default dispatch interface.

	OleObject (see page 2697)	The ActiveX control associated with the TOleControl (see page 2638) object.
	PerPropBrowsing (see page 2697)	Provides access to information about the property page properties of the OleControl.
	TabStop (see page 2697)	Determines if the user can tab to a control.

48.1.4.2 TOleControl.Create Constructor

Creates a new instance of TOleControl (see page 2638).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleControl(TComponent * AOwner);
```

Description

Use Create to create a new instance of the TOleControl (see page 2638) object. Create calls the inherited Create method and creates and initializes internal objects.

See Also

Destroy (see page 2643)

Create

48.1.4.3 TOleControl.Destroy Destructor

Frees the memory associated with this instance of TOleControl (see page 2638).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleControl();
```

Description

Do not call Destroy. Instead, call Free, which calls Destroy if this instance of TOleControl (see page 2638) is not nil.

See Also

Create (see page 2643)

System::TObject::Free

48.1.4.4 TOleControl Methods

The methods of the TOleControl class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2646)	Called when an application uses a component interface.
	_Release (see page 2647)	Called when an application releases a component interface.
	_SetColorProp (see page 2647)	Sets a property of an ActiveX control to the specified color.
	_SetTColorProp (see page 2648)	Sets a property of an ActiveX control to the specified color.

	_SetTFontProp (see page 2648)	Sets a property of an ActiveX control to the specified font.
	_SetTOleEnumProp (see page 2649)	Sets a property of an ActiveX control to the specified enumeration value.
	_SetTPictureProp (see page 2649)	Sets a property of an ActiveX control to the specified picture object.
	CanInPlaceActivate (see page 2650)	Checks whether the ActiveX control supports in-place activation.
	ContextSensitiveHelp (see page 2650)	Checks whether the ActiveX control supports context-sensitive help.
V	CreateWnd (see page 2651)	Creates the underlying window.
	DeactivateAndUndo (see page 2651)	Deactivates the in-place session and reverts the changes.
V	DefineProperties (see page 2652)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DestroyWindowHandle (see page 2652)	Destroys the window created in the CreateWindowHandle method.
	DiscardUndoState (see page 2653)	Discards the undo queue for the ActiveX control.
	EnableModeless (see page 2653)	Enables or disables the modeless dialogs of the ActiveX control.
	GetBorder (see page 2654)	Returns the rectangle in which the ActiveX control can draw toolbars.
	GetByteProp (see page 2654)	Reads a property of an ActiveX control. The property is expected to be of type `Byte`.
	GetColorProp (see page 2655)	Reads a property of an ActiveX control. The property is expected to be of type TColor.
	GetCompProp (see page 2655)	Reads a property of an ActiveX control. The property is expected to be of type `TColor`.
	GetContainer (see page 2655)	Returns a pointer to an `IOleClientSite` OLE interface.
	GetCurrencyProp (see page 2656)	Reads a property of an ActiveX control. The property is expected to be of type `Currency`.
	GetDoubleProp (see page 2656)	Reads a property of an ActiveX control. The property is expected to be of type `Double`.
	GetExtendedControl (see page 2657)	This is GetExtendedControl, a member of class TOleControl.
	GetIDispatchProp (see page 2657)	Reads a property of an ActiveX control. The property is expected to be of type IDispatch.
	GetIDsOfNames (see page 2658)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIntegerProp (see page 2658)	Reads a property of an ActiveX control. The property is expected to be of type `Integer`.
	GetIUnknownProp (see page 2658)	Reads a property of an ActiveX control. The property is expected to be of type IUnknown.
	GetMoniker (see page 2659)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 2659)	Reads a property of an ActiveX control. The property is expected to be of type `TOleBool`.
	GetOleDateProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `TOleDate`.
	GetOleEnumProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum` (see page 2705).
	GetOleVariantProp (see page 2660)	Reads a property of an ActiveX control. The property is expected to be of type `OleVariant`.
	GetProperty (see page 2661)	Reads a property of an ActiveX control.
	GetShortIntProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `ShortInt`.
	GetSingleProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `Single`.
	GetSmallintProp (see page 2662)	Reads a property of an ActiveX control. The property is expected to be of type `Smallint`.
	GetStringProp (see page 2663)	Reads a property of an ActiveX control. The property is expected to be of type `String`.
	GetTColorProp (see page 2663)	Reads a property of an ActiveX control. The property is expected to be of type TColor.
	GetTDateTimeProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type TDateTime.
	GetTFontProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type TFont.
	GetTOleEnumProp (see page 2664)	Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum` (see page 2705).
	GetTPictureProp (see page 2665)	Reads a property of an ActiveX control. The property is expected to be of type TPicture.

	GetTypeInfo (see page 2665)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2665)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 2666)	Reads a property of an ActiveX control.
	GetWideStringProp (see page 2666)	Reads a property of an ActiveX control. The property is expected to be of type `WideString`.
	GetWindowContext (see page 2667)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 2667)	Reads a property of an ActiveX control. The property is expected to be of type `WordBool`.
	GetWordProp (see page 2667)	Reads a property of an ActiveX control. The property is expected to be of type `Word`.
A	InitControlData (see page 2668)	This is InitControlData, a member of class TOleControl.
V	InitControlInterface (see page 2668)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 2668)	This is InsertMenus, a member of class TOleControl.
	Invoke (see page 2668)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 2669)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 2669)	This is InvokeMethod, a member of class TOleControl.
	LockInPlaceActive (see page 2670)	This is LockInPlaceActive, a member of class TOleControl.
	OleControlSite_TranslateAccelerator (see page 2670)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 2670)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 2670)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 2671)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 2671)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 2671)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 2671)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 2672)	This is OnInPlaceActivate, a member of class TOleControl.
	OnInPlaceDeactivate (see page 2672)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 2672)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 2672)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 2672)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 2673)	This is OnUIActivate, a member of class TOleControl.
	OnUIDeactivate (see page 2673)	This is OnUIDeactivate, a member of class TOleControl.
V	PaletteChanged (see page 2673)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PictureChanged (see page 2674)	This is PictureChanged, a member of class TOleControl.
	PostMessageFilter (see page 2674)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 2674)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 2675)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 2675)	This is QueryService, a member of class TOleControl.
	RemoveMenus (see page 2675)	This is RemoveMenus, a member of class TOleControl.
	RequestBorderSpace (see page 2675)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 2676)	This is RequestNewObjectLayout, a member of class TOleControl.
	SaveObject (see page 2676)	Saves the object to persistent storage.
	Scroll (see page 2676)	Scrolls the view by the indicated amount of pixels.
	SetActiveObject (see page 2677)	This is SetActiveObject, a member of class TOleControl.
	SetBorderSpace (see page 2677)	Allocates border space for the ActiveX control.
	SetByteProp (see page 2677)	Sets a property of an ActiveX control to the specified value of type `Byte`.
	SetColorProp (see page 2678)	Sets a property of an ActiveX control to the specified color.
	SetCompProp (see page 2678)	Sets a property of an ActiveX control to the specified value of type `Comp`.
	SetCurrencyProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type `Currency`.
	SetDoubleProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type `Double`.
	SetIDispatchProp (see page 2679)	Sets a property of an ActiveX control to the specified value of type IDispatch.
	SetIntegerProp (see page 2680)	Sets a property of an ActiveX control to the specified value of type `Integer`.
	SetIUnknownProp (see page 2680)	Sets a property of an ActiveX control to the specified value of type IUnknown.
	SetMenu (see page 2680)	Attaches a menu to the in-place activated ActiveX object.

	SetName (see page 2681)	Sets the name of the control.
	SetOleBoolProp (see page 2681)	Sets a property of an ActiveX control to the specified value of type `TOleBool`.
	SetOleDateProp (see page 2681)	Sets a property of an ActiveX control to the specified value of type `TOleDate`.
	SetOleEnumProp (see page 2682)	Sets a property of an ActiveX control to the specified value of type TOleEnum (see page 2705).
	SetOleVariantProp (see page 2682)	Sets a property of an ActiveX control to the specified value of type `OleVariant`.
	SetParent (see page 2682)	Sets the parent of the control.
	SetProperty (see page 2683)	Sets a property of an ActiveX control to the specified value.
	SetShortIntProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `ShortInt`.
	SetSingleProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `Single`.
	SetSmallintProp (see page 2684)	Sets a property of an ActiveX control to the specified value of type `Smallint`.
	SetStatusText (see page 2685)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 2685)	Sets a property of an ActiveX control to the specified value of type `String`.
	SetTColorProp (see page 2685)	Sets a property of an ActiveX control to the specified color.
	SetTDateTimeProp (see page 2686)	Sets a property of an ActiveX control to the specified value of type TDateTime.
	SetTFontProp (see page 2686)	Sets a property of an ActiveX control to the specified font.
	SetTOleEnumProp (see page 2686)	Sets a property of an ActiveX control to the specified enumeration value.
	SetTPictureProp (see page 2687)	Sets a property of an ActiveX control to the specified picture object.
	SetVariantProp (see page 2687)	Sets a property of an ActiveX control to the specified value.
	SetWideStringProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `WideString`.
	SetWordBoolProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `WordBool`.
	SetWordProp (see page 2688)	Sets a property of an ActiveX control to the specified value of type `Word`.
	ShowObject (see page 2689)	Makes the enclosed object visible.
	ShowPropertyFrame (see page 2689)	Specifies whether the TOleControl (see page 2638) shows a property sheet.
	StandardEvent (see page 2690)	This is StandardEvent, a member of class TOleControl.
	SuppressException (see page 2690)	SuppressException suppresses OLE exceptions at design time.
	TransformCoords (see page 2690)	Translates a set of coordinates.
	WndProc (see page 2691)	Provides specific message responses for the control.

Public Methods

	Name	Description
	BrowseProperties (see page 2649)	Notifies the ActiveX control to display its Properties dialog box.
	DefaultHandler (see page 2651)	Handles all otherwise-unhandled messages.
	DoObjectVerb (see page 2653)	Notifies the ActiveX control to perform one of its actions.
	GetEnumPropDesc (see page 2656)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 2657)	Retrieves the Help context of a member of the ActiveX control.
	GetObjectVerbs (see page 2659)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetPropDisplayString (see page 2661)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 2661)	Returns the display strings for an interface for the ActiveX control.
	IsCustomProperty (see page 2669)	Indicates whether an interface for the ActiveX control is a custom property.
	IsPropPageProperty (see page 2669)	Indicates whether an interface for the OCX control is a property page property.
	SetBounds (see page 2677)	Sets the boundaries of the ActiveX control.
	SetPropDisplayString (see page 2683)	Sets the display string for an interface for the ActiveX control.
	ShowAboutBox (see page 2689)	Notifies the ActiveX control to display its About box.

48.1.4.4.1 TOleControl._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

QueryInterface

_Release

_AddRef

48.1.4.4.2 TOleControl._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

QueryInterface

_AddRef

48.1.4.4.3 TOleControl._SetColorProp Method

Sets a property of an ActiveX control to the specified color.

Pascal

```
procedure _SetColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall _SetColorProp(int Index, TColor Value);
```

Description

Use _SetColorProp to set a property of an ActiveX control to the specified color. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set color.

Note: _SetColorProp simply calls the SetColorProp (see page 2678) method.

See Also

SetColorProp (see page 2678)

_SetTColorProp (see page 2648)

SetTColorProp (see page 2685)

48.1.4.4.4 TOleControl._SetTColorProp Method

Sets a property of an ActiveX control to the specified color.

Pascal

```
procedure _SetTColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall _SetTColorProp(int Index, TColor Value);
```

Description

Use _SetTColorProp to set a property of an ActiveX control to the specified color. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set color.

Note: _SetTColorProp simply calls the SetTColorProp (see page 2685) method.

See Also

SetTColorProp (see page 2685)

_SetColorProp (see page 2647)

SetColorProp (see page 2678)

48.1.4.4.5 TOleControl._SetTFontProp Method

Sets a property of an ActiveX control to the specified font.

Pascal

```
procedure _SetTFontProp(Index: Integer; Value: TFont);
```

C++

```
__fastcall _SetTFontProp(int Index, TFont Value);
```

Description

Use _SetTFontProp to set a property of an ActiveX control to the specified font. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set font.

Note: _SetTFontProp simply calls the SetTFontProp (see page 2686) method.

See Also

SetTFontProp (see page 2686)

SetTColorProp (see page 2685)

SetTPictureProp (see page 2687)

SetTOleEnumProp (see page 2686)

48.1.4.4.6 TOleControl._SetTOleEnumProp Method

Sets a property of an ActiveX control to the specified enumeration value.

Pascal

```
procedure _SetTOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall _SetTOleEnumProp(int Index, TOleEnum Value);
```

Description

Use _SetTOleEnumProp to set a property of an ActiveX control to the specified enumeration value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set enumeration value.

Note: _SetTOleEnumProp simply calls the SetTOleEnumProp (see page 2686) method.

See Also

SetTOleEnumProp (see page 2686)

SetTFontProp (see page 2686)

SetTColorProp (see page 2685)

SetTPictureProp (see page 2687)

48.1.4.4.7 TOleControl._SetTPictureProp Method

Sets a property of an ActiveX control to the specified picture object.

Pascal

```
procedure _SetTPictureProp(Index: Integer; Value: TPicture);
```

C++

```
__fastcall _SetTPictureProp(int Index, TPicture Value);
```

Description

Use _SetTPictureProp to set a property of an ActiveX control to the specified picture object. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set picture object.

Note: _SetTPictureProp simply calls the SetTPictureProp (see page 2687) method.

See Also

SetTPictureProp (see page 2687)

SetTColorProp (see page 2685)

SetTFontProp (see page 2686)

SetTOleEnumProp (see page 2686)

48.1.4.4.8 TOleControl.BrowseProperties Method

Notifies the ActiveX control to display its Properties dialog box.

Pascal

```
procedure BrowseProperties;
```

C++

```
__fastcall BrowseProperties();
```

Description

Use BrowseProperties to notify the ActiveX control to display its Properties dialog box. The Properties dialog box contains property pages for the ActiveX control.

48.1.4.4.9 TOleControl.CanInPlaceActivate Method

Checks whether the ActiveX control supports in-place activation.

Pascal

```
function CanInPlaceActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CanInPlaceActivate();
```

Description

Call CanInPlaceActivate to determine whether the ActiveX control can be activated in-place. The container of the ActiveX control automatically calls the method when the container must activate the ActiveX control in-place.

Note: As implemented in TOleControl (see page 2638), CanInPlaceActivate always returns S_OK, which means that the ActiveX control can always be activated in-place.

See Also

OnInPlaceActivate (see page 2672)

OnInPlaceDeactivate (see page 2672)

OnUIActivate (see page 2673)

OnUIDeactivate (see page 2673)

48.1.4.4.10 TOleControl.ContextSensitiveHelp Method

Checks whether the ActiveX control supports context-sensitive help.

Pascal

```
function ContextSensitiveHelp(fEnterMode: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ContextSensitiveHelp(BOOL fEnterMode);
```

Description

Call ContextSensitiveHelp to determine whether the ActiveX control supports context-sensitive help when in-place mode is activated. This method is called automatically when the in-place mode is activated by the container of the ActiveX control.

Note: As implemented in TOleControl (see page 2638), ContextSensitiveHelp always returns S_OK, which means that the context-sensitive help is always enabled.

See Also

CanInPlaceActivate (see page 2650)

OnInPlaceActivate (see page 2672)

48.1.4.4.11 TOleControl.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams

CreateWindowHandle

Perform

DestroyWnd

48.1.4.4.12 TOleControl.DeactivateAndUndo Method

Deactivates the in-place session and reverts the changes.

Pascal

```
function DeactivateAndUndo: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DeactivateAndUndo();
```

Description

Call DeactivateAndUndo to deactivate the current in-place session of the ActiveX control. DeactivateAndUndo also notifies the control to revert to the internally stored undo state.

See Also

OnInPlaceDeactivate (see page 2672)

OnUIDeactivate (see page 2673)

48.1.4.4.13 TOleControl.DefaultHandler Method

Handles all otherwise-unhandled messages.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

DefaultHandler handles all messages not already handled in a control's WndProc (see page 2691) or message handling

methods. The inherited method should always be called for unhandled messages.

See Also

DefaultHandler

48.1.4.4.14 TOleControl.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

See Also

DefineBinaryProperty

DefineProperty

DefineProperties

IsControl

48.1.4.4.15 TOleControl.DestroyWindowHandle Method

Destroys the window created in the CreateWindowHandle method.

Pascal

```
procedure DestroyWindowHandle; override;
```

C++

```
virtual __fastcall DestroyWindowHandle();
```

Description

Call DestroyWindowHandle to dispose of the window for the control.

TWinControl's Destroy method calls DestroyWindowHandle to destroy any window associated with a windowed control before destroying the object. The DestroyWnd method also calls DestroyWindowHandle.

See Also

CreateWindowHandle

Destroy

DestroyWnd

48.1.4.4.16 TOleControl.DiscardUndoState Method

Discards the undo queue for the ActiveX control.

Pascal

```
function DiscardUndoState: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DiscardUndoState();
```

Description

Call DiscardUndoState to clear the undo queue of the ActiveX control contained within the container.

See Also

OnInPlaceDeactivate (see page 2672)

DeactivateAndUndo (see page 2651)

48.1.4.4.17 TOleControl.DoObjectVerb Method

Notifies the ActiveX control to perform one of its actions.

Pascal

```
procedure DoObjectVerb(Verb: Integer);
```

C++

```
__fastcall DoObjectVerb(int Verb);
```

Description

Use DoObjectVerb to notify the ActiveX control to perform one of its actions. Verb is an integer that corresponds to the action. Most application-defined verbs are small positive integers.

Verb Name	Verb
OLEIVERB_PRIMARY	0
OLEIVERB_SHOW	–1
OLEIVERB_OPEN	–2
OLEIVERB_HIDE	–3
OLEIVERB_UIACTIVATE	–4
OLEIVERB_INPLACEACTIVATE	–5
OLEIVERB_DISCARDUNDOSTATE	–6
OLEIVERB_PROPERTIES	–7

For more information about verbs, search the OLE.HLP file or the latest Microsoft Developer Network CD.

48.1.4.4.18 TOleControl.EnableModeless Method

Enables or disables the modeless dialogs of the ActiveX control.

Pascal

```
function EnableModeless(fEnable: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnableModeless(BOOL fEnable);
```

Description

Call EnableModeless to enable or disable the modeless dialog boxes of the ActiveX control. To make modal dialogs work properly, you must perform a call to the EnableModeless methods with the `fEnable` parameter set to **False**.

See Also

CanInPlaceActivate (see page 2650)

OnInPlaceActivate (see page 2672)

GetBorder (see page 2654)

48.1.4.4.19 TOleControl.GetBorder Method

Returns the rectangle in which the ActiveX control can draw toolbars.

Pascal

```
function GetBorder(out rectBorder: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetBorder(TRect rectBorder);
```

Description

Call GetBorder to receive the rectangle in which the ActiveX control can draw custom controls, such as toolbars. The drawn controls are only visible when the container is in place mode.

See Also

CanInPlaceActivate (see page 2650)

OnInPlaceActivate (see page 2672)

EnableModeless (see page 2653)

48.1.4.4.20 TOleControl.GetByteProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Byte`.

Pascal

```
function GetByteProp(Index: Integer): Byte;
```

C++

```
__fastcall Byte GetByteProp(int Index);
```

Description

Use GetByteProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetByteProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.21 TOleControl.GetColorProp Method

Reads a property of an ActiveX control. The property is expected to be of type TColor.

Pascal

```
function GetColorProp(Index: Integer): TColor;
```

C++

```
__fastcall TColor GetColorProp(int Index);
```

Description

Use GetColorProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetColorProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetTColorProp (see page 2663)

GetVariantProp (see page 2666)

48.1.4.4.22 TOleControl.GetCompProp Method

Reads a property of an ActiveX control. The property is expected to be of type `TColor`.

Pascal

```
function GetCompProp(Index: Integer): Comp;
```

C++

```
__fastcall Comp GetCompProp(int Index);
```

Description

Use GetCompProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetCompProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.23 TOleControl.GetContainer Method

Returns a pointer to an `IOleClientSite` OLE interface.

Pascal

```
function GetContainer(out container: IOleContainer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetContainer(IOleContainer container);
```

Description

Use GetContainer to obtain a pointer to an `IOleClientSite` OLE interface implemented by this TOleControl (see page 2638).

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.24 TOleControl.GetCurrencyProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Currency`.

Pascal

```
function GetCurrencyProp(Index: Integer): Currency;
```

C++

```
__fastcall Currency GetCurrencyProp(int Index);
```

Description

Use GetCurrencyProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetCurrencyProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.25 TOleControl.GetDoubleProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Double`.

Pascal

```
function GetDoubleProp(Index: Integer): Double;
```

C++

```
__fastcall Double GetDoubleProp(int Index);
```

Description

Use GetDoubleProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetDoubleProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.26 TOleControl.GetEnumPropDesc Method

Returns descriptions of the ActiveX control's properties.

Pascal

```
function GetEnumPropDesc(DispID: Integer): TEnumPropDesc;
```

C++

```
__fastcall TEnumPropDesc GetEnumPropDesc(int DispID);
```

Description

Use GetEnumPropDesc to return descriptions of the ActiveX control's properties. GetEnumPropDesc returns the descriptions in a TEnumPropDesc (see page 2631) object.

48.1.4.4.27 TOleControl.GetExtendedControl Method

Pascal

```
function GetExtendedControl(out disp: IDispatch): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetExtendedControl(IDispatch disp);
```

Description

This is GetExtendedControl, a member of class TOleControl.

48.1.4.4.28 TOleControl.GetHelpContext Method

Retrieves the Help context of a member of the ActiveX control.

Pascal

```
function GetHelpContext(Member: string; var HelpCtx: Integer; var HelpFile: string): Boolean;
```

C++

```
__fastcall Boolean GetHelpContext(UnicodeString Member, int HelpCtx, UnicodeString HelpFile);
```

Description

Use GetHelpContext to retrieve the Help context of a member of the ActiveX control.

Member is the name of a property, method, or event of the ActiveX control. To retrieve the help context of the ActiveX control itself, set Member to nil (Delphi) or NULL (C++).

HelpCtx is a variable in which the Help context identifier of Member is to be stored.

HelpFile is a variable in which the name of the Help file containing HelpCtx is to be stored.

The information about the ActiveX control is retrieved from its ITypeInfo interfaces. For more information, search the OLE.HLP file for ITypeInfo.

GetHelpContext returns false if Member is not found; otherwise, GetHelpContext returns true.

48.1.4.4.29 TOleControl.GetIDispatchProp Method

Reads a property of an ActiveX control. The property is expected to be of type IDispatch.

Pascal

```
function GetIDispatchProp(Index: Integer): IDispatch;
```

C++

```
__fastcall IDispatch GetIDispatchProp(int Index);
```

Description

Use GetIDispatchProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetIDispatchProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.30 TOleControl.GetIDsOfNames Method

Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

GetIDsOfNames implements the IDispatch interface GetIDsOfNames method. For components that support interfaces, GetIDsOfNames calls this method for the interface supported by the component, passing the specified parameters. The returned value can be used on subsequent calls to the Invoke method.

See Also

GetTypeInfo

GetTypeInfoCount

Invoke

48.1.4.4.31 TOleControl.GetIntegerProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Integer`.

Pascal

```
function GetIntegerProp(Index: Integer): Integer;
```

C++

```
__fastcall int GetIntegerProp(int Index);
```

Description

Use GetIntegerProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetIntegerProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.32 TOleControl.GetIUnknownProp Method

Reads a property of an ActiveX control. The property is expected to be of type IUnknown.

Pascal

```
function GetIUnknownProp(Index: Integer): IUnknown;
```

C++

```
__fastcall IUnknown GetIUnknownProp(int Index);
```

Description

Use GetIUnknownProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetIUnknownProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.33 TOleControl.GetMoniker Method

Pascal

```
function GetMoniker(dwAssign: Longint; dwWhichMoniker: Longint; out mk: IMoniker): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetMoniker(Longint dwAssign, Longint dwWhichMoniker, IMoniker mk);
```

Description

This is GetMoniker, a member of class TOleControl.

48.1.4.4.34 TOleControl.GetObjectVerbs Method

Retrieves the names of the verbs implemented by the ActiveX control.

Pascal

```
procedure GetObjectVerbs(List: TStrings);
```

C++

```
__fastcall GetObjectVerbs(TStrings List);
```

Description

Use GetObjectVerbs to retrieve the names of the verbs implemented by the ActiveX control.

List is where the names of the verbs are to be stored.

48.1.4.4.35 TOleControl.GetOleBoolProp Method

Reads a property of an ActiveX control. The property is expected to be of type `TOleBool`.

Pascal

```
function GetOleBoolProp(Index: Integer): TOleBool;
```

C++

```
__fastcall TOleBool GetOleBoolProp(int Index);
```

Description

Use GetOleBoolProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetOleBoolProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.36 TOleControl.GetOleDateProp Method

Reads a property of an ActiveX control. The property is expected to be of type `TOleDate`.

Pascal

```
function GetOleDateProp(Index: Integer): TOleDate;
```

C++

```
__fastcall TOleDate GetOleDateProp(int Index);
```

Description

Use GetOleDateProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetOleDateProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.37 TOleControl.GetOleEnumProp Method

Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum (see page 2705)`.

Pascal

```
function GetOleEnumProp(Index: Integer): TOleEnum;
```

C++

```
__fastcall TOleEnum GetOleEnumProp(int Index);
```

Description

Use GetOleEnumProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetOleEnumProp returns the value of the read property.

See Also

GetTOleEnumProp (see page 2664)

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.38 TOleControl.GetOleVariantProp Method

Reads a property of an ActiveX control. The property is expected to be of type `OleVariant`.

Pascal

```
function GetOleVariantProp(Index: Integer): OleVariant;
```

C++

```
__fastcall OleVariant GetOleVariantProp(int Index);
```

Description

Use GetOleVariantProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetOleVariantProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.39 TOleControl.GetPropDisplayString Method

Returns the display string for an interface for the ActiveX control.

Pascal

```
function GetPropDisplayString(DispID: Integer): string;
```

C++

```
__fastcall UnicodeString GetPropDisplayString(int DispID);
```

Description

GetPropDisplayString returns the display string for an interface for the ActiveX control.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

For more information about GetPropDisplayString, search the latest Microsoft Developer Network CD for GetDisplayStrings.

See Also

GetPropDisplayStrings (see page 2661)

SetPropDisplayString (see page 2683)

48.1.4.4.40 TOleControl.GetPropDisplayStrings Method

Returns the display strings for an interface for the ActiveX control.

Pascal

```
procedure GetPropDisplayStrings(DispID: Integer; List: TStrings);
```

C++

```
__fastcall GetPropDisplayStrings(int DispID, TStrings List);
```

Description

List is where the strings are to be stored.

For more information about GetPropDisplayStrings, search the latest Microsoft Developer Network CD for GetDisplayStrings.

See Also

GetPropDisplayString (see page 2661)

48.1.4.4.41 TOleControl.GetProperty Method

Reads a property of an ActiveX control.

Pascal

```
procedure GetProperty(Index: Integer; var Value: TVarData);
```

C++

```
__fastcall GetProperty(int Index, TVarData Value);
```

Description

Use GetProperty to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. The `Value` output parameter is a TVarData, which will be filled with the read property value.

See Also

GetOleVariantProp (see page 2660)

GetVariantProp (see page 2666)

48.1.4.4.42 TOleControl.GetShortIntProp Method

Reads a property of an ActiveX control. The property is expected to be of type `ShortInt`.

Pascal

```
function GetShortIntProp(Index: Integer): ShortInt;
```

C++

```
__fastcall ShortInt GetShortIntProp(int Index);
```

Description

Use GetShortIntProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetShortIntProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.43 TOleControl.GetSingleProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Single`.

Pascal

```
function GetSingleProp(Index: Integer): Single;
```

C++

```
__fastcall Single GetSingleProp(int Index);
```

Description

Use GetSingleProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetSingleProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.44 TOleControl.GetSmallintProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Smallint`.

Pascal

```
function GetSmallintProp(Index: Integer): Smallint;
```

C++

```
__fastcall Smallint GetSmallintProp(int Index);
```

Description

Use GetSmallintProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetSmallintProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.45 TOleControl.GetStringProp Method

Reads a property of an ActiveX control. The property is expected to be of type `String`.

Pascal

```
function GetStringProp(Index: Integer): string;
```

C++

```
__fastcall UnicodeString GetStringProp(int Index);
```

Description

Use GetStringProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetStringProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.46 TOleControl.GetTColorProp Method

Reads a property of an ActiveX control. The property is expected to be of type TColor.

Pascal

```
function GetTColorProp(Index: Integer): TColor;
```

C++

```
__fastcall TColor GetTColorProp(int Index);
```

Description

Use GetTColorProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetTColorProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetColorProp (see page 2655)

GetVariantProp (see page 2666)

48.1.4.4.47 TOleControl.GetTDateTimeProp Method

Reads a property of an ActiveX control. The property is expected to be of type TDateTime.

Pascal

```
function GetTDateTimeProp(Index: Integer): TDateTime;
```

C++

```
__fastcall TDateTime GetTDateTimeProp(int Index);
```

Description

Use GetTDateTimeProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetTDateTimeProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.48 TOleControl.GetTFontProp Method

Reads a property of an ActiveX control. The property is expected to be of type TFont.

Pascal

```
function GetTFontProp(Index: Integer): TFont;
```

C++

```
__fastcall TFont GetTFontProp(int Index);
```

Description

Use GetTFontProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetTFontProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.49 TOleControl.GetTOleEnumProp Method

Reads a property of an ActiveX control. The property is expected to be of type `TOleEnum (see page 2705)`.

Pascal

```
function GetTOleEnumProp(Index: Integer): TOleEnum;
```

C++

```
__fastcall TOleEnum GetTOleEnumProp(int Index);
```

Description

Use GetTOleEnumProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetTOleEnumProp returns the value of the read property.

See Also

GetOleEnumProp (see page 2660)

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.50 TOleControl.GetTPictureProp Method

Reads a property of an ActiveX control. The property is expected to be of type TPicture.

Pascal

```
function GetTPictureProp(Index: Integer): TPicture;
```

C++

```
__fastcall TPicture GetTPictureProp(int Index);
```

Description

Use GetTPictureProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetTPictureProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.51 TOleControl.GetTypeInfo Method

Retrieves the type information for an object.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo implements the IDispatch interface GetTypeInfo method. For components that support interfaces, GetTypeInfo calls the GetTypeInfo method for the interface supported by the component, passing it the specified parameters. Use the returned value to get the type information for an interface implemented by the component.

See Also

GetIDsOfNames

GetTypeInfoCount

Invoke

48.1.4.4.52 TOleControl.GetTypeInfoCount Method

Returns the number of type information interfaces that an object provides (either 0 or 1).

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount implements the IDispatch interface GetTypeInfoCount method. For components that support interfaces, GetTypeInfoCount calls this method for the interface supported by the component. The `Count` parameter points to a location that receives the number of type information interfaces provided by the object. If the object provides type information, this number is 1; otherwise the number is 0.

See Also

GetIDsOfNames

GetTypeInfo

Invoke

48.1.4.4.53 TOleControl.GetVariantProp Method

Reads a property of an ActiveX control.

Pascal

```
function GetVariantProp(Index: Integer): Variant;
```

C++

```
__fastcall Variant GetVariantProp(int Index);
```

Description

Use GetVariantProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. The `Value` output parameter is a `Variant` that will be filled with the read property value.

See Also

GetOleVariantProp (see page 2660)

GetProperty (see page 2661)

48.1.4.4.54 TOleControl.GetWideStringProp Method

Reads a property of an ActiveX control. The property is expected to be of type `WideString`.

Pascal

```
function GetWideStringProp(Index: Integer): WideString;
```

C++

```
__fastcall BSTR GetWideStringProp(int Index);
```

Description

Use GetWideStringProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetWideStringProp returns the value of the read property.

See Also

GetStringProp (see page 2663)

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.55 TOleControl.GetWindowContext Method

Pascal

```
function GetWindowContext(out frame: IOleInPlaceFrame; out doc: IOleInPlaceUIWindow; out
rcPosRect: TRect; out rcClipRect: TRect; out frameInfo: TOleInPlaceFrameInfo): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetWindowContext(IOleInPlaceFrame frame, IOleInPlaceUIWindow doc,
TRect rcPosRect, TRect rcClipRect, TOleInPlaceFrameInfo frameInfo);
```

Description

This is GetWindowContext, a member of class TOleControl.

48.1.4.4.56 TOleControl.GetWordBoolProp Method

Reads a property of an ActiveX control. The property is expected to be of type `WordBool`.

Pascal

```
function GetWordBoolProp(Index: Integer): WordBool;
```

C++

```
__fastcall WordBool GetWordBoolProp(int Index);
```

Description

Use GetWordBoolProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetWordBoolProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.57 TOleControl.GetWordProp Method

Reads a property of an ActiveX control. The property is expected to be of type `Word`.

Pascal

```
function GetWordProp(Index: Integer): Word;
```

C++

```
__fastcall Word GetWordProp(int Index);
```

Description

Use GetWordProp to read a property of an ActiveX control. The `Index` parameter specifies the **dispid** of the property being read. GetWordProp returns the value of the read property.

See Also

GetProperty (see page 2661)

GetVariantProp (see page 2666)

48.1.4.4.58 TOleControl.InitControlData Method

Pascal

```
procedure InitControlData; virtual; abstract;
```

C++

```
virtual __fastcall InitControlData() = 0;
```

Description

This is InitControlData, a member of class TOleControl.

48.1.4.4.59 TOleControl.InitControlInterface Method

Pascal

```
procedure InitControlInterface(const Obj: IUnknown); virtual;
```

C++

```
virtual __fastcall InitControlInterface(const IUnknown Obj);
```

Description

This is InitControlInterface, a member of class TOleControl.

48.1.4.4.60 TOleControl.InsertMenus Method

Pascal

```
function InsertMenus(hmenuShared: HMenu; var menuWidths: TOleMenuGroupWidths): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT InsertMenus(HMenu hmenuShared, TOleMenuGroupWidths menuWidths);
```

Description

This is InsertMenus, a member of class TOleControl.

48.1.4.4.61 TOleControl.Invoke Method

Provides access to Automation properties and methods when the component wraps an Automation object.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke is the standard mechanism for accessing the exposed properties and methods of an Automation object. For components that wrap the IDispatch interface of an Automation object, Invoke calls the Invoke method for the interface supported by the component, passing it the parameters specified by the function.

See Also

GetIDsOfNames

GetTypeInfo

GetTypeInfoCount

ComObject

48.1.4.4.62 TOleControl.InvokeEvent Method

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TDispParams); virtual;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TDispParams Params);
```

Description

This is InvokeEvent, a member of class TOleControl.

48.1.4.4.63 TOleControl.InvokeMethod Method

Pascal

```
procedure InvokeMethod(const DispInfo; Result: Pointer);
```

C++

```
__fastcall InvokeMethod(const  DispInfo, void * Result);
```

Description

This is InvokeMethod, a member of class TOleControl.

48.1.4.4.64 TOleControl.IsCustomProperty Method

Indicates whether an interface for the ActiveX control is a custom property.

Pascal

```
function IsCustomProperty(DispID: Integer): Boolean;
```

C++

```
__fastcall Boolean IsCustomProperty(int DispID);
```

Description

Use IsCustomProperty to determine whether an interface for the ActiveX control is a custom property.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

IsCustomProperty returns true if an interface is a custom property; otherwise, IsCustomProperty returns false.

48.1.4.4.65 TOleControl.IsPropPageProperty Method

Indicates whether an interface for the OCX control is a property page property.

Pascal

```
function IsPropPageProperty(DispID: Integer): Boolean;
```

C++

```
__fastcall Boolean IsPropPageProperty(int DispID);
```

Description

Use IsPropPageProperty to determine whether an interface for the OCX control is a property page property.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

IsPropPageProperty returns true if an interface is a property page property; otherwise, IsPropPageProperty returns false.

48.1.4.4.66 TOleControl.LockInPlaceActive Method

Pascal

```
function LockInPlaceActive(fLock: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT LockInPlaceActive(BOOL fLock);
```

Description

This is LockInPlaceActive, a member of class TOleControl.

48.1.4.4.67 TOleControl.OleControlSite_TranslateAccelerator Method

Pascal

```
function OleControlSite_TranslateAccelerator(msg: PMsg; grfModifiers: Longint): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleControlSite_TranslateAccelerator(PMsg msg, Longint
grfModifiers);
```

Description

This is OleControlSite_TranslateAccelerator, a member of class TOleControl.

48.1.4.4.68 TOleControl.OleInPlaceFrame_GetWindow Method

Pascal

```
function OleInPlaceFrame_GetWindow(out wnd: HWnd): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceFrame_GetWindow(HWnd wnd);
```

Description

This is OleInPlaceFrame_GetWindow, a member of class TOleControl.

48.1.4.4.69 TOleControl.OleInPlaceFrame_TranslateAccelerator Method

Pascal

```
function OleInPlaceFrame_TranslateAccelerator(var msg: TMsg; wID: Word): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceFrame_TranslateAccelerator(TMsg msg, Word wID);
```

Description

This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.

48.1.4.4.70 TOleControl.OleInPlaceSite_GetWindow Method

Pascal

```
function OleInPlaceSite_GetWindow(out wnd: HWnd): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceSite_GetWindow(HWnd wnd);
```

Description

This is OleInPlaceSite_GetWindow, a member of class TOleControl.

48.1.4.4.71 TOleControl.OnChanged Method

Pascal

```
function OnChanged(dispid: TDispID): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT OnChanged(TDispID dispid);
```

Description

This is OnChanged, a member of class TOleControl.

48.1.4.4.72 TOleControl.OnControlInfoChanged Method

Pascal

```
function OnControlInfoChanged: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnControlInfoChanged();
```

Description

This is OnControlInfoChanged, a member of class TOleControl.

48.1.4.4.73 TOleControl.OnFocus Method

Pascal

```
function OnFocus(fGotFocus: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnFocus(BOOL fGotFocus);
```

Description

This is OnFocus, a member of class TOleControl.

48.1.4.4.74 TOleControl.OnInPlaceActivate Method

Pascal

```
function OnInPlaceActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnInPlaceActivate();
```

Description

This is OnInPlaceActivate, a member of class TOleControl.

48.1.4.4.75 TOleControl.OnInPlaceDeactivate Method

Pascal

```
function OnInPlaceDeactivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnInPlaceDeactivate();
```

Description

This is OnInPlaceDeactivate, a member of class TOleControl.

48.1.4.4.76 TOleControl.OnPosRectChange Method

Pascal

```
function OnPosRectChange(const rcPosRect: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnPosRectChange(const TRect rcPosRect);
```

Description

This is OnPosRectChange, a member of class TOleControl.

48.1.4.4.77 TOleControl.OnRequestEdit Method

Pascal

```
function OnRequestEdit(dispid: TDispID): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT OnRequestEdit(TDispID dispid);
```

Description

This is OnRequestEdit, a member of class TOleControl.

48.1.4.4.78 TOleControl.OnShowWindow Method

Pascal

```
function OnShowWindow(fShow: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnShowWindow(BOOL fShow);
```

Description

This is OnShowWindow, a member of class TOleControl.

48.1.4.4.79 TOleControl.OnUIActivate Method

Pascal

```
function OnUIActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnUIActivate();
```

Description

This is OnUIActivate, a member of class TOleControl.

48.1.4.4.80 TOleControl.OnUIDeactivate Method

Pascal

```
function OnUIDeactivate(fUndoable: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnUIDeactivate(BOOL fUndoable);
```

Description

This is OnUIDeactivate, a member of class TOleControl.

48.1.4.4.81 TOleControl.PaletteChanged Method

Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.

Pascal

```
function PaletteChanged(Foreground: Boolean): Boolean; override;
```

C++

```
virtual __fastcall Boolean PaletteChanged(Boolean Foreground);
```

Description

PaletteChanged is called automatically when the Windows system palette changes. TWinControl responds to these notifications by trying to realize the windowed control's palette, if any, into the current device context, and then passing on the PaletteChanged notification to each of the child controls in turn. If the change in the system palette causes the actual value of the control's palette to change, PaletteChanged will invalidate the control so that it can repaint with the new palette.

Windows paints the active window with a foreground palette, while other windows are forced to use background palettes. Background palettes are approximate matches to the colors specified by the control's logical palette, given the limitations imposed by implementing the foreground palette. Windows only allows a single foreground palette.

PaletteChanged allows the control to obtain a new realization of its palette when the system palette changes. When Foreground is true, the form has been activated and the control is specifying the new foreground palette. When Foreground is false, another application or form has changed the foreground palette, and controls that are sensitive to the available palette should realize new background palettes to best match their logical palettes.

If the control does not have a logical palette to be realized into the current device context, GetPalette will return a handle of 0, and PaletteChanged will not try to realize a palette for the windowed control. Instead, it simply passes the notification on to the child controls. If the windowed control or any of its child controls realize a palette into the current device context in response to

PaletteChanged, this method returns true.

Override PaletteChanged to change the way in which controls are given an opportunity to realize a new palette when the Windows system palette changes. For example, override PaletteChanged to change the order in which child controls realize their palettes, giving a particular control the foreground palette when the form is activated, or to pass palette change notification to custom controls implemented outside of the VCL, such as in DLLs.

Override GetPalette instead to affect whether the windowed control actually has a palette to realize, or to change the value of the control's logical palette.

Note: PaletteChanged is called only when the run-time video mode requires palette support, such as for 256 color mode, but not 16 million color mode.

GetDeviceContext

GetPalette

48.1.4.4.82 TOleControl.PictureChanged Method

Pascal

```
procedure PictureChanged(Sender: TObject);
```

C++

```
__fastcall PictureChanged(TObject * Sender);
```

Description

This is PictureChanged, a member of class TOleControl.

48.1.4.4.83 TOleControl.PostMessageFilter Method

Pascal

```
function PostMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res:
Integer; Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PostMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PostMessageFilter, a member of class TOleControl.

48.1.4.4.84 TOleControl.PreMessageFilter Method

Pascal

```
function PreMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res: Integer;
out Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PreMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PreMessageFilter, a member of class TOleControl.

48.1.4.4.85 TOleControl.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the component supports the interface specified by IID, and if so, returns a reference to that interface as the Obj parameter. If the component does not support the interface, the Obj parameter returns nil (Delphi) or NULL (C++).

Note: For components that act as COM object wrapper, QueryInterface calls the QueryInterface method of the internal COM object.

_Release

QueryInterface

48.1.4.4.86 TOleControl.QueryService Method

Pascal

```
function QueryService(const rsid: TGuid; const iid: TGuid; out obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryService(const TGuid rsid, const TGuid iid,  obj);
```

Description

This is QueryService, a member of class TOleControl.

48.1.4.4.87 TOleControl.RemoveMenus Method

Pascal

```
function RemoveMenus(hmenuShared: HMenu): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RemoveMenus(HMenu hmenuShared);
```

Description

This is RemoveMenus, a member of class TOleControl.

48.1.4.4.88 TOleControl.RequestBorderSpace Method

Pascal

```
function RequestBorderSpace(const borderwidths: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RequestBorderSpace(const TRect borderwidths);
```

Description

This is RequestBorderSpace, a member of class TOleControl.

48.1.4.4.89 TOleControl.RequestNewObjectLayout Method

Pascal

```
function RequestNewObjectLayout: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RequestNewObjectLayout();
```

Description

This is RequestNewObjectLayout, a member of class TOleControl.

48.1.4.4.90 TOleControl.SaveObject Method

Saves the object to persistent storage.

Pascal

```
function SaveObject: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SaveObject();
```

Description

SaveObject is called by an enclosed ActiveX control whenever saving it is required. The call blocks until the operation completes. This guarantees that the object has been stored before the call returns.

See Also

ShowObject (see page 2689)

GetContainer (see page 2655)

48.1.4.4.91 TOleControl.Scroll Method

Scrolls the view by the indicated amount of pixels.

Pascal

```
function Scroll(scrollExtent: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Scroll(TPoint scrollExtent);
```

Description

Call Scroll to scroll the view of the ActiveX control by the indicated amount of pixels.

See Also

SetBounds (see page 2677)

GetBorder (see page 2654)

48.1.4.4.92 TOleControl.SetActiveObject Method

Pascal

```
function SetActiveObject(const activeObject: IOleInPlaceActiveObject; pszObjName: POleStr):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetActiveObject(const IOleInPlaceActiveObject activeObject,
POleStr pszObjName);
```

Description

This is SetActiveObject, a member of class TOleControl.

48.1.4.4.93 TOleControl.SetBorderSpace Method

Allocates border space for the ActiveX control.

Pascal

```
function SetBorderSpace(pborderwidths: PRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetBorderSpace(PRect pborderwidths);
```

Description

Call SetBorderSpace to allocate border space for the ActiveX control. You should perform a call to RequestBorderSpace (see page 2675) prior to a call to SetBorderSpace.

See Also

ShowPropertyFrame (see page 2689)

SetBounds (see page 2677)

RequestBorderSpace (see page 2675)

48.1.4.4.94 TOleControl.SetBounds Method

Sets the boundaries of the ActiveX control.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to set the boundaries of the ActiveX control.

ALeft, ATop, AWidth, and AHeight are the x-coordinate of the upper-left corner, the y-coordinate of the upper-left corner, the width and the height of the ActiveX control.

48.1.4.4.95 TOleControl.SetByteProp Method

Sets a property of an ActiveX control to the specified value of type `Byte`.

Pascal

```
procedure SetByteProp(Index: Integer; Value: Byte);
```

C++

```
__fastcall SetByteProp(int Index, Byte Value);
```

Description

Use SetByteProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.96 TOleControl.SetColorProp Method

Sets a property of an ActiveX control to the specified color.

Pascal

```
procedure SetColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall SetColorProp(int Index, TColor Value);
```

Description

Use SetColorProp to set a property of an ActiveX control to the specified color. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set color.

See Also

_SetTColorProp (see page 2648)

SetTColorProp (see page 2685)

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.97 TOleControl.SetCompProp Method

Sets a property of an ActiveX control to the specified value of type `Comp`.

Pascal

```
procedure SetCompProp(Index: Integer; const Value: Comp);
```

C++

```
__fastcall SetCompProp(int Index, const Comp Value);
```

Description

Use SetCompProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.98 TOleControl.SetCurrencyProp Method

Sets a property of an ActiveX control to the specified value of type `Currency`.

Pascal

```
procedure SetCurrencyProp(Index: Integer; const Value: Currency);
```

C++

```
__fastcall SetCurrencyProp(int Index, const Currency Value);
```

Description

Use SetCurrencyProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.99 TOleControl.SetDoubleProp Method

Sets a property of an ActiveX control to the specified value of type `Double`.

Pascal

```
procedure SetDoubleProp(Index: Integer; const Value: Double);
```

C++

```
__fastcall SetDoubleProp(int Index, const Double Value);
```

Description

Use SetDoubleProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.100 TOleControl.SetIDispatchProp Method

Sets a property of an ActiveX control to the specified value of type IDispatch.

Pascal

```
procedure SetIDispatchProp(Index: Integer; const Value: IDispatch);
```

C++

```
__fastcall SetIDispatchProp(int Index, const IDispatch Value);
```

Description

Use SetIDispatchProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.101 TOleControl.SetIntegerProp Method

Sets a property of an ActiveX control to the specified value of type `Integer`.

Pascal

```
procedure SetIntegerProp(Index: Integer; Value: Integer);
```

C++

```
__fastcall SetIntegerProp(int Index, int Value);
```

Description

Use SetIntegerProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.102 TOleControl.SetIUnknownProp Method

Sets a property of an ActiveX control to the specified value of type IUnknown.

Pascal

```
procedure SetIUnknownProp(Index: Integer; const Value: IUnknown);
```

C++

```
__fastcall SetIUnknownProp(int Index, const IUnknown Value);
```

Description

Use SetIUnknownProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.103 TOleControl.SetMenu Method

Attaches a menu to the in-place activated ActiveX object.

Pascal

```
function SetMenu(hmenuShared: HMenu; holemenu: HMenu; hwndActiveObject: HWnd): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetMenu(HMenu hmenuShared, HMenu holemenu, HWnd hwndActiveObject);
```

Description

Call SetMenu to attach a menu to the ActiveX control, which is in-place activated. To remove the menu, call SetMenu with `hmenuShared` set to 0. Removing the menu is mandatory when the ActiveX object is to be deactivated.

See Also

ShowPropertyFrame (see page 2689)

SetBounds (see page 2677)

GetBorder (see page 2654)

48.1.4.4.104 TOleControl.SetName Method

Sets the name of the control.

Pascal

```
procedure SetName(const Value: TComponentName); override;
```

C++

```
virtual __fastcall SetName(const TComponentName Value);
```

Description

SetName is the protected write implementation of the Name property. TControl updates the Text or Caption property, if appropriate, after changing the value of Name.

Override SetName to execute additional code when the value of the Name property changes.

See Also

Name

Caption

Text

48.1.4.4.105 TOleControl.SetOleBoolProp Method

Sets a property of an ActiveX control to the specified value of type `TOleBool`.

Pascal

```
procedure SetOleBoolProp(Index: Integer; Value: TOleBool);
```

C++

```
__fastcall SetOleBoolProp(int Index, TOleBool Value);
```

Description

Use SetOleBoolProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.106 TOleControl.SetOleDateProp Method

Sets a property of an ActiveX control to the specified value of type `TOleDate`.

Pascal

```
procedure SetOleDateProp(Index: Integer; const Value: TOleDate);
```

C++

```
__fastcall SetOleDateProp(int Index, const TOleDate Value);
```

Description

Use SetOleDateProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.107 TOleControl.SetOleEnumProp Method

Sets a property of an ActiveX control to the specified value of type TOleEnum (see page 2705).

Pascal

```
procedure SetOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall SetOleEnumProp(int Index, TOleEnum Value);
```

Description

Use SetOleEnumProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.108 TOleControl.SetOleVariantProp Method

Sets a property of an ActiveX control to the specified value of type `OleVariant`.

Pascal

```
procedure SetOleVariantProp(Index: Integer; const Value: OleVariant);
```

C++

```
__fastcall SetOleVariantProp(int Index, const OleVariant Value);
```

Description

Use SetOleVariantProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.109 TOleControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

Destroy

InsertControl

Parent

RemoveControl

48.1.4.4.110 TOleControl.SetPropDisplayString Method

Sets the display string for an interface for the ActiveX control.

Pascal

```
procedure SetPropDisplayString(DispID: Integer; const Value: string);
```

C++

```
__fastcall SetPropDisplayString(int DispID, const UnicodeString Value);
```

Description

Use SetPropDisplayString to set the display string for an interface for the ActiveX control.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

Value is the new display string for the interface.

See Also

GetPropDisplayStrings (see page 2661)

48.1.4.4.111 TOleControl.SetProperty Method

Sets a property of an ActiveX control to the specified value.

Pascal

```
procedure SetProperty(Index: Integer; const Value: TVarData);
```

C++

```
__fastcall SetProperty(int Index, const TVarData Value);
```

Description

Use SetProperty to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetOleVariantProp (see page 2682)

SetVariantProp (see page 2687)

48.1.4.4.112 TOleControl.SetShortIntProp Method

Sets a property of an ActiveX control to the specified value of type `ShortInt`.

Pascal

```
procedure SetShortIntProp(Index: Integer; Value: Shortint);
```

C++

```
__fastcall SetShortIntProp(int Index, Shortint Value);
```

Description

Use SetShortIntProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.113 TOleControl.SetSingleProp Method

Sets a property of an ActiveX control to the specified value of type `Single`.

Pascal

```
procedure SetSingleProp(Index: Integer; const Value: Single);
```

C++

```
__fastcall SetSingleProp(int Index, const Single Value);
```

Description

Use SetSingleProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.114 TOleControl.SetSmallintProp Method

Sets a property of an ActiveX control to the specified value of type `Smallint`.

Pascal

```
procedure SetSmallintProp(Index: Integer; Value: Smallint);
```

C++

```
__fastcall SetSmallintProp(int Index, Smallint Value);
```

Description

Use SetSmallintProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.115 TOleControl.SetStatusText Method

Pascal

```
function SetStatusText(pszStatusText: POleStr): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetStatusText(POleStr pszStatusText);
```

Description

This is SetStatusText, a member of class TOleControl.

48.1.4.4.116 TOleControl.SetStringProp Method

Sets a property of an ActiveX control to the specified value of type `String`.

Pascal

```
procedure SetStringProp(Index: Integer; const Value: string);
```

C++

```
__fastcall SetStringProp(int Index, const UnicodeString Value);
```

Description

Use SetStringProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.117 TOleControl.SetTColorProp Method

Sets a property of an ActiveX control to the specified color.

Pascal

```
procedure SetTColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall SetTColorProp(int Index, TColor Value);
```

Description

Use SetTColorProp to set a property of an ActiveX control to the specified color. The `Index` parameter specifies the

dispid of the property being set. The `Value` parameter contains the set color.

See Also

_SetTColorProp (see page 2648)

_SetColorProp (see page 2647)

SetColorProp (see page 2678)

48.1.4.4.118 TOleControl.SetTDateTimeProp Method

Sets a property of an ActiveX control to the specified value of type TDateTime.

Pascal

```
procedure SetTDateTimeProp(Index: Integer; const Value: TDateTime);
```

C++

```
__fastcall SetTDateTimeProp(int Index, const TDateTime Value);
```

Description

Use SetTDateTimeProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.119 TOleControl.SetTFontProp Method

Sets a property of an ActiveX control to the specified font.

Pascal

```
procedure SetTFontProp(Index: Integer; Value: TFont);
```

C++

```
__fastcall SetTFontProp(int Index, TFont Value);
```

Description

Use SetTFontProp to set a property of an ActiveX control to the specified font. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set font.

See Also

_SetTFontProp (see page 2648)

SetTColorProp (see page 2685)

SetTPictureProp (see page 2687)

SetTOleEnumProp (see page 2686)

48.1.4.4.120 TOleControl.SetTOleEnumProp Method

Sets a property of an ActiveX control to the specified enumeration value.

Pascal

```
procedure SetTOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall SetTOleEnumProp(int Index, TOleEnum Value);
```

Description

Use SetTOleEnumProp to set a property of an ActiveX control to the specified enumeration value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set enumeration value.

See Also

_SetTOleEnumProp (see page 2649)

SetTFontProp (see page 2686)

SetTColorProp (see page 2685)

SetTPictureProp (see page 2687)

48.1.4.4.121 TOleControl.SetTPictureProp Method

Sets a property of an ActiveX control to the specified picture object.

Pascal

```
procedure SetTPictureProp(Index: Integer; Value: TPicture);
```

C++

```
__fastcall SetTPictureProp(int Index, TPicture Value);
```

Description

Use SetTPictureProp to set a property of an ActiveX control to the specified picture object. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set picture object.

See Also

_SetTPictureProp (see page 2649)

SetTColorProp (see page 2685)

SetTFontProp (see page 2686)

SetTOleEnumProp (see page 2686)

48.1.4.4.122 TOleControl.SetVariantProp Method

Sets a property of an ActiveX control to the specified value.

Pascal

```
procedure SetVariantProp(Index: Integer; const Value: Variant);
```

C++

```
__fastcall SetVariantProp(int Index, const Variant Value);
```

Description

Use SetVariantProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

48.1.4.4.123 TOleControl.SetWideStringProp Method

Sets a property of an ActiveX control to the specified value of type `WideString`.

Pascal

```
procedure SetWideStringProp(Index: Integer; const Value: WideString);
```

C++

```
__fastcall SetWideStringProp(int Index, const BSTR Value);
```

Description

Use SetWideStringProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.124 TOleControl.SetWordBoolProp Method

Sets a property of an ActiveX control to the specified value of type `WordBool`.

Pascal

```
procedure SetWordBoolProp(Index: Integer; Value: WordBool);
```

C++

```
__fastcall SetWordBoolProp(int Index, WordBool Value);
```

Description

Use SetWordBoolProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.125 TOleControl.SetWordProp Method

Sets a property of an ActiveX control to the specified value of type `Word`.

Pascal

```
procedure SetWordProp(Index: Integer; Value: Word);
```

C++

```
__fastcall SetWordProp(int Index, Word Value);
```

Description

Use SetWordProp to set a property of an ActiveX control to the specified value. The `Index` parameter specifies the **dispid** of the property being set. The `Value` parameter contains the set value.

See Also

SetProperty (see page 2683)

SetVariantProp (see page 2687)

48.1.4.4.126 TOleControl.ShowAboutBox Method

Notifies the ActiveX control to display its About box.

Pascal

```
procedure ShowAboutBox;
```

C++

```
__fastcall ShowAboutBox();
```

Description

Use ShowAboutBox to notify the ActiveX control to display its About box.

48.1.4.4.127 TOleControl.ShowObject Method

Makes the enclosed object visible.

Pascal

```
function ShowObject: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ShowObject();
```

Description

Call ShowObject to make the enclosed ActiveX object visible. The enclosed ActiveX control may not be visible directly after the call. The call to ShowObject does not guarantee that the object becomes visible.

See Also

ShowPropertyFrame (see page 2689)

SetBounds (see page 2677)

GetBorder (see page 2654)

48.1.4.4.128 TOleControl.ShowPropertyFrame Method

Specifies whether the TOleControl (see page 2638) shows a property sheet.

Pascal

```
function ShowPropertyFrame: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ShowPropertyFrame();
```

Description

Call ShowPropertyFrame to check whether this ActiveX control shows a property sheet for the contained controls. This method always returns E_NOTIMPL, which means that this feature is not implemented in TOleControl (see page 2638).

See Also

ShowObject (see page 2689)

SetBounds (see page 2677)

GetBorder (see page 2654)

48.1.4.4.129 TOleControl.StandardEvent Method

Pascal

```
procedure StandardEvent(DispID: TDispID; var Params: TDispParams); virtual;
```

C++

```
virtual __fastcall StandardEvent(TDispID DispID, TDispParams Params);
```

Description

This is StandardEvent, a member of class TOleControl.

48.1.4.4.130 TOleControl.SuppressException Method

SuppressException suppresses OLE exceptions at design time.

Pascal

```
function SuppressException(E: Exception): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SuppressException(Exception E);
```

Description

SuppressException is called whenever an exception is thrown by this TOleControl (see page 2638). The implementation provided in TOleControl (see page 2638) suppresses all OLE exceptions thrown by the control at design time. To add custom logic to error suppressing, override SuppressException in descendant classes.

See Also

EOleSysError (see page 2499)

48.1.4.4.131 TOleControl.TransformCoords Method

Translates a set of coordinates.

Pascal

```
function TransformCoords(var ptlHimetric: TPoint; var ptfContainer: TPointF; flags: Longint):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT TransformCoords(TPoint ptlHimetric, TPointF ptfContainer, Longint
flags);
```

Description

Use TransformCoords to transform the OLE-style set of coordinates in the `ptlHimetric` record to a control-style set given by the `ptfContainer` record.

See Also

SetBounds (see page 2677)

GetBorder (see page 2654)

48.1.4.4.132 TOleControl.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
    PostMessage(
      MyListBoxDescendant1->Handle,
      WM_STYLEMESSAGE,
      Integer(lbOwnerDrawFixed),
      0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbStandard),
    0);
}

void __fastcall TForm1::SubClassRadioGroup1Click(TObject *Sender)
{
  MyListBoxDescendant1->ToggleSubClass(SubClassRadioGroup1->ItemIndex == 0);
}

void __fastcall TMyListBoxDescendant::SubClassWndProc(Messages::TMessage &Message)
{
  if (Message.Msg == WM_STYLEMESSAGE)
    Style = (TListBoxStyle)Message.WParam;
  else
    WndProc(Message);
}

void __fastcall TMyListBoxDescendant::ToggleSubClass(bool On)
{
  if (On)
    WindowProc = SubClassWndProc;
  else
    WindowProc = WndProc;
}

#include <memory>       //for STL auto_ptr class

void __fastcall TMyListBoxDescendant::OnDrawItemProc(TWinControl *Control, int Index,
      const TRect &Rect, TOwnerDrawState State)
{

48.1.4.5 TOleControl Properties

The properties of the TOleControl class are listed here.

Protected Properties

	Name	Description
	ControlData (see page 2696)	Specifies the PControlData (see page 2704) associated with TOleControl (see page 2638).

Public Properties

	Name	Description
	Anchors (see page 2695)	Specifies how the control is anchored to its parent.
R	DefaultDispatch (see page 2696)	The default dispatch interface.
R	OleObject (see page 2697)	The ActiveX control associated with the TOleControl (see page 2638) object.
R	PerPropBrowsing (see page 2697)	Provides access to information about the property page properties of the OleControl.
	TabStop (see page 2697)	Determines if the user can tab to a control.

48.1.4.5.1 TOleControl.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

48.1.4.5.2 TOleControl.ControlData Property

Specifies the PControlData (see page 2704) associated with TOleControl (see page 2638).

Pascal

```
property ControlData: PControlData;
```

C++

```
__property PControlData ControlData;
```

Description

Use ControlData to get or set the PControlData (see page 2704) associated with TOleControl (see page 2638). The returned value is a pointer to a TControlData (see page 2701) record, which contains all the information associated to the ActiveX control.

See Also

TControlData (see page 2701)

PControlData (see page 2704)

48.1.4.5.3 TOleControl.DefaultDispatch Property

The default dispatch interface.

Pascal

```
property DefaultDispatch: IDispatch;
```

C++

```
__property IDispatch DefaultDispatch;
```

Description

DefaultDispatch default dispatch interface that the TOleControl (see page 2638) object encapsulates. For those ActiveX controls that have multiple dispatch interfaces, one is typically identified as the default.

48.1.4.5.4 TOleControl.OleObject Property

The ActiveX control associated with the TOleControl (see page 2638) object.

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

OleObject is used to get the ActiveX control that is associated with the TOleControl (see page 2638)

48.1.4.5.5 TOleControl.PerPropBrowsing Property

Provides access to information about the property page properties of the OleControl.

Pascal

```
property PerPropBrowsing: IPerPropertyBrowsing;
```

C++

```
__property IPerPropertyBrowsing PerPropBrowsing;
```

Description

PerPropBrowsing is an interface to information about the properties of the OleControl as they appear on the associated property page.

See Also

BrowseProperties (see page 2649)

48.1.4.5.6 TOleControl.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

48.1.4.6 TOleControl Events

The events of the TOleControl class are listed here.

Public Events

	Name	Description
	ServiceQuery (see page 2698)	Specifies the TServiceQuery (see page 2706) associated with this ActiveX control.

48.1.4.6.1 TOleControl.ServiceQuery Event

Specifies the TServiceQuery (see page 2706) associated with this ActiveX control.

Pascal

```
property ServiceQuery: TServiceQuery;
```

C++

```
__property TServiceQuery ServiceQuery;
```

Description

Use TServiceQuery (see page 2706) to set or get the TServiceQuery (see page 2706) used by this ActiveX control. The value of ServiceQuery is used by the QueryService (see page 2675) method. Whenever QueryService (see page 2675) is called, it forwards the call to the associated TServiceQuery (see page 2706).

See Also

QueryService (see page 2675)

48.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	EmptyParam (see page 2699)	This is function OleCtrls.EmptyParam.
	FontToOleFont (see page 2699)	Returns a Variant containing an IFontDispatch interface that represents a TFont object.
	OleFontToFont (see page 2700)	Fills in a TFont structure to represent an IFontDispatch.

48.2.1 OleCtrls.EmptyParam Function

Pascal

```
function EmptyParam: OleVariant;
```

C++

```
OleVariant EmptyParam();
```

File

OleCtrls

Description

This is function OleCtrls.EmptyParam.

48.2.2 OleCtrls.FontToOleFont Function

Returns a Variant containing an IFontDispatch interface that represents a TFont object.

Pascal

```
function FontToOleFont(Font: TFont): Variant;
```

C++

```
Variant FontToOleFont(TFont Font);
```

File

OleCtrls

Description

Use FontToOleFont to convert a font from TFont to IFontDispatch format. The interface uses the TFont object to implement the methods of the interface.

See Also

OleFontToFont (see page 2700)

OleStrToStrVar

StringToOleStr

OleStrToString

48.2.3 OleCtrls.OleFontToFont Function

Fills in a TFont structure to represent an IFontDispatch.

Pascal

```
procedure OleFontToFont(const OleFont: Variant; Font: TFont);
```

C++

```
OleFontToFont(const Variant OleFont, TFont Font);
```

File

OleCtrls

Description

Use OleFontToFont to convert a font from COM (IFontDispatch) to TFont format.

See Also

FontToOleFont (see page 2699)

OleStrToStrVar

StringToOleStr

OleStrToString

48.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TControlData (see page 2701)	This is record OleCtrls.TControlData.
	TControlData2 (see page 2702)	This is record OleCtrls.TControlData2.
	TEnumValue (see page 2702)	This is record OleCtrls.TEnumValue.

48.3.1 OleCtrls.TControlData Record

Pascal

```
TControlData = record
  ClassID: TGUID;
  EventIID: TGUID;
  EventCount: Longint;
  EventDispIDs: Pointer;
  LicenseKey: Pointer;
  Flags: DWORD;
  Version: Integer;
  FontCount: Integer;
  FontIDs: PDispIDList;
  PictureCount: Integer;
  PictureIDs: PDispIDList;
  Reserved: Integer;
  InstanceCount: Integer;
  EnumPropDescs: TList;
end;
```

C++

```
struct TControlData {
  TGUID ClassID;
  TGUID EventIID;
  Longint EventCount;
  void * EventDispIDs;
  void * LicenseKey;
  DWORD Flags;
  int Version;
  int FontCount;
  PDispIDList FontIDs;
  int PictureCount;
  PDispIDList PictureIDs;
  int Reserved;
  int InstanceCount;
  TList EnumPropDescs;
};
```

File

OleCtrls

Description

This is record OleCtrls.TControlData.

48.3.2 OleCtrls.TControlData2 Record

Pascal

```
TControlData2 = record
  ClassID: TGUID;
  EventIID: TGUID;
  EventCount: Longint;
  EventDispIDs: Pointer;
  LicenseKey: Pointer;
  Flags: DWORD;
  Version: Integer;
  FontCount: Integer;
  FontIDs: PDispIDList;
  PictureCount: Integer;
  PictureIDs: PDispIDList;
  Reserved: Integer;
  InstanceCount: Integer;
  EnumPropDescs: TList;
  FirstEventOfs: Cardinal;
end;
```

C++

```
struct TControlData2 {
  TGUID ClassID;
  TGUID EventIID;
  Longint EventCount;
  void * EventDispIDs;
  void * LicenseKey;
  DWORD Flags;
  int Version;
  int FontCount;
  PDispIDList FontIDs;
  int PictureCount;
  PDispIDList PictureIDs;
  int Reserved;
  int InstanceCount;
  TList EnumPropDescs;
  unsigned FirstEventOfs;
};
```

File

OleCtrls

Description

This is record OleCtrls.TControlData2.

48.3.3 OleCtrls.TEnumValue Record

Pascal

```
TEnumValue = record
  Value: Longint;
  Ident: string;
end;
```

C++

```
struct TEnumValue {
  Longint Value;
  UnicodeString Ident;
};
```

File

OleCtrls

Description

This is record OleCtrls.TEnumValue.

48.4 Types

The following table lists types in this documentation.

Types

Name	Description
PControlData (see page 2704)	This is type OleCtrls.PControlData.
PControlData2 (see page 2704)	This is type OleCtrls.PControlData2.
PEnumValueList (see page 2705)	This is type OleCtrls.PEnumValueList.
TEnumValueList (see page 2705)	This is type OleCtrls.TEnumValueList.
TOleEnum (see page 2705)	Represents enumerated types that must be sent over a COM interface.
TServiceQuery (see page 2706)	This is type OleCtrls.TServiceQuery.

48.4.1 OleCtrls.PControlData Type

Pascal

```
PControlData = ^TControlData;
```

C++

```
^TControlData PControlData;
```

File

OleCtrls

Description

This is type OleCtrls.PControlData.

48.4.2 OleCtrls.PControlData2 Type

Pascal

```
PControlData2 = ^TControlData2;
```

C++

```
^TControlData2 PControlData2;
```

File

OleCtrls

Description

This is type OleCtrls.PControlData2.

48.4.3 OleCtrls.PEnumValueList Type

Pascal

```
PEnumValueList = ^TEnumValueList;
```

C++

```
^TEnumValueList PEnumValueList;
```

File

OleCtrls

Description

This is type OleCtrls.PEnumValueList.

48.4.4 OleCtrls.TEnumValueList Type

Pascal

```
TEnumValueList = array[0..32767] of TEnumValue;
```

C++

```
array[0..32767] of TEnumValue TEnumValueList;
```

File

OleCtrls

Description

This is type OleCtrls.TEnumValueList.

48.4.5 OleCtrls.TOleEnum Type

Represents enumerated types that must be sent over a COM interface.

Pascal

```
TOleEnum = ActiveX.TOleEnum;
```

C++

```
ActiveX.TOleEnum TOleEnum;
```

File

OleCtrls

Description

Dispatch interfaces do not marshal enumerated types. TOleEnum is used in the Delphi language for interface parameters that are logically an enumerated type but must be passed as an integer value instead. Typically, each interface member that uses TOleEnum defines a set of integer constants to represent the enumerated values.

48.4.6 OleCtrls.TServiceQuery Type

Pascal

```
TServiceQuery = function (const rsid, iid: TGuid; out obj): HResult of object;
```

C++

```
(const rsid, iid: TGuid; out obj): HResult ( TServiceQuery)();
```

File

OleCtrls

Description

This is type OleCtrls.TServiceQuery.

49 OleServer Namespace

This is namespace OleServer.

Types (see page 2727)	The following table lists types in this documentation.

Classes

	Name	Description
	TOleServer (see page 2708)	TOleServer is the base class for components that represent an imported COM server.
	TServerEventDispatch (see page 2720)	This is class OleServer.TServerEventDispatch.

Structs, Records, Enums

	Name	Description
	TConnectKind (see page 2725)	This is record OleServer.TConnectKind.
	TServerData (see page 2725)	This is record OleServer.TServerData.

Types

Name	Description
PServerData (see page 2727)	This is type OleServer.PServerData.
TVariantArray (see page 2727)	This is type OleServer.TVariantArray.

49.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TOleServer (see page 2708)	TOleServer is the base class for components that represent an imported COM server.
	TServerEventDispatch (see page 2720)	This is class OleServer.TServerEventDispatch.

49.1.1 TOleServer Class

TOleServer is the base class for components that represent an imported COM server.

Class Hierarchy

Pascal

```
TOleServer = class(TComponent, IUnknown);
```

C++

```
class TOleServer : public TComponent, public IUnknown;
```

File

OleServer

Description

TOleServer is the base class for COM servers that are imported by choosing Component | Import Component from the IDE. TOleServer introduces several properties and methods that manage the connection to a COM server and for invoking its default events.

Descendants of TOleServer expose the properties, methods, and events of the server CoClass. When an application calls one of the TOleServer descendant's methods or sets one of its properties, the component automatically establishes a connection to the COM server. You can also connect explicitly by calling the Connect (see page 2712) method.

Do not create instances of TOleServer. TOleServer relies on abstract pure virtual methods to establish and break a connection to the COM server. Instead, use a descendant of TOleServer that wraps the desired server. Numerous TOleServer descendants are provided on the Servers tab of the Component Palette. In addition, you can create your own descendants by importing a server's type library.

Code Generated When You Import Type Library Information

49.1.1.1 TOleServer Members

The following tables list the members exposed by TOleServer.

Protected Methods

	Name	Description
	_AddRef (see page 2711)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2712)	Decrements the reference count for the calling interface on a object.
	ConnectEvents (see page 2713)	Establishes a connection using the EventDispatch (see page 2718) property as an event sink.
	DisconnectEvents (see page 2713)	Terminates a connection that was established using the ConnectEvents (see page 2713) method.
	GetAutoConnect (see page 2714)	Returns the value of the AutoConnect (see page 2717) property.
	GetConnectKind (see page 2714)	Returns the value of the ConnectKind (see page 2718) property.
	GetServer (see page 2714)	Returns an interface for the COM server.
	InitServerData (see page 2715)	Initializes the ServerData (see page 2719) property to reflect the type library information of the COM server.
	InvokeEvent (see page 2715)	Dispatches an event from the COM server to the appropriate event handler.
	Loaded (see page 2716)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 2717) is True true.
	QueryInterface (see page 2716)	Returns a reference to a specified interface if the OLE server supports that interface.
	SetAutoConnect (see page 2716)	Sets the value of the AutoConnect (see page 2717) property.
	SetConnectKind (see page 2717)	Sets the value of the ConnectKind (see page 2718) property.

Protected Properties

	Name	Description
	EventDispatch (see page 2718)	Specifies a helper object that enables the TOleServer (see page 2708) object to handle server events.
	ServerData (see page 2719)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
	Connect (see page 2712)	Establishes a connection to the COM server.
	Create (see page 2709)	Allocates memory and constructs a safely initialized instance of a component.
	Destroy (see page 2710)	Disposes of the component and its owned components.
	Disconnect (see page 2713)	Terminates the connection to the COM server.

Published Properties

	Name	Description
	AutoConnect (see page 2717)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 2718)	Indicates the type of process to which the ConnectKind component establishes a connection.
	RemoteMachineName (see page 2719)	Specifies the machine running the COM server when ConnectKind (see page 2718) is ckRemote.

49.1.1.2 TOleServer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleServer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

ComponentStyle

System::TObject::Create

Destroy

System::TObject::Free

Owner

49.1.1.3 TOleServer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleServer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

49.1.1.4 TOleServer Methods

The methods of the TOleServer class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2711)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2712)	Decrements the reference count for the calling interface on a object.
	ConnectEvents (see page 2713)	Establishes a connection using the EventDispatch (see page 2718) property as an event sink.
	DisconnectEvents (see page 2713)	Terminates a connection that was established using the ConnectEvents (see page 2713) method.
	GetAutoConnect (see page 2714)	Returns the value of the AutoConnect (see page 2717) property.
	GetConnectKind (see page 2714)	Returns the value of the ConnectKind (see page 2718) property.
V	GetServer (see page 2714)	Returns an interface for the COM server.
A	InitServerData (see page 2715)	Initializes the ServerData (see page 2719) property to reflect the type library information of the COM server.
V	InvokeEvent (see page 2715)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 2716)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 2717) is True true.
V	QueryInterface (see page 2716)	Returns a reference to a specified interface if the OLE server supports that interface.
	SetAutoConnect (see page 2716)	Sets the value of the AutoConnect (see page 2717) property.
	SetConnectKind (see page 2717)	Sets the value of the ConnectKind (see page 2718) property.

Public Methods

	Name	Description
A	Connect (see page 2712)	Establishes a connection to the COM server.
A	Disconnect (see page 2713)	Terminates the connection to the COM server.

49.1.1.4.1 TOleServer._AddRef Method

Increments the reference count for the number of interface references dependent on the OLE server.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

_AddRef implements the IUnknown interface method, AddRef, which increments the reference count of objects using the OLE server's interface. _AddRef returns the resulting value of the reference count.

See Also

Invoke

QueryInterface (see page 2716)

_Release (see page 2712)

49.1.1.4.2 TOleServer._Release Method

Decrements the reference count for the calling interface on a object.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

_Release implements the IUnknown interface method, Release, which decrements the reference count of objects using the OLE server's interface. If the reference count on the interface falls to 0, the server object is freed from memory.

_Release returns the resulting value of the reference count.

See Also

Invoke

QueryInterface (see page 2716)

_AddRef (see page 2711)

49.1.1.4.3 TOleServer.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; virtual; abstract;
```

C++

```
virtual __fastcall Connect() = 0;
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect (see page 2717) property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind (see page 2718) is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind (see page 2718) is ckRemote, the RemoteMachineName (see page 2719) property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 2717)

ConnectKind (see page 2718)

RemoteMachineName (see page 2719)

Disconnect (see page 2713)

Using Component Wrappers

49.1.1.4.4 TOleServer.ConnectEvents Method

Establishes a connection using the EventDispatch (see page 2718) property as an event sink.

Pascal

```
procedure ConnectEvents(const Obj: IUnknown);
```

C++

```
__fastcall ConnectEvents(const IUnknown Obj);
```

Description

ConnectEvents descendants use ConnectEvents internally to implement their event handlers for events on the COM server. If the ConnectEvents descendant does not expose any server events, ConnectEvents is not used.

The Obj parameter is an interface for the COM server that generates events.

See Also

EventDispatch (see page 2718)

DisconnectEvents (see page 2713)

49.1.1.4.5 TOleServer.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; virtual; abstract;
```

C++

```
virtual __fastcall Disconnect() = 0;
```

Description

Call Disconnect to terminate a connection formed using the Connect (see page 2712) method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 2712)

Using Component Wrappers

49.1.1.4.6 TOleServer.DisconnectEvents Method

Terminates a connection that was established using the ConnectEvents (see page 2713) method.

Pascal

```
procedure DisconnectEvents(const Obj: Iunknown);
```

C++

```
__fastcall DisconnectEvents(const Iunknown Obj);
```

Description

DisconnectEvents descendants use DisconnectEvents internally to terminate the connection established by ConnectEvents (see page 2713). If the DisconnectEvents descendant does not expose any server events, DisconnectEvents is not used.

The Obj parameter is an interface for the COM server that generates events.

See Also

ConnectEvents (see page 2713)

49.1.1.4.7 TOleServer.GetAutoConnect Method

Returns the value of the AutoConnect (see page 2717) property.

Pascal

```
function GetAutoConnect: Boolean;
```

C++

```
__fastcall Boolean GetAutoConnect();
```

Description

GetAutoConnect is the protected read implementation for the AutoConnect (see page 2717) property.

See Also

AutoConnect (see page 2717)

49.1.1.4.8 TOleServer.GetConnectKind Method

Returns the value of the ConnectKind (see page 2718) property.

Pascal

```
function GetConnectKind: TConnectKind;
```

C++

```
__fastcall TConnectKind GetConnectKind();
```

Description

GetConnectKind is the protected read implementation for the ConnectKind (see page 2718) property.

See Also

ConnectKind (see page 2718)

49.1.1.4.9 TOleServer.GetServer Method

Returns an interface for the COM server.

Pascal

```
function GetServer: IUnknown; virtual;
```

C++

```
virtual __fastcall IUnknown GetServer();
```

Description

GetServer descendants call GetServer from the implementation of their Connect (see page 2712) methods. GetServer obtains an interface for the COM server described by ServerData (see page 2719). The ConnectKind (see page 2718) property indicates how GetServer can obtain the interface.

See Also

Connect (see page 2712)

ConnectKind (see page 2718)

ServerData (see page 2719)

49.1.1.4.10 TOleServer.InitServerData Method

Initializes the ServerData (see page 2719) property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; virtual; abstract;
```

C++

```
virtual __fastcall InitServerData() = 0;
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData (see page 2719) with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData (see page 2719) property reflects its particular COM server.

See Also

ServerData (see page 2719)

Create (see page 2709)

49.1.1.4.11 TOleServer.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); virtual;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch (see page 2718) can pass

events on to the appropriate event handlers.

See Also

EventDispatch (see page 2718)

49.1.1.4.12 TOleServer.Loaded Method

Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 2717) is True true.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The VCL streaming system automatically calls Loaded after the Loaded component is loaded into memory.

Loaded checks the AutoConnect (see page 2717) property, and if it is True true, calls the Connect (see page 2712) method to establish a connection.

See Also

AutoConnect (see page 2717)

Loaded

49.1.1.4.13 TOleServer.QueryInterface Method

Returns a reference to a specified interface if the OLE server supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface implements the IUnknown interface method QueryInterface. QueryInterface returns a reference to the interface specified by the IID parameter as the Obj parameter. If the OLE server does not support the interface, the Obj parameter returns nil NULL and QueryInterface returns a nonzero error code.

See Also

_AddRef (see page 2711)

_Release (see page 2712)

Invoke

49.1.1.4.14 TOleServer.SetAutoConnect Method

Sets the value of the AutoConnect (see page 2717) property.

Pascal

```
procedure SetAutoConnect(flag: Boolean);
```

C++

```
__fastcall SetAutoConnect(Boolean flag);
```

Description

SetAutoConnect is the protected write implementation for the AutoConnect (see page 2717) property.

See Also

AutoConnect (see page 2717)

49.1.1.4.15 TOleServer.SetConnectKind Method

Sets the value of the ConnectKind (see page 2718) property.

Pascal

```
procedure SetConnectKind(ck: TConnectKind);
```

C++

```
__fastcall SetConnectKind(TConnectKind ck);
```

Description

SetConnectKind is the protected write implementation for the ConnectKind (see page 2718) property.

See Also

ConnectKind (see page 2718)

49.1.1.5 TOleServer Properties

The properties of the TOleServer class are listed here.

Protected Properties

	Name	Description
	EventDispatch (see page 2718)	Specifies a helper object that enables the TOleServer (see page 2708) object to handle server events.
	ServerData (see page 2719)	Encodes information about the COM server to which ServerData connects.

Published Properties

	Name	Description
	AutoConnect (see page 2717)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 2718)	Indicates the type of process to which the ConnectKind component establishes a connection.
	RemoteMachineName (see page 2719)	Specifies the machine running the COM server when ConnectKind (see page 2718) is ckRemote.

49.1.1.5.1 TOleServer.AutoConnect Property

Specifies whether the component automatically connects to the server.

Pascal

```
property AutoConnect: Boolean;
```

C++

```
__property Boolean AutoConnect;
```

Description

Set AutoConnect to True true to specify whether the server should be loaded automatically when the application first starts up. If AutoConnect is False false, the application establishes a connection when it calls one of the AutoConnect descendant's methods, sets a property, or calls the Connect (see page 2712) method.

Note: AutoConnect only establishes a connection when the application is first run. Changing the AutoConnect property at runtime has no effect.

See Also

Connect (see page 2712)

Using Component Wrappers

49.1.1.5.2 TOleServer.ConnectKind Property

Indicates the type of process to which the ConnectKind component establishes a connection.

Pascal

```
property ConnectKind: TConnectKind;
```

C++

```
__property TConnectKind ConnectKind;
```

Description

Set ConnectKind to indicate how the ConnectKind component establishes a connection. ConnectKind establishes the connection when the application is run (if AutoConnect (see page 2717) is True true) or when the application calls the Connect (see page 2712) (or ConnectTo) method.

The following table lists the possible values:

Value	Meaning
ckRunningOrNew	Attach to a running server or create a new instance of the server.
ckNewInstance	Always create a new instance of the server.
ckRunningInstance	Only attach to a running instance of the server.
ckRemote	Bind to a remote instance of the server. When using this option, you must supply a value for RemoteMachineName (see page 2719).
ckAttachToInterface	Don't bind to the server. Instead, the application supplies an interface using the ConnectTo method, which is introduced in descendant classes. This option can't be used with the AutoConnect (see page 2717) property.

See Also

Connect (see page 2712)

RemoteMachineName (see page 2719)

AutoConnect (see page 2717)

Using Component Wrappers

49.1.1.5.3 TOleServer.EventDispatch Property

Specifies a helper object that enables the TOleServer (see page 2708) object to handle server events.

Pascal

```
property EventDispatch: TServerEventDispatch;
```

C++

```
__property TServerEventDispatch EventDispatch;
```

Description

EventDispatch is used internally by descendant objects that surface the events of a COM server. EventDispatch supports an IDispatch interface, which it uses to allow TOleServer (see page 2708) descendants to dispatch events to the appropriate event handler. TOleServer (see page 2708) introduces no events of its own. EventDispatch is used only by descendants that surface events from a COM server.

See Also

ServerData (see page 2719)

49.1.1.5.4 TOleServer.RemoteMachineName Property

Specifies the machine running the COM server when ConnectKind (see page 2718) is ckRemote.

Pascal

```
property RemoteMachineName: string;
```

C++

```
__property UnicodeString RemoteMachineName;
```

Description

Use RemoteMachineName when the COM server instance is running remotely on another machine. Specify the name of the machine on which the COM server is running as the value of RemoteMachineName.

Note: RemoteMachineName is only used if ConnectKind (see page 2718) is ckRemote. Setting RemoteMachineName to a non-empty string sets ConnectKind (see page 2718) to ckRemote.

See Also

ConnectKind (see page 2718)

Connect (see page 2712)

Using Component Wrappers

49.1.1.5.5 TOleServer.ServerData Property

Encodes information about the COM server to which ServerData connects.

Pascal

```
property ServerData: PServerData;
```

C++

```
__property PServerData ServerData;
```

Description

ServerData uses ServerData internally to store type library information describing its COM server. Each ServerData descendant initializes this property in the constructor, specifying the information it needs to establish a connection.

See Also

InitServerData (see page 2715)

49.1.2 TServerEventDispatch Class

Class Hierarchy

Pascal

```
TServerEventDispatch = class(TObject, IUnknown, IDispatch);
```

C++

```
class TServerEventDispatch : public TObject, public IUnknown, public IDispatch;
```

File

OleServer

Description

This is class OleServer.TServerEventDispatch.

49.1.2.1 TServerEventDispatch Members

The following tables list the members exposed by TServerEventDispatch.

Protected Methods

	Name	Description
	_AddRef (see page 2721)	This is _AddRef, a member of class TServerEventDispatch.
	_Release (see page 2721)	This is _Release, a member of class TServerEventDispatch.
	GetIDsOfNames (see page 2721)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 2722)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2722)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2723)	Invoke performs a call to a late-binded property or method.
	QueryInterface (see page 2723)	This is QueryInterface, a member of class TServerEventDispatch.
	ServerDisconnect (see page 2723)	This is ServerDisconnect, a member of class TServerEventDispatch.

Protected Properties

	Name	Description
R	Server (see page 2724)	This is Server, a member of class TServerEventDispatch.

Public Methods

	Name	Description
	Create (see page 2720)	This is Create, a member of class TServerEventDispatch.

49.1.2.2 TServerEventDispatch.Create Constructor

Pascal

```
constructor Create(Server: TOleServer);
```

C++

```
__fastcall TServerEventDispatch(TOleServer Server);
```

Description

This is Create, a member of class TServerEventDispatch.

49.1.2.3 TServerEventDispatch Methods

The methods of the TServerEventDispatch class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2721)	This is _AddRef, a member of class TServerEventDispatch.
	_Release (see page 2721)	This is _Release, a member of class TServerEventDispatch.
	GetIDsOfNames (see page 2721)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 2722)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 2722)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 2723)	Invoke performs a call to a late-binded property or method.
	QueryInterface (see page 2723)	This is QueryInterface, a member of class TServerEventDispatch.
	ServerDisconnect (see page 2723)	This is ServerDisconnect, a member of class TServerEventDispatch.

49.1.2.3.1 TServerEventDispatch._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TServerEventDispatch.

49.1.2.3.2 TServerEventDispatch._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TServerEventDispatch.

49.1.2.3.3 TServerEventDispatch.GetIDsOfNames Method

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name. GetIDsOfNames is used primarily to obtain dispatch identifiers for the late-binded methods exposed by the COM object through the IDispatch interface.

See Also

GetTypeInfoCount

GetTypeInfo

Invoke

49.1.2.3.4 TServerEventDispatch.GetTypeInfo Method

GetTypeInfo returns the object's type information.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo returns the type information for a specified index. The index is previously obtained by a call to the GetTypeInfoCount method. If the method returns S_OK, the `TypeInfo` parameter is set to point to the requested type information; otherwise an error code is returned.

See Also

GetTypeInfoCount

GetIDsOfNames

Invoke

49.1.2.3.5 TServerEventDispatch.GetTypeInfoCount Method

GetTypeInfoCount returns the count of type information interfaces.

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount returns the count of type information interfaces supported by the implementing COM object. If the method returns S_OK, the `Count` parameter is set to the number of type information interfaces, which is either 1 (if the object supports type information) or 0 (if the object does not support type information). A return value of E_NOTIMPL means that the method is not implemented in the COM object.

GetIDsOfNames

Invoke

49.1.2.3.6 TServerEventDispatch.Invoke Method

Invoke performs a call to a late-binded property or method.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke actually calls a method or a property exposed by the COM object through IDispatch. Invoke requires a previously obtained dispatch identifier. The identifier uniquely identifies a method, a property, and a list of parameters to be passed to the called method and exception information. The dispatch identifier of a method or property (also known as **dispid**) can be obtained by a calling the GetIDsOfNames method.

49.1.2.3.7 TServerEventDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TServerEventDispatch.

49.1.2.3.8 TServerEventDispatch.ServerDisconnect Method

Pascal

```
function ServerDisconnect: Boolean;
```

C++

```
__fastcall Boolean ServerDisconnect();
```

Description

This is ServerDisconnect, a member of class TServerEventDispatch.

49.1.2.4 TServerEventDispatch Properties

The properties of the TServerEventDispatch class are listed here.

Protected Properties

	Name	Description
	Server (see page 2724)	This is Server, a member of class TServerEventDispatch.

49.1.2.4.1 TServerEventDispatch.Server Property

Pascal

```
property Server: TOleServer;
```

C++

```
__property TOleServer Server;
```

Description

This is Server, a member of class TServerEventDispatch.

49.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectKind (see page 2725)	This is record OleServer.TConnectKind.

Records

	Name	Description
	TServerData (see page 2725)	This is record OleServer.TServerData.

49.2.1 OleServer.TConnectKind Enumeration

Pascal

```
TConnectKind = (
  ckRunningOrNew,
  ckNewInstance,
  ckRunningInstance,
  ckRemote,
  ckAttachToInterface
);
```

C++

```
enum TConnectKind {
  ckRunningOrNew,
  ckNewInstance,
  ckRunningInstance,
  ckRemote,
  ckAttachToInterface
};
```

File

OleServer

Description

This is record OleServer.TConnectKind.

49.2.2 OleServer.TServerData Record

Pascal

```
TServerData = record
  ClassID: TGUID;
  IntfIID: TGUID;
  EventIID: TGUID;
  LicenseKey: Pointer;
  Version: Integer;
  InstanceCount: Integer;
```

```
  end;
```

C++

```
  struct TServerData {
    TGUID ClassID;
    TGUID IntfIID;
    TGUID EventIID;
    void * LicenseKey;
    int Version;
    int InstanceCount;
  };
```

File

OleServer

Description

This is record OleServer.TServerData.

49.3 Types

The following table lists types in this documentation.

Types

Name	Description
PServerData (see page 2727)	This is type OleServer.PServerData.
TVariantArray (see page 2727)	This is type OleServer.TVariantArray.

49.3.1 OleServer.PServerData Type

Pascal

```
PServerData = ^TServerData;
```

C++

```
^TServerData PServerData;
```

File

OleServer

Description

This is type OleServer.PServerData.

49.3.2 OleServer.TVariantArray Type

Pascal

```
TVariantArray = Array of OleVariant;
```

C++

```
Array of OleVariant TVariantArray;
```

File

OleServer

Description

This is type OleServer.TVariantArray.

50 OPConvert Namespace

This is namespace OPConvert.

Topics

Name	Description
Interfaces (see page 2730)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 2740)	The following table lists structs, records, enums in this documentation.
Types (see page 2743)	The following table lists types in this documentation.

Interfaces

	Name	Description
	IOPConvert (see page 2730)	IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

Structs, Records, Enums

	Name	Description
	TSOAPConvertOption (see page 2740)	TSOAPConvertOption and TSOAPConvertOptions (see page 2743) represent flags that customize the conversion between a SOAP encoding and native method calls.

Types

Name	Description
TSOAPConvertOptions (see page 2743)	This is type OPConvert.TSOAPConvertOptions.

50.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IOPConvert (see page 2730)	IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

50.1.1 IOPConvert Interface

IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

Class Hierarchy

Pascal

```
IOPConvert = interface;
```

C++

```
__interface IOPConvert;
```

File

OPConvert

Description

IOPConvert is implemented by classes that marshal and unmarshal method calls in Web Service applications. It defines methods for marshaling and unmarshaling method calls, as well as any exceptions that occur when attempting to execute those method calls.

The IOPConvert interface is used by remote interfaced objects on the client (TRIO descendants) and invoker components on the server (TSoapPascalInvoker descendants). Both the remote interfaced object and the invoker classes use the same IOPConvert implementation class, which represents a single encoding system (such as SOAP).

Classes that implement IOPConvert use the runtime type information (RTTI) on an invokable interface to interpret or encode method calls. They do not execute these calls, but rather, convert between transportable strings that are the encoding of interface method calls and an invocation context (TInvContext (see page 829) object).

Note: C++ method declarations that use IOPConvert use the _di_IOPConvert type instead. This type is a DelphiInterface wrapper around the IOPConvert interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IOPConvert >  _di_IOPConvert;
```

TInvContext (see page 829)

50.1.1.1 IOPConvert Members

The following tables list the members exposed by IOPConvert.

Public Methods

	Name	Description
	GetAttachments (see page 2732)	Returns the value of the Attachments (see page 2738) property.
	GetEncoding (see page 2732)	Returns the value of the Encoding (see page 2738) property.
	GetOptions (see page 2732)	Returns the value of the Options (see page 2739) property.
	GetTempDir (see page 2732)	Returns the value of the TempDir (see page 2739) property.
	InvContextToMsg (see page 2733)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 2733)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 2734)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 2734)	This is the overview for the MsgToInvContext method overload.
	ProcessResponse (see page 2735)	This is the overview for the ProcessResponse method overload.
	SetAttachments (see page 2736)	Sets the value of the Attachments (see page 2738) property.
	SetEncoding (see page 2737)	Sets the value of the Encoding (see page 2738) property.
	SetOptions (see page 2737)	Sets the value of the Options (see page 2739) property.
	SetTempDir (see page 2737)	Sets the value of the TempDir (see page 2739) property.

Public Properties

	Name	Description
	Attachments (see page 2738)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
	Encoding (see page 2738)	Indicates the character set to use for encoded method calls.
	Options (see page 2739)	Controls how certain types of conversions are performed.
	TempDir (see page 2739)	Specifies the directory where temporary files for attachments are saved.

50.1.1.2 IOPConvert Methods

The methods of the IOPConvert class are listed here.

Public Methods

	Name	Description
	GetAttachments (see page 2732)	Returns the value of the Attachments (see page 2738) property.
	GetEncoding (see page 2732)	Returns the value of the Encoding (see page 2738) property.
	GetOptions (see page 2732)	Returns the value of the Options (see page 2739) property.
	GetTempDir (see page 2732)	Returns the value of the TempDir (see page 2739) property.
	InvContextToMsg (see page 2733)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 2733)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 2734)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 2734)	This is the overview for the MsgToInvContext method overload.
	ProcessResponse (see page 2735)	This is the overview for the ProcessResponse method overload.
	SetAttachments (see page 2736)	Sets the value of the Attachments (see page 2738) property.
	SetEncoding (see page 2737)	Sets the value of the Encoding (see page 2738) property.
	SetOptions (see page 2737)	Sets the value of the Options (see page 2739) property.
	SetTempDir (see page 2737)	Sets the value of the TempDir (see page 2739) property.

50.1.1.2.1 IOPConvert.GetAttachments Method

Returns the value of the Attachments (see page 2738) property.

Pascal

```
function GetAttachments: TSoapDataList;
```

C++

```
__fastcall TSoapDataList GetAttachments();
```

Description

GetAttachments is the read implementation for the Attachments (see page 2738) property.

See Also

Attachments (see page 2738)

50.1.1.2.2 IOPConvert.GetEncoding Method

Returns the value of the Encoding (see page 2738) property.

Pascal

```
function GetEncoding: DOMString;
```

C++

```
__fastcall DOMString GetEncoding();
```

Description

GetEncoding is the read implementation for the Encoding (see page 2738) property.

See Also

Encoding (see page 2738)

50.1.1.2.3 IOPConvert.GetOptions Method

Returns the value of the Options (see page 2739) property.

Pascal

```
function GetOptions: TSOAPConvertOptions;
```

C++

```
__fastcall TSOAPConvertOptions GetOptions();
```

Description

GetOptions is the read implementation for the Options (see page 2739) property.

See Also

Options (see page 2739)

50.1.1.2.4 IOPConvert.GetTempDir Method

Returns the value of the TempDir (see page 2739) property.

Pascal

```
function GetTempDir: string;
```

C++

```
__fastcall UnicodeString GetTempDir();
```

Description

GetTempDir is the read implementation for the TempDir (see page 2739) property.

See Also

TempDir (see page 2739)

50.1.1.2.5 IOPConvert.InvContextToMsg Method

Marshals a method call from an invocation context to a transportable string.

Pascal

```
function InvContextToMsg(const IntfMD: TIntfMetaData; MethNum: Integer; Con: TInvContext;
Headers: THeaderList): TStream;
```

C++

```
__fastcall TStream InvContextToMsg(const TIntfMetaData IntfMD, int MethNum, TInvContext Con,
THeaderList Headers);
```

Description

InvContextToMsg looks up a specified method call, including the types and values of any arguments, from an invocation context, and returns an encoded version of that method call that can be transported to the application that executes it.

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum identifies the called method by its position in the interface's method table.

Con is the invocation context that contains details of the method call, including the parameter values passed in, the calling conventions, and any other temporary data used when making the call.

Headers is a list of TSOAPHeader (see page 908) descendants that represent the headers of the SOAP envelope that contained the method call.

InvContextToMsg returns a stream from which an application can read the encoded version of the method call. This encoded method call can then be passed to an IWebNode interface for execution.

See Also

MsgToInvContext (see page 2735)

Execute

50.1.1.2.6 IOPConvert.MakeFault Method

Encodes an exception that was raised when trying to execute a method on an invokable interface.

Pascal

```
procedure MakeFault(const Ex: Exception; EStream: TStream);
```

C++

```
__fastcall MakeFault(const Exception Ex, TStream EStream);
```

Description

MakeFault encodes an exception that a Web Service application catches when trying to execute a method on an invokable interface. It generates an encoded exception packet, which the client can decode and use to raise the exception on the client application.

Ex is the exception object that represents the exception that occurred.

EStream is a stream to which MakeFault writes the encoded exception packet.

See Also

MakeResponse (see page 2734)

50.1.1.2.7 IOPConvert.MakeResponse Method

Encodes the results of successfully executing a method on an invokable interface.

Pascal

```
procedure MakeResponse(const IntfMD: TIntfMetaData; const MethNum: Integer; Context:
TInvContext; Response: TStream; Headers: THeaderList);
```

C++

```
__fastcall MakeResponse(const TIntfMetaData IntfMD, const int MethNum, TInvContext Context,
TStream Response, THeaderList Headers);
```

Description

MakeResponse retrieves the results of executing a method on an invokable interface from an invocation context and packages them into a transportable string, which it writes to a stream. This string is passed back to the client, which can unpack it using the ProcessResponse (see page 2736) method.

IntfMD represents the runtime type information (RTTI) from the interface whose method was executed.

MethNum identifies the called method by its position in the interface's method table.

Context is the invocation context that contains details of the method call.

Response is a stream to which MakeResponse writes the encoded version of the method result and any output parameters.

Headers is a list of TSOAPHeader (see page 908) descendants that represent the headers that should be added to the response message.

See Also

MakeFault (see page 2733)

ProcessResponse (see page 2736)

50.1.1.2.8 MsgToInvContext Method

This is the overview for the MsgToInvContext method overload.

Overload List

	Name	Description
	IOPConvert.MsgToInvContext (InvString, TIntfMetaData, Integer, TInvContext) (see page 2735)	Unpacks an encoded method call into an invocation context so that it can be executed.

	IOPConvert.MsgToInvContext (TStream, TIntfMetaData, Integer, TInvContext, THeaderList) (see page 2735)	Unpacks an encoded method call into an invocation context so that it can be executed.

50.1.1.2.8.1 IOPConvert.MsgToInvContext Method (InvString, TIntfMetaData, Integer, TInvContext)

Unpacks an encoded method call into an invocation context so that it can be executed.

Pascal

```
procedure MsgToInvContext(const Request: InvString; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext); overload;
procedure MsgToInvContext(const Request: TStream; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext; Headers: THeaderList); overload;
```

C++

```
__fastcall MsgToInvContext(const InvString Request, const TIntfMetaData IntfMD, int MethNum,
TInvContext Context);
__fastcall MsgToInvContext(const TStream Request, const TIntfMetaData IntfMD, int MethNum,
TInvContext Context, THeaderList Headers);
```

Description

MsgToInvContext takes an encoded message that a server application receives and uses it to fill out an invocation context, which can then be used to execute the method call.

Request is the encoded method call, or a stream from which to read that method call. It is generated on the client by a call to InvContextToMsg (see page 2733).

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum returns the position of the called method in the interface's method table.

Context is the invocation context to which this method adds the information encoded in Request.

Headers is an object list to which MsgToInvContext adds TSOAPHeader (see page 908) descendants to represent every header in the encoded message.

See Also

InvContextToMsg (see page 2733)

50.1.1.2.9 ProcessResponse Method

This is the overview for the ProcessResponse method overload.

Overload List

	Name	Description
	IOPConvert.ProcessResponse (InvString, TIntfMetaData, TIntfMethEntry, TInvContext) (see page 2736)	Unpacks the response packet from a method call into an invocation context.
	IOPConvert.ProcessResponse (TStream, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 2736)	Unpacks the response packet from a method call into an invocation context.

50.1.1.2.9.1 IOPConvert.ProcessResponse Method (InvString, TIntfMetaData, TIntfMethEntry, TInvContext)

Unpacks the response packet from a method call into an invocation context.

Pascal

```
procedure ProcessResponse(const Resp: TStream; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); overload;
procedure ProcessResponse(const Resp: InvString; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext); overload; deprecated;
```

C++

```
__fastcall ProcessResponse(const TStream Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
__fastcall ProcessResponse(const InvString Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context);
```

Description

ProcessResponse takes the encoded results of executing a method on an invokable interface from an invocation context and unpacks them into an invocation context.

Response is the encoded results of executing a method on the invokable interface, or a stream from which those results can be read. It is generated on the server by the MakeResponse (see page 2734) method if the call was successful, or the MakeFault (see page 2733) method if the call was unsuccessful.

XMLDoc is the interface to an XML document that represents the results of executing a method on the invokable interface. The values of its nodes come from the MakeResponse (see page 2734) method if the call was successful, or the MakeFault (see page 2733) method if the call was unsuccessful.

IntfMD describes the runtime type information (RTTI) of the interface whose method was called.

MD describes the runtime type information (RTTI) of the method that was called.

Context is the invocation context that ProcessResponse fills out based on the contents of Response.

Headers is a list that ProcessResponse fills with TSOAPHeader (see page 908) descendants that represent the headers of the encoded result message.

See Also

MakeFault (see page 2733)

MakeResponse (see page 2734)

50.1.1.2.10 IOPConvert.SetAttachments Method

Sets the value of the Attachments (see page 2738) property.

Pascal

```
procedure SetAttachments(Value: TSoapDataList);
```

C++

```
__fastcall SetAttachments(TSoapDataList Value);
```

Description

SetAttachments is the write implementation for the Attachments (see page 2738) property.

Value is a list of TSoapAttachment objects that encapsulate the current set of attachments.

See Also

Attachments (see page 2738)

50.1.1.2.11 IOPConvert.SetEncoding Method

Sets the value of the Encoding (see page 2738) property.

Pascal

```
procedure SetEncoding(const Encoding: DOMString);
```

C++

```
__fastcall SetEncoding(const DOMString Encoding);
```

Description

SetEncoding is the write implementation for the Encoding (see page 2738) property.

Encoding (see page 2738) is the name of the new encoding to use for method calls.

See Also

Encoding (see page 2738)

50.1.1.2.12 IOPConvert.SetOptions Method

Sets the value of the Options (see page 2739) property.

Pascal

```
procedure SetOptions(const Value: TSOAPConvertOptions);
```

C++

```
__fastcall SetOptions(const TSOAPConvertOptions Value);
```

Description

SetOptions is the write implementation for the Options (see page 2739) property.

Value is the new set of options to use when marshaling and unmarshaling method calls.

See Also

Options (see page 2739)

50.1.1.2.13 IOPConvert.SetTempDir Method

Sets the value of the TempDir (see page 2739) property.

Pascal

```
procedure SetTempDir(const Value: string);
```

C++

```
__fastcall SetTempDir(const UnicodeString Value);
```

Description

SetTempDir is the write implementation for the TempDir (see page 2739) property.

Value is the new temporary directory to use.

See Also

TempDir (see page 2739)

50.1.1.3 IOPConvert Properties

The properties of the IOPConvert class are listed here.

Public Properties

	Name	Description
	Attachments (see page 2738)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
	Encoding (see page 2738)	Indicates the character set to use for encoded method calls.
	Options (see page 2739)	Controls how certain types of conversions are performed.
	TempDir (see page 2739)	Specifies the directory where temporary files for attachments are saved.

50.1.1.3.1 IOPConvert.Attachments Property

Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Pascal

```
property Attachments: TSoapDataList;
```

C++

```
__property TSoapDataList Attachments;
```

Description

When a method on an invokable interface requires the user to send or receive attachments, these attachments are each represented by a TSoapAttachment object. Attachments lists the TSoapAttachment objects for each attachment of the current method.

Note: When the application that contains IOPConvert (see page 2730) receives attachments, it writes them to a temporary file rather than storing them in memory. The location for these temporary files is specified by the TempDir (see page 2739) property.

See Also

TempDir (see page 2739)

TSOAPAttachment (see page 895)

50.1.1.3.2 IOPConvert.Encoding Property

Indicates the character set to use for encoded method calls.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Use Encoding to indicate the character set that is used for encoded method calls. If you do not specify an encoding (that is, if Encoding is an empty string), UTF-8 is assumed.

See Also

DefaultDOMVendor

Encoding

50.1.1.3.3 IOPConvert.Options Property

Controls how certain types of conversions are performed.

Pascal

```
property Options: TSOAPConvertOptions;
```

C++

```
__property TSOAPConvertOptions Options;
```

Description

Set Options to indicate how you want to handle various types of conversions. This set can include zero or more of the TSOAPConvertOption (see page 2740) flags.

See Also

MsgToInvContext (see page 2735)

ClassOptions (see page 877)

InvContextToMsg (see page 2733)

50.1.1.3.4 IOPConvert.TempDir Property

Specifies the directory where temporary files for attachments are saved.

Pascal

```
property TempDir: string;
```

C++

```
__property UnicodeString TempDir;
```

Description

When the application receives an attachment as the value of a parameter (or the return value) of the current method on the invokable interface, it writes the attachment to a temporary file. This temporary file becomes the value of the CacheFile property on the TSoapAttachment object that represents the attachment.

Use TempDir to specify the directory where temporary files for attachments are written.

Note: If TempDir is not set, the application uses the default temporary directory. On Windows, this is the directory that the Windows API GetTempPath returns. On Linux, this is obtained from the TMPDIR environment setting (or, if TMPDIR is not set, /tmp/)

See Also

Attachments (see page 2738)

CacheFile (see page 904)

50.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSOAPConvertOption (see page 2740)	TSOAPConvertOption and TSOAPConvertOptions (see page 2743) represent flags that customize the conversion between a SOAP encoding and native method calls.

50.2.1 OPConvert.TSOAPConvertOption Enumeration

TSOAPConvertOption and TSOAPConvertOptions (see page 2743) represent flags that customize the conversion between a SOAP encoding and native method calls.

Pascal

```
TSOAPConvertOption = (
  soSendUntyped,
  soSendMultiRefObj,
  soSendMultiRefArray,
  soTryAllSchema,
  soRootRefNodesToBody,
  soDocument,
  soReturnSuccessForFault,
  soUTF8InHeader,
  soDontSendEmptyNodes,
  soCacheMimeResponse,
  soDontClearOutBoundHeaders,
  soCustomFaultAtDetailsNode,
  soLiteralParams,
  soUTF8EncodeXML,
  soXXXXHdr
);
```

C++

```
enum TSOAPConvertOption {
  soSendUntyped,
  soSendMultiRefObj,
  soSendMultiRefArray,
  soTryAllSchema,
  soRootRefNodesToBody,
  soDocument,
  soReturnSuccessForFault,
  soUTF8InHeader,
  soDontSendEmptyNodes,
  soCacheMimeResponse,
  soDontClearOutBoundHeaders,
  soCustomFaultAtDetailsNode,
  soLiteralParams,
  soUTF8EncodeXML,
  soXXXXHdr
};
```

File

OPConvert

Description

TSOAPConvertOptions (see page 2743) is a set of TSOAPConvertOption values. TSOAPConvertOption values are flags that govern the conversions that TSOAPDomConv makes when translating between native code and its SOAP representation. The following table lists the possible values:

Option	Meaning
soSendUntyped	When converting from a native type to SOAP, do not include the type attribute. Some Web Service applications do not need type information to be included in the SOAP request, but simply assume that values match the function signature.
soSendMultiRefObj	When converting from a native type to SOAP, indicate when multiple references refer to the same object. That is, treat objects so that their identify is based on the object reference, rather than simply treating them as structures, where their identity is based only on the value of their properties.
soSendMultiRefArray	When converting from a native type to SOAP, indicate when multiple references refer to the same array. That is, treat arrays so that their identify is based on the array reference, rather than simply treating them as structures, where their identity is based only on the value of their elements.
soTryAllSchema	When converting from SOAP to a native type, TSOAPDomConv assumes, by default, that xml schema definitions fall in the xml schema that is associated with the application. If it is possible that the SOAP request uses another xml schema to define standard types, include soTryAllSchema. This causes TSOAPDomConv to look in all schema documents that that are defined in the xml schema unit to locate type definitions.
soRootRefNodesToBody	When converting from a native type to SOAP, multiple references all appear as children of the <soap:body> tag, rather than as siblings of the first instance. This option is recommended, because some Web Service providers require multiple references to be rooted to the body tag and will not understand the request if this flag is not included.
soDocument	When converting from SOAP to a native type, assume that the request is encoded as a document rather than as a remote procedure call (RPC). This option is used when communicating with document servers.
soReturnSuccessForFault	When the server generates a SOAP fault packet, the response message should not have an error status code, but rather it should indicate success (200). This allows servers to send fault packets to clients that generate exceptions when an HTTP response does not indicate success.
soUTF8InHeader	When converting from native types to SOAP, include a SOAP header that indicates that the SOAP packet uses a UTF8 encoding style. Because the SOAP specification does not treat UTF8 as the default encoding style, this header is technically required. Some Web Service applications, however, do not use this header.
soDontSendEmptyNodes	When converting from native types to SOAP, do not include an element for empty strings , empty arrays, or nil (Delphi) or NULL (C++) object references.
soCacheMimeResponse	When converting a response from SOAP to native types, store the incoming response content in a temporary file rather than in memory if the binding type (TWebServiceBindingType) indicates that the response uses a MIME encoding. This is because MIME encodings indicate the presence of attachments, which can be very large. Only remove this flag if the expected attachments are known to be small.
soDontClearOutBoundHeaders	When converting from native types to SOAP, do not free any classes that represent headers after generating their SOAP representation.
soCustomFaultAtDetailsNode	When generating a SOAP fault packet to represent an exception, serialize information to the details node rather than as a child of the details node.
soLiteralParams	When converting from the SOAP encoding to native types, do not unwind parameter, even if the WSDL importer was called with the option for unwinding literal parameters. This option is needed in document literal encoding when the name of a method and the name of the structure representing its parameters are different.

soUTF8EncodeXML	When converting from native types to SOAP, encode characters at the transport level to UTF-8. This encoding is less efficient than DOM-level encoding, but is required for some Web Services that assume transport-level rather than DOM-level encoding.
soXXXXHdr	The type being converted represents a header.

50.3 Types

The following table lists types in this documentation.

Types

Name	Description
TSOAPConvertOptions (see page 2743)	This is type OPConvert.TSOAPConvertOptions.

50.3.1 OPConvert.TSOAPConvertOptions Type

Pascal

```
TSOAPConvertOptions = set of TSOAPConvertOption;
```

C++

```
TSOAPConvertOption TSOAPConvertOptions;
```

File

OPConvert

Description

This is type OPConvert.TSOAPConvertOptions.

51 OPToSOAPDomConv Namespace

This is namespace OPToSOAPDomConv.

Topics

Name	Description
Classes (see page 2747)	The following table lists classes in this documentation.
Functions (see page 2783)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2784)	The following table lists structs, records, enums in this documentation.
Types (see page 2786)	The following table lists types in this documentation.
Variables (see page 2789)	The following table lists variables in this documentation.
Constants (see page 2790)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESOAPDomConvertError (see page 2747)	ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.
	TOPToSoapDomConvert (see page 2747)	TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.
	TSOAPDomConv (see page 2758)	TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

Constants

Name	Description
SVarArrayType (see page 2790)	This is constant OPToSOAPDomConv.SVarArrayType.

Functions

	Name	Description
	GetOrdPropEx (see page 2783)	This is function OPToSOAPDomConv.GetOrdPropEx.

Structs, Records, Enums

	Name	Description
	ConvNodeState (see page 2784)	This is record OPToSOAPDomConv.ConvNodeState.
	TMultiRefNodeElem (see page 2784)	This is record OPToSOAPDomConv.TMultiRefNodeElem.
	TMultiRefNodeMapElem (see page 2785)	This is record OPToSOAPDomConv.TMultiRefNodeMapElem.
	TSOAPArrayElemDesc (see page 2785)	This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

Types

Name	Description
TMemberDataNotReceivedEvent (see page 2786)	TMemberDataNotReceivedEvent is the type of the OnMemberDataNotReceived event of TSOAPDomConv (see page 2758).
TMultiRefNodeMap (see page 2787)	This is type OPToSOAPDomConv.TMultiRefNodeMap.
TMultiRefNodes (see page 2787)	This is type OPToSOAPDomConv.TMultiRefNodes.
TSOAPArrayDesc (see page 2787)	This is type OPToSOAPDomConv.TSOAPArrayDesc.
TUnhandledNodeEvent (see page 2788)	TUnhandledNodeEvent is the type of the OnUnhandledNode event of TSOAPDomConv (see page 2758).
TXMLNodeArray (see page 2788)	This is type OPToSOAPDomConv.TXMLNodeArray.

Variables

Name	Description
DefArrayElemName (see page 2789)	This is variable OPToSOAPDomConv.DefArrayElemName.

51.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESOAPDomConvertError (see page 2747)	ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.
	TOPToSoapDomConvert (see page 2747)	TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.
	TSOAPDomConv (see page 2758)	TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

51.1.1 ESOAPDomConvertError Class

ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.

Class Hierarchy

Pascal

```
ESOAPDomConvertError = class(Exception);
```

C++

```
class ESOAPDomConvertError : public Exception;
```

File

OPToSOAPDomConv

Description

TOPToSoapDomConvert (see page 2747) raises ESOAPDomConvertError exceptions when it can't marshal or unmarshal a SOAP packet that encodes a method call or its results.

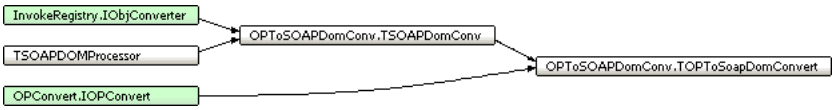
See Also

TOPToSoapDomConvert (see page 2747)

51.1.2 TOPToSoapDomConvert Class

TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.

Class Hierarchy



Pascal

```
TOPToSoapDomConvert = class(TSOAPDomConv, IOPConvert);
```

C++

```
class TOPToSoapDomConvert : public TSOAPDomConv, public IOPConvert;
```

File

OPToSOAPDomConv

Description

TOPToSoapDomConvert is an implementation of the IOPConvert (see page 2730) interface that handles the marshaling and unmarshaling of SOAP method calls. It uses a DOM parser to parse and edit the SOAP encoding of a method call and its results.

Typically, applications do not use TOPToSoapDomConvert directly. Rather, It is created and used by THTTPRio on client applications and THTTPSoapPascalInvoker or THTTPSoapCppInvoker on server applications.

TOPToSoapDomConvert converts between the SOAP encoding of a method call or its results and an invocation context. If the method call results in an exception, TOPToSoapDomConvert generates a SOAP error packet for that exception so that the client can raise the exception remotely.

51.1.2.1 TOPToSoapDomConvert Members

The following tables list the members exposed by TOPToSoapDomConvert.

Protected Methods

	Name	Description
	AddAttachment (see page 2763)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 2763)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 2763)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 2763)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
	CheckEncodingStyle (see page 2764)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 2764)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 2764)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 2764)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 2765)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 2765)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.
	ConvertSoapToEnum (see page 2766)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 2766)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 2766)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 2767)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 2767)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 2768)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.

	CreateMultiRefNode (see page 2768)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 2768)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 2768)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 2769)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.
	CreateTypedNode (see page 2769)	This is CreateTypedNode, a member of class TSOAPDomConv.
	FinalizeMultiRefNodes (see page 2769)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 2769)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
	FindMultiRefNodeByID (see page 2770)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 2770)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 2770)	This is FindNodeByHREF, a member of class TSOAPDomConv.
	FindPrefixForURI (see page 2770)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetDataNode (see page 2771)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 2771)	This is GetElementType, a member of class TSOAPDomConv.
	GetNewID (see page 2771)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 2771)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 2771)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 2772)	This is GetOptions, a member of class TSOAPDomConv.
	GetTypeBySchemaNS (see page 2772)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	InitObjectFromSOAP (see page 2772)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	IsNodeAVarArray (see page 2773)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 2773)	This is IsObjectWriting, a member of class TSOAPDomConv.
	LoadObject (see page 2773)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 2773)	This is the overview for the MakeArrayNode method overload.
	MultiRefObject (see page 2774)	This is MultiRefObject, a member of class TSOAPDomConv.
	NewXMLDocument (see page 2754)	Creates a new empty XML document to hold the SOAP representation and returns its interface.
	NodeIsNULL (see page 2774)	This is NodeIsNULL, a member of class TSOAPDomConv.
	ObjectMemberNoShow (see page 2775)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 2775)	Returns the SOAP representation of a remotable object.
	ReadHeader (see page 2775)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 2776)	This is ReadRectDynArray, a member of class TSOAPDomConv.
	ReadRectDynArrayElem (see page 2776)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 2776)	This is ReadRow, a member of class TSOAPDomConv.
	ReadVarArrayDim (see page 2776)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 2777)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 2777)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 2777)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 2777)	This is the overview for the SerializationOptions method overload.
	SetNodeType (see page 2778)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 2778)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 2779)	This is SetOptions, a member of class TSOAPDomConv.
	UnhandledNode (see page 2779)	This is UnhandledNode, a member of class TSOAPDomConv.
	WriteHeader (see page 2779)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 2779)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 2780)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 2780)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 2780)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.
	WriteVarArray (see page 2780)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 2781)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 2781)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	AddAttachment (see page 921)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	ConvertNativeDataToSoap (see page 2765)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 2766)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.
	Create (see page 2751)	Creates a new TOPToSoapDomConvert (see page 2747) object.
	Destroy (see page 2751)	Frees the memory associated with the TOPToSoapDomConvert (see page 2747) object.
	FindAttachment (see page 922)	Returns a TSOAPAttachment (see page 895) instance that represent the attachment with a specified ID.
	GetAttachments (see page 2732)	Returns the value of the Attachments (see page 2738) property.
	GetEncoding (see page 2732)	Returns the value of the Encoding (see page 2738) property.
	GetOptions (see page 2732)	Returns the value of the Options (see page 2739) property.
	GetTempDir (see page 2732)	Returns the value of the TempDir (see page 2739) property.
	InitObjectFromSOAP (see page 922)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	InvContextToMsg (see page 2752)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 2752)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 2753)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 2734)	This is the overview for the MsgToInvContext method overload.
	MsgToInvContext (see page 2753)	This is the overview for the MsgToInvContext method overload.
	ObjInstanceToSOAP (see page 922)	Returns the SOAP representation of a remotable object.
	ProcessResponse (see page 2735)	This is the overview for the ProcessResponse method overload.
	ProcessResponse (see page 2755)	This is the overview for the ProcessResponse method overload.
	SetAttachments (see page 2736)	Sets the value of the Attachments (see page 2738) property.
	SetEncoding (see page 2737)	Sets the value of the Encoding (see page 2738) property.
	SetOptions (see page 2737)	Sets the value of the Options (see page 2739) property.
	SetTempDir (see page 2737)	Sets the value of the TempDir (see page 2739) property.

Public Properties

	Name	Description
	Attachments (see page 2756)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
	Options (see page 2739)	Controls how certain types of conversions are performed.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 2782)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 2782)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Published Properties

	Name	Description
	Encoding (see page 2756)	Indicates the character set to use for encoded method calls.
	Options (see page 2781)	Controls how the TSOAPDomConv (see page 2758) object performs certain types of conversions.
	TempDir (see page 2757)	Specifies the directory where temporary files for attachments are saved.
	WSDLView (see page 2758)	Provides access to information in a WSDL document that represents the SOAP request.

51.1.2.2 TOPToSoapDomConvert.Create Constructor

Creates a new TOPToSoapDomConvert (see page 2747) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOPToSoapDomConvert(TComponent * AOwner);
```

Description

Most applications do not create instances of TOPToSoapDomConvert (see page 2747). It is created by the THTTPRio and TSoapPascalInvoker objects to handle the marshaling and unmarshaling of SOAP method calls.

The AOwner parameter specifies the component that is responsible for freeing the TOPToSoapDomConvert (see page 2747) instance.

See Also

Owner

THTTPRIO

TSoapPascalInvoker

51.1.2.3 TOPToSoapDomConvert.Destroy Destructor

Frees the memory associated with the TOPToSoapDomConvert (see page 2747) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOPToSoapDomConvert();
```

Description

Typically, TOPToSoapDomConvert (see page 2747) objects are freed by the objects that create them to handle the marshaling and unmarshaling of SOAP method calls.

Do not call Destroy directly in an application. Instead, use the Free method, that checks whether the reference is nil before calling Destroy.

See Also

Create (see page 2751)

System::TObject::Free

51.1.2.4 TOPToSoapDomConvert Methods

The methods of the TOPToSoapDomConvert class are listed here.

Protected Methods

	Name	Description
	NewXMLDocument (see page 2754)	Creates a new empty XML document to hold the SOAP representation and returns its interface.

Public Methods

	Name	Description
	InvContextToMsg (see page 2752)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 2752)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 2753)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 2753)	This is the overview for the MsgToInvContext method overload.
	ProcessResponse (see page 2755)	This is the overview for the ProcessResponse method overload.

51.1.2.4.1 TOPToSoapDomConvert.InvContextToMsg Method

Marshals a method call from an invocation context to a transportable string.

Pascal

```
function InvContextToMsg(const IntfMD: TIntfMetaData; MethNum: Integer; Con: TInvContext;
Headers: THeaderList): TStream;
```

C++

```
__fastcall TStream InvContextToMsg(const TIntfMetaData IntfMD, int MethNum, TInvContext Con,
THeaderList Headers);
```

Description

InvContextToMsg looks up a specified method call, including the types and values of any arguments, from an invocation context, and returns an encoded version of that method call that can be transported to the application that executes it.

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum identifies the called method by its position in the interface's method table.

Con is the invocation context that contains details of the method call, including the parameter values passed in, the calling conventions, and any other temporary data used when making the call.

Headers is a list of TSOAPHeader (see page 908) descendants that represent the headers of the SOAP envelope that contained the method call.

InvContextToMsg returns a stream from which an application can read the encoded version of the method call.

See Also

MsgToInvContext (see page 2754)

51.1.2.4.2 TOPToSoapDomConvert.MakeFault Method

Encodes an exception that was raised when trying to execute a method on an invokable interface.

Pascal

```
procedure MakeFault(const Ex: Exception; EStream: TStream); virtual;
```

C++

```
virtual __fastcall MakeFault(const Exception Ex, TStream EStream);
```

Description

MakeFault encodes an exception that a Web Service application catches when trying to execute a method on an invokable interface. It generates an encoded exception packet, which the client can decode and use to raise the exception on the client application.

Ex is the exception object that represents the exception that occurred.

EStream is a stream to which MakeFault writes the encoded exception packet.

See Also

MakeResponse (see page 2753)

51.1.2.4.3 TOPToSoapDomConvert.MakeResponse Method

Encodes the results of successfully executing a method on an invokable interface.

Pascal

```
procedure MakeResponse(const IntfMD: TIntfMetaData; const MethNum: Integer; Context:
TInvContext; Response: TStream; Headers: THeaderLIst); virtual;
```

C++

```
virtual __fastcall MakeResponse(const TIntfMetaData IntfMD, const int MethNum, TInvContext
Context, TStream Response, THeaderLIst Headers);
```

Description

MakeResponse retrieves the results of executing a method on an invokable interface from an invocation context and packages them into a transportable string, which it writes to a stream. This string is passed back to the client, which can unpack it using the ProcessResponse (see page 2755) method.

IntfMD represents the runtime type information (RTTI) from the interface whose method was executed.

MethNum identifies the called method by its position in the interface's method table.

Context is the invocation context that contains details of the method call.

Headers is a list of TSOAPHeader (see page 908) descendants that should be converted to headers on the encoded response.

Response is a stream to which MakeResponse writes the encoded version of the method result and any output parameters.

Headers is a list of TSOAPHeader (see page 908) descendants that represent the headers that should be added to the response message.

See Also

MakeFault (see page 2752)

ProcessResponse (see page 2755)

51.1.2.4.4 MsgToInvContext Method

This is the overview for the MsgToInvContext method overload.

Overload List

	Name	Description
	TOPToSoapDomConvert.MsgToInvContext (InvString, TIntfMetaData, Integer, TInvContext) (see page 2754)	Unpacks an encoded method call into an invocation context so that it can be executed.

	TOPToSoapDomConvert.MsgToInvContext (TStream, TIntfMetaData, Integer, TInvContext, THeaderList) (see page 2754)	Unpacks an encoded method call into an invocation context so that it can be executed.

51.1.2.4.4.1 TOPToSoapDomConvert.MsgToInvContext Method (InvString, TIntfMetaData, Integer, TInvContext)

Unpacks an encoded method call into an invocation context so that it can be executed.

Pascal

```
procedure MsgToInvContext(const Request: InvString; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext); virtual; overload;
procedure MsgToInvContext(const Request: TStream; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext; Headers: THeaderList); virtual; overload;
```

C++

```
virtual __fastcall MsgToInvContext(const InvString Request, const TIntfMetaData IntfMD, int
MethNum, TInvContext Context);
virtual __fastcall MsgToInvContext(const TStream Request, const TIntfMetaData IntfMD, int
MethNum, TInvContext Context, THeaderList Headers);
```

Description

MsgToInvContext takes an encoded message that a server application receives and uses it to fill out an invocation context, which can then be used to execute the method call.

Request is the encoded method call, or a stream from which to read that method call. It is generated on the client by a call to InvContextToMsg (see page 2752).

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum returns the position of the called method in the interface's method table.

Context is the invocation context to which this method adds the information encoded in Request.

Headers is an object list to which MsgToInvContext adds TSOAPHeader (see page 908) descendants to represent every header in the encoded message.

See Also

InvContextToMsg (see page 2752)

51.1.2.4.5 TOPToSoapDomConvert.NewXMLDocument Method

Creates a new empty XML document to hold the SOAP representation and returns its interface.

Pascal

```
function NewXMLDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument NewXMLDocument();
```

Description

TOPToSoapDomConvert (see page 2747) uses NewXMLDocument internally to create the object that holds the SOAP representation of a message. It returns an interface for working with this representation. Note that the XML document that NewXMLDocument returns is empty. TOPToSoapDomConvert (see page 2747) subsequently uses the methods of the interface to fill out the body of this document.

51.1.2.4.6 ProcessResponse Method

This is the overview for the ProcessResponse method overload.

Overload List

	Name	Description
	TOPToSoapDomConvert.ProcessResponse (InvString, TIntfMetaData, TIntfMethEntry, TInvContext) (see page 2755)	Unpacks the response packet from a method call into an invocation context.
	TOPToSoapDomConvert.ProcessResponse (IXMLDocument, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 2755)	Unpacks the response packet from a method call into an invocation context.
	TOPToSoapDomConvert.ProcessResponse (TStream, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 2755)	Unpacks the response packet from a method call into an invocation context.

51.1.2.4.6.1 TOPToSoapDomConvert.ProcessResponse Method (IXMLDocument, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList)

Unpacks the response packet from a method call into an invocation context.

Pascal

```
procedure ProcessResponse(const Resp: InvString; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext); virtual; overload;
procedure ProcessResponse(const Resp: TStream; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); virtual; overload;
procedure ProcessResponse(const XMLDoc: IXMLDocument; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); virtual; overload;
```

C++

```
virtual __fastcall ProcessResponse(const InvString Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context);
virtual __fastcall ProcessResponse(const TStream Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
virtual __fastcall ProcessResponse(const IXMLDocument XMLDoc, const TIntfMetaData IntfMD,
const TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
```

Description

ProcessResponse takes the encoded results of executing a method on an invokable interface from an invocation context and unpacks them into an invocation context.

Response is the encoded results of executing a method on the invokable interface, or a stream from which those results can be read. It is generated on the server by the MakeResponse (see page 2753) method if the call was successful, or the MakeFault (see page 2752) method if the call was unsuccessful.

XMLDoc is the interface to an XML document that represents the results of executing a method on the invokable interface. The values of its nodes come from the MakeResponse (see page 2753) method if the call was successful, or the MakeFault (see page 2752) method if the call was unsuccessful.

IntfMD describes the runtime type information (RTTI) of the interface whose method was called.

MD describes the runtime type information (RTTI) of the method that was called.

Context is the invocation context that ProcessResponse fills out based on the contents of Response.

Headers is a list that ProcessResponse fills with TSOAPHeader (see page 908) descendants that represent the headers of the

encoded result message.

MakeFault (see page 2752)

MakeResponse (see page 2753)

51.1.2.5 TOPToSoapDomConvert Properties

The properties of the TOPToSoapDomConvert class are listed here.

Public Properties

	Name	Description
	Attachments (see page 2756)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Published Properties

	Name	Description
	Encoding (see page 2756)	Indicates the character set to use for encoded method calls.
	TempDir (see page 2757)	Specifies the directory where temporary files for attachments are saved.
	WSDLView (see page 2758)	Provides access to information in a WSDL document that represents the SOAP request.

51.1.2.5.1 TOPToSoapDomConvert.Attachments Property

Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Pascal

```
property Attachments: TSOAPDataList;
```

C++

```
__property TSOAPDataList Attachments;
```

Description

When a method on an invokable interface requires the user to send or receive attachments, these attachments are each represented by a TSoapAttachment object. Attachments lists the TSoapAttachment objects for each attachment of the current method.

Note: When the application that contains TOPToSoapDomConvert (see page 2747) receives attachments, it writes them to a temporary file rather than storing them in memory. The location for these temporary files is specified by the TempDir (see page 2757) property.

See Also

TempDir (see page 2757)

TSOAPAttachment (see page 895)

51.1.2.5.2 TOPToSoapDomConvert.Encoding Property

Indicates the character set to use for encoded method calls.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Use Encoding to indicate the character set that is used for encoded method calls. Encoding causes the converter to make character set conversions using the DOM, rather than at the transport level. This approach is more efficient than transport-level encoding. If you set Encoding, the Options (see page 2781) property should not include soUTF8EncodeXML and soUTF8InHeader.

If you do not specify an encoding (that is, if Encoding is an empty string), TOPToSoapDomConvert (see page 2747) converts characters at the transport level assuming UTF-8.

TOPToSoapDomConvert (see page 2747) uses the DOM parser identified by the global DefaultDOMVendor variable to perform its conversions. Encoding must indicate an encoding that this default DOM parser supports.

Note: Some Web Services (such as Apache or .NET) require transport level encoding rather than DOM level encoding. In such cases, it is possible that setting Encoding can cause problems because the Web Service converts characters at the transport level and then converts a second time because of the encoding attribute that Encoding adds to the XML representation. If a Web Service requires transport-level encoding and assumes UTF8, Encoding should be an empty string and the Options (see page 2781) property should include soUTF8EncodeXML and soUTF8InHeader.

See Also

DefaultDOMVendor

Encoding

Options (see page 2781)

51.1.2.5.3 TOPToSoapDomConvert.TempDir Property

Specifies the directory where temporary files for attachments are saved.

Pascal

```
property TempDir: string;
```

C++

```
__property UnicodeString TempDir;
```

Description

When the application that includes this TOPToSoapDomConvert (see page 2747) instance receives an attachment as the value of a parameter (or the return value) of the current method, TOPToSoapDomConvert (see page 2747) writes the attachment to a temporary file. This temporary file becomes the value of the CacheFile property on the TSoapAttachment object that represents the attachment.

Use TempDir to specify the directory where TOPToSoapDomConvert (see page 2747) writes the temporary files for attachments.

Note: If TempDir is not set, the application uses the default temporary directory. On Windows, this is the directory that the Windows API GetTempPath returns. On Linux, this is obtained from the TMPDIR environment setting (or, if TMPDIR is not set, /tmp/)

See Also

Attachments (see page 2756)

CacheFile (see page 904)

51.1.2.5.4 TOPToSoapDomConvert.WSDLView Property

Provides access to information in a WSDL document that represents the SOAP request.

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

WSDLView represents information about the SOAP request when the application uses a WSDL document to define information about the interface. If the application does not use a WSDL document, WSDLView is nil (Delphi) or NULL (C++).

WSDL includes the parsed WSDL document, as well as properties to identify the target method call.

51.1.3 TSOAPDomConv Class

TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

Class Hierarchy

Pascal

```
TSOAPDomConv = class(TSOAPDOMProcessor, IObjConverter);
```

C++

```
class TSOAPDomConv : public TSOAPDOMProcessor, public IObjConverter;
```

File

OPToSOAPDomConv

Description

TSOAPDomConv is the base class for DOM-based components that interpret and create SOAP method calls. It handles the logic of converting between the SOAP representation of a type and its native representation. TSOAPDomConv uses the remotable type registry (RemTypeRegistry (see page 931)) to look up the native type or class that corresponds to a type from a SOAP method call and to generate an instance of that type to represent an incoming value. It uses runtime type information (RTTI) to convert a native type or remotable class to its SOAP representation.

TSOAPDomConv implements the IObjConverter (see page 920) interface.

Do not create instances of TSOAPDomConv. It is intended only as a base class for components that interpret or create SOAP method calls.

See Also

TOPToSoapDomConvert (see page 2747)

RemTypeRegistry (see page 931)

IObjConverter (see page 920)

51.1.3.1 TSOAPDomConv Members

The following tables list the members exposed by TSOAPDomConv.

Protected Methods

	Name	Description
	AddAttachment (see page 2763)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 2763)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 2763)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 2763)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
	CheckEncodingStyle (see page 2764)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 2764)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 2764)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 2764)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 2765)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 2765)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.
	ConvertSoapToEnum (see page 2766)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 2766)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 2766)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 2767)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 2767)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 2768)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.
	CreateMultiRefNode (see page 2768)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 2768)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 2768)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 2769)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.
	CreateTypedNode (see page 2769)	This is CreateTypedNode, a member of class TSOAPDomConv.
	FinalizeMultiRefNodes (see page 2769)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 2769)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
	FindMultiRefNodeByID (see page 2770)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 2770)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 2770)	This is FindNodeByHREF, a member of class TSOAPDomConv.
	FindPrefixForURI (see page 2770)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetDataNode (see page 2771)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 2771)	This is GetElementType, a member of class TSOAPDomConv.
	GetNewID (see page 2771)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 2771)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 2771)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 2772)	This is GetOptions, a member of class TSOAPDomConv.
	GetTypeBySchemaNS (see page 2772)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	InitObjectFromSOAP (see page 2772)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	IsNodeAVarArray (see page 2773)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 2773)	This is IsObjectWriting, a member of class TSOAPDomConv.
	LoadObject (see page 2773)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 2773)	This is the overview for the MakeArrayNode method overload.
	MultiRefObject (see page 2774)	This is MultiRefObject, a member of class TSOAPDomConv.
	NodeIsNULL (see page 2774)	This is NodeIsNULL, a member of class TSOAPDomConv.
	ObjectMemberNoShow (see page 2775)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 2775)	Returns the SOAP representation of a remotable object.
	ReadHeader (see page 2775)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 2776)	This is ReadRectDynArray, a member of class TSOAPDomConv.

	ReadRectDynArrayElem (see page 2776)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 2776)	This is ReadRow, a member of class TSOAPDomConv.
	ReadVarArrayDim (see page 2776)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 2777)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 2777)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 2777)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 2777)	This is the overview for the SerializationOptions method overload.
	SetNodeType (see page 2778)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 2778)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 2779)	This is SetOptions, a member of class TSOAPDomConv.
	UnhandledNode (see page 2779)	This is UnhandledNode, a member of class TSOAPDomConv.
	WriteHeader (see page 2779)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 2779)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 2780)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 2780)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 2780)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.
	WriteVarArray (see page 2780)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 2781)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 2781)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	ConvertNativeDataToSoap (see page 2765)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 2766)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.
V	Create (see page 2760)	Creates a new TSOAPDomConv (see page 2758) object.
V	Destroy (see page 2761)	Frees the memory associated with the TSOAPDomConv (see page 2758) object.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 2782)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 2782)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Published Properties

	Name	Description
	Options (see page 2781)	Controls how the TSOAPDomConv (see page 2758) object performs certain types of conversions.

51.1.3.2 TSOAPDomConv.Create Constructor

Creates a new TSOAPDomConv (see page 2758) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSOAPDomConv(TComponent * AOwner);
```

Description

Typically, applications do not need to create instances of TSOAPDomConv (see page 2758). Instead, it is created and used by THTTPRio on client applications and THTTPSoapPascalInvoker or THTTPSoapCppInvoker on server applications.

The AOwner parameter specifies the component that is responsible for freeing the TSOAPDomConv (see page 2758) instance.

See Also

Owner

THTTPRIO

THTTPSoapPascalInvoker

THTTPSoapCppInvoker

51.1.3.3 TSOAPDomConv.Destroy Destructor

Frees the memory associated with the TSOAPDomConv (see page 2758) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPDomConv();
```

Description

Do not call Destroy to free an instance of TSOAPDomConv (see page 2758). Instead, use the Free method, which first checks for a nil reference before calling Destroy.

See Also

System::TObject::Free

51.1.3.4 TSOAPDomConv Methods

The methods of the TSOAPDomConv class are listed here.

Protected Methods

	Name	Description
	AddAttachment (see page 2763)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 2763)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 2763)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 2763)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
	CheckEncodingStyle (see page 2764)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 2764)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 2764)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 2764)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 2765)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 2765)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.
	ConvertSoapToEnum (see page 2766)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 2766)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 2766)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 2767)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 2767)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 2768)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.
	CreateMultiRefNode (see page 2768)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 2768)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 2768)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 2769)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.

	CreateTypedNode (see page 2769)	This is CreateTypedNode, a member of class TSOAPDomConv.
	FinalizeMultiRefNodes (see page 2769)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 2769)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
	FindMultiRefNodeByID (see page 2770)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 2770)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 2770)	This is FindNodeByHREF, a member of class TSOAPDomConv.
	FindPrefixForURI (see page 2770)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetDataNode (see page 2771)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 2771)	This is GetElementType, a member of class TSOAPDomConv.
	GetNewID (see page 2771)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 2771)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 2771)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 2772)	This is GetOptions, a member of class TSOAPDomConv.
	GetTypeBySchemaNS (see page 2772)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	InitObjectFromSOAP (see page 2772)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	IsNodeAVarArray (see page 2773)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 2773)	This is IsObjectWriting, a member of class TSOAPDomConv.
	LoadObject (see page 2773)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 2773)	This is the overview for the MakeArrayNode method overload.
	MultiRefObject (see page 2774)	This is MultiRefObject, a member of class TSOAPDomConv.
	NodeIsNULL (see page 2774)	This is NodeIsNULL, a member of class TSOAPDomConv.
	ObjectMemberNoShow (see page 2775)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 2775)	Returns the SOAP representation of a remotable object.
	ReadHeader (see page 2775)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 2776)	This is ReadRectDynArray, a member of class TSOAPDomConv.
	ReadRectDynArrayElem (see page 2776)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 2776)	This is ReadRow, a member of class TSOAPDomConv.
	ReadVarArrayDim (see page 2776)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 2777)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 2777)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 2777)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 2777)	This is the overview for the SerializationOptions method overload.
	SetNodeType (see page 2778)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 2778)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 2779)	This is SetOptions, a member of class TSOAPDomConv.
	UnhandledNode (see page 2779)	This is UnhandledNode, a member of class TSOAPDomConv.
	WriteHeader (see page 2779)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 2779)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 2780)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 2780)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 2780)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.
	WriteVarArray (see page 2780)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 2781)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 2781)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	ConvertNativeDataToSoap (see page 2765)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 2766)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.

51.1.3.4.1 TSOAPDomConv.AddAttachment Method

Stores information about a SOAP attachment so that it is included in the final message that is created.

Pascal

```
procedure AddAttachment(Attachment: TSOAPAttachment; const AContentId: string);
```

C++

```
__fastcall AddAttachment(TSOAPAttachment Attachment, const UnicodeString AContentId);
```

Description

AddAttachment stores a SOAP attachment so that it can be used to generate part of the multipart form that includes the SOAP envelope as another of its parts.

Attachment is the attachment that should be added to the multipart form.

AContentId is a string that uniquely identifies the attachment. It is added as a header to the part of the form that contains the attachment so that XML in the SOAP envelope can refer to the attachment. When interpreting the encoded SOAP envelope, this value is passed to the FindAttachment method so that the information in the attachment part can be used to recreate the TSOAPAttachment instance.

See Also

FindAttachment (see page 922)

51.1.3.4.2 TSOAPDomConv.AddMultiRefNode Method

Pascal

```
procedure AddMultiRefNode(const ID: string; Instance: Pointer);
```

C++

```
__fastcall AddMultiRefNode(const UnicodeString ID, void * Instance);
```

Description

This is AddMultiRefNode, a member of class TSOAPDomConv.

51.1.3.4.3 TSOAPDomConv.AddNamespaceDecl Method

Pascal

```
function AddNamespaceDecl(Node: IXMLNode; const URI: InvString): InvString;
```

C++

```
__fastcall InvString AddNamespaceDecl(IXMLNode Node, const InvString URI);
```

Description

This is AddNamespaceDecl, a member of class TSOAPDomConv.

51.1.3.4.4 TSOAPDomConv.AddObjectAsWriting Method

Pascal

```
procedure AddObjectAsWriting(Instance: TObject);
```

C++

```
__fastcall AddObjectAsWriting(TObject * Instance);
```

Description

This is AddObjectAsWriting, a member of class TSOAPDomConv.

51.1.3.4.5 TSOAPDomConv.CheckEncodingStyle Method

Pascal

```
procedure CheckEncodingStyle(Node: IXMLNode);
```

C++

```
__fastcall CheckEncodingStyle(IXMLNode Node);
```

Description

This is CheckEncodingStyle, a member of class TSOAPDomConv.

51.1.3.4.6 TSOAPDomConv.ChildNodesAreNull Method

Pascal

```
function ChildNodesAreNull(Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean ChildNodesAreNull(IXMLNode Node);
```

Description

This is ChildNodesAreNull, a member of class TSOAPDomConv.

51.1.3.4.7 TSOAPDomConv.ConvertByteArrayToSoap Method

Pascal

```
procedure ConvertByteArrayToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer);
```

C++

```
__fastcall ConvertByteArrayToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P);
```

Description

This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.

51.1.3.4.8 TSOAPDomConv.ConvertEnumToSoap Method

Pascal

```
function ConvertEnumToSoap(Info: PTypeInfo; P: Pointer; NumIndirect: Integer): InvString;
```

C++

```
__fastcall InvString ConvertEnumToSoap(PTypeInfo Info, void * P, int NumIndirect);
```

Description

This is ConvertEnumToSoap, a member of class TSOAPDomConv.

51.1.3.4.9 TSOAPDomConv.ConvertNativeArrayToSoap Method

Pascal

```
procedure ConvertNativeArrayToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer; NumIndirect: Integer; InlineElements: Boolean = False);
```

C++

```
__fastcall ConvertNativeArrayToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P, int NumIndirect, Boolean InlineElements = False);
```

Description

This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.

51.1.3.4.10 TSOAPDomConv.ConvertNativeDataToSoap Method

Converts a native type to its SOAP representation.

Pascal

```
procedure ConvertNativeDataToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer; NumIndirect: Integer); dynamic;
```

C++

```
__fastcall ConvertNativeDataToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P, int NumIndirect);
```

Description

ConvertNativeDataToSoap performs the conversion from a native type to its SOAP representation and adds that to the emerging DOM representation of a SOAP packet. It uses the options specified by the Options (see page 2781) property to determine whether to include type data and how to handle multiple references to the same remotable object.

RootNode is the node in the emerging SOAP representation that acts as a parent to any elements that represent an object that has multiple references.

Node is the parent node to which ConvertNativeDataToSoap adds a new child node that represents the native value.

Name is the type name of the SOAP encoding of the native type.

Info is a TypeInfo pointer that indicates the type in which the native data appears.

P is a pointer to the value to convert. It points (possibly with additional levels of indirection) to a value of the type indicated by Info.

NumIndirect indicates the number of levels of indirection by which P points to a value of the type indicated by Info.

ConvertSoapToNativeData (see page 2766)

Options (see page 2781)

51.1.3.4.11 TSOAPDomConv.ConvertObjectToSOAP Method

Pascal

```
procedure ConvertObjectToSOAP(const Name: InvString; ObjP: Pointer; RootNode: IXMLNOde; Node:
IXMLNOde; NumIndirect: Integer);
```

C++

```
__fastcall ConvertObjectToSOAP(const InvString Name, void * ObjP, IXMLNOde RootNode, IXMLNOde
Node, int NumIndirect);
```

Description

This is ConvertObjectToSOAP, a member of class TSOAPDomConv.

51.1.3.4.12 TSOAPDomConv.ConvertSoapToEnum Method

Pascal

```
function ConvertSoapToEnum(Info: PTypeInfo; S: InvString; IsNull: Boolean): Integer;
```

C++

```
__fastcall int ConvertSoapToEnum(PTypeInfo Info, InvString S, Boolean IsNull);
```

Description

This is ConvertSoapToEnum, a member of class TSOAPDomConv.

51.1.3.4.13 TSOAPDomConv.ConvertSoapToNativeArray Method

Pascal

```
function ConvertSoapToNativeArray(DataP: Pointer; TypeInfo: PTypeInfo; RootNode: IXMLNode;
Node: IXMLNode): Pointer;
```

C++

```
__fastcall void * ConvertSoapToNativeArray(void * DataP, PTypeInfo TypeInfo, IXMLNode
RootNode, IXMLNode Node);
```

Description

This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.

51.1.3.4.14 TSOAPDomConv.ConvertSoapToNativeArrayElem Method

Pascal

```
function ConvertSoapToNativeArrayElem(ArrayInfo: PTypeInfo; ElemInfo: PTypeInfo; RootNode:
IXMLNode; Node: IXMLNode; ArrayDesc: TSOAPArrayDesc; Dims: Integer; CurDim: Integer; DataP:
Pointer): Pointer;
```

C++

```
__fastcall void * ConvertSoapToNativeArrayElem(PTypeInfo ArrayInfo, PTypeInfo ElemInfo,
IXMLNode RootNode, IXMLNode Node, TSOAPArrayDesc ArrayDesc, int Dims, int CurDim, void *
DataP);
```

Description

This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.

51.1.3.4.15 TSOAPDomConv.ConvertSoapToNativeData Method

Converts the SOAP representation of a value to a pointer to the corresponding native representation.

Pascal

```
procedure ConvertSoapToNativeData(DataP: Pointer; TypeInfo: PTypeInfo; Context: TDataContext;
RootNode: IXMLNode; Node: IXMLNode; Translate: Boolean; ByRef: Boolean; NumIndirect: Integer);
```

```
dynamic;
```

C++

```
__fastcall ConvertSoapToNativeData(void * DataP, PTypeInfo TypeInfo, TDataContext Context,
IXMLNode RootNode, IXMLNode Node, Boolean Translate, Boolean ByRef, int NumIndirect);
```

Description

ConvertSoapToNativeData performs the conversion from a DOM node that represents a SOAP encoding of a value to the corresponding native representation.

DataP is a pointer to the memory allocated to hold the native representation of the value, and points to the results of the conversion.

TypeInfo is the typeinfo pointer that describes the native type that will represent the value.

Context is the TDataContext (see page 814) object that stores the value.

RootNode is the node in the SOAP packet that acts as a parent to any elements to which there are multiple references.

Node is the node in the SOAP packet whose value is to be translated.

Translate indicates whether Node represents a value to be translated, as opposed to a reference to value that is found elsewhere in the SOAP packet.

ByRef indicates whether the node corresponds to a parameter that is passed by reference.

NumIndirect indicates the number of levels of indirection by which DataP points to its value.

ConvertNativeDataToSoap (see page 2765)

Options (see page 2781)

51.1.3.4.16 TSOAPDomConv.ConvertSOAPToObject Method

Pascal

```
function ConvertSOAPToObject(RootNode: IXMLNode; Node: IXMLNode; AClass: TClass; const URI:
InvString; const TypeName: InvString; ObjP: Pointer; NumIndirect: Integer): TObject;
```

C++

```
__fastcall TObject * ConvertSOAPToObject(IXMLNode RootNode, IXMLNode Node, TClass AClass,
const InvString URI, const InvString TypeName, void * ObjP, int NumIndirect);
```

Description

This is ConvertSOAPToObject, a member of class TSOAPDomConv.

51.1.3.4.17 TSOAPDomConv.ConvertSoapToVariant Method

Pascal

```
procedure ConvertSoapToVariant(Node: IXMLNode; InvData: Pointer);
```

C++

```
__fastcall ConvertSoapToVariant(IXMLNode Node, void * InvData);
```

Description

This is ConvertSoapToVariant, a member of class TSOAPDomConv.

51.1.3.4.18 TSOAPDomConv.ConvertVariantToSoap Method

Pascal

```
procedure ConvertVariantToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: PVarData; NumIndirect: Integer; V: Variant; UseVariant: Boolean);
```

C++

```
__fastcall ConvertVariantToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, PVarData P, int NumIndirect, Variant V, Boolean UseVariant);
```

Description

This is ConvertVariantToSoap, a member of class TSOAPDomConv.

51.1.3.4.19 TSOAPDomConv.CreateMultiRefNode Method

Pascal

```
function CreateMultiRefNode(RootNode: IXMLNode; const Name: InvString; const ID: InvString):
IXMLNode;
```

C++

```
__fastcall IXMLNode CreateMultiRefNode(IXMLNode RootNode, const InvString Name, const
InvString ID);
```

Description

This is CreateMultiRefNode, a member of class TSOAPDomConv.

51.1.3.4.20 TSOAPDomConv.CreateNULLNode Method

Pascal

```
function CreateNULLNode(RootNode: IXMLNode; ParentNode: IXMLNode; const Name: InvString;
UseParentNode: Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNULLNode(IXMLNode RootNode, IXMLNode ParentNode, const InvString
Name, Boolean UseParentNode = False);
```

Description

This is CreateNULLNode, a member of class TSOAPDomConv.

51.1.3.4.21 TSOAPDomConv.CreateObjectNode Method

Pascal

```
function CreateObjectNode(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
Name: InvString; const URI: InvString; ObjConvOpts: TObjectConvertOptions): InvString;
```

C++

```
__fastcall InvString CreateObjectNode(TObject * Instance, IXMLNode RootNode, IXMLNode
ParentNode, const InvString Name, const InvString URI, TObjectConvertOptions ObjConvOpts);
```

Description

This is CreateObjectNode, a member of class TSOAPDomConv.

51.1.3.4.22 TSOAPDomConv.CreateScalarNodeXS Method

Pascal

```
function CreateScalarNodeXS(RootNode: IXMLNode; ParentNode: IXMLNode; const NodeName:
InvString; const URI: InvString; const TypeName: InvString; const Value: InvString; GenPre:
Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateScalarNodeXS(IXMLNode RootNode, IXMLNode ParentNode, const InvString
NodeName, const InvString URI, const InvString TypeName, const InvString Value, Boolean GenPre
= False);
```

Description

This is CreateScalarNodeXS, a member of class TSOAPDomConv.

51.1.3.4.23 TSOAPDomConv.CreateTypedNode Method

Pascal

```
function CreateTypedNode(RootNode: IXMLNode; ParentNode: IXMLNode; const NodeName: InvString;
const URI: InvString; TypeName: InvString; GenPre: Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateTypedNode(IXMLNode RootNode, IXMLNode ParentNode, const InvString
NodeName, const InvString URI, InvString TypeName, Boolean GenPre = False);
```

Description

This is CreateTypedNode, a member of class TSOAPDomConv.

51.1.3.4.24 TSOAPDomConv.FinalizeMultiRefNodes Method

Pascal

```
procedure FinalizeMultiRefNodes;
```

C++

```
__fastcall FinalizeMultiRefNodes();
```

Description

This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.

51.1.3.4.25 TSOAPDomConv.FindAttachment Method

Returns a TSOAPAttachment instance that represent the attachment with a specified ID.

Pascal

```
function FindAttachment(const AContentId: string): TSOAPAttachment;
```

C++

```
__fastcall TSOAPAttachment FindAttachment(const UnicodeString AContentId);
```

Description

FindAttachment locates the attachment that is identified by a specified content ID (HREF).

AContentId is the unique identifier for the attachment that was supplied to the AddAttachment method when the attachment was

first added to the multipart form.

FindAttachment returns a TSOAPAttachment instance that represents the attachment.

See Also

AddAttachment (see page 921)

51.1.3.4.26 TSOAPDomConv.FindMultiRefNodeByID Method

Pascal

```
function FindMultiRefNodeByID(const ID: string): Pointer;
```

C++

```
__fastcall void * FindMultiRefNodeByID(const UnicodeString ID);
```

Description

This is FindMultiRefNodeByID, a member of class TSOAPDomConv.

51.1.3.4.27 TSOAPDomConv.FindMultiRefNodeByInstance Method

Pascal

```
function FindMultiRefNodeByInstance(Instance: Pointer): string;
```

C++

```
__fastcall UnicodeString FindMultiRefNodeByInstance(void * Instance);
```

Description

This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.

51.1.3.4.28 TSOAPDomConv.FindNodeByHREF Method

Pascal

```
function FindNodeByHREF(RootNode: IXMLNode; const HREF: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNodeByHREF(IXMLNode RootNode, const InvString HREF);
```

Description

This is FindNodeByHREF, a member of class TSOAPDomConv.

51.1.3.4.29 TSOAPDomConv.FindPrefixForURI Method

Pascal

```
function FindPrefixForURI(RootNode: IXMLNode; Node: IXMLNode; const URI: InvString;
DeclIfNone: Boolean = False): InvString;
```

C++

```
__fastcall InvString FindPrefixForURI(IXMLNode RootNode, IXMLNode Node, const InvString URI,
Boolean DeclIfNone = False);
```

Description

This is FindPrefixForURI, a member of class TSOAPDomConv.

51.1.3.4.30 TSOAPDomConv.GetDataNode Method

Pascal

```
function GetDataNode(RootNode: IXMLNode; Node: IXMLNode; var ID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDataNode(IXMLNode RootNode, IXMLNode Node, InvString ID);
```

Description

This is GetDataNode, a member of class TSOAPDomConv.

51.1.3.4.31 TSOAPDomConv.GetElementType Method

Pascal

```
function GetElementType(Node: IXMLNode; var TypeURI: InvString; var TypeName: InvString):
Boolean;
```

C++

```
__fastcall Boolean GetElementType(IXMLNode Node, InvString TypeURI, InvString TypeName);
```

Description

This is GetElementType, a member of class TSOAPDomConv.

51.1.3.4.32 TSOAPDomConv.GetNewID Method

Pascal

```
function GetNewID: string;
```

C++

```
__fastcall UnicodeString GetNewID();
```

Description

This is GetNewID, a member of class TSOAPDomConv.

51.1.3.4.33 TSOAPDomConv.GetNodeAsText Method

Pascal

```
function GetNodeAsText(Node: IXMLNode): InvString;
```

C++

```
__fastcall InvString GetNodeAsText(IXMLNode Node);
```

Description

This is GetNodeAsText, a member of class TSOAPDomConv.

51.1.3.4.34 TSOAPDomConv.GetObjectPropAsText Method

Pascal

```
function GetObjectPropAsText(Instance: TObject; PropInfo: PPropInfo): InvString;
```

C++

```
__fastcall InvString GetObjectPropAsText(TObject * Instance, PPropInfo PropInfo);
```

Description

This is GetObjectPropAsText, a member of class TSOAPDomConv.

51.1.3.4.35 TSOAPDomConv.GetOptions Method

Pascal

```
function GetOptions: TSOAPConvertOptions;
```

C++

```
__fastcall TSOAPConvertOptions GetOptions();
```

Description

This is GetOptions, a member of class TSOAPDomConv.

51.1.3.4.36 TSOAPDomConv.GetTypeBySchemaNS Method

Pascal

```
function GetTypeBySchemaNS(Node: IXMLNode; const URI: InvString): Variant;
```

C++

```
__fastcall Variant GetTypeBySchemaNS(IXMLNode Node, const InvString URI);
```

Description

This is GetTypeBySchemaNS, a member of class TSOAPDomConv.

51.1.3.4.37 TSOAPDomConv.InitObjectFromSOAP Method

Initializes an instance of a remotable object to reflect the values in its SOAP representation.

Pascal

```
procedure InitObjectFromSOAP(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall InitObjectFromSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

InitObjectFromSOAP assigns values to the published properties of a remotable object that represents a node from the SOAP envelope.

Instance is the remotable object to initialize from its SOAP representation.

RootNode is an ancestor node of the node for the remotable object that can contain information needed for initializing the remotable object.

Node is the node in the SOAP envelope that represents the remotable object.

See Also

ObjInstanceToSOAP (see page 922)

51.1.3.4.38 TSOAPDomConv.IsNodeAVarArray Method

Pascal

```
function IsNodeAVarArray(const Node: IXMLNode; var VT: TVarType): Boolean;
```

C++

```
__fastcall Boolean IsNodeAVarArray(const IXMLNode Node, TVarType VT);
```

Description

This is IsNodeAVarArray, a member of class TSOAPDomConv.

51.1.3.4.39 TSOAPDomConv.IsObjectWriting Method

Pascal

```
function IsObjectWriting(Instance: TObject): Boolean;
```

C++

```
__fastcall Boolean IsObjectWriting(TObject * Instance);
```

Description

This is IsObjectWriting, a member of class TSOAPDomConv.

51.1.3.4.40 TSOAPDomConv.LoadObject Method

Pascal

```
procedure LoadObject(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall LoadObject(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

This is LoadObject, a member of class TSOAPDomConv.

51.1.3.4.41 MakeArrayNode Method

This is the overview for the MakeArrayNode method overload.

Overload List

	Name	Description
	TSOAPDomConv.MakeArrayNode (IXMLNode, IXMLNode, InvString, InvString, InvString, array of Integer) (see page 2774)	This is MakeArrayNode, a member of class TSOAPDomConv.
	TSOAPDomConv.MakeArrayNode (IXMLNode, IXMLNode, InvString, InvString, InvString, Integer, Integer) (see page 2774)	This is MakeArrayNode, a member of class TSOAPDomConv.

51.1.3.4.41.1 TSOAPDomConv.MakeArrayNode Method (IXMLNode, IXMLNode, InvString, InvString, InvString, Integer, Integer)

Pascal

```
function MakeArrayNode(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; const URI:
InvString; const TypeName: InvString; Dim: Integer; Len: Integer): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode MakeArrayNode(IXMLNode RootNode, IXMLNode Node, const InvString Name,
const InvString URI, const InvString TypeName, int Dim, int Len);
```

Description

This is MakeArrayNode, a member of class TSOAPDomConv.

51.1.3.4.41.2 TSOAPDomConv.MakeArrayNode Method (IXMLNode, IXMLNode, InvString, InvString, InvString, array of Integer)

Pascal

```
function MakeArrayNode(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; const URI:
InvString; const TypeName: InvString; Indices: array of Integer): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode MakeArrayNode(IXMLNode RootNode, IXMLNode Node, const InvString Name,
const InvString URI, const InvString TypeName, array of Integer Indices);
```

Description

This is MakeArrayNode, a member of class TSOAPDomConv.

51.1.3.4.42 TSOAPDomConv.MultiRefObject Method

Pascal

```
function MultiRefObject(Cls: TClass): Boolean;
```

C++

```
__fastcall Boolean MultiRefObject(TClass Cls);
```

Description

This is MultiRefObject, a member of class TSOAPDomConv.

51.1.3.4.43 TSOAPDomConv.NodeIsNULL Method

Pascal

```
function NodeIsNULL(Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean NodeIsNULL(IXMLNode Node);
```

Description

This is NodeIsNULL, a member of class TSOAPDomConv.

51.1.3.4.44 TSOAPDomConv.ObjectMemberNoShow Method

Pascal

```
procedure ObjectMemberNoShow(const ClassName: string; const MemberName: string);
```

C++

```
__fastcall ObjectMemberNoShow(const UnicodeString ClassName, const UnicodeString MemberName);
```

Description

This is ObjectMemberNoShow, a member of class TSOAPDomConv.

51.1.3.4.45 TSOAPDomConv.ObjInstanceToSOAP Method

Returns the SOAP representation of a remotable object.

Pascal

```
function ObjInstanceToSOAP(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
NodeName: InvString; const NodeNamespace: InvString; ObjConvOpts: TObjectConvertOptions; out
RefID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode ObjInstanceToSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode
ParentNode, const InvString NodeName, const InvString NodeNamespace, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjInstanceToSOAP adds a node to represent the value of a remotable object.

Instance is the remotable object to encode as its SOAP representation.

RootNode is an ancestor of the node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjInstanceToSOAP generates.

NodeName is the name of the node that is generated.

NodeNamespace is the URI for the namespace in which NodeName is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjInstanceToSOAP returns the XML for the newly generated node.

See Also

InitObjectFromSOAP (see page 922)

51.1.3.4.46 TSOAPDomConv.ReadHeader Method

Pascal

```
procedure ReadHeader(const EnvNode: IXMLNode; const HdrNode: IXMLNode; Headers: THeaderList);
```

C++

```
__fastcall ReadHeader(const IXMLNode EnvNode, const IXMLNode HdrNode, THeaderList Headers);
```

Description

This is ReadHeader, a member of class TSOAPDomConv.

51.1.3.4.47 TSOAPDomConv.ReadRectDynArray Method

Pascal

```
procedure ReadRectDynArray(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Dims: Integer;
P: Pointer; CurElem: Integer);
```

C++

```
__fastcall ReadRectDynArray(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Dims, void *
P, int CurElem);
```

Description

This is ReadRectDynArray, a member of class TSOAPDomConv.

51.1.3.4.48 TSOAPDomConv.ReadRectDynArrayElem Method

Pascal

```
procedure ReadRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Size:
Integer; Dim: Integer; P: Pointer; var CurElem: Integer);
```

C++

```
__fastcall ReadRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Size,
int Dim, void * P, int CurElem);
```

Description

This is ReadRectDynArrayElem, a member of class TSOAPDomConv.

51.1.3.4.49 TSOAPDomConv.ReadRow Method

Pascal

```
procedure ReadRow(RootNode: IXMLNode; Node: IXMLNode; var CurElem: Integer; Size: Integer; P:
Pointer; Info: PTypeInfo);
```

C++

```
__fastcall ReadRow(IXMLNode RootNode, IXMLNode Node, int CurElem, int Size, void * P,
PTypeInfo Info);
```

Description

This is ReadRow, a member of class TSOAPDomConv.

51.1.3.4.50 TSOAPDomConv.ReadVarArrayDim Method

Pascal

```
function ReadVarArrayDim(Node: IXMLNode; IsVarVArray: Boolean = False; VT: TVarType = 0):
Variant;
```

C++

```
__fastcall Variant ReadVarArrayDim(IXMLNode Node, Boolean IsVarVArray = False, TVarType VT =
0);
```

Description

This is ReadVarArrayDim, a member of class TSOAPDomConv.

51.1.3.4.51 TSOAPDomConv.ReadVariant Method

Pascal

```
procedure ReadVariant(Node: IXMLNode; P: Pointer);
```

C++

```
__fastcall ReadVariant(IXMLNode Node, void * P);
```

Description

This is ReadVariant, a member of class TSOAPDomConv.

51.1.3.4.52 TSOAPDomConv.RemoveObjectAsWriting Method

Pascal

```
procedure RemoveObjectAsWriting(Instance: TObject);
```

C++

```
__fastcall RemoveObjectAsWriting(TObject * Instance);
```

Description

This is RemoveObjectAsWriting, a member of class TSOAPDomConv.

51.1.3.4.53 TSOAPDomConv.ResetMultiRef Method

Pascal

```
procedure ResetMultiRef;
```

C++

```
__fastcall ResetMultiRef();
```

Description

This is ResetMultiRef, a member of class TSOAPDomConv.

51.1.3.4.54 SerializationOptions Method

This is the overview for the SerializationOptions method overload.

Overload List

	Name	Description
	TSOAPDomConv.SerializationOptions (PTypeInfo) (see page 2778)	This is SerializationOptions, a member of class TSOAPDomConv.
	TSOAPDomConv.SerializationOptions (TClass) (see page 2778)	This is SerializationOptions, a member of class TSOAPDomConv.
	TSOAPDomConv.SerializationOptions (TObject) (see page 2778)	This is SerializationOptions, a member of class TSOAPDomConv.

51.1.3.4.54.1 TSOAPDomConv.SerializationOptions Method (PTypeInfo)

Pascal

```
function SerializationOptions(ATypeInfo: PTypeInfo): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(PTypeInfo ATypeInfo);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

51.1.3.4.54.2 TSOAPDomConv.SerializationOptions Method (TClass)

Pascal

```
function SerializationOptions(Cls: TClass): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(TClass Cls);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

51.1.3.4.54.3 TSOAPDomConv.SerializationOptions Method (TObject)

Pascal

```
function SerializationOptions(Obj: TObject): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(TObject * Obj);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

51.1.3.4.55 TSOAPDomConv.SetNodeType Method

Pascal

```
procedure SetNodeType(RootNode: IXMLNode; InstNode: IXMLNode; const ElemURI: InvString; const
TypeName: InvString);
```

C++

```
__fastcall SetNodeType(IXMLNode RootNode, IXMLNode InstNode, const InvString ElemURI, const
InvString TypeName);
```

Description

This is SetNodeType, a member of class TSOAPDomConv.

51.1.3.4.56 TSOAPDomConv.SetObjectPropFromText Method

Pascal

```
procedure SetObjectPropFromText(Instance: TObject; PropInfo: PPropInfo; const SoapData:
InvString);
```

C++

```
__fastcall SetObjectPropFromText(TObject * Instance, PPropInfo PropInfo, const InvString
SoapData);
```

Description

This is SetObjectPropFromText, a member of class TSOAPDomConv.

51.1.3.4.57 TSOAPDomConv.SetOptions Method

Pascal

```
procedure SetOptions(const Value: TSOAPConvertOptions);
```

C++

```
__fastcall SetOptions(const TSOAPConvertOptions Value);
```

Description

This is SetOptions, a member of class TSOAPDomConv.

51.1.3.4.58 TSOAPDomConv.UnhandledNode Method

Pascal

```
procedure UnhandledNode(const Name: string; NodeXML: InvString);
```

C++

```
__fastcall UnhandledNode(const UnicodeString Name, InvString NodeXML);
```

Description

This is UnhandledNode, a member of class TSOAPDomConv.

51.1.3.4.59 TSOAPDomConv.WriteHeader Method

Pascal

```
procedure WriteHeader(const Header: TObject; RootNode: IXMLNode; ParentNode: IXMLNode);
```

C++

```
__fastcall WriteHeader(const TObject * Header, IXMLNode RootNode, IXMLNode ParentNode);
```

Description

This is WriteHeader, a member of class TSOAPDomConv.

51.1.3.4.60 TSOAPDomConv.WriteNonRectDynArray Method

Pascal

```
procedure WriteNonRectDynArray(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; const URI: InvString; const TypeName: InvString; P: Pointer; Dim: Integer);
```

C++

```
__fastcall WriteNonRectDynArray(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, const InvString URI, const InvString TypeName, void * P, int Dim);
```

Description

This is WriteNonRectDynArray, a member of class TSOAPDomConv.

51.1.3.4.61 TSOAPDomConv.WriteNonRectDynArrayElem Method

Pascal

```
function WriteNonRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; const
URI: InvString; const TypeName: InvString; P: Pointer; Dim: Integer): Integer;
```

C++

```
__fastcall int WriteNonRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info,
const InvString URI, const InvString TypeName, void * P, int Dim);
```

Description

This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.

51.1.3.4.62 TSOAPDomConv.WriteRectDynArray Method

Pascal

```
procedure WriteRectDynArray(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Dims:
Integer; P: Pointer; const TypeName: InvString);
```

C++

```
__fastcall WriteRectDynArray(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Dims, void
* P, const InvString TypeName);
```

Description

This is WriteRectDynArray, a member of class TSOAPDomConv.

51.1.3.4.63 TSOAPDomConv.WriteRectDynArrayElem Method

Pascal

```
procedure WriteRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Size:
Integer; Dim: Integer; P: Pointer; const TypeName: InvString);
```

C++

```
__fastcall WriteRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Size,
int Dim, void * P, const InvString TypeName);
```

Description

This is WriteRectDynArrayElem, a member of class TSOAPDomConv.

51.1.3.4.64 TSOAPDomConv.WriteVarArray Method

Pascal

```
procedure WriteVarArray(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V: Variant);
```

C++

```
__fastcall WriteVarArray(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant V);
```

Description

This is WriteVarArray, a member of class TSOAPDomConv.

51.1.3.4.65 TSOAPDomConv.WriteVarArrayAsB64 Method

Pascal

```
procedure WriteVarArrayAsB64(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V:
Variant);
```

C++

```
__fastcall WriteVarArrayAsB64(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant
V);
```

Description

This is WriteVarArrayAsB64, a member of class TSOAPDomConv.

51.1.3.4.66 TSOAPDomConv.WriteVariant Method

Pascal

```
procedure WriteVariant(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V: Variant);
```

C++

```
__fastcall WriteVariant(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant V);
```

Description

This is WriteVariant, a member of class TSOAPDomConv.

51.1.3.5 TSOAPDomConv Properties

The properties of the TSOAPDomConv class are listed here.

Published Properties

	Name	Description
	Options (see page 2781)	Controls how the TSOAPDomConv (see page 2758) object performs certain types of conversions.

51.1.3.5.1 TSOAPDomConv.Options Property

Controls how the TSOAPDomConv (see page 2758) object performs certain types of conversions.

Pascal

```
property Options: TSOAPConvertOptions;
```

C++

```
__property TSOAPConvertOptions Options;
```

Description

Set Options to indicate how you want the TSOAPDomConv (see page 2758) object to handle various types of conversions. This set can include zero or more of the TSOAPConvertOption (see page 2740) flags.

See Also

ConvertNativeDataToSoap (see page 2765)

ClassOptions (see page 877)

ConvertSoapToNativeData (see page 2766)

51.1.3.6 TSOAPDomConv Events

The events of the TSOAPDomConv class are listed here.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 2782)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 2782)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

51.1.3.6.1 TSOAPDomConv.OnMemberDataNotReceived Event

Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.

Pascal

```
property OnMemberDataNotReceived: TMemberDataNotReceivedEvent;
```

C++

```
__property TMemberDataNotReceivedEvent OnMemberDataNotReceived;
```

Description

Write an OnMemberDataNotReceived to detect cases where the converter does not receive the information it excepts When a method on an invokable interface requires the user to send or receive OnMemberDataNotReceived, these for deserializing a remotable type (a TRemotable (see page 868) descendant). This event is especially useful during debugging. Typically, after detecting a problem using OnMemberDataNotReceived, the problem is then handled by changing the code that declares or registers the remotable type.

See Also

TRemotable (see page 868)

51.1.3.6.2 TSOAPDomConv.OnUnhandledNode Event

Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Pascal

```
property OnUnhandledNode: TUnhandledNodeEvent;
```

C++

```
__property TUnhandledNodeEvent OnUnhandledNode;
```

Description

Write an OnUnhandledNode to detect and, possibly, fix cases where the converter can't correctly generate the native code corresponding to a node in a SOAP packet.

51.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetOrdPropEx (see page 2783)	This is function OPToSOAPDomConv.GetOrdPropEx.

51.2.1 OPToSOAPDomConv.GetOrdPropEx Function

Pascal

```
function GetOrdPropEx(Instance: TObject; PropInfo: PPropInfo): Longint;
```

C++

```
Longint GetOrdPropEx(TObject * Instance, PPropInfo PropInfo);
```

File

OPToSOAPDomConv

Description

This is function OPToSOAPDomConv.GetOrdPropEx.

51.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	ConvNodeState (see page 2784)	This is record OPToSOAPDomConv.ConvNodeState.

Records

	Name	Description
	TMultiRefNodeElem (see page 2784)	This is record OPToSOAPDomConv.TMultiRefNodeElem.
	TMultiRefNodeMapElem (see page 2785)	This is record OPToSOAPDomConv.TMultiRefNodeMapElem.
	TSOAPArrayElemDesc (see page 2785)	This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

51.3.1 OPToSOAPDomConv.ConvNodeState Enumeration

Pascal

```
ConvNodeState = (
  nsClientSend,
  nsServerReceive,
  nsServerSend,
  nsClientReceive
);
```

C++

```
enum ConvNodeState {
  nsClientSend,
  nsServerReceive,
  nsServerSend,
  nsClientReceive
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.ConvNodeState.

51.3.2 OPToSOAPDomConv.TMultiRefNodeElem Record

Pascal

```
TMultiRefNodeElem = record
  Node: IXMLNode;
  MultiRefChildren: TXMLNodeArray;
end;
```

C++

```
struct TMultiRefNodeElem {
  IXMLNode Node;
  TXMLNodeArray MultiRefChildren;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TMultiRefNodeElem.

51.3.3 OPToSOAPDomConv.TMultiRefNodeMapElem Record

Pascal

```
TMultiRefNodeMapElem = record
  Instance: Pointer;
  ID: string;
end;
```

C++

```
struct TMultiRefNodeMapElem {
  void * Instance;
  UnicodeString ID;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TMultiRefNodeMapElem.

51.3.4 OPToSOAPDomConv.TSOAPArrayElemDesc Record

Pascal

```
TSOAPArrayElemDesc = record
  MultiDim: Boolean;
  Dims: TIntegerDynArray;
end;
```

C++

```
struct TSOAPArrayElemDesc {
  Boolean MultiDim;
  TIntegerDynArray Dims;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

51.4 Types

The following table lists types in this documentation.

Types

Name	Description
TMemberDataNotReceivedEvent (see page 2786)	TMemberDataNotReceivedEvent is the type of the OnMemberDataNotReceived event of TSOAPDomConv (see page 2758).
TMultiRefNodeMap (see page 2787)	This is type OPToSOAPDomConv.TMultiRefNodeMap.
TMultiRefNodes (see page 2787)	This is type OPToSOAPDomConv.TMultiRefNodes.
TSOAPArrayDesc (see page 2787)	This is type OPToSOAPDomConv.TSOAPArrayDesc.
TUnhandledNodeEvent (see page 2788)	TUnhandledNodeEvent is the type of the OnUnhandledNode event of TSOAPDomConv (see page 2758).
TXMLNodeArray (see page 2788)	This is type OPToSOAPDomConv.TXMLNodeArray.

51.4.1 OPToSOAPDomConv.TMemberDataNotReceivedEvent Type

TMemberDataNotReceivedEvent is the type of the OnMemberDataNotReceived event of TSOAPDomConv (see page 2758).

Pascal

```
TMemberDataNotReceivedEvent = procedure (const ClassName: string; const Member: string) of object;
```

C++

```
(const ClassName: string; const Member: string) ( TMemberDataNotReceivedEvent)();
```

File

OPToSOAPDomConv

Description

TMemberDataNotReceivedEvent is the type of the OnMemberDataNotReceived event handler, which is called when a converter is constructing a remotable object from its SOAP representation and fails to find a published class member.

ClassName is the name of the remotable object's class.

Member is the name of the member that was not found in the SOAP representation.

See Also

Procedural types

Creating events

51.4.2 OPToSOAPDomConv.TMultiRefNodeMap Type

Pascal

```
TMultiRefNodeMap = array of TMultiRefNodeMapElem;
```

C++

```
array of TMultiRefNodeMapElem TMultiRefNodeMap;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TMultiRefNodeMap.

51.4.3 OPToSOAPDomConv.TMultiRefNodes Type

Pascal

```
TMultiRefNodes = array of TMultiRefNodeElem;
```

C++

```
array of TMultiRefNodeElem TMultiRefNodes;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TMultiRefNodes.

51.4.4 OPToSOAPDomConv.TSOAPArrayDesc Type

Pascal

```
TSOAPArrayDesc = array of TSOAPArrayElemDesc;
```

C++

```
array of TSOAPArrayElemDesc TSOAPArrayDesc;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TSOAPArrayDesc.

51.4.5 OPToSOAPDomConv.TUnhandledNodeEvent Type

TUnhandledNodeEvent is the type of the OnUnhandledNode event of TSOAPDomConv (see page 2758).

Pascal

```
TUnhandledNodeEvent = procedure (const Name: string; NodeXML: InvString) of object;
```

C++

```
(const Name: string; NodeXML: InvString) ( TUnhandledNodeEvent)();
```

File

OPToSOAPDomConv

Description

TUnhandledNodeEvent is the type of the OnUnhandledNode event handler, which is called when a converter encounters an XML node that it could not convert.

Name is the name of the XML node that the converter did not recognize.

Node is the interface of the node that the converter did not recognize.

See Also

Procedural types

Creating events

51.4.6 OPToSOAPDomConv.TXMLNodeArray Type

Pascal

```
TXMLNodeArray = array of IXMLNode;
```

C++

```
array of IXMLNode TXMLNodeArray;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TXMLNodeArray.

51.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefArrayElemName (see page 2789)	This is variable OPToSOAPDomConv.DefArrayElemName.

51.5.1 OPToSOAPDomConv.DefArrayElemName Variable

Pascal

```
DefArrayElemName: string = 'item';
```

C++

```
UnicodeString DefArrayElemName = 'item';
```

File

OPToSOAPDomConv

Description

This is variable OPToSOAPDomConv.DefArrayElemName.

51.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SVarArrayType (see page 2790)	This is constant OPToSOAPDomConv.SVarArrayType.

51.6.1 OPToSOAPDomConv.SVarArrayType Constant

Pascal

```
SVarArrayType = 'VarArrayType';
```

C++

```
SVarArrayType = 'VarArrayType';
```

File

OPToSOAPDomConv

Description

This is constant OPToSOAPDomConv.SVarArrayType.

52 OrbPas Namespace

This is namespace OrbPas.

Topics

Name	Description
Interfaces (see page 2793)	The following table lists interfaces in this documentation.
Functions (see page 2821)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2826)	The following table lists structs, records, enums in this documentation.
Types (see page 2828)	The following table lists types in this documentation.

Functions

	Name	Description
	AnyToVariant (see page 2821)	This is function OrbPas.AnyToVariant.
	BindStub (see page 2821)	This is function OrbPas.BindStub.
	CorbaAnyType (see page 2822)	This is function OrbPas.CorbaAnyType.
	CorbaDuplicateAny (see page 2822)	This is function OrbPas.CorbaDuplicateAny.
	CorbaReleaseAny (see page 2822)	This is function OrbPas.CorbaReleaseAny.
	CorbaStringFree (see page 2823)	This is function OrbPas.CorbaStringFree.
	CorbaWStringFree (see page 2823)	This is function OrbPas.CorbaWStringFree.
	CreateSkeleton (see page 2823)	This is function OrbPas.CreateSkeleton.
	CreateUserException (see page 2824)	This is function OrbPas.CreateUserException.
	InitORB (see page 2824)	This is function OrbPas.InitORB.
	RegisterUserException (see page 2824)	This is function OrbPas.RegisterUserException.
	SequenceToVariant (see page 2825)	This is function OrbPas.SequenceToVariant.
	UnRegisterUserException (see page 2825)	This is function OrbPas.UnRegisterUserException.
	VariantToAny (see page 2825)	This is function OrbPas.VariantToAny.

Interfaces

	Name	Description
	IBOA (see page 2793)	This is class OrbPas.IBOA.
	ICorbaObj (see page 2795)	This is class OrbPas.ICorbaObj.
	IMarshalInBuffer (see page 2796)	This is class OrbPas.IMarshalInBuffer.
	IMarshalOutBuffer (see page 2800)	This is class OrbPas.IMarshalOutBuffer.
	IORB (see page 2805)	This is class OrbPas.IORB.
	ISkeleton (see page 2809)	This is class OrbPas.ISkeleton.
	ISkeletonObject (see page 2810)	This is class OrbPas.ISkeletonObject.

	IStub (see page 2812)	This is class OrbPas.IStub.
	IStubObject (see page 2815)	This is class OrbPas.IStubObject.
	ITypeCode (see page 2816)	This is class OrbPas.ITypeCode.

Structs, Records, Enums

	Name	Description
	TCKind (see page 2826)	This is record OrbPas.TCKind.
	TStructMember (see page 2827)	This is record OrbPas.TStructMember.

Types

Name	Description
CorbaBoolean (see page 2828)	This is type OrbPas.CorbaBoolean.
CorbaULong (see page 2828)	This is type OrbPas.CorbaULong.
PCorbaAny (see page 2829)	This is type OrbPas.PCorbaAny.
PCorbaInterfaceDef (see page 2829)	This is type OrbPas.PCorbaInterfaceDef.
PCorbaObject (see page 2829)	This is type OrbPas.PCorbaObject.
PCorbaOrb (see page 2830)	This is type OrbPas.PCorbaOrb.
PExceptionDescription (see page 2830)	This is type OrbPas.PExceptionDescription.
PMarshalInbuffer (see page 2830)	This is type OrbPas.PMarshalInbuffer.
PMarshalOutbuffer (see page 2831)	This is type OrbPas.PMarshalOutbuffer.
PUserExceptionProxy (see page 2831)	This is type OrbPas.PUserExceptionProxy.
TArgv (see page 2831)	This is type OrbPas.TArgv.
TCopyUserExceptionProc (see page 2832)	This is type OrbPas.TCopyUserExceptionProc.
TStructMembers (see page 2832)	This is type OrbPas.TStructMembers.
TThrowUserExceptionProc (see page 2832)	This is type OrbPas.TThrowUserExceptionProc.
TUserExceptionFactoryProc (see page 2833)	This is type OrbPas.TUserExceptionFactoryProc.

52.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IBOA (see page 2793)	This is class OrbPas.IBOA.
	ICorbaObj (see page 2795)	This is class OrbPas.ICorbaObj.
	IMarshalInBuffer (see page 2796)	This is class OrbPas.IMarshalInBuffer.
	IMarshalOutBuffer (see page 2800)	This is class OrbPas.IMarshalOutBuffer.
	IORB (see page 2805)	This is class OrbPas.IORB.
	ISkeleton (see page 2809)	This is class OrbPas.ISkeleton.
	ISkeletonObject (see page 2810)	This is class OrbPas.ISkeletonObject.
	IStub (see page 2812)	This is class OrbPas.IStub.
	IStubObject (see page 2815)	This is class OrbPas.IStubObject.
	ITypeCode (see page 2816)	This is class OrbPas.ITypeCode.

52.1.1 IBOA Interface

Class Hierarchy

OrbPas.IBOA

Pascal

```
IBOA = interface;
```

C++

```
__interface IBOA;
```

File

OrbPas

Description

This is class OrbPas.IBOA.

52.1.1.1 IBOA Members

The following tables list the members exposed by IBOA.

Public Methods

	Name	Description
	Deactivate (see page 2794)	This is Deactivate, a member of class IBOA.
	GetPrincipal (see page 2794)	This is GetPrincipal, a member of class IBOA.
	GetPrincipalLength (see page 2794)	This is GetPrincipalLength, a member of class IBOA.
	ImplIsReady (see page 2794)	This is ImplIsReady, a member of class IBOA.
	ObjIsReady (see page 2795)	This is ObjIsReady, a member of class IBOA.

52.1.1.2 IBOA Methods

The methods of the IBOA class are listed here.

Public Methods

	Name	Description
	Deactivate (see page 2794)	This is Deactivate, a member of class IBOA.
	GetPrincipal (see page 2794)	This is GetPrincipal, a member of class IBOA.
	GetPrincipalLength (see page 2794)	This is GetPrincipalLength, a member of class IBOA.
	ImplIsReady (see page 2794)	This is ImplIsReady, a member of class IBOA.
	ObjIsReady (see page 2795)	This is ObjIsReady, a member of class IBOA.

52.1.1.2.1 IBOA.Deactivate Method

Pascal

```
procedure Deactivate(const Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall Deactivate(const ISkeleton Skeleton);
```

Description

This is Deactivate, a member of class IBOA.

52.1.1.2.2 IBOA.GetPrincipal Method

Pascal

```
function GetPrincipal(Skeleton: ISkeleton; Bytes: Pointer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetPrincipal(ISkeleton Skeleton, void * Bytes);
```

Description

This is GetPrincipal, a member of class IBOA.

52.1.1.2.3 IBOA.GetPrincipalLength Method

Pascal

```
function GetPrincipalLength(Skeleton: ISkeleton): Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetPrincipalLength(ISkeleton Skeleton);
```

Description

This is GetPrincipalLength, a member of class IBOA.

52.1.1.2.4 IBOA.ImplIsReady Method

Pascal

```
procedure ImplIsReady; stdcall;
```

C++

```
__fastcall __stdcall ImplIsReady();
```

Description

This is ImplIsReady, a member of class IBOA.

52.1.1.2.5 IBOA.ObjIsReady Method

Pascal

```
procedure ObjIsReady(const Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall ObjIsReady(const ISkeleton Skeleton);
```

Description

This is ObjIsReady, a member of class IBOA.

52.1.2 ICorbaObj Interface

Class Hierarchy

Pascal

```
ICorbaObj = interface;
```

C++

```
__interface ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.ICorbaObj.

52.1.2.1 ICorbaObj Members

The following tables list the members exposed by ICorbaObj.

Public Methods

	Name	Description
	CorbaObject (see page 2796)	This is CorbaObject, a member of class ICorbaObj.
	IsLocal (see page 2796)	This is IsLocal, a member of class ICorbaObj.

52.1.2.2 ICorbaObj Methods

The methods of the ICorbaObj class are listed here.

Public Methods

	Name	Description
	CorbaObject (see page 2796)	This is CorbaObject, a member of class ICorbaObj.
	IsLocal (see page 2796)	This is IsLocal, a member of class ICorbaObj.

52.1.2.2.1 ICorbaObj.CorbaObject Method

Pascal

```
function CorbaObject: PCorbaObject; stdcall;
```

C++

```
__fastcall __stdcall PCorbaObject CorbaObject();
```

Description

This is CorbaObject, a member of class ICorbaObj.

52.1.2.2.2 ICorbaObj.IsLocal Method

Pascal

```
function IsLocal: CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean IsLocal();
```

Description

This is IsLocal, a member of class ICorbaObj.

52.1.3 IMarshalInBuffer Interface

Class Hierarchy

OrbPas.IMarshalInBuffer

Pascal

```
IMarshalInBuffer = interface;
```

C++

```
__interface IMarshalInBuffer;
```

File

OrbPas

Description

This is class OrbPas.IMarshalInBuffer.

52.1.3.1 IMarshalInBuffer Members

The following tables list the members exposed by IMarshalInBuffer.

Public Methods

	Name	Description
	Buffer (see page 2797)	This is Buffer, a member of class IMarshalInBuffer.
	GetAny (see page 2798)	This is GetAny, a member of class IMarshalInBuffer.
	GetChar (see page 2798)	This is GetChar, a member of class IMarshalInBuffer.
	GetDouble (see page 2798)	This is GetDouble, a member of class IMarshalInBuffer.
	GetFloat (see page 2798)	This is GetFloat, a member of class IMarshalInBuffer.
	GetLong (see page 2798)	This is GetLong, a member of class IMarshalInBuffer.
	GetObject (see page 2799)	This is GetObject, a member of class IMarshalInBuffer.
	GetShort (see page 2799)	This is GetShort, a member of class IMarshalInBuffer.
	GetText (see page 2799)	This is GetText, a member of class IMarshalInBuffer.
	GetUnsignedChar (see page 2799)	This is GetUnsignedChar, a member of class IMarshalInBuffer.
	GetUnsignedLong (see page 2800)	This is GetUnsignedLong, a member of class IMarshalInBuffer.
	GetUnsignedShort (see page 2800)	This is GetUnsignedShort, a member of class IMarshalInBuffer.
	GetWidechar (see page 2800)	This is GetWidechar, a member of class IMarshalInBuffer.
	GetWideText (see page 2800)	This is GetWideText, a member of class IMarshalInBuffer.

52.1.3.2 IMarshalInBuffer Methods

The methods of the IMarshalInBuffer class are listed here.

Public Methods

	Name	Description
	Buffer (see page 2797)	This is Buffer, a member of class IMarshalInBuffer.
	GetAny (see page 2798)	This is GetAny, a member of class IMarshalInBuffer.
	GetChar (see page 2798)	This is GetChar, a member of class IMarshalInBuffer.
	GetDouble (see page 2798)	This is GetDouble, a member of class IMarshalInBuffer.
	GetFloat (see page 2798)	This is GetFloat, a member of class IMarshalInBuffer.
	GetLong (see page 2798)	This is GetLong, a member of class IMarshalInBuffer.
	GetObject (see page 2799)	This is GetObject, a member of class IMarshalInBuffer.
	GetShort (see page 2799)	This is GetShort, a member of class IMarshalInBuffer.
	GetText (see page 2799)	This is GetText, a member of class IMarshalInBuffer.
	GetUnsignedChar (see page 2799)	This is GetUnsignedChar, a member of class IMarshalInBuffer.
	GetUnsignedLong (see page 2800)	This is GetUnsignedLong, a member of class IMarshalInBuffer.
	GetUnsignedShort (see page 2800)	This is GetUnsignedShort, a member of class IMarshalInBuffer.
	GetWidechar (see page 2800)	This is GetWidechar, a member of class IMarshalInBuffer.
	GetWideText (see page 2800)	This is GetWideText, a member of class IMarshalInBuffer.

52.1.3.2.1 IMarshalInBuffer.Buffer Method

Pascal

```
function Buffer: PMarshalInbuffer; stdcall;
```

C++

```
__fastcall __stdcall PMarshalInbuffer Buffer();
```

Description

This is Buffer, a member of class IMarshalInBuffer.

52.1.3.2.2 IMarshalInBuffer.GetAny Method

Pascal

```
function GetAny: PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny GetAny();
```

Description

This is GetAny, a member of class IMarshalInBuffer.

52.1.3.2.3 IMarshalInBuffer.GetChar Method

Pascal

```
function GetChar: Shortint; stdcall;
```

C++

```
__fastcall __stdcall Shortint GetChar();
```

Description

This is GetChar, a member of class IMarshalInBuffer.

52.1.3.2.4 IMarshalInBuffer.GetDouble Method

Pascal

```
function GetDouble: Double; stdcall;
```

C++

```
__fastcall __stdcall Double GetDouble();
```

Description

This is GetDouble, a member of class IMarshalInBuffer.

52.1.3.2.5 IMarshalInBuffer.GetFloat Method

Pascal

```
function GetFloat: Single; stdcall;
```

C++

```
__fastcall __stdcall Single GetFloat();
```

Description

This is GetFloat, a member of class IMarshalInBuffer.

52.1.3.2.6 IMarshalInBuffer.GetLong Method

Pascal

```
function GetLong: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetLong();
```

Description

This is GetLong, a member of class IMarshalInBuffer.

52.1.3.2.7 IMarshalInBuffer.GetObject Method

Pascal

```
procedure GetObject(out Obj: ICorbaObj; ref_cnt: CorbaBoolean = True); stdcall;
```

C++

```
__fastcall __stdcall GetObject(ICorbaObj Obj, CorbaBoolean ref_cnt = True);
```

Description

This is GetObject, a member of class IMarshalInBuffer.

52.1.3.2.8 IMarshalInBuffer.GetShort Method

Pascal

```
function GetShort: Smallint; stdcall;
```

C++

```
__fastcall __stdcall Smallint GetShort();
```

Description

This is GetShort, a member of class IMarshalInBuffer.

52.1.3.2.9 IMarshalInBuffer.GetText Method

Pascal

```
function GetText: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * GetText();
```

Description

This is GetText, a member of class IMarshalInBuffer.

52.1.3.2.10 IMarshalInBuffer.GetUnsignedChar Method

Pascal

```
function GetUnsignedChar: Byte; stdcall;
```

C++

```
__fastcall __stdcall Byte GetUnsignedChar();
```

Description

This is GetUnsignedChar, a member of class IMarshalInBuffer.

52.1.3.2.11 IMarshalInBuffer.GetUnsignedLong Method

Pascal

```
function GetUnsignedLong: UINT; stdcall;
```

C++

```
__fastcall __stdcall UINT GetUnsignedLong();
```

Description

This is GetUnsignedLong, a member of class IMarshalInBuffer.

52.1.3.2.12 IMarshalInBuffer.GetUnsignedShort Method

Pascal

```
function GetUnsignedShort: Word; stdcall;
```

C++

```
__fastcall __stdcall Word GetUnsignedShort();
```

Description

This is GetUnsignedShort, a member of class IMarshalInBuffer.

52.1.3.2.13 IMarshalInBuffer.GetWidechar Method

Pascal

```
function GetWidechar: Word; stdcall;
```

C++

```
__fastcall __stdcall Word GetWidechar();
```

Description

This is GetWidechar, a member of class IMarshalInBuffer.

52.1.3.2.14 IMarshalInBuffer.GetWideText Method

Pascal

```
function GetWideText: PWideChar; stdcall;
```

C++

```
__fastcall __stdcall PWideChar GetWideText();
```

Description

This is GetWideText, a member of class IMarshalInBuffer.

52.1.4 IMarshalOutBuffer Interface

Class Hierarchy

Pascal

```
IMarshalOutBuffer = interface;
```

C++

```
__interface IMarshalOutBuffer;
```

File

OrbPas

Description

This is class OrbPas.IMarshalOutBuffer.

52.1.4.1 IMarshalOutBuffer Members

The following tables list the members exposed by IMarshalOutBuffer.

Public Methods

	Name	Description
	Buffer (see page 2802)	This is Buffer, a member of class IMarshalOutBuffer.
	PutAny (see page 2802)	This is PutAny, a member of class IMarshalOutBuffer.
	PutChar (see page 2802)	This is PutChar, a member of class IMarshalOutBuffer.
	PutDouble (see page 2802)	This is PutDouble, a member of class IMarshalOutBuffer.
	PutFloat (see page 2802)	This is PutFloat, a member of class IMarshalOutBuffer.
	PutLong (see page 2803)	This is PutLong, a member of class IMarshalOutBuffer.
	PutObject (see page 2803)	This is PutObject, a member of class IMarshalOutBuffer.
	PutShort (see page 2803)	This is PutShort, a member of class IMarshalOutBuffer.
	PutText (see page 2803)	This is PutText, a member of class IMarshalOutBuffer.
	PutUnsignedChar (see page 2804)	This is PutUnsignedChar, a member of class IMarshalOutBuffer.
	PutUnsignedLong (see page 2804)	This is PutUnsignedLong, a member of class IMarshalOutBuffer.
	PutUnsignedShort (see page 2804)	This is PutUnsignedShort, a member of class IMarshalOutBuffer.
	PutWidechar (see page 2804)	This is PutWidechar, a member of class IMarshalOutBuffer.
	PutWideText (see page 2804)	This is PutWideText, a member of class IMarshalOutBuffer.

52.1.4.2 IMarshalOutBuffer Methods

The methods of the IMarshalOutBuffer class are listed here.

Public Methods

	Name	Description
	Buffer (see page 2802)	This is Buffer, a member of class IMarshalOutBuffer.
	PutAny (see page 2802)	This is PutAny, a member of class IMarshalOutBuffer.
	PutChar (see page 2802)	This is PutChar, a member of class IMarshalOutBuffer.
	PutDouble (see page 2802)	This is PutDouble, a member of class IMarshalOutBuffer.
	PutFloat (see page 2802)	This is PutFloat, a member of class IMarshalOutBuffer.
	PutLong (see page 2803)	This is PutLong, a member of class IMarshalOutBuffer.
	PutObject (see page 2803)	This is PutObject, a member of class IMarshalOutBuffer.
	PutShort (see page 2803)	This is PutShort, a member of class IMarshalOutBuffer.
	PutText (see page 2803)	This is PutText, a member of class IMarshalOutBuffer.
	PutUnsignedChar (see page 2804)	This is PutUnsignedChar, a member of class IMarshalOutBuffer.
	PutUnsignedLong (see page 2804)	This is PutUnsignedLong, a member of class IMarshalOutBuffer.
	PutUnsignedShort (see page 2804)	This is PutUnsignedShort, a member of class IMarshalOutBuffer.
	PutWidechar (see page 2804)	This is PutWidechar, a member of class IMarshalOutBuffer.

	PutWideText (see page 2804)	This is PutWideText, a member of class IMarshalOutBuffer.

52.1.4.2.1 IMarshalOutBuffer.Buffer Method

Pascal

```
function Buffer: PMarshalOutbuffer; stdcall;
```

C++

```
__fastcall __stdcall PMarshalOutbuffer Buffer();
```

Description

This is Buffer, a member of class IMarshalOutBuffer.

52.1.4.2.2 IMarshalOutBuffer.PutAny Method

Pascal

```
procedure PutAny(Value: PCorbaAny); stdcall;
```

C++

```
__fastcall __stdcall PutAny(PCorbaAny Value);
```

Description

This is PutAny, a member of class IMarshalOutBuffer.

52.1.4.2.3 IMarshalOutBuffer.PutChar Method

Pascal

```
procedure PutChar(Value: Shortint); stdcall;
```

C++

```
__fastcall __stdcall PutChar(Shortint Value);
```

Description

This is PutChar, a member of class IMarshalOutBuffer.

52.1.4.2.4 IMarshalOutBuffer.PutDouble Method

Pascal

```
procedure PutDouble(Value: Double); stdcall;
```

C++

```
__fastcall __stdcall PutDouble(Double Value);
```

Description

This is PutDouble, a member of class IMarshalOutBuffer.

52.1.4.2.5 IMarshalOutBuffer.PutFloat Method

Pascal

```
procedure PutFloat(Value: Single); stdcall;
```

C++

```
__fastcall __stdcall PutFloat(Single Value);
```

Description

This is PutFloat, a member of class IMarshalOutBuffer.

52.1.4.2.6 IMarshalOutBuffer.PutLong Method

Pascal

```
procedure PutLong(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall PutLong(int Value);
```

Description

This is PutLong, a member of class IMarshalOutBuffer.

52.1.4.2.7 IMarshalOutBuffer.PutObject Method

Pascal

```
procedure PutObject(const Value: ICorbaObj); stdcall;
```

C++

```
__fastcall __stdcall PutObject(const ICorbaObj Value);
```

Description

This is PutObject, a member of class IMarshalOutBuffer.

52.1.4.2.8 IMarshalOutBuffer.PutShort Method

Pascal

```
procedure PutShort(Value: Smallint); stdcall;
```

C++

```
__fastcall __stdcall PutShort(Smallint Value);
```

Description

This is PutShort, a member of class IMarshalOutBuffer.

52.1.4.2.9 IMarshalOutBuffer.PutText Method

Pascal

```
procedure PutText(Value: PChar); stdcall;
```

C++

```
__fastcall __stdcall PutText(const char * Value);
```

Description

This is PutText, a member of class IMarshalOutBuffer.

52.1.4.2.10 IMarshalOutBuffer.PutUnsignedChar Method

Pascal

```
procedure PutUnsignedChar(Value: Byte); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedChar(Byte Value);
```

Description

This is PutUnsignedChar, a member of class IMarshalOutBuffer.

52.1.4.2.11 IMarshalOutBuffer.PutUnsignedLong Method

Pascal

```
procedure PutUnsignedLong(Value: UINT); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedLong(UINT Value);
```

Description

This is PutUnsignedLong, a member of class IMarshalOutBuffer.

52.1.4.2.12 IMarshalOutBuffer.PutUnsignedShort Method

Pascal

```
procedure PutUnsignedShort(Value: Word); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedShort(Word Value);
```

Description

This is PutUnsignedShort, a member of class IMarshalOutBuffer.

52.1.4.2.13 IMarshalOutBuffer.PutWidechar Method

Pascal

```
procedure PutWidechar(Value: Word); stdcall;
```

C++

```
__fastcall __stdcall PutWidechar(Word Value);
```

Description

This is PutWidechar, a member of class IMarshalOutBuffer.

52.1.4.2.14 IMarshalOutBuffer.PutWideText Method

Pascal

```
procedure PutWideText(Value: PWideChar); stdcall;
```

C++

```
__fastcall __stdcall PutWideText(PWideChar Value);
```

Description

This is PutWideText, a member of class IMarshalOutBuffer.

52.1.5 IORB Interface

Class Hierarchy

Pascal

```
IORB = interface;
```

C++

```
__interface IORB;
```

File

OrbPas

Description

This is class OrbPas.IORB.

52.1.5.1 IORB Members

The following tables list the members exposed by IORB.

Public Methods

	Name	Description
	BOAInit (see page 2806)	This is BOAInit, a member of class IORB.
	CreateAliasTC (see page 2806)	This is CreateAliasTC, a member of class IORB.
	CreateArrayTC (see page 2806)	This is CreateArrayTC, a member of class IORB.
	CreateObjRefTC (see page 2807)	This is CreateObjRefTC, a member of class IORB.
	CreateSequenceTC (see page 2807)	This is CreateSequenceTC, a member of class IORB.
	CreateStructTC (see page 2807)	This is CreateStructTC, a member of class IORB.
	CreateTC (see page 2807)	This is CreateTC, a member of class IORB.
	DispatchStruct (see page 2807)	This is DispatchStruct, a member of class IORB.
	FindRepositoryTC (see page 2808)	This is FindRepositoryTC, a member of class IORB.
	MakeAny (see page 2808)	This is MakeAny, a member of class IORB.
	ObjectToString (see page 2808)	This is ObjectToString, a member of class IORB.
	Orb (see page 2808)	This is Orb, a member of class IORB.
	Shutdown (see page 2809)	This is Shutdown, a member of class IORB.
	StringToObject (see page 2809)	This is StringToObject, a member of class IORB.

52.1.5.2 IORB Methods

The methods of the IORB class are listed here.

Public Methods

	Name	Description
	BOAInit (see page 2806)	This is BOAInit, a member of class IORB.

	CreateAliasTC (see page 2806)	This is CreateAliasTC, a member of class IORB.
	CreateArrayTC (see page 2806)	This is CreateArrayTC, a member of class IORB.
	CreateObjRefTC (see page 2807)	This is CreateObjRefTC, a member of class IORB.
	CreateSequenceTC (see page 2807)	This is CreateSequenceTC, a member of class IORB.
	CreateStructTC (see page 2807)	This is CreateStructTC, a member of class IORB.
	CreateTC (see page 2807)	This is CreateTC, a member of class IORB.
	DispatchStruct (see page 2807)	This is DispatchStruct, a member of class IORB.
	FindRepositoryTC (see page 2808)	This is FindRepositoryTC, a member of class IORB.
	MakeAny (see page 2808)	This is MakeAny, a member of class IORB.
	ObjectToString (see page 2808)	This is ObjectToString, a member of class IORB.
	Orb (see page 2808)	This is Orb, a member of class IORB.
	Shutdown (see page 2809)	This is Shutdown, a member of class IORB.
	StringToObject (see page 2809)	This is StringToObject, a member of class IORB.

52.1.5.2.1 IORB.BOAInit Method

Pascal

```
procedure BOAInit(Argc: Integer; const Argv: TArgv; out BOA: IBOA); stdcall;
```

C++

```
__fastcall __stdcall BOAInit(int Argc, const TArgv Argv, IBOA BOA);
```

Description

This is BOAInit, a member of class IORB.

52.1.5.2.2 IORB.CreateAliasTC Method

Pascal

```
procedure CreateAliasTC(RepID: PChar; TypeName: PChar; const TC: ITypeCode; out Result:
ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateAliasTC(const char * RepID, const char * TypeName, const ITypeCode
TC, ITypeCode Result);
```

Description

This is CreateAliasTC, a member of class IORB.

52.1.5.2.3 IORB.CreateArrayTC Method

Pascal

```
procedure CreateArrayTC(Bound: CorbaULong; const TC: ITypeCode; out Result: ITypeCode);
stdcall;
```

C++

```
__fastcall __stdcall CreateArrayTC(CorbaULong Bound, const ITypeCode TC, ITypeCode Result);
```

Description

This is CreateArrayTC, a member of class IORB.

52.1.5.2.4 IORB.CreateObjRefTC Method

Pascal

```
procedure CreateObjRefTC(RepId: PChar; Name: PChar; out Result: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateObjRefTC(const char * RepId, const char * Name, ITypeCode Result);
```

Description

This is CreateObjRefTC, a member of class IORB.

52.1.5.2.5 IORB.CreateSequenceTC Method

Pascal

```
procedure CreateSequenceTC(Bound: CorbaULong; const TC: ITypeCode; out Result: ITypeCode);
stdcall;
```

C++

```
__fastcall __stdcall CreateSequenceTC(CorbaULong Bound, const ITypeCode TC, ITypeCode Result);
```

Description

This is CreateSequenceTC, a member of class IORB.

52.1.5.2.6 IORB.CreateStructTC Method

Pascal

```
procedure CreateStructTC(Kind: TCKind; RepId: PChar; Name: PChar; Members: TStructMembers;
nMember: Integer; out Result: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateStructTC(TCKind Kind, const char * RepId, const char * Name,
TStructMembers Members, int nMember, ITypeCode Result);
```

Description

This is CreateStructTC, a member of class IORB.

52.1.5.2.7 IORB.CreateTC Method

Pascal

```
procedure CreateTC(Kind: TCKind; out TC: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateTC(TCKind Kind, ITypeCode TC);
```

Description

This is CreateTC, a member of class IORB.

52.1.5.2.8 IORB.DispatchStruct Method

Pascal

```
function DispatchStruct(Any: PCorbaAny; CallDesc: PCallDesc; Params: Pointer; out Result:
```

```
  Variant): Integer; stdcall;
```

C++

```
  __fastcall __stdcall int DispatchStruct(PCorbaAny Any, PCallDesc CallDesc, void * Params,
  Variant Result);
```

Description

This is DispatchStruct, a member of class IORB.

52.1.5.2.9 IORB.FindRepositoryTC Method

Pascal

```
  procedure FindRepositoryTC(RepID: PChar; out TC: ITypeCode); stdcall;
```

C++

```
  __fastcall __stdcall FindRepositoryTC(const char * RepID, ITypeCode TC);
```

Description

This is FindRepositoryTC, a member of class IORB.

52.1.5.2.10 IORB.MakeAny Method

Pascal

```
  function MakeAny(const TC: ITypeCode; VS: array of Variant): PCorbaAny; stdcall;
```

C++

```
  __fastcall __stdcall PCorbaAny MakeAny(const ITypeCode TC, array of Variant VS);
```

Description

This is MakeAny, a member of class IORB.

52.1.5.2.11 IORB.ObjectToString Method

Pascal

```
  function ObjectToString(const Obj: IStub): PChar; stdcall;
```

C++

```
  __fastcall __stdcall const char * ObjectToString(const IStub Obj);
```

Description

This is ObjectToString, a member of class IORB.

52.1.5.2.12 IORB.Orb Method

Pascal

```
  function Orb: PCorbaOrb;
```

C++

```
  __fastcall PCorbaOrb Orb();
```

Description

This is Orb, a member of class IORB.

52.1.5.2.13 IORB.Shutdown Method

Pascal

```
procedure Shutdown; stdcall;
```

C++

```
__fastcall __stdcall Shutdown();
```

Description

This is Shutdown, a member of class IORB.

52.1.5.2.14 IORB.StringToObject Method

Pascal

```
procedure StringToObject(Str: PChar; out Obj: IStub); stdcall;
```

C++

```
__fastcall __stdcall StringToObject(const char * Str, IStub Obj);
```

Description

This is StringToObject, a member of class IORB.

52.1.6 ISkeleton Interface

Class Hierarchy

Pascal

```
ISkeleton = interface(ICorbaObj);
```

C++

```
__interface ISkeleton : public ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.ISkeleton.

52.1.6.1 ISkeleton Members

The following tables list the members exposed by ISkeleton.

Public Methods

	Name	Description
	CorbaObject (see page 2796)	This is CorbaObject, a member of class ICorbaObj.
	GetImplementation (see page 2810)	This is GetImplementation, a member of class ISkeleton.
	GetReplyBuffer (see page 2810)	This is GetReplyBuffer, a member of class ISkeleton.

	IsLocal (see page 2796)	This is IsLocal, a member of class ICorbaObj.

52.1.6.2 ISkeleton Methods

The methods of the ISkeleton class are listed here.

Public Methods

	Name	Description
	GetImplementation (see page 2810)	This is GetImplementation, a member of class ISkeleton.
	GetReplyBuffer (see page 2810)	This is GetReplyBuffer, a member of class ISkeleton.

52.1.6.2.1 ISkeleton.GetImplementation Method

Pascal

```
procedure GetImplementation(out Impl: IUnknown); stdcall;
```

C++

```
__fastcall __stdcall GetImplementation(IUnknown Impl);
```

Description

This is GetImplementation, a member of class ISkeleton.

52.1.6.2.2 ISkeleton.GetReplyBuffer Method

Pascal

```
procedure GetReplyBuffer(cookie: Pointer; out Outbuf: IMarshalOutBuffer); stdcall;
```

C++

```
__fastcall __stdcall GetReplyBuffer(void * cookie, IMarshalOutBuffer Outbuf);
```

Description

This is GetReplyBuffer, a member of class ISkeleton.

52.1.7 ISkeletonObject Interface

Class Hierarchy

OrbPas.ISkeletonObject

Pascal

```
ISkeletonObject = interface;
```

C++

```
__interface ISkeletonObject;
```

File

OrbPas

Description

This is class OrbPas.ISkeletonObject.

52.1.7.1 ISkeletonObject Members

The following tables list the members exposed by ISkeletonObject.

Public Methods

	Name	Description
	Execute (see page 2811)	This is Execute, a member of class ISkeletonObject.
	GetImplementation (see page 2811)	This is GetImplementation, a member of class ISkeletonObject.
	GetSkeleton (see page 2811)	This is GetSkeleton, a member of class ISkeletonObject.

52.1.7.2 ISkeletonObject Methods

The methods of the ISkeletonObject class are listed here.

Public Methods

	Name	Description
	Execute (see page 2811)	This is Execute, a member of class ISkeletonObject.
	GetImplementation (see page 2811)	This is GetImplementation, a member of class ISkeletonObject.
	GetSkeleton (see page 2811)	This is GetSkeleton, a member of class ISkeletonObject.

52.1.7.2.1 ISkeletonObject.Execute Method

Pascal

```
function Execute(Operation: PAnsiChar; const Strm: IMarshalInBuffer; Cookie: Pointer):
CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean Execute(PAnsiChar Operation, const IMarshalInBuffer Strm,
void * Cookie);
```

Description

This is Execute, a member of class ISkeletonObject.

52.1.7.2.2 ISkeletonObject.GetImplementation Method

Pascal

```
procedure GetImplementation(out Impl: IUnknown); stdcall;
```

C++

```
__fastcall __stdcall GetImplementation(IUnknown Impl);
```

Description

This is GetImplementation, a member of class ISkeletonObject.

52.1.7.2.3 ISkeletonObject.GetSkeleton Method

Pascal

```
procedure GetSkeleton(out Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall GetSkeleton(ISkeleton Skeleton);
```

Description

This is GetSkeleton, a member of class ISkeletonObject.

52.1.8 IStub Interface

Class Hierarchy

Pascal

```
IStub = interface(ICorbaObj);
```

C++

```
__interface IStub : public ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.IStub.

52.1.8.1 IStub Members

The following tables list the members exposed by IStub.

Public Methods

	Name	Description
	CorbaObject (see page 2796)	This is CorbaObject, a member of class ICorbaObj.
	CreateRequest (see page 2813)	This is CreateRequest, a member of class IStub.
	Dispatch (see page 2813)	This is Dispatch, a member of class IStub.
	GetInterface (see page 2813)	This is GetInterface, a member of class IStub.
	Hash (see page 2813)	This is Hash, a member of class IStub.
	Invoke (see page 2814)	This is Invoke, a member of class IStub.
	IsA (see page 2814)	This is IsA, a member of class IStub.
	IsLocal (see page 2796)	This is IsLocal, a member of class ICorbaObj.
	NonExistent (see page 2814)	This is NonExistent, a member of class IStub.
	RepositoryID (see page 2814)	This is RepositoryID, a member of class IStub.
	SetPrincipal (see page 2815)	This is SetPrincipal, a member of class IStub.

52.1.8.2 IStub Methods

The methods of the IStub class are listed here.

Public Methods

	Name	Description
	CreateRequest (see page 2813)	This is CreateRequest, a member of class IStub.

	Dispatch (see page 2813)	This is Dispatch, a member of class IStub.
	GetInterface (see page 2813)	This is GetInterface, a member of class IStub.
	Hash (see page 2813)	This is Hash, a member of class IStub.
	Invoke (see page 2814)	This is Invoke, a member of class IStub.
	IsA (see page 2814)	This is IsA, a member of class IStub.
	NonExistent (see page 2814)	This is NonExistent, a member of class IStub.
	RepositoryID (see page 2814)	This is RepositoryID, a member of class IStub.
	SetPrincipal (see page 2815)	This is SetPrincipal, a member of class IStub.

52.1.8.2.1 IStub.CreateRequest Method

Pascal

```
procedure CreateRequest(Operation: PChar; ResponseExpected: CorbaBoolean; out Outbuf:
IMarshalOutBuffer); stdcall;
```

C++

```
__fastcall __stdcall CreateRequest(const char * Operation, CorbaBoolean ResponseExpected,
IMarshalOutBuffer Outbuf);
```

Description

This is CreateRequest, a member of class IStub.

52.1.8.2.2 IStub.Dispatch Method

Pascal

```
function Dispatch(CallDesc: PCallDesc; Params: Pointer; out Result: Variant): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Dispatch(PCallDesc CallDesc, void * Params, Variant Result);
```

Description

This is Dispatch, a member of class IStub.

52.1.8.2.3 IStub.GetInterface Method

Pascal

```
function GetInterface: PCorbaInterfaceDef; stdcall;
```

C++

```
__fastcall __stdcall PCorbaInterfaceDef GetInterface();
```

Description

This is GetInterface, a member of class IStub.

52.1.8.2.4 IStub.Hash Method

Pascal

```
function Hash(Maximum: CorbaULong): CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong Hash(CorbaULong Maximum);
```

Description

This is Hash, a member of class IStub.

52.1.8.2.5 IStub.Invoke Method

Pascal

```
procedure Invoke(const Outbuf: IMarshalOutBuffer; out Inbuf: IMarshalInBuffer); stdcall;
```

C++

```
__fastcall __stdcall Invoke(const IMarshalOutBuffer Outbuf, IMarshalInBuffer Inbuf);
```

Description

This is Invoke, a member of class IStub.

52.1.8.2.6 IStub.IsA Method

Pascal

```
function IsA(LogicalTypeId: PChar): CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean IsA(const char * LogicalTypeId);
```

Description

This is IsA, a member of class IStub.

52.1.8.2.7 IStub.NonExistent Method

Pascal

```
function NonExistent: CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean NonExistent();
```

Description

This is NonExistent, a member of class IStub.

52.1.8.2.8 IStub.RepositoryID Method

Pascal

```
function RepositoryID: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * RepositoryID();
```

Description

This is RepositoryID, a member of class IStub.

52.1.8.2.9 IStub.SetPrincipal Method

Pascal

```
procedure SetPrincipal(Bytes: Pointer; Length: CorbaULong); stdcall;
```

C++

```
__fastcall __stdcall SetPrincipal(void * Bytes, CorbaULong Length);
```

Description

This is SetPrincipal, a member of class IStub.

52.1.9 IStubObject Interface

Class Hierarchy

Pascal

```
IStubObject = interface;
```

C++

```
__interface IStubObject;
```

File

OrbPas

Description

This is class OrbPas.IStubObject.

52.1.9.1 IStubObject Members

The following tables list the members exposed by IStubObject.

Public Methods

	Name	Description
	GetStub (see page 2816)	This is GetStub, a member of class IStubObject.

52.1.9.2 IStubObject Methods

The methods of the IStubObject class are listed here.

Public Methods

	Name	Description
	GetStub (see page 2816)	This is GetStub, a member of class IStubObject.

52.1.9.2.1 IStubObject.GetStub Method

Pascal

```
procedure GetStub(out stub: IStub); stdcall;
```

C++

```
__fastcall __stdcall GetStub(IStub stub);
```

Description

This is GetStub, a member of class IStubObject.

52.1.10 ITypeCode Interface

Class Hierarchy

Pascal

```
ITypeCode = interface;
```

C++

```
__interface ITypeCode;
```

File

OrbPas

Description

This is class OrbPas.ITypeCode.

52.1.10.1 ITypeCode Members

The following tables list the members exposed by ITypeCode.

Public Methods

	Name	Description
	ContentType (see page 2817)	This is ContentType, a member of class ITypeCode.
	DefaultIndex (see page 2817)	This is DefaultIndex, a member of class ITypeCode.
	DiscriminatorType (see page 2817)	This is DiscriminatorType, a member of class ITypeCode.
	Equal (see page 2818)	This is Equal, a member of class ITypeCode.
	Id (see page 2818)	This is Id, a member of class ITypeCode.
	Kind (see page 2818)	This is Kind, a member of class ITypeCode.
	Length (see page 2818)	This is Length, a member of class ITypeCode.
	MemberCount (see page 2819)	This is MemberCount, a member of class ITypeCode.
	MemberLabel (see page 2819)	This is MemberLabel, a member of class ITypeCode.
	MemberName (see page 2819)	This is MemberName, a member of class ITypeCode.
	MemberType (see page 2819)	This is MemberType, a member of class ITypeCode.
	Name (see page 2819)	This is Name, a member of class ITypeCode.
	Parameter (see page 2820)	This is Parameter, a member of class ITypeCode.
	ParameterCount (see page 2820)	This is ParameterCount, a member of class ITypeCode.

52.1.10.2 ITypeCode Methods

The methods of the ITypeCode class are listed here.

Public Methods

	Name	Description
	ContentType (see page 2817)	This is ContentType, a member of class ITypeCode.
	DefaultIndex (see page 2817)	This is DefaultIndex, a member of class ITypeCode.
	DiscriminatorType (see page 2817)	This is DiscriminatorType, a member of class ITypeCode.
	Equal (see page 2818)	This is Equal, a member of class ITypeCode.
	Id (see page 2818)	This is Id, a member of class ITypeCode.
	Kind (see page 2818)	This is Kind, a member of class ITypeCode.
	Length (see page 2818)	This is Length, a member of class ITypeCode.
	MemberCount (see page 2819)	This is MemberCount, a member of class ITypeCode.
	MemberLabel (see page 2819)	This is MemberLabel, a member of class ITypeCode.
	MemberName (see page 2819)	This is MemberName, a member of class ITypeCode.
	MemberType (see page 2819)	This is MemberType, a member of class ITypeCode.
	Name (see page 2819)	This is Name, a member of class ITypeCode.
	Parameter (see page 2820)	This is Parameter, a member of class ITypeCode.
	ParameterCount (see page 2820)	This is ParameterCount, a member of class ITypeCode.

52.1.10.2.1 ITypeCode.ContentType Method

Pascal

```
procedure ContentType(out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall ContentType(ITypeCode tc);
```

Description

This is ContentType, a member of class ITypeCode.

52.1.10.2.2 ITypeCode.DefaultIndex Method

Pascal

```
function DefaultIndex: Integer; stdcall;
```

C++

```
__fastcall __stdcall int DefaultIndex();
```

Description

This is DefaultIndex, a member of class ITypeCode.

52.1.10.2.3 ITypeCode.DiscriminatorType Method

Pascal

```
procedure DiscriminatorType(out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall DiscriminatorType(ITypeCode tc);
```

Description

This is DiscriminatorType, a member of class ITypeCode.

52.1.10.2.4 ITypeCode.Equal Method

Pascal

```
function Equal(const tc: ITypeCode): CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean Equal(const ITypeCode tc);
```

Description

This is Equal, a member of class ITypeCode.

52.1.10.2.5 ITypeCode.Id Method

Pascal

```
function Id: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * Id();
```

Description

This is Id, a member of class ITypeCode.

52.1.10.2.6 ITypeCode.Kind Method

Pascal

```
function Kind: TCKind; stdcall;
```

C++

```
__fastcall __stdcall TCKind Kind();
```

Description

This is Kind, a member of class ITypeCode.

52.1.10.2.7 ITypeCode.Length Method

Pascal

```
function Length: CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong Length();
```

Description

This is Length, a member of class ITypeCode.

52.1.10.2.8 ITypeCode.MemberCount Method

Pascal

```
function MemberCount: CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong MemberCount();
```

Description

This is MemberCount, a member of class ITypeCode.

52.1.10.2.9 ITypeCode.MemberLabel Method

Pascal

```
function MemberLabel(index: CorbaULong): PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny MemberLabel(CorbaULong index);
```

Description

This is MemberLabel, a member of class ITypeCode.

52.1.10.2.10 ITypeCode.MemberName Method

Pascal

```
function MemberName(index: CorbaULong): PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * MemberName(CorbaULong index);
```

Description

This is MemberName, a member of class ITypeCode.

52.1.10.2.11 ITypeCode.MemberType Method

Pascal

```
procedure MemberType(index: CorbaULong; out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall MemberType(CorbaULong index, ITypeCode tc);
```

Description

This is MemberType, a member of class ITypeCode.

52.1.10.2.12 ITypeCode.Name Method

Pascal

```
function Name: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * Name();
```

Description

This is Name, a member of class ITypeCode.

52.1.10.2.13 ITypeCode.Parameter Method

Pascal

```
function Parameter(index: Integer): PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny Parameter(int index);
```

Description

This is Parameter, a member of class ITypeCode.

52.1.10.2.14 ITypeCode.ParameterCount Method

Pascal

```
function ParameterCount: Integer; stdcall;
```

C++

```
__fastcall __stdcall int ParameterCount();
```

Description

This is ParameterCount, a member of class ITypeCode.

52.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnyToVariant (see page 2821)	This is function OrbPas.AnyToVariant.
	BindStub (see page 2821)	This is function OrbPas.BindStub.
	CorbaAnyType (see page 2822)	This is function OrbPas.CorbaAnyType.
	CorbaDuplicateAny (see page 2822)	This is function OrbPas.CorbaDuplicateAny.
	CorbaReleaseAny (see page 2822)	This is function OrbPas.CorbaReleaseAny.
	CorbaStringFree (see page 2823)	This is function OrbPas.CorbaStringFree.
	CorbaWStringFree (see page 2823)	This is function OrbPas.CorbaWStringFree.
	CreateSkeleton (see page 2823)	This is function OrbPas.CreateSkeleton.
	CreateUserException (see page 2824)	This is function OrbPas.CreateUserException.
	InitORB (see page 2824)	This is function OrbPas.InitORB.
	RegisterUserException (see page 2824)	This is function OrbPas.RegisterUserException.
	SequenceToVariant (see page 2825)	This is function OrbPas.SequenceToVariant.
	UnRegisterUserException (see page 2825)	This is function OrbPas.UnRegisterUserException.
	VariantToAny (see page 2825)	This is function OrbPas.VariantToAny.

52.2.1 OrbPas.AnyToVariant Function

Pascal

```
function AnyToVariant(Value: PCorbaAny; OV: PVariant): Boolean;
```

C++

```
Boolean AnyToVariant(PCorbaAny Value, PVariant OV);
```

File

OrbPas

Description

This is function OrbPas.AnyToVariant.

52.2.2 OrbPas.BindStub Function

Pascal

```
procedure BindStub(RepositoryID: PChar; InstanceName: PChar; HostName: PChar; const Orb: IORB;
RefCountServer: CorbaBoolean; out Stub: IStub);
```

C++

```
BindStub(const char * RepositoryID, const char * InstanceName, const char * HostName, const
IORB Orb, CorbaBoolean RefCountServer, IStub Stub);
```

File

OrbPas

Description

This is function OrbPas.BindStub.

52.2.3 OrbPas.CorbaAnyType Function

Pascal

```
procedure CorbaAnyType(Any: PCorbaAny; out TypeCode: ITypeCode);
```

C++

```
CorbaAnyType(PCorbaAny Any, ITypeCode TypeCode);
```

File

OrbPas

Description

This is function OrbPas.CorbaAnyType.

52.2.4 OrbPas.CorbaDuplicateAny Function

Pascal

```
function CorbaDuplicateAny(Any: PCorbaAny): PCorbaAny;
```

C++

```
PCorbaAny CorbaDuplicateAny(PCorbaAny Any);
```

File

OrbPas

Description

This is function OrbPas.CorbaDuplicateAny.

52.2.5 OrbPas.CorbaReleaseAny Function

Pascal

```
procedure CorbaReleaseAny(Any: PCorbaAny);
```

C++

```
CorbaReleaseAny(PCorbaAny Any);
```

File

OrbPas

Description

This is function OrbPas.CorbaReleaseAny.

52.2.6 OrbPas.CorbaStringFree Function

Pascal

```
procedure CorbaStringFree(Str: PChar);
```

C++

```
CorbaStringFree(const char * Str);
```

File

OrbPas

Description

This is function OrbPas.CorbaStringFree.

52.2.7 OrbPas.CorbaWStringFree Function

Pascal

```
procedure CorbaWStringFree(Str: PWideChar);
```

C++

```
CorbaWStringFree(PWideChar Str);
```

File

OrbPas

Description

This is function OrbPas.CorbaWStringFree.

52.2.8 OrbPas.CreateSkeleton Function

Pascal

```
procedure CreateSkeleton(InterfaceName: PChar; const DelphiObject: ISkeletonObject; Serialize:
CorbaBoolean; InstanceName: PChar; RepositoryID: PChar; ClientRefCount: CorbaBoolean; out
Skeleton: ISkeleton);
```

C++

```
CreateSkeleton(const char * InterfaceName, const ISkeletonObject DelphiObject, CorbaBoolean
Serialize, const char * InstanceName, const char * RepositoryID, CorbaBoolean ClientRefCount,
ISkeleton Skeleton);
```

File

OrbPas

Description

This is function OrbPas.CreateSkeleton.

52.2.9 OrbPas.CreateUserException Function

Pascal

```
function CreateUserException(copy: TCopyUserExceptionProc; throwobj: TThrowUserExceptionProc):
PUserExceptionProxy;
```

C++

```
PUserExceptionProxy CreateUserException(TCopyUserExceptionProc copy, TThrowUserExceptionProc
throwobj);
```

File

OrbPas

Description

This is function OrbPas.CreateUserException.

52.2.10 OrbPas.InitORB Function

Pascal

```
procedure InitORB(const Argv: TArgv; out Orb: IORB);
```

C++

```
InitORB(const TArgv Argv, IORB Orb);
```

File

OrbPas

Description

This is function OrbPas.InitORB.

52.2.11 OrbPas.RegisterUserException Function

Pascal

```
function RegisterUserException(Name: PChar; RepositoryID: PChar; Factory:
TUserExceptionFactoryProc): PExceptionDescription;
```

C++

```
PExceptionDescription RegisterUserException(const char * Name, const char * RepositoryID,
TUserExceptionFactoryProc Factory);
```

File

OrbPas

Description

This is function OrbPas.RegisterUserException.

52.2.12 OrbPas.SequenceToVariant Function

Pascal

```
function SequenceToVariant(Value: PCorbaAny; OV: PVariant): Boolean;
```

C++

```
Boolean SequenceToVariant(PCorbaAny Value, PVariant OV);
```

File

OrbPas

Description

This is function OrbPas.SequenceToVariant.

52.2.13 OrbPas.UnRegisterUserException Function

Pascal

```
procedure UnRegisterUserException(Description: PExceptionDescription);
```

C++

```
UnRegisterUserException(PExceptionDescription Description);
```

File

OrbPas

Description

This is function OrbPas.UnRegisterUserException.

52.2.14 OrbPas.VariantToAny Function

Pascal

```
function VariantToAny(Value: PVariant): PCorbaAny;
```

C++

```
PCorbaAny VariantToAny(PVariant Value);
```

File

OrbPas

Description

This is function OrbPas.VariantToAny.

52.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCKind (see page 2826)	This is record OrbPas.TCKind.

Records

	Name	Description
	TStructMember (see page 2827)	This is record OrbPas.TStructMember.

52.3.1 OrbPas.TCKind Enumeration

Pascal

```
TCKind = (
  tk_null,
  tk_void,
  tk_short,
  tk_long,
  tk_ushort,
  tk_ulong,
  tk_float,
  tk_double,
  tk_boolean,
  tk_char,
  tk_octet,
  tk_any,
  tk_TypeCode,
  tk_Principal,
  tk_objref,
  tk_struct,
  tk_union,
  tk_enum,
  tk_string,
  tk_sequence,
  tk_array,
  tk_alias,
  tk_except,
  tk_longlong,
  tk_ulonglong,
  tk_longdouble,
  tk_wchar,
  tk_wstring,
  tk_fixed
);
```

C++

```
enum TCKind {
  tk_null,
  tk_void,
  tk_short,
  tk_long,
  tk_ushort,
```

```
    tk_ulong,
    tk_float,
    tk_double,
    tk_boolean,
    tk_char,
    tk_octet,
    tk_any,
    tk_TypeCode,
    tk_Principal,
    tk_objref,
    tk_struct,
    tk_union,
    tk_enum,
    tk_string,
    tk_sequence,
    tk_array,
    tk_alias,
    tk_except,
    tk_longlong,
    tk_ulonglong,
    tk_longdouble,
    tk_wchar,
    tk_wstring,
    tk_fixed
  };
```

File

OrbPas

Description

This is record OrbPas.TCKind.

52.3.2 OrbPas.TStructMember Record

Pascal

```
  TStructMember = record
    Name: string;
    TC: ITypeCode;
  end;
```

C++

```
  struct TStructMember {
    UnicodeString Name;
    ITypeCode TC;
  };
```

File

OrbPas

Description

This is record OrbPas.TStructMember.

52.4 Types

The following table lists types in this documentation.

Types

Name	Description
CorbaBoolean (see page 2828)	This is type OrbPas.CorbaBoolean.
CorbaULong (see page 2828)	This is type OrbPas.CorbaULong.
PCorbaAny (see page 2829)	This is type OrbPas.PCorbaAny.
PCorbaInterfaceDef (see page 2829)	This is type OrbPas.PCorbaInterfaceDef.
PCorbaObject (see page 2829)	This is type OrbPas.PCorbaObject.
PCorbaOrb (see page 2830)	This is type OrbPas.PCorbaOrb.
PExceptionDescription (see page 2830)	This is type OrbPas.PExceptionDescription.
PMarshalInbuffer (see page 2830)	This is type OrbPas.PMarshalInbuffer.
PMarshalOutbuffer (see page 2831)	This is type OrbPas.PMarshalOutbuffer.
PUserExceptionProxy (see page 2831)	This is type OrbPas.PUserExceptionProxy.
TArgv (see page 2831)	This is type OrbPas.TArgv.
TCopyUserExceptionProc (see page 2832)	This is type OrbPas.TCopyUserExceptionProc.
TStructMembers (see page 2832)	This is type OrbPas.TStructMembers.
TThrowUserExceptionProc (see page 2832)	This is type OrbPas.TThrowUserExceptionProc.
TUserExceptionFactoryProc (see page 2833)	This is type OrbPas.TUserExceptionFactoryProc.

52.4.1 OrbPas.CorbaBoolean Type

Pascal

```
CorbaBoolean = ByteBool;
```

C++

```
ByteBool CorbaBoolean;
```

File

OrbPas

Description

This is type OrbPas.CorbaBoolean.

52.4.2 OrbPas.CorbaULong Type

Pascal

```
CorbaULong = Integer;
```

C++

```
int CorbaULong;
```

File

OrbPas

Description

This is type OrbPas.CorbaULong.

52.4.3 OrbPas.PCorbaAny Type

Pascal

```
PCorbaAny = type Pointer;
```

C++

```
type Pointer PCorbaAny;
```

File

OrbPas

Description

This is type OrbPas.PCorbaAny.

52.4.4 OrbPas.PCorbaInterfaceDef Type

Pascal

```
PCorbaInterfaceDef = type Pointer;
```

C++

```
type Pointer PCorbaInterfaceDef;
```

File

OrbPas

Description

This is type OrbPas.PCorbaInterfaceDef.

52.4.5 OrbPas.PCorbaObject Type

Pascal

```
PCorbaObject = type Pointer;
```

C++

```
type Pointer PCorbaObject;
```

File

OrbPas

Description

This is type OrbPas.PCorbaObject.

52.4.6 OrbPas.PCorbaOrb Type

Pascal

```
PCorbaOrb = type Pointer;
```

C++

```
type Pointer PCorbaOrb;
```

File

OrbPas

Description

This is type OrbPas.PCorbaOrb.

52.4.7 OrbPas.PExceptionDescription Type

Pascal

```
PExceptionDescription = type Pointer;
```

C++

```
type Pointer PExceptionDescription;
```

File

OrbPas

Description

This is type OrbPas.PExceptionDescription.

52.4.8 OrbPas.PMarshalInbuffer Type

Pascal

```
PMarshalInbuffer = type Pointer;
```

C++

```
type Pointer PMarshalInbuffer;
```

File

OrbPas

Description

This is type OrbPas.PMarshalInbuffer.

52.4.9 OrbPas.PMarshalOutbuffer Type

Pascal

```
PMarshalOutbuffer = type Pointer;
```

C++

```
type Pointer PMarshalOutbuffer;
```

File

OrbPas

Description

This is type OrbPas.PMarshalOutbuffer.

52.4.10 OrbPas.PUserExceptionProxy Type

Pascal

```
PUserExceptionProxy = type Pointer;
```

C++

```
type Pointer PUserExceptionProxy;
```

File

OrbPas

Description

This is type OrbPas.PUserExceptionProxy.

52.4.11 OrbPas.TArgv Type

Pascal

```
TArgv = array of string;
```

C++

```
array of string TArgv;
```

File

OrbPas

Description

This is type OrbPas.TArgv.

52.4.12 OrbPas.TCopyUserExceptionProc Type

Pascal

```
TCopyUserExceptionProc = procedure (const InBuf: IMarshalInBuffer) of object;
```

C++

```
(const InBuf: IMarshalInBuffer) ( TCopyUserExceptionProc)();
```

File

OrbPas

Description

This is type OrbPas.TCopyUserExceptionProc.

52.4.13 OrbPas.TStructMembers Type

Pascal

```
TStructMembers = array of TStructMember;
```

C++

```
array of TStructMember TStructMembers;
```

File

OrbPas

Description

This is type OrbPas.TStructMembers.

52.4.14 OrbPas.TThrowUserExceptionProc Type

Pascal

```
TThrowUserExceptionProc = procedure of object;
```

C++

```
( TThrowUserExceptionProc)();
```

File

OrbPas

Description

This is type OrbPas.TThrowUserExceptionProc.

52.4.15 OrbPas.TUserExceptionFactoryProc Type

Pascal

```
TUserExceptionFactoryProc = function : PUserExceptionProxy;
```

C++

```
: PUserExceptionProxy ( TUserExceptionFactoryProc)();
```

File

OrbPas

Description

This is type OrbPas.TUserExceptionFactoryProc.

53 Outline Namespace

This is namespace Outline.

Topics

Name	Description
Classes (see page 2837)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 2957)	The following table lists structs, records, enums in this documentation.
Types (see page 2962)	The following table lists types in this documentation.

Classes

	Name	Description
	EOutlineError (see page 2837)	EOutlineError is the exception class for outline components.
	OutlineError (see page 2838)	OutlineError is a special exception class for invalid outline-node indexes.
	TCustomOutline (see page 2838)	TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 2940) objects).
	TOutline (see page 2874)	TOutline is a multilevel outline that displays the values of TOutlineNode (see page 2940) objects.
	TOutlineNode (see page 2940)	TOutlineNode represents a node in a TCustomOutline (see page 2838) object.

Structs, Records, Enums

	Name	Description
	TAttachMode (see page 2957)	TAttachMode indicates how an outline node should be inserted into an outline.
	TOutlineBitmap (see page 2958)	This is record Outline.TOutlineBitmap.
	TOutlineNodeCompare (see page 2958)	This is record Outline.TOutlineNodeCompare.
	TOutlineOption (see page 2959)	TOutlineOptions (see page 2964) represents the style in which an outline is drawn.
	TOutlineStyle (see page 2959)	TOutlineStyle determines how the nodes of an outline are drawn.
	TOutlineType (see page 2960)	TOutlineType indicates whether an outline is owner-drawn.

Types

Name	Description
EOutlineChange (see page 2962)	EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.
TBitmapArray (see page 2962)	This is type Outline.TBitmapArray.
TBitmapArrayRange (see page 2963)	This is type Outline.TBitmapArrayRange.
TChangeRange (see page 2963)	TChangeRange indicates the direction in which a node is moved.
TOutlineBitmaps (see page 2963)	This is type Outline.TOutlineBitmaps.

TOutlineOptions (see page 2964)	TOutlineOptions represents the style in which an outline is drawn.

53.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOutlineError (see page 2837)	EOutlineError is the exception class for outline components.
	OutlineError (see page 2838)	OutlineError is a special exception class for invalid outline-node indexes.
	TCustomOutline (see page 2838)	TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 2940) objects).
	TOutline (see page 2874)	TOutline is a multilevel outline that displays the values of TOutlineNode (see page 2940) objects.
	TOutlineNode (see page 2940)	TOutlineNode represents a node in a TCustomOutline (see page 2838) object.

53.1.1 EOutlineError Class

EOutlineError is the exception class for outline components.

Class Hierarchy

Pascal

```
EOutlineError = class(Exception);
```

C++

```
class EOutlineError : public Exception;
```

File

Outline

Description

EOutlineError is raised when an error occurs as an application works with an outline component. For example, an EOutlineError exception occurs when an application

Attempts to access an outline using an invalid node index.

Attempts to expand a node whose parent isn't expanded.

Attempts to load items from a file using an invalid file extension.

Note: EOutlineError is raised by the TOutline (see page 2874) component, which is maintained for backward compatibility.

See Also

OutlineError (see page 2838)

53.1.2 OutlineError Class

OutlineError is a special exception class for invalid outline-node indexes.

Class Hierarchy

Pascal

```
OutlineError = class(TObject);
```

C++

```
class OutlineError : public TObject;
```

File

Outline

Description

OutlineError is raised when an application cannot access a specified outline node. In most cases, this occurs because the index used is invalid.

OutlineError is raised internally to abort look-ups of outline components. Because it does not descend from Exception, it never appears at runtime—even if the debugger is set to break on exceptions. Thus it is a useful tool for aborting deep recursions.

Note: OutlineError is raised by the TOutline (see page 2874) component, which is maintained for backward compatibility.

See Also

EOutlineError (see page 2837)

Exception

53.1.3 TCustomOutline Class

TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 2940) objects).

Class Hierarchy

Pascal

```
TCustomOutline = class(TCustomGrid);
```

C++

```
class TCustomOutline : public TCustomGrid;
```

File

Outline

Description

Use TCustomOutline as a base class when defining a control that displays outline nodes in a two-dimensional layout. TCustomOutline introduces the ability to manage a hierarchy of outline nodes, including the ability to control the appearance and layout of those nodes and to expand or collapse branches of the outline tree.

Do not create instances of TCustomOutline. To add an outline control to a form, use the TOutline (see page 2874) object, which publishes many of the properties, events, and methods of TCustomOutline, or TTreeView, which wraps the Windows control that performs the same function.

TOutline (see page 2874)

TOutlineNode (see page 2940)

TTreeView

53.1.3.1 TCustomOutline Members

The following tables list the members exposed by TCustomOutline.

Protected Events

	Name	Description
	OnCollapse (see page 2873)	Occurs immediately after a node in the outline is collapsed.
	OnDrawItem (see page 2873)	Occurs when a node must be drawn in an owner-draw outline.
	OnExpand (see page 2873)	Occurs immediately after a node in the outline is expanded.

Protected Methods

	Name	Description
	BadIndex (see page 2845)	Indicates whether a node's index is up to date.
V	Click (see page 2846)	Updates the SelectedItem (see page 2872) property.
	Collapse (see page 2847)	Generates an OnCollapse (see page 2873) event.
V	DblClick (see page 2847)	Expands or collapses the selected node.
V	DefineProperties (see page 2847)	Creates a binary property for customized bitmap values.
	DeleteNode (see page 2848)	Fixes up the outline after a node has been deleted.
V	DrawCell (see page 2849)	Draws a node in the outline.
	Expand (see page 2850)	Generates an OnExpand (see page 2873) event.
	InvalidateCell (see page 2854)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
V	KeyDown (see page 2855)	Provides special processing when the user presses a key.
V	KeyPress (see page 2855)	Provides special processing when a key is pressed.
V	Loaded (see page 2856)	Sets up the outline after it has been streamed in.
V	MouseDown (see page 2858)	Updates the SelectedItem (see page 2872) property.
	Move (see page 2858)	Repositions a node in the outline.
	SetDisplayWidth (see page 2860)	Sets the display width of the outline.
	SetGoodIndex (see page 2860)	Returns the first node in the Items (see page 2865) array that must be reindexed to make the index of the Value parameter correct.
	SetLevel (see page 2861)	Sets the level of an outline node.

Protected Properties

	Name	Description
	ItemHeight (see page 2864)	Specifies the height of each node in the outline.
	ItemSeparator (see page 2865)	Specifies a delimiting string for outline nodes.
	Lines (see page 2866)	Lists the Text property values of all nodes in the outline.
	Options (see page 2866)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 2867)	Specifies how the outline tree is displayed.
	PictureClosed (see page 2868)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 2868)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 2869)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 2869)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 2870)	Specifies the bitmap used to represent a collapsed item that has subitems.

	Style (see page 2872)	Determines whether the nodes and tree are drawn automatically.

Public Methods

	Name	Description
	Add (see page 2842)	Adds a node to the outline.
	AddChild (see page 2843)	Adds a child node to a node in the outline.
	AddChildObject (see page 2844)	Adds a child node containing data to a node in the outline.
	AddObject (see page 2844)	Adds a node containing data to the outline.
	BeginUpdate (see page 2846)	Prevents the updating of the outline until the EndUpdate (see page 2849) method is called.
	Clear (see page 2846)	Removes all items from the outline.
V	Create (see page 2840)	Creates an instance of TCustomOutline (see page 2838).
	Delete (see page 2848)	Deletes a node from the outline.
V	Destroy (see page 2841)	Destroys an instance of TCustomOutline (see page 2838).
	EndUpdate (see page 2849)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 2846).
	FullCollapse (see page 2850)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 2850)	Expands every node in the outline.
	GetDataItem (see page 2851)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetItem (see page 2851)	Returns the index of the node at the position indicated by the X and Y parameters.
	GetNodeDisplayWidth (see page 2852)	Returns the length of the row containing a specified node.
	GetTextItem (see page 2852)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetVisibleNode (see page 2852)	Returns the TOutlineNode (see page 2940) object for the node indicated by a position in the image of the outline.
	Insert (see page 2853)	Inserts a node at a specified position.
	InsertObject (see page 2853)	Inserts a node containing data at a specified position.
	LoadFromFile (see page 2856)	This is the overview for the LoadFromFile method overload.
	LoadFromStream (see page 2857)	This is the overview for the LoadFromStream method overload.
	SaveToFile (see page 2858)	This is the overview for the SaveToFile method overload.
	SaveToStream (see page 2859)	This is the overview for the SaveToStream method overload.
	SetUpdateState (see page 2861)	Enables or disables the maintenance of the node indexes.

Public Properties

	Name	Description
	Canvas (see page 2862)	Specifies the TCanvas object that presents a drawing surface for the control.
R	ItemCount (see page 2864)	Indicates the number of nodes in the outline.
R	Items (see page 2865)	Lists the nodes in the outline.
	Row (see page 2870)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 2872)	Specifies the index of the selected node.

53.1.3.2 TCustomOutline.Create Constructor

Creates an instance of TCustomOutline (see page 2838).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomOutline(TComponent * AOwner);
```

Description

Call Create to instantiate a TCustomOutline (see page 2838) object at runtime. Outlines placed on forms at design time are created automatically.

Create initializes the outline object, setting the values of some internal properties, as well as setting

Color to clWindow and ParentColor to false.

Height to 97 and Width to 121.

ItemSeparator (see page 2865) to '\'.

Options (see page 2866) to [ooDrawTreeRoot, ooDrawFocusRect].

OutlineStyle (see page 2867) to osTreePictureText.

See Also

Height

ItemSeparator (see page 2865)

Options (see page 2866)

OutlineStyle (see page 2867)

Color

ParentColor

Create

Width

53.1.3.3 TCustomOutline.Destroy Destructor

Destroys an instance of TCustomOutline (see page 2838).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomOutline();
```

Description

Destroy frees all memory associated with the outline. While the destructor frees the TOutlineNode (see page 2940) objects that comprise the outline, any objects associated with those nodes are not freed.

53.1.3.4 TCustomOutline Methods

The methods of the TCustomOutline class are listed here.

Protected Methods

	Name	Description
	BadIndex (see page 2845)	Indicates whether a node's index is up to date.
V	Click (see page 2846)	Updates the SelectedItem (see page 2872) property.
	Collapse (see page 2847)	Generates an OnCollapse (see page 2873) event.
V	DblClick (see page 2847)	Expands or collapses the selected node.
V	DefineProperties (see page 2847)	Creates a binary property for customized bitmap values.
	DeleteNode (see page 2848)	Fixes up the outline after a node has been deleted.
V	DrawCell (see page 2849)	Draws a node in the outline.
	Expand (see page 2850)	Generates an OnExpand (see page 2873) event.

	InvalidateCell (see page 2854)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	KeyDown (see page 2855)	Provides special processing when the user presses a key.
	KeyPress (see page 2855)	Provides special processing when a key is pressed.
	Loaded (see page 2856)	Sets up the outline after it has been streamed in.
	MouseDown (see page 2858)	Updates the SelectedItem (see page 2872) property.
	Move (see page 2858)	Repositions a node in the outline.
	SetDisplayWidth (see page 2860)	Sets the display width of the outline.
	SetGoodIndex (see page 2860)	Returns the first node in the Items (see page 2865) array that must be reindexed to make the index of the Value parameter correct.
	SetLevel (see page 2861)	Sets the level of an outline node.

Public Methods

	Name	Description
	Add (see page 2842)	Adds a node to the outline.
	AddChild (see page 2843)	Adds a child node to a node in the outline.
	AddChildObject (see page 2844)	Adds a child node containing data to a node in the outline.
	AddObject (see page 2844)	Adds a node containing data to the outline.
	BeginUpdate (see page 2846)	Prevents the updating of the outline until the EndUpdate (see page 2849) method is called.
	Clear (see page 2846)	Removes all items from the outline.
	Delete (see page 2848)	Deletes a node from the outline.
	EndUpdate (see page 2849)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 2846).
	FullCollapse (see page 2850)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 2850)	Expands every node in the outline.
	GetDataItem (see page 2851)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetItem (see page 2851)	Returns the index of the node at the position indicated by the X and Y parameters.
	GetNodeDisplayWidth (see page 2852)	Returns the length of the row containing a specified node.
	GetTextItem (see page 2852)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetVisibleNode (see page 2852)	Returns the TOutlineNode (see page 2940) object for the node indicated by a position in the image of the outline.
	Insert (see page 2853)	Inserts a node at a specified position.
	InsertObject (see page 2853)	Inserts a node containing data at a specified position.
	LoadFromFile (see page 2856)	This is the overview for the LoadFromFile method overload.
	LoadFromStream (see page 2857)	This is the overview for the LoadFromStream method overload.
	SaveToFile (see page 2858)	This is the overview for the SaveToFile method overload.
	SaveToStream (see page 2859)	This is the overview for the SaveToStream method overload.
	SetUpdateState (see page 2861)	Enables or disables the maintenance of the node indexes.

53.1.3.4.1 TCustomOutline.Add Method

Adds a node to the outline.

Pascal

```
function Add(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt Add(LongInt Index, const UnicodeString Text);
```

Description

Use Add to add a TOutlineNode (see page 2940) object to the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last sibling of the node identified by

Index. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

Add returns the Index property of the new node.

See Also

AddChild (see page 2843)

AddObject (see page 2844)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

Insert (see page 2853)

Items (see page 2865)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.2 TCustomOutline.AddChild Method

Adds a child node to a node in the outline.

Pascal

```
function AddChild(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt AddChild(LongInt Index, const UnicodeString Text);
```

Description

Use AddChild to add a TOutlineNode (see page 2940) object as the child of a node in the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last child of the node identified by Index. To add nodes to the top level of the outline (off the root), specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

AddChild returns the Index property of the new node.

See Also

Add (see page 2842)

AddChildObject (see page 2844)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

Insert (see page 2853)

Items (see page 2865)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.3 TCustomOutline.AddChildObject Method

Adds a child node containing data to a node in the outline.

Pascal

```
function AddChildObject(Index: LongInt; const Text: string; const Data: TCustomData): LongInt;
```

C++

```
__fastcall LongInt AddChildObject(LongInt Index, const UnicodeString Text, const TCustomData
Data);
```

Description

Use AddChildObject to add a TOutlineNode (see page 2940) object as the child of a node in the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last child of the node identified by Index. To add nodes to the top level of the outline (off the root), specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

AddChildObject returns the Index property of the new node.

See Also

AddChild (see page 2843)

AddObject (see page 2844)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

InsertObject (see page 2853)

Items (see page 2865)

Data (see page 2951)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.4 TCustomOutline.AddObject Method

Adds a node containing data to the outline.

Pascal

```
function AddObject(Index: LongInt; const Text: string; const Data: TCustomData): LongInt;
```

C++

```
__fastcall LongInt AddObject(LongInt Index, const UnicodeString Text, const TCustomData Data);
```

Description

Use AddObject to add a TOutlineNode (see page 2940) object to the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last sibling of the node identified by Index. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

AddChild (see page 2843) returns the Index property of the new node.

See Also

Add (see page 2842)

AddChildObject (see page 2844)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

InsertObject (see page 2853)

Items (see page 2865)

Data (see page 2951)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.5 TCustomOutline.BadIndex Method

Indicates whether a node's index is up to date.

Pascal

```
function BadIndex(Value: TOutlineNode): Boolean;
```

C++

```
__fastcall Boolean BadIndex(TOutlineNode Value);
```

Description

Use BadIndex to determine whether the Index property of the TOutlineNode (see page 2940) object specified by the Value parameter accurately reflects the position of the node in the outline.

If nodes are added or removed after a call to BeginUpdate (see page 2846), the indexes may be out of date until the EndUpdate (see page 2849) method is called.

See Also

BeginUpdate (see page 2846)

EndUpdate (see page 2849)

Index (see page 2953)

53.1.3.4.6 TCustomOutline.BeginUpdate Method

Prevents the updating of the outline until the EndUpdate (see page 2849) method is called.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before adding, removing, or moving multiple outline items. BeginUpdate speeds processing time by deferring repaints and the adjustment of index values until EndUpdate (see page 2849) is called.

Note: Make sure that EndUpdate (see page 2849) is called after all changes have been made to the nodes in the Items (see page 2865) array.

See Also

BadIndex (see page 2845)

EndUpdate (see page 2849)

Items (see page 2865)

53.1.3.4.7 TCustomOutline.Clear Method

Removes all items from the outline.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the outline of all its nodes. Clear frees the memory for the removed items but not any memory for associated data.

53.1.3.4.8 TCustomOutline.Click Method

Updates the SelectedItem (see page 2872) property.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Click is called automatically when the user clicks the mouse on a node in the outline. Click updates the SelectedItem (see page 2872) property before the OnClick event handler is called by the inherited method.

See Also

DblClick (see page 2847)

SelectedItem (see page 2872)

53.1.3.4.9 TCustomOutline.Collapse Method

Generates an OnCollapse (see page 2873) event.

Pascal

```
procedure Collapse(Index: LongInt); dynamic;
```

C++

```
__fastcall Collapse(LongInt Index);
```

Description

Collapse is called automatically after a node in the outline is collapsed. It calls the OnCollapse (see page 2873) event handler if it is assigned.

Override the Collapse method to provide additional processing after nodes in the outline have been collapsed, or to block the OnCollapse (see page 2873) event.

See Also

Expand (see page 2850)

OnCollapse (see page 2873)

53.1.3.4.10 TCustomOutline.DblClick Method

Expands or collapses the selected node.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick is called automatically when the user double clicks the mouse on a node in the outline. After calling the OnDblClick event handler, DblClick updates the SelectedItem (see page 2872) property and expands the selected node if it is collapsed or collapses the selected node if it is expanded.

See Also

Click (see page 2846)

SelectedItem (see page 2872)

Expanded (see page 2952)

53.1.3.4.11 TCustomOutline.DefineProperties Method

Creates a binary property for customized bitmap values.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

The streaming system calls DefineProperties to allow the outline to define new properties that should be saved with the outline object. DefineProperties checks whether the outline uses any bitmaps other than the default values of PictureClosed (see page 2868), PictureLeaf (see page 2868), PictureMinus (see page 2869), PictureOpen (see page 2869), and PicturePlus (see page 2870). If the outline has customized any of these bitmaps, DefineProperties uses the DefineBinaryProperty method of the Filer parameter to create a binary property for the customized values.

See Also

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

TWriter

DefineBinaryProperty

53.1.3.4.12 TCustomOutline.Delete Method

Deletes a node from the outline.

Pascal

```
procedure Delete(Index: LongInt);
```

C++

```
__fastcall Delete(LongInt Index);
```

Description

Call Delete to remove a node and all its descendants from the outline. Index is the index of the node to delete.

Delete removes the node and its children, frees all associated memory, and then calls DeleteNode (see page 2848) to update the indexes and make sure that SelectedItem (see page 2872) is valid.

See Also

Add (see page 2842)

DeleteNode (see page 2848)

SelectedItem (see page 2872)

53.1.3.4.13 TCustomOutline.DeleteNode Method

Fixes up the outline after a node has been deleted.

Pascal

```
procedure DeleteNode(Node: TOutlineNode; CurIndex: LongInt);
```

C++

```
__fastcall DeleteNode(TOutlineNode Node, LongInt CurIndex);
```

Description

DeleteNode is called automatically whenever a node in the outline is destroyed. It fixes up the index and makes sure that the

SelectedItem (see page 2872) property is valid.

To Delete (see page 2848) a node from the outline, call the Delete (see page 2848) method of the outline or free the TOulineNode object.

See Also

Delete (see page 2848)

SelectedItem (see page 2872)

53.1.3.4.14 TCustomOutline.DrawCell Method

Draws a node in the outline.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically whenever the outline needs to draw a node. If the Style (see page 2872) property is otOwnerDraw and an OnDrawItem (see page 2873) event handler has been supplied, DrawCell generates an OnDrawItem (see page 2873) event. Otherwise, DrawCell draws the node in the manner indicated by the OutlineStyle (see page 2867) property.

See Also

OnDrawItem (see page 2873)

OutlineStyle (see page 2867)

53.1.3.4.15 TCustomOutline.EndUpdate Method

Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 2846).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate at the end of a segment of code that began with a call to BeginUpdate (see page 2846). Every time BeginUpdate (see page 2846) is called, an internal counter is incremented. When EndUpdate is called, the counter is decremented. When every call to BeginUpdate (see page 2846) has been matched by a call to EndUpdate, EndUpdate fixes up the indexes and repaints the outline.

See Also

BeginUpdate (see page 2846)

Items (see page 2865)

53.1.3.4.16 TCustomOutline.Expand Method

Generates an OnExpand (see page 2873) event.

Pascal

```
procedure Expand(Index: LongInt); dynamic;
```

C++

```
__fastcall Expand(LongInt Index);
```

Description

Expand is called automatically after a node in the outline is expanded. It calls the OnExpand (see page 2873) event handler if it is assigned.

Override the Expand method to provide additional processing after nodes in the outline have been expanded, or to block the OnExpand (see page 2873) event.

See Also

Collapse (see page 2847)

OnExpand (see page 2873)

53.1.3.4.17 TCustomOutline.FullCollapse Method

Causes all top-level nodes in the outline to collapse.

Pascal

```
procedure FullCollapse;
```

C++

```
__fastcall FullCollapse();
```

Description

Call FullCollapse to shrink the outline as much as possible. FullCollapse sets the Expanded property of each TOutlineNode (see page 2940) that is a direct descendant of the root of the outline to false. This causes all the descendants of these top-level nodes to be hidden. Depending on the value of OutlineStyle (see page 2867), each collapsed top-level node is then represented with the PictureClosed (see page 2868) bitmap and/or the PicturePlus (see page 2870) bitmap.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PicturePlus (see page 2870)

Expanded (see page 2952)

53.1.3.4.18 TCustomOutline.FullExpand Method

Expands every node in the outline.

Pascal

```
procedure FullExpand;
```

C++

```
__fastcall FullExpand();
```

Description

Call FullExpand to show all nodes in the outline. FullExpand calls the FullExpand method of the root node. This causes the Expanded property of all nodes in the outline to be set to true. Every node in the Items (see page 2865) array appears fully expanded in the outline. Depending on the value of OutlineStyle (see page 2867), each node that has descendants is then represented with the PictureOpen (see page 2869) bitmap and/or the PictureMinus (see page 2869) bitmap. The appearance of leaf nodes is unaffected.

See Also

OutlineStyle (see page 2867)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

FullExpand (see page 2945)

53.1.3.4.19 TCustomOutline.GetDataItem Method

Returns the index of the first node in the outline that has the Value pointer as its Data property.

Pascal

```
function GetDataItem(Value: TCustomData): Longint;
```

C++

```
__fastcall Longint GetDataItem(TCustomData Value);
```

Description

Call GetDataItem to locate the node that corresponds to the Value parameter. GetDataItem returns an index into the Items (see page 2865) property array.

See Also

Items (see page 2865)

Data (see page 2951)

53.1.3.4.20 TCustomOutline.GetItem Method

Returns the index of the node at the position indicated by the X and Y parameters.

Pascal

```
function GetItem(X: Integer; Y: Integer): LongInt;
```

C++

```
__fastcall LongInt GetItem(int X, int Y);
```

Description

Call GetItem to locate the node at the specified screen pixel coordinates. GetItem returns an index into the Items (see page 2865) property array.

See Also

Items (see page 2865)

53.1.3.4.21 TCustomOutline.GetNodeDisplayWidth Method

Returns the length of the row containing a specified node.

Pascal

```
function GetNodeDisplayWidth(Node: TOutlineNode): Integer;
```

C++

```
__fastcall int GetNodeDisplayWidth(TOutlineNode Node);
```

Description

Call GetNodeDisplayWidth to determine the length, in pixels, of the line in the outline that contains the node specified by the Node parameter. GetNodeDisplayWidth adjusts for the lines and bitmaps specified by the OutlineStyle (see page 2867) property.

See Also

ItemHeight (see page 2864)

OutlineStyle (see page 2867)

53.1.3.4.22 TCustomOutline.GetTextItem Method

Returns the index of the first node in the outline with the Value parameter as its Text property.

Pascal

```
function GetTextItem(const Value: string): Longint;
```

C++

```
__fastcall Longint GetTextItem(const UnicodeString Value);
```

Description

Call GetTextItem to locate the node that corresponds to the Value parameter. GetTextItem returns an index into the Items (see page 2865) property array.

See Also

Items (see page 2865)

Text (see page 2955)

53.1.3.4.23 TCustomOutline.GetVisibleNode Method

Returns the TOutlineNode (see page 2940) object for the node indicated by a position in the image of the outline.

Pascal

```
function GetVisibleNode(Index: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetVisibleNode(LongInt Index);
```

Description

Call GetVisibleNode to locate a node with the position given by the Index parameter, where all nodes that are hidden because their parent node is collapsed are ignored. An Index of 0 indicates the first visible node, an Index of 1 indicates the second visible node, and so on. If the outline is fully expanded, GetVisibleNode returns the value of Items (see page 2865)[Index+1].

See Also

Items (see page 2865)

53.1.3.4.24 TCustomOutline.Insert Method

Inserts a node at a specified position.

Pascal

```
function Insert(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt Insert(LongInt Index, const UnicodeString Text);
```

Description

Use Insert to add a TOutlineNode (see page 2940) object to the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline in the position currently occupied by the node identified by Index. The new node is inserted at the same level as the node currently identified by Index, so that the original node and the new node are siblings and share the same parent. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node, including the one specified by Index before Insert is called, are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

Insert returns the Index property of the new node.

See Also

Add (see page 2842)

AddChild (see page 2843)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

InsertObject (see page 2853)

Items (see page 2865)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.25 TCustomOutline.InsertObject Method

Inserts a node containing data at a specified position.

Pascal

```
function InsertObject(Index: LongInt; const Text: string; const Data: TCustomData): LongInt;
```

C++

```
__fastcall LongInt InsertObject(LongInt Index, const UnicodeString Text, const TCustomData
Data);
```

Description

Use InsertObject to add a TOutlineNode (see page 2940) object to the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline in the position currently occupied by the node identified by Index. The new node is inserted at the same level as the node currently identified by Index, so that the original node and the new node are siblings and share the same parent. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node, including the one specified by Index before Insert (see page 2853) is called, are moved down one row and reindexed in the Items (see page 2865) property array with valid Index values. If BeginUpdate (see page 2846) has been called, the Items (see page 2865) array is not reindexed until the EndUpdate (see page 2849) method is called.

Insert (see page 2853) returns the Index property of the new node.

See Also

AddObject (see page 2844)

AddChildObject (see page 2844)

BeginUpdate (see page 2846)

Delete (see page 2848)

EndUpdate (see page 2849)

Insert (see page 2853)

Items (see page 2865)

Data (see page 2951)

Index (see page 2953)

Text (see page 2955)

53.1.3.4.26 TCustomOutline.InvalidateCell Method

Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.

Pascal

```
procedure InvalidateCell(ACol: Longint; ARow: Longint);
```

C++

```
__fastcall InvalidateCell(Longint ACol, Longint ARow);
```

Description

Call InvalidateCell when the contents of a cell change so that the cell will need to be repainted. The ACol parameter is the column index of the cell, and the ARow parameter is the row index.

See Also

CellRect

InvalidateCol

InvalidateEditor

InvalidateRow

53.1.3.4.27 TCustomOutline.KeyDown Method

Provides special processing when the user presses a key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

KeyDown is called automatically when the user presses a key. After calling the inherited method, which generates an OnKeyDown event, KeyDown processes the following keystrokes:

Key	Behavior
Home	Selects the first node in the outline.
End	Selects the last node in the outline.
Return	Toggles the selected node between its collapsed and expanded states.
Ctrl+*	Fully expands the outline.
Right arrow	Selects the first child of the selected node.
Left arrow	Selects the parent of the selected node.
Ctrl+Up arrow	Selects the node following the selected node.
Ctrl+Down arrow	Selects the node preceding the selected node.

See Also

KeyPress (see page 2855)

SelectedItem (see page 2872)

KeyDown

53.1.3.4.28 TCustomOutline.KeyPress Method

Provides special processing when a key is pressed.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically after the user presses a key but before it is released. After calling the inherited method, which generates an OnKeyPress event, KeyPress processes the following characters :

Key	Behavior
+	Expands the selected node.
-	Collapses the selected node.
*	Fully expands the outline.

See Also

KeyDown (see page 2855)

KeyPress

53.1.3.4.29 TCustomOutline.Loaded Method

Sets up the outline after it has been streamed in.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The streaming system calls Loaded after the outline has been fully loaded into memory. Loaded makes sure that all indexes are correct, loads any custom bitmaps that replaced the default values, and selects the first node in the outline.

See Also

DefineProperties (see page 2847)

SelectedItem (see page 2872)

SetGoodIndex (see page 2860)

53.1.3.4.30 LoadFromFile Method

This is the overview for the LoadFromFile method overload.

Overload List

	Name	Description
	TCustomOutline.LoadFromFile (string) (see page 2856)	Loads the outline from a text image stored in a file.
	TCustomOutline.LoadFromFile (string, TEncoding) (see page 2856)	Loads the outline from a text image stored in a file.

53.1.3.4.30.1 TCustomOutline.LoadFromFile Method (string)

Loads the outline from a text image stored in a file.

Pascal

```
procedure LoadFromFile(const FileName: string); overload;
procedure LoadFromFile(const FileName: string; Encoding: TEncoding); overload;
```

C++

```
__fastcall LoadFromFile(const UnicodeString FileName);
__fastcall LoadFromFile(const UnicodeString FileName, TEncoding Encoding);
```

Description

Call LoadFromFile to fill an outline from the file specified by the FileName parameter. Each line in the file represents a node in the outline. The file does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items.

For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

To fill the outline from a text image read from a stream, use the LoadFromStream (see page 2857) method. To fill the outline from a text image represented as a TStrings object, use the Lines (see page 2866) property.

See Also

Lines (see page 2866)

LoadFromStream (see page 2857)

SaveToFile (see page 2859)

53.1.3.4.31 LoadFromStream Method

This is the overview for the LoadFromStream method overload.

Overload List

	Name	Description
	TCustomOutline.LoadFromStream (TStream) (see page 2857)	Loads the outline from a text image read from a stream.
	TCustomOutline.LoadFromStream (TStream, TEncoding) (see page 2857)	Loads the outline from a text image read from a stream.

53.1.3.4.31.1 TCustomOutline.LoadFromStream Method (TStream)

Loads the outline from a text image read from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); overload;
procedure LoadFromStream(Stream: TStream; Encoding: TEncoding); overload;
```

C++

```
__fastcall LoadFromStream(TStream Stream);
__fastcall LoadFromStream(TStream Stream, TEncoding Encoding);
```

Description

Call LoadFromStream to fill an outline from the stream specified by the Stream parameter. For example, use LoadFromStream to load an outline from an image stored in a database table, using a TBlobStream object. Each node in the outline is separated by a newline character. The stream does not provide the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

To fill the outline from a text image read from a file, use the LoadFromFile (see page 2856) method. To fill the outline from a

text image represented as a TStrings object, use the Lines (see page 2866) property.

See Also

Lines (see page 2866)

LoadFromFile (see page 2856)

SaveToStream (see page 2859)

53.1.3.4.32 TCustomOutline.MouseDown Method

Updates the SelectedItem (see page 2872) property.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

After calling the inherited method to generate an OnMouseDown event and locate the line under the mouse, MouseDown sets the SelectedItem (see page 2872) property to the node in the line under the mouse.

See Also

SelectedItem (see page 2872)

53.1.3.4.33 TCustomOutline.Move Method

Repositions a node in the outline.

Pascal

```
procedure Move(Destination: LongInt; Source: LongInt; AttachMode: TAttachMode);
```

C++

```
__fastcall Move(LongInt Destination, LongInt Source, TAttachMode AttachMode);
```

Description

Call Move to reposition the node with the index specified by the Source parameter to the position indicated by the Destination parameter. The meaning of the Destination parameter depends on the value of the AttachMode parameter.

See Also

Add (see page 2842)

AddChild (see page 2843)

Insert (see page 2853)

Items (see page 2865)

53.1.3.4.34 SaveToFile Method

This is the overview for the SaveToFile method overload.

Overload List

	Name	Description
	TCustomOutline.SaveToFile (string) (see page 2859)	Saves the Lines (see page 2866) property to a file.
	TCustomOutline.SaveToFile (string, TEncoding) (see page 2859)	Saves the Lines (see page 2866) property to a file.

53.1.3.4.34.1 TCustomOutline.SaveToFile Method (string)

Saves the Lines (see page 2866) property to a file.

Pascal

```
procedure SaveToFile(const FileName: string); overload;
procedure SaveToFile(const FileName: string; Encoding: TEncoding); overload;
```

C++

```
__fastcall SaveToFile(const UnicodeString FileName);
__fastcall SaveToFile(const UnicodeString FileName, TEncoding Encoding);
```

Description

Call SaveToFile to save a text image of the outline to the file specified by the FileName parameter. The image saved is the value of the Lines (see page 2866) property, where each line of the file represents a node, and each level of the outline is represented by a tab character.

To write the outline to an arbitrary stream, use the SaveToStream (see page 2859) method.

See Also

Lines (see page 2866)

LoadFromFile (see page 2856)

SaveToStream (see page 2859)

53.1.3.4.35 SaveToStream Method

This is the overview for the SaveToStream method overload.

Overload List

	Name	Description
	TCustomOutline.SaveToStream (TStream) (see page 2859)	Writes the Lines (see page 2866) property to a stream.
	TCustomOutline.SaveToStream (TStream, TEncoding) (see page 2859)	Writes the Lines (see page 2866) property to a stream.

53.1.3.4.35.1 TCustomOutline.SaveToStream Method (TStream)

Writes the Lines (see page 2866) property to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); overload;
procedure SaveToStream(Stream: TStream; Encoding: TEncoding); overload;
```

C++

```
__fastcall SaveToStream(TStream Stream);
__fastcall SaveToStream(TStream Stream, TEncoding Encoding);
```

Description

Call SaveToStream to write a text image of the outline to the stream specified by the Stream parameter. The image saved is the value of the Lines (see page 2866) property, where each line of text represents a node, and each level of the outline is represented by a tab character.

To write the outline to a file, use the SaveToFile (see page 2859) method.

See Also

Lines (see page 2866)

LoadFromStream (see page 2857)

SaveToFile (see page 2859)

53.1.3.4.36 TCustomOutline.SetDisplayWidth Method

Sets the display width of the outline.

Pascal

```
procedure SetDisplayWidth(Value: Integer);
```

C++

```
__fastcall SetDisplayWidth(int Value);
```

Description

Call SetDisplayWidth to set the width of the image of the outline to the number of pixels specified by the Value parameter. Value should large enough to display the most deeply nested node. Use the GetNodeDisplayWidth (see page 2852) method to determine the size needed to display the visible nodes.

If the display width is greater than the client width of the control, users can scroll the image to view the entire width.

See Also

ClientWidth

GetNodeDisplayWidth (see page 2852)

GetVisibleNode (see page 2852)

53.1.3.4.37 TCustomOutline.SetGoodIndex Method

Returns the first node in the Items (see page 2865) array that must be reindexed to make the index of the Value parameter correct.

Pascal

```
function SetGoodIndex(Value: TOutlineNode): TOutlineNode;
```

C++

```
__fastcall TOutlineNode SetGoodIndex(TOutlineNode Value);
```

Description

Call SetGoodIndex to determine how much of the Items (see page 2865) array must be reindexed after changing the nodes in the outline. All nodes from the root to the value returned by SetGoodIndex do not need to be reindexed.

See Also

BadIndex (see page 2845)

53.1.3.4.38 TCustomOutline.SetLevel Method

Sets the level of an outline node.

Pascal

```
procedure SetLevel(Node: TOutlineNode; CurLevel: Cardinal; NewLevel: Cardinal);
```

C++

```
__fastcall SetLevel(TOutlineNode Node, unsigned CurLevel, unsigned NewLevel);
```

Description

Call SetLevel to change the nesting depth of the node specified by the Node parameter. CurLevel is the node's current level and NewLevel is the node's new level.

For example, consider the outline specified by the following value of Lines (see page 2866):

```
NodeA
 NodeB
  NodeC
 NodeD
```

Calling SetLevel for NodeD with CurLevel set to 2 and NewLevel set to 4 results in the outline with the following value of Lines (see page 2866):

```
NodeA
 NodeB
  NodeC
   NodeD
```

That is, the parent of NodeD was changed from NodeA to NodeC.

See Also

Lines (see page 2866)

53.1.3.4.39 TCustomOutline.SetUpdateState Method

Enables or disables the maintenance of the node indexes.

Pascal

```
procedure SetUpdateState(Value: Boolean);
```

C++

```
__fastcall SetUpdateState(Boolean Value);
```

Description

Call SetUpdateState with Value set to true to block the recomputation of indexes. Call SetUpdateState with Value set to false to recompute all indexes in the outline and enable the maintenance of indexes with every change to the nodes in the outline.

Unlike calls to BeginUpdate (see page 2846) and EndUpdate (see page 2849), calls to SetUpdateState do not nest: Calling SetUpdateState with Value set to false always recomputes the indexes regardless of the number of previous calls to SetUpdateState with Value set to true.

Note: Calling SetUpdateState takes precedence over any enabling or disabling of index maintenance provided by BeginUpdate (see page 2846) or EndUpdate (see page 2849).

See Also

BeginUpdate (see page 2846)

EndUpdate (see page 2849)

53.1.3.5 TCustomOutline Properties

The properties of the TCustomOutline class are listed here.

Protected Properties

	Name	Description
	ItemHeight (see page 2864)	Specifies the height of each node in the outline.
	ItemSeparator (see page 2865)	Specifies a delimiting string for outline nodes.
	Lines (see page 2866)	Lists the Text property values of all nodes in the outline.
	Options (see page 2866)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 2867)	Specifies how the outline tree is displayed.
	PictureClosed (see page 2868)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 2868)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 2869)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 2869)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 2870)	Specifies the bitmap used to represent a collapsed item that has subitems.
	Style (see page 2872)	Determines whether the nodes and tree are drawn automatically.

Public Properties

	Name	Description
	Canvas (see page 2862)	Specifies the TCanvas object that presents a drawing surface for the control.
R	ItemCount (see page 2864)	Indicates the number of nodes in the outline.
R	Items (see page 2865)	Lists the nodes in the outline.
	Row (see page 2870)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 2872)	Specifies the index of the selected node.

53.1.3.5.1 TCustomOutline.Canvas Property

Specifies the TCanvas object that presents a drawing surface for the control.

Pascal

```
property Canvas;
```

C++

```
__property Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control. Canvas encapsulates a Windows device context, providing all the tools and methods needed for drawing and painting.

Canvas is a protected property that is usually redeclared as public in descendants of TCustomControl.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
```

```
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStringGrid *myStringGrid;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStringGrid")
  {
    myStringGrid = dynamic_cast<TStringGrid *>(ListBox1->Items->Objects[Index]);
    // make sure we are using the TControls canvas and not the from's!
    myStringGrid->Canvas->MoveTo(myStringGrid->ClientRect.Left, myStringGrid->ClientRect.Top);
    myStringGrid->Canvas->LineTo(myStringGrid->ClientRect.Right,
myStringGrid->ClientRect.Bottom);
    myStringGrid = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
```

```
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TStringGrid) then
  begin
    myStringGrid:= (ListBox1.Items.Objects[Index] as TStringGrid);
    with myStringGrid.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myStringGrid.Canvas.MoveTo(Left, Top);
      myStringGrid.Canvas.LineTo(Right, Bottom);
    end;
  myStringGrid:= nil;
  end;
```

See Also

Paint

53.1.3.5.2 TCustomOutline.ItemCount Property

Indicates the number of nodes in the outline.

Pascal

```
property ItemCount: LongInt;
```

C++

```
__property LongInt ItemCount;
```

Description

Read ItemCount to determine the number of nodes in the outline. Use ItemCount with the Items (see page 2865) property array to iterate over all nodes in the outline.

Note: Reading ItemCount can be computationally expensive, as it causes all the indexes used by the outline to be updated.

See Also

Items (see page 2865)

53.1.3.5.3 TCustomOutline.ItemHeight Property

Specifies the height of each node in the outline.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Set ItemHeight to the height, in pixels, of each node in the outline. Changing the ItemHeight property also changes the font used to display the nodes.

See Also

ItemCount (see page 2864)

Items (see page 2865)

53.1.3.5.4 TCustomOutline.Items Property

Lists the nodes in the outline.

Pascal

```
property Items [Index: LongInt]: TOutlineNode;
```

C++

```
__property TOutlineNode Items[LongInt Index];
```

Description

Use Items to access a node in the outline. Each item is a TOutlineNode (see page 2940) object.

Index is a number specifying the node to return, where Items[0] refers to the root, Items[1] is the first (topmost) node, and so on.

Note: Items is the default property of TCustomOutline (see page 2838). This means that the name of the property may be omitted in code. Thus the line

Note: Outline1.Items[1].Text := Edit1.Text;

Note: can also be written

Note: Outline1[1].Text := Edit1.Text;

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

See Also

ItemCount (see page 2864)

ItemHeight (see page 2864)

ItemSeparator (see page 2865)

Lines (see page 2866)

53.1.3.5.5 TCustomOutline.ItemSeparator Property

Specifies a delimiting string for outline nodes.

Pascal

```
property ItemSeparator: string;
```

C++

```
__property UnicodeString ItemSeparator;
```

Description

Set ItemSeparator to the string that should appear between node names in the path description of any individual node in the outline. ItemSeparator is used to implement the FullPath read method of TOutlineNode (see page 2940).

ItemSeparator is initialized to the backslash (\) character when the TCustomOutline (see page 2838) object is created.

See Also

Items (see page 2865)

FullPath (see page 2952)

53.1.3.5.6 TCustomOutline.Lines Property

Lists the Text property values of all nodes in the outline.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Read Lines to obtain a text representation of the outline. Set Lines to fill the outline from a set of text strings. Each string in the Lines property represents a node in the outline. Lines does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

The Lines property is primarily useful for filling an outline with items at design time. While Lines can be used to access the individual nodes at run time, it is much quicker to access an item with the Items (see page 2865) property.

See Also

Items (see page 2865)

Text (see page 2955)

53.1.3.5.7 TCustomOutline.Options Property

Determines how the nodes in the outline are drawn.

Pascal

```
property Options: TOutlineOptions;
```

C++

```
__property TOutlineOptions Options;
```

Description

Set Options to any combination of the following values:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf (see page 2868), PictureOpen (see page 2869), PictureClosed (see page 2868), PicturePlus (see page 2870), PictureMinus (see page 2869)) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

Items (see page 2865)

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

SelectedItem (see page 2872)

53.1.3.5.8 TCustomOutline.OutlineStyle Property

Specifies how the outline tree is displayed.

Pascal

```
property OutlineStyle: TOutlineStyle;
```

C++

```
__property TOutlineStyle OutlineStyle;
```

Description

Set OutlineStyle to one of the following values:

Value	Meaning
osText	Displays node text (specified in Text) only.
osPlusMinusText	Displays plus picture (specified in PicturePlus (see page 2870)), minus picture (specified in PictureMinus (see page 2869)), and node text (specified in Text).
osPictureText	Displays open picture (specified in PictureOpen (see page 2869)), closed picture (specified in PictureClosed (see page 2868)), leaf picture (specified in PictureLeaf (see page 2868)) and node text (specified in Text).

osPlusMinusPictureText	Displays plus picture (specified in PicturePlus (see page 2870)), minus picture (specified in PictureMinus (see page 2869)), open picture (specified in PictureOpen (see page 2869)), closed picture (specified in PictureClosed (see page 2868)), leaf picture (specified in PictureLeaf (see page 2868)), and node text (specified in Text).
osTreeText	Displays lines connecting outline nodes and node text (specified in Text).
osTreePictureText	Displays lines connecting outline nodes, open picture (specified in PictureOpen (see page 2869)), closed picture (specified in PictureClosed (see page 2868)), leaf picture (specified in PictureLeaf (see page 2868)), and node text (specified in Text).

Note: If the Style (see page 2872) property is otOwnerDraw, the value of OutlineStyle is ignored. The connecting lines, node bitmaps, and node text must all be drawn in an OnDrawItem (see page 2873) event handler.

See Also

Options (see page 2866)

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

Style (see page 2872)

Text (see page 2955)

53.1.3.5.9 TCustomOutline.PictureClosed Property

Specifies the bitmap used to represent a collapsed node that has subitems.

Pascal

```
property PictureClosed: TBitmap;
```

C++

```
__property TBitmap PictureClosed;
```

Description

By default, PictureClosed is a closed file folder bitmap. Set PictureClosed to change the bitmap used for collapsed nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 2867) property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

53.1.3.5.10 TCustomOutline.PictureLeaf Property

Specifies the bitmap used to represent an item that does not have subitems.

Pascal

```
property PictureLeaf: TBitmap;
```

C++

```
__property TBitmap PictureLeaf;
```

Description

By default, PictureLeaf is a document bitmap. Set PictureLeaf to change the bitmap used for leaf nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 2867) property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureOpen (see page 2869)

53.1.3.5.11 TCustomOutline.PictureMinus Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureMinus: TBitmap;
```

C++

```
__property TBitmap PictureMinus;
```

Description

By default, PictureMinus is a minus sign (-). Set PictureMinus to change the bitmap used for collapsible nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 2867) property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 2867)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

53.1.3.5.12 TCustomOutline.PictureOpen Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureOpen: TBitmap;
```

C++

```
__property TBitmap PictureOpen;
```

Description

By default, the PictureOpen property is an open file folder. Set PictureOpen to change the bitmap used for expanded nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 2867) property is set to osPictureText,

osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PicturePlus (see page 2870)

53.1.3.5.13 TCustomOutline.PicturePlus Property

Specifies the bitmap used to represent a collapsed item that has subitems.

Pascal

```
property PicturePlus: TBitmap;
```

C++

```
__property TBitmap PicturePlus;
```

Description

By default, the PicturePlus property is a plus sign (+). Set PicturePlus to change the bitmap used for collapsed nodes.

Note: The bitmap will not be displayed in the outline unless the OutlineStyle (see page 2867) property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureMinus (see page 2869)

53.1.3.5.14 TCustomOutline.Row Property

Specifies the index of the row that contains the selected cell.

Pascal

```
property Row;
```

C++

```
__property Row;
```

Description

Use Row at runtime to determine the current row in the grid. Setting Row moves focus to the cell in the current column that is in the new row. The first row has an index of 0, the second row an index of 1, and so on.

The selected cell in the grid can be located by reading the Row property and the Col property to obtain the indexes of its row and column. When focus moves to the grid, the selected cell gets input focus.

C++ Examples:

```
/*
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
```

```
  Note that when the grid contains an empty cell, the list box
  has a corresponding empty string.
  */
  void __fastcall TForm1::Button1Click(TObject *Sender)
  {
    ListBox1->Items = StringGrid1->Rows[StringGrid1->Row];
  }

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {

    StringGrid1->Cells[1][0] = "Column 1";
    StringGrid1->Cells[2][0] = "Column 2";
    StringGrid1->Cells[3][0] = "Column 3";
    StringGrid1->Cells[4][0] = "Column 4";
    StringGrid1->Cells[0][1] = "Row 1";
    StringGrid1->Cells[1][1] = "Object";
    StringGrid1->Cells[2][1] = "Pascal";
    StringGrid1->Cells[3][1] = "is";
    StringGrid1->Cells[4][1] = "excellent";
    StringGrid1->Cells[0][2] = "Row 2";
    StringGrid1->Cells[1][2] = "Delphi";
    StringGrid1->Cells[2][2] = "is";
    StringGrid1->Cells[4][2] = "RAD";

  }
```

Delphi Examples:

```
  {
  This example displays a string grid, a list box, and a
  button on a form. When the application runs, strings are put
  in the cells of row 1 of the string grid. When the user
  clicks the button, The strings in the current row of the
  grid are displayed in the list box.
  Note that when the grid contains an empty cell, the list box
  has a corresponding empty string.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    ListBox1.Items := StringGrid1.Rows[StringGrid1.Row];
  end;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    with StringGrid1 do
    begin
      Cells[1,0] := 'Column 1';
      Cells[2,0] := 'Column 2';
      Cells[3,0] := 'Column 3';
      Cells[4,0] := 'Column 4';
      Cells[0,1] := 'Row 1';
      Cells[1,1] := 'Object';
      Cells[2,1] := 'Pascal';
      Cells[3,1] := 'is';
      Cells[4,1] := 'excellent';
      Cells[0,2] := 'Row 2';
      Cells[1,2] := 'Delphi';
      Cells[2,2] := 'is';
      Cells[4,2] := 'RAD';
    end;
  end;
```

See Also

Col

53.1.3.5.15 TCustomOutline.SelectedItem Property

Specifies the index of the selected node.

Pascal

```
property SelectedItem: Longint;
```

C++

```
__property Longint SelectedItem;
```

Description

Read SelectedItem to determine the Index of the selected node. If no node is selected, SelectedItem is 0. Set SelectedItem to set focus to a particular node in the outline.

See Also

Items (see page 2865)

53.1.3.5.16 TCustomOutline.Style Property

Determines whether the nodes and tree are drawn automatically.

Pascal

```
property Style: TOutlineType;
```

C++

```
__property TOutlineType Style;
```

Description

By default, Style is osStandard, meaning that the outline displays items in the style determined by the OutlineStyle (see page 2867) property. Set Style to otOwnerDraw to create owner-draw outlines, meaning that items must be drawn on the canvas of the outline by code in an OnDrawItem (see page 2873) event handler.

Owner-draw outlines can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed (see page 2868), PictureOpen (see page 2869), PictureMinus (see page 2869), PicturePlus (see page 2870), and PictureLeaf (see page 2868) properties. Owner-draw outlines require more programming, however, as the application must specify how to render the image for each node in an OnDrawItem (see page 2873) event handler.

See Also

Canvas

OnDrawItem (see page 2873)

OutlineStyle (see page 2867)

53.1.3.6 TCustomOutline Events

The events of the TCustomOutline class are listed here.

Protected Events

	Name	Description
	OnCollapse (see page 2873)	Occurs immediately after a node in the outline is collapsed.
	OnDrawItem (see page 2873)	Occurs when a node must be drawn in an owner-draw outline.
	OnExpand (see page 2873)	Occurs immediately after a node in the outline is expanded.

53.1.3.6.1 TCustomOutline.OnCollapse Event

Occurs immediately after a node in the outline is collapsed.

Pascal

```
property OnCollapse: EOutlineChange;
```

C++

```
__property EOutlineChange OnCollapse;
```

Description

Write an OnCollapse event handler to perform special processing when a node in the outline is collapsed. The event handler supplies the index of the node that collapsed.

See Also

OnExpand (see page 2873)

53.1.3.6.2 TCustomOutline.OnDrawItem Event

Occurs when a node must be drawn in an owner-draw outline.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

When the Style (see page 2872) property is set to otOwnerDraw, specify an OnDrawItem event handler to render the image of each node in the outline. An OnDrawItem event handler can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed (see page 2868), PictureOpen (see page 2869), PictureMinus (see page 2869), PicturePlus (see page 2870), and PictureLeaf (see page 2868) properties.

Draw the image of the node specified by the Index parameter onto the canvas of the outline.

See Also

Canvas

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

Style (see page 2872)

Text (see page 2955)

53.1.3.6.3 TCustomOutline.OnExpand Event

Occurs immediately after a node in the outline is expanded.

Pascal

```
property OnExpand: EOutlineChange;
```

C++

```
__property EOutlineChange OnExpand;
```

Description

Write an OnExpand event handler to perform special processing when a node in the outline is expanded. The event handler identifies the node that was just expanded.

See Also

OnCollapse (see page 2873)

53.1.4 TOutline Class

TOutline is a multilevel outline that displays the values of TOutlineNode (see page 2940) objects.

Class Hierarchy

Pascal

```
TOutline = class(TCustomOutline);
```

C++

```
class TOutline : public TCustomOutline;
```

File

Outline

Description

Use an outline to visually organize information in a hierarchical tree. Each item in an outline is contained in a TOutlineNode (see page 2940) object. Outline (see page 2835) controls allow an application to manage a hierarchy of outline nodes, including the ability to control the appearance and layout of those nodes and the ability to expand or collapse branches of the outline tree.

TOutline is provided primarily for backward compatibility. New applications should use TTreeView instead.

See Also

TOutlineNode (see page 2940)

TTreeView

53.1.4.1 TOutline Members

The following tables list the members exposed by TOutline.

Protected Methods

	Name	Description
	BadIndex (see page 2845)	Indicates whether a node's index is up to date.
	Click (see page 2846)	Updates the SelectedItem (see page 2872) property.
	Collapse (see page 2847)	Generates an OnCollapse (see page 2873) event.

	DblClick (see page 2847)	Expands or collapses the selected node.
	DefineProperties (see page 2847)	Creates a binary property for customized bitmap values.
	DeleteNode (see page 2848)	Fixes up the outline after a node has been deleted.
	DrawCell (see page 2849)	Draws a node in the outline.
	Expand (see page 2850)	Generates an OnExpand (see page 2873) event.
	InvalidateCell (see page 2854)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	KeyDown (see page 2855)	Provides special processing when the user presses a key.
	KeyPress (see page 2855)	Provides special processing when a key is pressed.
	Loaded (see page 2856)	Sets up the outline after it has been streamed in.
	MouseDown (see page 2858)	Updates the SelectedItem (see page 2872) property.
	Move (see page 2858)	Repositions a node in the outline.
	SetDisplayWidth (see page 2860)	Sets the display width of the outline.
	SetGoodIndex (see page 2860)	Returns the first node in the Items (see page 2865) array that must be reindexed to make the index of the Value parameter correct.
	SetLevel (see page 2861)	Sets the level of an outline node.

Public Methods

	Name	Description
	Add (see page 2842)	Adds a node to the outline.
	AddChild (see page 2843)	Adds a child node to a node in the outline.
	AddChildObject (see page 2844)	Adds a child node containing data to a node in the outline.
	AddObject (see page 2844)	Adds a node containing data to the outline.
	BeginUpdate (see page 2846)	Prevents the updating of the outline until the EndUpdate (see page 2849) method is called.
	Clear (see page 2846)	Removes all items from the outline.
	Create (see page 2840)	Creates an instance of TCustomOutline (see page 2838).
	Delete (see page 2848)	Deletes a node from the outline.
	Destroy (see page 2841)	Destroys an instance of TCustomOutline (see page 2838).
	EndUpdate (see page 2849)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 2846).
	FullCollapse (see page 2850)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 2850)	Expands every node in the outline.
	GetDataItem (see page 2851)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetItem (see page 2851)	Returns the index of the node at the position indicated by the X and Y parameters.
	GetNodeDisplayWidth (see page 2852)	Returns the length of the row containing a specified node.
	GetTextItem (see page 2852)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetVisibleNode (see page 2852)	Returns the TOutlineNode (see page 2940) object for the node indicated by a position in the image of the outline.
	Insert (see page 2853)	Inserts a node at a specified position.
	InsertObject (see page 2853)	Inserts a node containing data at a specified position.
	LoadFromFile (see page 2856)	This is the overview for the LoadFromFile method overload.
	LoadFromStream (see page 2857)	This is the overview for the LoadFromStream method overload.
	SaveToFile (see page 2858)	This is the overview for the SaveToFile method overload.
	SaveToStream (see page 2859)	This is the overview for the SaveToStream method overload.
	SetUpdateState (see page 2861)	Enables or disables the maintenance of the node indexes.

Public Properties

	Name	Description
	Canvas (see page 2862)	Specifies the TCanvas object that presents a drawing surface for the control.
R	ItemCount (see page 2864)	Indicates the number of nodes in the outline.
R	Items (see page 2865)	Lists the nodes in the outline.
	Row (see page 2870)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 2872)	Specifies the index of the selected node.

Published Events

	Name	Description
	OnClick (see page 2906)	Occurs when the user clicks the control.
	OnCollapse (see page 2908)	Occurs immediately after a node in the outline is collapsed.
	OnContextPopup (see page 2908)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2909)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 2909)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2912)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 2916)	Occurs when a node must be drawn in an owner-draw outline.
	OnEndDock (see page 2916)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2917)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2918)	Occurs when a control receives the input focus.
	OnExit (see page 2920)	Occurs when the input focus shifts away from one control to another.
	OnExpand (see page 2924)	Occurs immediately after a node in the outline is expanded.
	OnKeyDown (see page 2924)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2928)	Occurs when a key is pressed.
	OnKeyUp (see page 2929)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2931)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2932)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2934)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2934)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2935)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2937)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 2939)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2940)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 2878)	Determines how the control aligns within its container (parent control).
	BorderStyle (see page 2881)	Determines whether a single line border is drawn around the grid.
	Color (see page 2881)	Specifies the background color of the control.
	Ctl3D (see page 2882)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 2883)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 2885)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2885)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2885)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2887)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2887)	Controls the attributes of text written on or in the control.
	ItemHeight (see page 2888)	Specifies the height of each node in the outline.
	ItemSeparator (see page 2889)	Specifies a delimiting string for outline nodes.
	Lines (see page 2889)	Lists the Text property values of all nodes in the outline.
	Options (see page 2890)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 2890)	Specifies how the outline tree is displayed.
	ParentColor (see page 2891)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2892)	Determines where a component looks to determine if it should appear three dimensional.

	ParentDoubleBuffered (see page 2892)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2892)	Determines where a control looks for its font information.
	ParentShowHint (see page 2893)	Determines where a control looks to find out if its Help Hint should be shown.
	PictureClosed (see page 2893)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 2894)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 2894)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 2895)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 2895)	Specifies the bitmap used to represent a collapsed item that has subitems.
	PopupMenu (see page 2896)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 2901)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 2901)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 2902)	Determines whether the nodes and tree are drawn automatically.
	TabOrder (see page 2903)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2904)	Determines if the user can tab to a control.
	Visible (see page 2904)	Determines whether the component appears onscreen.

53.1.4.2 TOutline Properties

The properties of the TOutline class are listed here.

Published Properties

	Name	Description
	Align (see page 2878)	Determines how the control aligns within its container (parent control).
	BorderStyle (see page 2881)	Determines whether a single line border is drawn around the grid.
	Color (see page 2881)	Specifies the background color of the control.
	Ctl3D (see page 2882)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 2883)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 2885)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2885)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2885)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2887)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2887)	Controls the attributes of text written on or in the control.
	ItemHeight (see page 2888)	Specifies the height of each node in the outline.
	ItemSeparator (see page 2889)	Specifies a delimiting string for outline nodes.
	Lines (see page 2889)	Lists the Text property values of all nodes in the outline.
	Options (see page 2890)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 2890)	Specifies how the outline tree is displayed.
	ParentColor (see page 2891)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2892)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 2892)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2892)	Determines where a control looks for its font information.
	ParentShowHint (see page 2893)	Determines where a control looks to find out if its Help Hint should be shown.
	PictureClosed (see page 2893)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 2894)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 2894)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 2895)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 2895)	Specifies the bitmap used to represent a collapsed item that has subitems.
	PopupMenu (see page 2896)	Identifies the pop-up menu associated with the control.

	ScrollBars (see page 2901)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 2901)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 2902)	Determines whether the nodes and tree are drawn automatically.
	TabOrder (see page 2903)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2904)	Determines if the user can tab to a control.
	Visible (see page 2904)	Determines whether the component appears onscreen.

53.1.4.2.1 TOutline.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
```

```
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}

Parent

Anchors

53.1.4.2.2 TOutline.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle;
```

C++

```
__property BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

53.1.4.2.3 TOutline.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

53.1.4.2.4 TOutline.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

BorderWidth

53.1.4.2.5 TOutline.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
```

```
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

53.1.4.2.6 TOutline.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

53.1.4.2.7 TOutline.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

53.1.4.2.8 TOutline.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

Arranging the Order of Persistent Columns

53.1.4.2.9 TOutline.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

53.1.4.2.10 TOutline.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

53.1.4.2.11 TOutline.ItemHeight Property

Specifies the height of each node in the outline.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Set ItemHeight to the height, in pixels, of each node in the outline. Changing the ItemHeight property also changes the font used to display the nodes.

See Also

ItemCount (see page 2864)

Items (see page 2865)

53.1.4.2.12 TOutline.ItemSeparator Property

Specifies a delimiting string for outline nodes.

Pascal

```
property ItemSeparator: string;
```

C++

```
__property UnicodeString ItemSeparator;
```

Description

Set ItemSeparator to the string that should appear between node names in the path description of any individual node in the outline. ItemSeparator is used to implement the FullPath read method of TOutlineNode.

ItemSeparator is initialized to the backslash (\) character when the TCustomOutline object is created.

See Also

Items (see page 2865)

FullPath (see page 2952)

53.1.4.2.13 TOutline.Lines Property

Lists the Text property values of all nodes in the outline.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Read Lines to obtain a text representation of the outline. Set Lines to fill the outline from a set of text strings. Each string in the Lines property represents a node in the outline. Lines does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

The Lines property is primarily useful for filling an outline with items at design time. While Lines can be used to access the individual nodes at run time, it is much quicker to access an item with the Items property.

See Also

Items (see page 2865)

Text (see page 2955)

53.1.4.2.14 TOutline.Options Property

Determines how the nodes in the outline are drawn.

Pascal

```
property Options: TOutlineOptions;
```

C++

```
__property TOutlineOptions Options;
```

Description

Set Options to any combination of the following values:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

Items (see page 2865)

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

SelectedItem (see page 2872)

53.1.4.2.15 TOutline.OutlineStyle Property

Specifies how the outline tree is displayed.

Pascal

```
property OutlineStyle: TOutlineStyle;
```

C++

```
__property TOutlineStyle OutlineStyle;
```

Description

Set OutlineStyle to one of the following values:

Value	Meaning
osText	Displays node text (specified in Text) only.
osPlusMinusText	Displays plus picture (specified in PicturePlus), minus picture (specified in PictureMinus), and node text (specified in Text).
osPictureText	Displays open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf) and node text (specified in Text).
osPlusMinusPictureText	Displays plus picture (specified in PicturePlus), minus picture (specified in PictureMinus), open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf), and node text (specified in Text).
osTreeText	Displays lines connecting outline nodes and node text (specified in Text).
osTreePictureText	Displays lines connecting outline nodes, open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf), and node text (specified in Text).

Note: If the Style property is otOwnerDraw, the value of OutlineStyle is ignored. The connecting lines, node bitmaps, and node text must all be drawn in an OnDrawItem event handler.

53.1.4.2.16 TOutline.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the

form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

ParentShowHint

53.1.4.2.17 TOutline.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

53.1.4.2.18 TOutline.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

53.1.4.2.19 TOutline.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentColor

ParentShowHint

53.1.4.2.20 TOutline.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

53.1.4.2.21 TOutline.PictureClosed Property

Specifies the bitmap used to represent a collapsed node that has subitems.

Pascal

```
property PictureClosed: TBitmap;
```

C++

```
__property TBitmap PictureClosed;
```

Description

By default, PictureClosed is a closed file folder bitmap. Set PictureClosed to change the bitmap used for collapsed nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureLeaf (see page 2868)

PictureMinus (see page 2869)

PictureOpen (see page 2869)

53.1.4.2.22 TOutline.PictureLeaf Property

Specifies the bitmap used to represent an item that does not have subitems.

Pascal

```
property PictureLeaf: TBitmap;
```

C++

```
__property TBitmap PictureLeaf;
```

Description

By default, PictureLeaf is a document bitmap. Set PictureLeaf to change the bitmap used for leaf nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureOpen (see page 2869)

53.1.4.2.23 TOutline.PictureMinus Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureMinus: TBitmap;
```

C++

```
__property TBitmap PictureMinus;
```

Description

By default, PictureMinus is a minus sign (-). Set PictureMinus to change the bitmap used for collapsible nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 2867)

PictureOpen (see page 2869)

PicturePlus (see page 2870)

53.1.4.2.24 TOutline.PictureOpen Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureOpen: TBitmap;
```

C++

```
__property TBitmap PictureOpen;
```

Description

By default, the PictureOpen property is an open file folder. Set PictureOpen to change the bitmap used for expanded nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureLeaf (see page 2868)

PicturePlus (see page 2870)

53.1.4.2.25 TOutline.PicturePlus Property

Specifies the bitmap used to represent a collapsed item that has subitems.

Pascal

```
property PicturePlus: TBitmap;
```

C++

```
__property TBitmap PicturePlus;
```

Description

By default, the PicturePlus property is a plus sign (+). Set PicturePlus to change the bitmap used for collapsed nodes.

Note: The bitmap will not be displayed in the outline unless the OutlineStyle property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 2867)

PictureClosed (see page 2868)

PictureMinus (see page 2869)

53.1.4.2.26 TOutline.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
```

```
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
```

```
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

53.1.4.2.27 TOutline.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars;
```

C++

```
__property ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

ClientHeight

ClientWidth

53.1.4.2.28 TOutline.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;
```

```
    char string[10];
    char index[3];
    for(int i = 1; i <= 10; i++)
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
}
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}

Displaying Fly-over Help

53.1.4.2.29 TOutline.Style Property

Determines whether the nodes and tree are drawn automatically.

Pascal

```
property Style: TOutlineType;
```

C++

```
__property TOutlineType Style;
```

Description

By default, Style is osStandard, meaning that the outline displays items in the style determined by the OutlineStyle property. Set Style to otOwnerDraw to create owner-draw outlines, meaning that items must be drawn on the canvas of the outline by code in an OnDrawItem event handler.

Owner-draw outlines can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed, PictureOpen, PictureMinus, PicturePlus, and PictureLeaf properties. Owner-draw outlines require more programming, however, as the application must specify how to render the image for each node in an OnDrawItem event handler.

Canvas

OnDrawItem (see page 2873)

OutlineStyle (see page 2867)

53.1.4.2.30 TOutline.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

53.1.4.2.31 TOutline.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

53.1.4.2.32 TOutline.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
```

```
    {
      TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
      pPage->PageControl = PageControl1;
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this); // The owner will clean this up.
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin

53.1.4.3 TOutline Events

The events of the TOutline class are listed here.

Published Events

	Name	Description
	OnClick (see page 2906)	Occurs when the user clicks the control.
	OnCollapse (see page 2908)	Occurs immediately after a node in the outline is collapsed.
	OnContextPopup (see page 2908)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2909)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 2909)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2912)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 2916)	Occurs when a node must be drawn in an owner-draw outline.
	OnEndDock (see page 2916)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2917)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2918)	Occurs when a control receives the input focus.
	OnExit (see page 2920)	Occurs when the input focus shifts away from one control to another.
	OnExpand (see page 2924)	Occurs immediately after a node in the outline is expanded.
	OnKeyDown (see page 2924)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2928)	Occurs when a key is pressed.
	OnKeyUp (see page 2929)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2931)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2932)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2934)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2934)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2935)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2937)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 2939)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2940)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

53.1.4.3.1 TOutline.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).

- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
```

```
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

53.1.4.3.2 TOutline.OnCollapse Event

Occurs immediately after a node in the outline is collapsed.

Pascal

```
property OnCollapse: EOutlineChange;
```

C++

```
__property EOutlineChange OnCollapse;
```

Description

Write an OnCollapse event handler to perform special processing when a node in the outline is collapsed. The event handler supplies the index of the node that collapsed.

See Also

OnExpand (see page 2873)

53.1.4.3.3 TOutline.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 1430)

PopupMenu

AutoPopup (see page 1437)

53.1.4.3.4 TOutline.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

53.1.4.3.5 TOutline.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{

53.1.4.3.6 TOutline.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
  property OnDragOver;
```

C++

```
  __property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*

53.1.4.3.7 TOutline.OnDrawItem Event

Occurs when a node must be drawn in an owner-draw outline.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

When the Style property is set to otOwnerDraw, specify an OnDrawItem event handler to render the image of each node in the outline. An OnDrawItem event handler can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed, PictureOpen, PictureMinus, PicturePlus, and PictureLeaf properties.

Draw the image of the node specified by the Index parameter onto the canvas of the outline.

53.1.4.3.8 TOutline.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock;
```

C++

```
__property OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

53.1.4.3.9 TOutline.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

DragKind

53.1.4.3.10 TOutline.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))

  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;

53.1.4.3.11 TOutline.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)

OnCollapse (see page 2873)

53.1.4.3.13 TOutline.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/

KeyPreview

OnKeyPress

OnKeyUp

53.1.4.3.14 TOutline.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
```

```
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyPress

53.1.4.3.16 TOutline.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events.

This information is applicable to both VCL Win32 and VCL.NET.

53.1.4.3.17 TOutline.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
```

```
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);

53.1.4.3.18 TOutline.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

53.1.4.3.19 TOutline.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

53.1.4.3.20 TOutline.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

53.1.4.3.22 TOutline.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

53.1.4.3.23 TOutline.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

53.1.5 TOutlineNode Class

TOutlineNode represents a node in a TCustomOutline (see page 2838) object.

Class Hierarchy

Pascal

```
TOutlineNode = class(TPersistent);
```

C++

```
class TOutlineNode : public TPersistent;
```

File

Outline

Description

Use TOutlineNode to describe a node in a Win 3.1 outline. Each outline node appears as a line, or row, of the outline. An outline node can have from 0 to 16368 subnodes, which are subordinate to the parent node in the outline structure.

See Also

TOutline (see page 2874)

53.1.5.1 TOutlineNode Members

The following tables list the members exposed by TOutlineNode.

Protected Methods

	Name	Description
	AddNode (see page 2944)	This is AddNode, a member of class TOutlineNode.
	GetDataItem (see page 2946)	This is GetDataItem, a member of class TOutlineNode.
	GetNodeAtIndex (see page 2947)	This is GetNodeAtIndex, a member of class TOutlineNode.
	GetRowOfNode (see page 2948)	This is GetRowOfNode, a member of class TOutlineNode.
	GetTextItem (see page 2948)	This is GetTextItem, a member of class TOutlineNode.
	GetVisibleNode (see page 2949)	This is GetVisibleNode, a member of class TOutlineNode.
	HasAsParent (see page 2949)	This is HasAsParent, a member of class TOutlineNode.
	InsertNode (see page 2949)	This is InsertNode, a member of class TOutlineNode.
	InternalRemove (see page 2949)	This is InternalRemove, a member of class TOutlineNode.
	Remove (see page 2950)	This is Remove, a member of class TOutlineNode.
	WriteNode (see page 2950)	This is the overview for the WriteNode method overload.

Protected Properties

	Name	Description
R	ExpandCount (see page 2952)	This is ExpandCount, a member of class TOutlineNode.
R	Items (see page 2954)	This is Items, a member of class TOutlineNode.
R	List (see page 2955)	This is List, a member of class TOutlineNode.
R	Outline (see page 2955)	This is Outline, a member of class TOutlineNode.

Public Methods

	Name	Description
	ChangeLevelBy (see page 2944)	Changes the level of an outline node.
	Collapse (see page 2944)	Collapses an outline item.
	Create (see page 2942)	Creates a new TOutlineNode (see page 2940) object.
V	Destroy (see page 2943)	Frees the memory associated with the TOutlineNode (see page 2940) object.
	Expand (see page 2945)	Expands an outline item.
	FullExpand (see page 2945)	Expands an outline node and all its descendants.
	GetDisplayWidth (see page 2946)	Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.
	getFirstChild (see page 2946)	Returns the Index (see page 2953) value of the first subnode.
	GetLastChild (see page 2947)	Returns the Index (see page 2953) value of the last subnode.
	GetNextChild (see page 2947)	Returns the Index (see page 2953) value of the next child of an outline node.
	GetPrevChild (see page 2948)	Returns the Index (see page 2953) value of the previous child of an outline node.

	MoveTo (see page 2949)	Moves an outline node from one location within the outline to another.

Public Properties

	Name	Description
	Data (see page 2951)	Points to application-specific data associated with the node.
	Expanded (see page 2952)	Determines whether descendants of the outline node are displayed.
R	FullPath (see page 2952)	Describes an outline node, using its text and the text of all ancestor nodes in the outline.
R	HasItems (see page 2953)	Indicates whether the outline node has any subnodes.
R	Index (see page 2953)	Identifies the node in the Items (see page 2954) array maintained by the outline.
R	IsVisible (see page 2954)	Indicates whether the outline node is visible in the outline.
	Level (see page 2954)	Indicates the level of indentation of a node within the outline.
R	Parent (see page 2955)	Identifies the immediate ancestor of the node.
	Text (see page 2955)	Specifies the string that identifies the outline node.
R	TopItem (see page 2956)	Indicates which outline node is the topmost ancestor of a node.

53.1.5.2 TOutlineNode.Create Constructor

Creates a new TOutlineNode (see page 2940) object.

Pascal

```
constructor Create(AOwner: TCustomOutline);
```

C++

```
__fastcall TOutlineNode(TCustomOutline AOwner);
```

Description

Do not call the constructor for TOutlineNode (see page 2940) directly. Instead, use one of the methods of the outline component in which the node should appear. These methods are as follows:

Method	Action
Add	Creates the node as the last sibling of a specified node.
AddObject	Same as Add, but also initializing the node's Data (see page 2951) property.
AddChild	Creates the node as the last child of a specified node.
AddChildObject	Same as AddChild, but also initializing the node's Data (see page 2951) property.
Insert	Creates the node in the current position of an existing node.
InsertObject	Same as Insert, but also initializing the node's Data (see page 2951) property.

See Also

Data (see page 2951)

Add (see page 2842)

AddObject (see page 2844)

AddChild (see page 2843)

Insert (see page 2853)

AddChildObject (see page 2844)

InsertObject (see page 2853)

53.1.5.3 TOutlineNode.Destroy Destructor

Frees the memory associated with the TOutlineNode (see page 2940) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOutlineNode();
```

Description

Do not call Destroy directly. The preferred method of deleting nodes is to use the Delete method of the containing outline component.

See Also

System::TObject::Free

Delete (see page 2848)

53.1.5.4 TOutlineNode Methods

The methods of the TOutlineNode class are listed here.

Protected Methods

	Name	Description
	AddNode (see page 2944)	This is AddNode, a member of class TOutlineNode.
	GetDataItem (see page 2946)	This is GetDataItem, a member of class TOutlineNode.
	GetNodeAtIndex (see page 2947)	This is GetNodeAtIndex, a member of class TOutlineNode.
	GetRowOfNode (see page 2948)	This is GetRowOfNode, a member of class TOutlineNode.
	GetTextItem (see page 2948)	This is GetTextItem, a member of class TOutlineNode.
	GetVisibleNode (see page 2949)	This is GetVisibleNode, a member of class TOutlineNode.
	HasAsParent (see page 2949)	This is HasAsParent, a member of class TOutlineNode.
	InsertNode (see page 2949)	This is InsertNode, a member of class TOutlineNode.
	InternalRemove (see page 2949)	This is InternalRemove, a member of class TOutlineNode.
	Remove (see page 2950)	This is Remove, a member of class TOutlineNode.
	WriteNode (see page 2950)	This is the overview for the WriteNode method overload.

Public Methods

	Name	Description
	ChangeLevelBy (see page 2944)	Changes the level of an outline node.
	Collapse (see page 2944)	Collapses an outline item.
	Expand (see page 2945)	Expands an outline item.
	FullExpand (see page 2945)	Expands an outline node and all its descendants.
	GetDisplayWidth (see page 2946)	Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.
	getFirstChild (see page 2946)	Returns the Index (see page 2953) value of the first subnode.
	GetLastChild (see page 2947)	Returns the Index (see page 2953) value of the last subnode.
	GetNextChild (see page 2947)	Returns the Index (see page 2953) value of the next child of an outline node.
	GetPrevChild (see page 2948)	Returns the Index (see page 2953) value of the previous child of an outline node.
	MoveTo (see page 2949)	Moves an outline node from one location within the outline to another.

53.1.5.4.1 TOutlineNode.AddNode Method

Pascal

```
function AddNode(Value: TOutlineNode): LongInt;
```

C++

```
__fastcall LongInt AddNode(TOutlineNode Value);
```

Description

This is AddNode, a member of class TOutlineNode.

53.1.5.4.2 TOutlineNode.ChangeLevelBy Method

Changes the level of an outline node.

Pascal

```
procedure ChangeLevelBy(Value: TChangeRange);
```

C++

```
__fastcall ChangeLevelBy(TChangeRange Value);
```

Description

Call ChangeLevelBy to move a node up or down a branch in the outline. Specify a Value parameter value of -1 to move up (toward the root) one level. Specify a Value parameter value of 1 to move down (away from the root) one level.

When moving up one level, an item becomes the next sibling of its former parent. When moving down one level, an item becomes the last child of its former prior sibling.

Nodes at the first level can not be moved up, as they have no parent. The first node in the outline can not be moved down either, as it has no prior sibling.

Note: Before calling ChangeLevelBy, be sure that the node has the appropriate number of parents or that the appropriate prior siblings exist.

See Also

Level (see page 2954)

MoveTo (see page 2949)

Parent (see page 2955)

53.1.5.4.3 TOutlineNode.Collapse Method

Collapses an outline item.

Pascal

```
procedure Collapse;
```

C++

```
__fastcall Collapse();
```

Description

Collapse sets the Expanded (see page 2952) property to false. When an outline node is collapsed, its descendants are hidden and, depending on the OutlineStyle property of the outline in which the node is contained, the plus picture or closed picture is displayed.

Collapse does nothing to nodes that have no descendants.

See Also

Expand (see page 2945)

Expanded (see page 2952)

OutlineStyle (see page 2867)

53.1.5.4.4 TOutlineNode.Expand Method

Expands an outline item.

Pascal

```
procedure Expand;
```

C++

```
__fastcall Expand();
```

Description

Expand sets the Expanded (see page 2952) property to true. When an outline node is expanded, its descendants are displayed and, depending on the OutlineStyle property of the outline in which the node is contained, the minus picture or open picture is displayed.

Expand does nothing to nodes that have no descendants.

Note: Expand only ensures that the immediate children of a node are visible. To expand all descendants of a node, use the FullExpand (see page 2945) method.

See Also

Collapse (see page 2944)

Expanded (see page 2952)

FullExpand (see page 2945)

OutlineStyle (see page 2867)

53.1.5.4.5 TOutlineNode.FullExpand Method

Expands an outline node and all its descendants.

Pascal

```
procedure FullExpand;
```

C++

```
__fastcall FullExpand();
```

Description

Use FullExpand to expand all the nodes in the subtree of the outline rooted at the outline node. FullExpand sets the Expanded (see page 2952) property of the node and all its descendants to true.

See Also

Collapse (see page 2944)

Expand (see page 2945)

Expanded (see page 2952)

53.1.5.4.6 TOutlineNode.GetDataItem Method

Pascal

```
function GetDataItem(Value: TCustomData): LongInt;
```

C++

```
__fastcall LongInt GetDataItem(TCustomData Value);
```

Description

This is GetDataItem, a member of class TOutlineNode.

53.1.5.4.7 TOutlineNode.GetDisplayWidth Method

Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.

Pascal

```
function GetDisplayWidth: Integer;
```

C++

```
__fastcall int GetDisplayWidth();
```

Description

Call GetDisplayWidth to determine the length of the line in the outline that contains the outline node. GetDisplayWidth adjusts for the lines and bitmaps specified by the OutlineStyle property of the outline.

See Also

GetNodeDisplayWidth (see page 2852)

OutlineStyle (see page 2867)

53.1.5.4.8 TOutlineNode.getFirstChild Method

Returns the Index (see page 2953) value of the first subnode.

Pascal

```
function getFirstChild: LongInt;
```

C++

```
__fastcall LongInt getFirstChild();
```

Description

Call getFirstChild to locate the first subnode of a node when traversing the outline tree. If the node has no descendants, getFirstChild returns -1.

See Also

GetLastChild (see page 2947)

GetNextChild (see page 2947)

GetPrevChild (see page 2948)

HasItems (see page 2953)

Index (see page 2953)

Parent (see page 2955)

53.1.5.4.9 TOutlineNode.GetLastChild Method

Returns the Index (see page 2953) value of the last subnode.

Pascal

```
function GetLastChild: LongInt;
```

C++

```
__fastcall LongInt GetLastChild();
```

Description

Call GetLastChild to locate the last subnode of a node. If the node has no descendants, GetLastChild returns -1.

See Also

getFirstChild (see page 2946)

GetNextChild (see page 2947)

GetPrevChild (see page 2948)

HasItems (see page 2953)

Index (see page 2953)

53.1.5.4.10 TOutlineNode.GetNextChild Method

Returns the Index (see page 2953) value of the next child of an outline node.

Pascal

```
function GetNextChild(Value: LongInt): LongInt;
```

C++

```
__fastcall LongInt GetNextChild(LongInt Value);
```

Description

Call GetNextChild to obtain the index of the next immediate descendant of a node, following the child node with the index given by the Value parameter. If the child node indicated by Value has no next sibling, or if the child node indicated by Value is not an immediate descendant of the outline node, GetNextChild returns -1.

Index (see page 2953) values reflect a depth-first traversal of the outline. Thus, the node returned by GetNextChild is not simply the node with an index of Value+1, unless the node with index Value has no descendants. GetNextChild allows a breadth-first traversal of the outline.

See Also

getFirstChild (see page 2946)

GetLastChild (see page 2947)

GetPrevChild (see page 2948)

Index (see page 2953)

53.1.5.4.11 TOutlineNode.GetNodeAtIndex Method

Pascal

```
function GetNodeAtIndex(TargetIndex: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetNodeAtIndex(LongInt TargetIndex);
```

Description

This is GetNodeAtIndex, a member of class TOutlineNode.

53.1.5.4.12 TOutlineNode.GetPrevChild Method

Returns the Index (see page 2953) value of the previous child of an outline node.

Pascal

```
function GetPrevChild(Value: LongInt): LongInt;
```

C++

```
__fastcall LongInt GetPrevChild(LongInt Value);
```

Description

Call GetPrevChild to obtain the index of the previous immediate descendant of a node, preceding the child node with the index given by the Value parameter. If the child node indicated by Value has no prior sibling, or if the child node indicated by Value is not an immediate descendant of the outline node, GetPrevChild returns -1.

Index (see page 2953) values reflect a depth-first traversal of the outline. Thus, the previous sibling of the child node indicated by Value is not simply one less than Value, unless that previous sibling has no descendants.

See Also

getFirstChild (see page 2946)

GetLastChild (see page 2947)

GetNextChild (see page 2947)

Index (see page 2953)

53.1.5.4.13 TOutlineNode.GetRowOfNode Method

Pascal

```
function GetRowOfNode(TargetNode: TOutlineNode; var RowCount: Longint): Boolean;
```

C++

```
__fastcall Boolean GetRowOfNode(TOutlineNode TargetNode, Longint RowCount);
```

Description

This is GetRowOfNode, a member of class TOutlineNode.

53.1.5.4.14 TOutlineNode.GetTextItem Method

Pascal

```
function GetTextItem(const Value: string): LongInt;
```

C++

```
__fastcall LongInt GetTextItem(const UnicodeString Value);
```

Description

This is GetTextItem, a member of class TOutlineNode.

53.1.5.4.15 TOutlineNode.GetVisibleNode Method

Pascal

```
function GetVisibleNode(TargetCount: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetVisibleNode(LongInt TargetCount);
```

Description

This is GetVisibleNode, a member of class TOutlineNode.

53.1.5.4.16 TOutlineNode.HasAsParent Method

Pascal

```
function HasAsParent(Value: TOutlineNode): Boolean;
```

C++

```
__fastcall Boolean HasAsParent(TOutlineNode Value);
```

Description

This is HasAsParent, a member of class TOutlineNode.

53.1.5.4.17 TOutlineNode.InsertNode Method

Pascal

```
function InsertNode(Index: LongInt; Value: TOutlineNode): LongInt;
```

C++

```
__fastcall LongInt InsertNode(LongInt Index, TOutlineNode Value);
```

Description

This is InsertNode, a member of class TOutlineNode.

53.1.5.4.18 TOutlineNode.InternalRemove Method

Pascal

```
procedure InternalRemove(Value: TOutlineNode; Index: Integer);
```

C++

```
__fastcall InternalRemove(TOutlineNode Value, int Index);
```

Description

This is InternalRemove, a member of class TOutlineNode.

53.1.5.4.19 TOutlineNode.MoveTo Method

Moves an outline node from one location within the outline to another.

Pascal

```
procedure MoveTo(Destination: LongInt; AttachMode: TAttachMode);
```

C++

```
__fastcall MoveTo(LongInt Destination, TAttachMode AttachMode);
```

Description

Call MoveTo to reposition the node to the position indicated by the Destination parameter. Destination is the Index (see page 2953) value of another outline node. The AttachMode parameter specifies how to attach the moved node to the destination position.

Note: To change only the level of a node, use the ChangeLevelBy (see page 2944) method.

See Also

ChangeLevelBy (see page 2944)

Index (see page 2953)

Add (see page 2842)

AddChild (see page 2843)

Insert (see page 2853)

53.1.5.4.20 TOutlineNode.Remove Method

Pascal

```
procedure Remove(Value: TOutlineNode);
```

C++

```
__fastcall Remove(TOutlineNode Value);
```

Description

This is Remove, a member of class TOutlineNode.

53.1.5.4.21 WriteNode Method

This is the overview for the WriteNode method overload.

Overload List

	Name	Description
	TOutlineNode.WriteNode (PChar, TStream) (see page 2950)	This is WriteNode, a member of class TOutlineNode.
	TOutlineNode.WriteNode (TStream, TEncoding) (see page 2951)	This is WriteNode, a member of class TOutlineNode.

53.1.5.4.21.1 TOutlineNode.WriteNode Method (PChar, TStream)

Pascal

```
procedure WriteNode(Buffer: PChar; Stream: TStream); overload; deprecated;
```

C++

```
__fastcall WriteNode(const char * Buffer, TStream Stream);
```

Description

This is WriteNode, a member of class TOutlineNode.

53.1.5.4.21.2 TOutlineNode.WriteNode Method (TStream, TEncoding)

Pascal

```
procedure WriteNode(Stream: TStream; Encoding: TEncoding); overload;
```

C++

```
__fastcall WriteNode(TStream Stream, TEncoding Encoding);
```

Description

This is WriteNode, a member of class TOutlineNode.

53.1.5.5 TOutlineNode Properties

The properties of the TOutlineNode class are listed here.

Protected Properties

	Name	Description
	ExpandCount (see page 2952)	This is ExpandCount, a member of class TOutlineNode.
	Items (see page 2954)	This is Items, a member of class TOutlineNode.
	List (see page 2955)	This is List, a member of class TOutlineNode.
	Outline (see page 2955)	This is Outline, a member of class TOutlineNode.

Public Properties

	Name	Description
	Data (see page 2951)	Points to application-specific data associated with the node.
	Expanded (see page 2952)	Determines whether descendants of the outline node are displayed.
	FullPath (see page 2952)	Describes an outline node, using its text and the text of all ancestor nodes in the outline.
	HasItems (see page 2953)	Indicates whether the outline node has any subnodes.
	Index (see page 2953)	Identifies the node in the Items (see page 2954) array maintained by the outline.
	IsVisible (see page 2954)	Indicates whether the outline node is visible in the outline.
	Level (see page 2954)	Indicates the level of indentation of a node within the outline.
	Parent (see page 2955)	Identifies the immediate ancestor of the node.
	Text (see page 2955)	Specifies the string that identifies the outline node.
	TopItem (see page 2956)	Indicates which outline node is the topmost ancestor of a node.

53.1.5.5.1 TOutlineNode.Data Property

Points to application-specific data associated with the node.

Pascal

```
property Data: TCustomData;
```

C++

```
__property TCustomData Data;
```

Description

Use Data to associate an arbitrary value with a node in an outline. For example, if the outline represents the table of contents to an electronic document, Data could point to an object that provides jump information for accessing the section of the document named by the node.

The Data property is usually described by the Text (see page 2955) property, which is displayed in the rendered image of the node.

See Also

Text (see page 2955)

53.1.5.5.2 TOutlineNode.ExpandCount Property

Pascal

```
property ExpandCount: LongInt;
```

C++

```
__property LongInt ExpandCount;
```

Description

This is ExpandCount, a member of class TOutlineNode.

53.1.5.5.3 TOutlineNode.Expanded Property

Determines whether descendants of the outline node are displayed.

Pascal

```
property Expanded: Boolean;
```

C++

```
__property Boolean Expanded;
```

Description

Set Expanded to true to display all subnodes of a node. When an outline node is expanded, its descendants are displayed and, depending on the OutlineStyle property of the outline in which the node is contained, the minus picture or open picture is displayed.

Set Expanded to false to collapse the node. When an outline node is collapsed, its descendants are hidden and, depending on the OutlineStyle property of the outline in which the node is contained, the plus picture or closed picture is displayed.

Expanded is not meaningful for nodes that have no descendants.

See Also

HasItems (see page 2953)

OutlineStyle (see page 2867)

53.1.5.5.4 TOutlineNode.FullPath Property

Describes an outline node, using its text and the text of all ancestor nodes in the outline.

Pascal

```
property FullPath: string;
```

C++

```
__property UnicodeString FullPath;
```

Description

Read FullPath to obtain a description of the entire branch of the outline leading to the outline node. FullPath consists of the values of the Text (see page 2955) properties of all outline items, starting with the text of the node at the first level and traversing the outline down to the outline node. The string specified as the ItemSeparator property of the outline separates the

text for each node in the path.

See Also

Level (see page 2954)

Parent (see page 2955)

ItemSeparator (see page 2865)

Text (see page 2955)

TopItem (see page 2956)

53.1.5.5.5 TOutlineNode.HasItems Property

Indicates whether the outline node has any subnodes.

Pascal

```
property HasItems: Boolean;
```

C++

```
__property Boolean HasItems;
```

Description

Read HasItem to determine whether the outline node is a leaf node. Depending on the OutlineStyle property of the outline that contains the node, leaf nodes may appear with the leaf bitmap. If the node is not a leaf, subnodes appear below and indented from the node when it is expanded.

HasItem returns true if the node has any descendants, even if the node is collapsed and the descendants are not visible. HasItem returns false if the node is a leaf node.

See Also

Expanded (see page 2952)

Parent (see page 2955)

OutlineStyle (see page 2867)

53.1.5.5.6 TOutlineNode.Index Property

Identifies the node in the Items (see page 2954) array maintained by the outline.

Pascal

```
property Index: LongInt;
```

C++

```
__property LongInt Index;
```

Description

Read Index to determine the row of the outline where the node appears. The first node has an Index value of 1, and subsequent nodes are indexed sequentially. If a node has subnodes, the Index value of the parent node is one less than the Index value of its first descendant.

When nodes in the outline are added, moved, or deleted, the values of the Index properties of all subsequent nodes must be recalculated to be valid. Sometimes, the recalculation of indexes is deferred until all changes to the nodes are complete. To ensure that the value of Index is valid, call the SetUpdateState method of the outline that contains the node.

See Also

Items (see page 2865)

SetUpdateState (see page 2861)

53.1.5.5.7 TOutlineNode.IsVisible Property

Indicates whether the outline node is visible in the outline.

Pascal

```
property IsVisible: Boolean;
```

C++

```
__property Boolean IsVisible;
```

Description

Read IsVisible to determine whether the node is part of the current image of the outline. A node is visible if it is on level 1 or if all its parents are expanded.

Note: Do not confuse IsVisible with the Visible property of TControl objects. Outline (see page 2955) nodes are not controls, but merely helper objects that describe nodes for an outline control. IsVisible indicates whether a node is visible because its parents are expanded or collapsed. It does not provide information about whether the node has been scrolled out of view, or even if the outline is not visible.

See Also

Expanded (see page 2952)

Visible

53.1.5.5.8 TOutlineNode.Items Property

Pascal

```
property Items [Index: LongInt]: TOutlineNode;
```

C++

```
__property TOutlineNode Items[LongInt Index];
```

Description

This is Items, a member of class TOutlineNode.

53.1.5.5.9 TOutlineNode.Level Property

Indicates the level of indentation of a node within the outline.

Pascal

```
property Level: Cardinal;
```

C++

```
__property unsigned Level;
```

Description

The value of Level is 1 for nodes that directly descend from the root of the outline (the top level). The value of Level is 2 for their children, and so on.

See Also

ChangeLevelBy (see page 2944)

Parent (see page 2955)

TopItem (see page 2956)

53.1.5.5.10 TOutlineNode.List Property

Pascal

```
property List: TList;
```

C++

```
__property TList List;
```

Description

This is List, a member of class TOutlineNode.

53.1.5.5.11 TOutlineNode.Outline Property

Pascal

```
property Outline: TCustomOutline;
```

C++

```
__property TCustomOutline Outline;
```

Description

This is Outline, a member of class TOutlineNode.

53.1.5.5.12 TOutlineNode.Parent Property

Identifies the immediate ancestor of the node.

Pascal

```
property Parent: TOutlineNode;
```

C++

```
__property TOutlineNode Parent;
```

Description

Read Parent to find the parent of an outline node. A parent node is one level higher and contains the child node as a subnode.

See Also

Level (see page 2954)

TopItem (see page 2956)

53.1.5.5.13 TOutlineNode.Text Property

Specifies the string that identifies the outline node.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to determine the string that is displayed in the outline to represent the node.

See Also

FullPath (see page 2952)

53.1.5.5.14 TOutlineNode.TopItem Property

Indicates which outline node is the topmost ancestor of a node.

Pascal

```
property TopItem: Longint;
```

C++

```
__property Longint TopItem;
```

Description

Read TopItem to determine the first node in the branch of the outline tree that contains the outline node. The TopItem property specifies the Index (see page 2953) value of the level 1 ancestor of the outline node. For a node on level 1, TopItem has the same value as the Index (see page 2953) property.

See Also

Index (see page 2953)

Level (see page 2954)

Parent (see page 2955)

53.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAttachMode (see page 2957)	TAttachMode indicates how an outline node should be inserted into an outline.
	TOutlineBitmap (see page 2958)	This is record Outline.TOutlineBitmap.
	TOutlineNodeCompare (see page 2958)	This is record Outline.TOutlineNodeCompare.
	TOutlineOption (see page 2959)	TOutlineOptions (see page 2964) represents the style in which an outline is drawn.
	TOutlineStyle (see page 2959)	TOutlineStyle determines how the nodes of an outline are drawn.
	TOutlineType (see page 2960)	TOutlineType indicates whether an outline is owner-drawn.

53.2.1 Outline.TAttachMode Enumeration

TAttachMode indicates how an outline node should be inserted into an outline.

Pascal

```
TAttachMode = (
  oaAdd,
  oaAddChild,
  oaInsert
);
```

C++

```
enum TAttachMode {
  oaAdd,
  oaAddChild,
  oaInsert
};
```

File

Outline

Description

TAttachMode is used by methods that move outline nodes within an outline. It includes the following values:

Value	Description
oaAdd	The item is attached as if added with the Add method. The moved item becomes the last sibling of the item specified by the Destination parameter, sharing the same parent as the Destination item.
oaAddChild	The item is attached as if added with the AddChild method. The moved item becomes the last child of the item specified by the Destination parameter. The Destination item becomes the parent of the moved item.
oaInsert	The item is attached as if inserted with the Insert method. The moved item replaces the Destination item in the outline, while the Destination item and all other following items are moved down one row.

TCustomOutline (see page 2838)

TOutlineNode (see page 2940)

53.2.2 Outline.TOutlineBitmap Enumeration

Pascal

```
TOutlineBitmap = (
  obPlus,
  obMinus,
  obOpen,
  obClose,
  obLeaf
);
```

C++

```
enum TOutlineBitmap {
  obPlus,
  obMinus,
  obOpen,
  obClose,
  obLeaf
};
```

File

Outline

Description

This is record Outline.TOutlineBitmap.

53.2.3 Outline.TOutlineNodeCompare Enumeration

Pascal

```
TOutlineNodeCompare = (
  ocLess,
  ocSame,
  ocGreater,
  ocInvalid
);
```

C++

```
enum TOutlineNodeCompare {
  ocLess,
  ocSame,
  ocGreater,
  ocInvalid
};
```

File

Outline

Description

This is record Outline.TOutlineNodeCompare.

53.2.4 Outline.TOutlineOption Enumeration

TOutlineOptions (see page 2964) represents the style in which an outline is drawn.

Pascal

```
TOutlineOption = (
  ooDrawTreeRoot,
  ooDrawFocusRect,
  ooStretchBitmaps
);
```

C++

```
enum TOutlineOption {
  ooDrawTreeRoot,
  ooDrawFocusRect,
  ooStretchBitmaps
};
```

File

Outline

Description

TOutlineOptions (see page 2964) is a set of TOutlineOption values. Together they influence the way an outline is drawn. Each TOutlineOption value is described below:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

TCustomOutline (see page 2838)

53.2.5 Outline.TOutlineStyle Enumeration

TOutlineStyle determines how the nodes of an outline are drawn.

Pascal

```
TOutlineStyle = (
  osText,
  osPlusMinusText,
  osPictureText,
  osPlusMinusPictureText,
  osTreeText,
  osTreePictureText
);
```

C++

```
enum TOutlineStyle {
  osText,
  osPlusMinusText,
  osPictureText,
  osPlusMinusPictureText,
  osTreeText,
  osTreePictureText
};
```

File

Outline

Description

TOutlineStyle is the type of TCustomOutline (see page 2838).::OutlineStyle. It includes the following values:

Value	Meaning
osText	Only the text of nodes is drawn.
osPlusMinusText	In addition to the text, each node displays plus picture (when it can be expanded) or minus picture (when it can be collapsed).
osPictureText	In addition to the text, each node displays the open picture (when it is expanded), closed picture (when it is collapsed), or leaf picture (when it has no subnodes).
osPlusMinusPictureText	In addition to the text, each node displays the plus picture or minus picture (as in osPlusMinusText), and the open, closed or leaf picture (as in osPictureText).
osTreeText	Visible lines connect the outline nodes.
osTreePictureText	In addition to the text, each node displays the open picture (when it is expanded), closed picture (when it is collapsed), or leaf picture (when it has no subnodes). Visible lines connect the outline nodes.

See Also

TCustomOutline (see page 2838)

53.2.6 Outline.TOutlineType Enumeration

TOutlineType indicates whether an outline is owner-drawn.

Pascal

```
TOutlineType = (
  otStandard,
  otOwnerDraw
);
```

C++

```
enum TOutlineType {
  otStandard,
  otOwnerDraw
};
```

File

Outline

Description

TOutlineType determines whether an outline is drawn automatically or by user code in an OnDrawItem event.

Value	Meaning
otStandardItems	Items are drawn automatically.
otOwnerDraw	Items are drawn on the Canvas by application code.

See Also

TCustomOutline (see page 2838)

53.3 Types

The following table lists types in this documentation.

Types

Name	Description
EOutlineChange (see page 2962)	EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.
TBitmapArray (see page 2962)	This is type Outline.TBitmapArray.
TBitmapArrayRange (see page 2963)	This is type Outline.TBitmapArrayRange.
TChangeRange (see page 2963)	TChangeRange indicates the direction in which a node is moved.
TOutlineBitmaps (see page 2963)	This is type Outline.TOutlineBitmaps.
TOutlineOptions (see page 2964)	TOutlineOptions represents the style in which an outline is drawn.

53.3.1 Outline.EOutlineChange Type

EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.

Pascal

```
EOutlineChange = procedure (Sender: TObject; Index: LongInt) of object;
```

C++

```
(Sender: TObject; Index: LongInt) ( EOutlineChange)();
```

File

Outline

Description

Sender is the outline control whose node just changed.

Index is the index of the node that just changed.

53.3.2 Outline.TBitmapArray Type

Pascal

```
TBitmapArray = array[TBitmapArrayRange] of TBitmap;
```

C++

```
array[TBitmapArrayRange] of TBitmap TBitmapArray;
```

File

Outline

Description

This is type Outline.TBitmapArray.

53.3.3 Outline.TBitmapArrayRange Type

Pascal

```
TBitmapArrayRange = 0..4;
```

C++

```
0..4 TBitmapArrayRange;
```

File

Outline

Description

This is type Outline.TBitmapArrayRange.

53.3.4 Outline.TChangeRange Type

TChangeRange indicates the direction in which a node is moved.

Pascal

```
TChangeRange = -1..1;
```

C++

```
-1..1 TChangeRange;
```

File

Outline

Description

TChangeRange is the type of the Value parameter of an outline node's ChangeLevelBy method. It can take one of the following values:

Value	Meaning
-1	Move the node toward the root by one level.
1	Move the node toward the leaf by one level.

See Also

TOutlineNode (see page 2940)

53.3.5 Outline.TOutlineBitmaps Type

Pascal

```
TOutlineBitmaps = set of TOutlineBitmap;
```

C++

```
TOutlineBitmap TOutlineBitmaps;
```

File

Outline

Description

This is type Outline.TOutlineBitmaps.

53.3.6 Outline.TOutlineOptions Type

TOutlineOptions represents the style in which an outline is drawn.

Pascal

```
TOutlineOptions = set of TOutlineOption;
```

C++

```
TOutlineOption TOutlineOptions;
```

File

Outline

Description

TOutlineOptions is a set of TOutlineOption (see page 2959) values. Together they influence the way an outline is drawn. Each TOutlineOption (see page 2959) value is described below:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

54 PagItems Namespace

This is namespace PagItems.

Topics

Name	Description
Classes (see page 2966)	The following table lists classes in this documentation.

Classes

	Name	Description
	TBasePageItemsProducer (see page 2966)	TBasePageItemsProducer produces a string of HTML commands based on an input template.
	TPageItemsProducer (see page 2970)	TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

54.1 Classes

The following table lists classes in this documentation.

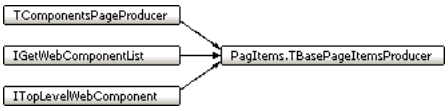
Classes

	Name	Description
	TBasePageItemsProducer (see page 2966)	TBasePageItemsProducer produces a string of HTML commands based on an input template.
	TPageItemsProducer (see page 2970)	TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

54.1.1 TBasePageItemsProducer Class

TBasePageItemsProducer produces a string of HTML commands based on an input template.

Class Hierarchy



Pascal

```
TBasePageItemsProducer = class(TComponentsPageProducer, IGetWebComponentList,
ITopLevelWebComponent);
```

C++

```
class TBasePageItemsProducer : public TComponentsPageProducer, public IGetWebComponentList,
public ITopLevelWebComponent;
```

File

PagItems

Description

Use TBasePageItemsProducer to convert an HTML template that includes content generated by other components into a string of HTML commands that can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the components page producer in an OnHTMLTag event handler.

TBasePageItemsProducer differs from other page producer components in that it replaces special HTML-transparent tags of the format

```
<#COMPONENT Name=WebContentComponent>
```

with the HTML produced by the components named WebContentComponent. In addition, TBasePageItemsProducer stores a default value for WebContentComponent as the value of its WebPageItems (see page 2969) property.

IWebContent

TPageItemsProducer (see page 2970)

TInetXPageProducer (see page 2285)

TAdapterPageProducer

54.1.1.1 TBasePageItemsProducer Members

The following tables list the members exposed by TBasePageItemsProducer.

Protected Methods

	Name	Description
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.

Public Methods

	Name	Description
	Create (see page 2967)	Creates an instance of a TBasePageItemsProducer (see page 2966).
	Destroy (see page 2967)	Destroys the instance of the TBasePageItemsProducer (see page 2966).

Public Properties

	Name	Description
	WebPageItems (see page 2969)	Maintains a list of components that generate HTML content for the producer.

54.1.1.2 TBasePageItemsProducer.Create Constructor

Creates an instance of a TBasePageItemsProducer (see page 2966).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBasePageItemsProducer(TComponent * AOwner);
```

Description

Call Create to instantiate a TBasePageItemsProducer (see page 2966) component at runtime if it was not created at design time.

AOwner is the component, typically the Web module, that becomes the value of this page producer's Owner property. The Owner is responsible for freeing the TBasePageItemsProducer (see page 2966) instance.

See Also

Owner

54.1.1.3 TBasePageItemsProducer.Destroy Destructor

Destroys the instance of the TBasePageItemsProducer (see page 2966).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBasePageItemsProducer();
```

Description

Do not call Destroy directly. Instead call Free, which checks that the TBasePageItemsProducer (see page 2966) reference is not nil before calling Destroy.

See Also

Create (see page 2967)

System::TObject::Free

54.1.1.4 TBasePageItemsProducer Methods

The methods of the TBasePageItemsProducer class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.

54.1.1.4.1 TBasePageItemsProducer.GetChildren Method

Enumerates all child components.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is used internally in the component streaming system. It is not necessary to call it directly.

GetChildren expects a TGetChildProc routine that receives all enumerated components.

`Root` represents the owner of the components that will be enumerated.

This method does nothing in TComponent and is expected to be overridden in descendants.

See Also

TGetChildProc

GetParentComponent

54.1.1.4.2 TBasePageItemsProducer.GetComponentList Method

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

This is GetComponentList, a member of class TBasePageItemsProducer.

54.1.1.4.3 TBasePageItemsProducer.GetDefaultComponentList Method

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

This is GetDefaultComponentList, a member of class TBasePageItemsProducer.

54.1.1.4.4 TBasePageItemsProducer.SetChildOrder Method

Sets the visual ordering of a child control.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder is used internally in the component streaming system. It is not necessary to call it directly.

Derived classes override this method to actually implement the ordering. TWinControl uses this ordering information to Z-align the controls.

See Also

SetZOrder

54.1.1.5 TBasePageItemsProducer Properties

The properties of the TBasePageItemsProducer class are listed here.

Public Properties

	Name	Description
	WebPageItems (see page 2969)	Maintains a list of components that generate HTML content for the producer.

54.1.1.5.1 TBasePageItemsProducer.WebPageItems Property

Maintains a list of components that generate HTML content for the producer.

Pascal

```
property WebPageItems: TWebComponentList;
```

C++

```
__property TWebComponentList WebPageItems;
```

Description

WebPageItems lists the components that generate content for the page items producer. Each of these components supports the IWebContent interface, and can contain its own list of Web items that help it generate its content.

The type of items that can be added to the WebPageItems list are restricted by a protected method that is abstract or, in C++ terminology, pure virtual in TBasePageItemsProducer (see page 2966). Descendant classes implement this protected method to indicate what types of items can be added to the list.

At design time, use the Web page editor to add components to the WebPageItems property.

Note: Typically, WebPageItems lists all the components that generate content for the page items producer, in the order that the generated content appears in the final HTML document. However, the page items producer can transform COMPONENT tags in its template using components that are not in this list, as long as they have the same owner as the page items producer..

See Also

IWebContent

Creating Web Pages with an InternetExpress Page Producer

54.1.2 TPageItemsProducer Class

TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TPageItemsProducer = class(TBasePageItemsProducer);
```

C++

```
class TPageItemsProducer : public TBasePageItemsProducer;
```

File

PagItems

Description

Use TPageItemsProducer as the base class for components that convert an HTML template that includes content generated by other components into a string of HTML commands that can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page items producer in an OnHTMLTag event handler.

Page item producers differ from other page producer components in that they replace special HTML-transparent tags of the format

```
<#COMPONENT Name=WebContentComponent>
```

with the HTML produced by the component named WebContentComponent. WebContentComponent must have the same Owner as the page item producer and support the IWebContent interface, which the page item producer uses to obtain the replacement HTML for the COMPONENT tag.

TPageItemsProducer introduces the WebPageItems (see page 2969) property to maintain a hierarchical list of these Web content components, where each component produces content for its parent component.

See Also

IWebContent

TInetXPageProducer (see page 2285)

54.1.2.1 TPageItemsProducer Members

The following tables list the members exposed by TPageItemsProducer.

Protected Methods

	Name	Description
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetTemplateStream (see page 2972)	This is GetTemplateStream, a member of class TPageItemsProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.

Public Methods

	Name	Description
	Create (see page 2971)	Creates and initializes an instance of TPageItemsProducer (see page 2970).
	Destroy (see page 2971)	Frees an instance of TPageItemsProducer (see page 2970).

Public Properties

	Name	Description
	HTMLDoc (see page 2972)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 2973)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	WebPageItems (see page 2969)	Maintains a list of components that generate HTML content for the producer.

54.1.2.2 TPageItemsProducer.Create Constructor

Creates and initializes an instance of TPageItemsProducer (see page 2970).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPageItemsProducer(TComponent * AOwner);
```

Description

Call Create to instantiate a page items producer at runtime.

54.1.2.3 TPageItemsProducer.Destroy Destructor

Frees an instance of TPageItemsProducer (see page 2970).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPageItemsProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the TPageItemsProducer (see page 2970) reference is not nil before calling Destroy.

See Also

System::TObject::Free

54.1.2.4 TPageItemsProducer Methods

The methods of the TPageItemsProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateStream (see page 2972)	This is GetTemplateStream, a member of class TPageItemsProducer.

54.1.2.4.1 TPageItemsProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TPageItemsProducer.

54.1.2.5 TPageItemsProducer Properties

The properties of the TPageItemsProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 2972)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 2973)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

54.1.2.5.1 TPageItemsProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile (see page 2973) property.

See Also

Content

HTMLFile (see page 2973)

54.1.2.5.2 TPageItemsProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 2972) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

55.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TPlatformDefaultStyleActionBars (see page 2976)	This is class PlatformDefaultStyleActnCtrls.TPlatformDefaultStyleActionBars.

55.1.1 TPlatformDefaultStyleActionBars Class

Class Hierarchy

Pascal

```
TPlatformDefaultStyleActionBars = class(TActionBarStyleEx);
```

C++

```
class TPlatformDefaultStyleActionBars : public TActionBarStyleEx;
```

File

PlatformDefaultStyleActnCtrls

Description

This is class PlatformDefaultStyleActnCtrls.TPlatformDefaultStyleActionBars.

55.1.1.1 TPlatformDefaultStyleActionBars Members

The following tables list the members exposed by TPlatformDefaultStyleActionBars.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 2977)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 2977)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 2977)	Returns the control class type on an action bar item.
	GetPopupClass (see page 2978)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 2978)	This is GetScrollBtnClass, a member of class TPlatformDefaultStyleActionBars.
	GetStyleName (see page 2978)	Returns the style associated with action manager.

55.1.1.2 TPlatformDefaultStyleActionBars Methods

The methods of the TPlatformDefaultStyleActionBars class are listed here.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 2977)	Returns the base class for ActionBand menus for customizing action bands.

	GetColorMapClass (see page 2977)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 2977)	Returns the control class type on an action bar item.
	GetPopupClass (see page 2978)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 2978)	This is GetScrollBtnClass, a member of class TPlatformDefaultStyleActionBars.
	GetStyleName (see page 2978)	Returns the style associated with action manager.

55.1.1.2.1 TPlatformDefaultStyleActionBars.GetAddRemoveItemClass Method

Returns the base class for ActionBand menus for customizing action bands.

Pascal

```
function GetAddRemoveItemClass(ActionBar: TCustomActionBar): TCustomAddRemoveItemClass;
override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass(TCustomActionBar ActionBar);
```

Description

Call GetAddRemoveItemClass to customize action bands.

See Also

TCustomAddRemoveItem

55.1.1.2.2 TPlatformDefaultStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

55.1.1.2.3 TPlatformDefaultStyleActionBars.GetControlClass Method

Returns the control class type on an action bar item.

Pascal

```
function GetControlClass(ActionBar: TCustomActionBar; AnItem: TActionClientItem):
TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TCustomActionBar ActionBar,
TActionClientItem AnItem);
```

Description

Returns the control class type on an item in the action bar, such as a button or menu item.

55.1.1.2.4 TPlatformDefaultStyleActionBars.GetPopupClass Method

Returns the popup class added to a menu action band.

Pascal

```
function GetPopupClass(ActionBar: TCustomActionBar): TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass(TCustomActionBar ActionBar);
```

Description

Call GetPopupClass to find the popup menu associated with a menu action band. Override GetPopupClass to change which popup class is associated with a menu action band depending on the state of the control.

TCustomActionPopupMenu

55.1.1.2.5 TPlatformDefaultStyleActionBars.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TPlatformDefaultStyleActionBars.

55.1.1.2.6 TPlatformDefaultStyleActionBars.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetStyleName();
```

Description

Returns the value of the Style property.

55.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
PlatformDefaultStyle (see page 2979)	This is variable PlatformDefaultStyleActnCtrls.PlatformDefaultStyle.

55.2.1 PlatformDefaultStyleActnCtrls.PlatformDefaultStyle Variable

Pascal

```
PlatformDefaultStyle: TPlatformDefaultStyleActionBars;
```

C++

```
TPlatformDefaultStyleActionBars PlatformDefaultStyle;
```

File

PlatformDefaultStyleActnCtrls

Description

This is variable PlatformDefaultStyleActnCtrls.PlatformDefaultStyle.

56 pngimage Namespace

This is namespace pngimage.

Topics

Name	Description
Classes (see page 2984)	The following table lists classes in this documentation.
Functions (see page 3009)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3020)	The following table lists structs, records, enums in this documentation.
Types (see page 3023)	The following table lists types in this documentation.
Constants (see page 3029)	The following table lists constants in this documentation.

Classes

	Name	Description
	EPNGCannotChangeTransparent (see page 2984)	This is class pngimage.EPNGCannotChangeTransparent.
	EPNGCouldNotLoadResource (see page 2985)	This is class pngimage.EPNGCouldNotLoadResource.
	EPngError (see page 2985)	This is class pngimage.EPngError.
	EPNGHeaderNotPresent (see page 2985)	This is class pngimage.EPNGHeaderNotPresent.
	EPNGIHDRNotFirst (see page 2986)	This is class pngimage.EPNGIHDRNotFirst.
	EPngInvalidCRC (see page 2986)	This is class pngimage.EPngInvalidCRC.
	EPNGInvalidFileHeader (see page 2987)	This is class pngimage.EPNGInvalidFileHeader.
	EPngInvalidIHDR (see page 2987)	This is class pngimage.EPngInvalidIHDR.
	EPNGInvalidNewSize (see page 2987)	This is class pngimage.EPNGInvalidNewSize.
	EPNGInvalidPalette (see page 2988)	This is class pngimage.EPNGInvalidPalette.
	EPNGInvalidSpec (see page 2988)	This is class pngimage.EPNGInvalidSpec.
	EPNGMissingMultipleIDAT (see page 2988)	This is class pngimage.EPNGMissingMultipleIDAT.
	EPNGMissingPalette (see page 2989)	This is class pngimage.EPNGMissingPalette.
	EPNGNoImageData (see page 2989)	This is class pngimage.EPNGNoImageData.
	EPNGNotExists (see page 2990)	This is class pngimage.EPNGNotExists.
	EPNGOutMemory (see page 2990)	This is class pngimage.EPNGOutMemory.
	EPNGSizeExceeds (see page 2990)	This is class pngimage.EPNGSizeExceeds.
	EPngUnexpectedEnd (see page 2991)	This is class pngimage.EPngUnexpectedEnd.
	EPNGUnknownCompression (see page 2991)	This is class pngimage.EPNGUnknownCompression.
	EPNGUnknownCriticalChunk (see page 2991)	This is class pngimage.EPNGUnknownCriticalChunk.
	EPNGUnknownInterlace (see page 2992)	This is class pngimage.EPNGUnknownInterlace.
	EPNGZLIBError (see page 2992)	This is class pngimage.EPNGZLIBError.
	Exception (see page 2993)	This is class pngimage.Exception.

	TFileStream (see page 2993)	This is class pngimage.TFileStream.
	TPngImage (see page 2996)	This is class pngimage.TPngImage.
	TPNGList (see page 2997)	This is class pngimage.TPNGList.
	TPNGPointerList (see page 2999)	This is class pngimage.TPNGPointerList.
	TResourceStream (see page 3003)	This is class pngimage.TResourceStream.
	TStream (see page 3005)	This is class pngimage.TStream.

Constants

Name	Description
COLOR_GRAYSCALE (see page 3029)	This is constant pngimage.COLOR_GRAYSCALE.
COLOR_GRAYSCALEALPHA (see page 3029)	This is constant pngimage.COLOR_GRAYSCALEALPHA.
COLOR_PALETTE (see page 3030)	This is constant pngimage.COLOR_PALETTE.
COLOR_RGB (see page 3030)	This is constant pngimage.COLOR_RGB.
COLOR_RGBALPHA (see page 3030)	This is constant pngimage.COLOR_RGBALPHA.
FILTER_AVERAGE (see page 3031)	This is constant pngimage.FILTER_AVERAGE.
FILTER_NONE (see page 3031)	This is constant pngimage.FILTER_NONE.
FILTER_PAETH (see page 3031)	This is constant pngimage.FILTER_PAETH.
FILTER_SUB (see page 3032)	This is constant pngimage.FILTER_SUB.
FILTER_UP (see page 3032)	This is constant pngimage.FILTER_UP.
Index (see page 3032)	This is constant pngimage.Index.
LibraryVersion (see page 3033)	This is constant pngimage.LibraryVersion.
soFromBeginning (see page 3033)	This is constant pngimage.soFromBeginning.
soFromCurrent (see page 3033)	This is constant pngimage.soFromCurrent.
soFromEnd (see page 3034)	This is constant pngimage.soFromEnd.
Z_FINISH (see page 3034)	This is constant pngimage.Z_FINISH.
Z_NO_FLUSH (see page 3034)	This is constant pngimage.Z_NO_FLUSH.
Z_STREAM_END (see page 3035)	This is constant pngimage.Z_STREAM_END.
ZLIBErrors (see page 3035)	This is constant pngimage.ZLIBErrors.

Functions

	Name	Description
	AddtEXt (see page 3009)	This is function pngimage.AddtEXt.
	AddzTXt (see page 3010)	This is function pngimage.AddzTXt.
	Assign (see page 3010)	This is function pngimage.Assign.
	AssignHandle (see page 3010)	This is function pngimage.AssignHandle.
	AssignPNG (see page 3011)	This is function pngimage.AssignPNG.
	CreateAlpha (see page 3011)	This is function pngimage.CreateAlpha.
	DoSetPalette (see page 3011)	This is function pngimage.DoSetPalette.
	Draw (see page 3012)	This is function pngimage.Draw.
	DrawPartialTrans (see page 3012)	This is function pngimage.DrawPartialTrans.
	DrawUsingPixelInformation (see page 3012)	This is function pngimage.DrawUsingPixelInformation.
	GetAlphaScanline (see page 3013)	This is function pngimage.GetAlphaScanline.
	GetEmpty (see page 3013)	This is function pngimage.GetEmpty.
	GetLibraryVersion (see page 3013)	This is function pngimage.GetLibraryVersion.
	GetPalette (see page 3014)	This is function pngimage.GetPalette.
	GetPixelInformation (see page 3014)	This is function pngimage.GetPixelInformation.
	GetPixels (see page 3014)	This is function pngimage.GetPixels.
	GetScanline (see page 3015)	This is function pngimage.GetScanline.
	GetSupportsPartialTransparency (see page 3015)	This is function pngimage.GetSupportsPartialTransparency.
	GetTransparencyMode (see page 3015)	This is function pngimage.GetTransparencyMode.
	GetTransparentColor (see page 3016)	This is function pngimage.GetTransparentColor.
	GetWidth (see page 3016)	This is function pngimage.GetWidth.
	HasPixelInformation (see page 3016)	This is function pngimage.HasPixelInformation.
	RaiseError (see page 3017)	This is function pngimage.RaiseError.
	RemoveTransparency (see page 3017)	This is function pngimage.RemoveTransparency.

	Resize (see page 3017)	This is function pngimage.Resize.
	SetMaxIdatSize (see page 3018)	This is function pngimage.SetMaxIdatSize.
	SetPixels (see page 3018)	This is function pngimage.SetPixels.
	SetTransparentColor (see page 3018)	This is function pngimage.SetTransparentColor.
	SetWidth (see page 3019)	This is function pngimage.SetWidth.

Structs, Records, Enums

	Name	Description
	TFileStreamMode (see page 3020)	This is record pngimage.TFileStreamMode.
	TFilter (see page 3020)	This is record pngimage.TFilter.
	TInterlaceMethod (see page 3021)	This is record pngimage.TInterlaceMethod.
	TMAXBITMAPINFO (see page 3021)	This is record pngimage.TMAXBITMAPINFO.
	TPNGTransparencyMode (see page 3022)	This is record pngimage.TPNGTransparencyMode.
	TRGBPixel (see page 3022)	This is record pngimage.TRGBPixel.

Types

Name	Description
ExceptClass (see page 3023)	This is type pngimage.ExceptClass.
pByteArray (see page 3023)	This is type pngimage.pByteArray.
pCardinal (see page 3024)	This is type pngimage.pCardinal.
pPointerArray (see page 3024)	This is type pngimage.pPointerArray.
pRGBLine (see page 3024)	This is type pngimage.pRGBLine.
pRGBPixel (see page 3025)	This is type pngimage.pRGBPixel.
TBitmap (see page 3025)	This is type pngimage.TBitmap.
TByteArray (see page 3025)	This is type pngimage.TByteArray.
TCanvas (see page 3026)	This is type pngimage.TCanvas.
TChunkClass (see page 3026)	This is type pngimage.TChunkClass.
TColor (see page 3026)	This is type pngimage.TColor.
TCompressionLevel (see page 3027)	This is type pngimage.TCompressionLevel.
TFileStreamModeSet (see page 3027)	This is type pngimage.TFileStreamModeSet.
TFilters (see page 3027)	This is type pngimage.TFilters.
TPersistent (see page 3028)	This is type pngimage.TPersistent.
TPointerArray (see page 3028)	This is type pngimage.TPointerArray.
TRGBLine (see page 3028)	This is type pngimage.TRGBLine.

56.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EPNGCannotChangeTransparent (see page 2984)	This is class pngimage.EPNGCannotChangeTransparent.
	EPNGCouldNotLoadResource (see page 2985)	This is class pngimage.EPNGCouldNotLoadResource.
	EPngError (see page 2985)	This is class pngimage.EPngError.
	EPNGHeaderNotPresent (see page 2985)	This is class pngimage.EPNGHeaderNotPresent.
	EPNGIHDRNotFirst (see page 2986)	This is class pngimage.EPNGIHDRNotFirst.
	EPngInvalidCRC (see page 2986)	This is class pngimage.EPngInvalidCRC.
	EPNGInvalidFileHeader (see page 2987)	This is class pngimage.EPNGInvalidFileHeader.
	EPngInvalidIHDR (see page 2987)	This is class pngimage.EPngInvalidIHDR.
	EPNGInvalidNewSize (see page 2987)	This is class pngimage.EPNGInvalidNewSize.
	EPNGInvalidPalette (see page 2988)	This is class pngimage.EPNGInvalidPalette.
	EPNGInvalidSpec (see page 2988)	This is class pngimage.EPNGInvalidSpec.
	EPNGMissingMultipleIDAT (see page 2988)	This is class pngimage.EPNGMissingMultipleIDAT.
	EPNGMissingPalette (see page 2989)	This is class pngimage.EPNGMissingPalette.
	EPNGNoImageData (see page 2989)	This is class pngimage.EPNGNoImageData.
	EPNGNotExists (see page 2990)	This is class pngimage.EPNGNotExists.
	EPNGOutMemory (see page 2990)	This is class pngimage.EPNGOutMemory.
	EPNGSizeExceeds (see page 2990)	This is class pngimage.EPNGSizeExceeds.
	EPngUnexpectedEnd (see page 2991)	This is class pngimage.EPngUnexpectedEnd.
	EPNGUnknownCompression (see page 2991)	This is class pngimage.EPNGUnknownCompression.
	EPNGUnknownCriticalChunk (see page 2991)	This is class pngimage.EPNGUnknownCriticalChunk.
	EPNGUnknownInterlace (see page 2992)	This is class pngimage.EPNGUnknownInterlace.
	EPNGZLIBError (see page 2992)	This is class pngimage.EPNGZLIBError.
	Exception (see page 2993)	This is class pngimage.Exception.
	TFileStream (see page 2993)	This is class pngimage.TFileStream.
	TPngImage (see page 2996)	This is class pngimage.TPngImage.
	TPNGList (see page 2997)	This is class pngimage.TPNGList.
	TPNGPointerList (see page 2999)	This is class pngimage.TPNGPointerList.
	TResourceStream (see page 3003)	This is class pngimage.TResourceStream.
	TStream (see page 3005)	This is class pngimage.TStream.

56.1.1 EPNGCannotChangeTransparent Class

Class Hierarchy

Pascal

```
EPNGCannotChangeTransparent = class(Exception);
```

C++

```
class EPNGCannotChangeTransparent : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGCannotChangeTransparent.

56.1.2 EPNGCouldNotLoadResource Class

Class Hierarchy

Pascal

```
EPNGCouldNotLoadResource = class(Exception);
```

C++

```
class EPNGCouldNotLoadResource : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGCouldNotLoadResource.

56.1.3 EPngError Class

Class Hierarchy

Pascal

```
EPngError = class(Exception);
```

C++

```
class EPngError : public Exception;
```

File

pngimage

Description

This is class pngimage.EPngError.

56.1.4 EPNGHeaderNotPresent Class

Class Hierarchy

Pascal

```
EPNGHeaderNotPresent = class(Exception);
```

C++

```
class EPNGHeaderNotPresent : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGHeaderNotPresent.

56.1.5 EPNGIHDRNotFirst Class

Class Hierarchy

Pascal

```
EPNGIHDRNotFirst = class(Exception);
```

C++

```
class EPNGIHDRNotFirst : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGIHDRNotFirst.

56.1.6 EPngInvalidCRC Class

Class Hierarchy

Pascal

```
EPngInvalidCRC = class(Exception);
```

C++

```
class EPngInvalidCRC : public Exception;
```

File

pngimage

Description

This is class pngimage.EPngInvalidCRC.

56.1.7 EPNGInvalidFileHeader Class

Class Hierarchy

Pascal

```
EPNGInvalidFileHeader = class(Exception);
```

C++

```
class EPNGInvalidFileHeader : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGInvalidFileHeader.

56.1.8 EPngInvalidIHDR Class

Class Hierarchy

Pascal

```
EPngInvalidIHDR = class(Exception);
```

C++

```
class EPngInvalidIHDR : public Exception;
```

File

pngimage

Description

This is class pngimage.EPngInvalidIHDR.

56.1.9 EPNGInvalidNewSize Class

Class Hierarchy

Pascal

```
EPNGInvalidNewSize = class(Exception);
```

C++

```
class EPNGInvalidNewSize : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGInvalidNewSize.

56.1.10 EPNGInvalidPalette Class

Class Hierarchy

Pascal

```
EPNGInvalidPalette = class(Exception);
```

C++

```
class EPNGInvalidPalette : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGInvalidPalette.

56.1.11 EPNGInvalidSpec Class

Class Hierarchy

Pascal

```
EPNGInvalidSpec = class(Exception);
```

C++

```
class EPNGInvalidSpec : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGInvalidSpec.

56.1.12 EPNGMissingMultipleIDAT Class

Class Hierarchy

Pascal

```
EPNGMissingMultipleIDAT = class(Exception);
```

C++

```
class EPNGMissingMultipleIDAT : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGMissingMultipleIDAT.

56.1.13 EPNGMissingPalette Class

Class Hierarchy

Pascal

```
EPNGMissingPalette = class(Exception);
```

C++

```
class EPNGMissingPalette : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGMissingPalette.

56.1.14 EPNGNoImageData Class

Class Hierarchy

Pascal

```
EPNGNoImageData = class(Exception);
```

C++

```
class EPNGNoImageData : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGNoImageData.

56.1.15 EPNGNotExists Class

Class Hierarchy

Pascal

```
EPNGNotExists = class(Exception);
```

C++

```
class EPNGNotExists : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGNotExists.

56.1.16 EPNGOutMemory Class

Class Hierarchy

Pascal

```
EPNGOutMemory = class(Exception);
```

C++

```
class EPNGOutMemory : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGOutMemory.

56.1.17 EPNGSizeExceeds Class

Class Hierarchy

Pascal

```
EPNGSizeExceeds = class(Exception);
```

C++

```
class EPNGSizeExceeds : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGSizeExceeds.

56.1.18 EPngUnexpectedEnd Class

Class Hierarchy

Pascal

```
EPngUnexpectedEnd = class(Exception);
```

C++

```
class EPngUnexpectedEnd : public Exception;
```

File

pngimage

Description

This is class pngimage.EPngUnexpectedEnd.

56.1.19 EPNGUnknownCompression Class

Class Hierarchy

Pascal

```
EPNGUnknownCompression = class(Exception);
```

C++

```
class EPNGUnknownCompression : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGUnknownCompression.

56.1.20 EPNGUnknownCriticalChunk Class

Class Hierarchy

Pascal

```
EPNGUnknownCriticalChunk = class(Exception);
```

C++

```
class EPNGUnknownCriticalChunk : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGUnknownCriticalChunk.

56.1.21 EPNGUnknownInterlace Class

Class Hierarchy

Pascal

```
EPNGUnknownInterlace = class(Exception);
```

C++

```
class EPNGUnknownInterlace : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGUnknownInterlace.

56.1.22 EPNGZLIBError Class

Class Hierarchy

Pascal

```
EPNGZLIBError = class(Exception);
```

C++

```
class EPNGZLIBError : public Exception;
```

File

pngimage

Description

This is class pngimage.EPNGZLIBError.

56.1.23 Exception Class

Class Hierarchy

Pascal

```
Exception = class(TObject);
```

C++

```
class Exception : public TObject;
```

File

pngimage

Description

This is class pngimage.Exception.

56.1.23.1 Exception Members

The following tables list the members exposed by Exception.

Public Methods

	Name	Description
	Create (see page 2993)	This is Create, a member of class Exception.

56.1.23.2 Exception.Create Constructor

Pascal

```
constructor Create(Msg: String);
```

C++

```
__fastcall Exception(UnicodeString Msg);
```

Description

This is Create, a member of class Exception.

56.1.24 TFileStream Class

Class Hierarchy

Pascal

```
TFileStream = class(TStream);
```

C++

```
class TFileStream : public TStream;
```

File

pngimage

Description

This is class pngimage.TFileStream.

56.1.24.1 TFileStream Members

The following tables list the members exposed by TFileStream.

Protected Methods

	Name	Description
	GetPosition (see page 3006)	This is GetPosition, a member of class TStream.
	GetSize (see page 3006)	This is GetSize, a member of class TStream.
	SetPosition (see page 3007)	This is SetPosition, a member of class TStream.
	SetSize (see page 2995)	This is SetSize, a member of class TFileStream.

Public Methods

	Name	Description
	CopyFrom (see page 3006)	This is CopyFrom, a member of class TStream.
	Create (see page 2994)	This is Create, a member of class TFileStream.
	Destroy (see page 2994)	This is Destroy, a member of class TFileStream.
	Read (see page 2995)	This is Read, a member of class TFileStream.
	Seek (see page 2995)	This is Seek, a member of class TFileStream.
	Write (see page 2996)	This is Write, a member of class TFileStream.

Public Properties

	Name	Description
	Position (see page 3008)	This is Position, a member of class TStream.
	Size (see page 3008)	This is Size, a member of class TStream.

56.1.24.2 TFileStream.Create Constructor

Pascal

```
constructor Create(Filename: String; Mode: TFileStreamModeSet);
```

C++

```
__fastcall TFileStream(UnicodeString Filename, TFileStreamModeSet Mode);
```

Description

This is Create, a member of class TFileStream.

56.1.24.3 TFileStream.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFileStream();
```

Description

This is Destroy, a member of class TFileStream.

56.1.24.4 TFileStream Methods

The methods of the TFileStream class are listed here.

Protected Methods

	Name	Description
	SetSize (see page 2995)	This is SetSize, a member of class TFileStream.

Public Methods

	Name	Description
	Read (see page 2995)	This is Read, a member of class TFileStream.
	Seek (see page 2995)	This is Seek, a member of class TFileStream.
	Write (see page 2996)	This is Write, a member of class TFileStream.

56.1.24.4.1 TFileStream.Read Method

Pascal

```
function Read(var Buffer; Count: Longint): Cardinal; override;
```

C++

```
virtual __fastcall unsigned Read( Buffer, Longint Count);
```

Description

This is Read, a member of class TFileStream.

56.1.24.4.2 TFileStream.Seek Method

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

This is Seek, a member of class TFileStream.

56.1.24.4.3 TFileStream.SetSize Method

Pascal

```
procedure SetSize(const Value: Longint); override;
```

C++

```
virtual __fastcall SetSize(const Longint Value);
```

Description

This is SetSize, a member of class TFileStream.

56.1.24.4.4 TFileStream.Write Method

Pascal

```
function Write(const Buffer; Count: Longint): Cardinal; override;
```

C++

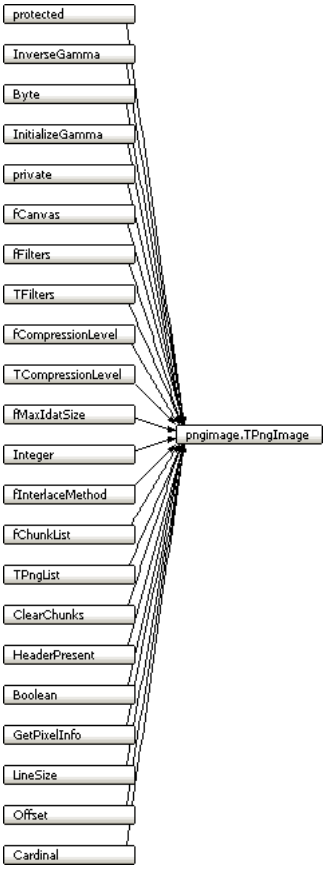
```
virtual __fastcall unsigned Write(const  Buffer, Longint Count);
```

Description

This is Write, a member of class TFileStream.

56.1.25 TPngImage Class

Class Hierarchy



Pascal

```
TPngImage = class(protected, InverseGamma, Byte, InitializeGamma, private, fCanvas, fFilters,
TFilters, fCompressionLevel, TCompressionLevel, fMaxIdatSize, Integer, fInterlaceMethod,
TInterlaceMethod, fChunkList, TPngList, ClearChunks, HeaderPresent, Boolean, GetPixelInfo,
```

```
LineSize, Offset, Cardinal);
```

C++

```
class TPngImage : public protected, public InverseGamma, public Byte, public InitializeGamma,
public private, public fCanvas, public fFilters, public TFilters, public fCompressionLevel,
public TCompressionLevel, public fMaxIdatSize, public Integer, public fInterlaceMethod, public
TInterlaceMethod, public fChunkList, public TPngList, public ClearChunks, public
HeaderPresent, public Boolean, public GetPixelInfo, public LineSize, public Offset, public
Cardinal;
```

File

pngimage

Description

This is class pngimage.TPngImage.

56.1.26 TPNGList Class

Class Hierarchy

Pascal

```
TPNGList = class(TPNGPointerList);
```

C++

```
class TPNGList : public TPNGPointerList;
```

File

pngimage

Description

This is class pngimage.TPNGList.

56.1.26.1 TPNGList Members

The following tables list the members exposed by TPNGList.

Protected Methods

	Name	Description
	Insert (see page 3001)	This is Insert, a member of class TPNGPointerList.
V	Remove (see page 3001)	This is Remove, a member of class TPNGPointerList.
	SetSize (see page 3001)	This is SetSize, a member of class TPNGPointerList.

Protected Properties

	Name	Description
R	Owner (see page 3002)	This is Owner, a member of class TPNGPointerList.

Public Methods

	Name	Description
	Add (see page 2998)	This is Add, a member of class TPNGList.
	Create (see page 3000)	This is Create, a member of class TPNGPointerList.
V	Destroy (see page 3000)	This is Destroy, a member of class TPNGPointerList.

	FindChunk (see page 2998)	This is FindChunk, a member of class TPNGList.
	ItemFromClass (see page 2998)	This is ItemFromClass, a member of class TPNGList.
	RemoveChunk (see page 2999)	This is RemoveChunk, a member of class TPNGList.

Public Properties

	Name	Description
	Count (see page 3002)	This is Count, a member of class TPNGPointerList.
R	Item (see page 2999)	This is Item, a member of class TPNGList.

56.1.26.2 TPNGList Methods

The methods of the TPNGList class are listed here.

Public Methods

	Name	Description
	Add (see page 2998)	This is Add, a member of class TPNGList.
	FindChunk (see page 2998)	This is FindChunk, a member of class TPNGList.
	ItemFromClass (see page 2998)	This is ItemFromClass, a member of class TPNGList.
	RemoveChunk (see page 2999)	This is RemoveChunk, a member of class TPNGList.

56.1.26.2.1 TPNGList.Add Method

Pascal

```
function Add(ChunkClass: TChunkClass): TChunk;
```

C++

```
__fastcall TChunk Add(TChunkClass ChunkClass);
```

Description

This is Add, a member of class TPNGList.

56.1.26.2.2 TPNGList.FindChunk Method

Pascal

```
function FindChunk(ChunkClass: TChunkClass): TChunk;
```

C++

```
__fastcall TChunk FindChunk(TChunkClass ChunkClass);
```

Description

This is FindChunk, a member of class TPNGList.

56.1.26.2.3 TPNGList.ItemFromClass Method

Pascal

```
function ItemFromClass(ChunkClass: TChunkClass): TChunk;
```

C++

```
__fastcall TChunk ItemFromClass(TChunkClass ChunkClass);
```

Description

This is ItemFromClass, a member of class TPNGList.

56.1.26.2.4 TPNGList.RemoveChunk Method

Pascal

```
procedure RemoveChunk(Chunk: TChunk); overload;
```

C++

```
__fastcall RemoveChunk(TChunk Chunk);
```

Description

This is RemoveChunk, a member of class TPNGList.

56.1.26.3 TPNGList Properties

The properties of the TPNGList class are listed here.

Public Properties

	Name	Description
	Item (see page 2999)	This is Item, a member of class TPNGList.

56.1.26.3.1 TPNGList.Item Property

Pascal

```
property Item [Index: Cardinal]: TChunk;
```

C++

```
__property TChunk Item[unsigned Index];
```

Description

This is Item, a member of class TPNGList.

56.1.27 TPNGPointerList Class

Class Hierarchy

Pascal

```
TPNGPointerList = class;
```

C++

```
class TPNGPointerList;
```

File

pngimage

Description

This is class pngimage.TPNGPointerList.

56.1.27.1 TPNGPointerList Members

The following tables list the members exposed by TPNGPointerList.

Protected Methods

	Name	Description
	Add (see page 3001)	This is Add, a member of class TPNGPointerList.
	Insert (see page 3001)	This is Insert, a member of class TPNGPointerList.
V	Remove (see page 3001)	This is Remove, a member of class TPNGPointerList.
	SetSize (see page 3001)	This is SetSize, a member of class TPNGPointerList.

Protected Properties

	Name	Description
	Item (see page 3002)	This is Item, a member of class TPNGPointerList.
R	Owner (see page 3002)	This is Owner, a member of class TPNGPointerList.

Public Methods

	Name	Description
	Create (see page 3000)	This is Create, a member of class TPNGPointerList.
V	Destroy (see page 3000)	This is Destroy, a member of class TPNGPointerList.

Public Properties

	Name	Description
	Count (see page 3002)	This is Count, a member of class TPNGPointerList.

56.1.27.2 TPNGPointerList.Create Constructor

Pascal

```
constructor Create(AOwner: TPngImage);
```

C++

```
__fastcall TPNGPointerList(TPngImage AOwner);
```

Description

This is Create, a member of class TPNGPointerList.

56.1.27.3 TPNGPointerList.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPNGPointerList();
```

Description

This is Destroy, a member of class TPNGPointerList.

56.1.27.4 TPNGPointerList Methods

The methods of the TPNGPointerList class are listed here.

Protected Methods

	Name	Description
	Add (see page 3001)	This is Add, a member of class TPNGPointerList.
	Insert (see page 3001)	This is Insert, a member of class TPNGPointerList.
	Remove (see page 3001)	This is Remove, a member of class TPNGPointerList.
	SetSize (see page 3001)	This is SetSize, a member of class TPNGPointerList.

56.1.27.4.1 TPNGPointerList.Add Method

Pascal

```
procedure Add(Value: Pointer);
```

C++

```
__fastcall Add(void * Value);
```

Description

This is Add, a member of class TPNGPointerList.

56.1.27.4.2 TPNGPointerList.Insert Method

Pascal

```
procedure Insert(Value: Pointer; Position: Cardinal);
```

C++

```
__fastcall Insert(void * Value, unsigned Position);
```

Description

This is Insert, a member of class TPNGPointerList.

56.1.27.4.3 TPNGPointerList.Remove Method

Pascal

```
function Remove(Value: Pointer): Pointer; virtual;
```

C++

```
virtual __fastcall void * Remove(void * Value);
```

Description

This is Remove, a member of class TPNGPointerList.

56.1.27.4.4 TPNGPointerList.SetSize Method

Pascal

```
procedure SetSize(const Size: Cardinal);
```

C++

```
__fastcall SetSize(const unsigned Size);
```

Description

This is SetSize, a member of class TPNGPointerList.

56.1.27.5 TPNGPointerList Properties

The properties of the TPNGPointerList class are listed here.

Protected Properties

	Name	Description
	Item (see page 3002)	This is Item, a member of class TPNGPointerList.
R	Owner (see page 3002)	This is Owner, a member of class TPNGPointerList.

Public Properties

	Name	Description
	Count (see page 3002)	This is Count, a member of class TPNGPointerList.

56.1.27.5.1 TPNGPointerList.Count Property

Pascal

```
property Count: Cardinal;
```

C++

```
__property unsigned Count;
```

Description

This is Count, a member of class TPNGPointerList.

56.1.27.5.2 TPNGPointerList.Item Property

Pascal

```
property Item [Index: Cardinal]: Pointer;
```

C++

```
__property void * Item[unsigned Index];
```

Description

This is Item, a member of class TPNGPointerList.

56.1.27.5.3 TPNGPointerList.Owner Property

Pascal

```
property Owner: TPngImage;
```

C++

```
__property TPngImage Owner;
```

Description

This is Owner, a member of class TPNGPointerList.

56.1.28 TResourceStream Class

Class Hierarchy

Pascal

```
TResourceStream = class(TStream);
```

C++

```
class TResourceStream : public TStream;
```

File

pngimage

Description

This is class pngimage.TResourceStream.

56.1.28.1 TResourceStream Members

The following tables list the members exposed by TResourceStream.

Protected Methods

	Name	Description
	GetPosition (see page 3006)	This is GetPosition, a member of class TStream.
	GetSize (see page 3006)	This is GetSize, a member of class TStream.
	SetPosition (see page 3007)	This is SetPosition, a member of class TStream.
	SetSize (see page 3004)	This is SetSize, a member of class TResourceStream.

Public Methods

	Name	Description
	CopyFrom (see page 3006)	This is CopyFrom, a member of class TStream.
	Create (see page 3003)	This is Create, a member of class TResourceStream.
	Read (see page 3004)	This is Read, a member of class TResourceStream.
	Seek (see page 3004)	This is Seek, a member of class TResourceStream.
	Write (see page 3005)	This is Write, a member of class TResourceStream.

Public Properties

	Name	Description
	Position (see page 3008)	This is Position, a member of class TStream.
	Size (see page 3008)	This is Size, a member of class TStream.

56.1.28.2 TResourceStream.Create Constructor

Pascal

```
constructor Create(Instance: HInst; const ResName: String; ResType: PChar);
```

C++

```
__fastcall TResourceStream(HInst Instance, const UnicodeString ResName, const char * ResType);
```

Description

This is Create, a member of class TResourceStream.

56.1.28.3 TResourceStream Methods

The methods of the TResourceStream class are listed here.

Protected Methods

	Name	Description
	SetSize (see page 3004)	This is SetSize, a member of class TResourceStream.

Public Methods

	Name	Description
	Read (see page 3004)	This is Read, a member of class TResourceStream.
	Seek (see page 3004)	This is Seek, a member of class TResourceStream.
	Write (see page 3005)	This is Write, a member of class TResourceStream.

56.1.28.3.1 TResourceStream.Read Method

Pascal

```
function Read(var Buffer; Count: Integer): Cardinal; override;
```

C++

```
virtual __fastcall unsigned Read( Buffer, int Count);
```

Description

This is Read, a member of class TResourceStream.

56.1.28.3.2 TResourceStream.Seek Method

Pascal

```
function Seek(Offset: Integer; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(int Offset, Word Origin);
```

Description

This is Seek, a member of class TResourceStream.

56.1.28.3.3 TResourceStream.SetSize Method

Pascal

```
procedure SetSize(const Value: Longint); override;
```

C++

```
virtual __fastcall SetSize(const Longint Value);
```

Description

This is SetSize, a member of class TResourceStream.

56.1.28.3.4 TResourceStream.Write Method

Pascal

```
function Write(const Buffer; Count: Longint): Cardinal; override;
```

C++

```
virtual __fastcall unsigned Write(const  Buffer, Longint Count);
```

Description

This is Write, a member of class TResourceStream.

56.1.29 TStream Class

Class Hierarchy

Pascal

```
TStream = class;
```

C++

```
class TStream;
```

File

pngimage

Description

This is class pngimage.TStream.

56.1.29.1 TStream Members

The following tables list the members exposed by TStream.

Protected Methods

	Name	Description
	GetPosition (see page 3006)	This is GetPosition, a member of class TStream.
	GetSize (see page 3006)	This is GetSize, a member of class TStream.
	SetPosition (see page 3007)	This is SetPosition, a member of class TStream.
	SetSize (see page 3007)	This is SetSize, a member of class TStream.

Public Methods

	Name	Description
	CopyFrom (see page 3006)	This is CopyFrom, a member of class TStream.
	Read (see page 3007)	This is Read, a member of class TStream.
	Seek (see page 3007)	This is Seek, a member of class TStream.
	Write (see page 3007)	This is Write, a member of class TStream.

Public Properties

	Name	Description
	Position (see page 3008)	This is Position, a member of class TStream.

	Size (see page 3008)	This is Size, a member of class TStream.

56.1.29.2 TStream Methods

The methods of the TStream class are listed here.

Protected Methods

	Name	Description
	GetPosition (see page 3006)	This is GetPosition, a member of class TStream.
	GetSize (see page 3006)	This is GetSize, a member of class TStream.
	SetPosition (see page 3007)	This is SetPosition, a member of class TStream.
	SetSize (see page 3007)	This is SetSize, a member of class TStream.

Public Methods

	Name	Description
	CopyFrom (see page 3006)	This is CopyFrom, a member of class TStream.
	Read (see page 3007)	This is Read, a member of class TStream.
	Seek (see page 3007)	This is Seek, a member of class TStream.
	Write (see page 3007)	This is Write, a member of class TStream.

56.1.29.2.1 TStream.CopyFrom Method

Pascal

```
function CopyFrom(Source: TStream; Count: Cardinal): Cardinal; virtual;
```

C++

```
virtual __fastcall unsigned CopyFrom(TStream Source, unsigned Count);
```

Description

This is CopyFrom, a member of class TStream.

56.1.29.2.2 TStream.GetPosition Method

Pascal

```
function GetPosition: Longint; virtual;
```

C++

```
virtual __fastcall Longint GetPosition();
```

Description

This is GetPosition, a member of class TStream.

56.1.29.2.3 TStream.GetSize Method

Pascal

```
function GetSize: Longint; virtual;
```

C++

```
virtual __fastcall Longint GetSize();
```

Description

This is GetSize, a member of class TStream.

56.1.29.2.4 TStream.Read Method

Pascal

```
function Read(var Buffer; Count: Longint): Cardinal; virtual; abstract;
```

C++

```
virtual __fastcall unsigned Read( Buffer, Longint Count) = 0;
```

Description

This is Read, a member of class TStream.

56.1.29.2.5 TStream.Seek Method

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; virtual; abstract;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin) = 0;
```

Description

This is Seek, a member of class TStream.

56.1.29.2.6 TStream.SetPosition Method

Pascal

```
procedure SetPosition(const Value: Longint); virtual;
```

C++

```
virtual __fastcall SetPosition(const Longint Value);
```

Description

This is SetPosition, a member of class TStream.

56.1.29.2.7 TStream.SetSize Method

Pascal

```
procedure SetSize(const Value: Longint); virtual; abstract;
```

C++

```
virtual __fastcall SetSize(const Longint Value) = 0;
```

Description

This is SetSize, a member of class TStream.

56.1.29.2.8 TStream.Write Method

Pascal

```
function Write(const Buffer; Count: Longint): Cardinal; virtual; abstract;
```

C++

```
virtual __fastcall unsigned Write(const  Buffer, Longint Count) = 0;
```

Description

This is Write, a member of class TStream.

56.1.29.3 TStream Properties

The properties of the TStream class are listed here.

Public Properties

	Name	Description
	Position (see page 3008)	This is Position, a member of class TStream.
	Size (see page 3008)	This is Size, a member of class TStream.

56.1.29.3.1 TStream.Position Property

Pascal

```
property Position: Longint;
```

C++

```
__property Longint Position;
```

Description

This is Position, a member of class TStream.

56.1.29.3.2 TStream.Size Property

Pascal

```
property Size: Longint;
```

C++

```
__property Longint Size;
```

Description

This is Size, a member of class TStream.

56.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddtEXt (see page 3009)	This is function pngimage.AddtEXt.
	AddzTXt (see page 3010)	This is function pngimage.AddzTXt.
	Assign (see page 3010)	This is function pngimage.Assign.
	AssignHandle (see page 3010)	This is function pngimage.AssignHandle.
	AssignPNG (see page 3011)	This is function pngimage.AssignPNG.
	CreateAlpha (see page 3011)	This is function pngimage.CreateAlpha.
	DoSetPalette (see page 3011)	This is function pngimage.DoSetPalette.
	Draw (see page 3012)	This is function pngimage.Draw.
	DrawPartialTrans (see page 3012)	This is function pngimage.DrawPartialTrans.
	DrawUsingPixelInformation (see page 3012)	This is function pngimage.DrawUsingPixelInformation.
	GetAlphaScanline (see page 3013)	This is function pngimage.GetAlphaScanline.
	GetEmpty (see page 3013)	This is function pngimage.GetEmpty.
	GetLibraryVersion (see page 3013)	This is function pngimage.GetLibraryVersion.
	GetPalette (see page 3014)	This is function pngimage.GetPalette.
	GetPixelInformation (see page 3014)	This is function pngimage.GetPixelInformation.
	GetPixels (see page 3014)	This is function pngimage.GetPixels.
	GetScanline (see page 3015)	This is function pngimage.GetScanline.
	GetSupportsPartialTransparency (see page 3015)	This is function pngimage.GetSupportsPartialTransparency.
	GetTransparencyMode (see page 3015)	This is function pngimage.GetTransparencyMode.
	GetTransparentColor (see page 3016)	This is function pngimage.GetTransparentColor.
	GetWidth (see page 3016)	This is function pngimage.GetWidth.
	HasPixelInformation (see page 3016)	This is function pngimage.HasPixelInformation.
	RaiseError (see page 3017)	This is function pngimage.RaiseError.
	RemoveTransparency (see page 3017)	This is function pngimage.RemoveTransparency.
	Resize (see page 3017)	This is function pngimage.Resize.
	SetMaxIdatSize (see page 3018)	This is function pngimage.SetMaxIdatSize.
	SetPixels (see page 3018)	This is function pngimage.SetPixels.
	SetTransparentColor (see page 3018)	This is function pngimage.SetTransparentColor.
	SetWidth (see page 3019)	This is function pngimage.SetWidth.

56.2.1 pngimage.AddtEXt Function

Pascal

```
procedure AddtEXt(const Keyword: AnsiString; const Text: AnsiString);
```

C++

```
AddtEXt(const AnsiString Keyword, const AnsiString Text);
```

File

pngimage

Description

This is function pngimage.AddtEXt.

56.2.2 pngimage.AddzTXt Function

Pascal

```
procedure AddzTXt(const Keyword: AnsiString; const Text: AnsiString);
```

C++

```
AddzTXt(const AnsiString Keyword, const AnsiString Text);
```

File

pngimage

Description

This is function pngimage.AddzTXt.

56.2.3 pngimage.Assign Function

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
Assign(TPersistent * Source);
```

File

pngimage

Description

This is function pngimage.Assign.

56.2.4 pngimage.AssignHandle Function

Pascal

```
procedure AssignHandle(Handle: HBitmap; Transparent: Boolean; TransparentColor: ColorRef);
```

C++

```
AssignHandle(HBitmap Handle, Boolean Transparent, ColorRef TransparentColor);
```

File

pngimage

Description

This is function pngimage.AssignHandle.

56.2.5 pngimage.AssignPNG Function

Pascal

```
procedure AssignPNG(Source: TPngImage);
```

C++

```
AssignPNG(TPngImage Source);
```

File

pngimage

Description

This is function pngimage.AssignPNG.

56.2.6 pngimage.CreateAlpha Function

Pascal

```
procedure CreateAlpha;
```

C++

```
CreateAlpha();
```

File

pngimage

Description

This is function pngimage.CreateAlpha.

56.2.7 pngimage.DoSetPalette Function

Pascal

```
procedure DoSetPalette(Value: HPALETTE; const UpdateColors: Boolean);
```

C++

```
DoSetPalette(HPALETTE Value, const Boolean UpdateColors);
```

File

pngimage

Description

This is function pngimage.DoSetPalette.

56.2.8 pngimage.Draw Function

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
Draw(TCanvas ACanvas, const TRect Rect);
```

File

pngimage

Description

This is function pngimage.Draw.

56.2.9 pngimage.DrawPartialTrans Function

Pascal

```
procedure DrawPartialTrans(DC: HDC; Rect: TRect);
```

C++

```
DrawPartialTrans(HDC DC, TRect Rect);
```

File

pngimage

Description

This is function pngimage.DrawPartialTrans.

56.2.10 pngimage.DrawUsingPixelInformation Function

Pascal

```
procedure DrawUsingPixelInformation(Canvas: TCanvas; Point: TPoint);
```

C++

```
DrawUsingPixelInformation(TCanvas Canvas, TPoint Point);
```

File

pngimage

Description

This is function pngimage.DrawUsingPixelInformation.

56.2.11 pngimage.GetAlphaScanline Function

Pascal

```
function GetAlphaScanline(const LineIndex: Integer): pByteArray;
```

C++

```
pByteArray GetAlphaScanline(const int LineIndex);
```

File

pngimage

Description

This is function pngimage.GetAlphaScanline.

56.2.12 pngimage.GetEmpty Function

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
Boolean GetEmpty();
```

File

pngimage

Description

This is function pngimage.GetEmpty.

56.2.13 pngimage.GetLibraryVersion Function

Pascal

```
function GetLibraryVersion: String;
```

C++

```
UnicodeString GetLibraryVersion();
```

File

pngimage

Description

This is function pngimage.GetLibraryVersion.

56.2.14 pngimage.GetPalette Function

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
HPALETTE GetPalette();
```

File

pngimage

Description

This is function pngimage.GetPalette.

56.2.15 pngimage.GetPixelInformation Function

Pascal

```
function GetPixelInformation: TChunkpHYs;
```

C++

```
TChunkpHYs GetPixelInformation();
```

File

pngimage

Description

This is function pngimage.GetPixelInformation.

56.2.16 pngimage.GetPixels Function

Pascal

```
function GetPixels(const X: Integer; const Y: Integer): TColor; virtual;
```

C++

```
virtual TColor GetPixels(const int X, const int Y);
```

File

pngimage

Description

This is function pngimage.GetPixels.

56.2.17 pngimage.GetScanline Function

Pascal

```
function GetScanline(const LineIndex: Integer): Pointer;
```

C++

```
void * GetScanline(const int LineIndex);
```

File

pngimage

Description

This is function pngimage.GetScanline.

56.2.18 pngimage.GetSupportsPartialTransparency Function

Pascal

```
function GetSupportsPartialTransparency: Boolean; override;
```

C++

```
Boolean GetSupportsPartialTransparency();
```

File

pngimage

Description

This is function pngimage.GetSupportsPartialTransparency.

56.2.19 pngimage.GetTransparencyMode Function

Pascal

```
function GetTransparencyMode: TPNGTransparencyMode;
```

C++

```
TPNGTransparencyMode GetTransparencyMode();
```

File

pngimage

Description

This is function pngimage.GetTransparencyMode.

56.2.20 pngimage.GetTransparentColor Function

Pascal

```
function GetTransparentColor: TColor;
```

C++

```
TColor GetTransparentColor();
```

File

pngimage

Description

This is function pngimage.GetTransparentColor.

56.2.21 pngimage.GetWidth Function

Pascal

```
function GetWidth: Integer; override;
```

C++

```
int GetWidth();
```

File

pngimage

Description

This is function pngimage.GetWidth.

56.2.22 pngimage.HasPixelInformation Function

Pascal

```
function HasPixelInformation: Boolean;
```

C++

```
Boolean HasPixelInformation();
```

File

pngimage

Description

This is function pngimage.HasPixelInformation.

56.2.23 pngimage.RaiseError Function

Pascal

```
procedure RaiseError(ExceptionClass: ExceptClass; Text: String);
```

C++

```
RaiseError(ExceptClass ExceptionClass, UnicodeString Text);
```

File

pngimage

Description

This is function pngimage.RaiseError.

56.2.24 pngimage.RemoveTransparency Function

Pascal

```
procedure RemoveTransparency;
```

C++

```
RemoveTransparency();
```

File

pngimage

Description

This is function pngimage.RemoveTransparency.

56.2.25 pngimage.Resize Function

Pascal

```
procedure Resize(const CX: Integer; const CY: Integer);
```

C++

```
Resize(const int CX, const int CY);
```

File

pngimage

Description

This is function pngimage.Resize.

56.2.26 pngimage.SetMaxIdatSize Function

Pascal

```
procedure SetMaxIdatSize(const Value: Integer);
```

C++

```
SetMaxIdatSize(const int Value);
```

File

pngimage

Description

This is function pngimage.SetMaxIdatSize.

56.2.27 pngimage.SetPixels Function

Pascal

```
procedure SetPixels(const X: Integer; const Y: Integer; const Value: TColor); virtual;
```

C++

```
virtual SetPixels(const int X, const int Y, const TColor Value);
```

File

pngimage

Description

This is function pngimage.SetPixels.

56.2.28 pngimage.SetTransparentColor Function

Pascal

```
procedure SetTransparentColor(const Value: TColor);
```

C++

```
SetTransparentColor(const TColor Value);
```

File

pngimage

Description

This is function pngimage.SetTransparentColor.

56.2.29 pngimage.SetWidth Function

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
SetWidth(int Value);
```

File

pngimage

Description

This is function pngimage.SetWidth.

56.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFileStreamMode (see page 3020)	This is record pngimage.TFileStreamMode.
	TFilter (see page 3020)	This is record pngimage.TFilter.
	TInterlaceMethod (see page 3021)	This is record pngimage.TInterlaceMethod.
	TPNGTransparencyMode (see page 3022)	This is record pngimage.TPNGTransparencyMode.

Records

	Name	Description
	TMAXBITMAPINFO (see page 3021)	This is record pngimage.TMAXBITMAPINFO.
	TRGBPixel (see page 3022)	This is record pngimage.TRGBPixel.

56.3.1 pngimage.TFileStreamMode Enumeration

Pascal

```
TFileStreamMode = (
  fsmRead,
  fsmWrite,
  fsmCreate
);
```

C++

```
enum TFileStreamMode {
  fsmRead,
  fsmWrite,
  fsmCreate
};
```

File

pngimage

Description

This is record pngimage.TFileStreamMode.

56.3.2 pngimage.TFilter Enumeration

Pascal

```
TFilter = (
  pfNone,
  pfSub,
  pfUp,
  pfAverage,
  pfPaeth
```

```
);
```

C++

```
enum TFilter {
  pfNone,
  pfSub,
  pfUp,
  pfAverage,
  pfPaeth
};
```

File

pngimage

Description

This is record pngimage.TFilter.

56.3.3 pngimage.TInterlaceMethod Enumeration

Pascal

```
TInterlaceMethod = (
  imNone,
  imAdam7
);
```

C++

```
enum TInterlaceMethod {
  imNone,
  imAdam7
};
```

File

pngimage

Description

This is record pngimage.TInterlaceMethod.

56.3.4 pngimage.TMAXBITMAPINFO Record

Pascal

```
TMAXBITMAPINFO = packed record
  bmiHeader: TBitmapInfoHeader;
  bmiColors: packed array[0..255] of TRGBQuad;
end;
```

C++

```
struct TMAXBITMAPINFO {
  TBitmapInfoHeader bmiHeader;
  packed array[0..255] of TRGBQuad bmiColors;
};
```

File

pngimage

Description

This is record pngimage.TMAXBITMAPINFO.

56.3.5 pngimage.TPNGTransparencyMode Enumeration

Pascal

```
TPNGTransparencyMode = (
  ptmNone,
  ptmBit,
  ptmPartial
);
```

C++

```
enum TPNGTransparencyMode {
  ptmNone,
  ptmBit,
  ptmPartial
};
```

File

pngimage

Description

This is record pngimage.TPNGTransparencyMode.

56.3.6 pngimage.TRGBPixel Record

Pascal

```
TRGBPixel = packed record
  B: Byte;
  G: Byte;
  R: Byte;
end;
```

C++

```
struct TRGBPixel {
  Byte B;
  Byte G;
  Byte R;
};
```

File

pngimage

Description

This is record pngimage.TRGBPixel.

56.4 Types

The following table lists types in this documentation.

Types

Name	Description
ExceptClass (see page 3023)	This is type pngimage.ExceptClass.
pByteArray (see page 3023)	This is type pngimage.pByteArray.
pCardinal (see page 3024)	This is type pngimage.pCardinal.
pPointerArray (see page 3024)	This is type pngimage.pPointerArray.
pRGBLine (see page 3024)	This is type pngimage.pRGBLine.
pRGBPixel (see page 3025)	This is type pngimage.pRGBPixel.
TBitmap (see page 3025)	This is type pngimage.TBitmap.
TByteArray (see page 3025)	This is type pngimage.TByteArray.
TCanvas (see page 3026)	This is type pngimage.TCanvas.
TChunkClass (see page 3026)	This is type pngimage.TChunkClass.
TColor (see page 3026)	This is type pngimage.TColor.
TCompressionLevel (see page 3027)	This is type pngimage.TCompressionLevel.
TFileStreamModeSet (see page 3027)	This is type pngimage.TFileStreamModeSet.
TFilters (see page 3027)	This is type pngimage.TFilters.
TPersistent (see page 3028)	This is type pngimage.TPersistent.
TPointerArray (see page 3028)	This is type pngimage.TPointerArray.
TRGBLine (see page 3028)	This is type pngimage.TRGBLine.

56.4.1 pngimage.ExceptClass Type

Pascal

```
ExceptClass = class of Exception;
```

C++

```
Exception ExceptClass;
```

File

pngimage

Description

This is type pngimage.ExceptClass.

56.4.2 pngimage.pByteArray Type

Pascal

```
pByteArray = ^TByteArray;
```

C++

```
^TByteArray pByteArray;
```

File

pngimage

Description

This is type pngimage.pByteArray.

56.4.3 pngimage.pCardinal Type

Pascal

```
pCardinal = ^Cardinal;
```

C++

```
^Cardinal pCardinal;
```

File

pngimage

Description

This is type pngimage.pCardinal.

56.4.4 pngimage.pPointerArray Type

Pascal

```
pPointerArray = ^TPointerArray;
```

C++

```
^TPointerArray pPointerArray;
```

File

pngimage

Description

This is type pngimage.pPointerArray.

56.4.5 pngimage.pRGBLine Type

Pascal

```
pRGBLine = ^TRGBLine;
```

C++

```
^TRGBLine pRGBLine;
```

File

pngimage

Description

This is type pngimage.pRGBLine.

56.4.6 pngimage.pRGBPixel Type

Pascal

```
pRGBPixel = ^TRGBPixel;
```

C++

```
^TRGBPixel pRGBPixel;
```

File

pngimage

Description

This is type pngimage.pRGBPixel.

56.4.7 pngimage.TBitmap Type

Pascal

```
TBitmap = HBitmap;
```

C++

```
HBitmap TBitmap;
```

File

pngimage

Description

This is type pngimage.TBitmap.

56.4.8 pngimage.TByteArray Type

Pascal

```
TByteArray = Array[Word] of Byte;
```

C++

```
Array[Word] of Byte TByteArray;
```

File

pngimage

Description

This is type pngimage.TByteArray.

56.4.9 pngimage.TCanvas Type

Pascal

```
TCanvas = THandle;
```

C++

```
THandle TCanvas;
```

File

pngimage

Description

This is type pngimage.TCanvas.

56.4.10 pngimage.TChunkClass Type

Pascal

```
TChunkClass = class of TChunk;
```

C++

```
TChunk TChunkClass;
```

File

pngimage

Description

This is type pngimage.TChunkClass.

56.4.11 pngimage.TColor Type

Pascal

```
TColor = ColorRef;
```

C++

```
ColorRef TColor;
```

File

pngimage

Description

This is type pngimage.TColor.

56.4.12 pngimage.TCompressionLevel Type

Pascal

```
TCompressionLevel = 0..9;
```

C++

```
0..9 TCompressionLevel;
```

File

pngimage

Description

This is type pngimage.TCompressionLevel.

56.4.13 pngimage.TFileStreamModeSet Type

Pascal

```
TFileStreamModeSet = set of TFileStreamMode;
```

C++

```
TFileStreamMode TFileStreamModeSet;
```

File

pngimage

Description

This is type pngimage.TFileStreamModeSet.

56.4.14 pngimage.TFilters Type

Pascal

```
TFilters = set of TFilter;
```

C++

```
TFilter TFilters;
```

File

pngimage

Description

This is type pngimage.TFilters.

56.4.15 pngimage.TPersistent Type

Pascal

```
TPersistent = TObject;
```

C++

```
TObject * TPersistent;
```

File

pngimage

Description

This is type pngimage.TPersistent.

56.4.16 pngimage.TPointerArray Type

Pascal

```
TPointerArray = Array[Word] of Pointer;
```

C++

```
Array[Word] of Pointer TPointerArray;
```

File

pngimage

Description

This is type pngimage.TPointerArray.

56.4.17 pngimage.TRGBLine Type

Pascal

```
TRGBLine = array[word] of TRGBTriple;
```

C++

```
array[word] of TRGBTriple TRGBLine;
```

File

pngimage

Description

This is type pngimage.TRGBLine.

56.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
COLOR_GRAYSCALE (see page 3029)	This is constant pngimage.COLOR_GRAYSCALE.
COLOR_GRAYSCALEALPHA (see page 3029)	This is constant pngimage.COLOR_GRAYSCALEALPHA.
COLOR_PALETTE (see page 3030)	This is constant pngimage.COLOR_PALETTE.
COLOR_RGB (see page 3030)	This is constant pngimage.COLOR_RGB.
COLOR_RGBALPHA (see page 3030)	This is constant pngimage.COLOR_RGBALPHA.
FILTER_AVERAGE (see page 3031)	This is constant pngimage.FILTER_AVERAGE.
FILTER_NONE (see page 3031)	This is constant pngimage.FILTER_NONE.
FILTER_PAETH (see page 3031)	This is constant pngimage.FILTER_PAETH.
FILTER_SUB (see page 3032)	This is constant pngimage.FILTER_SUB.
FILTER_UP (see page 3032)	This is constant pngimage.FILTER_UP.
Index (see page 3032)	This is constant pngimage.Index.
LibraryVersion (see page 3033)	This is constant pngimage.LibraryVersion.
soFromBeginning (see page 3033)	This is constant pngimage.soFromBeginning.
soFromCurrent (see page 3033)	This is constant pngimage.soFromCurrent.
soFromEnd (see page 3034)	This is constant pngimage.soFromEnd.
Z_FINISH (see page 3034)	This is constant pngimage.Z_FINISH.
Z_NO_FLUSH (see page 3034)	This is constant pngimage.Z_NO_FLUSH.
Z_STREAM_END (see page 3035)	This is constant pngimage.Z_STREAM_END.
ZLIBErrors (see page 3035)	This is constant pngimage.ZLIBErrors.

56.5.1 pngimage.COLOR_GRAYSCALE Constant

Pascal

```
COLOR_GRAYSCALE = 0;
```

C++

```
COLOR_GRAYSCALE = 0;
```

File

pngimage

Description

This is constant pngimage.COLOR_GRAYSCALE.

56.5.2 pngimage.COLOR_GRAYSCALEALPHA Constant

Pascal

```
COLOR_GRAYSCALEALPHA = 4;
```

C++

```
COLOR_GRAYSCALEALPHA = 4;
```

File

pngimage

Description

This is constant pngimage.COLOR_GRAYSCALEALPHA.

56.5.3 pngimage.COLOR_PALETTE Constant

Pascal

```
COLOR_PALETTE = 3;
```

C++

```
COLOR_PALETTE = 3;
```

File

pngimage

Description

This is constant pngimage.COLOR_PALETTE.

56.5.4 pngimage.COLOR_RGB Constant

Pascal

```
COLOR_RGB = 2;
```

C++

```
COLOR_RGB = 2;
```

File

pngimage

Description

This is constant pngimage.COLOR_RGB.

56.5.5 pngimage.COLOR_RGBALPHA Constant

Pascal

```
COLOR_RGBALPHA = 6;
```

C++

```
COLOR_RGBALPHA = 6;
```

File

pngimage

Description

This is constant pngimage.COLOR_RGBALPHA.

56.5.6 pngimage.FILTER_AVERAGE Constant

Pascal

```
FILTER_AVERAGE = 3;
```

C++

```
FILTER_AVERAGE = 3;
```

File

pngimage

Description

This is constant pngimage.FILTER_AVERAGE.

56.5.7 pngimage.FILTER_NONE Constant

Pascal

```
FILTER_NONE = 0;
```

C++

```
FILTER_NONE = 0;
```

File

pngimage

Description

This is constant pngimage.FILTER_NONE.

56.5.8 pngimage.FILTER_PAETH Constant

Pascal

```
FILTER_PAETH = 4;
```

C++

```
FILTER_PAETH = 4;
```

File

pngimage

Description

This is constant pngimage.FILTER_PAETH.

56.5.9 pngimage.FILTER_SUB Constant

Pascal

```
FILTER_SUB = 1;
```

C++

```
FILTER_SUB = 1;
```

File

pngimage

Description

This is constant pngimage.FILTER_SUB.

56.5.10 pngimage.FILTER_UP Constant

Pascal

```
FILTER_UP = 2;
```

C++

```
FILTER_UP = 2;
```

File

pngimage

Description

This is constant pngimage.FILTER_UP.

56.5.11 pngimage.Index Constant

Pascal

```
Index: Integer]: pByteArray read GetAlphaScanline = ;
```

C++

```
Integer]: pByteArray read GetAlphaScanline Index;
```

File

pngimage

Description

This is constant pngimage.Index.

56.5.12 pngimage.LibraryVersion Constant

Pascal

```
LibraryVersion = '1.564';
```

C++

```
LibraryVersion = '1.564';
```

File

pngimage

Description

This is constant pngimage.LibraryVersion.

56.5.13 pngimage.soFromBeginning Constant

Pascal

```
soFromBeginning = 0;
```

C++

```
soFromBeginning = 0;
```

File

pngimage

Description

This is constant pngimage.soFromBeginning.

56.5.14 pngimage.soFromCurrent Constant

Pascal

```
soFromCurrent = 1;
```

C++

```
soFromCurrent = 1;
```

File

pngimage

Description

This is constant pngimage.soFromCurrent.

56.5.15 pngimage.soFromEnd Constant

Pascal

```
soFromEnd = 2;
```

C++

```
soFromEnd = 2;
```

File

pngimage

Description

This is constant pngimage.soFromEnd.

56.5.16 pngimage.Z_FINISH Constant

Pascal

```
Z_FINISH = 4;
```

C++

```
Z_FINISH = 4;
```

File

pngimage

Description

This is constant pngimage.Z_FINISH.

56.5.17 pngimage.Z_NO_FLUSH Constant

Pascal

```
Z_NO_FLUSH = 0;
```

C++

```
Z_NO_FLUSH = 0;
```

File

pngimage

Description

This is constant pngimage.Z_NO_FLUSH.

56.5.18 pngimage.Z_STREAM_END Constant

Pascal

```
Z_STREAM_END = 1;
```

C++

```
Z_STREAM_END = 1;
```

File

pngimage

Description

This is constant pngimage.Z_STREAM_END.

56.5.19 pngimage.ZLIBErrors Constant

Pascal

```
ZLIBErrors: Array[-6..2] of string = ('incompatible version (-6)', 'buffer error (-5)',
'insufficient memory (-4)', 'data error (-3)', 'stream error (-2)', 'file error (-1)', '(0)',
'stream end (1)', 'need dictionary (2)');
```

C++

```
Array[-6..2] of string ZLIBErrors = ('incompatible version (-6)', 'buffer error (-5)',
'insufficient memory (-4)', 'data error (-3)', 'stream error (-2)', 'file error (-1)', '(0)',
'stream end (1)', 'need dictionary (2)');
```

File

pngimage

Description

This is constant pngimage.ZLIBErrors.

57 Printers Namespace

This is namespace Printers.

Topics

Name	Description
Classes (see page 3038)	The following table lists classes in this documentation.
Functions (see page 3066)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3070)	The following table lists structs, records, enums in this documentation.
Types (see page 3072)	The following table lists types in this documentation.

Classes

	Name	Description
	EPrinter (see page 3038)	EPrinter is the exception class for printing errors.
	TPrinter (see page 3038)	TPrinter encapsulates the Windows printer interface.

Functions

	Name	Description
	AssignPrn (see page 3066)	Assigns a text file variable to the printer.
	Printer (see page 3066)	Returns a global instance of TPrinter (see page 3038) to manage interaction with the printer.
	SetPrinter (see page 3068)	Replaces the global instance of TPrinter (see page 3038) that manages interaction with the printer.

Structs, Records, Enums

	Name	Description
	TPrinterCapability (see page 3070)	TPrinterCapability and TPrinterCapabilities (see page 3072) specify the capabilities of a printer device driver.
	TPrinterOrientation (see page 3070)	TPrinterOrientation indicates the orientation of pages when printing.
	TPrinterState (see page 3071)	This is record Printers.TPrinterState.

Types

Name	Description
TPrinterCapabilities (see page 3072)	TPrinterCapabilities and TPrinterCapability (see page 3070) specify the capabilities of a printer device driver.

57.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EPrinter (see page 3038)	EPrinter is the exception class for printing errors.
	TPrinter (see page 3038)	TPrinter encapsulates the Windows printer interface.

57.1.1 EPrinter Class

EPrinter is the exception class for printing errors.

Class Hierarchy

Pascal

```
EPrinter = class(Exception);
```

C++

```
class EPrinter : public Exception;
```

File

Printers

Description

EPrinter is raised when a printing error occurs. For example, if an application attempts to use a printer that doesn't exist, or if a job can't be sent to the printer for some other reason, an EPrinter exception is raised.

See Also

TPrinter (see page 3038)

57.1.2 TPrinter Class

TPrinter encapsulates the Windows printer interface.

Class Hierarchy

Pascal

```
TPrinter = class(TObject);
```

C++

```
class TPrinter : public TObject;
```

File

Printers

Description

Use TPrinter to manage any printing performed by an application. Obtain an instance of TPrinter by calling the Printer (see page 3066) function in the Printers (see page 3062) unit.

To determine how the printed image of the form appears, use the PrintScale property of a TForm component.

A print job is started by a call to BeginDoc (see page 3043). The application sends commands by rendering through a Text variable or the printer's canvas. You can move to a new page by calling the NewPage (see page 3047) method. The job stays open until the application calls EndDoc (see page 3045). If a problem occurs and you need to terminate a print job that was not sent to the printer successfully, call the Abort (see page 3041) method.

Use the TPrinter properties to configure the print job. For example, the title displayed in the Print Manager (and on network header pages) is determined by the Title (see page 3065) property. Copies (see page 3054) determines the number of copies to print, and Orientation (see page 3056) lets you specify whether to print in portrait or landscape mode.

TPrinter includes several read-only properties as well, that let you determine which page is currently being printed, the fonts available on the printer, the paper size, and so on.

When creating a TPrinter descendant, you must call the SetPrinter (see page 3050) routine in order for the TPrinter descendant object to work correctly.

See Also

Printer (see page 3066)

TCustomForm

SetPrinter (see page 3068)

57.1.2.1 TPrinter Members

The following tables list the members exposed by TPrinter.

Public Methods

	Name	Description
	Abort (see page 3041)	Terminates the printing of a print job, dropping all unprinted data.
	BeginDoc (see page 3043)	Sends a print job to the printer.
	Create (see page 3040)	Creates a printer.
V	Destroy (see page 3040)	Destroys an instance of a printer.
	EndDoc (see page 3045)	Ends the current print job and closes the text file variable.
	GetPrinter (see page 3047)	Retrieves information about the current printer.
	NewPage (see page 3047)	Starts a new page and increments the PageNumber (see page 3059) property.
	Refresh (see page 3049)	Updates the Fonts (see page 3054) and Printers (see page 3062) properties.
	SetPrinter (see page 3050)	Specifies the current printer.

Public Properties

	Name	Description
R	Aborted (see page 3051)	Determines if the user aborted the print job.
R	Canvas (see page 3053)	Represents the surface of the currently printing page.
R	Capabilities (see page 3053)	Indicates the current settings of a printer device driver.
	Copies (see page 3054)	Specifies the number of copies to print.
R	Fonts (see page 3054)	Lists the fonts supported by the current printer.

R	Handle (see page 3054)	Provides access to the handle of the printer object.
	Orientation (see page 3056)	Determines if the print job prints vertically or horizontally on a page.
R	PageHeight (see page 3057)	Indicates the height (in pixels) of the currently printing page.
R	PageNumber (see page 3059)	Indicates the number of the page currently printing.
R	PageWidth (see page 3060)	Indicates the value of width (in pixels) of the currently printing page.
	PrinterIndex (see page 3062)	Specifies which printer listed in the Printers (see page 3062) property is the currently selected printer.
R	Printers (see page 3062)	Lists all printers installed in Windows.
R	Printing (see page 3062)	Indicates whether a print job is printing.
	Title (see page 3065)	Determines the text that is listed in the Print Manager and on network header pages.

57.1.2.2 TPrinter.Create Constructor

Creates a printer.

Pascal

```
constructor Create;
```

C++

```
__fastcall TPrinter();
```

Description

Never call Create directly. Create is called automatically by the Printer (see page 3066) function. Create allocates memory for a printer and calls the inherited Create. Then it sets the correct driver, device, and port.

See Also

System::TObject::Create

57.1.2.3 TPrinter.Destroy Destructor

Destroys an instance of a printer.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPrinter();
```

Description

Do not call Destroy directly. The printer object is automatically created and destroyed.

When Destroy is called, it verifies that any currently printing job has ended, then frees resources such as the handle, fonts, and canvas, closes the printer, and calls the inherited Destroy method.

See Also

System::TObject::Destroy

System::TObject::Free

57.1.2.4 TPrinter Methods

The methods of the TPrinter class are listed here.

Public Methods

	Name	Description
	Abort (see page 3041)	Terminates the printing of a print job, dropping all unprinted data.
	BeginDoc (see page 3043)	Sends a print job to the printer.
	EndDoc (see page 3045)	Ends the current print job and closes the text file variable.
	GetPrinter (see page 3047)	Retrieves information about the current printer.
	NewPage (see page 3047)	Starts a new page and increments the PageNumber (see page 3059) property.
	Refresh (see page 3049)	Updates the Fonts (see page 3054) and Printers (see page 3062) properties.
	SetPrinter (see page 3050)	Specifies the current printer.

57.1.2.4.1 TPrinter.Abort Method

Terminates the printing of a print job, dropping all unprinted data.

Pascal

```
procedure Abort;
```

C++

```
__fastcall Abort();
```

Description

Use Abort to terminate the print job before it completes; otherwise, use the EndDoc (see page 3045) method.

When Abort is called, the device is then set for the next print job.

C++ Examples:

```
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
   KeyPreview = True;

}

void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);
```

```
    Printer()->BeginDoc();
    int X = 200;
    int Y = 200;
    for (int I = 0; I <= 10; I++)
      if (!Printer()->Aborted)
      {
        Printer()->Canvas->TextOut(X, Y, Memo1->Lines->Strings[I]);
        Y = Y + 80;
        if (Y > (Printer()->PageHeight - 300))
        {
          Y = 200;
          Printer()->NewPage();
          Sleep(1000);  // to give you time to abort!
        }
      }
    if (!Printer()->Aborted) Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
end;
```

```
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

Aborted (see page 3051)

BeginDoc (see page 3043)

EndDoc (see page 3045)

Printing (see page 3062)

57.1.2.4.2 TPrinter.BeginDoc Method

Sends a print job to the printer.

Pascal

```
procedure BeginDoc;
```

C++

```
__fastcall BeginDoc();
```

Description

Call BeginDoc to initiate a print job. If the print job is sent successfully, the application calls EndDoc (see page 3045) to end the print job. The print job won't actually start printing until EndDoc (see page 3045) is called.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
```

```
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
PrintDialog1.MaxPage := PageControl1.PageCount;

EndDoc (see page 3045)

Printing (see page 3062)

57.1.2.4.3 TPrinter.EndDoc Method

Ends the current print job and closes the text file variable.

Pascal

```
procedure EndDoc;
```

C++

```
__fastcall EndDoc();
```

Description

EndDoc terminates the print job (and closes the currently open Text). The print job will begin printing on the printer after a call to EndDoc.

After the application calls EndDoc, the printer begins printing. Use EndDoc after successfully sending a print job to the printer. If the print job isn't successful, use the Abort (see page 3041) method.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.

57.1.2.4.4 TPrinter.GetPrinter Method

Retrieves information about the current printer.

Pascal

```
procedure GetPrinter(ADevice: PChar; ADriver: PChar; APort: PChar; var ADeviceMode: THandle);
```

C++

```
__fastcall GetPrinter(const char * ADevice, const char * ADriver, const char * APort, THandle
ADeviceMode);
```

Description

Call GetPrinter to obtain information about the current printer.

ADevice is a buffer that receives the device name of the current printer. This is the name that appears in the Print Manager (for example, "Epson FX-80"). It is not the printer model name.

ADriver is a buffer that receives the driver name for the current printer. Some versions of Windows do not use printer driver names, in which case this buffer is unused. On versions of Windows that support printer driver names, this is the name of a printer driver (usually 'WINSPOOL').

APort is a buffer that receives the port used by the current printer. It is not used on 32-bit versions of Windows, but is included for backward compatibility.

DeviceMode returns the handle to a memory buffer containing device-specific initialization data for the device driver. Use the GlobalLock function to convert this handle into a pointer to a DeviceMode record (Delphi) or DEVMODE structure (C++).

See Also

Printers (see page 3062)

57.1.2.4.5 TPrinter.NewPage Method

Starts a new page and increments the PageNumber (see page 3059) property.

Pascal

```
procedure NewPage;
```

C++

```
__fastcall NewPage();
```

Description

NewPage forces the current print job to begin printing on a new page in the printer.

NewPage increments the value of the PageNumber (see page 3059) property. It also resets the value of the Pen property of the Canvas (see page 3053) back to (0, 0).

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
```

```
  print dialog is displayed.  The user can select any subset
  of the pages in the page control for printing.  The selected
  pages are then printed.  To run this example successfully,
  you must add the Printers unit to the uses clause of your
  unit.  Right click on the PageControl to add at least one
  page to the PageControl.
  }
  procedure TForm1.Button1Click(Sender:TObject);
  var
    I, Start, Stop: Integer;
  begin
  PrintDialog1.Options := [poPageNums, poSelection];
  PrintDialog1.FromPage := 1;
  PrintDialog1.MinPage := 1;
  PrintDialog1.ToPage := PageControl1.PageCount;
  PrintDialog1.MaxPage := PageControl1.PageCount;

  if PrintDialog1.Execute() then
    begin
      { determine the range the user wants to print }
      with PrintDialog1 do
      begin
        if PrintRange = prAllPages then
          begin
          Start := MinPage - 1;
          Stop := MaxPage - 1;
        end
        else if PrintRange = prSelection then
        begin
          Start := PageControl1.ActivePage.PageIndex;
          Stop := Start;
          end
        else  { PrintRange = prPageNums }
        begin
          Start := FromPage - 1;
          Stop := ToPage - 1;
        end;
      end;
      { now, print the pages }
      with Printer do
      begin
        BeginDoc;
        for I := Start to Stop do
        begin
          PageControl1.Pages[I].PaintTo(Handle, 10, 10);
          if I <> Stop then
            NewPage;
        end;
        EndDoc;
      end;
    end;
  end;
```

See Also

PageNumber (see page 3059)

57.1.2.4.6 TPrinter.Refresh Method

Updates the Fonts (see page 3054) and Printers (see page 3062) properties.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the installed fonts or printers on the current system may have changed. Refresh clears the internal cache of installed fonts and printers, so that the Fonts (see page 3054) and Printers (see page 3062) properties are updated when they are next read.

See Also

Fonts (see page 3054)

Printers (see page 3062)

57.1.2.4.7 TPrinter.SetPrinter Method

Specifies the current printer.

Pascal

```
procedure SetPrinter(ADevice: PChar; ADriver: PChar; APort: PChar; ADeviceMode: THandle);
```

C++

```
__fastcall SetPrinter(const char * ADevice, const char * ADriver, const char * APort, THandle
ADeviceMode);
```

Description

Call SetPrinter to change the current printer.

ADevice specifies the device name of the new printer. This is the name that appears in the Print Manager (for example, "Epson FX-80"). It is not the printer model name.

ADriver specifies the driver name for the new printer (usually 'WINSPOOL').

APort is included for backward compatibility. It should be set to an empty string.

DeviceMode is the handle to a memory buffer device-specific initialization data for the device driver. This handle can be obtained by calling the GlobalAlloc function to allocate a DeviceMode record (Delphi) or DEVMODE structure (C++).

Printers (see page 3062)

57.1.2.5 TPrinter Properties

The properties of the TPrinter class are listed here.

Public Properties

	Name	Description
R	Aborted (see page 3051)	Determines if the user aborted the print job.
R	Canvas (see page 3053)	Represents the surface of the currently printing page.
R	Capabilities (see page 3053)	Indicates the current settings of a printer device driver.
	Copies (see page 3054)	Specifies the number of copies to print.
R	Fonts (see page 3054)	Lists the fonts supported by the current printer.
R	Handle (see page 3054)	Provides access to the handle of the printer object.
	Orientation (see page 3056)	Determines if the print job prints vertically or horizontally on a page.
R	PageHeight (see page 3057)	Indicates the height (in pixels) of the currently printing page.

R	PageNumber (see page 3059)	Indicates the number of the page currently printing.
R	PageWidth (see page 3060)	Indicates the value of width (in pixels) of the currently printing page.
	PrinterIndex (see page 3062)	Specifies which printer listed in the Printers (see page 3062) property is the currently selected printer.
R	Printers (see page 3062)	Lists all printers installed in Windows.
R	Printing (see page 3062)	Indicates whether a print job is printing.
	Title (see page 3065)	Determines the text that is listed in the Print Manager and on network header pages.

57.1.2.5.1 TPrinter.Aborted Property

Determines if the user aborted the print job.

Pascal

```
property Aborted: Boolean;
```

C++

```
__property Boolean Aborted;
```

Description

If Aborted is true, the print job was aborted. If it is false, the user did not abort the print job.

The Abort (see page 3041) method sets the Aborted property to true.

C++ Examples:

```
/*
The following code displays a dialog box if the print job
was aborted.  This code aborts a print job if the user
presses Esc. Note that you should set KeyPreview to true
to ensure that the OnKeyDown event handler of Form1 is called.
Also notice that the Button1Click routine continues to run
even after the print job has been aborted.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);

    Printer()->BeginDoc();
    int X = 200;
    int Y = 200;
    for (int I = 0; I <= 140; I++)
      if (!Printer()->Aborted)
      {
        Printer()->Canvas->TextOut(X, Y, Memo1->Lines->Strings[I]);
        Y = Y + 80;
        if (Y > (Printer()->PageHeight - 300))
        {
          Y = 200;
          Printer()->NewPage();
          Sleep(1000);  // to give you time to abort!
        }
      }
    if (!Printer()->Aborted) Printer()->EndDoc();
  }
  if (Printer()->Aborted)
    MessageDlg(
```

```
      "The print job did not finish printing",
      mtInformation, TMsgDlgButtons() << mbOK, 0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
//  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

See Also

Abort (see page 3041)

57.1.2.5.2 TPrinter.Canvas Property

Represents the surface of the currently printing page.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Canvas represents the printing surface of a page. Use the Brush, Font, and Pen properties of the Canvas object to determine how drawing or text appears on the page.

Note:

Brush

CopyRect

Draw

Font

Pen

StretchDraw

Handle

57.1.2.5.3 TPrinter.Capabilities Property

Indicates the current settings of a printer device driver.

Pascal

```
property Capabilities: TPrinterCapabilities;
```

C++

```
__property TPrinterCapabilities Capabilities;
```

Description

Capabilities contains the capabilities for the printer, indicating the orientation, number of copies, and whether or not collated is selected.

57.1.2.5.4 TPrinter.Copies Property

Specifies the number of copies to print.

Pascal

```
property Copies: Integer;
```

C++

```
__property int Copies;
```

Description

Set Copies to indicate the number of copies to print.

Copies uses the device mode to determine the number of copies to print.

57.1.2.5.5 TPrinter.Fonts Property

Lists the fonts supported by the current printer.

Pascal

```
property Fonts: TStrings;
```

C++

```
__property TStrings Fonts;
```

Description

Read Fonts to get a list of the fonts supported by the printer. Each string in Fonts is the name of a typeface.

Fonts contains TrueType fonts even if the printer doesn't support them natively because the Windows Graphics Device Interface (GDI) can draw TrueType fonts accurately when a print job uses them.

57.1.2.5.6 TPrinter.Handle Property

Provides access to the handle of the printer object.

Pascal

```
property Handle: HDC;
```

C++

```
__property HDC Handle;
```

Description

Use Handle to gain access to the handle of the printer object.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
```

```
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)

        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
```

```
PrintDialog1.MaxPage := PageControl1.PageCount;

if PrintDialog1.Execute() then
  begin
    { determine the range the user wants to print }
    with PrintDialog1 do
    begin
      if PrintRange = prAllPages then
        begin
        Start := MinPage - 1;
        Stop := MaxPage - 1;
      end
      else if PrintRange = prSelection then
      begin
        Start := PageControl1.ActivePage.PageIndex;
        Stop := Start;
        end
      else  { PrintRange = prPageNums }
      begin
        Start := FromPage - 1;
        Stop := ToPage - 1;
      end;
    end;
    { now, print the pages }
    with Printer do
    begin
      BeginDoc;
      for I := Start to Stop do
      begin
        PageControl1.Pages[I].PaintTo(Handle, 10, 10);
        if I <> Stop then
          NewPage;
      end;
      EndDoc;
    end;
  end;
end;
```

57.1.2.5.7 TPrinter.Orientation Property

Determines if the print job prints vertically or horizontally on a page.

Pascal

```
property Orientation: TPrinterOrientation;
```

C++

```
__property TPrinterOrientation Orientation;
```

Description

Use Orientation to determine if a print job prints in landscape or portrait.

C++ Examples:

```
/*
This example uses two radio buttons on a form named
Landscape and Portrait. The form also includes a button.
When the user selects an orientation by clicking one of the
radio buttons and then clicks the button to print one line
of text, the print job prints using the selected orientation:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Printer()->BeginDoc();
  Printer()->Canvas->TextOut(100,100,"Hi there!");
```

```
  Printer()->EndDoc();
}

void __fastcall TForm1::PortraitClick(TObject *Sender)
{
  Printer()->Orientation = poPortrait;
}

void __fastcall TForm1::LandscapeClick(TObject *Sender)
{
  Printer()->Orientation = poLandscape;
}
```

Delphi Examples:

```
{
This example uses two radio buttons on a form named
Landscape and Portrait. The form also includes a button.
When the user selects an orientation by clicking one of the
radio buttons and then clicks the button to print one line
of text, the print job prints using the selected orientation:
}
uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Printer.BeginDoc;
  Printer.Canvas.TextOut(100,100,'Hi there');
  Printer.EndDoc;
end;

procedure TForm1.LandscapeClick(Sender: TObject);
begin
  Printer.Orientation := poLandscape;
end;

procedure TForm1.PortraitClick(Sender: TObject);
begin
  Printer.Orientation := poPortrait;
end;
```

57.1.2.5.8 TPrinter.PageHeight Property

Indicates the height (in pixels) of the currently printing page.

Pascal

```
property PageHeight: Integer;
```

C++

```
__property int PageHeight;
```

Description

Use PageHeight to find the height in pixels of the currently printing page.

C++ Examples:

```
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
    KeyPreview = True;

}

void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);

    Printer()->BeginDoc();
    int X = 200;
    int Y = 200;
    for (int I = 0; I <= 10; I++)
      if (!Printer()->Aborted)
      {
        Printer()->Canvas->TextOut(X, Y, Memo1->Lines->Strings[I]);
        Y = Y + 80;
        if (Y > (Printer()->PageHeight - 300))
        {
          Y = 200;
          Printer()->NewPage();
          Sleep(1000);  // to give you time to abort!
        }
      }
    if (!Printer()->Aborted) Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);
```

```
    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
end;

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

PageNumber (see page 3059)

PageWidth (see page 3060)

57.1.2.5.9 TPrinter.PageNumber Property

Indicates the number of the page currently printing.

Pascal

```
property PageNumber: Integer;
```

C++

```
__property int PageNumber;
```

Description

Use PageNumber to find the page number of the currently printing page.

PageNumber is incremented whenever the NewPage (see page 3047) method is called. It is also incremented when a Text variable is written and a CR is encountered on the last line of the page.

C++ Examples:

```
/*
This example uses a button and a status bar on a form. When
the user clicks the button, one line of text is printed on
six separate pages. As each page is printed, a message
indicating the number of the page being printed appears on
the status bar.  Notice that the SimplePanel property of the
```

```
status bar to must be set to true.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  StatusBar1->SimplePanel = True; // so that SimpleText will work
  Printer()->BeginDoc();
  for (int i = 1;i < 7;i++)
  {
    Printer()->Canvas->TextOut(100, 100, "C++Builder rules!");
    StatusBar1->SimpleText = AnsiString("Printing page ") + Printer()->PageNumber;
    Printer()->NewPage();
  }
  Printer()->EndDoc();
}
```

Delphi Examples:

```
{
This example uses a button and a status bar on a form. When
the user clicks the button, one line of text is printed on
six separate pages. As each page is printed, a message
indicating the number of the page being printed appears on
the status bar.  To run this example successfully, you must
add Printers to the uses clause of your unit and set the
SimplePanel property of the status bar to true.
}
uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  StatusBar1.SimplePanel := True; { so that SimpleText will work }
  Printer.BeginDoc;
  for I := 1 to 6 do
  begin
    Printer.Canvas.TextOut(100, 100, 'Object Pascal is great');
    StatusBar1.SimpleText := 'Now printing page ' + IntToStr(Printer.PageNumber);
    Printer.NewPage;
  end;
  Printer.EndDoc;

end;
```

See Also

NewPage (see page 3047)

PageHeight (see page 3057)

PageWidth (see page 3060)

57.1.2.5.10 TPrinter.PageWidth Property

Indicates the value of width (in pixels) of the currently printing page.

Pascal

```
property PageWidth: Integer;
```

C++

```
__property int PageWidth;
```

Description

Use PageWidth to find the width in pixels of the currently printing page.

C++ Examples:

```
/*
This example uses a button and a memo on a form. When the
user clicks the button, the content of the memo is printed,
with a 200-pixel border around the page.
Note: The TMemo will wrap the lines of the text files, so to
see the TextRect clip, the memo width must be large and the
lines in the text file must be long.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Memo1->Width = 1000;
  Memo1->Lines->LoadFromFile("..\\readme.txt");
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Printer()->BeginDoc();
  int margin = 1000;
  int X = margin;
  int Y = margin;
  int I = 0;
  while(Y < Printer()->PageHeight)
  {
    Canvas->TextRect(Rect(X, Y, Printer()->PageWidth-margin, Printer()->PageHeight-margin),
                     X, Y, Memo1->Lines->Strings[I]);
    Y = Y + 100;
    I = I + 1;
  }
  Printer()->EndDoc();
}
```

Delphi Examples:

```
{
This example uses a button and a memo on a form. When the
user clicks the button, the content of the memo is printed,
with a 200-pixel border around the page. To run this example
successfully, include <Printers.hpp> in your unit file.
Note: The TMemo will wrap the lines of the text files, so to
see the TextRect clip, the memo width must be large and the
lines in the text file must be long.
}
uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  X, Y, I, margin: Integer;
begin
  with Printer do
  begin
    BeginDoc;
    margin := 1000;
    X := margin;
    Y := margin;
    I := 0;
    while(Y < PageHeight) do
    begin
      Canvas.TextRect(Rect(X, Y, PageWidth-margin, PageHeight-margin),
                      X, Y, Memo1.Lines[I]);
      Y := Y + 100;
      I := I + 1;
    end;
    EndDoc;
  end;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
begin
  Memo1.Width := 1000;
  Memo1.Lines.LoadFromFile('readme.txt');
end;
```

PageHeight (see page 3057)

PageNumber (see page 3059)

57.1.2.5.11 TPrinter.PrinterIndex Property

Specifies which printer listed in the Printers (see page 3062) property is the currently selected printer.

Pascal

```
property PrinterIndex: Integer;
```

C++

```
__property int PrinterIndex;
```

Description

The value of PrinterIndex is the currently selected printer. If this value is changed, EndDoc (see page 3045) is called automatically. To select the default printer, set the value of PrinterIndex to -1.

The list of installed printers is found in the Printers (see page 3062) property. The list of fonts supported by the current printer is found in the Fonts (see page 3054) property.

See Also

EndDoc (see page 3045)

Fonts (see page 3054)

Printers (see page 3062)

57.1.2.5.12 TPrinter.Printers Property

Lists all printers installed in Windows.

Pascal

```
property Printers: TStrings;
```

C++

```
__property TStrings Printers;
```

Description

The list of installed printers is found in the Printers property. The value of the PrinterIndex (see page 3062) property is the currently selected printer. The list of fonts supported by the current printer is found in the Fonts (see page 3054) property.

See Also

GetPrinter (see page 3047)

57.1.2.5.13 TPrinter.Printing Property

Indicates whether a print job is printing.

Pascal

```
property Printing: Boolean;
```

C++

```
__property Boolean Printing;
```

Description

Use Printing to determine if a job is printing.

Printing is true when the application has called the BeginDoc (see page 3043) method but the EndDoc (see page 3045) method (or the Abort (see page 3041) method) hasn't yet been called.

C++ Examples:

```
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
   KeyPreview = True;

}

void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);

    Printer()->BeginDoc();
    int X = 200;
    int Y = 200;
    for (int I = 0; I <= 10; I++)
      if (!Printer()->Aborted)
      {
        Printer()->Canvas->TextOut(X, Y, Memo1->Lines->Strings[I]);
        Y = Y + 80;
        if (Y > (Printer()->PageHeight - 300))
        {
          Y = 200;
          Printer()->NewPage();
          Sleep(1000);  // to give you time to abort!
        }
      }
    if (!Printer()->Aborted) Printer()->EndDoc();
```

```
  }
}
```

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
end;

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

See Also

Abort (see page 3041)

BeginDoc (see page 3043)

EndDoc (see page 3045)

57.1.2.5.14 TPrinter.Title Property

Determines the text that is listed in the Print Manager and on network header pages.

Pascal

```
property Title: string;
```

C++

```
__property UnicodeString Title;
```

Description

Title is used by Windows in the Print Manager and for network title pages.

57.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AssignPrn (see page 3066)	Assigns a text file variable to the printer.
	Printer (see page 3066)	Returns a global instance of TPrinter (see page 3038) to manage interaction with the printer.
	SetPrinter (see page 3068)	Replaces the global instance of TPrinter (see page 3038) that manages interaction with the printer.

57.2.1 Printers.AssignPrn Function

Assigns a text file variable to the printer.

Pascal

```
procedure AssignPrn(var F: Text);
```

C++

```
AssignPrn(Text F);
```

File

Printers

Description

In Delphi code, Call AssignPrn to cause all information written to the text file variable F to be directed to the printer. After the variable is assigned, the application must call the Rewrite procedure.

See Also

Rewrite

57.2.2 Printers.Printer Function

Returns a global instance of TPrinter (see page 3038) to manage interaction with the printer.

Pascal

```
function Printer: TPrinter;
```

C++

```
TPrinter Printer();
```

File

Printers

Description

Printer creates an instance of a global TPrinter (see page 3038) object the first time it is called. Use the Printer function to print

using the TPrinter (see page 3038) object.

Printer is declared in the Printers (see page 3037) unit. To use the Printer function and the TPrinter (see page 3038) object, add Printers (see page 3037) to the uses clause of your unit (Delphi) or include Printers.hpp in the source file (C++).

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
```

```
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
PrintDialog1.MaxPage := PageControl1.PageCount;

if PrintDialog1.Execute() then
  begin
    { determine the range the user wants to print }
    with PrintDialog1 do
    begin
      if PrintRange = prAllPages then
        begin
        Start := MinPage - 1;
        Stop := MaxPage - 1;
      end
      else if PrintRange = prSelection then
      begin
        Start := PageControl1.ActivePage.PageIndex;
        Stop := Start;
        end
      else  { PrintRange = prPageNums }
      begin
        Start := FromPage - 1;
        Stop := ToPage - 1;
      end;
    end;
    { now, print the pages }
    with Printer do
    begin
      BeginDoc;
      for I := Start to Stop do
      begin
        PageControl1.Pages[I].PaintTo(Handle, 10, 10);
        if I <> Stop then
          NewPage;
      end;
      EndDoc;
    end;
  end;
end;
```

See Also

SetPrinter (see page 3068)

57.2.3 Printers.SetPrinter Function

Replaces the global instance of TPrinter (see page 3038) that manages interaction with the printer.

Pascal

```
function SetPrinter(NewPrinter: TPrinter): TPrinter;
```

C++

```
TPrinter SetPrinter(TPrinter NewPrinter);
```

File

Printers

Description

SetPrinter replaces the global TPrinter (see page 3038) object with another TPrinter (see page 3038) object. This allows applications to change the way they handle printing by substituting a TPrinter (see page 3038) descendant for the default TPrinter (see page 3038) object.

NewPrinter is the new TPrinter (see page 3038) object that replaces the current global TPrinter (see page 3038) object.

SetPrinter returns the previous global TPrinter (see page 3038) object.

Note: The global TPrinter (see page 3038) object is freed automatically when the application shuts down. After a call to SetPrinter, the printer that is returned is not automatically freed. It is the caller's responsibility to either free the return value, or replace it using another call to SetPrinter and to free the substitute printer that the second SetPrinter call returns.

SetPrinter is declared in the Printers (see page 3037) unit. To use the SetPrinter function, add Printers (see page 3037) to the uses clause of your unit (Delphi) or include Printers.hpp in the source file (C++) .

Printer (see page 3066)

57.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPrinterCapability (see page 3070)	TPrinterCapability and TPrinterCapabilities (see page 3072) specify the capabilities of a printer device driver.
	TPrinterOrientation (see page 3070)	TPrinterOrientation indicates the orientation of pages when printing.
	TPrinterState (see page 3071)	This is record Printers.TPrinterState.

57.3.1 Printers.TPrinterCapability Enumeration

TPrinterCapability and TPrinterCapabilities (see page 3072) specify the capabilities of a printer device driver.

Pascal

```
TPrinterCapability = (
  pcCopies,
  pcOrientation,
  pcCollation
);
```

C++

```
enum TPrinterCapability {
  pcCopies,
  pcOrientation,
  pcCollation
};
```

File

Printers

Description

TPrinterCapabilities (see page 3072) is a set of TPrinterCapability values. The possible values of TPrinterCapability are

Value	Meaning
pcCopies	The printer driver allows the user to specify the number of copies.
pcOrientation	The printer driver allows the user to specify portrait or landscape orientation.
pcCollation	The printer driver allows the user to specify whether copies should be collated.

57.3.2 Printers.TPrinterOrientation Enumeration

TPrinterOrientation indicates the orientation of pages when printing.

Pascal

```
TPrinterOrientation = (
```

```
    poPortrait,
    poLandscape
  );
```

C++

```
  enum TPrinterOrientation {
    poPortrait,
    poLandscape
  };
```

File

Printers

Description

These are the possible values for TPrinterOrientation:

Value	Meaning
poPortrait	The job prints vertically on the page.
poLandscape	The job prints horizontally on the page.

57.3.3 Printers.TPrinterState Enumeration

Pascal

```
  TPrinterState = (
    psNoHandle,
    psHandleIC,
    psHandleDC
  );
```

C++

```
  enum TPrinterState {
    psNoHandle,
    psHandleIC,
    psHandleDC
  };
```

File

Printers

Description

This is record Printers.TPrinterState.

57.4 Types

The following table lists types in this documentation.

Types

Name	Description
TPrinterCapabilities (see page 3072)	TPrinterCapabilities and TPrinterCapability (see page 3070) specify the capabilities of a printer device driver.

57.4.1 Printers.TPrinterCapabilities Type

TPrinterCapabilities and TPrinterCapability (see page 3070) specify the capabilities of a printer device driver.

Pascal

```
TPrinterCapabilities = set of TPrinterCapability;
```

C++

```
TPrinterCapability TPrinterCapabilities;
```

File

Printers

Description

TPrinterCapabilities is a set of TPrinterCapability (see page 3070) values. The following table lists the possible values of TPrinterCapability (see page 3070).

Value	Meaning
pcCopies	The printer driver allows the user to specify the number of copies.
pcOrientation	The printer driver allows the user to specify portrait or landscape orientation.
pcCollation	The printer driver allows the user to specify whether copies should be collated.

See Also

TPrinterCapability (see page 3070)

58 Provider Namespace

This is namespace Provider.

Topics

Name	Description
Classes (see page 3075)	The following table lists classes in this documentation.
Interfaces (see page 3213)	The following table lists interfaces in this documentation.
Functions (see page 3215)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3217)	The following table lists structs, records, enums in this documentation.
Types (see page 3222)	The following table lists types in this documentation.
Variables (see page 3231)	The following table lists variables in this documentation.
Constants (see page 3232)	The following table lists constants in this documentation.

Classes

	Name	Description
	EDSWriter (see page 3075)	EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.
	TBaseProvider (see page 3077)	TBaseProvider is a base class for all providers that represent the data in a dataset.
	TCustomPacketWriter (see page 3093)	This is class Provider.TCustomPacketWriter.
	TCustomProvider (see page 3096)	TCustomProvider is the base class for data providers.
	TCustomResolver (see page 3125)	TCustomResolver is the base class for components that apply updates on behalf of a provider.
	TDataPacketWriter (see page 3136)	This is class Provider.TDataPacketWriter.
	TDataSetProvider (see page 3145)	TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.
	TDataSetResolver (see page 3176)	TDataSetResolver applies updates to a dataset on behalf of a provider.
	TLocalAppServer (see page 3182)	This is class Provider.TLocalAppServer.
	TPacketDataSet (see page 3188)	TPacketDataSet represents a data packet or delta packet that is used by a provider.
	TProvider (see page 3196)	TProvider provides data to and applies updates from a client dataset.
	TSQLResolver (see page 3196)	TSQLResolver applies updates to a database server on behalf of a provider.
	TUpdateTree (see page 3205)	TUpdateTree stores information about a delta packet on behalf of a resolver.

Constants

Name	Description
MetaDataOption (see page 3232)	Specifies the options available when retrieving metadata from a target database.

ResetOption (see page 3233)	This is constant Provider.ResetOption.
XMLOption (see page 3233)	This is constant Provider.XMLOption.
XMLUTF8Option (see page 3234)	This is constant Provider.XMLUTF8Option.

Functions

	Name	Description
	GetObjectProperty (see page 3215)	This is function Provider.GetObjectProperty.
	GetStringProperty (see page 3215)	This is function Provider.GetStringProperty.
	VarArrayFromStrings (see page 3215)	Creates a Variant array that contains the strings in a TStrings object.
	VarArrayFromWideStrings (see page 3216)	This is function Provider.VarArrayFromWideStrings.

Interfaces

	Name	Description
	IProviderContainer (see page 3213)	This is class Provider.IProviderContainer.

Structs, Records, Enums

	Name	Description
	TGetRecordOption (see page 3217)	TGetRecordOption enumerates the types of information that can be added to data packets.
	TProviderOption (see page 3218)	TProviderOption and TProviderOptions (see page 3228) influence the type of information that is communicated between client datasets and provider components.
	TPutFieldInfo (see page 3220)	TPutFieldInfo contains information about a field.
	TResolverResponse (see page 3221)	TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Types

Name	Description
PPutFieldInfo (see page 3222)	PPutFieldInfo is a pointer type to a TPutFieldInfo (see page 3220) record.
TAfterUpdateRecordEvent (see page 3223)	TAfterUpdateRecordEvent represents the type of events that occur when the associated resolver has just updated a record.
TBeforeCommitEvent (see page 3223)	TBeforeCommitEvent represents the procedure type for the events that occur before committing a data set.
TBeforeUpdateRecordEvent (see page 3224)	TBeforeUpdateRecordEvent represents the procedure type for the events that occur before a record is updated.
TDataRequestEvent (see page 3224)	Represents the function type for the events that occur when a provider calls its DataRequest method.
TGetDSProps (see page 3225)	Represents the procedure type for the events that occur when the provider adds additional information to a data packet it is creating.
TGetParamsEvent (see page 3225)	Represents the procedure type for the events that occur when the provider adds attributes to the data set.
TGetRecordOptions (see page 3226)	TGetRecordOptions is used to decide what type of information is added to data packets.
TGetTableNameEvent (see page 3226)	Represents the procedure type for the events that occur when a resolver initializes its information about the table to which it applies updates.
TInfoArray (see page 3227)	TInfoArray is an array of TPutFieldInfo (see page 3220) records.
TOnValidate (see page 3227)	Represents the procedure type for the events that occur when the provider applies updates contained in a `Delta` packet.
TProviderDataEvent (see page 3228)	Represents the procedure type for the events that occur when the provider applies updates or retrieves data.
TProviderOptions (see page 3228)	TProviderOptions influences the type of information that is communicated between client datasets and provider components.
TPutFieldProc (see page 3229)	Allows to decide the procedure used when adding a new field to a data set.
TResolverErrorEvent (see page 3230)	Represents the procedure type for the events that occur when the provider fails to update a record.

Variables

Name	Description
InformixLob (see page 3231)	Resolves Informix rather than Oracle BLOB and CLOB fields.

58.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDSWriter (see page 3075)	EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.
	TBaseProvider (see page 3077)	TBaseProvider is a base class for all providers that represent the data in a dataset.
	TCustomPacketWriter (see page 3093)	This is class Provider.TCustomPacketWriter.
	TCustomProvider (see page 3096)	TCustomProvider is the base class for data providers.
	TCustomResolver (see page 3125)	TCustomResolver is the base class for components that apply updates on behalf of a provider.
	TDataPacketWriter (see page 3136)	This is class Provider.TDataPacketWriter.
	TDataSetProvider (see page 3145)	TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.
	TDataSetResolver (see page 3176)	TDataSetResolver applies updates to a dataset on behalf of a provider.
	TLocalAppServer (see page 3182)	This is class Provider.TLocalAppServer.
	TPacketDataSet (see page 3188)	TPacketDataSet represents a data packet or delta packet that is used by a provider.
	TProvider (see page 3196)	TProvider provides data to and applies updates from a client dataset.
	TSQLResolver (see page 3196)	TSQLResolver applies updates to a database server on behalf of a provider.
	TUpdateTree (see page 3205)	TUpdateTree stores information about a delta packet on behalf of a resolver.

58.1.1 EDSWriter Class

EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.

Class Hierarchy

Pascal

```
EDSWriter = class(Exception);
```

C++

```
class EDSWriter : public Exception;
```

File

Provider

Description

EDSWriter is raised whenever a provider component encounters an error while trying to create a data packet from a dataset.

See Also

TDataSetProvider (see page 3145)

TCustomProvider (see page 3096)

58.1.1.1 EDSWriter Members

The following tables list the members exposed by EDSWriter.

Public Methods

	Name	Description
	Create (see page 3076)	Creates an instance of EDSWriter (see page 3075) using a specified error code and message string.

Public Properties

	Name	Description
	ErrorCode (see page 3076)	Indicates the error code that this exception represents.

58.1.1.2 EDSWriter.Create Constructor

Creates an instance of EDSWriter (see page 3075) using a specified error code and message string.

Pascal

```
constructor Create(ErrMsg: string; Status: Integer);
```

C++

```
__fastcall EDSWriter(UnicodeString ErrMsg, int Status);
```

Description

Create instantiates EDSWriter (see page 3075), setting the Message property to ErrMsg and the ErrorCode (see page 3076) property to Status.

See Also

Create

ErrorCode (see page 3076)

58.1.1.3 EDSWriter Properties

The properties of the EDSWriter class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 3076)	Indicates the error code that this exception represents.

58.1.1.3.1 EDSWriter.ErrorCode Property

Indicates the error code that this exception represents.

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

Use ErrorCode to determine what error gave rise to this exception. ErrorCode is the value passed to the canonical EDSWriter (

see page 3075) constructor (C++) or Create (see page 3076) method (Delphi).

See Also

Create (see page 3076)

58.1.2 TBaseProvider Class

TBaseProvider is a base class for all providers that represent the data in a dataset.

Class Hierarchy

Pascal

```
TBaseProvider = class(TCustomProvider);
```

C++

```
class TBaseProvider : public TCustomProvider;
```

File

Provider

Description

TBaseProvider is the immediate ancestor of TDataSetProvider (see page 3145), which provides data from any dataset and applies updates back to that dataset or directly to an SQL server. Use TBaseProvider to derive other customized data provider objects, such as providers that apply updates directly to a database without using SQL.

Unlike its immediate ancestor (TCustomProvider (see page 3096)) TBaseProvider includes no abstract (Delphi) or pure virtual (C++) methods. However, applications should not create instances of TBaseProvider, as many of the methods are merely stubs that provide a backstop for specialized descendants that do not implement all the provider methods. To add a provider component to a form or data module, use TDataSetProvider (see page 3145) (or TXMLTransformProvider).

A provider derived from TBaseProvider is an intermediate link between a TClientDataSet or TXMLBroker object and a source dataset. The source dataset can reside in the same application as the client dataset or XML broker, or it can be part of a separate application server. The provider packages data from the source dataset and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database or source dataset.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 3115) property must be true, and its Owner property must specify the remote data module.

TDataSetProvider (see page 3145)

IAppServer

TCustomProvider (see page 3096)

TXMLTransformProvider

TSoapDataModule

58.1.2.1 TBaseProvider Members

The following tables list the members exposed by TBaseProvider.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 3116)	Occurs after the provider applies updates.
	AfterExecute (see page 3117)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 3118)	Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.
	AfterGetRecords (see page 3118)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 3119)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 3120)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 3121)	Occurs before the provider passes an execute command to its dataset.
	BeforeGetParams (see page 3121)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 3122)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 3123)	Occurs before the provider creates a delta packet with information about the current record.
	OnValidate (see page 3125)	This is OnValidate, a member of class TCustomProvider.

Protected Methods

	Name	Description
	CheckResolver (see page 3081)	Instantiates a resolver for the Resolver (see page 3088) property if it does not already exist.
	CreateDataPacket (see page 3081)	Generates a data packet for the data associated with the provider.
	CreateResolver (see page 3082)	Creates a resolver component for handling the application of updates.
	DoAfterApplyUpdates (see page 3102)	Generates an AfterApplyUpdates (see page 3116) event.
	DoAfterExecute (see page 3102)	Generates an AfterExecute (see page 3117) event.
	DoAfterGetParams (see page 3102)	Generates an AfterGetParams (see page 3118) event.
	DoAfterGetRecords (see page 3103)	Generates an AfterGetRecords (see page 3118) event.
	DoAfterRowRequest (see page 3103)	Generates an AfterRowRequest (see page 3119) event.
	DoAfterUpdateRecord (see page 3082)	Generates an AfterUpdateRecord (see page 3090) event.
	DoApplyUpdates (see page 3104)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 3104)	Generates a BeforeApplyUpdates (see page 3120) event.
	DoBeforeCommit (see page 3082)	This is DoBeforeCommit, a member of class TBaseProvider.
	DoBeforeExecute (see page 3105)	Generates a BeforeExecute (see page 3121) event.
	DoBeforeGetParams (see page 3105)	Generates a BeforeGetParams (see page 3121) event.
	DoBeforeGetRecords (see page 3106)	Generates a BeforeGetRecords (see page 3122) event.
	DoBeforeRowRequest (see page 3106)	Generates a BeforeRowRequest (see page 3123) event.
	DoBeforeUpdateRecord (see page 3083)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.
	DoGetRecords (see page 3107)	This is DoGetRecords, a member of class TCustomProvider.
	DoOnGetData (see page 3083)	Generates an OnGetData (see page 3091) event.
	DoOnUpdateData (see page 3083)	Generates an OnUpdateData (see page 3092) event.
	FetchDetails (see page 3083)	Fills a delta dataset with all nested dataset field values.
	FreeResolver (see page 3084)	Frees the resolver specified by the Resolver (see page 3088) property.

	InternalApplyUpdates (see page 3084)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.
	InternalExecute (see page 3111)	Provides the underlying implementation of the Execute (see page 3107) method.
	InternalGetParams (see page 3111)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 3085)	Provides the underlying implementation of the GetRecords (see page 3109) method.
	InternalRowRequest (see page 3086)	Provides the underlying implementation of the RowRequest (see page 3113) method.
	LocateRecord (see page 3086)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
	SetActiveUpdateException (see page 3114)	This is SetActiveUpdateException, a member of class TCustomProvider.
	UpdateRecord (see page 3087)	Retrieves specified data from a source dataset into a delta packet.

Protected Properties

	Name	Description
	ActiveUpdateException (see page 3114)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 3115)	This is OwnerData, a member of class TCustomProvider.
	PacketDataSet (see page 3088)	This is PacketDataSet, a member of class TBaseProvider.

Public Events

	Name	Description
	AfterUpdateRecord (see page 3090)	Occurs when the associated resolver has just updated a record.
	BeforeUpdateRecord (see page 3090)	Occurs immediately before each record is applied to the remote dataset.
	OnDataRequest (see page 3091)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 3091)	Occurs after a provider retrieves data but before it is sent to the client.
	OnUpdateData (see page 3092)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 3092)	Occurs when a provider can't update a record because of an error condition.

Public Methods

	Name	Description
	ApplyUpdates (see page 3100)	This is the overview for the ApplyUpdates method overload.
	Create (see page 3079)	Creates and initializes a TBaseProvider (see page 3077) object.
	DataRequest (see page 3101)	Generates an OnDataRequest (see page 3124) event.
	Destroy (see page 3080)	Frees an instance of a provider object.
	Execute (see page 3107)	Executes a query, stored procedure, or custom SQL statement.
	GetParams (see page 3108)	Returns the current parameter values.
	GetRecords (see page 3109)	This is the overview for the GetRecords method overload.
	RowRequest (see page 3113)	Returns information from a specified record.

Public Properties

	Name	Description
	Data (see page 3115)	Denotes a data packet created by the provider.
	Exported (see page 3115)	Allows client applications to pass calls to the provider when it resides on an application server.
	Options (see page 3087)	Influences what is included in data packets and how the information in data packets is used.
	Resolver (see page 3088)	Provides access to the resolver component that applies updates and resolves update errors.
	UpdateMode (see page 3089)	Controls how the provider locates records when applying updates.

58.1.2.2 TBaseProvider.Create Constructor

Creates and initializes a TBaseProvider (see page 3077) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

AOwner specifies the component, typically a form or data module, that is responsible for freeing the provider.

See Also

Owner

58.1.2.3 TBaseProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the provider is not nil before calling the Destroy method.

See Also

System::TObject::Free

Resolver (see page 3088)

58.1.2.4 TBaseProvider Methods

The methods of the TBaseProvider class are listed here.

Protected Methods

	Name	Description
	CheckResolver (see page 3081)	Instantiates a resolver for the Resolver (see page 3088) property if it does not already exist.
V	CreateDataPacket (see page 3081)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 3082)	Creates a resolver component for handling the application of updates.
V	DoAfterUpdateRecord (see page 3082)	Generates an AfterUpdateRecord (see page 3090) event.
V	DoBeforeCommit (see page 3082)	This is DoBeforeCommit, a member of class TBaseProvider.
V	DoBeforeUpdateRecord (see page 3083)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.
V	DoOnGetData (see page 3083)	Generates an OnGetData (see page 3091) event.
V	DoOnUpdateData (see page 3083)	Generates an OnUpdateData (see page 3092) event.
V	FetchDetails (see page 3083)	Fills a delta dataset with all nested dataset field values.
	FreeResolver (see page 3084)	Frees the resolver specified by the Resolver (see page 3088) property.
V	InternalApplyUpdates (see page 3084)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.

	InternalGetRecords (see page 3085)	Provides the underlying implementation of the GetRecords (see page 3109) method.
	InternalRowRequest (see page 3086)	Provides the underlying implementation of the RowRequest (see page 3113) method.
	LocateRecord (see page 3086)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
	UpdateRecord (see page 3087)	Retrieves specified data from a source dataset into a delta packet.

58.1.2.4.1 TBaseProvider.CheckResolver Method

Instantiates a resolver for the Resolver (see page 3088) property if it does not already exist.

Pascal

```
procedure CheckResolver;
```

C++

```
__fastcall CheckResolver();
```

Description

CheckResolver is called internally when the provider needs to use its resolver component. It checks whether Resolver (see page 3088) is nil (Delphi) or NULL (C++), and if so, calls CreateResolver (see page 3082) to assign a value.

See Also

Resolver (see page 3088)

CreateResolver (see page 3082)

58.1.2.4.2 TBaseProvider.CreateDataPacket Method

Generates a data packet for the data associated with the provider.

Pascal

```
procedure CreateDataPacket(PacketOpts: TGetRecordOptions; ProvOpts: TProviderOptions; var
RecsOut: Integer; var Data: OleVariant); virtual;
```

C++

```
virtual __fastcall CreateDataPacket(TGetRecordOptions PacketOpts, TProviderOptions ProvOpts,
int RecsOut, OleVariant Data);
```

Description

CreateDataPacket is used internally to generate data packets. As implemented in TBaseProvider (see page 3077), CreateDataPacket sets RecsOut to 0 and Data (see page 3115) to NULL. Descendants override this method to create the data packets that are returned by GetRecords (see page 3109).

The PacketOpts parameter indicates what information (other than record values) is included in the data packet. It reflects the Options (see page 3087) passed to the GetRecords (see page 3109) method.

The ProvOpts parameter reflects the current value of the Options (see page 3087) property.

The RecsOut parameter specifies the number of records desired in the packet and returns the actual number of records in the generated data packet.

The Data (see page 3115) parameter returns the generated data packet.

See Also

GetRecords (see page 3109)

Options (see page 3087)

58.1.2.4.3 TBaseProvider.CreateResolver Method

Creates a resolver component for handling the application of updates.

Pascal

```
function CreateResolver: TCustomResolver; virtual;
```

C++

```
virtual __fastcall TCustomResolver CreateResolver();
```

Description

CreateResolver is called automatically when a resolver is needed to implement one of TBaseProvider (see page 3077)'s methods. As implemented in TBaseProvider (see page 3077), CreateResolver always returns nil (Delphi) or NULL (C++). Descendants of TBaseProvider (see page 3077) override this method to create a TCustomResolver (see page 3125) descendant that applies updates in the desired manner.

See Also

Resolver (see page 3088)

FreeResolver (see page 3084)

58.1.2.4.4 TBaseProvider.DoAfterUpdateRecord Method

Generates an AfterUpdateRecord (see page 3090) event.

Pascal

```
procedure DoAfterUpdateRecord(SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind:
TUpdateKind); virtual;
```

C++

```
virtual __fastcall DoAfterUpdateRecord(TDataSet SourceDS, TCustomClientDataSet DeltaDS,
TUpdateKind UpdateKind);
```

Description

DoAfterUpdateRecord is the protected implementation of the AfterUpdateRecord (see page 3090) event. Override this method to perform class-specific actions in response to data requests.

See Also

AfterUpdateRecord (see page 3090)

58.1.2.4.5 TBaseProvider.DoBeforeCommit Method

Pascal

```
procedure DoBeforeCommit(Delta: TPacketDataSet; ErrorCount: Integer; MaxErrors: Integer; const
ReturnVar: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeCommit(TPacketDataSet Delta, int ErrorCount, int MaxErrors, const
OleVariant ReturnVar);
```

Description

This is DoBeforeCommit, a member of class TBaseProvider.

58.1.2.4.6 TBaseProvider.DoBeforeUpdateRecord Method

Pascal

```
procedure DoBeforeUpdateRecord(SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind:
TUpdateKind; var Applied: Boolean); virtual;
```

C++

```
virtual __fastcall DoBeforeUpdateRecord(TDataSet SourceDS, TCustomClientDataSet DeltaDS,
TUpdateKind UpdateKind, Boolean Applied);
```

Description

This is DoBeforeUpdateRecord, a member of class TBaseProvider.

58.1.2.4.7 TBaseProvider.DoOnGetData Method

Generates an OnGetData (see page 3091) event.

Pascal

```
procedure DoOnGetData(var Data: OleVariant); virtual;
```

C++

```
virtual __fastcall DoOnGetData(OleVariant Data);
```

Description

DoOnGetData is the protected implementation of the OnGetData (see page 3091) event. Override this method to perform class-specific actions in response to data requests.

See Also

OnGetData (see page 3091)

58.1.2.4.8 TBaseProvider.DoOnUpdateData Method

Generates an OnUpdateData (see page 3092) event.

Pascal

```
procedure DoOnUpdateData(Delta: TPacketDataSet); virtual;
```

C++

```
virtual __fastcall DoOnUpdateData(TPacketDataSet Delta);
```

Description

DoOnUpdateData is the protected implementation of the OnUpdateData (see page 3092) event. The Delta property contains the delta packet of records to update. It is passed to the OnUpdateData (see page 3092) event handler as a client dataset.

Override this method to perform class-specific actions in response to update requests.

See Also

OnUpdateData (see page 3092)

58.1.2.4.9 TBaseProvider.FetchDetails Method

Fills a delta dataset with all nested dataset field values.

Pascal

```
procedure FetchDetails(Source: TDataSet; Delta: TDataSet); virtual;
```

C++

```
virtual __fastcall FetchDetails(TDataSet Source, TDataSet Delta);
```

Description

FetchDetails is used internally to fetch the current values of any nested datasets when the provider is executing its RowRequest (see page 3113) method. As implemented in TBaseProvider (see page 3077), FetchDetails does nothing. Descendants override this method to add nested detail datasets to the delta packet specified by Delta.

Source is a source dataset that has the current values for all fields. Delta is a delta dataset that must be updated so that its nested detail fields match the values in Source.

See Also

RowRequest (see page 3113)

58.1.2.4.10 TBaseProvider.FreeResolver Method

Frees the resolver specified by the Resolver (see page 3088) property.

Pascal

```
procedure FreeResolver;
```

C++

```
__fastcall FreeResolver();
```

Description

Call FreeResolver to safely dispose of the component specified by the Resolver (see page 3088) property. FreeResolver sets the Resolver (see page 3088) property to nil (Delphi) or NULL (C++) after calling the resolver's Free method.

See Also

Resolver (see page 3088)

CreateResolver (see page 3082)

System::TObject::Free

58.1.2.4.11 TBaseProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 3100) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates (see page 3100) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 3120) event and before generating the AfterApplyUpdates (see page 3116) event.

If the Options (see page 3087) property includes poReadOnly, InternalApplyUpdates raises an exception. Otherwise, it calls the ApplyUpdates (see page 3100) method of its Resolver (see page 3088) component to handle the actual update and resolving process. If the Resolver (see page 3088) property is nil (Delphi) or NULL (C++), ApplyUpdates (see page 3100) calls the CreateResolver (see page 3082) method and assigns the resulting resolver to the Resolver (see page 3088) property.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

Resolver (see page 3088)

ApplyUpdates (see page 3128)

CreateResolver (see page 3082)

Options (see page 3087)

ApplyUpdates (see page 3100)

58.1.2.4.12 TBaseProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 3109) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 3109) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 3106) to apply the CommandText and Params and generate a BeforeGetRecords (see page 3122) event. InternalGetRecords calls CreateDataPacket (see page 3081) to create a data packet that reflects the current property settings of the provider. It then generates an OnGetData (see page 3091) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options (see page 3087) indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options (see page 3087) property does not include poAllowCommandText.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure.

If the provider is associated with a table, Params specifies field values that filter the result set. On exit from GetRecords (see page 3109), Params returns any output parameters.

Records are returned as a data packet in a Variant.

See Also

Data (see page 3115)

CreateDataPacket (see page 3081)

GetRecords (see page 3109)

OnGetData (see page 3091)

58.1.2.4.13 TBaseProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 3113) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; RequestType: TFetchOptions): OleVariant;
override;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions
RequestType);
```

Description

The RowRequest (see page 3113) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 3123) event and before generating an AfterRowRequest (see page 3119) event. InternalRowRequest passes this request on to its associated Resolver (see page 3088).

The Row parameter is an OleVariant that describes the record for which information is requested. The provider uses Row to locate the record before assembling the requested information.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 3113)

Resolver (see page 3088)

RowRequest (see page 3134)

58.1.2.4.14 TBaseProvider.LocateRecord Method

Positions a data set on the record that corresponds to the current update in a specified delta packet.

Pascal

```
procedure LocateRecord(Source: TDataSet; Delta: TDataSet); virtual;
```

C++

```
virtual __fastcall LocateRecord(TDataSet Source, TDataSet Delta);
```

Description

LocateRecord is called indirectly by the RowRequest (see page 3113) method to locate a record before fetching information about a specified record. The Source parameter is the dataset containing current record values. The Delta parameter is a delta packet that identifies the desired type of information and information identifying the desired record.

As implemented in TBaseProvider (see page 3077), LocateRecord does nothing. Descendants override this method to locate the specified record in Source and navigate to it.

See Also

RowRequest (see page 3113)

58.1.2.4.15 TBaseProvider.UpdateRecord Method

Retrieves specified data from a source dataset into a delta packet.

Pascal

```
procedure UpdateRecord(Source: TDataSet; Delta: TDataSet; BlobsOnly: Boolean; KeyOnly:
Boolean); virtual;
```

C++

```
virtual __fastcall UpdateRecord(TDataSet Source, TDataSet Delta, Boolean BlobsOnly, Boolean
KeyOnly);
```

Description

UpdateRecord is called indirectly by the RowRequest (see page 3113) method to fetch BLOB fields or nested detail sets. The Source parameter is the dataset containing the BLOB fields or the detail dataset. The Delta parameter is a delta packet that returns the requested data. BlobsOnly indicates whether all field values should be provided (BlobsOnly == false) or only Blob field values (BlobsOnly == true).

As implemented in TBaseProvider (see page 3077), UpdateRecord does nothing. Descendants override this method to fill the Delta parameter with the requested information.

See Also

RowRequest (see page 3113)

58.1.2.5 TBaseProvider Properties

The properties of the TBaseProvider class are listed here.

Protected Properties

	Name	Description
	PacketDataSet (see page 3088)	This is PacketDataSet, a member of class TBaseProvider.

Public Properties

	Name	Description
	Options (see page 3087)	Influences what is included in data packets and how the information in data packets is used.
R	Resolver (see page 3088)	Provides access to the resolver component that applies updates and resolves update errors.
	UpdateMode (see page 3089)	Controls how the provider locates records when applying updates.

58.1.2.5.1 TBaseProvider.Options Property

Influences what is included in data packets and how the information in data packets is used.

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

Set Options to customize how the provider communicates with client datasets. Options is a set that specifies

Whether nested detail sets and BLOB data are included in data packets or fetched separately.

Whether data packets include field component properties such as formats, display names, and maximum & minimum values.

Whether data packets are provided on a read-only basis, and whether specific types of changes (insertions, edits, or deletions) are disabled.

Whether changes to master table fields should cause corresponding updates to detail tables.

Whether a single update can affect multiple server records.

Whether the client's records are refreshed when it applies updates.

Whether the client can send SQL statements that override the provider's dataset.

Note: Not all options are supported by an InternetExpress client. Specifically, InternetExpress clients don't support poFetchBlobsOnDemand, poFetchDetailsOnDemand, poDisableInserts, poDisableEdits, psDisableDeletes, poPropogateChanges, and poAllowCommandText.

Setting Options That Influence the Data Packets

58.1.2.5.2 TBaseProvider.PacketDataSet Property

Pascal

```
property PacketDataSet: TPacketDataSet;
```

C++

```
__property TPacketDataSet PacketDataSet;
```

Description

This is PacketDataSet, a member of class TBaseProvider.

58.1.2.5.3 TBaseProvider.Resolver Property

Provides access to the resolver component that applies updates and resolves update errors.

Pascal

```
property Resolver: TCustomResolver;
```

C++

```
__property TCustomResolver Resolver;
```

Description

Provider (see page 3073) components use a resolver to handle the details of applying updates and resolving update errors. Most applications do not need to use the resolver directly.

When any method that uses a resolver is called, the provider automatically creates a resolver component (using the CreateResolver (see page 3082) method) if the value of Resolver is nil (Delphi) or NULL (C++). Thus, this property is nil (Delphi) or NULL (C++) until the first method that requires a resolver is called.

See Also

ApplyUpdates (see page 3100)

CreateResolver (see page 3082)

58.1.2.5.4 TBaseProvider.UpdateMode Property

Controls how the provider locates records when applying updates.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

Use UpdateMode to specify the criteria for locating a record in the dataset when applying updates. UpdateMode specifies whether modified records are located based on all columns (fields), on only the key fields, or on the key fields plus the original values of fields that have been modified.

Note: To control how the provider locates records by specifying individual fields, use the field components' ProviderFlags property.

Influencing How Updates Are Applied

58.1.2.6 TBaseProvider Events

The events of the TBaseProvider class are listed here.

Public Events

	Name	Description
	AfterUpdateRecord (see page 3090)	Occurs when the associated resolver has just updated a record.
	BeforeUpdateRecord (see page 3090)	Occurs immediately before each record is applied to the remote dataset.
	OnDataRequest (see page 3091)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 3091)	Occurs after a provider retrieves data but before it is sent to the client.
	OnUpdateData (see page 3092)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 3092)	Occurs when a provider can't update a record because of an error condition.

58.1.2.6.1 TBaseProvider.AfterUpdateRecord Event

Occurs when the associated resolver has just updated a record.

Pascal

```
property AfterUpdateRecord: TAfterUpdateRecordEvent;
```

C++

```
__property TAfterUpdateRecordEvent AfterUpdateRecord;
```

Description

Write an AfterUpdateRecord event handler to provide special processing immediately after a record has been successfully updated. For example, use AfterUpdateRecord to maintain a log of successful updates.

See Also

BeforeUpdateRecord (see page 3090)

AfterApplyUpdates (see page 3116)

58.1.2.6.2 TBaseProvider.BeforeUpdateRecord Event

Occurs immediately before each record is applied to the remote dataset.

Pascal

```
property BeforeUpdateRecord: TBeforeUpdateRecordEvent;
```

C++

```
__property TBeforeUpdateRecordEvent BeforeUpdateRecord;
```

Description

Write a BeforeUpdateRecord event handler to:

Prepare individual record updates before they are applied to the source dataset or the database server. For example, you can insert additional changes into a record before it is updated or set the ProviderFlags property of the fields in the DeltaDS parameter to indicate how the provider should identify the records that are to be updated or changed and which fields should be updated.

Manually apply updates that the provider can't handle. For example, the provider can't generate the appropriate SQL when the data results from a multi-table join and more than one table must be updated. Write code in the event handler to apply the update and then set the Applied parameter to true so that the provider does not generate an error.

Selectively prevent certain updates from occurring. By setting the Applied parameter to true, the default update does not occur. When you prevent updates in this way, the provider does not generate an update error.

See Also

AfterUpdateRecord (see page 3090)

ApplyUpdates (see page 3100)

OnUpdateData (see page 3092)

OnUpdateError (see page 3092)

ProviderFlags

BeforeApplyUpdates (see page 3120)

58.1.2.6.3 TBaseProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

See Also

DataRequest (see page 3101)

IAppServer

Communicating with Providers Using Custom Events

Communicating with the Client Dataset

Responding to Client-generated Events

58.1.2.6.4 TBaseProvider.OnGetData Event

Occurs after a provider retrieves data but before it is sent to the client.

Pascal

```
property OnGetData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnGetData;
```

Description

Write an OnGetData event handler to perform any custom data processing the provider should handle before returning data to a client. The OnGetData event occurs after a provider fetches data from its dataset but before the data is sent on to the client. Using the methods of the DataSet parameter, data can be edited in the OnGetData event handler before sending it to the client dataset or XML broker.

Note: OnGetData occurs when the Data (see page 3115) property is read, as well as when the GetRecords (see page 3109) method is called.

See Also

GetRecords (see page 3109)

OnUpdateData (see page 3092)

BeforeGetRecords (see page 3122)

AfterGetRecords (see page 3118)

Responding to Client Data Requests

58.1.2.6.5 TBaseProvider.OnUpdateData Event

Occurs when a provider begins to apply updates.

Pascal

```
property OnUpdateData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnUpdateData;
```

Description

Write an OnUpdateData event to handle special processing before the provider begins applying updates received from the client dataset or XML broker. Using the methods belonging to the DataSet parameter, an application can

Examine data (for example, for values or data changes that should not permitted), and raise exceptions that cancel applying of updates before they occur.

Change data (for example encrypting or decrypting values) before it is sent on to the source dataset or database server.

ApplyUpdates (see page 3100)

BeforeUpdateRecord (see page 3090)

Adding Custom Information to Data Packets

Editing Delta Packets Before Updating the Database

Influencing How Updates Are Applied

58.1.2.6.6 TBaseProvider.OnUpdateError Event

Occurs when a provider can't update a record because of an error condition.

Pascal

```
property OnUpdateError: TResolverErrorEvent;
```

C++

```
__property TResolverErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to error conditions that arise when the provider applies a client dataset's updates. The OnUpdateError event handler is called for each record that can't be updated.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. This situation will not generate an OnUpdateError event.

58.1.3 TCustomPacketWriter Class

Class Hierarchy

Pascal

```
TCustomPacketWriter = class(TObject);
```

C++

```
class TCustomPacketWriter : public TObject;
```

File

Provider

Description

This is class Provider.TCustomPacketWriter.

58.1.3.1 TCustomPacketWriter Members

The following tables list the members exposed by TCustomPacketWriter.

Protected Fields

	Name	Description
	FBuffer (see page 3095)	This is FBuffer, a member of class TCustomPacketWriter.

Protected Methods

	Name	Description
V	AddAttribute (see page 3095)	This is AddAttribute, a member of class TCustomPacketWriter.
	Check (see page 3095)	This is Check, a member of class TCustomPacketWriter.
	SetDSWriter (see page 3096)	This is SetDSWriter, a member of class TCustomPacketWriter.

Protected Properties

	Name	Description
R	DSWriter (see page 3096)	This is DSWriter, a member of class TCustomPacketWriter.

Public Methods

	Name	Description
V	Create (see page 3094)	Constructs an object and initializes its data before the object is first used.
V	Destroy (see page 3094)	Disposes of an object instance.

58.1.3.2 TCustomPacketWriter.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TCustomPacketWriter();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy

System::TObject::Free

58.1.3.3 TCustomPacketWriter.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomPacketWriter();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

58.1.3.4 TCustomPacketWriter Fields

The fields of the TCustomPacketWriter class are listed here.

Protected Fields

	Name	Description
	FBuffer (see page 3095)	This is FBuffer, a member of class TCustomPacketWriter.

58.1.3.4.1 TCustomPacketWriter.FBuffer Field

Pascal

```
FBuffer: TBlobByteData;
```

C++

```
TBlobByteData FBuffer;
```

Description

This is FBuffer, a member of class TCustomPacketWriter.

58.1.3.5 TCustomPacketWriter Methods

The methods of the TCustomPacketWriter class are listed here.

Protected Methods

	Name	Description
V	AddAttribute (see page 3095)	This is AddAttribute, a member of class TCustomPacketWriter.
	Check (see page 3095)	This is Check, a member of class TCustomPacketWriter.
	SetDSWriter (see page 3096)	This is SetDSWriter, a member of class TCustomPacketWriter.

58.1.3.5.1 TCustomPacketWriter.AddAttribute Method

Pascal

```
procedure AddAttribute(Area: TPcktAttrArea; const ParamName: string; const Value: OleVariant;
IncludeInDelta: Boolean); virtual;
```

C++

```
virtual __fastcall AddAttribute(TPcktAttrArea Area, const UnicodeString ParamName, const
OleVariant Value, Boolean IncludeInDelta);
```

Description

This is AddAttribute, a member of class TCustomPacketWriter.

58.1.3.5.2 TCustomPacketWriter.Check Method

Pascal

```
procedure Check(Status: Integer);
```

C++

```
__fastcall Check(int Status);
```

Description

This is Check, a member of class TCustomPacketWriter.

58.1.3.5.3 TCustomPacketWriter.SetDSWriter Method

Pascal

```
procedure SetDSWriter(const Value: IDSWriter);
```

C++

```
__fastcall SetDSWriter(const IDSWriter Value);
```

Description

This is SetDSWriter, a member of class TCustomPacketWriter.

58.1.3.6 TCustomPacketWriter Properties

The properties of the TCustomPacketWriter class are listed here.

Protected Properties

	Name	Description
	DSWriter (see page 3096)	This is DSWriter, a member of class TCustomPacketWriter.

58.1.3.6.1 TCustomPacketWriter.DSWriter Property

Pascal

```
property DSWriter: IDSWriter;
```

C++

```
__property IDSWriter DSWriter;
```

Description

This is DSWriter, a member of class TCustomPacketWriter.

58.1.4 TCustomProvider Class

TCustomProvider is the base class for data providers.

Class Hierarchy

Pascal

```
TCustomProvider = class(TComponent);
```

C++

```
class TCustomProvider : public TComponent;
```

File

Provider

Description

TCustomProvider defines the fundamental properties, methods, and events required of all provider objects, either through abstract (in C++ terminology, pure virutal) method declarations, or through virtual methods that do nothing but provide a backstop.

Do not create instances of TCustomProvider. To add a provider component to a form or data module, use a descendant of TCustomProvider such as TDataSetProvider (see page 3145) or TXMLTransformProvider.

A provider derived from TCustomProvider is an intermediate link between TClientDataSet or TXMLBroker object and a source dataset or source XML document. The source dataset or XML document can reside in the same application as the client dataset or XML broker, or it can be part of a separate application server. The provider packages data from the source dataset or XML document and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database, to the source dataset, or to the source XML document.

If the provider can encode data packets in XML, it can supply data to an XML broker, which adds the data packet to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database, to the source dataset, or to the source XML document.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 3115) property must be true, and its Owner property must specify the remote data module.

TXMLTransformProvider

58.1.4.1 TCustomProvider Members

The following tables list the members exposed by TCustomProvider.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 3116)	Occurs after the provider applies updates.
	AfterExecute (see page 3117)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 3118)	Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.
	AfterGetRecords (see page 3118)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 3119)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 3120)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 3121)	Occurs before the provider passes an execute command to its dataset.
	BeforeGetParams (see page 3121)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.

	BeforeGetRecords (see page 3122)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 3123)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 3124)	Occurs when a provider calls its DataRequest (see page 3101) method.
	OnValidate (see page 3125)	This is OnValidate, a member of class TCustomProvider.

Protected Methods

	Name	Description
V	DoAfterApplyUpdates (see page 3102)	Generates an AfterApplyUpdates (see page 3116) event.
V	DoAfterExecute (see page 3102)	Generates an AfterExecute (see page 3117) event.
V	DoAfterGetParams (see page 3102)	Generates an AfterGetParams (see page 3118) event.
V	DoAfterGetRecords (see page 3103)	Generates an AfterGetRecords (see page 3118) event.
V	DoAfterRowRequest (see page 3103)	Generates an AfterRowRequest (see page 3119) event.
V	DoApplyUpdates (see page 3104)	This is DoApplyUpdates, a member of class TCustomProvider.
V	DoBeforeApplyUpdates (see page 3104)	Generates a BeforeApplyUpdates (see page 3120) event.
V	DoBeforeExecute (see page 3105)	Generates a BeforeExecute (see page 3121) event.
V	DoBeforeGetParams (see page 3105)	Generates a BeforeGetParams (see page 3121) event.
V	DoBeforeGetRecords (see page 3106)	Generates a BeforeGetRecords (see page 3122) event.
V	DoBeforeRowRequest (see page 3106)	Generates a BeforeRowRequest (see page 3123) event.
V	DoGetRecords (see page 3107)	This is DoGetRecords, a member of class TCustomProvider.
A	InternalApplyUpdates (see page 3110)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.
V	InternalExecute (see page 3111)	Provides the underlying implementation of the Execute (see page 3107) method.
V	InternalGetParams (see page 3111)	Returns the requested parameter values as a Variant array.
V	InternalGetRecords (see page 3112)	Provides the underlying implementation of the GetRecords (see page 3109) method.
V	InternalRowRequest (see page 3113)	Provides the underlying implementation of the RowRequest (see page 3113) method.
	SetActiveUpdateException (see page 3114)	This is SetActiveUpdateException, a member of class TCustomProvider.

Protected Properties

	Name	Description
R	ActiveUpdateException (see page 3114)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 3115)	This is OwnerData, a member of class TCustomProvider.

Public Methods

	Name	Description
	ApplyUpdates (see page 3100)	This is the overview for the ApplyUpdates method overload.
V	Create (see page 3099)	Creates a new TCustomProvider (see page 3096) object.
V	DataRequest (see page 3101)	Generates an OnDataRequest (see page 3124) event.
V	Destroy (see page 3099)	Frees an instance of a provider object.
V	Execute (see page 3107)	Executes a query, stored procedure, or custom SQL statement.
V	GetParams (see page 3108)	Returns the current parameter values.
	GetRecords (see page 3109)	This is the overview for the GetRecords method overload.
V	RowRequest (see page 3113)	Returns information from a specified record.

Public Properties

	Name	Description
R	Data (see page 3115)	Denotes a data packet created by the provider.
	Exported (see page 3115)	Allows client applications to pass calls to the provider when it resides on an application server.

58.1.4.2 TCustomProvider.Create Constructor

Creates a new TCustomProvider (see page 3096) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

The constructor assigns the AOwner parameter as the owner of the provider. This owner is responsible for freeing the provider when it is destroyed. If the owner is a remote data module, the constructor registers the provider with that remote data module so that it is available to client applications through the IAppServer interface.

See Also

IAppServer

Providers

RegisterProvider

Owner

58.1.4.3 TCustomProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the provider is not nil before calling its Destroy method. If the provider's Owner is a remote data module, Destroy unregisters the provider from that remote data module.

58.1.4.4 TCustomProvider Methods

The methods of the TCustomProvider class are listed here.

Protected Methods

	Name	Description
	DoAfterApplyUpdates (see page 3102)	Generates an AfterApplyUpdates (see page 3116) event.
	DoAfterExecute (see page 3102)	Generates an AfterExecute (see page 3117) event.
	DoAfterGetParams (see page 3102)	Generates an AfterGetParams (see page 3118) event.
	DoAfterGetRecords (see page 3103)	Generates an AfterGetRecords (see page 3118) event.
	DoAfterRowRequest (see page 3103)	Generates an AfterRowRequest (see page 3119) event.

	DoApplyUpdates (see page 3104)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 3104)	Generates a BeforeApplyUpdates (see page 3120) event.
	DoBeforeExecute (see page 3105)	Generates a BeforeExecute (see page 3121) event.
	DoBeforeGetParams (see page 3105)	Generates a BeforeGetParams (see page 3121) event.
	DoBeforeGetRecords (see page 3106)	Generates a BeforeGetRecords (see page 3122) event.
	DoBeforeRowRequest (see page 3106)	Generates a BeforeRowRequest (see page 3123) event.
	DoGetRecords (see page 3107)	This is DoGetRecords, a member of class TCustomProvider.
	InternalApplyUpdates (see page 3110)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.
	InternalExecute (see page 3111)	Provides the underlying implementation of the Execute (see page 3107) method.
	InternalGetParams (see page 3111)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 3112)	Provides the underlying implementation of the GetRecords (see page 3109) method.
	InternalRowRequest (see page 3113)	Provides the underlying implementation of the RowRequest (see page 3113) method.
	SetActiveUpdateException (see page 3114)	This is SetActiveUpdateException, a member of class TCustomProvider.

Public Methods

	Name	Description
	ApplyUpdates (see page 3100)	This is the overview for the ApplyUpdates method overload.
	DataRequest (see page 3101)	Generates an OnDataRequest (see page 3124) event.
	Execute (see page 3107)	Executes a query, stored procedure, or custom SQL statement.
	GetParams (see page 3108)	Returns the current parameter values.
	GetRecords (see page 3109)	This is the overview for the GetRecords method overload.
	RowRequest (see page 3113)	Returns information from a specified record.

58.1.4.4.1 ApplyUpdates Method

This is the overview for the ApplyUpdates method overload.

Overload List

	Name	Description
	TCustomProvider.ApplyUpdates (OleVariant, Integer, Integer) (see page 3100)	Applies updates received as a delta packet.
	TCustomProvider.ApplyUpdates (OleVariant, Integer, Integer, OleVariant) (see page 3100)	Applies updates received as a delta packet.

58.1.4.4.1.1 TCustomProvider.ApplyUpdates Method (OleVariant, Integer, Integer)

Applies updates received as a delta packet.

Pascal

```
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant; overload;
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer;
var OwnerData: OleVariant): OleVariant; overload;
```

C++

```
__fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int ErrorCount);
__fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int ErrorCount,
OleVariant OwnerData);
```

Description

Call ApplyUpdates to apply updates contained in a delta packet. ApplyUpdates generates a BeforeApplyUpdates (see page

3120) event, applies the updates, and then generates an AfterApplyUpdates (see page 3116) event.

Specify the delta packet as the Delta parameter.

Use the MaxErrors parameter to indicate the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

The OwnerData (see page 3115) parameter (if used) supplies custom information that is passed to the BeforeApplyUpdates (see page 3120) event handler and which returns any information supplied by that event handler.

ApplyUpdates returns a data packet (as an OleVariant) of updates that could not be applied to the database.

Note: ApplyUpdates always generates the BeforeApplyUpdates (see page 3120) and AfterApplyUpdates (see page 3116) events, even if you use the syntax that does not include an OwnerData (see page 3115) parameter. In that case, the value of OwnerData (see page 3115) is nil (Delphi) or NULL (C++) on entry to the BeforeApplyUpdates (see page 3120) event handler and is discarded on exit from the AfterApplyUpdates (see page 3116) event handler.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. This situation will not contribute to the errors counted by ErrorCount.

BeforeApplyUpdates (see page 3120)

AfterApplyUpdates (see page 3116)

AS_ApplyUpdates

ApplyUpdates

InternalApplyUpdates (see page 3110)

58.1.4.4.2 TCustomProvider.DataRequest Method

Generates an OnDataRequest (see page 3124) event.

Pascal

```
function DataRequest(Input: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DataRequest(OleVariant Input);
```

Description

Write an OnDataRequest (see page 3124) event handler and call the DataRequest function to invoke the event handler at runtime. This function and the event it invokes enable an application to perform custom processing in response to a request for data.

Note: Calling the client dataset's DataRequest method causes a call to the provider's DataRequest method.

See Also

OnDataRequest (see page 3124)

AS_DataRequest

DataRequest

Communicating with the Client Dataset

58.1.4.4.3 TCustomProvider.DoAfterApplyUpdates Method

Generates an AfterApplyUpdates (see page 3116) event.

Pascal

```
procedure DoAfterApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterApplyUpdates(OleVariant OwnerData);
```

Description

The ApplyUpdates (see page 3100) method calls DoAfterApplyUpdates to generate the AfterApplyUpdates (see page 3116) event after applying updates and resolving any update errors that are handled by the provider.

OwnerData (see page 3115) supplies custom information to the AfterApplyUpdates (see page 3116) event handler. This is the same as the outgoing OwnerData (see page 3115) parameter of the BeforeApplyUpdates (see page 3120) event handler. The AfterApplyUpdates (see page 3116) event handler can change this value. The returned value is then passed to the client if it supplied an OwnerData (see page 3115) parameter when calling ApplyUpdates (see page 3100).

See Also

ApplyUpdates (see page 3100)

AfterApplyUpdates (see page 3116)

BeforeApplyUpdates (see page 3120)

58.1.4.4.4 TCustomProvider.DoAfterExecute Method

Generates an AfterExecute (see page 3117) event.

Pascal

```
procedure DoAfterExecute(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(OleVariant OwnerData);
```

Description

The Execute (see page 3107) method calls DoAfterExecute to generate the AfterExecute (see page 3117) event after executing CommandText or the associated query or stored procedure but before fetching any output parameters.

OwnerData (see page 3115) supplies custom information to the AfterExecute (see page 3117) event handler. This is the same as the outgoing OwnerData (see page 3115) parameter of the BeforeExecute (see page 3121) event handler. The AfterExecute (see page 3117) event handler can change this value. The returned value is then passed to the client.

See Also

Execute (see page 3107)

AfterExecute (see page 3117)

BeforeExecute (see page 3121)

58.1.4.4.5 TCustomProvider.DoAfterGetParams Method

Generates an AfterGetParams (see page 3118) event.

Pascal

```
procedure DoAfterGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetParams(OleVariant OwnerData);
```

Description

The GetParams (see page 3108) method calls DoAfterGetParams to generate the AfterGetParams (see page 3118) event after fetching the current parameter values of the associated dataset.

OwnerData (see page 3115) supplies custom information to the AfterGetParams (see page 3118) event handler. This is the same as the outgoing OwnerData (see page 3115) parameter of the BeforeGetParams (see page 3121) event handler. The AfterGetParams (see page 3118) event handler can change this value. The returned value is then passed to the client.

See Also

GetParams (see page 3108)

AfterGetParams (see page 3118)

BeforeGetParams (see page 3121)

58.1.4.4.6 TCustomProvider.DoAfterGetRecords Method

Generates an AfterGetRecords (see page 3118) event.

Pascal

```
procedure DoAfterGetRecords(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetRecords(OleVariant OwnerData);
```

Description

The GetRecords (see page 3109) method calls DoAfterGetRecords to generate the AfterGetRecords (see page 3118) event after assembling a data packet but before updating the parameters to reflect any output parameters.

OwnerData (see page 3115) supplies custom information to the AfterGetRecords (see page 3118) event handler. This is the same as the outgoing OwnerData (see page 3115) parameter of the BeforeGetRecords (see page 3122) event handler. The AfterGetRecords (see page 3118) event handler can change this value. The returned value is then passed to the client.

See Also

GetRecords (see page 3109)

AfterGetRecords (see page 3118)

BeforeGetRecords (see page 3122)

58.1.4.4.7 TCustomProvider.DoAfterRowRequest Method

Generates an AfterRowRequest (see page 3119) event.

Pascal

```
procedure DoAfterRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterRowRequest(OleVariant OwnerData);
```

Description

The RowRequest (see page 3113) method calls DoAfterRowRequest to generate the AfterRowRequest (see page 3119) event after fetching the requested data.

OwnerData (see page 3115) supplies custom information to the AfterRowRequest (see page 3119) event handler. This is the same as the outgoing OwnerData (see page 3115) parameter of the BeforeRowRequest (see page 3123) event handler. The AfterRowRequest (see page 3119) event handler can change this value. The returned value is then passed to the client.

See Also

RowRequest (see page 3113)

AfterRowRequest (see page 3119)

BeforeRowRequest (see page 3123)

58.1.4.4.8 TCustomProvider.DoApplyUpdates Method

Pascal

```
function DoApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer;
var OwnerData: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DoApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount, OleVariant OwnerData);
```

Description

This is DoApplyUpdates, a member of class TCustomProvider.

58.1.4.4.9 TCustomProvider.DoBeforeApplyUpdates Method

Generates a BeforeApplyUpdates (see page 3120) event.

Pascal

```
procedure DoBeforeApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeApplyUpdates(OleVariant OwnerData);
```

Description

The ApplyUpdates (see page 3100) method calls DoBeforeApplyUpdates to generate the BeforeApplyUpdates (see page 3120) event before it applies the updates in Delta.

Delta is the delta packet containing the updates as received from the client.

MaxErrors is the number of errors tolerated before the update operation should aborted.

OwnerData (see page 3115) supplies custom information to the BeforeApplyUpdates (see page 3120) event handler. The BeforeApplyUpdates (see page 3120) event handler can change this value. The returned value is then passed to the AfterApplyUpdates (see page 3116) event handler after applying the updates in Delta.

As implemented in TCustomProvider (see page 3096), Delta and MaxErrors are ignored.

See Also

ApplyUpdates (see page 3100)

AfterApplyUpdates (see page 3116)

BeforeApplyUpdates (see page 3120)

58.1.4.4.10 TCustomProvider.DoBeforeExecute Method

Generates a BeforeExecute (see page 3121) event.

Pascal

```
procedure DoBeforeExecute(const CommandText: WideString; var Params: OleVariant; var
OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(const BSTR CommandText, OleVariant Params, OleVariant
OwnerData);
```

Description

The Execute (see page 3107) method calls DoBeforeExecute to generate the BeforeExecute (see page 3121) event before it executes CommandText or executes an associated query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params contains any parameter values that should be applied to CommandText or to the query or stored procedure before execution.

OwnerData (see page 3115) supplies custom information to the BeforeExecute (see page 3121) event handler. The event handler can change this value. The returned value is then passed to an AfterExecute (see page 3117) event handler and then returned to the caller of the Execute (see page 3107) method.

As implemented in TCustomProvider (see page 3096), CommandText and Params are ignored. Descendant classes apply these values before generating the BeforeExecute (see page 3121) event.

See Also

Execute (see page 3107)

BeforeExecute (see page 3121)

AfterExecute (see page 3117)

Options (see page 3087)

58.1.4.4.11 TCustomProvider.DoBeforeGetParams Method

Generates a BeforeGetParams (see page 3121) event.

Pascal

```
procedure DoBeforeGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetParams(OleVariant OwnerData);
```

Description

The GetParams (see page 3108) method calls DoBeforeGetParams to generate the BeforeGetParams (see page 3121) event before fetching the current parameter values of the associated dataset.

OwnerData (see page 3115) supplies custom information to the BeforeGetParams (see page 3121) event handler. The event handler can change this value. The returned value is then passed to an AfterGetParams (see page 3118) event handler

and then returned to the caller of the GetParams (see page 3108) method.

See Also

GetParams (see page 3108)

BeforeGetParams (see page 3121)

AfterGetParams (see page 3118)

58.1.4.4.12 TCustomProvider.DoBeforeGetRecords Method

Generates a BeforeGetRecords (see page 3122) event.

Pascal

```
procedure DoBeforeGetRecords(Count: Integer; Options: Integer; const CommandText: WideString;
var Params: OleVariant; var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetRecords(int Count, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

The GetRecords (see page 3109) method calls DoBeforeGetRecords to generate the BeforeGetRecords (see page 3122) event before it fetches data and assembles it into a data packet.

Count is the number of records requested. If Count is –1, all records are requested.

Options indicates whether the data packet should include metadata, whether it should start with the first record, and whether the data packet should be encoded in XML. For details, see the GetRecords (see page 3109) method.

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params contains any parameter values that should be applied to CommandText or to a query or stored procedure before fetching data into a data packet.

OwnerData (see page 3115) supplies custom information to the BeforeGetRecords (see page 3122) event handler. The event handler can change this value. The returned value is then passed to an AfterGetRecords (see page 3118) event handler and then (optionally) returned to the caller of the GetRecords (see page 3109) method.

As implemented in TCustomProvider (see page 3096), Count, Options, CommandText, and Params are ignored. Descendant classes can apply these values before generating the BeforeExecute (see page 3121) event.

See Also

GetRecords (see page 3109)

BeforeGetRecords (see page 3122)

AfterGetRecords (see page 3118)

Options (see page 3087)

58.1.4.4.13 TCustomProvider.DoBeforeRowRequest Method

Generates a BeforeRowRequest (see page 3123) event.

Pascal

```
procedure DoBeforeRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeRowRequest(OleVariant OwnerData);
```

Description

The RowRequest (see page 3113) method calls DoBeforeRowRequest to generate the BeforeRowRequest (see page 3123) event before fetching the requested data.

OwnerData (see page 3115) supplies custom information to the BeforeRowRequest (see page 3123) event handler. The event handler can change this value. The returned value is then passed to an AfterRowRequest (see page 3119) event handler and then returned to the caller of the RowRequest (see page 3113) method.

See Also

RowRequest (see page 3113)

BeforeRowRequest (see page 3123)

AfterRowRequest (see page 3119)

58.1.4.4.14 TCustomProvider.DoGetRecords Method

Pascal

```
function DoGetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const
CommandText: WideString; var Params: OleVariant; var OwnerData: OleVariant): OleVariant;
virtual;
```

C++

```
virtual __fastcall OleVariant DoGetRecords(int Count, int RecsOut, int Options, const BSTR
CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is DoGetRecords, a member of class TCustomProvider.

58.1.4.4.15 TCustomProvider.Execute Method

Executes a query, stored procedure, or custom SQL statement.

Pascal

```
procedure Execute(const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant); virtual;
```

C++

```
virtual __fastcall Execute(const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Client datasets call Execute through the AS_Execute method of the IAppServer interface. In response, the provider executes an SQL command. If the provider represents a query or stored procedure that does not return a cursor, calling Execute causes the provider to execute the query or stored procedure. If the caller supplies a value for CommandText, Execute may execute that statement instead (see below).

Before executing the appropriate command, Execute generates a BeforeExecute (see page 3121) event. After executing the command, it generates an AfterExecute (see page 3117) event. Finally, it returns any output parameters as the value of the Params parameter.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

OwnerData (see page 3115) contains custom information passed to the provider from the client dataset's BeforeExecute (see page 3121) event handler. This information is passed in to the provider's BeforeExecute (see page 3121) event handler and is returned by the provider's AfterExecute (see page 3117) event handler.

58.1.4.4.16 TCustomProvider.GetParams Method

Returns the current parameter values.

Pascal

```
function GetParams(var OwnerData: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant GetParams(OleVariant OwnerData);
```

Description

GetParams returns a variant array of variant arrays that contains the current parameter values for the provider's data source. The first array dimension is an index into all the parameter values. Its value runs from 0 to one less than the number of parameters. The second array dimension has four values: The parameter name (a Delphi string or a C++ AnsiString), the parameter data type (a TFieldType), the parameter type (a TParamType), and the parameter value (a Variant). The values in this array can be applied to a TParams object using the global UnpackParams procedure.

Before fetching the current parameter values, GetParams generates a BeforeGetParams (see page 3121) event, passing the value supplied as the OwnerData (see page 3115) parameter to the event handler. After creating the OleVariant that contains the parameter values, GetParams generates an AfterGetParams (see page 3118) event, passing in the current value of OwnerData (see page 3115). Finally, the value of OwnerData (see page 3115) returned by the AfterGetParams (see page 3118) is returned in the OwnerData (see page 3115) parameter.

58.1.4.4.17 GetRecords Method

This is the overview for the GetRecords method overload.

Overload List

	Name	Description
	TCustomProvider.GetRecords (Integer, Integer, Integer) (see page 3109)	Retrieves a data packet that represents the provider's associated data.
	TCustomProvider.GetRecords (Integer, Integer, Integer, WideString, OleVariant, OleVariant) (see page 3109)	Retrieves a data packet that represents the provider's associated data.

58.1.4.4.17.1 TCustomProvider.GetRecords Method (Integer, Integer, Integer)

Retrieves a data packet that represents the provider's associated data.

Pascal

```
function GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer): OleVariant;
overload;
function GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const CommandText:
WideString; var Params: OleVariant; var OwnerData: OleVariant): OleVariant; overload;
```

C++

```
__fastcall OleVariant GetRecords(int Count, int RecsOut, int Options);
__fastcall OleVariant GetRecords(int Count, int RecsOut, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

Call GetRecords to retrieve a data packet containing a specified number of records. GetRecords generates a BeforeGetRecords (see page 3122) event, assembles a data packet, and then generates an AfterGetRecords (see page 3118) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records in the data packet.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable, Params specifies field values that filter the result set. On exit from GetRecords, Params returns any output parameters.

OwnerData (see page 3115) contains custom information that is supplied by a client dataset's BeforeGetRecords (see page 3122) event handler. This information is passed to the provider's BeforeGetRecords (see page 3122) event handler and is returned by the provider's AfterGetRecords (see page 3118) event handler.

Records are returned as a data packet in a Variant.

Note: GetRecords always generates the BeforeGetRecords (see page 3122) and AfterGetRecords (see page 3118) events, even if you use the syntax that does not include an OwnerData (see page 3115) parameter. In that case, the value of OwnerData (see page 3115) is nil (Delphi) or NULL (C++) on entry to the BeforeGetRecords (see page 3122) event handler and is discarded on exit from the AfterGetRecords (see page 3118) event handler.

Tip: If the provider is part of a stateless application server, there is no guarantee that the provider will be positioned on the desired record before it creates a data packet. Use a BeforeGetRecords (see page 3122) event handler to position the cursor before the call to GetRecords.

Communicating with the Client Dataset

Responding to Client Data Requests

58.1.4.4.18 TCustomProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 3100) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount) = 0;
```

Description

The ApplyUpdates (see page 3100) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 3120) event and before generating the AfterApplyUpdates (see page 3116) event. The InternalApplyUpdates method of TCustomProvider (see page 3096) is abstract (Delphi) or pure virtual (C++),

meaning that it has no implementation. Descendant classes override this method to apply updates, resolve update errors, and return any updates that could not be applied.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

ApplyUpdates (see page 3100)

58.1.4.4.19 TCustomProvider.InternalExecute Method

Provides the underlying implementation of the Execute (see page 3107) method.

Pascal

```
procedure InternalExecute(const CommandText: WideString; var Params: OleVariant); virtual;
```

C++

```
virtual __fastcall InternalExecute(const BSTR CommandText, OleVariant Params);
```

Description

The Execute (see page 3107) method calls InternalExecute to execute the appropriate SQL statement after calling DoBeforeExecute (see page 3105) to generate a BeforeExecute (see page 3121) event and apply the CommandText and Params. As Implemented in TCustomProvider (see page 3096), InternalExecute does nothing. Descendants override this method to pass the execute command on to an associated dataset.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

See Also

Execute (see page 3107)

DoBeforeExecute (see page 3105)

58.1.4.4.20 TCustomProvider.InternalGetParams Method

Returns the requested parameter values as a Variant array.

Pascal

```
function InternalGetParams(Types: TParamTypes = AllParamTypes): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant InternalGetParams(TParamTypes Types = AllParamTypes);
```

Description

TCustomProvider (see page 3096) uses InternalGetParams internally whenever it needs to assemble the current parameter values into an OleVariant. This provides the underlying implementation of the GetParams (see page 3108) method, as well as

assembling parameter values for methods that return output parameters (such as Execute (see page 3107) or GetRecords (see page 3109)).

The Types parameter limits the parameter values that are returned to a subset of all possible parameter types. If this parameter is omitted, all parameter values are returned.

As implemented in TCustomProvider (see page 3096), InternalGetParams always returns NULL. Descendants override this method to return the requested parameter values.

See Also

GetParams (see page 3108)

Execute (see page 3107)

GetRecords (see page 3109)

58.1.4.4.21 TCustomProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 3109) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 3109) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 3106) to apply the CommandText and Params and generate a BeforeGetRecords (see page 3122) event. As implemented in TCustomProvider (see page 3096), InternalGetRecords always returns NULL. Descendant classes override this method to fetch the requested records and assemble them into a data packet.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable object, Params specifies field values that filter the result set. On exit from GetRecords (see page 3109), Params returns any output parameters.

Records are returned as a data packet in a Variant.

See Also

GetRecords (see page 3109)

DoBeforeGetRecords (see page 3106)

58.1.4.4.22 TCustomProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 3113) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; RequestType: TFetchOptions): OleVariant;
virtual;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions
RequestType);
```

Description

The RowRequest (see page 3113) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 3123) event and before generating an AfterRowRequest (see page 3119) event. As implemented in TCustomProvider (see page 3096), InternalRowRequest does nothing. Descendant classes override this method to assemble the requested information into an OleVariant.

The Row parameter is an OleVariant that describes the current record on the client dataset. It enables the provider to locate the record of interest.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 3113)

58.1.4.4.23 TCustomProvider.RowRequest Method

Returns information from a specified record.

Pascal

```
function RowRequest(const Row: OleVariant; RequestType: Integer; var OwnerData: OleVariant):
OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant RowRequest(const OleVariant Row, int RequestType, OleVariant
OwnerData);
```

Description

RowRequest is called automatically in response to the client dataset's FetchBlobs, FetchDetails, or RefreshRecord method. It generates a BeforeRowRequest (see page 3123) event, assembles the requested information, and generates an AfterRowRequest (see page 3119) event.

The Row parameter is an OleVariant that describes the record about which information is requested. It enables the provider to locate the record of interest.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (Its an integer because the value must be marshaled over an IAppServer interface). In Delphi, to convert the TFetchOptions value to the appropriate integer, use the Ord function. In C++, to combine TFetchOption values, use the bitwise "or" operator. For example:

```
Ord(foBlobs) + Ord(foDetails);
foBlobs || foDetails
```

RowRequest returns the requested information in a delta packet.

As implemented in TCustomProvider (see page 3096), RowRequest always returns NULL. Descendant classes override this method to return the requested data.

58.1.4.4.24 TCustomProvider.SetActiveUpdateException Method

Pascal

```
procedure SetActiveUpdateException(E: Exception);
```

C++

```
__fastcall SetActiveUpdateException(Exception E);
```

Description

This is SetActiveUpdateException, a member of class TCustomProvider.

58.1.4.5 TCustomProvider Properties

The properties of the TCustomProvider class are listed here.

Protected Properties

	Name	Description
	ActiveUpdateException (see page 3114)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 3115)	This is OwnerData, a member of class TCustomProvider.

Public Properties

	Name	Description
	Data (see page 3115)	Denotes a data packet created by the provider.
	Exported (see page 3115)	Allows client applications to pass calls to the provider when it resides on an application server.

58.1.4.5.1 TCustomProvider.ActiveUpdateException Property

Pascal

```
property ActiveUpdateException: Exception;
```

C++

```
__property Exception ActiveUpdateException;
```

Description

This is ActiveUpdateException, a member of class TCustomProvider.

58.1.4.5.2 TCustomProvider.Data Property

Denotes a data packet created by the provider.

Pascal

```
property Data: OleVariant;
```

C++

```
__property OleVariant Data;
```

Description

Data is a read-only property that provides access to a data packet containing all records. Reading Data calls GetRecords (see page 3109) with a parameter of -1.

As implemented in TCustomProvider (see page 3096), GetRecords (see page 3109) returns NULL. Descendants of TCustomProvider (see page 3096) reimplement the GetRecords (see page 3109) method to implement the Data property.

See Also

GetRecords (see page 3109)

58.1.4.5.3 TCustomProvider.Exported Property

Allows client applications to pass calls to the provider when it resides on an application server.

Pascal

```
property Exported: Boolean;
```

C++

```
__property Boolean Exported;
```

Description

Use Exported to indicate whether the provider is made available to clients of a remote data module that owns it. When Exported is true, client applications can specify the provider as a target for calls made using the IAppServer interface. When Exported is false, IAppServer calls that specify the provider cause an exception.

Note: In addition to the Exported property, the provider must be registered with the remote data module for clients to access it using the data module's IAppServer interface. When the provider's Owner is the remote data module, it is automatically registered. If the provider has a different owner, the server application must explicitly register providers using the remote data module's RegisterProvider method.

IAppServer

Providers

RegisterProvider

58.1.4.5.4 TCustomProvider.OwnerData Property

Pascal

```
property OwnerData: OleVariant;
```

C++

```
__property OleVariant OwnerData;
```

Description

This is OwnerData, a member of class TCustomProvider.

58.1.4.6 TCustomProvider Events

The events of the TCustomProvider class are listed here.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 3116)	Occurs after the provider applies updates.
	AfterExecute (see page 3117)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 3118)	Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.
	AfterGetRecords (see page 3118)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 3119)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 3120)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 3121)	Occurs before the provider passes an execute command to its dataset.
	BeforeGetParams (see page 3121)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 3122)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 3123)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 3124)	Occurs when a provider calls its DataRequest (see page 3101) method.
	OnValidate (see page 3125)	This is OnValidate, a member of class TCustomProvider.

58.1.4.6.1 TCustomProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates (see page 3120) event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeApplyUpdates (see page 3120) event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the

provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates (see page 3100) is called without the OwnerData (see page 3115) parameter, on entry to the event handler the OwnerData (see page 3115) parameter contains the value set in the BeforeApplyUpdates (see page 3120) event handler and it is ignored on exit from the AfterApplyUpdates event handler.

58.1.4.6.2 TCustomProvider.AfterExecute Event

Occurs after the provider passes an execute command to its dataset.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to return custom information to a client dataset after executing a query or stored procedure. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing queries or stored procedures that do not return a cursor. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_Execute method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeExecute (see page 3121) event, where it can respond to or change custom information that the client dataset sends.

2.The provider dispatches its Execute (see page 3107) method to execute a query or stored procedure.

3.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeExecute (see page 3121) event handler.

4.The client dataset receives an AfterExecute event, where it can respond to the custom information returned by the provider in its AfterExecute event handler.

58.1.4.6.3 TCustomProvider.AfterGetParams Event

Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

Write an AfterGetParams event handler to send custom information to a client dataset when returning parameters from the provider's dataset. AfterGetParams is part of the mechanism by which a provider and a client dataset communicate information about parameter values. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetParams method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetParams (see page 3121) event, where it can respond to or change custom information that the client dataset sends.

2.The provider looks up the parameter values, if appropriate, and encodes them in an OleVariant.

3.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeGetParams (see page 3121) event handler.

4.The client dataset receives an AfterGetParams event, where it can respond to the custom information returned by the provider in its AfterGetParams event handler.

58.1.4.6.4 TCustomProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to

communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords (see page 3122) event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeGetRecords (see page 3122) event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

58.1.4.6.5 TCustomProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest (see page 3123) event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeRowRequest (see page 3123) event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

58.1.4.6.6 TCustomProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates (see page 3100) method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData (see page 3115) parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates (see page 3116) event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates (see page 3116) event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates (see page 3116) event handler.

Note: If ApplyUpdates (see page 3100) is called without the OwnerData (see page 3115) parameter, the OwnerData (see page 3115) parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates (see page 3116) event handler but not returned to the caller.

Responding to Client Update Requests

Communicating with the Client Dataset

58.1.4.6.7 TCustomProvider.BeforeExecute Event

Occurs before the provider passes an execute command to its dataset.

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to respond to custom information from a client dataset before executing a query or stored procedure. Any parameter values supplied by the client dataset with the Execute (see page 3107) command are applied before this event.

BeforeExecute is part of the mechanism by which a provider and a client dataset communicate information when executing queries or stored procedures that do not return cursors. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's Execute (see page 3107) method is called, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeExecute event, where the OleVariant from the client dataset appears as the OwnerData (see page 3115) parameter. The provider can respond to or change that information before passing the execute command on to its dataset.

3.The provider dispatches its Execute (see page 3107) method to execute a query or stored procedure.

4.The provider receives an AfterExecute (see page 3117) event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeExecute event handler.

5.The client dataset receives an AfterExecute (see page 3117) event, where it can respond to the custom information returned by the provider in its AfterExecute (see page 3117) event handler.

58.1.4.6.8 TCustomProvider.BeforeGetParams Event

Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to respond to custom information from a client dataset. BeforeGetParams is part of the mechanism by which a provider and a client dataset communicate information during parameter fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches parameter values from the provider, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetParams event, where the OleVariant from the client dataset appears as the OwnerData (see page 3115) parameter. The provider can respond to or change that information before it fetches and encodes the parameter values.

3.The provider generates an OleVariant for the current parameter values of its dataset, if appropriate.

4.The provider receives an AfterGetParams (see page 3118) event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset receives an AfterGetParams (see page 3118) event, where it can respond to the custom information returned by the provider in its AfterGetParams (see page 3118) event handler.

Communicating with the Client Dataset

58.1.4.6.9 TCustomProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData (see page 3115) parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords (see page 3118) event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords (see page 3118) event, where it can respond to the custom information returned by the provider in its AfterGetRecords (see page 3118) event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Communicating with the Client Dataset

Responding to Client Data Requests

58.1.4.6.10 TCustomProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData (see page 3115) parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest (see page 3119) event, where it can encode custom information into its OwnerData (see page 3115) parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest (see page 3119) event, where it can respond to the custom information returned by the provider in its AfterRowRequest (see page 3119) event handler.

Communicating with the Client Dataset

58.1.4.6.11 TCustomProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest (see page 3101) method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest (see page 3101) return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

58.1.4.6.12 TCustomProvider.OnValidate Event

Pascal

```
property OnValidate: TOnValidate;
```

C++

```
__property TOnValidate OnValidate;
```

Description

This is OnValidate, a member of class TCustomProvider.

58.1.5 TCustomResolver Class

TCustomResolver is the base class for components that apply updates on behalf of a provider.

Class Hierarchy

Pascal

```
TCustomResolver = class(TComponent);
```

C++

```
class TCustomResolver : public TComponent;
```

File

Provider

Description

TCustomResolver defines the fundamental properties and methods used by resolver components for applying updates from a client dataset or XML broker and resolving errors that occur as part of that update process.

TCustomResolver has two descendants: TDataSetResolver (see page 3176), which applies updates to a dataset, and TSQLResolver (see page 3196), which applies updates directly to a database server.

Do not create resolver instances. Provider (see page 3135) components create their own TCustomResolver descendants for applying updates.

See Also

TDataSetProvider (see page 3145)

TBaseProvider (see page 3077)

TDataSetResolver (see page 3176)

TSQLResolver (see page 3196)

58.1.5.1 TCustomResolver Members

The following tables list the members exposed by TCustomResolver.

Protected Methods

	Name	Description
	BeginUpdate (see page 3128)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 3129)	Defines a method that deletes a record.
	DoInsert (see page 3129)	Defines a method that inserts a record.
	DoUpdate (see page 3129)	Defines a method that modifies a record.
	EndUpdate (see page 3130)	Provides the interface for a method that performs any finalization after applying updates.
	HandleUpdateError (see page 3131)	Manages the resolving process when errors occur while applying updates.
	InitializeConflictBuffer (see page 3131)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	LogUpdateError (see page 3133)	Adds an update that could not be resolved to the error log.
	LogUpdateRecord (see page 3134)	Adds records to the error log if their data has been changed by another application.

Public Methods

	Name	Description
	ApplyUpdates (see page 3128)	Applies updates received from a provider.
	Create (see page 3126)	Creates and initializes a resolver.
	Destroy (see page 3127)	Frees an instance of a resolver object.
	FreeTreeData (see page 3130)	Frees the internal data maintained by a TUpdateTree (see page 3205).
	InitKeyFields (see page 3132)	Sets the provider flag pfInKey on all key fields in a delta data packet.
	InitTreeData (see page 3132)	Initializes the internal data maintained by TUpdateTree (see page 3205).
	InternalBeforeResolve (see page 3133)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
	InternalUpdateRecord (see page 3133)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 3205) object.
	RowRequest (see page 3134)	Returns information from a specified record.

Public Properties

	Name	Description
	Provider (see page 3135)	Indicates the provider that uses this resolver to apply updates.
	UpdateTree (see page 3135)	This is UpdateTree, a member of class TCustomResolver.

58.1.5.2 TCustomResolver.Create Constructor

Creates and initializes a resolver.

Pascal

```
constructor Create(AProvider: TBaseProvider); reintroduce;
```

C++

```
__fastcall TCustomResolver(TBaseProvider AProvider);
```

Description

Provider (see page 3135) components call the TCustomResolver (see page 3125) constructor when they need a resolver component for applying updates. The AProvider parameter specifies the provider that creates and uses the resolver.

Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function

independently of a provider.

See Also

Resolver (see page 3088)

58.1.5.3 TCustomResolver.Destroy Destructor

Frees an instance of a resolver object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomResolver();
```

Description

Applications rarely have to destroy resolvers explicitly. Once a resolver has been assigned as the Resolver property of a provider, the provider is responsible for freeing the resolver.

See Also

System::TObject::Free

Resolver (see page 3088)

58.1.5.4 TCustomResolver Methods

The methods of the TCustomResolver class are listed here.

Protected Methods

	Name	Description
	BeginUpdate (see page 3128)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 3129)	Defines a method that deletes a record.
	DoInsert (see page 3129)	Defines a method that inserts a record.
	DoUpdate (see page 3129)	Defines a method that modifies a record.
	EndUpdate (see page 3130)	Provides the interface for a method that performs any finalization after applying updates.
	HandleUpdateError (see page 3131)	Manages the resolving process when errors occur while applying updates.
	InitializeConflictBuffer (see page 3131)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	LogUpdateError (see page 3133)	Adds an update that could not be resolved to the error log.
	LogUpdateRecord (see page 3134)	Adds records to the error log if their data has been changed by another application.

Public Methods

	Name	Description
	ApplyUpdates (see page 3128)	Applies updates received from a provider.
	FreeTreeData (see page 3130)	Frees the internal data maintained by a TUpdateTree (see page 3205).
	InitKeyFields (see page 3132)	Sets the provider flag pfInKey on all key fields in a delta data packet.
	InitTreeData (see page 3132)	Initializes the internal data maintained by TUpdateTree (see page 3205).
	InternalBeforeResolve (see page 3133)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
	InternalUpdateRecord (see page 3133)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 3205) object.

	RowRequest (see page 3134)	Returns information from a specified record.

58.1.5.4.1 TCustomResolver.ApplyUpdates Method

Applies updates received from a provider.

Pascal

```
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

Providers call ApplyUpdates to apply updates received from a client dataset or XML broker.

ApplyUpdates generates an OnUpdateData event on the associated provider, and then applies the updates passed in as the Delta parameter, returning an OleVariant that contains any updates that could not be applied.

The Delta parameter specifies a delta packet that contains the insertions, deletions, and modifications to be applied. MaxErrors indicates the maximum number of errors to permit before aborting the update operation. ErrorCount returns the actual number of errors encountered during the update operation. If ErrorCount is greater than MaxErrors, (or an OnUpdateError event returns rrAbort), all updates that have been successfully applied so far are rolled back, and the update process is aborted.

If the associated provider has an OnUpdateError event handler, it is called automatically whenever a record in Delta cannot be updated. In the OnUpdateError handler, applications can correct error conditions and try reapplying an update before returning unsuccessfully updated records back to the client dataset or XML broker.

See Also

OnUpdateData (see page 3092)

OnUpdateError (see page 3092)

ApplyUpdates (see page 3100)

58.1.5.4.2 TCustomResolver.BeginUpdate Method

Provides the interface for a method that performs any initialization before applying updates.

Pascal

```
procedure BeginUpdate; virtual;
```

C++

```
virtual __fastcall BeginUpdate();
```

Description

The ApplyUpdates (see page 3128) method calls BeginUpdate before applying updates in a delta packet.

As implemented in TCustomResolver (see page 3125), BeginUpdate does nothing. Descendants that need take specific action before applying updates override this method.

See Also

EndUpdate (see page 3130)

ApplyUpdates (see page 3128)

58.1.5.4.3 TCustomResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree) = 0;
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates (see page 3128) method. These helper methods perform the actual updates in the delta packet. ApplyUpdates (see page 3128) wraps the delta packet in a TUpdateTree (see page 3205) object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver (see page 3125) does not implement the DoDelete method. Descendants override this method to delete records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoInsert (see page 3129)

DoUpdate (see page 3129)

58.1.5.4.4 TCustomResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree) = 0;
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates (see page 3128) method. These helper methods perform the actual updates in the delta packet. ApplyUpdates (see page 3128) wraps the delta packet in a TUpdateTree (see page 3205) object. For each record that must be inserted, the resolver calls DoInsert.

TCustomResolver (see page 3125) does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoUpdate (see page 3129)

58.1.5.4.5 TCustomResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree) = 0;
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates (see page 3128) method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates (see page 3128) wraps the delta packet in a TUpdateTree (see page 3205) object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver (see page 3125) does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoInsert (see page 3129)

58.1.5.4.6 TCustomResolver.EndUpdate Method

Provides the interface for a method that performs any finalization after applying updates.

Pascal

```
procedure EndUpdate; virtual;
```

C++

```
virtual __fastcall EndUpdate();
```

Description

The ApplyUpdates (see page 3128) method calls EndUpdate after applying updates.

As implemented in TCustomResolver (see page 3125), EndUpdate does nothing. Descendants that need take specific action after applying updates override this method.

See Also

BeginUpdate (see page 3128)

ApplyUpdates (see page 3128)

58.1.5.4.7 TCustomResolver.FreeTreeData Method

Frees the internal data maintained by a TUpdateTree (see page 3205).

Pascal

```
procedure FreeTreeData(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall FreeTreeData(TUpdateTree Tree);
```

Description

The ApplyUpdates (see page 3128) method wraps delta packets in a TUpdateTree (see page 3205) object. The TUpdateTree (see page 3205) stores the delta packet, along with information that the resolver uses when applying updates.

This information varies, depending on the class of resolver.

FreeTreeData is called internally just before the resolver's TUpdateTree (see page 3205) object is freed. As implemented in TCustomResolver (see page 3125), FreeTreeData does nothing. Descendants override this method if any specific action is required to free the resolver-specific information that is stored in the update tree.

See Also

ApplyUpdates (see page 3128)

InitTreeData (see page 3132)

58.1.5.4.8 TCustomResolver.HandleUpdateError Method

Manages the resolving process when errors occur while applying updates.

Pascal

```
function HandleUpdateError(Tree: TUpdateTree; E: EUpdateError; var MaxErrors: Integer; var
ErrorCount: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean HandleUpdateError(TUpdateTree Tree, EUpdateError E, int MaxErrors,
int ErrorCount);
```

Description

When a resolver encounters errors in applying updates, it calls HandleUpdateError to determine how to proceed. HandleUpdateError generates an OnUpdateError event on the associated provider so that applications have an opportunity to correct update errors. Depending on the response provided by the OnUpdateError handler (if any), HandleUpdateError logs the unresolved error or signals that the resolver should try to apply the (corrected) record again.

The Tree parameter specifies the TUpdateTree (see page 3205) that wraps all the updates currently being applied. The MaxErrors parameter indicates the maximum number of errors that the resolver will tolerate before the update operation is rolled back. The ErrorCount parameter specifies how many errors have been encountered so far.

HandleUpdateError returns true if the record has been corrected and the resolver should try to reapply the update. It returns false if the record is added to the error log.

See Also

OnUpdateError (see page 3092)

ApplyUpdates (see page 3128)

58.1.5.4.9 TCustomResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree) = 0;
```

Description

The HandleUpdateError (see page 3131) method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver (see page 3125) implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 3131)

OnUpdateError (see page 3092)

58.1.5.4.10 TCustomResolver.InitKeyFields Method

Sets the provider flag pfInKey on all key fields in a delta data packet.

Pascal

```
procedure InitKeyFields(Tree: TUpdateTree; ADelta: TPacketDataSet); virtual;
```

C++

```
virtual __fastcall InitKeyFields(TUpdateTree Tree, TPacketDataSet ADelta);
```

Description

InitKeyFields is used internally to mark fields from a delta packet that can be used to uniquely identify records in the underlying dataset.

The Tree parameter is the internal TUpdateTree (see page 3205) that the resolver uses to store information about the delta packet. The ADelta parameter is the delta packet of changes to apply. For every field in this delta packet that acts as a key value to uniquely identify records, InitKeyFields adds pfInKey to its ProviderFlags property.

See Also

ProviderFlags

58.1.5.4.11 TCustomResolver.InitTreeData Method

Initializes the internal data maintained by TUpdateTree (see page 3205).

Pascal

```
procedure InitTreeData(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall InitTreeData(TUpdateTree Tree);
```

Description

The ApplyUpdates (see page 3128) method wraps delta packets in a TUpdateTree (see page 3205) object. The TUpdateTree (see page 3205) stores the delta packet, along with information that the resolver uses when applying updates. This information varies, depending on the class of resolver.

InitTreeData is called internally when the resolver's TUpdateTree (see page 3205) object is created. As implemented in TCustomResolver (see page 3125), InitTreeData does nothing. Descendants override this method to store any class-specific information that they use when applying updates.

See Also

ApplyUpdates (see page 3128)

FreeTreeData (see page 3130)

58.1.5.4.12 TCustomResolver.InternalBeforeResolve Method

Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

Pascal

```
procedure InternalBeforeResolve(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall InternalBeforeResolve(TUpdateTree Tree);
```

Description

The ApplyUpdates (see page 3128) method wraps delta packets in a TUpdateTree (see page 3205) object. Once this is complete, InternalBeforeResolve performs any other initialization before the updates are applied.

As implemented in TCustomResolver (see page 3125), InternalBeforeResolve does nothing. Descendants override this method to perform class-specific initialization.

See Also

ApplyUpdates (see page 3128)

InitTreeData (see page 3132)

58.1.5.4.13 TCustomResolver.InternalUpdateRecord Method

Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 3205) object.

Pascal

```
function InternalUpdateRecord(Tree: TUpdateTree): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean InternalUpdateRecord(TUpdateTree Tree);
```

Description

InternalUpdateRecord orchestrates the updating process, ensuring that updates are applied in the correct order and that errors are resolved or logged. For each record that must be updated, InternalUpdateRecord

1.Generates a BeforeUpdateRecord event.

2.Applies the update.

3.Generates an AfterUpdateRecord event if the update is successful, or calls HandleUpdateError (see page 3131) to generate an OnUpdateError event.

See Also

ApplyUpdates (see page 3128)

BeforeUpdateRecord (see page 3090)

AfterUpdateRecord (see page 3090)

OnUpdateError (see page 3092)

HandleUpdateError (see page 3131)

58.1.5.4.14 TCustomResolver.LogUpdateError Method

Adds an update that could not be resolved to the error log.

Pascal

```
procedure LogUpdateError(Tree: TUpdateTree; E: EUpdateError; Response: TResolverResponse);
virtual;
```

C++

```
virtual __fastcall LogUpdateError(TUpdateTree Tree, EUpdateError E, TResolverResponse
Response);
```

Description

When the HandleUpdateError (see page 3131) method can't resolve an update conflict, it calls LogUpdateError to add the unapplied update to the error log. This error log is eventually returned by the ApplyUpdates (see page 3128) method when the update operation ends.

The Tree parameter represents the set of updates in the delta packet. The E parameter is the EUpdateError exception that represents the current update error. The Response parameter is rrSkip if the update process should continue after the update is logged, and rrAbort if the entire update operation should be rolled back. LogUpdateError is never called with Response set to any other value.

See Also

HandleUpdateError (see page 3131)

OnUpdateError (see page 3092)

58.1.5.4.15 TCustomResolver.LogUpdateRecord Method

Adds records to the error log if their data has been changed by another application.

Pascal

```
procedure LogUpdateRecord(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall LogUpdateRecord(TUpdateTree Tree);
```

Description

When the InternalUpdateRecord (see page 3133) method detects that a record includes other changes than those specified by an update in the delta packet, it calls LogUpdateRecord to add the changed and updated record to the error log so that the client dataset or XML broker can refresh the updated record. This error log is eventually returned by the ApplyUpdates (see page 3128) method when the update operation ends.

The Tree parameter represents the set of updates being applied.

See Also

LogUpdateError (see page 3133)

InternalUpdateRecord (see page 3133)

58.1.5.4.16 TCustomResolver.RowRequest Method

Returns information from a specified record.

Pascal

```
function RowRequest(Row: OleVariant; Options: TFetchOptions): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant RowRequest(OleVariant Row, TFetchOptions Options);
```

Description

RowRequest is called automatically in response to the associated provider's RowRequest method.

The Row parameter is an OleVariant that describes the record about which information is requested. The resolver uses this to locate the desired record.

The requested information is returned as a delta packet.

See Also

RowRequest (see page 3113)

58.1.5.5 TCustomResolver Properties

The properties of the TCustomResolver class are listed here.

Public Properties

	Name	Description
	Provider (see page 3135)	Indicates the provider that uses this resolver to apply updates.
	UpdateTree (see page 3135)	This is UpdateTree, a member of class TCustomResolver.

58.1.5.5.1 TCustomResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TBaseProvider;
```

C++

```
__property TBaseProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

See Also

Create (see page 3126)

58.1.5.5.2 TCustomResolver.UpdateTree Property

Pascal

```
property UpdateTree: TUpdateTree;
```

C++

```
__property TUpdateTree UpdateTree;
```

Description

This is UpdateTree, a member of class TCustomResolver.

58.1.6 TDataPacketWriter Class

Class Hierarchy

Pascal

```
TDataPacketWriter = class(TCustomPacketWriter);
```

C++

```
class TDataPacketWriter : public TCustomPacketWriter;
```

File

Provider

Description

This is class Provider.TDataPacketWriter.

58.1.6.1 TDataPacketWriter Members

The following tables list the members exposed by TDataPacketWriter.

Protected Fields

	Name	Description
	FBuffer (see page 3095)	This is FBuffer, a member of class TCustomPacketWriter.

Protected Methods

	Name	Description
V	AddAttribute (see page 3095)	This is AddAttribute, a member of class TCustomPacketWriter.
V	AddColumn (see page 3138)	This is AddColumn, a member of class TDataPacketWriter.
V	AddConstraints (see page 3138)	This is AddConstraints, a member of class TDataPacketWriter.
V	AddDataSetAttributes (see page 3139)	This is AddDataSetAttributes, a member of class TDataPacketWriter.
	AddExtraFieldProps (see page 3139)	This is AddExtraFieldProps, a member of class TDataPacketWriter.
V	AddFieldLinks (see page 3139)	This is AddFieldLinks, a member of class TDataPacketWriter.
V	AddIndexDefs (see page 3139)	This is AddIndexDefs, a member of class TDataPacketWriter.
	Check (see page 3095)	This is Check, a member of class TCustomPacketWriter.
	FreeInfoRecords (see page 3140)	This is FreeInfoRecords, a member of class TDataPacketWriter.
	GetFieldIdx (see page 3140)	This is GetFieldIdx, a member of class TDataPacketWriter.
	InitPutProcs (see page 3140)	This is InitPutProcs, a member of class TDataPacketWriter.
	PutADTField (see page 3140)	This is PutADTField, a member of class TDataPacketWriter.
	PutArrayField (see page 3141)	This is PutArrayField, a member of class TDataPacketWriter.
	PutBlobField (see page 3141)	This is PutBlobField, a member of class TDataPacketWriter.
	PutCalcField (see page 3141)	This is PutCalcField, a member of class TDataPacketWriter.
	PutDataSetField (see page 3141)	This is PutDataSetField, a member of class TDataPacketWriter.
	PutField (see page 3142)	This is PutField, a member of class TDataPacketWriter.
	PutStringField (see page 3142)	This is PutStringField, a member of class TDataPacketWriter.
	PutVarBytesField (see page 3142)	This is PutVarBytesField, a member of class TDataPacketWriter.
	PutWideStringField (see page 3142)	This is PutWideStringField, a member of class TDataPacketWriter.
	RefreshPutProcs (see page 3142)	This is RefreshPutProcs, a member of class TDataPacketWriter.
	SetDSWriter (see page 3096)	This is SetDSWriter, a member of class TCustomPacketWriter.
V	WriteDataSet (see page 3143)	This is WriteDataSet, a member of class TDataPacketWriter.

	WriteMetaData (see page 3143)	This is WriteMetaData, a member of class TDataPacketWriter.

Protected Properties

	Name	Description
	DSWriter (see page 3096)	This is DSWriter, a member of class TCustomPacketWriter.

Public Events

	Name	Description
	OnGetParams (see page 3144)	This is OnGetParams, a member of class TDataPacketWriter.

Public Methods

	Name	Description
	Create (see page 3094)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 3137)	Disposes of an object instance.
	GetDataPacket (see page 3140)	This is GetDataPacket, a member of class TDataPacketWriter.
	Reset (see page 3143)	This is Reset, a member of class TDataPacketWriter.

Public Properties

	Name	Description
	Constraints (see page 3144)	This is Constraints, a member of class TDataPacketWriter.
	Options (see page 3144)	This is Options, a member of class TDataPacketWriter.
	PacketOptions (see page 3144)	This is PacketOptions, a member of class TDataPacketWriter.

58.1.6.2 TDataPacketWriter.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataPacketWriter();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free

58.1.6.3 TDataPacketWriter Methods

The methods of the TDataPacketWriter class are listed here.

Protected Methods

	Name	Description
	AddColumn (see page 3138)	This is AddColumn, a member of class TDataPacketWriter.
	AddConstraints (see page 3138)	This is AddConstraints, a member of class TDataPacketWriter.
	AddDataSetAttributes (see page 3139)	This is AddDataSetAttributes, a member of class TDataPacketWriter.
	AddExtraFieldProps (see page 3139)	This is AddExtraFieldProps, a member of class TDataPacketWriter.
	AddFieldLinks (see page 3139)	This is AddFieldLinks, a member of class TDataPacketWriter.
	AddIndexDefs (see page 3139)	This is AddIndexDefs, a member of class TDataPacketWriter.
	FreeInfoRecords (see page 3140)	This is FreeInfoRecords, a member of class TDataPacketWriter.
	GetFieldIdx (see page 3140)	This is GetFieldIdx, a member of class TDataPacketWriter.
	InitPutProcs (see page 3140)	This is InitPutProcs, a member of class TDataPacketWriter.
	PutADTField (see page 3140)	This is PutADTField, a member of class TDataPacketWriter.
	PutArrayField (see page 3141)	This is PutArrayField, a member of class TDataPacketWriter.
	PutBlobField (see page 3141)	This is PutBlobField, a member of class TDataPacketWriter.
	PutCalcField (see page 3141)	This is PutCalcField, a member of class TDataPacketWriter.
	PutDataSetField (see page 3141)	This is PutDataSetField, a member of class TDataPacketWriter.
	PutField (see page 3142)	This is PutField, a member of class TDataPacketWriter.
	PutStringField (see page 3142)	This is PutStringField, a member of class TDataPacketWriter.
	PutVarBytesField (see page 3142)	This is PutVarBytesField, a member of class TDataPacketWriter.
	PutWideStringField (see page 3142)	This is PutWideStringField, a member of class TDataPacketWriter.
	RefreshPutProcs (see page 3142)	This is RefreshPutProcs, a member of class TDataPacketWriter.
	WriteDataSet (see page 3143)	This is WriteDataSet, a member of class TDataPacketWriter.
	WriteMetaData (see page 3143)	This is WriteMetaData, a member of class TDataPacketWriter.

Public Methods

	Name	Description
	GetDataPacket (see page 3140)	This is GetDataPacket, a member of class TDataPacketWriter.
	Reset (see page 3143)	This is Reset, a member of class TDataPacketWriter.

58.1.6.3.1 TDataPacketWriter.AddColumn Method

Pascal

```
procedure AddColumn(const Info: TPutFieldInfo); virtual;
```

C++

```
virtual __fastcall AddColumn(const TPutFieldInfo Info);
```

Description

This is AddColumn, a member of class TDataPacketWriter.

58.1.6.3.2 TDataPacketWriter.AddConstraints Method

Pascal

```
procedure AddConstraints(DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall AddConstraints(TDataSet DataSet);
```

Description

This is AddConstraints, a member of class TDataPacketWriter.

58.1.6.3.3 TDataPacketWriter.AddDataSetAttributes Method

Pascal

```
procedure AddDataSetAttributes(DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall AddDataSetAttributes(TDataSet DataSet);
```

Description

This is AddDataSetAttributes, a member of class TDataPacketWriter.

58.1.6.3.4 TDataPacketWriter.AddExtraFieldProps Method

Pascal

```
procedure AddExtraFieldProps(Field: TField);
```

C++

```
__fastcall AddExtraFieldProps(TField Field);
```

Description

This is AddExtraFieldProps, a member of class TDataPacketWriter.

58.1.6.3.5 TDataPacketWriter.AddFieldLinks Method

Pascal

```
procedure AddFieldLinks(const Info: TInfoArray); virtual;
```

C++

```
virtual __fastcall AddFieldLinks(const TInfoArray Info);
```

Description

This is AddFieldLinks, a member of class TDataPacketWriter.

58.1.6.3.6 TDataPacketWriter.AddIndexDefs Method

Pascal

```
procedure AddIndexDefs(DataSet: TDataSet; const Info: TInfoArray); virtual;
```

C++

```
virtual __fastcall AddIndexDefs(TDataSet DataSet, const TInfoArray Info);
```

Description

This is AddIndexDefs, a member of class TDataPacketWriter.

58.1.6.3.7 TDataPacketWriter.FreeInfoRecords Method

Pascal

```
procedure FreeInfoRecords(var Info: TInfoArray);
```

C++

```
__fastcall FreeInfoRecords(TInfoArray Info);
```

Description

This is FreeInfoRecords, a member of class TDataPacketWriter.

58.1.6.3.8 TDataPacketWriter.GetDataPacket Method

Pascal

```
procedure GetDataPacket(DataSet: TDataSet; var RecsOut: Integer; out Data: OleVariant);
virtual;
```

C++

```
virtual __fastcall GetDataPacket(TDataSet DataSet, int RecsOut, OleVariant Data);
```

Description

This is GetDataPacket, a member of class TDataPacketWriter.

58.1.6.3.9 TDataPacketWriter.GetFieldIdx Method

Pascal

```
function GetFieldIdx(const FieldName: WideString; const Info: TInfoArray): Integer;
```

C++

```
__fastcall int GetFieldIdx(const BSTR FieldName, const TInfoArray Info);
```

Description

This is GetFieldIdx, a member of class TDataPacketWriter.

58.1.6.3.10 TDataPacketWriter.InitPutProcs Method

Pascal

```
function InitPutProcs(ADataSet: TDataSet; var GlobalIdx: Integer): TInfoArray;
```

C++

```
__fastcall TInfoArray InitPutProcs(TDataSet ADataSet, int GlobalIdx);
```

Description

This is InitPutProcs, a member of class TDataPacketWriter.

58.1.6.3.11 TDataPacketWriter.PutADTField Method

Pascal

```
procedure PutADTField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutADTField(PPutFieldInfo Info);
```

Description

This is PutADTField, a member of class TDataPacketWriter.

58.1.6.3.12 TDataPacketWriter.PutArrayField Method

Pascal

```
procedure PutArrayField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutArrayField(PPutFieldInfo Info);
```

Description

This is PutArrayField, a member of class TDataPacketWriter.

58.1.6.3.13 TDataPacketWriter.PutBlobField Method

Pascal

```
procedure PutBlobField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutBlobField(PPutFieldInfo Info);
```

Description

This is PutBlobField, a member of class TDataPacketWriter.

58.1.6.3.14 TDataPacketWriter.PutCalcField Method

Pascal

```
procedure PutCalcField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutCalcField(PPutFieldInfo Info);
```

Description

This is PutCalcField, a member of class TDataPacketWriter.

58.1.6.3.15 TDataPacketWriter.PutDataSetField Method

Pascal

```
procedure PutDataSetField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutDataSetField(PPutFieldInfo Info);
```

Description

This is PutDataSetField, a member of class TDataPacketWriter.

58.1.6.3.16 TDataPacketWriter.PutField Method

Pascal

```
procedure PutField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutField(PPutFieldInfo Info);
```

Description

This is PutField, a member of class TDataPacketWriter.

58.1.6.3.17 TDataPacketWriter.PutStringField Method

Pascal

```
procedure PutStringField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutStringField(PPutFieldInfo Info);
```

Description

This is PutStringField, a member of class TDataPacketWriter.

58.1.6.3.18 TDataPacketWriter.PutVarBytesField Method

Pascal

```
procedure PutVarBytesField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutVarBytesField(PPutFieldInfo Info);
```

Description

This is PutVarBytesField, a member of class TDataPacketWriter.

58.1.6.3.19 TDataPacketWriter.PutWideStringField Method

Pascal

```
procedure PutWideStringField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutWideStringField(PPutFieldInfo Info);
```

Description

This is PutWideStringField, a member of class TDataPacketWriter.

58.1.6.3.20 TDataPacketWriter.RefreshPutProcs Method

Pascal

```
procedure RefreshPutProcs(ADataSet: TDataSet; var Info: TInfoArray);
```

C++

```
__fastcall RefreshPutProcs(TDataSet ADataSet, TInfoArray Info);
```

Description

This is RefreshPutProcs, a member of class TDataPacketWriter.

58.1.6.3.21 TDataPacketWriter.Reset Method

Pascal

```
procedure Reset;
```

C++

```
__fastcall Reset();
```

Description

This is Reset, a member of class TDataPacketWriter.

58.1.6.3.22 TDataPacketWriter.WriteDataSet Method

Pascal

```
function WriteDataSet(DataSet: TDataSet; var Info: TInfoArray; RecsOut: Integer): Integer;
virtual;
```

C++

```
virtual __fastcall int WriteDataSet(TDataSet DataSet, TInfoArray Info, int RecsOut);
```

Description

This is WriteDataSet, a member of class TDataPacketWriter.

58.1.6.3.23 TDataPacketWriter.WriteMetaData Method

Pascal

```
procedure WriteMetaData(DataSet: TDataSet; const Info: TInfoArray; IsReference: Boolean =
False); virtual;
```

C++

```
virtual __fastcall WriteMetaData(TDataSet DataSet, const TInfoArray Info, Boolean IsReference
= False);
```

Description

This is WriteMetaData, a member of class TDataPacketWriter.

58.1.6.4 TDataPacketWriter Properties

The properties of the TDataPacketWriter class are listed here.

Public Properties

	Name	Description
	Constraints (see page 3144)	This is Constraints, a member of class TDataPacketWriter.
	Options (see page 3144)	This is Options, a member of class TDataPacketWriter.
	PacketOptions (see page 3144)	This is PacketOptions, a member of class TDataPacketWriter.

58.1.6.4.1 TDataPacketWriter.Constraints Property

Pascal

```
property Constraints: Boolean;
```

C++

```
__property Boolean Constraints;
```

Description

This is Constraints, a member of class TDataPacketWriter.

58.1.6.4.2 TDataPacketWriter.Options Property

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

This is Options, a member of class TDataPacketWriter.

58.1.6.4.3 TDataPacketWriter.PacketOptions Property

Pascal

```
property PacketOptions: TGetRecordOptions;
```

C++

```
__property TGetRecordOptions PacketOptions;
```

Description

This is PacketOptions, a member of class TDataPacketWriter.

58.1.6.5 TDataPacketWriter Events

The events of the TDataPacketWriter class are listed here.

Public Events

	Name	Description
	OnGetParams (see page 3144)	This is OnGetParams, a member of class TDataPacketWriter.

58.1.6.5.1 TDataPacketWriter.OnGetParams Event

Pascal

```
property OnGetParams: TGetParamsEvent;
```

C++

```
__property TGetParamsEvent OnGetParams;
```

Description

This is OnGetParams, a member of class TDataPacketWriter.

58.1.7 TDataSetProvider Class

TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.

Class Hierarchy

Pascal

```
TDataSetProvider = class(TBaseProvider);
```

C++

```
class TDataSetProvider : public TBaseProvider;
```

File

Provider

Description

Use TDataSetProvider to provide data from a dataset to a client dataset or XML broker and to resolve updates from that client dataset or XML broker back to the dataset or to its underlying database server. TDataSetProvider can be a part of the same application as the client dataset or XML broker, or it can be placed in the application server of a multi-tiered application. It serves as a data broker between a remote database server and a client dataset.

TDataSetProvider packages data from a dataset and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database or source dataset.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 3160) property must be true, and its Owner property must specify the remote data module.

Using Provider Components

58.1.7.1 TDataSetProvider Members

The following tables list the members exposed by TDataSetProvider.

Protected Methods

	Name	Description
	CheckDataSet (see page 3149)	This is CheckDataSet, a member of class TDataSetProvider.
	CheckResolver (see page 3081)	Instantiates a resolver for the Resolver (see page 3088) property if it does not already exist.
V	CreateDataPacket (see page 3149)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 3150)	Creates a resolver component for handling the application of updates.
V	DoAfterApplyUpdates (see page 3102)	Generates an AfterApplyUpdates (see page 3116) event.
V	DoAfterExecute (see page 3102)	Generates an AfterExecute (see page 3117) event.
V	DoAfterGetParams (see page 3102)	Generates an AfterGetParams (see page 3118) event.
V	DoAfterGetRecords (see page 3103)	Generates an AfterGetRecords (see page 3118) event.
V	DoAfterRowRequest (see page 3103)	Generates an AfterRowRequest (see page 3119) event.
V	DoAfterUpdateRecord (see page 3082)	Generates an AfterUpdateRecord (see page 3090) event.
V	DoApplyUpdates (see page 3104)	This is DoApplyUpdates, a member of class TCustomProvider.
V	DoBeforeApplyUpdates (see page 3104)	Generates a BeforeApplyUpdates (see page 3120) event.
V	DoBeforeCommit (see page 3082)	This is DoBeforeCommit, a member of class TBaseProvider.
V	DoBeforeExecute (see page 3150)	Generates a BeforeExecute (see page 3169) event.
V	DoBeforeGetParams (see page 3105)	Generates a BeforeGetParams (see page 3121) event.
V	DoBeforeGetRecords (see page 3151)	Generates a BeforeGetRecords (see page 3170) event.
V	DoBeforeRowRequest (see page 3106)	Generates a BeforeRowRequest (see page 3123) event.
V	DoBeforeUpdateRecord (see page 3083)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.
V	DoGetProviderAttributes (see page 3152)	Fills a list with information about the dataset that can be used when providing or resolving.
V	DoGetRecords (see page 3107)	This is DoGetRecords, a member of class TCustomProvider.
V	DoGetTableName (see page 3152)	Generates an OnGetTableName (see page 3175) event.
V	DoOnGetData (see page 3083)	Generates an OnGetData (see page 3091) event.
V	DoOnUpdateData (see page 3083)	Generates an OnUpdateData (see page 3092) event.
V	FetchDetails (see page 3153)	Fills a delta dataset with all nested dataset field values.
V	FindRecord (see page 3153)	This is FindRecord, a member of class TDataSetProvider.
	FreeResolver (see page 3084)	Frees the resolver specified by the Resolver (see page 3088) property.
V	GetDataSetFromDelta (see page 3153)	Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.
V	InternalApplyUpdates (see page 3154)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.
V	InternalExecute (see page 3154)	Provides the underlying implementation of the Execute method.
V	InternalGetParams (see page 3155)	Returns the requested parameter values as a Variant array.
V	InternalGetRecords (see page 3155)	Provides the underlying implementation of the GetRecords (see page 3109) method.
V	InternalRowRequest (see page 3156)	Provides the underlying implementation of the RowRequest (see page 3113) method.
V	LocateRecord (see page 3157)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
V	Notification (see page 3157)	Responds to notifications that objects are being created or destroyed.
	Reset (see page 3157)	This is Reset, a member of class TDataSetProvider.
	SetActiveUpdateException (see page 3114)	This is SetActiveUpdateException, a member of class TCustomProvider.
V	SetCommandText (see page 3158)	This is SetCommandText, a member of class TDataSetProvider.
V	SetParams (see page 3158)	This is SetParams, a member of class TDataSetProvider.
V	UpdateRecord (see page 3158)	Retrieves specified data from a source dataset into a delta packet.

Protected Properties

	Name	Description
	PacketDataSet (see page 3088)	This is PacketDataSet, a member of class TBaseProvider.
	TransactionStarted (see page 3163)	This is TransactionStarted, a member of class TDataSetProvider.

Public Methods

	Name	Description
	ApplyUpdates (see page 3100)	This is the overview for the ApplyUpdates method overload.
V	Create (see page 3148)	Creates and initializes a TDataSetProvider (see page 3145) object.
V	DataRequest (see page 3101)	Generates an OnDataRequest (see page 3124) event.
V	Destroy (see page 3148)	Frees an instance of a data set provider.
V	Execute (see page 3107)	Executes a query, stored procedure, or custom SQL statement.
V	GetParams (see page 3108)	Returns the current parameter values.
	GetRecords (see page 3109)	This is the overview for the GetRecords method overload.
V	RowRequest (see page 3113)	Returns information from a specified record.

Public Properties

	Name	Description
	ActiveUpdateException (see page 3159)	This is ActiveUpdateException, a member of class TDataSetProvider.
R	Data (see page 3115)	Denotes a data packet created by the provider.
	OwnerData (see page 3162)	This is OwnerData, a member of class TDataSetProvider.
R	Params (see page 3162)	Stores the parameter values currently in use.
R	Resolver (see page 3088)	Provides access to the resolver component that applies updates and resolves update errors.

Published Events

	Name	Description
	AfterApplyUpdates (see page 3164)	Occurs after the provider applies updates.
	AfterExecute (see page 3165)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 3166)	Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.
	AfterGetRecords (see page 3166)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 3167)	Occurs after the provider fetches new information about the current record.
	AfterUpdateRecord (see page 3168)	Occurs when the associated resolver has just updated a record.
	BeforeApplyUpdates (see page 3168)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 3169)	Occurs before the provider passes an execute command to its dataset.
	BeforeGetParams (see page 3170)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 3170)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 3172)	Occurs before the provider creates a delta packet with information about the current record.
	BeforeUpdateRecord (see page 3172)	Occurs immediately before each record is applied to the remote dataset.
	OnDataRequest (see page 3173)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 3174)	Occurs after a provider retrieves data but before it is sent to the client.
	OnGetDataSetProperties (see page 3174)	Occurs when the provider adds additional information to a data packet it is creating.
	OnGetTableName (see page 3175)	Occurs when a resolver initializes its information about the table to which it applies updates.
	OnUpdateData (see page 3175)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 3176)	Occurs when a provider can't update a record because of an error condition.
	OnValidate (see page 3176)	This is OnValidate, a member of class TDataSetProvider.

Published Properties

	Name	Description
	Constraints (see page 3159)	Controls whether database constraints are passed to the client so that it can check them locally.

	DataSet (see page 3160)	Specifies the dataset from which the provider provides data and to which it applies updates.
	Exported (see page 3160)	Allows client applications to pass calls to the provider when it resides on an application server.
	Options (see page 3161)	Influences what is included in data packets and how the information in data packets is used.
	ResolveToDataSet (see page 3162)	Specifies whether updates should be applied to a dataset or directly to the database server.
	UpdateMode (see page 3163)	Controls how the provider locates records when applying updates.

58.1.7.2 TDataSetProvider.Create Constructor

Creates and initializes a TDataSetProvider (see page 3145) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

See Also

Create (see page 3079)

58.1.7.3 TDataSetProvider.Destroy Destructor

Frees an instance of a data set provider.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataSetProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the reference to the provider is not nil before calling its Destroy method. Destroy frees all helper objects, including the resolver component referenced by the Resolver (see page 3088) property.

See Also

System::TObject::Free

Resolver (see page 3088)

58.1.7.4 TDataSetProvider Methods

The methods of the TDataSetProvider class are listed here.

Protected Methods

	Name	Description
	CheckDataSet (see page 3149)	This is CheckDataSet, a member of class TDataSetProvider.
V	CreateDataPacket (see page 3149)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 3150)	Creates a resolver component for handling the application of updates.
V	DoBeforeExecute (see page 3150)	Generates a BeforeExecute (see page 3169) event.
V	DoBeforeGetRecords (see page 3151)	Generates a BeforeGetRecords (see page 3170) event.
V	DoGetProviderAttributes (see page 3152)	Fills a list with information about the dataset that can be used when providing or resolving.
V	DoGetTableName (see page 3152)	Generates an OnGetTableName (see page 3175) event.
V	FetchDetails (see page 3153)	Fills a delta dataset with all nested dataset field values.
V	FindRecord (see page 3153)	This is FindRecord, a member of class TDataSetProvider.
V	GetDataSetFromDelta (see page 3153)	Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.
V	InternalApplyUpdates (see page 3154)	Provides the underlying implementation of the ApplyUpdates (see page 3100) method.
V	InternalExecute (see page 3154)	Provides the underlying implementation of the Execute method.
V	InternalGetParams (see page 3155)	Returns the requested parameter values as a Variant array.
V	InternalGetRecords (see page 3155)	Provides the underlying implementation of the GetRecords (see page 3109) method.
V	InternalRowRequest (see page 3156)	Provides the underlying implementation of the RowRequest (see page 3113) method.
V	LocateRecord (see page 3157)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
V	Notification (see page 3157)	Responds to notifications that objects are being created or destroyed.
	Reset (see page 3157)	This is Reset, a member of class TDataSetProvider.
V	SetCommandText (see page 3158)	This is SetCommandText, a member of class TDataSetProvider.
V	SetParams (see page 3158)	This is SetParams, a member of class TDataSetProvider.
V	UpdateRecord (see page 3158)	Retrieves specified data from a source dataset into a delta packet.

58.1.7.4.1 TDataSetProvider.CheckDataSet Method

Pascal

```
procedure CheckDataSet;
```

C++

```
__fastcall CheckDataSet();
```

Description

This is CheckDataSet, a member of class TDataSetProvider.

58.1.7.4.2 TDataSetProvider.CreateDataPacket Method

Generates a data packet for the data associated with the provider.

Pascal

```
procedure CreateDataPacket(PacketOpts: TGetRecordOptions; ProvOpts: TProviderOptions; var
RecsOut: Integer; var Data: OleVariant); override;
```

C++

```
virtual __fastcall CreateDataPacket(TGetRecordOptions PacketOpts, TProviderOptions ProvOpts,
int RecsOut, OleVariant Data);
```

Description

CreateDataPacket is used internally to generate the data packets that are returned by GetRecords (see page 3109).

The PacketOpts parameter indicates what information (other than record values) is included in the data packet. It reflects any Options (see page 3161) passed to the GetRecords (see page 3109) method.

The ProvOpts parameter reflects the current value of the Options (see page 3161) property.

The RecsOut parameter specifies the number of records desired in the packet and returns the actual number of records in the generated data packet.

The Data (see page 3115) parameter returns the generated data packet.

See Also

GetRecords (see page 3109)

DataSet (see page 3160)

Options (see page 3087)

58.1.7.4.3 TDataSetProvider.CreateResolver Method

Creates a resolver component for handling the application of updates.

Pascal

```
function CreateResolver: TCustomResolver; override;
```

C++

```
virtual __fastcall TCustomResolver CreateResolver();
```

Description

CreateResolver is called automatically when a resolver is needed to implement one of the provider's methods. CreateResolver returns a newly instantiated resolver object, which is assigned to the Resolver (see page 3088) property. The type of resolver created depends on the ResolveToDataSet (see page 3162) property:

When ResolveToDataSet (see page 3162) is true, CreateResolver returns a TDataSetResolver (see page 3176) component, which applies updates directly to the dataset specified by the DataSet (see page 3160) property.

When ResolveToDataSet (see page 3162) is false, CreateResolver returns a TSQLResolver (see page 3196) component, which applies updates directly to the database server associated with DataSet (see page 3160).

See Also

Resolver (see page 3088)

ResolveToDataSet (see page 3162)

58.1.7.4.4 TDataSetProvider.DoBeforeExecute Method

Generates a BeforeExecute (see page 3169) event.

Pascal

```
procedure DoBeforeExecute(const CommandText: WideString; var Params: OleVariant; var
OwnerData: OleVariant); override;
```

C++

```
virtual __fastcall DoBeforeExecute(const BSTR CommandText, OleVariant Params, OleVariant
OwnerData);
```

Description

The Execute (see page 3107) method calls DoBeforeExecute to generate the BeforeExecute (see page 3169) event before

it executes CommandText or executes an associated query or stored procedure.

CommandText is either an optional SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. If Options (see page 3161) includes poAllowCommandText, DoBeforeExecute sends CommandText to the associated dataset so that it can execute the provided statement instead of its query or stored procedure.

Params (see page 3162) contains any parameter values that should be applied to CommandText or to the query or stored procedure before execution. DoBeforeExecute assigns these parameter values to the dataset (if appropriate).

OwnerData (see page 3162) supplies custom information to the BeforeExecute (see page 3169) event handler. The event handler can change this value. The returned value is then passed to an AfterExecute (see page 3165) event handler and then returned to the caller of the Execute (see page 3107) method.

See Also

Execute (see page 3107)

BeforeExecute (see page 3121)

AfterExecute (see page 3117)

DataSet (see page 3160)

58.1.7.4.5 TDataSetProvider.DoBeforeGetRecords Method

Generates a BeforeGetRecords (see page 3170) event.

Pascal

```
procedure DoBeforeGetRecords(Count: Integer; Options: Integer; const CommandText: WideString;
var Params: OleVariant; var OwnerData: OleVariant); override;
```

C++

```
virtual __fastcall DoBeforeGetRecords(int Count, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

The GetRecords (see page 3109) method calls DoBeforeGetRecords to generate the BeforeGetRecords (see page 3170) event before it fetches data and assembles it into a data packet.

Count is the number of records requested. TDataSetProvider (see page 3145) does not use this parameter.

Options (see page 3161) indicates whether the data packet should include metadata, whether it should start with the first record, and whether the data packet should be encoded in XML. In TDataSetProvider (see page 3145), DoBeforeGetRecords ignores this parameter.

CommandText specifies either an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. If Options (see page 3161) includes poAllowCommandText, DoBeforeGetRecords sends CommandText to the associated dataset so that it can generate the set of records.

Params (see page 3162) contains any parameter values that should be applied to CommandText or to a query or stored procedure before fetching data into a data packet. DoBeforeGetRecords assigns these values to the associated dataset, if appropriate.

OwnerData (see page 3162) supplies custom information to the BeforeGetRecords (see page 3170) event handler. The event handler can change this value. The returned value is then passed to an AfterGetRecords (see page 3166) event handler and then (optionally) returned to the caller of the GetRecords (see page 3109) method.

See Also

GetRecords (see page 3109)

BeforeGetRecords (see page 3122)

AfterGetRecords (see page 3118)

DataSet (see page 3160)

58.1.7.4.6 TDataSetProvider.DoGetProviderAttributes Method

Fills a list with information about the dataset that can be used when providing or resolving.

Pascal

```
procedure DoGetProviderAttributes(DataSet: TDataSet; List: TList); virtual;
```

C++

```
virtual __fastcall DoGetProviderAttributes(TDataSet DataSet, TList List);
```

Description

DoGetProviderAttributes is used internally to fetch information about the dataset. This includes both information provided by the dataset (using the IProviderSupport method PSGetAttributes) and custom information supplied by an OnGetDataSetProperties (see page 3174) event handler.

The DataSet (see page 3160) parameter specifies the dataset that stores the information. The List parameter is the list that is filled by DoGetProviderAttributes. DoGetProviderAttributes adds information to the list in Name/Value pairs.

See Also

PSGetAttributes

OnGetDataSetProperties (see page 3174)

58.1.7.4.7 TDataSetProvider.DoGetTableName Method

Generates an OnGetTableName (see page 3175) event.

Pascal

```
procedure DoGetTableName(DataSet: TDataSet; var TableName: WideString); virtual;
```

C++

```
virtual __fastcall DoGetTableName(TDataSet DataSet, BSTR TableName);
```

Description

The resolver calls DoGetTableName when it initializes the information it needs to apply updates. Override this method to provide an alternate mechanism for determining the name of the dataset that is the target of an update operation.

DataSet (see page 3160) is the dataset that is the target of the update operation.

The name of the target dataset as it should appear in generated SQL statements is returned as the TableName parameter.

See Also

OnGetTableName (see page 3175)

Resolver (see page 3088)

58.1.7.4.8 TDataSetProvider.FetchDetails Method

Fills a delta dataset with all nested dataset field values.

Pascal

```
procedure FetchDetails(Source: TDataSet; Delta: TDataSet); override;
```

C++

```
virtual __fastcall FetchDetails(TDataSet Source, TDataSet Delta);
```

Description

FetchDetails is used internally to fetch the current values of any nested datasets when the provider is executing its RowRequest (see page 3113) method. Source is a source dataset that has the current values for all fields. Delta is a delta dataset that must be updated so that its nested detail fields match the values in Source.

See Also

RowRequest (see page 3113)

58.1.7.4.9 TDataSetProvider.FindRecord Method

Pascal

```
function FindRecord(Source: TDataSet; Delta: TDataSet; UpdateMode: TUpdateMode): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean FindRecord(TDataSet Source, TDataSet Delta, TUpdateMode UpdateMode);
```

Description

This is FindRecord, a member of class TDataSetProvider.

58.1.7.4.10 TDataSetProvider.GetDataSetFromDelta Method

Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.

Pascal

```
function GetDataSetFromDelta(ATree: TUpdateTree; Source: TDataSet; Delta: TDataSet; Mode:
TUpdateMode): TDataSet; virtual;
```

C++

```
virtual __fastcall TDataSet GetDataSetFromDelta(TUpdateTree ATree, TDataSet Source, TDataSet
Delta, TUpdateMode Mode);
```

Description

GetDataSetFromDelta is used internally to fetch a specific record when the source dataset is unidirectional.

ATree is a TUpdateTree (see page 3205) object that represents the update or data fetch operation.

Source is a source dataset. Because it is unidirectional, however, it is not necessarily positioned on the correct record.

Delta is a delta dataset that indicates the desired record.

Mode indicates the criteria to use for locating a record on the server from the dataset that Source uses. The values that follow these criteria come from Delta.

GetDataSetFromDelta returns a unidirectional dataset that corresponds to Source but that contains a single record based on the

criteria in Delta and Mode.

See Also

IsUniDirectional

DataSet (see page 3160)

58.1.7.4.11 TDataSetProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 3100) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates (see page 3100) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 3168) event and before generating the AfterApplyUpdates (see page 3164) event.

If the Options (see page 3161) property includes poReadOnly, InternalApplyUpdates raises an exception. Otherwise, it tells the dataset to start a transaction, calls the ApplyUpdates (see page 3100) method of its Resolver (see page 3088) component to handle the actual update and resolving process, and tells the dataset to complete the transaction.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

Resolver (see page 3088)

ApplyUpdates (see page 3128)

CreateResolver (see page 3150)

Options (see page 3087)

ApplyUpdates (see page 3100)

58.1.7.4.12 TDataSetProvider.InternalExecute Method

Provides the underlying implementation of the Execute method.

Pascal

```
procedure InternalExecute(const CommandText: WideString; var Params: OleVariant); override;
```

C++

```
virtual __fastcall InternalExecute(const BSTR CommandText, OleVariant Params);
```

Description

The Execute method calls InternalExecute to execute the appropriate SQL statement after calling DoBeforeExecute to generate a BeforeExecute event and apply the CommandText and Params. As Implemented in TCustomProvider, InternalExecute does nothing. Descendants override this method to pass the execute command on to an associated dataset.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

See Also

Execute (see page 3107)

DoBeforeExecute (see page 3105)

58.1.7.4.13 TDataSetProvider.InternalGetParams Method

Returns the requested parameter values as a Variant array.

Pascal

```
function InternalGetParams(Types: TParamTypes = AllParamTypes): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetParams(TParamTypes Types = AllParamTypes);
```

Description

The provider uses InternalGetParams internally whenever it needs to assemble the current parameter values into an OleVariant. This provides the underlying implementation of the GetParams (see page 3108) method, as well as assembling parameter values for methods that return output parameters (such as Execute (see page 3107) or GetRecords (see page 3109)).

The Types parameter limits the parameter values that are returned to a subset of all possible parameter types. If this parameter is omitted, all parameter values are returned.

See Also

GetParams (see page 3108)

Execute (see page 3107)

GetRecords (see page 3109)

DataSet (see page 3160)

58.1.7.4.14 TDataSetProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 3109) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 3109) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 3151) to apply the CommandText and Params (see page 3162) and generate a BeforeGetRecords (see page 3170) event. InternalGetRecords calls CreateDataPacket (see page 3149) to create a data packet that reflects the current property settings of the provider. It then generates an OnGetData (see page 3174) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options (see page 3161) indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML but use UTF8 to encode extended characters).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options (see page 3161) property does not include poAllowCommandText.

Params (see page 3162) specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable, Params (see page 3162) specifies field values that filter the result set. On exit from GetRecords (see page 3109), Params (see page 3162) returns any output parameters.

Records are returned as a data packet in a Variant.

Note: If the DataSet (see page 3160) property is not set, InternalGetRecords raises an exception.

See Also

Data (see page 3115)

CreateDataPacket (see page 3149)

OnGetData (see page 3091)

BeforeGetRecords (see page 3122)

AfterGetRecords (see page 3118)

DoBeforeGetRecords (see page 3151)

58.1.7.4.15 TDataSetProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 3113) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; Options: TFetchOptions): OleVariant;
override;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions Options);
```

Description

The RowRequest (see page 3113) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 3172) event and before generating an AfterRowRequest (see page 3167) event. InternalRowRequest passes this request on to its associated Resolver (see page 3088).

The Row parameter is an OleVariant that describes the record about which information is requested.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 3113)

Resolver (see page 3088)

RowRequest (see page 3134)

58.1.7.4.16 TDataSetProvider.LocateRecord Method

Positions a data set on the record that corresponds to the current update in a specified delta packet.

Pascal

```
procedure LocateRecord(Source: TDataSet; Delta: TDataSet); override;
```

C++

```
virtual __fastcall LocateRecord(TDataSet Source, TDataSet Delta);
```

Description

LocateRecord is called indirectly by the RowRequest (see page 3113) method to locate a record before fetching information about it. The Source parameter is the dataset containing current record values. The Delta parameter is a delta packet that identifies the desired type of information and information identifying the desired record.

LocateRecord uses the criteria specified by UpdateMode (see page 3163) to identify the desired record.

See Also

RowRequest (see page 3113)

UpdateMode (see page 3089)

58.1.7.4.17 TDataSetProvider.Notification Method

Responds to notifications that objects are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification overrides the inherited method to add a check that the dataset specified by the DataSet (see page 3160) property is not being deleted. If DataSet (see page 3160) is about to be destroyed, Notification sets the DataSet (see page 3160) property to nil (Delphi) or NULL (C++).

See Also

OnUpdateError (see page 3092)

Create

58.1.7.4.18 TDataSetProvider.Reset Method

Pascal

```
procedure Reset;
```

C++

```
__fastcall Reset();
```

Description

This is Reset, a member of class TDataSetProvider.

58.1.7.4.19 TDataSetProvider.SetCommandText Method

Pascal

```
procedure SetCommandText(const CommandText: WideString); virtual;
```

C++

```
virtual __fastcall SetCommandText(const BSTR CommandText);
```

Description

This is SetCommandText, a member of class TDataSetProvider.

58.1.7.4.20 TDataSetProvider.SetParams Method

Pascal

```
procedure SetParams(Values: OleVariant); virtual;
```

C++

```
virtual __fastcall SetParams(OleVariant Values);
```

Description

This is SetParams, a member of class TDataSetProvider.

58.1.7.4.21 TDataSetProvider.UpdateRecord Method

Retrieves specified data from a source dataset into a delta packet.

Pascal

```
procedure UpdateRecord(Source: TDataSet; Delta: TDataSet; BlobsOnly: Boolean; KeyOnly:
Boolean); override;
```

C++

```
virtual __fastcall UpdateRecord(TDataSet Source, TDataSet Delta, Boolean BlobsOnly, Boolean
KeyOnly);
```

Description

UpdateRecord is called indirectly by the RowRequest (see page 3113) method to fetch information about a specified record. The Source parameter is the dataset containing indicated record. The Delta parameter is a delta packet that returns the requested data. BlobsOnly indicates whether all field values should be provided (BlobsOnly == false) or only Blob field values (BlobsOnly == true).

See Also

RowRequest (see page 3113)

58.1.7.5 TDataSetProvider Properties

The properties of the TDataSetProvider class are listed here.

Protected Properties

	Name	Description
	TransactionStarted (see page 3163)	This is TransactionStarted, a member of class TDataSetProvider.

Public Properties

	Name	Description
	ActiveUpdateException (see page 3159)	This is ActiveUpdateException, a member of class TDataSetProvider.
	OwnerData (see page 3162)	This is OwnerData, a member of class TDataSetProvider.
R	Params (see page 3162)	Stores the parameter values currently in use.

Published Properties

	Name	Description
	Constraints (see page 3159)	Controls whether database constraints are passed to the client so that it can check them locally.
	DataSet (see page 3160)	Specifies the dataset from which the provider provides data and to which it applies updates.
	Exported (see page 3160)	Allows client applications to pass calls to the provider when it resides on an application server.
	Options (see page 3161)	Influences what is included in data packets and how the information in data packets is used.
	ResolveToDataSet (see page 3162)	Specifies whether updates should be applied to a dataset or directly to the database server.
	UpdateMode (see page 3163)	Controls how the provider locates records when applying updates.

58.1.7.5.1 TDataSetProvider.ActiveUpdateException Property

Pascal

```
property ActiveUpdateException: Exception;
```

C++

```
__property Exception ActiveUpdateException;
```

Description

This is ActiveUpdateException, a member of class TDataSetProvider.

58.1.7.5.2 TDataSetProvider.Constraints Property

Controls whether database constraints are passed to the client so that it can check them locally.

Pascal

```
property Constraints: Boolean;
```

C++

```
__property Boolean Constraints;
```

Description

Set Constraints to specify whether data constraints defined for the provider's associated dataset are sent along with the metadata for the dataset. Sending constraints allows client datasets to check for constraint violations locally, so that updates are less likely to fail when sent back to the database server.

When Constraints is true, constraints are sent. To prevent the provider from sending constraint information, set Constraints to false.

Note: Before constraints can be sent to client applications, they must be imported to the data dictionary on the application server. Use SQL explorer to import constraints to the data dictionary.

See Also

Constraints

DataSet (see page 3160)

58.1.7.5.3 TDataSetProvider.DataSet Property

Specifies the dataset from which the provider provides data and to which it applies updates.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Set DataSet to link the dataset provider to a dataset that it represents. The dataset provider packages the records from (and other information about) DataSet into data packets that can be used by client datasets and XML brokers. DataSet must be defined if the provider is used to create data packets.

If the ResolveToDataSet (see page 3162) property is true, the provider applies updates from the application server directly to this dataset. Otherwise, the provider applies updates directly to the underlying database server.

Note: The provider communicates with DataSet using the IProviderSupport interface. This interface is available in all datasets, although in TDataSet most of the IProviderSupport methods are simple stubs that either do nothing or generate an exception. The dataset classes that ship with the IDE (dbExpress datasets, BDE-enabled datasets, ADO-enabled datasets, InterBase Express datasets,

and client datasets) override these protected methods to implement the IProviderSupport interface in a more useful fashion. If you are using custom dataset components, check with the vendor whether they can work with a dataset provider.

See Also

ApplyUpdates (see page 3100)

Data (see page 3115)

IProviderSupport

Connecting a Client Dataset to Another Dataset in the Same Application

Determining the Source of Data

58.1.7.5.4 TDataSetProvider.Exported Property

Allows client applications to pass calls to the provider when it resides on an application server.

Pascal

```
property Exported: Boolean;
```

C++

```
__property Boolean Exported;
```

Description

Use Exported to indicate whether the provider is made available to clients of a remote data module that owns it. When Exported is true, client applications can specify the provider as a target for calls made using the IAppServer interface. When Exported is false, IAppServer calls that specify the provider cause an exception.

Note: In addition to the Exported property, the provider must be registered with the remote data module for clients to access it using the data module's IAppServer interface. When the provider's Owner is the remote data module, it is automatically registered. If the provider has a different owner, the server application must explicitly register providers using the remote data module's RegisterProvider method.

See Also

IAppServer

Providers

RegisterProvider

58.1.7.5.5 TDataSetProvider.Options Property

Influences what is included in data packets and how the information in data packets is used.

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

Set Options to customize how the provider communicates with client datasets. Options is a set that specifies

Whether nested detail sets and BLOB data are included in data packets or fetched separately.

Whether data packets include field component properties such as formats, display names, and maximum & minimum values.

Whether data packets are provided on a read-only basis, and whether specific types of changes (insertions, edits, or deletions) are disabled.

Whether changes to master table fields should cause corresponding updates to detail tables.

Whether a single update can affect multiple server records.

Whether the client's records are refreshed when it applies updates.

Whether the client can send SQL statements that override the provider's dataset.

Note: Not all options are supported by an InternetExpress client. Specifically, InternetExpress clients don't support poFetchBlobsOnDemand, poFetchDetailsOnDemand, poDisableInserts, poDisableEdits, psDisableDeletes, poPropogateChanges, and poAllowCommandText.

Overriding the Dataset On the Application Server

Setting Options That Influence the Data Packets

58.1.7.5.6 TDataSetProvider.OwnerData Property

Pascal

```
property OwnerData: OleVariant;
```

C++

```
__property OleVariant OwnerData;
```

Description

This is OwnerData, a member of class TDataSetProvider.

58.1.7.5.7 TDataSetProvider.Params Property

Stores the parameter values currently in use.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

This protected property acts as a temporary cache for parameter values from clients. It is set to the parameter values supplied by calls to the Execute (see page 3107) or GetRecords (see page 3109) method.

Note: If the dataset provider is responding to multiple client datasets or XML brokers

, the value of Params can only be used within the context of a single call to SetParams (see page 3158), Execute (see page 3107), or GetRecords (see page 3109). After that, other client calls can change the value of parameters.

See Also

Execute (see page 3107)

GetRecords (see page 3109)

58.1.7.5.8 TDataSetProvider.ResolveToDataSet Property

Specifies whether updates should be applied to a dataset or directly to the database server.

Pascal

```
property ResolveToDataSet: Boolean;
```

C++

```
__property Boolean ResolveToDataSet;
```

Description

Set ResolveToDataSet to specify how updates are applied. When ResolveToDataSet is true, the Resolver (see page 3088) property is set to a TDataSetResolver (see page 3176) component, which applies updates directly to the dataset specified by the DataSet (see page 3160) property. This can be useful if the application uses the events on the dataset component or if the dataset does not represent the data from a database server (for example, a client dataset).

When ResolveToDataSet is false, the Resolver (see page 3088) property is set to a TSQLResolver (see page 3196) component, which applies updates directly to the database server associated with DataSet (see page 3160). This can be more efficient, because it skips the intermediate step of using the dataset. It is the only way to resolve updates if the source dataset is read-only (for example, a unidirectional dataset).

DataSet (see page 3160)

Resolver (see page 3088)

Choosing How to Apply Updates Using a Datasetm Provider

58.1.7.5.9 TDataSetProvider.TransactionStarted Property

Pascal

```
property TransactionStarted: Boolean;
```

C++

```
__property Boolean TransactionStarted;
```

Description

This is TransactionStarted, a member of class TDataSetProvider.

58.1.7.5.10 TDataSetProvider.UpdateMode Property

Controls how the provider locates records when applying updates.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

Use UpdateMode to specify the criteria for locating a record in the dataset when applying updates. UpdateMode specifies whether modified records are located based on all columns (fields), on only the key fields, or on the key fields plus the original values of fields that have been modified.

Note: To control how the provider locates records by specifying individual fields, use the field components' ProviderFlags property.

See Also

ApplyUpdates (see page 3100)

ProviderFlags

Influencing How Updates Are Applied

58.1.7.6 TDataSetProvider Events

The events of the TDataSetProvider class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 3164)	Occurs after the provider applies updates.
	AfterExecute (see page 3165)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 3166)	Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.
	AfterGetRecords (see page 3166)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 3167)	Occurs after the provider fetches new information about the current record.
	AfterUpdateRecord (see page 3168)	Occurs when the associated resolver has just updated a record.
	BeforeApplyUpdates (see page 3168)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 3169)	Occurs before the provider passes an execute command to its dataset.
	BeforeGetParams (see page 3170)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 3170)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 3172)	Occurs before the provider creates a delta packet with information about the current record.
	BeforeUpdateRecord (see page 3172)	Occurs immediately before each record is applied to the remote dataset.
	OnDataRequest (see page 3173)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 3174)	Occurs after a provider retrieves data but before it is sent to the client.
	OnGetDataSetProperties (see page 3174)	Occurs when the provider adds additional information to a data packet it is creating.
	OnGetTableName (see page 3175)	Occurs when a resolver initializes its information about the table to which it applies updates.
	OnUpdateData (see page 3175)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 3176)	Occurs when a provider can't update a record because of an error condition.
	OnValidate (see page 3176)	This is OnValidate, a member of class TDataSetProvider.

58.1.7.6.1 TDataSetProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the

provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, on entry to the event handler the OwnerData parameter contains the value set in the BeforeApplyUpdates event handler and it is ignored on exit from the AfterApplyUpdates event handler.

58.1.7.6.2 TDataSetProvider.AfterExecute Event

Occurs after the provider passes an execute command to its dataset.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to return custom information to a client dataset after executing a query or stored procedure. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing queries or stored procedures that do not return a cursor. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_Execute method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeExecute event, where it can respond to or change custom information that the client dataset sends.

2.The provider dispatches its Execute method to execute a query or stored procedure.

3.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

4.The client dataset receives an AfterExecute event, where it can respond to the custom information returned by the provider in its AfterExecute event handler.

Communicating with the Client Dataset

58.1.7.6.3 TDataSetProvider.AfterGetParams Event

Occurs after the provider creates an OleVariant containing parameter values to send to the client dataset.

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

Write an AfterGetParams event handler to send custom information to a client dataset when returning parameters from the provider's dataset. AfterGetParams is part of the mechanism by which a provider and a client dataset communicate information about parameter values. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetParams method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetParams event, where it can respond to or change custom information that the client dataset sends.

2.The provider looks up the parameter values, if appropriate, and encodes them in an OleVariant.

3.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

4.The client dataset receives an AfterGetParams event, where it can respond to the custom information returned by the provider in its AfterGetParams event handler.

58.1.7.6.4 TDataSetProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to

communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Responding to Client Data Requests

58.1.7.6.5 TDataSetProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

Communicating with the Client Dataset

58.1.7.6.6 TDataSetProvider.AfterUpdateRecord Event

Occurs when the associated resolver has just updated a record.

Pascal

```
property AfterUpdateRecord: TAfterUpdateRecordEvent;
```

C++

```
__property TAfterUpdateRecordEvent AfterUpdateRecord;
```

Description

Write an AfterUpdateRecord event handler to provide special processing immediately after a record has been successfully updated. For example, use AfterUpdateRecord to maintain a log of successful updates.

See Also

BeforeUpdateRecord (see page 3090)

AfterApplyUpdates (see page 3116)

58.1.7.6.7 TDataSetProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, the OwnerData parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates event handler but not returned to the caller.

Responding to Client Update Requests

Communicating with the Client Dataset

58.1.7.6.8 TDataSetProvider.BeforeExecute Event

Occurs before the provider passes an execute command to its dataset.

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to respond to custom information from a client dataset before executing a query or stored procedure. Any parameter values supplied by the client dataset with the Execute command are applied before this event.

BeforeExecute is part of the mechanism by which a provider and a client dataset communicate information when executing queries or stored procedures that do not return cursors. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's Execute method is called, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeExecute event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before passing the execute command on to its dataset.

3.The provider dispatches its Execute method to execute a query or stored procedure.

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset receives an AfterExecute event, where it can respond to the custom information returned by the provider in its AfterExecute event handler.

BeforeExecute

58.1.7.6.9 TDataSetProvider.BeforeGetParams Event

Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to respond to custom information from a client dataset. BeforeGetParams is part of the mechanism by which a provider and a client dataset communicate information during parameter fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches parameter values from the provider, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetParams event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it fetches and encodes the parameter values.

3.The provider generates an OleVariant for the current parameter values of its dataset, if appropriate.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset receives an AfterGetParams event, where it can respond to the custom information returned by the provider in its AfterGetParams event handler.

Communicating with the Client Dataset

58.1.7.6.10 TDataSetProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Communicating with the Client Dataset

Responding to Client Data Requests

58.1.7.6.11 TDataSetProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

RefreshRecord

Communicating with the Client Dataset

58.1.7.6.12 TDataSetProvider.BeforeUpdateRecord Event

Occurs immediately before each record is applied to the remote dataset.

Pascal

```
property BeforeUpdateRecord: TBeforeUpdateRecordEvent;
```

C++

```
__property TBeforeUpdateRecordEvent BeforeUpdateRecord;
```

Description

Write a BeforeUpdateRecord event handler to:

Prepare individual record updates before they are applied to the source dataset or the database server. For example, you can insert additional changes into a record before it is updated or set the ProviderFlags property of the fields in the DeltaDS parameter to indicate how the provider should identify the records that are to be updated or changed and which fields should be updated.

Manually apply updates that the provider can't handle. For example, the provider can't generate the appropriate SQL when the data results from a multi-table join and more than one table must be updated. Write code in the event handler to apply the update and then set the Applied parameter to true so that the provider does not generate an error.

Selectively prevent certain updates from occurring. By setting the Applied parameter to true, the default update does not occur. When you prevent updates in this way, the provider does not generate an update error.

BeforeApplyUpdates (see page 3120)

58.1.7.6.13 TDataSetProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

Communicating with Providers Using Custom Events

Communicating with the Client Dataset

Responding to Client-generated Events

58.1.7.6.14 TDataSetProvider.OnGetData Event

Occurs after a provider retrieves data but before it is sent to the client.

Pascal

```
property OnGetData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnGetData;
```

Description

Write an OnGetData event handler to perform any custom data processing the provider should handle before returning data to a client. The OnGetData event occurs after a provider fetches data from its dataset but before the data is sent on to the client. Using the methods of the DataSet parameter, data can be edited in the OnGetData event handler before sending it to the client dataset or XML broker.

Note: OnGetData occurs when the Data property is read, as well as when the GetRecords method is called.

Responding to Client Data Requests

58.1.7.6.15 TDataSetProvider.OnGetDataSetProperties Event

Occurs when the provider adds additional information to a data packet it is creating.

Pascal

```
property OnGetDataSetProperties: TGetDSProps;
```

C++

```
__property TGetDSProps OnGetDataSetProperties;
```

Description

Write an OnGetDataSetProperties event handler to include application-defined information in the data packets. This information can later be returned using the GetOptionalParam method of the client dataset that represents the data in the packet.

Note: The following names are reserved and can't be used as the name for storing custom information:

UNIQUE_KEY	DEFAULT_ORDER	CHANGE_LOG	SERVER_COL
CONSTRAINTS	DATASET_CONTEXT	DATASET_DELTA	LCID
BDERECORD_X	TABLE_NAME	MD_FIELDLINKS	UPDATEMODE

SetOptionalParam

Adding Custom Information to Data Packets

58.1.7.6.16 TDataSetProvider.OnGetTableName Event

Occurs when a resolver initializes its information about the table to which it applies updates.

Pascal

```
property OnGetTableName: TGetTableNameEvent;
```

C++

```
__property TGetTableNameEvent OnGetTableName;
```

Description

Write an OnGetTableName event handler to enable the provider to apply updates to datasets where the resolver can't determine the target table from the provider's dataset. When the resolver component is initialized, it stores the name of the table that is the target of its updates. This table name can be used in generated SQL statements that apply the updates. When the dataset is a TTable, the resolver can use the table's TableName property. However, i If the dataset represents a multi-table query or stored procedure, the resolver has no way to determine the destination of the update without input from an OnGetTableName event handler.

Return the name of the target table as the TableName parameter. The resolver uses this to apply updates.

See Also

Resolver (see page 3088)

DataSet (see page 3160)

ApplyUpdates (see page 3100)

58.1.7.6.17 TDataSetProvider.OnUpdateData Event

Occurs when a provider begins to apply updates.

Pascal

```
property OnUpdateData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnUpdateData;
```

Description

Write an OnUpdateData event to handle special processing before the provider begins applying updates received from the client dataset or XML broker. Using the methods belonging to the DataSet parameter, an application can

Examine data (for example, for values or data changes that should not permitted), and raise exceptions that cancel applying of updates before they occur.

Change data (for example encrypting or decrypting values) before it is sent on to the source dataset or database server.

Editing Delta Packets Before Updating the Database

Influencing How Updates Are Applied

58.1.7.6.18 TDataSetProvider.OnUpdateError Event

Occurs when a provider can't update a record because of an error condition.

Pascal

```
property OnUpdateError: TResolverErrorEvent;
```

C++

```
__property TResolverErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to error conditions that arise when the provider applies a client dataset's updates. The OnUpdateError event handler is called for each record that can't be updated.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. This situation will not generate an OnUpdateError event.

Resolving Update Errors On the Provider

58.1.7.6.19 TDataSetProvider.OnValidate Event

Pascal

```
property OnValidate: TOnValidate;
```

C++

```
__property TOnValidate OnValidate;
```

Description

This is OnValidate, a member of class TDataSetProvider.

58.1.8 TDataSetResolver Class

TDataSetResolver applies updates to a dataset on behalf of a provider.

Class Hierarchy

Pascal

```
TDataSetResolver = class(TCustomResolver);
```

C++

```
class TDataSetResolver : public TCustomResolver;
```

File

Provider

Description

TDataSetProvider (see page 3145) components use TDataSetResolver to apply updates to a dataset when their ResolveToDataSet property is true. Otherwise, they use TSQLResolver (see page 3196).

Do not create instances of TDataSetResolver. Provider (see page 3182) components create their own TDataSetResolver objects for applying updates.

See Also

TDataSetProvider (see page 3145)

TBaseProvider (see page 3077)

TSQLResolver (see page 3196)

58.1.8.1 TDataSetResolver Members

The following tables list the members exposed by TDataSetResolver.

Protected Methods

	Name	Description
	BeginUpdate (see page 3178)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 3179)	Defines a method that deletes a record.
	DoInsert (see page 3179)	Defines a method that inserts a record.
	DoUpdate (see page 3180)	Defines a method that modifies a record.
	EndUpdate (see page 3180)	Provides the interface for a method that performs any finalization after applying updates.
	HandleUpdateError (see page 3131)	Manages the resolving process when errors occur while applying updates.
	InitializeConflictBuffer (see page 3181)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	LogUpdateError (see page 3133)	Adds an update that could not be resolved to the error log.
	LogUpdateRecord (see page 3134)	Adds records to the error log if their data has been changed by another application.

Protected Properties

	Name	Description
	Provider (see page 3182)	Indicates the provider that uses this resolver to apply updates.

Public Methods

	Name	Description
	ApplyUpdates (see page 3128)	Applies updates received from a provider.
	Create (see page 3178)	Creates and initializes a dataset resolver.
	Destroy (see page 3127)	Frees an instance of a resolver object.
	FreeTreeData (see page 3130)	Frees the internal data maintained by a TUpdateTree (see page 3205).
	InitKeyFields (see page 3132)	Sets the provider flag pfInKey on all key fields in a delta data packet.
	InitTreeData (see page 3132)	Initializes the internal data maintained by TUpdateTree (see page 3205).

	InternalBeforeResolve (see page 3181)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
	InternalUpdateRecord (see page 3133)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 3205) object.
	RowRequest (see page 3134)	Returns information from a specified record.

Public Properties

	Name	Description
	UpdateTree (see page 3135)	This is UpdateTree, a member of class TCustomResolver.

58.1.8.2 TDataSetResolver.Create Constructor

Creates and initializes a dataset resolver.

Pascal

```
constructor Create(AProvider: TDataSetProvider); reintroduce;
```

C++

```
__fastcall TDataSetResolver(TDataSetProvider AProvider);
```

Description

Provider (see page 3182) components call Create when they need a resolver component for applying updates to a dataset. The AProvider parameter specifies the provider that creates and uses the resolver.

Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function independently of a provider.

See Also

Resolver (see page 3088)

58.1.8.3 TDataSetResolver Methods

The methods of the TDataSetResolver class are listed here.

Protected Methods

	Name	Description
	BeginUpdate (see page 3178)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 3179)	Defines a method that deletes a record.
	DoInsert (see page 3179)	Defines a method that inserts a record.
	DoUpdate (see page 3180)	Defines a method that modifies a record.
	EndUpdate (see page 3180)	Provides the interface for a method that performs any finalization after applying updates.
	InitializeConflictBuffer (see page 3181)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Public Methods

	Name	Description
	InternalBeforeResolve (see page 3181)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

58.1.8.3.1 TDataSetResolver.BeginUpdate Method

Provides the interface for a method that performs any initialization before applying updates.

Pascal

```
procedure BeginUpdate; override;
```

C++

```
virtual __fastcall BeginUpdate();
```

Description

The ApplyUpdates method calls BeginUpdate before applying updates in a delta packet.

As implemented in TCustomResolver, BeginUpdate does nothing. Descendants that need take specific action before applying updates override this method.

See Also

EndUpdate (see page 3130)

ApplyUpdates (see page 3128)

58.1.8.3.2 TDataSetResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree);
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver does not implement the DoDelete method. Descendants override this method to delete records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoInsert (see page 3129)

DoUpdate (see page 3129)

58.1.8.3.3 TDataSetResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree);
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be

inserted, the resolver calls DoInsert.

TCustomResolver does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoUpdate (see page 3129)

58.1.8.3.4 TDataSetResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree);
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoInsert (see page 3129)

58.1.8.3.5 TDataSetResolver.EndUpdate Method

Provides the interface for a method that performs any finalization after applying updates.

Pascal

```
procedure EndUpdate; override;
```

C++

```
virtual __fastcall EndUpdate();
```

Description

The ApplyUpdates method calls EndUpdate after applying updates.

As implemented in TCustomResolver, EndUpdate does nothing. Descendants that need take specific action after applying updates override this method.

See Also

BeginUpdate (see page 3128)

ApplyUpdates (see page 3128)

58.1.8.3.6 TDataSetResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree);
```

Description

The HandleUpdateError method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 3131)

OnUpdateError (see page 3092)

58.1.8.3.7 TDataSetResolver.InternalBeforeResolve Method

Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

Pascal

```
procedure InternalBeforeResolve(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InternalBeforeResolve(TUpdateTree Tree);
```

Description

The ApplyUpdates method wraps delta packets in a TUpdateTree object. Once this is complete, InternalBeforeResolve performs any other initialization before the updates are applied.

As implemented in TCustomResolver, InternalBeforeResolve does nothing. Descendants override this method to perform class-specific initialization.

See Also

ApplyUpdates (see page 3128)

InitTreeData (see page 3132)

58.1.8.4 TDataSetResolver Properties

The properties of the TDataSetResolver class are listed here.

Protected Properties

	Name	Description
	Provider (see page 3182)	Indicates the provider that uses this resolver to apply updates.

58.1.8.4.1 TDataSetResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TDataSetProvider;
```

C++

```
__property TDataSetProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

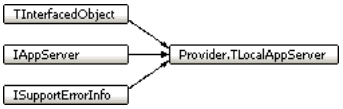
Create (see page 3126)

Resolver (see page 3088)

58.1.9 TLocalAppServer Class

Class Hierarchy



Pascal

```
TLocalAppServer = class(TInterfacedObject, IAppServer, ISupportErrorInfo);
```

C++

```
class TLocalAppServer : public TInterfacedObject, public IAppServer, public ISupportErrorInfo;
```

File

Provider

Description

This is class Provider.TLocalAppServer.

58.1.9.1 TLocalAppServer Members

The following tables list the members exposed by TLocalAppServer.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 3185)	This is AS_ApplyUpdates, a member of class TLocalAppServer.
	AS_DataRequest (see page 3185)	This is AS_DataRequest, a member of class TLocalAppServer.

	AS_Execute (see page 3185)	This is AS_Execute, a member of class TLocalAppServer.
	AS_GetParams (see page 3185)	This is AS_GetParams, a member of class TLocalAppServer.
	AS_GetProviderNames (see page 3186)	This is AS_GetProviderNames, a member of class TLocalAppServer.
	AS_GetRecords (see page 3186)	This is AS_GetRecords, a member of class TLocalAppServer.
	AS_RowRequest (see page 3186)	This is AS_RowRequest, a member of class TLocalAppServer.
	GetIDsOfNames (see page 3186)	This is GetIDsOfNames, a member of class TLocalAppServer.
	GetTypeInfo (see page 3187)	This is GetTypeInfo, a member of class TLocalAppServer.
	GetTypeInfoCount (see page 3187)	This is GetTypeInfoCount, a member of class TLocalAppServer.
	InterfaceSupportsErrorInfo (see page 3187)	This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.
	Invoke (see page 3187)	This is Invoke, a member of class TLocalAppServer.

Public Methods

	Name	Description
	Create (see page 3183)	This is the overview for the Create constructor overload.
V	Destroy (see page 3184)	Disposes of an object instance.
V	SafeCallException (see page 3188)	Handles exceptions in methods declared using the safecall calling convention.

58.1.9.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TLocalAppServer.Create (TCustomProvider) (see page 3183)	This is Create, a member of class TLocalAppServer.
	TLocalAppServer.Create (TDataset) (see page 3183)	This is Create, a member of class TLocalAppServer.

58.1.9.2.1 TLocalAppServer.Create Constructor (TCustomProvider)

Pascal

```
constructor Create(AProvider: TCustomProvider); overload;
```

C++

```
__fastcall TLocalAppServer(TCustomProvider AProvider);
```

Description

This is Create, a member of class TLocalAppServer.

58.1.9.2.2 TLocalAppServer.Create Constructor (TDataset)

Pascal

```
constructor Create(ADataset: TDataset); overload;
```

C++

```
__fastcall TLocalAppServer(TDataset ADataset);
```

Description

This is Create, a member of class TLocalAppServer.

58.1.9.3 TLocalAppServer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLocalAppServer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

58.1.9.4 TLocalAppServer Methods

The methods of the TLocalAppServer class are listed here.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 3185)	This is AS_ApplyUpdates, a member of class TLocalAppServer.
	AS_DataRequest (see page 3185)	This is AS_DataRequest, a member of class TLocalAppServer.
	AS_Execute (see page 3185)	This is AS_Execute, a member of class TLocalAppServer.
	AS_GetParams (see page 3185)	This is AS_GetParams, a member of class TLocalAppServer.
	AS_GetProviderNames (see page 3186)	This is AS_GetProviderNames, a member of class TLocalAppServer.
	AS_GetRecords (see page 3186)	This is AS_GetRecords, a member of class TLocalAppServer.
	AS_RowRequest (see page 3186)	This is AS_RowRequest, a member of class TLocalAppServer.
	GetIDsOfNames (see page 3186)	This is GetIDsOfNames, a member of class TLocalAppServer.
	GetTypeInfo (see page 3187)	This is GetTypeInfo, a member of class TLocalAppServer.
	GetTypeInfoCount (see page 3187)	This is GetTypeInfoCount, a member of class TLocalAppServer.
	InterfaceSupportsErrorInfo (see page 3187)	This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.
	Invoke (see page 3187)	This is Invoke, a member of class TLocalAppServer.

Public Methods

	Name	Description
	SafeCallException (see page 3188)	Handles exceptions in methods declared using the safecall calling convention.

58.1.9.4.1 TLocalAppServer.AS_ApplyUpdates Method

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

This is AS_ApplyUpdates, a member of class TLocalAppServer.

58.1.9.4.2 TLocalAppServer.AS_DataRequest Method

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

This is AS_DataRequest, a member of class TLocalAppServer.

58.1.9.4.3 TLocalAppServer.AS_Execute Method

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

This is AS_Execute, a member of class TLocalAppServer.

58.1.9.4.4 TLocalAppServer.AS_GetParams Method

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

This is AS_GetParams, a member of class TLocalAppServer.

58.1.9.4.5 TLocalAppServer.AS_GetProviderNames Method

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

This is AS_GetProviderNames, a member of class TLocalAppServer.

58.1.9.4.6 TLocalAppServer.AS_GetRecords Method

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is AS_GetRecords, a member of class TLocalAppServer.

58.1.9.4.7 TLocalAppServer.AS_RowRequest Method

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

This is AS_RowRequest, a member of class TLocalAppServer.

58.1.9.4.8 TLocalAppServer.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

This is GetIDsOfNames, a member of class TLocalAppServer.

58.1.9.4.9 TLocalAppServer.GetTypeInfo Method

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

This is GetTypeInfo, a member of class TLocalAppServer.

58.1.9.4.10 TLocalAppServer.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

This is GetTypeInfoCount, a member of class TLocalAppServer.

58.1.9.4.11 TLocalAppServer.InterfaceSupportsErrorInfo Method

Pascal

```
function InterfaceSupportsErrorInfo(const iid: TGUID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InterfaceSupportsErrorInfo(const TGUID iid);
```

Description

This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.

58.1.9.4.12 TLocalAppServer.Invoke Method

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is Invoke, a member of class TLocalAppServer.

58.1.9.4.13 TLocalAppServer.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

System::TObject::SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur.

As implemented in System::TObject, System::TObject::SafeCallException simply returns E_UNEXPECTED. This is the appropriate response for classes that do no support interfaces

58.1.10 TPacketDataSet Class

TPacketDataSet represents a data packet or delta packet that is used by a provider.

Class Hierarchy

Pascal

```
TPacketDataSet = class(TCustomClientDataSet);
```

C++

```
class TPacketDataSet : public TCustomClientDataSet;
```

File

Provider

Description

TPacketDataSet represents a data packet that a provider creates to represent its dataset's records and metadata or a delta data packet that a provider receives when it should apply updates. Provider (see page 3073) components create instances of TPacketDataSet to represent data packets before they are sent to clients and to represent delta packets after they are received from clients.

TPacketDataSet provides a convenient way for providers and resolvers to work with data packets. As a descendant of TCustomClientDataSet, TPacketDataSet allows providers and resolvers to use any of the standard dataset properties and methods to manipulate the data packet's records. In addition, TPacketDataSet introduces new properties and methods that describe what information goes into the data packet or how updates should be applied.

Applications do not need to work directly with packet datasets. They are mainly of use to component writers who want to create custom provider components.

See Also

TCustomClientDataSet

TCustomProvider (see page 3096)

58.1.10.1 TPacketDataSet Members

The following tables list the members exposed by TPacketDataSet.

Protected Methods

	Name	Description
	DataEvent (see page 3191)	This is DataEvent, a member of class TPacketDataSet.
	GetStateFieldValue (see page 3191)	This is GetStateFieldValue, a member of class TPacketDataSet.
	InternalClose (see page 3193)	This is InternalClose, a member of class TPacketDataSet.
	InternalInitRecord (see page 3193)	This is InternalInitRecord, a member of class TPacketDataSet.
	InternalOpen (see page 3193)	This is InternalOpen, a member of class TPacketDataSet.
	SetFieldData (see page 3194)	This is SetFieldData, a member of class TPacketDataSet.
	SetStateFieldValue (see page 3194)	This is SetStateFieldValue, a member of class TPacketDataSet.

Protected Properties

	Name	Description
	WritingCurValues (see page 3196)	This is WritingCurValues, a member of class TPacketDataSet.

Public Methods

	Name	Description
	AssignCurValues (see page 3190)	This is the overview for the AssignCurValues method overload.
	Create (see page 3189)	Creates and initializes instance of TPacketDataSet (see page 3188).
	CreateFromDelta (see page 3191)	Copies the data from another packet data set.
	HasCurValues (see page 3192)	Indicates whether the CurValue property is available for fields in the packet dataset.
	HasMergeConflicts (see page 3192)	Indicates whether a current record can be merged with updates in a delta packet.
	InitAltRecBuffers (see page 3192)	Fetches values for the CurValue, OldValue, and NewValue properties of fields.
	UpdateKind (see page 3194)	Indicates the type of update the current record represents.

Public Properties

	Name	Description
	NewValuesModified (see page 3195)	Indicates whether the NewValue property of any field in the current record has changed.
	StreamMetaData (see page 3195)	Indicates whether metadata should be included in the data packet.
	UseCurValues (see page 3195)	Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.

58.1.10.2 TPacketDataSet.Create Constructor

Creates and initializes instance of TPacketDataSet (see page 3188).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPacketDataSet(TComponent * AOwner);
```

Description

Most applications do not need to create packet datasets because they are created by the provider components that use them.Create initializes the properties of the packet dataset.

AOwner is the component that is responsible for freeing the TPacketDataSet (see page 3188) instance. If AOwner is nil (Delphi) or NULL (C++), the application must explicitly free the packet data set object.

See Also

Owner

58.1.10.3 TPacketDataSet Methods

The methods of the TPacketDataSet class are listed here.

Protected Methods

	Name	Description
	DataEvent (see page 3191)	This is DataEvent, a member of class TPacketDataSet.
	GetStateFieldValue (see page 3191)	This is GetStateFieldValue, a member of class TPacketDataSet.
	InternalClose (see page 3193)	This is InternalClose, a member of class TPacketDataSet.
	InternalInitRecord (see page 3193)	This is InternalInitRecord, a member of class TPacketDataSet.
	InternalOpen (see page 3193)	This is InternalOpen, a member of class TPacketDataSet.
	SetFieldData (see page 3194)	This is SetFieldData, a member of class TPacketDataSet.
	SetStateFieldValue (see page 3194)	This is SetStateFieldValue, a member of class TPacketDataSet.

Public Methods

	Name	Description
	AssignCurValues (see page 3190)	This is the overview for the AssignCurValues method overload.
	CreateFromDelta (see page 3191)	Copies the data from another packet data set.
	HasCurValues (see page 3192)	Indicates whether the CurValue property is available for fields in the packet dataset.
	HasMergeConflicts (see page 3192)	Indicates whether a current record can be merged with updates in a delta packet.
	InitAltRecBuffers (see page 3192)	Fetches values for the CurValue, OldValue, and NewValue properties of fields.
	UpdateKind (see page 3194)	Indicates the type of update the current record represents.

58.1.10.3.1 AssignCurValues Method

This is the overview for the AssignCurValues method overload.

Overload List

	Name	Description
	TPacketDataSet.AssignCurValues (TDataSet) (see page 3190)	Updates the current field value for each field in the packet dataset.
	TPacketDataSet.AssignCurValues (Variant) (see page 3190)	Updates the current field value for each field in the packet dataset.

58.1.10.3.1.1 TPacketDataSet.AssignCurValues Method (TDataSet)

Updates the current field value for each field in the packet dataset.

Pascal

```
procedure AssignCurValues(Source: TDataSet); overload;
procedure AssignCurValues(const CurValues: Variant); overload;
```

C++

```
__fastcall AssignCurValues(TDataSet Source);
__fastcall AssignCurValues(const Variant CurValues);
```

Description

When a resolver component encounters an update error, it calls AssignCurValues to set the CurValue property of fields before

triggering the OnUpdateError event handler.

If AssignCurValues is passed a dataset as the Source parameter, then for each field in the packet dataset, the CurValue property is set to the value of the field with the same name in the source dataset.

If AssignCurValues is passed a Variant array as the CurValues parameter, then each entry in the array is used to assign the CurValue property of a field in the packet dataset. CurValues can have one of two forms: an array of field values, or an array of Variant arrays, where each of those arrays has two elements: a field name and a value. In the first form, field values are assigned by position. In the second form, fields are located based on name and the CurValue property assigned accordingly.

See Also

CurValue

OnUpdateError (see page 3092)

58.1.10.3.2 TPacketDataSet.CreateFromDelta Method

Copies the data from another packet data set.

Pascal

```
procedure CreateFromDelta(Source: TPacketDataSet);
```

C++

```
__fastcall CreateFromDelta(TPacketDataSet Source);
```

Description

Applications should not need to call CreateFromDelta. This method is used internally when applying updates to create the error log of updates that could not be resolved. This log of update errors is eventually returned by the provider's ApplyUpdates method.

See Also

ApplyUpdates (see page 3100)

58.1.10.3.3 TPacketDataSet.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TPacketDataSet.

58.1.10.3.4 TPacketDataSet.GetStateFieldValue Method

Pascal

```
function GetStateFieldValue(State: TDataSetState; Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetStateFieldValue(TDataSetState State, TField Field);
```

Description

This is GetStateFieldValue, a member of class TPacketDataSet.

58.1.10.3.5 TPacketDataSet.HasCurValues Method

Indicates whether the CurValue property is available for fields in the packet dataset.

Pascal

```
function HasCurValues: Boolean;
```

C++

```
__fastcall Boolean HasCurValues();
```

Description

When an error occurs while applying an updated record, resolver components attempt to locate the current record in the underlying database (or the dataset to which updates are applied.) This current record can then be used when trying to determine the cause of the update error. If the current record can be located, HasCurValues returns true and the fields in the packet dataset have their CurValue properties set from this record. If the record can't be located (for example, if another user changed a key field value or deleted the record), then HasCurValues returns false and the CurValue property of packet dataset fields can't be used.

See Also

UseCurValues (see page 3195)

CurValue

58.1.10.3.6 TPacketDataSet.HasMergeConflicts Method

Indicates whether a current record can be merged with updates in a delta packet.

Pascal

```
function HasMergeConflicts: Boolean;
```

C++

```
__fastcall Boolean HasMergeConflicts();
```

Description

When resolving update errors in an OnUpdateError event handler, applications can specify that the updated record should be merged automatically with the current field values of the record. (To do this, set the Response parameter to rrMerge.) However, it is not always possible to merge client edits with the current record. If the updated record includes changes to field values that were also changed by other users, the merge will fail and HasMergeConflicts returns true.

See Also

CurValue

NewValue

OnUpdateError (see page 3092)

58.1.10.3.7 TPacketDataSet.InitAltRecBuffers Method

Fetches values for the CurValue, OldValue, and NewValue properties of fields.

Pascal

```
procedure InitAltRecBuffers(CheckModified: Boolean = True);
```

C++

```
__fastcall InitAltRecBuffers(Boolean CheckModified = True);
```

Description

While applying updates, InitAltRecBuffers is called automatically to ensure that fields in the packet dataset have values for the CurValue, OldValue, and NewValue properties. The CheckModified parameter specifies whether InitAltRecBuffers should check if the current record has been modified when it sets values. This check allows the packet dataset to reflect appropriate values when applying updates that are changed by an OnUpdateError event handler.

See Also

OldValue

NewValue

CurValue

OnUpdateError (see page 3092)

58.1.10.3.8 TPacketDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TPacketDataSet.

58.1.10.3.9 TPacketDataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: TRecordBuffer); override;
```

C++

```
virtual __fastcall InternalInitRecord(TRecordBuffer Buffer);
```

Description

This is InternalInitRecord, a member of class TPacketDataSet.

58.1.10.3.10 TPacketDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TPacketDataSet.

58.1.10.3.11 TPacketDataSet.SetFieldData Method

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TPacketDataSet.

58.1.10.3.12 TPacketDataSet.SetStateFieldValue Method

Pascal

```
procedure SetStateFieldValue(State: TDataSetState; Field: TField; const Value: Variant);
override;
```

C++

```
virtual __fastcall SetStateFieldValue(TDataSetState State, TField Field, const Variant Value);
```

Description

This is SetStateFieldValue, a member of class TPacketDataSet.

58.1.10.3.13 TPacketDataSet.UpdateKind Method

Indicates the type of update the current record represents.

Pascal

```
function UpdateKind: TUpdateKind;
```

C++

```
__fastcall TUpdateKind UpdateKind();
```

Description

Call UpdateKind while applying updates to determine the type of update the current record represents. UpdateKind returns

ukInsert if the current record is a newly inserted record.

ukDelete if the current record represents a record that should be deleted.

ukModify if the current record represents updates to an existing record.

58.1.10.4 TPacketDataSet Properties

The properties of the TPacketDataSet class are listed here.

Protected Properties

	Name	Description
	WritingCurValues (see page 3196)	This is WritingCurValues, a member of class TPacketDataSet.

Public Properties

	Name	Description
	NewValuesModified (see page 3195)	Indicates whether the NewValue property of any field in the current record has changed.
	StreamMetaData (see page 3195)	Indicates whether metadata should be included in the data packet.
	UseCurValues (see page 3195)	Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.

58.1.10.4.1 TPacketDataSet.NewValuesModified Property

Indicates whether the NewValue property of any field in the current record has changed.

Pascal

```
property NewValuesModified: Boolean;
```

C++

```
__property Boolean NewValuesModified;
```

Description

Read NewValuesModified to determine whether any fields in the current record were edited during the resolving process.

See Also

NewValue

58.1.10.4.2 TPacketDataSet.StreamMetaData Property

Indicates whether metadata should be included in the data packet.

Pascal

```
property StreamMetaData: Boolean;
```

C++

```
__property Boolean StreamMetaData;
```

Description

StreamMetaData reflects the MetaData parameter of the provider's CreateDataPacket method. When StreamMetaData is true, metadata is included in the data packet. When StreamMetaData is false, the data packet contains records but no metadata.

See Also

CreateDataPacket (see page 3149)

58.1.10.4.3 TPacketDataSet.UseCurValues Property

Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.

Pascal

```
property UseCurValues: Boolean;
```

C++

```
__property Boolean UseCurValues;
```

Description

UseCurValues is set during the resolving process when a record is corrected in an OnUpdateError event handler. This allows the resolver to reapply a corrected record rather than using the originally provided values as the basis of an update.

See Also

HasCurValues (see page 3192)

CurValue

OldValue

OnUpdateError (see page 3092)

58.1.10.4.4 TPacketDataSet.WritingCurValues Property

Pascal

```
property WritingCurValues: Boolean;
```

C++

```
__property Boolean WritingCurValues;
```

Description

This is WritingCurValues, a member of class TPacketDataSet.

58.1.11 TProvider Class

TProvider provides data to and applies updates from a client dataset.

Class Hierarchy

Pascal

```
TProvider = class(TDataSetProvider);
```

C++

```
class TProvider : public TDataSetProvider;
```

File

Provider

Description

TProvider is provided for backward compatibility. It is identical to TDataSetProvider (see page 3145). New applications should use TDataSetProvider (see page 3145) instead.

See Also

TDataSetProvider (see page 3145)

58.1.12 TSQLResolver Class

TSQLResolver applies updates to a database server on behalf of a provider.

Class Hierarchy

Pascal

```
TSQLResolver = class(TCustomResolver);
```

C++

```
class TSQLResolver : public TCustomResolver;
```

File

Provider

Description

Provider (see page 3204) components use TSQLResolver to apply updates from a client application directly to a database server when their ResolveToDataSet property is false. Otherwise, they use TDataSetResolver (see page 3176).

Do not create instances of TSQLResolver. Provider (see page 3204) components create their own TSQLResolver objects for applying updates.

See Also

TBaseProvider (see page 3077)

TDataSetResolver (see page 3176)

TDataSetProvider (see page 3145)

58.1.12.1 TSQLResolver Members

The following tables list the members exposed by TSQLResolver.

Protected Methods

	Name	Description
	BeginUpdate (see page 3128)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 3199)	Defines a method that deletes a record.
	DoExecSQL (see page 3200)	This is DoExecSQL, a member of class TSQLResolver.
	DoGetValues (see page 3200)	This is DoGetValues, a member of class TSQLResolver.
	DoInsert (see page 3200)	Defines a method that inserts a record.
	DoUpdate (see page 3201)	Defines a method that modifies a record.
	EndUpdate (see page 3130)	Provides the interface for a method that performs any finalization after applying updates.
	GenDeleteSQL (see page 3201)	This is GenDeleteSQL, a member of class TSQLResolver.
	GenInsertSQL (see page 3202)	This is GenInsertSQL, a member of class TSQLResolver.
	GenSelectSQL (see page 3202)	This is GenSelectSQL, a member of class TSQLResolver.
	GenUpdateSQL (see page 3202)	This is GenUpdateSQL, a member of class TSQLResolver.
	GenWhereSQL (see page 3202)	This is GenWhereSQL, a member of class TSQLResolver.
	GetProvider (see page 3203)	This is GetProvider, a member of class TSQLResolver.
	HandleUpdateError (see page 3131)	Manages the resolving process when errors occur while applying updates.
	InitializeConflictBuffer (see page 3203)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	InternalDoUpdate (see page 3204)	This is InternalDoUpdate, a member of class TSQLResolver.
	LogUpdateError (see page 3133)	Adds an update that could not be resolved to the error log.
	LogUpdateRecord (see page 3134)	Adds records to the error log if their data has been changed by another application.
	UseFieldInUpdate (see page 3204)	This is UseFieldInUpdate, a member of class TSQLResolver.
	UseFieldInWhere (see page 3204)	This is UseFieldInWhere, a member of class TSQLResolver.

Protected Properties

	Name	Description
	Provider (see page 3204)	Indicates the provider that uses this resolver to apply updates.

Public Methods

	Name	Description
	ApplyUpdates (see page 3128)	Applies updates received from a provider.
	Create (see page 3198)	Creates and initializes an SQL resolver.
	Destroy (see page 3198)	Destroys an instance of TSQLResolver (see page 3196).
	FreeTreeData (see page 3201)	Frees the internal data maintained by a TUpdateTree.
	InitKeyFields (see page 3132)	Sets the provider flag pfInKey on all key fields in a delta data packet.
	InitTreeData (see page 3203)	Initializes the internal data maintained by TUpdateTree.
	InternalBeforeResolve (see page 3133)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
	InternalUpdateRecord (see page 3133)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 3205) object.
	RowRequest (see page 3134)	Returns information from a specified record.

Public Properties

	Name	Description
	UpdateTree (see page 3135)	This is UpdateTree, a member of class TCustomResolver.

58.1.12.2 TSQLResolver.Create Constructor

Creates and initializes an SQL resolver.

Pascal

```
constructor Create(AProvider: TDataSetProvider); reintroduce;
```

C++

```
__fastcall TSQLResolver(TDataSetProvider AProvider);
```

Description

Provider (see page 3204) components call Create when they need a resolver component for applying updates to a database server. Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function independently of a provider.

The AProvider parameter specifies the provider that creates and uses the resolver.

See Also

Resolver (see page 3088)

58.1.12.3 TSQLResolver.Destroy Destructor

Destroys an instance of TSQLResolver (see page 3196).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLResolver();
```

Description

Most applications should not delete instances of TSQLResolver (see page 3196). SQL resolvers are freed automatically by the provider components that use them.

See Also

System::TObject::Free

Resolver (see page 3088)

58.1.12.4 TSQLResolver Methods

The methods of the TSQLResolver class are listed here.

Protected Methods

	Name	Description
	DoDelete (see page 3199)	Defines a method that deletes a record.
	DoExecSQL (see page 3200)	This is DoExecSQL, a member of class TSQLResolver.
	DoGetValues (see page 3200)	This is DoGetValues, a member of class TSQLResolver.
	DoInsert (see page 3200)	Defines a method that inserts a record.
	DoUpdate (see page 3201)	Defines a method that modifies a record.
	GenDeleteSQL (see page 3201)	This is GenDeleteSQL, a member of class TSQLResolver.
	GenInsertSQL (see page 3202)	This is GenInsertSQL, a member of class TSQLResolver.
	GenSelectSQL (see page 3202)	This is GenSelectSQL, a member of class TSQLResolver.
	GenUpdateSQL (see page 3202)	This is GenUpdateSQL, a member of class TSQLResolver.
	GenWhereSQL (see page 3202)	This is GenWhereSQL, a member of class TSQLResolver.
	GetProvider (see page 3203)	This is GetProvider, a member of class TSQLResolver.
	InitializeConflictBuffer (see page 3203)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	InternalDoUpdate (see page 3204)	This is InternalDoUpdate, a member of class TSQLResolver.
	UseFieldInUpdate (see page 3204)	This is UseFieldInUpdate, a member of class TSQLResolver.
	UseFieldInWhere (see page 3204)	This is UseFieldInWhere, a member of class TSQLResolver.

Public Methods

	Name	Description
	FreeTreeData (see page 3201)	Frees the internal data maintained by a TUpdateTree.
	InitTreeData (see page 3203)	Initializes the internal data maintained by TUpdateTree.

58.1.12.4.1 TSQLResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree);
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver does not implement the DoDelete method. Descendants override this method to delete records in their own

specialized way.

See Also

ApplyUpdates (see page 3128)

DoInsert (see page 3129)

DoUpdate (see page 3129)

58.1.12.4.2 TSQLResolver.DoExecSQL Method

Pascal

```
procedure DoExecSQL(SQL: TWideStringList; Params: TParams); virtual;
```

C++

```
virtual __fastcall DoExecSQL(TWideStringList SQL, TParams Params);
```

Description

This is DoExecSQL, a member of class TSQLResolver.

58.1.12.4.3 TSQLResolver.DoGetValues Method

Pascal

```
procedure DoGetValues(SQL: TWideStringList; Params: TParams; DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall DoGetValues(TWideStringList SQL, TParams Params, TDataSet DataSet);
```

Description

This is DoGetValues, a member of class TSQLResolver.

58.1.12.4.4 TSQLResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree);
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be inserted, the resolver calls DoInsert.

TCustomResolver does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoUpdate (see page 3129)

58.1.12.4.5 TSQLResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree);
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 3128)

DoDelete (see page 3129)

DoInsert (see page 3129)

58.1.12.4.6 TSQLResolver.FreeTreeData Method

Frees the internal data maintained by a TUpdateTree.

Pascal

```
procedure FreeTreeData(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall FreeTreeData(TUpdateTree Tree);
```

Description

The ApplyUpdates method wraps delta packets in a TUpdateTree object. The TUpdateTree stores the delta packet, along with information that the resolver uses when applying updates. This information varies, depending on the class of resolver.

FreeTreeData is called internally just before the resolver's TUpdateTree object is freed. As implemented in TCustomResolver, FreeTreeData does nothing. Descendants override this method if any specific action is required to free the resolver-specific information that is stored in the update tree.

See Also

ApplyUpdates (see page 3128)

InitTreeData (see page 3132)

58.1.12.4.7 TSQLResolver.GenDeleteSQL Method

Pascal

```
procedure GenDeleteSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string);
virtual;
```

C++

```
virtual __fastcall GenDeleteSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params,
UnicodeString Alias);
```

Description

This is GenDeleteSQL, a member of class TSQLResolver.

58.1.12.4.8 TSQLResolver.GenInsertSQL Method

Pascal

```
procedure GenInsertSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams); virtual;
```

C++

```
virtual __fastcall GenInsertSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params);
```

Description

This is GenInsertSQL, a member of class TSQLResolver.

58.1.12.4.9 TSQLResolver.GenSelectSQL Method

Pascal

```
procedure GenSelectSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string;
Mode: TUpdateMode = upWhereKeyOnly); virtual;
```

C++

```
virtual __fastcall GenSelectSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params,
UnicodeString Alias, TUpdateMode Mode = upWhereKeyOnly);
```

Description

This is GenSelectSQL, a member of class TSQLResolver.

58.1.12.4.10 TSQLResolver.GenUpdateSQL Method

Pascal

```
procedure GenUpdateSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string);
virtual;
```

C++

```
virtual __fastcall GenUpdateSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params,
UnicodeString Alias);
```

Description

This is GenUpdateSQL, a member of class TSQLResolver.

58.1.12.4.11 TSQLResolver.GenWhereSQL Method

Pascal

```
procedure GenWhereSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; GenUpdateMode:
TUpdateMode; Alias: string); virtual;
```

C++

```
virtual __fastcall GenWhereSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params, TUpdateMode
```

```
GenUpdateMode, UnicodeString Alias);
```

Description

This is GenWhereSQL, a member of class TSQLResolver.

58.1.12.4.12 TSQLResolver.GetProvider Method

Pascal

```
function GetProvider: TDataSetProvider; virtual;
```

C++

```
virtual __fastcall TDataSetProvider GetProvider();
```

Description

This is GetProvider, a member of class TSQLResolver.

58.1.12.4.13 TSQLResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree);
```

Description

The HandleUpdateError method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 3131)

OnUpdateError (see page 3092)

58.1.12.4.14 TSQLResolver.InitTreeData Method

Initializes the internal data maintained by TUpdateTree.

Pascal

```
procedure InitTreeData(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitTreeData(TUpdateTree Tree);
```

Description

The ApplyUpdates method wraps delta packets in a TUpdateTree object. The TUpdateTree stores the delta packet, along with information that the resolver uses when applying updates. This information varies, depending on the class of resolver.

InitTreeData is called internally when the resolver's TUpdateTree object is created. As implemented in TCustomResolver, InitTreeData does nothing. Descendants override this method to store any class-specific information that they use when applying

updates.

See Also

ApplyUpdates (see page 3128)

FreeTreeData (see page 3130)

58.1.12.4.15 TSQLResolver.InternalDoUpdate Method

Pascal

```
procedure InternalDoUpdate(Tree: TUpdateTree; UpdateKind: TUpdateKind); virtual;
```

C++

```
virtual __fastcall InternalDoUpdate(TUpdateTree Tree, TUpdateKind UpdateKind);
```

Description

This is InternalDoUpdate, a member of class TSQLResolver.

58.1.12.4.16 TSQLResolver.UseFieldInUpdate Method

Pascal

```
function UseFieldInUpdate(Field: TField): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseFieldInUpdate(TField Field);
```

Description

This is UseFieldInUpdate, a member of class TSQLResolver.

58.1.12.4.17 TSQLResolver.UseFieldInWhere Method

Pascal

```
function UseFieldInWhere(Field: TField; Mode: TUpdateMode): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseFieldInWhere(TField Field, TUpdateMode Mode);
```

Description

This is UseFieldInWhere, a member of class TSQLResolver.

58.1.12.5 TSQLResolver Properties

The properties of the TSQLResolver class are listed here.

Protected Properties

	Name	Description
	Provider (see page 3204)	Indicates the provider that uses this resolver to apply updates.

58.1.12.5.1 TSQLResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TDataSetProvider;
```

C++

```
__property TDataSetProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

See Also

Create (see page 3126)

Resolver (see page 3088)

58.1.13 TUpdateTree Class

TUpdateTree stores information about a delta packet on behalf of a resolver.

Class Hierarchy

Pascal

```
TUpdateTree = class(TObject);
```

C++

```
class TUpdateTree : public TObject;
```

File

Provider

Description

When a client dataset applies its updates to the source dataset or database server, the provider that represents that dataset or server passes the updates to a resolver component. The resolver takes this delta data packet and builds a TUpdateTree to store the updates and information about them in a convenient form. In particular, the TUpdateTree structure allows a resolver to handle master/detail relationships (represented as nested dataset fields in the delta packet) so that updates are applied in the proper order.

Applications can't use TUpdateTree directly. Most of the structured information about the delta packet is represented in protected properties that are only available to the resolver classes in the Provider (see page 3073) unit.

See Also

TCustomResolver (see page 3125)

TCustomClientDataSet

TCustomProvider (see page 3096)

58.1.13.1 TUpdateTree Members

The following tables list the members exposed by TUpdateTree.

Protected Properties

	Name	Description
	DetailList (see page 3210)	This is DetailList, a member of class TUpdateTree.
	Opened (see page 3211)	This is Opened, a member of class TUpdateTree.

Public Methods

	Name	Description
	Clear (see page 3207)	This is Clear, a member of class TUpdateTree.
	Create (see page 3206)	Creates and initializes an instance of TUpdateTree (see page 3205).
	Destroy (see page 3207)	Destroys an instance of TUpdateTree (see page 3205).
	DoUpdates (see page 3207)	This is DoUpdates, a member of class TUpdateTree.
	InitData (see page 3208)	This is InitData, a member of class TUpdateTree.
	InitDelta (see page 3208)	This is the overview for the InitDelta method overload.
	InitErrorPacket (see page 3209)	This is InitErrorPacket, a member of class TUpdateTree.
	RefreshData (see page 3209)	This is RefreshData, a member of class TUpdateTree.

Public Properties

	Name	Description
	Data (see page 3209)	This is Data, a member of class TUpdateTree.
	Delta (see page 3210)	This is Delta, a member of class TUpdateTree.
	DetailCount (see page 3210)	This is DetailCount, a member of class TUpdateTree.
	Details (see page 3210)	This is Details, a member of class TUpdateTree.
	ErrorDS (see page 3211)	This is ErrorDS, a member of class TUpdateTree.
	HasErrors (see page 3211)	This is HasErrors, a member of class TUpdateTree.
	IsNested (see page 3211)	This is IsNested, a member of class TUpdateTree.
	Name (see page 3211)	This is Name, a member of class TUpdateTree.
	Parent (see page 3212)	This is Parent, a member of class TUpdateTree.
	Resolver (see page 3212)	This is Resolver, a member of class TUpdateTree.
	Source (see page 3212)	This is Source, a member of class TUpdateTree.

58.1.13.2 TUpdateTree.Create Constructor

Creates and initializes an instance of TUpdateTree (see page 3205).

Pascal

```
constructor Create(AParent: TUpdateTree; AResolver: TCustomResolver);
```

C++

```
__fastcall TUpdateTree(TUpdateTree AParent, TCustomResolver AResolver);
```

Description

Applications do not need to call the TUpdateTree (see page 3205) constructor. Update trees are created automatically by the resolver components that use them.

The AParent parameter specifies the TUpdateTree (see page 3205) for the updates to a master table if this update tree represents a detail data set. If the TUpdateTree (see page 3205) does not represent the updates to a detail dataset, AParent is nil (Delphi) or NULL (C++).

The AResolver parameter specifies the resolver component that uses this update tree when applying updates. This parameter

must be specified because the update tree calls some of this resolver's methods.

58.1.13.3 TUpdateTree.Destroy Destructor

Destroys an instance of TUpdateTree (see page 3205).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TUpdateTree();
```

Description

Applications do not need to free TUpdateTree (see page 3205) instances. Update trees are freed by the resolver components that use them.

See Also

System::TObject::Free

58.1.13.4 TUpdateTree Methods

The methods of the TUpdateTree class are listed here.

Public Methods

	Name	Description
	Clear (see page 3207)	This is Clear, a member of class TUpdateTree.
	DoUpdates (see page 3207)	This is DoUpdates, a member of class TUpdateTree.
	InitData (see page 3208)	This is InitData, a member of class TUpdateTree.
	InitDelta (see page 3208)	This is the overview for the InitDelta method overload.
	InitErrorPacket (see page 3209)	This is InitErrorPacket, a member of class TUpdateTree.
	RefreshData (see page 3209)	This is RefreshData, a member of class TUpdateTree.

58.1.13.4.1 TUpdateTree.Clear Method

Pascal

```
procedure Clear; virtual;
```

C++

```
virtual __fastcall Clear();
```

Description

This is Clear, a member of class TUpdateTree.

58.1.13.4.2 TUpdateTree.DoUpdates Method

Pascal

```
function DoUpdates: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoUpdates();
```

Description

This is DoUpdates, a member of class TUpdateTree.

58.1.13.4.3 TUpdateTree.InitData Method

Pascal

```
procedure InitData(ASource: TDataSet); virtual;
```

C++

```
virtual __fastcall InitData(TDataSet ASource);
```

Description

This is InitData, a member of class TUpdateTree.

58.1.13.4.4 InitDelta Method

This is the overview for the InitDelta method overload.

Overload List

	Name	Description
	TUpdateTree.InitDelta (OleVariant) (see page 3208)	This is InitDelta, a member of class TUpdateTree.
	TUpdateTree.InitDelta (TPacketDataSet) (see page 3208)	This is InitDelta, a member of class TUpdateTree.

58.1.13.4.4.1 TUpdateTree.InitDelta Method (OleVariant)

Pascal

```
procedure InitDelta(const ADelta: OleVariant); virtual; overload;
```

C++

```
virtual __fastcall InitDelta(const OleVariant ADelta);
```

Description

This is InitDelta, a member of class TUpdateTree.

58.1.13.4.4.2 TUpdateTree.InitDelta Method (TPacketDataSet)

Pascal

```
procedure InitDelta(ADelta: TPacketDataSet); virtual; overload;
```

C++

```
virtual __fastcall InitDelta(TPacketDataSet ADelta);
```

Description

This is InitDelta, a member of class TUpdateTree.

58.1.13.4.5 TUpdateTree.InitErrorPacket Method

Pascal

```
procedure InitErrorPacket(E: EUpdateError; Response: TResolverResponse); virtual;
```

C++

```
virtual __fastcall InitErrorPacket(EUpdateError E, TResolverResponse Response);
```

Description

This is InitErrorPacket, a member of class TUpdateTree.

58.1.13.4.6 TUpdateTree.RefreshData Method

Pascal

```
procedure RefreshData(Options: TFetchOptions); virtual;
```

C++

```
virtual __fastcall RefreshData(TFetchOptions Options);
```

Description

This is RefreshData, a member of class TUpdateTree.

58.1.13.5 TUpdateTree Properties

The properties of the TUpdateTree class are listed here.

Protected Properties

	Name	Description
	DetailList (see page 3210)	This is DetailList, a member of class TUpdateTree.
	Opened (see page 3211)	This is Opened, a member of class TUpdateTree.

Public Properties

	Name	Description
	Data (see page 3209)	This is Data, a member of class TUpdateTree.
	Delta (see page 3210)	This is Delta, a member of class TUpdateTree.
	DetailCount (see page 3210)	This is DetailCount, a member of class TUpdateTree.
	Details (see page 3210)	This is Details, a member of class TUpdateTree.
	ErrorDS (see page 3211)	This is ErrorDS, a member of class TUpdateTree.
	HasErrors (see page 3211)	This is HasErrors, a member of class TUpdateTree.
	IsNested (see page 3211)	This is IsNested, a member of class TUpdateTree.
	Name (see page 3211)	This is Name, a member of class TUpdateTree.
	Parent (see page 3212)	This is Parent, a member of class TUpdateTree.
	Resolver (see page 3212)	This is Resolver, a member of class TUpdateTree.
	Source (see page 3212)	This is Source, a member of class TUpdateTree.

58.1.13.5.1 TUpdateTree.Data Property

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

This is Data, a member of class TUpdateTree.

58.1.13.5.2 TUpdateTree.Delta Property

Pascal

```
property Delta: TPacketDataSet;
```

C++

```
__property TPacketDataSet Delta;
```

Description

This is Delta, a member of class TUpdateTree.

58.1.13.5.3 TUpdateTree.DetailCount Property

Pascal

```
property DetailCount: Integer;
```

C++

```
__property int DetailCount;
```

Description

This is DetailCount, a member of class TUpdateTree.

58.1.13.5.4 TUpdateTree.DetailList Property

Pascal

```
property DetailList: TList;
```

C++

```
__property TList DetailList;
```

Description

This is DetailList, a member of class TUpdateTree.

58.1.13.5.5 TUpdateTree.Details Property

Pascal

```
property Details [Index: Integer]: TUpdateTree;
```

C++

```
__property TUpdateTree Details[int Index];
```

Description

This is Details, a member of class TUpdateTree.

58.1.13.5.6 TUpdateTree.ErrorDS Property

Pascal

```
property ErrorDS: TPacketDataSet;
```

C++

```
__property TPacketDataSet ErrorDS;
```

Description

This is ErrorDS, a member of class TUpdateTree.

58.1.13.5.7 TUpdateTree.HasErrors Property

Pascal

```
property HasErrors: Boolean;
```

C++

```
__property Boolean HasErrors;
```

Description

This is HasErrors, a member of class TUpdateTree.

58.1.13.5.8 TUpdateTree.IsNested Property

Pascal

```
property IsNested: Boolean;
```

C++

```
__property Boolean IsNested;
```

Description

This is IsNested, a member of class TUpdateTree.

58.1.13.5.9 TUpdateTree.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class TUpdateTree.

58.1.13.5.10 TUpdateTree.Opened Property

Pascal

```
property Opened: Boolean;
```

C++

```
__property Boolean Opened;
```

Description

This is Opened, a member of class TUpdateTree.

58.1.13.5.11 TUpdateTree.Parent Property

Pascal

```
property Parent: TUpdateTree;
```

C++

```
__property TUpdateTree Parent;
```

Description

This is Parent, a member of class TUpdateTree.

58.1.13.5.12 TUpdateTree.Resolver Property

Pascal

```
property Resolver: TCustomResolver;
```

C++

```
__property TCustomResolver Resolver;
```

Description

This is Resolver, a member of class TUpdateTree.

58.1.13.5.13 TUpdateTree.Source Property

Pascal

```
property Source: TDataSet;
```

C++

```
__property TDataSet Source;
```

Description

This is Source, a member of class TUpdateTree.

58.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IProviderContainer (see page 3213)	This is class Provider.IProviderContainer.

58.2.1 IProviderContainer Interface

Class Hierarchy

Provider.IProviderContainer

Pascal

```
IProviderContainer = interface;
```

C++

```
__interface IProviderContainer;
```

File

Provider

Description

This is class Provider.IProviderContainer.

58.2.1.1 IProviderContainer Members

The following tables list the members exposed by IProviderContainer.

Public Methods

	Name	Description
	RegisterProvider (see page 3214)	This is RegisterProvider, a member of class IProviderContainer.
	UnRegisterProvider (see page 3214)	This is UnRegisterProvider, a member of class IProviderContainer.

58.2.1.2 IProviderContainer Methods

The methods of the IProviderContainer class are listed here.

Public Methods

	Name	Description
	RegisterProvider (see page 3214)	This is RegisterProvider, a member of class IProviderContainer.
	UnRegisterProvider (see page 3214)	This is UnRegisterProvider, a member of class IProviderContainer.

58.2.1.2.1 IProviderContainer.RegisterProvider Method

Pascal

```
procedure RegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall RegisterProvider(TCustomProvider Prov);
```

Description

This is RegisterProvider, a member of class IProviderContainer.

58.2.1.2.2 IProviderContainer.UnRegisterProvider Method

Pascal

```
procedure UnRegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall UnRegisterProvider(TCustomProvider Prov);
```

Description

This is UnRegisterProvider, a member of class IProviderContainer.

58.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetObjectProperty (see page 3215)	This is function Provider.GetObjectProperty.
	GetStringProperty (see page 3215)	This is function Provider.GetStringProperty.
	VarArrayFromStrings (see page 3215)	Creates a Variant array that contains the strings in a TStrings object.
	VarArrayFromWideStrings (see page 3216)	This is function Provider.VarArrayFromWideStrings.

58.3.1 Provider.GetObjectProperty Function

Pascal

```
function GetObjectProperty(Instance: TPersistent; const PropName: string): TObject;
```

C++

```
TObject * GetObjectProperty(TPersistent * Instance, const UnicodeString PropName);
```

File

Provider

Description

This is function Provider.GetObjectProperty.

58.3.2 Provider.GetStringProperty Function

Pascal

```
function GetStringProperty(Instance: TPersistent; const PropName: string): WideString;
```

C++

```
BSTR GetStringProperty(TPersistent * Instance, const UnicodeString PropName);
```

File

Provider

Description

This is function Provider.GetStringProperty.

58.3.3 Provider.VarArrayFromStrings Function

Creates a Variant array that contains the strings in a TStrings object.

Pascal

```
function VarArrayFromStrings(Strings: TStrings): Variant;
```

C++

```
Variant VarArrayFromStrings(TStrings Strings);
```

File

Provider

Description

Call VarArrayFromStrings to create a Variant array to represent the strings in a TStrings object. VarArrayFromStrings creates a new Variant array of WideString values, where each WideString corresponds to a string in the specified TStrings object.

Strings is the TStrings object that supplies the strings for the Variant array.

VarArrayFromStrings returns the new Variant array.

See Also

PackageParams

VarArrayCreate

58.3.4 Provider.VarArrayFromWideStrings Function

Pascal

```
function VarArrayFromWideStrings(Strings: TWideStrings): Variant;
```

C++

```
Variant VarArrayFromWideStrings(TWideStrings Strings);
```

File

Provider

Description

This is function Provider.VarArrayFromWideStrings.

58.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TGetRecordOption (see page 3217)	TGetRecordOption enumerates the types of information that can be added to data packets.
	TProviderOption (see page 3218)	TProviderOption and TProviderOptions (see page 3228) influence the type of information that is communicated between client datasets and provider components.
	TResolverResponse (see page 3221)	TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Records

	Name	Description
	TPutFieldInfo (see page 3220)	TPutFieldInfo contains information about a field.

58.4.1 Provider.TGetRecordOption Enumeration

TGetRecordOption enumerates the types of information that can be added to data packets.

Pascal

```
TGetRecordOption = (
  grMetaData,
  grReset,
  grXML,
  grXMLUTF8
);
```

C++

```
enum TGetRecordOption {
  grMetaData,
  grReset,
  grXML,
  grXMLUTF8
};
```

File

Provider

Description

TGetRecordOption values are listed in the following table.

Value	Meaning
grMetaData	The data packet includes metadata as well as record values.
grReset	The records in the data packet start with the first record, regardless of the contents of any previously sent data packets.
grXML	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are expressed using escape sequences.

grXMLUTF8	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are encoded using UTF-8.

See Also

TCustomProvider (see page 3096)

TGetRecordOptions (see page 3226)

58.4.2 Provider.TProviderOption Enumeration

TProviderOption and TProviderOptions (see page 3228) influence the type of information that is communicated between client datasets and provider components.

Pascal

```
TProviderOption = (
  poFetchBlobsOnDemand,
  poFetchDetailsOnDemand,
  poIncFieldProps,
  poCascadeDeletes,
  poCascadeUpdates,
  poReadOnly,
  poAllowMultiRecordUpdates,
  poDisableInserts,
  poDisableEdits,
  poDisableDeletes,
  poNoReset,
  poAutoRefresh,
  poPropogateChanges,
  poAllowCommandText,
  poRetainServerOrder,
  poUseQuoteChar
);
```

C++

```
enum TProviderOption {
  poFetchBlobsOnDemand,
  poFetchDetailsOnDemand,
  poIncFieldProps,
  poCascadeDeletes,
  poCascadeUpdates,
  poReadOnly,
  poAllowMultiRecordUpdates,
  poDisableInserts,
  poDisableEdits,
  poDisableDeletes,
  poNoReset,
  poAutoRefresh,
  poPropogateChanges,
  poAllowCommandText,
  poRetainServerOrder,
  poUseQuoteChar
};
```

File

Provider

Description

TProviderOptions (see page 3228) is a set of TProviderOption values. TProviderOption values are listed in the following table.

Value	Meaning
poFetchBlobsOnDemand	BLOB fields are not included in data packets. Instead, client applications must request these values on an as-needed basis. If the client dataset's FetchOnDemand property is True, then the client requests these values automatically. Otherwise, the client application uses the FetchBlobs method to retrieve BLOB data.
poFetchDetailsOnDemand	When the provider represents the master of a master/detail relationship, nested detail values are not included in the data packet. Instead, client applications request these on an as-needed basis. If the client dataset's FetchOnDemand property is True, then the client requests these values automatically. Otherwise the client application uses the FetchDetails method to retrieve nested detail sets.
poIncFieldProps	The data packet includes the following field properties (where applicable): Alignment, DisplayLabel, DisplayWidth, Visible, DisplayFormat, EditFormat, MaxValue, MinValue, Currency, EditMask, DisplayValues.
poCascadeDeletes	Tells the server to automatically delete detail records when master table records are deleted. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded deletes as part of its referential integrity settings.
poCascadeUpdates	Tells the server to update detail records automatically when master table key values are changed. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded updates as part of its referential integrity settings.
poReadOnly	The client dataset can't apply updates to the provider.
poAllowMultiRecordUpdates	Enables individual updates that affect multiple records. When poAllowMultiRecordUpdates is not included, updates that change multiple records are automatically aborted.
poDisableInserts	Clients cannot add new records. If the client tries to insert a record, an exception is raised. (This does not affect the client's ability to edit or delete records.)
poDisableEdits	Clients cannot modify existing data values. If the client tries to edit a field, an exception is raised. (This does not affect the client's ability to insert or delete records.)
poDisableDeletes	Clients cannot delete records. If the client tries to delete a record, an exception is raised. (This does not affect the client's ability to edit or insert records.)
poNoReset	Ignores the reset flag in calls to AS_GetRecords (TGetRecordsOption value of grReset).
poAutoRefresh	Refreshes the client dataset with current record values whenever it applies updates.
poPropogateChanges	Changes made in a BeforeUpdateRecord or AfterUpdateRecord event handler are sent back to the client and merged into the client dataset.
poAllowCommandText	Enables the client to override the provider's dataset by replacing its associated SQL text or the name of its stored procedure or table. These overrides are supplied to the GetRecords or Execute method.
poRetainServerOrder	Signals that the client should not attempt to re-establish the default order by sorting the records in the data packet. This prevents the client from changing the record order because, for example, it is unable to duplicate the locale on the server.
poUseQuoteChar	Specifies that the quotation mark (“) used by the SQL provider will also be used to quote SQL identifiers in the SQL queries created by the provider. This option is True by default; set it to False to eliminate the quotes.

See Also

TBaseProvider (see page 3077)

TGetRecordOption (see page 3217)

58.4.3 Provider.TPutFieldInfo Record

TPutFieldInfo contains information about a field.

Pascal

```
TPutFieldInfo = record
  FieldNo: Integer;
  Field: TField;
  DataSet: TDataSet;
  Size: Integer;
  IsDetail: Boolean;
  Opened: Boolean;
  PutProc: TPutFieldProc;
  LocalFieldIndex: Integer;
  FieldInfos: Pointer;
end;
```

C++

```
struct TPutFieldInfo {
  int FieldNo;
  TField Field;
  TDataSet DataSet;
  int Size;
  Boolean IsDetail;
  Boolean Opened;
  TPutFieldProc PutProc;
  int LocalFieldIndex;
  void * FieldInfos;
};
```

File

Provider

Description

TPutFieldInfo is a record containing information about a field. TPutFieldInfo is used when adding a new field to a data set. TPutFieldInfo fields are listed in the following table.

Field	Meaning
FieldNo	The position of the field (column) in the underlying database table.
Field	The actual field component.
DataSet	Identifies the dataset to which the field component belongs.
Size	Indicates the size used in the definition of the physical database field for data types that support different sizes.
IsDetail	Specifies whether the field is linked to a data set.
Opened	Specifies whether the linked data set is active, in the case when the field is linked to a data set.
PutProc	Stores the procedure used to add the field to the data set.
LocalFieldIndex	Index variable used internally.
FieldInfos	In the case when the field is linked to a data set, FieldInfos contains information about all the fields in the linked data set. To access the information about the fields, do a typecast on FieldInfos to a TInfoArray (see page 3227).

See Also

TInfoArray (see page 3227)

PPutFieldInfo (see page 3222)

58.4.4 Provider.TResolverResponse Enumeration

TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Pascal

```
TResolverResponse = (
  rrSkip,
  rrAbort,
  rrMerge,
  rrApply,
  rrIgnore
);
```

C++

```
enum TResolverResponse {
  rrSkip,
  rrAbort,
  rrMerge,
  rrApply,
  rrIgnore
};
```

File

Provider

Description

The following table lists the possible values for TResolverResponse and what they indicate:

Value	Meaning
rrSkip	Skip updating the record that raised the error condition, and leave the unapplied changes in the cache.
rrAbort	Abort the entire update operation without displaying an error message.
rrMerge	Merge the updates in the delta packet with the new underlying value from the database. This will only succeed if none of the updated fields have been changed by another user.
rrApply	Apply the current record value (as it has been fixed in the OnUpdateError handler) instead of the original update.
rrIgnore	Ignore the error condition: Do not apply the record but do not return the record to the client dataset for resolving either.

See Also

OnUpdateError (see page 3092)

TCustomResolver (see page 3125)

58.5 Types

The following table lists types in this documentation.

Types

Name	Description
PPutFieldInfo (see page 3222)	PPutFieldInfo is a pointer type to a TPutFieldInfo (see page 3220) record.
TAfterUpdateRecordEvent (see page 3223)	TAfterUpdateRecordEvent represents the type of events that occur when the associated resolver has just updated a record.
TBeforeCommitEvent (see page 3223)	TBeforeCommitEvent represents the procedure type for the events that occur before committing a data set.
TBeforeUpdateRecordEvent (see page 3224)	TBeforeUpdateRecordEvent represents the procedure type for the events that occur before a record is updated.
TDataRequestEvent (see page 3224)	Represents the function type for the events that occur when a provider calls its DataRequest method.
TGetDSProps (see page 3225)	Represents the procedure type for the events that occur when the provider adds additional information to a data packet it is creating.
TGetParamsEvent (see page 3225)	Represents the procedure type for the events that occur when the provider adds attributes to the data set.
TGetRecordOptions (see page 3226)	TGetRecordOptions is used to decide what type of information is added to data packets.
TGetTableNameEvent (see page 3226)	Represents the procedure type for the events that occur when a resolver initializes its information about the table to which it applies updates.
TInfoArray (see page 3227)	TInfoArray is an array of TPutFieldInfo (see page 3220) records.
TOnValidate (see page 3227)	Represents the procedure type for the events that occur when the provider applies updates contained in a `Delta` packet.
TProviderDataEvent (see page 3228)	Represents the procedure type for the events that occur when the provider applies updates or retrieves data.
TProviderOptions (see page 3228)	TProviderOptions influences the type of information that is communicated between client datasets and provider components.
TPutFieldProc (see page 3229)	Allows to decide the procedure used when adding a new field to a data set.
TResolverErrorEvent (see page 3230)	Represents the procedure type for the events that occur when the provider fails to update a record.

58.5.1 Provider.PPutFieldInfo Type

PPutFieldInfo is a pointer type to a TPutFieldInfo (see page 3220) record.

Pascal

```
PPutFieldInfo = ^TPutFieldInfo;
```

C++

```
^TPutFieldInfo PPutFieldInfo;
```

File

Provider

Description

Declare a PPutFieldInfo type variable to reference a TPutFieldInfo (see page 3220) record, which contains information used when adding a new field to the data set.

See Also

TPutFieldInfo (see page 3220)

58.5.2 Provider.TAfterUpdateRecordEvent Type

TAfterUpdateRecordEvent represents the type of events that occur when the associated resolver has just updated a record.

Pascal

```
TAfterUpdateRecordEvent = procedure (Sender: TObject; SourceDS: TDataSet; DeltaDS:
TCustomClientDataSet; UpdateKind: TUpdateKind) of object;
```

C++

```
(Sender: TObject; SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind: TUpdateKind)
( TAfterUpdateRecordEvent)();
```

File

Provider

Description

Call TAfterUpdateRecordEvent to provide special processing immediately after a record has been successfully updated. For example, you can use an object of the TAfterUpdateRecordEvent type to maintain a log of successful updates.

See Also

TBeforeUpdateRecordEvent (see page 3224)

Procedural types

Creating events

58.5.3 Provider.TBeforeCommitEvent Type

TBeforeCommitEvent represents the procedure type for the events that occur before committing a data set.

Pascal

```
TBeforeCommitEvent = procedure (Sender:TObject; DeltaDS: TCustomClientDataSet; ErrorCount,
MaxErrors: integer; const ResultVar: OleVariant) of object;
```

C++

```
(Sender:TObject; DeltaDS: TCustomClientDataSet; ErrorCount, MaxErrors: integer; const
ResultVar: OleVariant) ( TBeforeCommitEvent)();
```

File

Provider

Description

A variable of TBeforeCommitEvent type references an event that occurs before the associated resolver commits the changes to the data set.

See Also

TAfterUpdateRecordEvent (see page 3223)

TBeforeUpdateRecordEvent (see page 3224)

Procedural types

Creating events

58.5.4 Provider.TBeforeUpdateRecordEvent Type

TBeforeUpdateRecordEvent represents the procedure type for the events that occur before a record is updated.

Pascal

```
TBeforeUpdateRecordEvent = procedure (Sender: TObject; SourceDS: TDataSet; DeltaDS:
TCustomClientDataSet; UpdateKind: TUpdateKind; var Applied: Boolean) of object;
```

C++

```
(Sender: TObject; SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind: TUpdateKind;
var Applied: Boolean) ( TBeforeUpdateRecordEvent)();
```

File

Provider

Description

A variable of TBeforeUpdateRecordEvent type references an event that occurs before the associated resolver updates a record.

See Also

TAfterUpdateRecordEvent (see page 3223)

Procedural types

Creating events

58.5.5 Provider.TDataRequestEvent Type

Represents the function type for the events that occur when a provider calls its DataRequest method.

Pascal

```
TDataRequestEvent = function (Sender: TObject; Input: OleVariant): OleVariant of object;
```

C++

```
(Sender: TObject; Input: OleVariant): OleVariant ( TDataRequestEvent)();
```

File

Provider

Description

Use a variable of TDataRequestEvent type to reference an event that occurs when a provider calls its DataRequest method.

See Also

DataRequest (see page 3101)

OnDataRequest (see page 3124)

Procedural types

Creating events

58.5.6 Provider.TGetDSProps Type

Represents the procedure type for the events that occur when the provider adds additional information to a data packet it is creating.

Pascal

```
TGetDSProps = procedure (Sender: TObject; DataSet: TDataSet; out Properties: OleVariant) of object;
```

C++

```
(Sender: TObject; DataSet: TDataSet; out Properties: OleVariant) ( TGetDSProps)();
```

File

Provider

Description

A variable of TGetDSProps type references an event that occurs when the provider adds additional information to a data packet it is creating.

See Also

OnGetDataSetProperties (see page 3174)

58.5.7 Provider.TGetParamsEvent Type

Represents the procedure type for the events that occur when the provider adds attributes to the data set.

Pascal

```
TGetParamsEvent = procedure (DataSet: TDataSet; Params: TList) of object;
```

C++

```
(DataSet: TDataSet; Params: TList) ( TGetParamsEvent)();
```

File

Provider

Description

A variable of TGetParamsEvent type references an event that occurs when the provider adds attributes to the data set.

See Also

AddDataSetAttributes (see page 3139)

Procedural types

Creating events

58.5.8 Provider.TGetRecordOptions Type

TGetRecordOptions is used to decide what type of information is added to data packets.

Pascal

```
TGetRecordOptions = set of TGetRecordOption;
```

C++

```
TGetRecordOption TGetRecordOptions;
```

File

Provider

Description

TGetRecordOptions is a set of TGetRecordOption (see page 3217) values. TGetRecordOption (see page 3217) values are listed in the following table.

Value	Meaning
grMetaData	The data packet includes metadata as well as record values.
grReset	The records in the data packet start with the first record, regardless of the contents of any previously sent data packets.
grXML	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are expressed using escape sequences.
grXMLUTF8	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are encoded using UTF-8.

See Also

TCustomProvider (see page 3096)

58.5.9 Provider.TGetTableNameEvent Type

Represents the procedure type for the events that occur when a resolver initializes its information about the table to which it applies updates.

Pascal

```
TGetTableNameEvent = procedure (Sender: TObject; DataSet: TDataSet; var TableName: WideString)
of object;
```

C++

```
(Sender: TObject; DataSet: TDataSet; var TableName: WideString) ( TGetTableNameEvent)();
```

File

Provider

Description

A variable of TGetTableNameEvent type references an event that enables the provider to apply updates to datasets where the resolver cannot determine the target table in the provider's dataset.

See Also

OnGetTableName (see page 3175)

Procedural types

Creating events

58.5.10 Provider.TInfoArray Type

TInfoArray is an array of TPutFieldInfo (see page 3220) records.

Pascal

```
TInfoArray = array of TPutFieldInfo;
```

C++

```
array of TPutFieldInfo TInfoArray;
```

File

Provider

Description

Use a variable of TInfoArray type to store information about adding an entire record to a data set. The record contains several fields of various types.

See Also

TPutFieldInfo (see page 3220)

PPutFieldInfo (see page 3222)

58.5.11 Provider.TOnValidate Type

Represents the procedure type for the events that occur when the provider applies updates contained in a `Delta` packet.

Pascal

```
TOnValidate = procedure (const Delta: OleVariant) of object;
```

C++

```
(const Delta: OleVariant) ( TOnValidate)();
```

File

Provider

Description

A variable of TOnValidate type references an event that occurs when the provider applies updates contained in a `Delta` packet.

See Also

OnValidate (see page 3125)

58.5.12 Provider.TProviderDataEvent Type

Represents the procedure type for the events that occur when the provider applies updates or retrieves data.

Pascal

```
TProviderDataEvent = procedure (Sender: TObject; DataSet: TCustomClientDataSet) of object;
```

C++

```
(Sender: TObject; DataSet: TCustomClientDataSet) ( TProviderDataEvent)();
```

File

Provider

Description

A variable of TProviderDataEvent type references an event that occurs either when the provider begins to apply updates or when the provider retrieves data.

See Also

OnUpdateData (see page 3092)

OnGetData (see page 3091)

Procedural types

Creating events

58.5.13 Provider.TProviderOptions Type

TProviderOptions influences the type of information that is communicated between client datasets and provider components.

Pascal

```
TProviderOptions = set of TProviderOption;
```

C++

```
TProviderOption TProviderOptions;
```

File

Provider

Description

TProviderOptions is a set of TProviderOption (see page 3218) values.

TProviderOption (see page 3218) values are listed in the following table.

Value	Meaning
poFetchBlobsOnDemand	BLOB fields are not included in data packets. Instead, client applications must request these values on an as-needed basis. If the client dataset's FetchOnDemand property is True, then the client requests these values automatically. Otherwise, the client application uses the FetchBlobs method to retrieve BLOB data.

poFetchDetailsOnDemand	When the provider represents the master of a master/detail relationship, nested detail values are not included in the data packet. Instead, client applications request these on an as-needed basis. If the client dataset's FetchOnDemand property is True, then the client requests these values automatically. Otherwise the client application uses the FetchDetails method to retrieve nested detail sets.
poIncFieldProps	The data packet includes the following field properties (where applicable): Alignment, DisplayLabel, DisplayWidth, Visible, DisplayFormat, EditFormat, MaxValue, MinValue, Currency, EditMask, DisplayValues.
poCascadeDeletes	Tells the server to delete detail records automatically when master table records are deleted. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded deletes as part of its referential integrity settings.
poCascadeUpdates	Tells the server to automatically update detail records when master table key values are changed. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded updates as part of its referential integrity settings.
poReadOnly	The client dataset cannot apply updates to the provider.
poAllowMultiRecordUpdates	Enables individual updates that affect multiple records. When poAllowMultiRecordUpdates is not included, updates that change multiple records are automatically aborted.
poDisableInserts	Clients cannot add new records. If the client tries to insert a record, an exception is raised. (This does not affect the client's ability to edit or delete records.)
poDisableEdits	Clients cannot modify existing data values. If the client tries to edit a field, an exception is raised. (This does not affect the client's ability to insert or delete records.)
poDisableDeletes	Clients cannot delete records. If the client tries to delete a record, an exception is raised. (This does not affect the client's ability to edit or insert records.)
poNoReset	Ignores the reset flag in calls to AS_GetRecords (TGetRecordsOption value of grReset).
poAutoRefresh	Refreshes the client dataset with current record values whenever it applies updates.
poPropogateChanges	Changes made in a BeforeUpdateRecord or AfterUpdateRecord event handler are sent back to the client and merged into the client dataset.
poAllowCommandText	Enables the client to override the provider's dataset by replacing its associated SQL text or the name of its stored procedure or table. These overrides are supplied to the GetRecords or Execute method.
poRetainServerOrder	Signals that the client should not attempt to re-establish the default order by sorting the records in the data packet. This prevents the client from changing the record order because, for example, it is unable to duplicate the locale on the server.
poUseQuoteChar	Specifies that the quotation mark (“) used by the SQL provider will also be used to quote SQL identifiers in the SQL queries created by the provider. This option is True by default; set it to False to eliminate the quotes.

See Also

TBaseProvider (see page 3077)

TGetRecordOption (see page 3217)

58.5.14 Provider.TPutFieldProc Type

Allows to decide the procedure used when adding a new field to a data set.

Pascal

```
TPutFieldProc = procedure (Info: PPutFieldInfo) of object;
```

C++

```
(Info: PPutFieldInfo) ( TPutFieldProc)();
```

File

Provider

Description

A variable of the TPutFieldProc type references a procedure used when adding a new field to a data set.

See Also

TPutFieldInfo (see page 3220)

PPutFieldInfo (see page 3222)

58.5.15 Provider.TResolverErrorEvent Type

Represents the procedure type for the events that occur when the provider fails to update a record.

Pascal

```
TResolverErrorEvent = procedure (Sender: TObject; DataSet: TCustomClientDataSet; E:
EUpdateError; UpdateKind: TUpdateKind; var Response: TResolverResponse) of object;
```

C++

```
(Sender: TObject; DataSet: TCustomClientDataSet; E: EUpdateError; UpdateKind: TUpdateKind; var
Response: TResolverResponse) ( TResolverErrorEvent)();
```

File

Provider

Description

A variable of TResolverErrorEvent type references an event that occurs when the provider cannot update a record because of an error condition.

See Also

OnUpdateError (see page 3092)

Procedural types

Creating events

58.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
InformixLob (see page 3231)	Resolves Informix rather than Oracle BLOB and CLOB fields.

58.6.1 Provider.InformixLob Variable

Resolves Informix rather than Oracle BLOB and CLOB fields.

Pascal

```
InformixLob: Boolean;
```

C++

```
Boolean InformixLob;
```

File

Provider

Description

Informix BLOB (fldBLOB, fldstHBINARY) and CLOB (fldBLOB, fldstHMEMO) fields are mapped as ftOraBlob and ftOraClob respectively. The DataSnap resolver performs Oracle-specific query generation when resolving Oracle BLOB/CLOB fields, but not when resolving Informix BLOB/CLOBs. When using Informix BLOB/CLOBs, set InformixLob to true. To resume using Oracle BLOB/CLOBs, set InformixLob to false (the default).

58.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MetaDataOption (see page 3232)	Specifies the options available when retrieving metadata from a target database.
ResetOption (see page 3233)	This is constant Provider.ResetOption.
XMLOption (see page 3233)	This is constant Provider.XMLOption.
XMLUTF8Option (see page 3234)	This is constant Provider.XMLUTF8Option.

58.7.1 Provider.MetaDataOption Constant

Specifies the options available when retrieving metadata from a target database.

Pascal

```
MetaDataOption: Integer = 1 shl ord(grMetaData);
```

C++

```
int MetaDataOption = 1 shl ord(grMetaData);
```

File

Provider

Description

Each database provides a number of options for data that can be retrieved from and about the database. When you build your own data provider, it can be helpful to use these options when implementing the `ISQLMetaData` interface. The following table describes the allowable metadata options.

Element	Description
CatalogName	Specifies a system table name.
DatabaseName	Specifies the name of the database.
DatabaseVersion	Specifies the version number of the database.
MaxColumnInSelect	Limits the number of columns that can be specified in a SELECT statement. The column count starts with the first column. Any columns beyond the limit are not returned.
MaxColumnsInTable	Limits the number of columns that can be returned from a table. The column count starts with the first column. Any columns beyond the limit are not returned.
MaxObjectNameLength	Limits the number of characters returned of a database object name. Names exceeding this limit are truncated. If database object names are similar, truncating them might result in duplicate names or meaningless names.
MaxRowSize	Limits the size of any returned rows. This can be useful if you suspect there might be BLOBs in the rows you are selecting, but you want to protect the performance of your query.
MaxSQLLength	Limits the length, in characters, of a SQL statement.
ObjectQuoteChar	Specifies the quote character to use when delimiting object names containing special characters, such as spaces.

PackageName	Specifies the name of a package.
ProcSupportsCursor	Specifies whether or not a stored procedure supports the use of a cursor. Set to **true** if it supports a cursor, otherwise set to **false**.
ProcSupportsCursors	Specifies whether or not a stored procedure supports the use of multiple cursors. Set to **true** if it supports cursors, otherwise set to **false**.
SQLEscapeChar	Specifies the character to use to delimit escape sequences in SQL statements.
SchemaName	Specifies the name of a database schema if different from the DatabaseName.
SupportsTransaction	Specifies whether or not the database can be named in a transaction-based SQL statement. Set to **true** if it supports a transaction, otherwise set to **false**.
SupportsTransactions	Specifies whether or not the database can be named in multiple transaction-based SQL statements. Set to **true** if it supports transactions, otherwise set to **false**.
TransactionIsoLevel	Specifies the transaction isolation level. Isolation levels supported by BDP.NET include ReadCommitted, RepeatableRead, DirtyRead, and Custom.

58.7.2 Provider.ResetOption Constant

Pascal

```
ResetOption: Integer = 1 shl ord(grReset);
```

C++

```
int ResetOption = 1 shl ord(grReset);
```

File

Provider

Description

This is constant Provider.ResetOption.

58.7.3 Provider.XMLOption Constant

Pascal

```
XMLOption: Integer = 1 shl ord(grXML);
```

C++

```
int XMLOption = 1 shl ord(grXML);
```

File

Provider

Description

This is constant Provider.XMLOption.

58.7.4 Provider.XMLUTF8Option Constant

Pascal

```
XMLUTF8Option: Integer = 1 shl ord(grXMLUTF8);
```

C++

```
int XMLUTF8Option = 1 shl ord(grXMLUTF8);
```

File

Provider

Description

This is constant Provider.XMLUTF8Option.

59 Registry Namespace

This is namespace Registry.

Topics

Name	Description
Classes (see page 3236)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3327)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	ERegistryException (see page 3236)	ERegistryException is the exception class for registry errors.
	TRegIniFile (see page 3237)	TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.
	TRegistry (see page 3246)	TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.
	TRegistryIniFile (see page 3299)	TRegistryIniFile is a wrapper for the Windows system registry.

Structs, Records, Enums

	Name	Description
	TRegDataInfo (see page 3327)	TRegDataInfo is a type used by the GetDataInfo method of TRegistery.
	TRegDataType (see page 3327)	TRegDataType is a type used by the GetDataInfo method of TRegistery.
	TRegKeyInfo (see page 3328)	TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

59.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERegistryException (see page 3236)	ERegistryException is the exception class for registry errors.
	TRegIniFile (see page 3237)	TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.
	TRegistry (see page 3246)	TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.
	TRegistryIniFile (see page 3299)	TRegistryIniFile is a wrapper for the Windows system registry.

59.1.1 ERegistryException Class

ERegistryException is the exception class for registry errors.

Class Hierarchy

Pascal

```
ERegistryException = class(Exception);
```

C++

```
class ERegistryException : public Exception;
```

File

Registry

Description

ERegistryException is raised when an application cannot

Create a new key in the registry.

Read a data value associated with a key.

Read a binary data value associated with a key into a local buffer.

Write a data value to a key.

Key creation fails when an application attempts to create a subkey under a key for which it does not have KEY_CREATE_SUB_KEY security access.

Reading a data value associated with a key fails when an application does not have KEY_READ security access, or when the application attempts to read the wrong kind of data from a key (for example, attempting to read string data from an integer data value).

Reading a binary data value into a local buffer fails when an application does not allocate a buffer large enough for the data.

Writing a data value to a key fails because an application does not have KEY_WRITE security access for the current key.

See Also

TRegistry (see page 3246)

TRegIniFile (see page 3237)

59.1.2 TRegIniFile Class

TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.

Class Hierarchy

Pascal

```
TRegIniFile = class(TRegistry);
```

C++

```
class TRegIniFile : public TRegistry;
```

File

Registry

Description

TRegIniFile presents a simple interface to the system registry, hiding the need to know about the underlying structure of the registry. TRegIniFile acts as a helper object to TRegistryIniFile (see page 3299), which descends from TCustomIniFile (see page 716) (and is therefore more widely compatible with other INI file classes).

TRegIniFile enables handling the Windows 95/NT system registry as if it were a Windows 3.x INI file. Instead of processing an INI file, however, TRegIniFile reads from and writes to the system registry.

Although TRegIniFile descends from TRegistry (see page 3246), it adds the properties and methods used by a TIniFile (see page 752) object. The FileName (see page 3246) passed to a TRegIniFile object becomes a subkey under the system registry's root key (HKEY_CURRENT_USER by default). What corresponds to a section in an INI file is treated as a key in the system registry, and what corresponds to data entries under a section in an INI file are treated as data values under a key in the system registry.

Note: TRegIniFile is intended to be used primarily as a helper object to TRegistryIniFile (see page 3299), which unifies the interface to INI files and the system registry. However, applications can use TRegIniFile directly.

See Also

TIniFile (see page 752)

TMemIniFile (see page 765)

TCustomIniFile (see page 716)

TRegistryIniFile (see page 3299)

59.1.2.1 TRegIniFile Members

The following tables list the members exposed by TRegIniFile.

Protected Methods

	Name	Description
	ChangeKey (see page 3255)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 3262)	This is GetBaseKey, a member of class TRegistry.

	GetData (see page 3262)	This is GetData, a member of class TRegistry.
	GetKey (see page 3264)	This is GetKey, a member of class TRegistry.
	PutData (see page 3273)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 3280)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
	CloseKey (see page 3255)	Writes the current key to the registry and closes the key.
	Create (see page 3239)	This is the overview for the Create constructor overload.
	Create (see page 3251)	This is the overview for the Create constructor overload.
	CreateKey (see page 3258)	Creates a new key in the registry.
	DeleteKey (see page 3240)	Erases a data value that is associated with a key.
	DeleteValue (see page 3261)	Erases a data value that is associated with the current key.
	Destroy (see page 3253)	Closes the current key and destroys the TRegistry (see page 3246) object.
	EraseSection (see page 3241)	Deletes a key and its data values in the system registry.
	GetDataAsString (see page 3262)	This is GetDataAsString, a member of class TRegistry.
	GetDataInfo (see page 3263)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 3263)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 3264)	Returns the enumerated data type of a specified data value associated with the current key.
	GetKeyInfo (see page 3264)	Returns information about the current key.
	GetKeyNames (see page 3265)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 3265)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 3266)	Determines if the current key has subkeys.
	KeyExists (see page 3266)	Determines if a specified key exists.
	LoadKey (see page 3268)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.
	MoveKey (see page 3269)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
	OpenKey (see page 3270)	Opens a specified key.
	OpenKeyReadOnly (see page 3272)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 3273)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 3241)	Retrieves a Boolean value from a specified data value associated with a key.
	ReadCurrency (see page 3274)	Retrieves a currency value from a specified data value associated with the current key.
	ReadDate (see page 3274)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 3275)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 3275)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 3242)	Retrieves an integer value from a specified data value (Ident) associated with a key (Section).
	ReadSection (see page 3242)	Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.
	ReadSections (see page 3243)	Retrieves the names of all subkeys associated with the current key.
	ReadSectionValues (see page 3243)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 3244)	Retrieves a string value from a specified data value (Ident) associated with a key (Section).
	ReadTime (see page 3277)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 3277)	Establishes a connection to a registry on another computer.
	RenameValue (see page 3278)	Changes the name of a data value associated with the current key.

	ReplaceKey (see page 3278)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 3279)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
	SaveKey (see page 3279)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 3280)	Removes a hive from the registry.
	ValueExists (see page 3281)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 3281)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 3244)	Writes a Boolean value to a specified data value associated with a specified key.
	WriteCurrency (see page 3282)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 3282)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 3283)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 3286)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 3288)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 3245)	Writes a long integer value to a specified data value associated with a specified key.
	WriteString (see page 3245)	Writes a string value to a specified data value associated with a specified key.
	WriteTime (see page 3292)	Stores a time value in a specifically named data value associated with the current key.

Public Properties

	Name	Description
	Access (see page 3293)	Specifies the level of access to use when opening keys.
R	CurrentKey (see page 3296)	Specifies the registry key that is currently open.
R	CurrentPath (see page 3296)	Indicates the registry path associated with the current key.
R	FileName (see page 3246)	Specifies the name of the key opened or created in the system registry.
	LazyWrite (see page 3296)	Specifies how keys are written to the registry when calling the CloseKey (see page 3255) procedure.
	RootKey (see page 3297)	Specifies the root key for the TRegistry (see page 3246) object in an application.

59.1.2.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegIniFile.Create (string) (see page 3239)	Creates a TRegIniFile (see page 3237) object for an application.
	TRegIniFile.Create (string, LongWord) (see page 3239)	Creates a TRegIniFile (see page 3237) object for an application.

59.1.2.2.1 TRegIniFile.Create Constructor (string)

Creates a TRegIniFile (see page 3237) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
```

```
constructor Create(const FileName: string; AAccess: LongWord); overload;
```

C++

```
__fastcall TRegIniFile(const UnicodeString FileName);
__fastcall TRegIniFile(const UnicodeString FileName, LongWord AAccess);
```

Description

Use Create to construct a TRegIniFile (see page 3237) object for an application.

FileName (see page 3246) initializes the FileName (see page 3246) property.

AAccess initializes the Access (see page 3293) property, which determines the access rights used when opening keys. If no AAccess parameter is supplied, Access (see page 3293) is initialized to KEY_ALL_ACCESS.

See Also

FileName (see page 3246)

Create (see page 3251)

Access (see page 3293)

59.1.2.3 TRegIniFile Methods

The methods of the TRegIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 3240)	Erases a data value that is associated with a key.
	EraseSection (see page 3241)	Deletes a key and its data values in the system registry.
	ReadBool (see page 3241)	Retrieves a Boolean value from a specified data value associated with a key.
	ReadInteger (see page 3242)	Retrieves an integer value from a specified data value (Ident) associated with a key (Section).
	ReadSection (see page 3242)	Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.
	ReadSections (see page 3243)	Retrieves the names of all subkeys associated with the current key.
	ReadSectionValues (see page 3243)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 3244)	Retrieves a string value from a specified data value (Ident) associated with a key (Section).
	WriteBool (see page 3244)	Writes a Boolean value to a specified data value associated with a specified key.
	WriteInteger (see page 3245)	Writes a long integer value to a specified data value associated with a specified key.
	WriteString (see page 3245)	Writes a string value to a specified data value associated with a specified key.

59.1.2.3.1 TRegIniFile.DeleteKey Method

Erases a data value that is associated with a key.

Pascal

```
procedure DeleteKey(const Section: string; const Ident: string);
```

C++

```
__fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase a data value associated with a key. Section is string containing the name of the system registry key containing the value to delete. Ident is a string containing the name of the data value to delete.

Note: DeleteKey for TRegIniFile (see page 3237) obscures the DeleteKey method of TRegistry (see page 3246), from which TRegIniFile (see page 3237) descends. You can access TRegistry (see page 3246)'s DeleteKey method by casting the call to DeleteKey as type TRegistry (see page 3246), or by using the scope resolution operator.

Note: On Windows 95, DeleteKey will delete the key and all its subkeys. On Windows NT, the subkeys must be explicitly deleted by separate calls to DeleteKey.

See Also

DeleteKey (see page 3259)

EraseSection (see page 3241)

59.1.2.3.2 TRegIniFile.EraseSection Method

Deletes a key and its data values in the system registry.

Pascal

```
procedure EraseSection(const Section: string);
```

C++

```
__fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a key and its data values from the system registry. Section identifies the key to delete.

See Also

DeleteKey (see page 3240)

59.1.2.3.3 TRegIniFile.ReadBool Method

Retrieves a Boolean value from a specified data value associated with a key.

Pascal

```
function ReadBool(const Section: string; const Ident: string; Default: Boolean): Boolean;
```

C++

```
__fastcall Boolean ReadBool(const UnicodeString Section, const UnicodeString Ident, Boolean
Default);
```

Description

Call ReadBool to retrieve a Boolean value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is a Boolean value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadBool function of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the ReadBool function of TRegistry (see page 3246) instead of this function, cast the call to ReadBool as TRegistry (see page 3246).

See Also

ReadInteger (see page 3242)

ReadString (see page 3244)

ReadBool (see page 3274)

59.1.2.3.4 TRegIniFile.ReadInteger Method

Retrieves an integer value from a specified data value (Ident) associated with a key (Section).

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
```

C++

```
__fastcall Longint ReadInteger(const UnicodeString Section, const UnicodeString Ident, Longint
Default);
```

Description

Call ReadInteger to retrieve an integer value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is an integer value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadInteger function of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the ReadInteger function of TRegistry (see page 3246) instead of this function, cast the call to ReadInteger as TRegistry (see page 3246).

See Also

ReadBool (see page 3241)

ReadString (see page 3244)

ReadInteger (see page 3276)

59.1.2.3.5 TRegIniFile.ReadSection Method

Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings);
```

C++

```
__fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all data values associated with a key into a TStrings object.

Section is a string identifying the key for which to retrieve data-value names.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object such as a string list, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

ReadSections (see page 3243)

ReadSectionValues (see page 3243)

TListBox

Items

59.1.2.3.6 TRegIniFile.ReadSections Method

Retrieves the names of all subkeys associated with the current key.

Pascal

```
procedure ReadSections(Strings: TStrings);
```

C++

```
__fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all subkeys associated with the current key.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

CurrentKey (see page 3296)

ReadSection (see page 3242)

ReadSectionValues (see page 3243)

TListBox

Items

59.1.2.3.7 TRegIniFile.ReadSectionValues Method

Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings);
```

C++

```
__fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read all data values associated with a specified key into a string object.

Section is the name of the key from which to retrieve data-values.

Strings specifies the string list object to hold the retrieved values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself. Use the Values property of the string object to access a specific string in the object.

Items

Values

59.1.2.3.8 TRegIniFile.ReadString Method

Retrieves a string value from a specified data value (Ident) associated with a key (Section).

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string): string;
```

C++

```
__fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString Ident,
const UnicodeString Default);
```

Description

Call ReadString to retrieve a string value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is a string value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadString function of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the ReadString function of TRegistry (see page 3246) instead of this function, cast the call to ReadString as TRegistry (see page 3246).

See Also

ReadBool (see page 3241)

ReadInteger (see page 3242)

ReadString (see page 3276)

59.1.2.3.9 TRegIniFile.WriteBool Method

Writes a Boolean value to a specified data value associated with a specified key.

Pascal

```
procedure WriteBool(const Section: string; const Ident: string; Value: Boolean);
```

C++

```
__fastcall WriteBool(const UnicodeString Section, const UnicodeString Ident, Boolean Value);
```

Description

Call WriteBool to store a Boolean value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the Boolean value to write into the data value.

Note: This function overrides the WriteBool procedure of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the WriteBool procedure of TRegistry (see page 3246) instead of this procedure, cast the call to WriteBool as TRegistry (see page 3246).

See Also

WriteInteger (see page 3245)

WriteString (see page 3245)

WriteBool (see page 3282)

59.1.2.3.10 TRegIniFile.WriteInteger Method

Writes a long integer value to a specified data value associated with a specified key.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint);
```

C++

```
__fastcall WriteInteger(const UnicodeString Section, const UnicodeString Ident, Longint Value);
```

Description

Call WriteInteger to store an integer value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the integer value to write into the data value.

Note: This function overrides the WriteInteger procedure of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the WriteInteger procedure of TRegistry (see page 3246) instead of this procedure, cast the call to WriteInteger as TRegistry (see page 3246).

See Also

WriteBool (see page 3244)

WriteString (see page 3245)

WriteInteger (see page 3289)

59.1.2.3.11 TRegIniFile.WriteString Method

Writes a string value to a specified data value associated with a specified key.

Pascal

```
procedure WriteString(const Section: string; const Ident: string; const Value: string);
```

C++

```
__fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to store a string value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the string value to write into the data value.

Note: This function overrides the WriteString procedure of TRegistry (see page 3246), from which TRegIniFile (see page 3237) is derived. To call the WriteString procedure of TRegistry (see page 3246) instead of this procedure, cast the call to WriteString as TRegistry (see page 3246).

See Also

WriteBool (see page 3244)

WriteInteger (see page 3245)

WriteString (see page 3289)

59.1.2.4 TRegIniFile Properties

The properties of the TRegIniFile class are listed here.

Public Properties

	Name	Description
	FileName (see page 3246)	Specifies the name of the key opened or created in the system registry.

59.1.2.4.1 TRegIniFile.FileName Property

Specifies the name of the key opened or created in the system registry.

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

Query FileName to determine the name of the key in the system registry that is the root key for all TRegIniFile (see page 3237) operations.

See Also

CurrentKey (see page 3296)

RootKey (see page 3297)

59.1.3 TRegistry Class

TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.

Class Hierarchy

Pascal

```
TRegistry = class(TObject);
```

C++

```
class TRegistry : public TObject;
```

File

Registry

Description

Use TRegistry to encapsulate access to the Windows system registry in an application. The registry is a database that an application can use to store and retrieve configuration information. Configuration information is stored in a hierarchical tree. Each node in the tree is called a key. Every key can contain subkeys and data values that represent part of the configuration information for an application.

All keys that an application creates, opens, reads, or writes are subkeys of predefined root keys. By default, a TRegistry object is created with a root key of HKEY_CURRENT_USER.

Only one key is accessible at a time in a TRegistry object. To determine the key that is currently accessible, read the value of the CurrentKey (see page 3296) property. TRegistry methods enable an application to open, close, save, move, copy, and delete keys.

One or more data values containing actual configuration information can be stored in a key. TRegistry methods enable an application to query a key to see if it contains data, to read data in a key, and to write data to a key.

Note: The TRegistry component is not fully compatable with the Windows NT environment. Functions such as RestoreKey (see page 3279) and SaveKey (see page 3279) may not perform properly without a significant number of workarounds.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
```

```
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                           mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
      MessageDlg('Unable to create key! Exiting.',
                 mtError, mbOKCancel, 0);
      Exit();
    end;

  {checking if the values exist and inserting when neccesary}

  if not reg.KeyExists('Creation\ Date') then
    begin
      today := Now;
        reg.WriteDateTime('Creation\ Date', today);
    end;

  if not reg.KeyExists('Licenced\ To') then
    begin
        reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
    end;

  if not reg.KeyExists('App\ Location') then
    begin
        reg.WriteExpandString('App\ Location',
                              '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
    end;

  if not reg.KeyExists('Projects\ Location') then
```

```
    begin
        reg.WriteExpandString('Projects\ Location',
                              '%USERPROFILE%\\MyApplication\\Projects\\');
    end;

  reg.CloseKey();

end;

procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
var
  reg : TRegistry;
begin
  reg := TRegistry.Create(KEY_WRITE);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
  reg.DeleteKey('Software\\MyCompanyName');

  reg.CloseKey();
end;
```

59.1.3.1 TRegistry Members

The following tables list the members exposed by TRegistry.

Protected Methods

	Name	Description
	ChangeKey (see page 3255)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 3262)	This is GetBaseKey, a member of class TRegistry.
	GetData (see page 3262)	This is GetData, a member of class TRegistry.
	GetKey (see page 3264)	This is GetKey, a member of class TRegistry.
	PutData (see page 3273)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 3280)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
	CloseKey (see page 3255)	Writes the current key to the registry and closes the key.
	Create (see page 3251)	This is the overview for the Create constructor overload.
	CreateKey (see page 3258)	Creates a new key in the registry.
	DeleteKey (see page 3259)	Removes a specified key and its associated data from the registry.
	DeleteValue (see page 3261)	Erases a data value that is associated with the current key.
	Destroy (see page 3253)	Closes the current key and destroys the TRegistry (see page 3246) object.
	GetDataAsString (see page 3262)	This is GetDataAsString, a member of class TRegistry.
	GetDataInfo (see page 3263)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 3263)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 3264)	Returns the enumerated data type of a specified data value associated with the current key.
	GetKeyInfo (see page 3264)	Returns information about the current key.
	GetKeyNames (see page 3265)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 3265)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 3266)	Determines if the current key has subkeys.
	KeyExists (see page 3266)	Determines if a specified key exists.
	LoadKey (see page 3268)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.

	MoveKey (see page 3269)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
	OpenKey (see page 3270)	Opens a specified key.
	OpenKeyReadOnly (see page 3272)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 3273)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 3274)	Retrieves a Boolean value from a specified data value associated with the current key.
	ReadCurrency (see page 3274)	Retrieves a currency value from a specified data value associated with the current key.
	ReadDate (see page 3274)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 3275)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 3275)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 3276)	Retrieves an integer value from a specified data value associated with the current key.
	ReadString (see page 3276)	Retrieves a string value from a specified data value associated with the current key.
	ReadTime (see page 3277)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 3277)	Establishes a connection to a registry on another computer.
	RenameValue (see page 3278)	Changes the name of a data value associated with the current key.
	ReplaceKey (see page 3278)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 3279)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
	SaveKey (see page 3279)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 3280)	Removes a hive from the registry.
	ValueExists (see page 3281)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 3281)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 3282)	Stores a Boolean value in a specifically named data value associated with the current key.
	WriteCurrency (see page 3282)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 3282)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 3283)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 3286)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 3288)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 3289)	Stores an integer value in a specifically named data value associated with the current key.
	WriteString (see page 3289)	Stores a string value in a specifically named data value associated with the current key.
	WriteTime (see page 3292)	Stores a time value in a specifically named data value associated with the current key.

Public Properties

	Name	Description
	Access (see page 3293)	Specifies the level of access to use when opening keys.
R	CurrentKey (see page 3296)	Specifies the registry key that is currently open.
R	CurrentPath (see page 3296)	Indicates the registry path associated with the current key.
	LazyWrite (see page 3296)	Specifies how keys are written to the registry when calling the CloseKey (see page 3255) procedure.
	RootKey (see page 3297)	Specifies the root key for the TRegistry (see page 3246) object in an application.

59.1.3.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegistry.Create () (see page 3251)	Creates a TRegistry (see page 3246) object for an application.
	TRegistry.Create (LongWord) (see page 3251)	Creates a TRegistry (see page 3246) object for an application.

59.1.3.2.1 TRegistry.Create Constructor ()

Creates a TRegistry (see page 3246) object for an application.

Pascal

```
constructor Create; overload;
constructor Create(AAccess: LongWord); overload;
```

C++

```
__fastcall TRegistry();
__fastcall TRegistry(LongWord AAccess);
```

Description

Create instantiates a TRegistry (see page 3246) object and sets the RootKey (see page 3297) property to HKEY_CURRENT_USER and the LazyWrite (see page 3296) property to true. If an AAccess parameter is supplied, this value is used to initialize the Access (see page 3293) property. Otherwise, Access (see page 3293) is initialized to KEY_ALL_ACCESS.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary
```

```
    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
```

```
        MessageDlg('Unable to create key! Exiting.',
                   mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

Destroy (see page 3253)

Access (see page 3293)

59.1.3.3 TRegistry.Destroy Destructor

Closes the current key and destroys the TRegistry (see page 3246) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistry();
```

Description

Destroy closes the current key and frees the resources allocated for a registry object when it is no longer needed.

59.1.3.4 TRegistry Methods

The methods of the TRegistry class are listed here.

Protected Methods

	Name	Description
	ChangeKey (see page 3255)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 3262)	This is GetBaseKey, a member of class TRegistry.
	GetData (see page 3262)	This is GetData, a member of class TRegistry.
	GetKey (see page 3264)	This is GetKey, a member of class TRegistry.
	PutData (see page 3273)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 3280)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
	CloseKey (see page 3255)	Writes the current key to the registry and closes the key.
	CreateKey (see page 3258)	Creates a new key in the registry.
	DeleteKey (see page 3259)	Removes a specified key and its associated data from the registry.
	DeleteValue (see page 3261)	Erases a data value that is associated with the current key.
	GetDataAsString (see page 3262)	This is GetDataAsString, a member of class TRegistry.
	GetDataInfo (see page 3263)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 3263)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 3264)	Returns the enumerated data type of a specified data value associated with the current key.
	GetKeyInfo (see page 3264)	Returns information about the current key.
	GetKeyNames (see page 3265)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 3265)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 3266)	Determines if the current key has subkeys.
	KeyExists (see page 3266)	Determines if a specified key exists.
	LoadKey (see page 3268)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.
	MoveKey (see page 3269)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
	OpenKey (see page 3270)	Opens a specified key.
	OpenKeyReadOnly (see page 3272)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 3273)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 3274)	Retrieves a Boolean value from a specified data value associated with the current key.

	ReadCurrency (see page 3274)	Retrieves a currency value from a specified data value associated with the current key.
	ReadDate (see page 3274)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 3275)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 3275)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 3276)	Retrieves an integer value from a specified data value associated with the current key.
	ReadString (see page 3276)	Retrieves a string value from a specified data value associated with the current key.
	ReadTime (see page 3277)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 3277)	Establishes a connection to a registry on another computer.
	RenameValue (see page 3278)	Changes the name of a data value associated with the current key.
	ReplaceKey (see page 3278)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 3279)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
	SaveKey (see page 3279)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 3280)	Removes a hive from the registry.
	ValueExists (see page 3281)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 3281)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 3282)	Stores a Boolean value in a specifically named data value associated with the current key.
	WriteCurrency (see page 3282)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 3282)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 3283)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 3286)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 3288)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 3289)	Stores an integer value in a specifically named data value associated with the current key.
	WriteString (see page 3289)	Stores a string value in a specifically named data value associated with the current key.
	WriteTime (see page 3292)	Stores a time value in a specifically named data value associated with the current key.

59.1.3.4.1 TRegistry.ChangeKey Method

Pascal

```
procedure ChangeKey(Value: HKey; const Path: string);
```

C++

```
__fastcall ChangeKey(HKey Value, const UnicodeString Path);
```

Description

This is ChangeKey, a member of class TRegistry.

59.1.3.4.2 TRegistry.CloseKey Method

Writes the current key to the registry and closes the key.

Pascal

```
procedure CloseKey;
```

C++

```
__fastcall CloseKey();
```

Description

Call CloseKey to write the current key to the registry and close the key. An application should not keep keys open any longer than necessary. Many TRegistry (see page 3246) methods routinely call CloseKey after reading from or writing to the registry. Calling CloseKey when there is no current key has no effect.

Note: When an application closes a key, the key is written to the registry. The LazyWrite (see page 3296) property determines how the write takes place.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
```

```
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                           mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
      MessageDlg('Unable to create key! Exiting.',
                 mtError, mbOKCancel, 0);
      Exit();
    end;

  {checking if the values exist and inserting when neccesary}

  if not reg.KeyExists('Creation\ Date') then
    begin
      today := Now;
        reg.WriteDateTime('Creation\ Date', today);
    end;

  if not reg.KeyExists('Licenced\ To') then
    begin
        reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
    end;

  if not reg.KeyExists('App\ Location') then
    begin
```

```
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

59.1.3.4.3 TRegistry.CreateKey Method

Creates a new key in the registry.

Pascal

```
function CreateKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean CreateKey(const UnicodeString Key);
```

Description

Use CreateKey to add a new key to the registry. Key is the name of the key to create. Key can be an absolute or relative name. An absolute key begins with a backslash (\) and is a subkey of the root key. A relative key is a subkey of the current key.

CreateKey returns true if key creation is successful. On error, an exception is raised. Attempting to create a key that already exists has no effect.

CreateKey creates only non-volatile keys. If you need to create volatile keys on Windows NT, you must call the Windows API directly.

CreateKey creates keys with a security access of KEY_ALL_ACCESS. If you need to create keys with more restricted access, you must call the Windows API directly.

A key created by CreateKey has no values. To set key values, use the WriteCurrency (see page 3282), WriteBinaryData (see page 3281), WriteBool (see page 3282), WriteDate (see page 3282), WriteDateTime (see page 3283), WriteFloat (see page 3288), WriteInteger (see page 3289), WriteString (see page 3289), or WriteTime (see page 3292) procedures.

See Also

WriteDate (see page 3282)

WriteDateTime (see page 3283)

WriteFloat (see page 3288)

WriteInteger (see page 3289)

WriteString (see page 3289)

WriteTime (see page 3292)

Access (see page 3293)

59.1.3.4.4 TRegistry.DeleteKey Method

Removes a specified key and its associated data from the registry.

Pascal

```
function DeleteKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean DeleteKey(const UnicodeString Key);
```

Description

Call DeleteKey to remove a specified key and its associated data, if any, from the registry. Under Windows 95, if the key has subkeys, the subkeys and any associated data are also removed. Under Windows NT, subkeys must be explicitly deleted by separate calls to DeleteKey.

DeleteKey returns true if key deletion is successful. On error, DeleteKey returns false.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                    mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                    mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary
```

```
    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
      MessageDlg('Unable to create key! Exiting.',
```

```
                    mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

See Also

CreateKey (see page 3258)

DeleteValue (see page 3261)

59.1.3.4.5 TRegistry.DeleteValue Method

Erases a data value that is associated with the current key.

Pascal

```
function DeleteValue(const Name: string): Boolean;
```

C++

```
__fastcall Boolean DeleteValue(const UnicodeString Name);
```

Description

Call DeleteValue to remove a specific data value associated with the current key. Name is string containing the name of the

value to delete. Keys can contain multiple data values, and every value associated with a key has a unique name.

DeleteValue returns true if the deletion is successful, false if the deletion fails.

See Also

DeleteKey (see page 3259)

WriteBinaryData (see page 3281)

WriteBool (see page 3282)

WriteDate (see page 3282)

WriteDateTime (see page 3283)

WriteFloat (see page 3288)

WriteInteger (see page 3289)

WriteString (see page 3289)

WriteTime (see page 3292)

59.1.3.4.6 TRegistry.GetBaseKey Method

Pascal

```
function GetBaseKey(Relative: Boolean): HKey;
```

C++

```
__fastcall HKey GetBaseKey(Boolean Relative);
```

Description

This is GetBaseKey, a member of class TRegistry.

59.1.3.4.7 TRegistry.GetData Method

Pascal

```
function GetData(const Name: string; Buffer: Pointer; BufSize: Integer; var RegData:
TRegDataType): Integer;
```

C++

```
__fastcall int GetData(const UnicodeString Name, void * Buffer, int BufSize, TRegDataType
RegData);
```

Description

This is GetData, a member of class TRegistry.

59.1.3.4.8 TRegistry.GetDataAsString Method

Pascal

```
function GetDataAsString(const ValueName: string; PrefixType: Boolean = false): string;
```

C++

```
__fastcall UnicodeString GetDataAsString(const UnicodeString ValueName, Boolean PrefixType =
false);
```

Description

This is GetDataAsString, a member of class TRegistry.

59.1.3.4.9 TRegistry.GetDataInfo Method

Returns information about a specified data value associated with the current key.

Pascal

```
function GetDataInfo(const ValueName: string; var Value: TRegDataInfo): Boolean;
```

C++

```
__fastcall Boolean GetDataInfo(const UnicodeString ValueName, TRegDataInfo Value);
```

Description

Call GetDataInfo to get information about a data value associated with the current key. ValueName is a string containing the name of the data value to query. Value is a TRegDataInfo (see page 3327) value in which information about the data value is returned. If the data value is of type rdString or rdExpandString, the size of the data value includes an extra byte for the terminating null character.

GetDataInfo returns true if data value information is returned. If GetDataInfo fails, it returns false, and the Value record is filled with zeros.

CurrentKey (see page 3296)

GetDataSize (see page 3263)

GetDataType (see page 3264)

GetKeyInfo (see page 3264)

59.1.3.4.10 TRegistry.GetDataSize Method

Returns the size, in bytes, of a specified data value associated with the current key.

Pascal

```
function GetDataSize(const ValueName: string): Integer;
```

C++

```
__fastcall int GetDataSize(const UnicodeString ValueName);
```

Description

Call GetDataSize to determine the size, in bytes, of a data value associated with the current key. ValueName is a string containing the name of the data value to query.

On success, GetDataSize returns the size of the data value. On failure, GetDataSize returns -1.

Note: If the data value is a string, GetDataSize returns the size of the data value and one extra byte for the terminating null character.

See Also

CurrentKey (see page 3296)

GetDataInfo (see page 3263)

GetDataType (see page 3264)

GetKeyInfo (see page 3264)

59.1.3.4.11 TRegistry.GetDataType Method

Returns the enumerated data type of a specified data value associated with the current key.

Pascal

```
function GetDataType(const ValueName: string): TRegDataType;
```

C++

```
__fastcall TRegDataType GetDataType(const UnicodeString ValueName);
```

Description

Call GetDataType to determine the data type of a data value associated with the current key. ValueName is a string containing the name of the data value to query.

GetDataType returns a TRegDataType (see page 3327) value that indicates the type of value associated with the current key.

See Also

CurrentKey (see page 3296)

GetDataInfo (see page 3263)

GetDataSize (see page 3263)

GetKeyInfo (see page 3264)

59.1.3.4.12 TRegistry.GetKey Method

Pascal

```
function GetKey(const Key: string): HKEY;
```

C++

```
__fastcall HKEY GetKey(const UnicodeString Key);
```

Description

This is GetKey, a member of class TRegistry.

59.1.3.4.13 TRegistry.GetKeyInfo Method

Returns information about the current key.

Pascal

```
function GetKeyInfo(var Value: TRegKeyInfo): Boolean;
```

C++

```
__fastcall Boolean GetKeyInfo(TRegKeyInfo Value);
```

Description

Call GetKeyInfo to return all information about the current key to an application. Value is a variable declared in an application to store the key information returned by this function.

On success GetKeyInfo returns true. On failure it returns false, and the Value record is set to zeros.

See Also

CurrentKey (see page 3296)

GetKeyNames (see page 3265)

GetValueNames (see page 3265)

HasSubKeys (see page 3266)

59.1.3.4.14 TRegistry.GetKeyNames Method

Returns a string list containing the names of all subkeys belonging to the current key.

Pascal

```
procedure GetKeyNames(Strings: TStrings);
```

C++

```
__fastcall GetKeyNames(TStrings Strings);
```

Description

Call GetKeyNames to determine the names of all subkeys belonging to the current key. Determining the names of subkeys is useful in an application that iterates through a set of keys.

Strings is a variable of type TStrings into which to return the list of subkey names.

See Also

CurrentKey (see page 3296)

GetKeyInfo (see page 3264)

GetValueNames (see page 3265)

59.1.3.4.15 TRegistry.GetValueNames Method

Returns a string list containing the names of all data values associated with the current key.

Pascal

```
procedure GetValueNames(Strings: TStrings);
```

C++

```
__fastcall GetValueNames(TStrings Strings);
```

Description

Call GetValueNames to determine the names of all data values associated with the current key. Determining the names of data values is useful in an application that iterates through a set of data values for a key.

Strings is a variable of type TStrings into which to return the list of data value names.

See Also

CurrentKey (see page 3296)

GetDataInfo (see page 3263)

GetKeyNames (see page 3265)

ValueExists (see page 3281)

59.1.3.4.16 TRegistry.HasSubKeys Method

Determines if the current key has subkeys.

Pascal

```
function HasSubKeys: Boolean;
```

C++

```
__fastcall Boolean HasSubKeys();
```

Description

Call HasSubKeys to determine if the current key has any subkeys. HasSubKeys returns true if the current key has at least one subkey. Otherwise it returns false.

See Also

CurrentKey (see page 3296)

KeyExists (see page 3266)

59.1.3.4.17 TRegistry.KeyExists Method

Determines if a specified key exists.

Pascal

```
function KeyExists(const Key: string): Boolean;
```

C++

```
__fastcall Boolean KeyExists(const UnicodeString Key);
```

Description

Call KeyExists to determine if a key of a specified name exists. Key is the name of the key for which to search.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
```

```
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
```

```
      begin
        MessageDlg('Unable to create key! Exiting.',
                   mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

LoadKey (see page 3268)

ValueExists (see page 3281)

59.1.3.4.18 TRegistry.LoadKey Method

Creates a subkey under the root key and loads registry information from a file into the newly created subkey.

Pascal

```
function LoadKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean LoadKey(const UnicodeString Key, const UnicodeString FileName);
```

Description

Call LoadKey to:

1Create (see page 3251) a new subkey under the root key, and

2Load registry information from a file into the subkey. Registry (see page 3235) information can include data values, subkeys, and data values for those subkeys.

LoadKey is intended to simplify creation of a key, its values and subkeys, and the values for those subkeys in a single operation. A key, its subkeys, and all data values of the key and its subkeys is called a hive. Rather than creating each key and value separately, an application can read a hive from a file. This is especially useful for applications that users can reconfigure at run time.

Note: Before an application calls LoadKey, the RootKey (see page 3297) property must be set to HKEY_USERS, HKEY_LOCAL_MACHINE, or to a key returned by a previous call to RegistryConnect (see page 3277).

The Key parameter is the name of the subkey to create. The FileName parameter is the location of the file containing registry information to store in the subkey. The file specified by FileName must be one previously created using the SaveKey (see page 3279) function or the RegSaveKey Windows API function. On systems that use a file allocation table (FAT), FileName cannot include an extension.

RootKey (see page 3297)

CreateKey (see page 3258)

RegistryConnect (see page 3277)

SaveKey (see page 3279)

UnLoadKey (see page 3280)

59.1.3.4.19 TRegistry.MoveKey Method

Moves an existing key, its subkeys, and data values to a new location using a new key name.

Pascal

```
procedure MoveKey(const OldName: string; const NewName: string; Delete: Boolean);
```

C++

```
__fastcall MoveKey(const UnicodeString OldName, const UnicodeString NewName, Boolean Delete);
```

Description

Call MoveKey to copy or move an existing key, its subkeys, and data values to a different location. Under Windows 95, copying is recursive. If a key contains subkeys and data values, they too, are copied. When the operation is complete, the new key is closed. Under Windows NT, subkeys must be moved explicitly with separate calls to MoveKey.

OldName specifies the key to copy or move. NewName specifies a name for the duplicate key to create. If the key specified by NewName does not exist, MoveKey creates it. Delete specifies whether to delete the old key after the copy operation. If Delete is true, the key specified by OldName is deleted after it is copied. Otherwise the old key is closed.

See Also

CreateKey (see page 3258)

DeleteKey (see page 3259)

OpenKey (see page 3270)

59.1.3.4.20 TRegistry.OpenKey Method

Opens a specified key.

Pascal

```
function OpenKey(const Key: string; CanCreate: Boolean): Boolean;
```

C++

```
__fastcall Boolean OpenKey(const UnicodeString Key, Boolean CanCreate);
```

Description

Call OpenKey to make a specified key the current key. Key is the name of the key to open. If Key is nil (Delphi) or NULL (C++), the CurrentKey (see page 3296) property is set to the key specified by the RootKey (see page 3297) property.

CanCreate specifies whether to create the specified key if it does not exist. If CanCreate is true, the key is created if necessary.

Key is opened or created with the security access value specified by the Access (see page 3293) property. OpenKey only creates non-volatile keys, A non-volatile key is stored in the registry and is preserved when the system is restarted.

OpenKey returns true if the key is successfully opened or created

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                    mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                    mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
```

```
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
      MessageDlg('Unable to create key! Exiting.',
                 mtError, mbOKCancel, 0);
      Exit();
    end;

  {checking if the values exist and inserting when neccesary}

  if not reg.KeyExists('Creation\ Date') then
    begin
      today := Now;
        reg.WriteDateTime('Creation\ Date', today);
    end;

  if not reg.KeyExists('Licenced\ To') then
```

```
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

CreateKey (see page 3258)

OpenKeyReadOnly (see page 3272)

Access (see page 3293)

59.1.3.4.21 TRegistry.OpenKeyReadOnly Method

Opens a specified key in a read-only manner.

Pascal

```
function OpenKeyReadOnly(const Key: String): Boolean;
```

C++

```
__fastcall Boolean OpenKeyReadOnly(const UnicodeString Key);
```

Description

Call OpenKeyReadOnly to make a specified key the current key. Key is the name of the key to open. If Key is nil (Delphi) or NULL (C++), the CurrentKey (see page 3296) property is set to the key specified by the RootKey (see page 3297) property.

Key is opened with the security access value KEY_READ.

OpenKey (see page 3270) returns true if the key is successfully opened and CurrentKey (see page 3296) is set to the key.

Note: After a successful call to OpenKeyReadOnly the Access (see page 3293) property of the registry component is

automatically changed to KEY_READ, regardless of what that property was set to prior to the method call.

59.1.3.4.22 TRegistry.PutData Method

Pascal

```
procedure PutData(const Name: string; Buffer: Pointer; BufSize: Integer; RegData:
TRegDataType);
```

C++

```
__fastcall PutData(const UnicodeString Name, void * Buffer, int BufSize, TRegDataType RegData);
```

Description

This is PutData, a member of class TRegistry.

59.1.3.4.23 TRegistry.ReadBinaryData Method

Retrieves a binary value from a specified data value associated with the current key.

Pascal

```
function ReadBinaryData(const Name: string; var Buffer; BufSize: Integer): Integer;
```

C++

```
__fastcall int ReadBinaryData(const UnicodeString Name,  Buffer, int BufSize);
```

Description

Call ReadBinaryData to read a binary value from a specified data value associated with the current key. Name is the name of the data value to read. Buffer is the application variable into which to read the registry data. Buffer must be large enough to hold all of the data returned. BufSize specifies the size of Buffer.

If successful, ReadBinaryData writes the requested data into Buffer and returns the number of bytes written. If the Registry (see page 3235) entry contains a known type (such as a string), ReadBinaryData raises an exception.

Note: Binary data is typically a complex data structure (a record in Delphi or struct in C++). It might also be an icon or a bitmap although Microsoft recommends against storing graphics objects in the registry for performance reasons.

ReadInteger (see page 3276)

ReadString (see page 3276)

ReadTime (see page 3277)

59.1.3.4.24 TRegistry.ReadBool Method

Retrieves a Boolean value from a specified data value associated with the current key.

Pascal

```
function ReadBool(const Name: string): Boolean;
```

C++

```
__fastcall Boolean ReadBool(const UnicodeString Name);
```

Description

Call ReadBool to read a Boolean value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadBool returns the requested Boolean value. If the Registry (see page 3235) entry does not contain a boolean or integer value, an exception is raised.

See Also

CurrentKey (see page 3296)

WriteBool (see page 3282)

59.1.3.4.25 TRegistry.ReadCurrency Method

Retrieves a currency value from a specified data value associated with the current key.

Pascal

```
function ReadCurrency(const Name: string): Currency;
```

C++

```
__fastcall Currency ReadCurrency(const UnicodeString Name);
```

Description

Call ReadCurrency to read a Currency value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadCurrency returns a Currency value. If the Registry (see page 3235) entry does not contain a Currency value, an exception is raised.

See Also

CurrentKey (see page 3296)

WriteCurrency (see page 3282)

59.1.3.4.26 TRegistry.ReadDate Method

Retrieves a date value from a specified data value associated with the current key.

Pascal

```
function ReadDate(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadDate(const UnicodeString Name);
```

Description

Call ReadDate to read a date value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadDate returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the Registry (see page 3235) entry does not contain a date or time value, an exception is raised.

Note: Only use ReadDate to read data values previously stored with the WriteDate (see page 3282) procedure.

See Also

CurrentKey (see page 3296)

WriteDate (see page 3282)

ReadDateTime (see page 3275)

59.1.3.4.27 TRegistry.ReadDateTime Method

Retrieves a date and time value from a specified data value associated with the current key.

Pascal

```
function ReadDateTime(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadDateTime(const UnicodeString Name);
```

Description

Call ReadDateTime to read a datetime value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadDateTime returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the Registry (see page 3235) entry does not contain a date or time value, an exception is raised.

See Also

CurrentKey (see page 3296)

WriteDateTime (see page 3283)

ReadDate (see page 3274)

ReadTime (see page 3277)

59.1.3.4.28 TRegistry.ReadFloat Method

Retrieves a float value from a specified data value associated with the current key.

Pascal

```
function ReadFloat(const Name: string): Double;
```

C++

```
__fastcall Double ReadFloat(const UnicodeString Name);
```

Description

Call ReadFloat to read a float value from a specified data value associated with the current key. Name is the name of the data value to read.

If the Registry (see page 3235) entry does not contain a floating-point value, an exception is raised.

See Also

CurrentKey (see page 3296)

WriteFloat (see page 3288)

59.1.3.4.29 TRegistry.ReadInteger Method

Retrieves an integer value from a specified data value associated with the current key.

Pascal

```
function ReadInteger(const Name: string): Integer;
```

C++

```
__fastcall int ReadInteger(const UnicodeString Name);
```

Description

Call ReadInteger to read an integer value from a specified data value associated with the current key. Name is the name of the data value to read.

If the Registry (see page 3235) entry does not contain an integer, an exception is raised.

See Also

CurrentKey (see page 3296)

WriteInteger (see page 3289)

59.1.3.4.30 TRegistry.ReadString Method

Retrieves a string value from a specified data value associated with the current key.

Pascal

```
function ReadString(const Name: string): string;
```

C++

```
__fastcall UnicodeString ReadString(const UnicodeString Name);
```

Description

Call ReadString to read a string value from a specified data value associated with the current key. Name is the name of the data value to read.

If there is no Registry (see page 3235) entry with the specified name, ReadString returns an empty string. If the Registry (see page 3235) entry contains something other than a string, an exception is raised.

Note: ReadString retrieves data stored by either the WriteString (see page 3289) or WriteExpandString (see page 3286) method.

See Also

CurrentKey (see page 3296)

WriteString (see page 3289)

WriteExpandString (see page 3286)

59.1.3.4.31 TRegistry.ReadTime Method

Retrieves a time value from a specified data value associated with the current key.

Pascal

```
function ReadTime(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadTime(const UnicodeString Name);
```

Description

Call ReadTime to read a time value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadTime returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the specified Registry (see page 3235) entry does not contain a date or time value, an exception is raised.

Note: Only use ReadTime to read data values previously stored with the WriteTime (see page 3292) method.

See Also

CurrentKey (see page 3296)

WriteTime (see page 3292)

ReadDateTime (see page 3275)

59.1.3.4.32 TRegistry.RegistryConnect Method

Establishes a connection to a registry on another computer.

Pascal

```
function RegistryConnect(const UNCName: string): Boolean;
```

C++

```
__fastcall Boolean RegistryConnect(const UnicodeString UNCName);
```

Description

Call RegistryConnect to establish a connection to a registry on another computer running Windows 95 or Windows NT. UNCName is the name of the remote computer, and must take the following form:

```
\\computername
```

where computername is the name of the remote computer. If UNCName is nil (Delphi) or NULL (C++), the local machine name is used.

Note: Before calling RegistryConnect, an application must set the RootKey (see page 3297) property for its registry object to HKEY_USERS or HKEY_LOCAL_MACHINE.

If connection is successful, RegistryConnect sets the RootKey (see page 3297) property to the root key of the remote

computer and returns true. If unsuccessful, RegistryConnect returns false, and RootKey (see page 3297) remains unchanged.

See Also

RootKey (see page 3297)

LoadKey (see page 3268)

ReplaceKey (see page 3278)

RestoreKey (see page 3279)

SaveKey (see page 3279)

59.1.3.4.33 TRegistry.RenameValue Method

Changes the name of a data value associated with the current key.

Pascal

```
procedure RenameValue(const OldName: string; const NewName: string);
```

C++

```
__fastcall RenameValue(const UnicodeString OldName, const UnicodeString NewName);
```

Description

Call RenameValue to change the name of a data value associated with the current key. OldName is a string containing the current name of the data value. NewName is a string containing the replacement name for the data value.

If OldName is the name of an existing data value for the current key, and NewName is not the name of an existing data value for the current key, RenameValue changes the data value name as specified. Otherwise the current name remains unchanged.

CurrentKey (see page 3296)

GetValueNames (see page 3265)

ValueExists (see page 3281)

MoveKey (see page 3269)

59.1.3.4.34 TRegistry.ReplaceKey Method

Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.

Pascal

```
function ReplaceKey(const Key: string; const FileName: string; const BackUpFileName: string):
Boolean;
```

C++

```
__fastcall Boolean ReplaceKey(const UnicodeString Key, const UnicodeString FileName, const
UnicodeString BackUpFileName);
```

Description

Call ReplaceKey to replace the hive file backing a key and all its subkeys with a different hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

FileName indicates the name of the file containing the new key and subkey information. BackUpFileName is the name of a backup file used to store the current key and subkey information before it is overwritten.

ReplaceKey returns true if it is successful.

Note: The file specified by FileName parameter must be created with the SaveKey (see page 3279) function, or by directly calling the Windows 95/NT RegSaveKey API function. Under the FAT file system FileName cannot have an extension.

See Also

LoadKey (see page 3268)

RestoreKey (see page 3279)

SaveKey (see page 3279)

59.1.3.4.35 TRegistry.RestoreKey Method

Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.

Pascal

```
function RestoreKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean RestoreKey(const UnicodeString Key, const UnicodeString FileName);
```

Description

Call RestoreKey to open the specified key with a security access value of KEY_ALL_ACCESS and overwrite any information in the key and its subkeys with registry data stored in a hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the name of the key to open. FileName is the name of the file containing the hive information.

If RestoreKey successfully reads and copies the registry information in FileName to the specified key, the return value of RestoreKey is true and the key is closed.

Note: The file specified by FileName parameter must be created with the SaveKey (see page 3279) function, or by directly calling the Windows 95/NT RegSaveKey API function. Under the FAT file system FileName cannot have an extension.

See Also

LoadKey (see page 3268)

ReplaceKey (see page 3278)

RegistryConnect (see page 3277)

SaveKey (see page 3279)

59.1.3.4.36 TRegistry.SaveKey Method

Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.

Pascal

```
function SaveKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean SaveKey(const UnicodeString Key, const UnicodeString FileName);
```

Description

Call SaveKey to open a key with a security access value of KEY_ALL_ACCESS, and save the key and its subkeys and data values to a hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the key to save. FileName is the file into which to save the key information. It must be the name of a new file that does not already exist. On FAT file systems FileName cannot include an extension.

Files created by SaveKey are passed as parameters to the RestoreKey (see page 3279), ReplaceKey (see page 3278) and LoadKey (see page 3268) functions.

If SaveKey is successful it returns true and closes the key.

See Also

LoadKey (see page 3268)

ReplaceKey (see page 3278)

RestoreKey (see page 3279)

59.1.3.4.37 TRegistry.SetCurrentKey Method

Pascal

```
procedure SetCurrentKey(Value: HKEY);
```

C++

```
__fastcall SetCurrentKey(HKEY Value);
```

Description

This is SetCurrentKey, a member of class TRegistry.

59.1.3.4.38 TRegistry.UnLoadKey Method

Removes a hive from the registry.

Pascal

```
function UnLoadKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean UnLoadKey(const UnicodeString Key);
```

Description

Call UnLoadKey to remove a hive from the registry without modifying its associated hive file, if any. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the name of the key at the root of the hive to remove.

If successful, UnLoadKey returns true.

Note: Before calling this function, set RootKey (see page 3297) to HKEY_USERS, HKEY_LOCAL_MACHINE, or call RegistryConnect (see page 3277).

See Also

RootKey (see page 3297)

ReplaceKey (see page 3278)

RestoreKey (see page 3279)

SaveKey (see page 3279)

59.1.3.4.39 TRegistry.ValueExists Method

Determines if a specified data value exists for the current key.

Pascal

```
function ValueExists(const Name: string): Boolean;
```

C++

```
__fastcall Boolean ValueExists(const UnicodeString Name);
```

Description

Call ValueExists to determine if a particular data item exists in the registry. Calling ValueExists is especially useful before calling other TRegistry (see page 3246) methods that operate only on existing data items.

Name is the name of the data value for which to check.

ValueExists returns true if a match if found, false otherwise.

See Also

CurrentKey (see page 3296)

KeyExists (see page 3266)

59.1.3.4.40 TRegistry.WriteBinaryData Method

Stores a specifically named data value associated with the current key.

Pascal

```
procedure WriteBinaryData(const Name: string; var Buffer; BufSize: Integer);
```

C++

```
__fastcall WriteBinaryData(const UnicodeString Name,  Buffer, int BufSize);
```

Description

Call WriteBinaryData to store a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteBinary. If Name does not exist, it is created.

Buffer is a data buffer containing the data to store in the registry. BufSize indicates the size of Buffer.

Note: Data-value lengths are limited by available memory. Long values (more than 2048 bytes) should be stored as separate files, and those file names should be stored in the registry. Application elements such as icons, bitmaps, and executable files should be stored as separate files rather than as values in the registry.

If WriteBinaryData fails, an exception is raised, and the value is not written to the registry.

CurrentKey (see page 3296)

ReadBinaryData (see page 3273)

59.1.3.4.41 TRegistry.WriteBool Method

Stores a Boolean value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteBool(const Name: string; Value: Boolean);
```

C++

```
__fastcall WriteBool(const UnicodeString Name, Boolean Value);
```

Description

Call WriteBool to store a boolean value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteBool. If Name does not exist, it is created.

If WriteBool fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 3296)

ReadBool (see page 3274)

59.1.3.4.42 TRegistry.WriteCurrency Method

Stores a currency value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteCurrency(const Name: string; Value: Currency);
```

C++

```
__fastcall WriteCurrency(const UnicodeString Name, Currency Value);
```

Description

Call WriteCurrency to store a Currency value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteCurrency. If Name does not exist, it is created.

Value is a Currency value to store in the registry.

If WriteCurrency fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 3296)

ReadCurrency (see page 3274)

59.1.3.4.43 TRegistry.WriteDate Method

Stores a date value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteDate(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteDate(const UnicodeString Name, TDateTime Value);
```

Description

Call WriteDate to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteDate. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteDate fails, an exception is raised, and the value is not written to the registry.

If successful, WriteDate stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

WriteDateTime (see page 3283)

59.1.3.4.44 TRegistry.WriteDateTime Method

Stores a datetime value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteDateTime(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteDateTime(const UnicodeString Name, TDateTime Value);
```

Description

Call WriteDateTime to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteDateTime. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteDateTime fails, an exception is raised, and the value is not written to the registry.

If successful, WriteDateTime stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
```

```
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
```

```
    reg := TRegistry.Create(KEY_READ);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
      begin
        MessageDlg('Key not found! Created now.',
                               mtInformation, mbOKCancel, 0);
      end;
    reg.Access := KEY_WRITE;
    openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

    if not openResult = True then
      begin
        MessageDlg('Unable to create key! Exiting.',
                    mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

59.1.3.4.45 TRegistry.WriteExpandString Method

Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.

Pascal

```
procedure WriteExpandString(const Name: string; const Value: string);
```

C++

```
__fastcall WriteExpandString(const UnicodeString Name, const UnicodeString Value);
```

Description

Call WriteExpandString to store a string that contains unexpanded references to environment variables such as "%PATH%". The string is stored in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteExpandString. If Name does not exist, it is created.

Value is a string value to store in the registry.

If WriteExpandString fails, an exception is raised.

Note: To write strings that do not contain unexpanded environment variables, use WriteString (see page 3289) instead.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }
```

```
    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
  openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

  if not openResult = True then
    begin
      MessageDlg('Unable to create key! Exiting.',
                  mtError, mbOKCancel, 0);
      Exit();
    end;

  {checking if the values exist and inserting when neccesary}
```

```
    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

59.1.3.4.46 TRegistry.WriteFloat Method

Stores a Double value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteFloat(const Name: string; Value: Double);
```

C++

```
__fastcall WriteFloat(const UnicodeString Name, Double Value);
```

Description

Call WriteFloat to store a float value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteFloat. If Name does not exist, it is created.

Value is a float value to store in the registry.

If WriteFloat fails, an exception is raised, and the value is not written to the registry.

ReadFloat (see page 3275)

59.1.3.4.47 TRegistry.WriteInteger Method

Stores an integer value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteInteger(const Name: string; Value: Integer);
```

C++

```
__fastcall WriteInteger(const UnicodeString Name, int Value);
```

Description

Call WriteInteger to store an integer value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteInteger. If Name does not exist, it is created.

Value is a integer value to store in the registry.

If WriteInteger fails, an exception is raised, and the value is not written to the registry.

59.1.3.4.48 TRegistry.WriteString Method

Stores a string value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteString(const Name: string; const Value: string);
```

C++

```
__fastcall WriteString(const UnicodeString Name, const UnicodeString Value);
```

Description

Call WriteString to store a string value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteString. If Name does not exist, it is created.

Value is a string value to store in the registry.

If WriteString fails, an exception is raised, and the value is not written to the registry.

59.1.3.4.49 TRegistry.WriteTime Method

Stores a time value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteTime(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteTime(const UnicodeString Name, TDateTime Value);
```

Description

Call WriteTime to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteTime. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteTime fails, an exception is raised, and the value is not written to the registry.

If successful, WriteTime stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

CurrentKey (see page 3296)

ReadTime (see page 3277)

WriteDateTime (see page 3283)

59.1.3.5 TRegistry Properties

The properties of the TRegistry class are listed here.

Public Properties

	Name	Description
	Access (see page 3293)	Specifies the level of access to use when opening keys.
R	CurrentKey (see page 3296)	Specifies the registry key that is currently open.
R	CurrentPath (see page 3296)	Indicates the registry path associated with the current key.
	LazyWrite (see page 3296)	Specifies how keys are written to the registry when calling the CloseKey (see page 3255) procedure.
	RootKey (see page 3297)	Specifies the root key for the TRegistry (see page 3246) object in an application.

59.1.3.5.1 TRegistry.Access Property

Specifies the level of access to use when opening keys.

Pascal

```
property Access: LongWord;
```

C++

```
__property LongWord Access;
```

Description

Use Access to specify the level of security access to use when opening keys. The OpenKey (see page 3270) method uses the value of Access when opening a registry key. Access is initialized by the TRegistry (see page 3246) constructor, but can be altered before calling OpenKey (see page 3270).

The value of Access is a set of flags or'd together, where each flag indicates a type of permission. Choose a value that grants sufficient permission to allow the desired actions while not exceeding the access level of the system running the application. The following table lists the flags that can be included:

Flag	Meaning
KEY_ALL_ACCESS	combination of KEY_READ, KEY_WRITE, and KEY_CREATE_LINK.
KEY_READ	combination of KEY_QUERY_VALUE, KEY_ENUMERATE_SUB_KEYS, and KEY_NOTIFY.
KEY_WRITE	combination of KEY_SET_VALUE and KEY_CREATE_SUB_KEY.
KEY_QUERY_VALUE	grants permission to query subkey data.
KEY_ENUMERATE_SUB_KEYS	grants permission to enumerate subkeys.
KEY_NOTIFY	grants ability to receive change notifications.
KEY_SET_VALUE	grants permission to set subkey data.
KEY_CREATE_SUB_KEY	grants permission to create subkeys.
KEY_CREATE_LINK	grants permission to create symbolic links.
KEY_EXECUTE	restricts permission to read-only access.

Note: Access is ignored by the CreateKey (see page 3258) method, which always uses KEY_ALL_ACCESS.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                   mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
```

```
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
                   mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;
```

```
    if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
      begin
        MessageDlg('Key not found! Created now.',
                               mtInformation, mbOKCancel, 0);
      end;
    reg.Access := KEY_WRITE;
    openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

    if not openResult = True then
      begin
        MessageDlg('Unable to create key! Exiting.',
                     mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                               '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                               '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

See Also

OpenKey (see page 3270)

Create (see page 3251)

OpenKeyReadOnly (see page 3272)

59.1.3.5.2 TRegistry.CurrentKey Property

Specifies the registry key that is currently open.

Pascal

```
property CurrentKey: HKEY;
```

C++

```
__property HKEY CurrentKey;
```

Description

Use CurrentKey to determine the registry key that is currently open. All operations performed by TRegistry (see page 3246) affect only the current key. To access another key, call the OpenKey (see page 3270) or OpenKeyReadOnly (see page 3272) method.

See Also

CurrentPath (see page 3296)

RootKey (see page 3297)

OpenKey (see page 3270)

OpenKeyReadOnly (see page 3272)

59.1.3.5.3 TRegistry.CurrentPath Property

Indicates the registry path associated with the current key.

Pascal

```
property CurrentPath: string;
```

C++

```
__property UnicodeString CurrentPath;
```

Description

Use CurrentPath to determine the registry path of the current key. The system registry is hierarchical, and CurrentPath returns a string that spells out the hierarchy of keys from the root key to the current key, inclusive.

CurrentPath is automatically reset each time a different key becomes the current key.

See Also

CurrentKey (see page 3296)

RootKey (see page 3297)

59.1.3.5.4 TRegistry.LazyWrite Property

Specifies how keys are written to the registry when calling the CloseKey (see page 3255) procedure.

Pascal

```
property LazyWrite: Boolean;
```

C++

```
__property Boolean LazyWrite;
```

Description

Use LazyWrite to specify how keys are written to the registry. LazyWrite is initialized to true when a registry object is first created. When LazyWrite is true, keys are written to the registry when they are closed, but the CloseKey (see page 3255) procedure may return before the write operation takes place.

When LazyWrite is false, keys are written to the registry before CloseKey (see page 3255) returns. Set LazyWrite to false only when absolutely necessary. Setting LazyWrite to false guarantees that the changes an application makes to keys are written to the registry before further application processing takes place, but it uses more system resources when keys are closed. If LazyWrite is false, and an application is displaying or changing many registry entries, there will be a degradation in application performance.

See Also

CloseKey (see page 3255)

59.1.3.5.5 TRegistry.RootKey Property

Specifies the root key for the TRegistry (see page 3246) object in an application.

Pascal

```
property RootKey: HKEY;
```

C++

```
__property HKEY RootKey;
```

Description

Use RootKey to determine the hierarchy of subkeys an application can access, or to specify the root key for the application.

By default, RootKey is set to HKEY_CURRENT_USER when the registry object is created. To change the root key, specify a valid integer value for the RootKey property.

Note: For some operations, such as LoadKey (see page 3268) or RegistryConnect (see page 3277), an application may need to change the default value of RootKey.

C++ Examples:

```
/*
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
for inserting and deleting the values.
*/
void __fastcall TForm2::InsertToRegBtnClick(TObject *Sender)
{
    TRegistry* reg = new TRegistry(KEY_READ);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    if(!reg->KeyExists("Software\\MyCompanyName\\MyApplication\\"))
    {
        MessageDlg("Key not found! Created now.",
                    mtInformation, TMsgDlgButtons() << mbOK, 0);
    }
    reg->Access = KEY_WRITE;
    bool openResult = reg->OpenKey("Software\\MyCompanyName\\MyApplication\\", true);

    if(!openResult)
    {
        MessageDlg("Unable to create key! Exiting.",
```

```
                    mtError, TMsgDlgButtons() << mbOK, 0);
        return;
    }
    //checking if the values exist and inserting when neccesary

    if(!reg->KeyExists("Creation\ Date"))
    {
        TDateTime today = TDateTime::CurrentDateTime();
        reg->WriteDateTime("Creation\ Date", today);
    }

    if(!reg->KeyExists("Licenced\ To"))
    {
        reg->WriteString("Licenced\ To", "MySurname\ MyFirstName");
    }

    if(!reg->KeyExists("App\ Location"))
    {
        reg->WriteExpandString("App\ Location",
                               "%PROGRAMFILES%\\MyCompanyName\\MyApplication\\");
    }

    if(!reg->KeyExists("Projects\ Location"))
    {
        reg->WriteExpandString("Projects\ Location",
                               "%USERPROFILE%\\MyApplication\\Projects\\");
    }

    reg->CloseKey();
}
//---------------------------------------------------------------------------
void __fastcall TForm2::DelFromRegBtnClick(TObject *Sender)
{
    //deleting the example registry entries
    TRegistry* reg = new TRegistry(KEY_WRITE);
    reg->RootKey = HKEY_LOCAL_MACHINE;

    reg->DeleteKey("Software\\MyCompanyName\\MyApplication");
    reg->DeleteKey("Software\\MyCompanyName");

    reg->CloseKey();
}
//---------------------------------------------------------------------------
```

Delphi Examples:

```
{
This example shows how to use the TRegistry class in order to
find, insert and delete Keys and Items into the Windows Registry.
This example uses two buttons: InsertToRegBtn and DeleteFromRegBtn,
on a form, for inserting and deleting the values.
}
procedure TForm3.InsertToRegBtnClick(Sender: TObject);
var
  reg        : TRegistry;
  openResult : Boolean;
  today      : TDateTime;
begin
  reg := TRegistry.Create(KEY_READ);
  reg.RootKey := HKEY_LOCAL_MACHINE;

  if (not reg.KeyExists('Software\\MyCompanyName\\MyApplication\\')) then
    begin
      MessageDlg('Key not found! Created now.',
                          mtInformation, mbOKCancel, 0);
    end;
  reg.Access := KEY_WRITE;
```

```
    openResult := reg.OpenKey('Software\\MyCompanyName\\MyApplication\\',True);

    if not openResult = True then
      begin
        MessageDlg('Unable to create key! Exiting.',
                   mtError, mbOKCancel, 0);
        Exit();
      end;

    {checking if the values exist and inserting when neccesary}

    if not reg.KeyExists('Creation\ Date') then
      begin
        today := Now;
          reg.WriteDateTime('Creation\ Date', today);
      end;

    if not reg.KeyExists('Licenced\ To') then
      begin
          reg.WriteString('Licenced\ To', 'MySurname\ MyFirstName');
      end;

    if not reg.KeyExists('App\ Location') then
      begin
          reg.WriteExpandString('App\ Location',
                                '%PROGRAMFILES%\\MyCompanyName\\MyApplication\\');
      end;

    if not reg.KeyExists('Projects\ Location') then
      begin
          reg.WriteExpandString('Projects\ Location',
                                '%USERPROFILE%\\MyApplication\\Projects\\');
      end;

    reg.CloseKey();

  end;

  procedure TForm3.DeleteFromRegBtnClick(Sender: TObject);
  var
    reg : TRegistry;
  begin
    reg := TRegistry.Create(KEY_WRITE);
    reg.RootKey := HKEY_LOCAL_MACHINE;

    reg.DeleteKey('Software\\MyCompanyName\\MyApplication');
    reg.DeleteKey('Software\\MyCompanyName');

    reg.CloseKey();
  end;
```

59.1.4 TRegistryIniFile Class

TRegistryIniFile is a wrapper for the Windows system registry.

Class Hierarchy

Pascal

```
TRegistryIniFile = class(TCustomIniFile);
```

C++

```
class TRegistryIniFile : public TCustomIniFile;
```

File

Registry

Description

TRegistryIniFile presents a simple interface to the system registry and hides the need to know about the underlying structure of the registry. TRegistryIniFile enables handling the Windows system registry as if it were a Windows 3.x INI file. Instead of processing an INI file, however, TRegistryIniFile reads from and writes to the system registry. Because TRegistryIniFile, like TIniFile (see page 752), descends from TCustomIniFile (see page 716), you can use it in common code that writes to both INI files and the registry.

In addition, application developers that are switching from the use of INI files to the system registry can use this object to migrate their application with a minimum of coding changes. By finding all references to TIniFile (see page 752) in an application, replacing them with TRegistryIniFile, and recompiling the application, a developer can update an application to use the system registry instead of INI files without having to code any new logic into the application.

Note: Information contained in existing users' INI files is not migrated into the system registry using the method described above. A one-time operation to explicitly copy the INI file data, through TRegistryIniFile, must be used to do this.

TRegistryIniFile adapts the methods inherited from TCustomIniFile (see page 716) to operate on Registry (see page 3235) entries rather than INI file keys. It reinterprets the FileName property as a subkey under the system registry's root key (HKEY_CURRENT_USER by default). What corresponds to a section in an INI file is treated as a key in the system registry, and what corresponds to data entries under a section in an INI file are treated as data values under a key in the system registry.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}
```

```
void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
```

```
      {
      Read all saved values from the last session. The section name
      is the name of the form. Also use form's properties as defaults
      }
      Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
      Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
      Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
      Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
      Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

      { Load last window state }
      case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
        true : WindowState := wsMaximized;
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
```

```
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

59.1.4.1 TRegistryIniFile Members

The following tables list the members exposed by TRegistryIniFile.

Public Methods

	Name	Description
	Create (see page 3304)	This is the overview for the Create constructor overload.
	DeleteKey (see page 3305)	Erases the data value associated with an INI file entry.
	Destroy (see page 3304)	Disposes of an object instance.
	EraseSection (see page 3306)	Erases an entire section of an INI file.
	ReadBinaryStream (see page 3306)	Retrieves a binary value from the registry.
	ReadBool (see page 723)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 3307)	Retrieves a date value from an INI file.
	ReadDateTime (see page 3307)	Retrieves a date-time value from an INI file.
	ReadFloat (see page 3308)	Retrieves a float value from an INI file.
	ReadInteger (see page 3308)	Retrieves an integer value from an INI file.
	ReadSection (see page 3311)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 731)	This is the overview for the ReadSections method overload.
	ReadSections (see page 3312)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 3313)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 3313)	Retrieves a string value from an INI file.
	ReadTime (see page 3316)	Retrieves a time value from an INI file.
	SectionExists (see page 736)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 3317)	Flushes buffered INI file data to disk.
	ValueExists (see page 736)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 3317)	Writes a binary value to the registry.
	WriteBool (see page 737)	Writes a Boolean value to an ini file.
	WriteDate (see page 3317)	Writes a date value to an INI file.
	WriteDateTime (see page 3318)	Writes a date-time value to an INI file.
	WriteFloat (see page 3319)	Writes a float value to an INI file.
	WriteInteger (see page 3319)	Writes an integer value to an INI file.
	WriteString (see page 3322)	Writes a string value to an INI file.
	WriteTime (see page 3325)	Writes a time value to an INI file.

Public Properties

	Name	Description
	FileName (see page 749)	Contains the name of the ini file from which to read and to which to write information.
	RegIniFile (see page 3326)	Contains and internal instance of a TRegIniFile (see page 3237) object.

59.1.4.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegistryIniFile.Create (string) (see page 3304)	Creates a TRegistryIniFile (see page 3299) object for an application.
	TRegistryIniFile.Create (string, LongWord) (see page 3304)	Creates a TRegistryIniFile (see page 3299) object for an application.

59.1.4.2.1 TRegistryIniFile.Create Constructor (string)

Creates a TRegistryIniFile (see page 3299) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
constructor Create(const FileName: string; AAccess: LongWord); overload;
```

C++

```
__fastcall TRegistryIniFile(const UnicodeString FileName);
__fastcall TRegistryIniFile(const UnicodeString FileName, LongWord AAccess);
```

Description

Create constructs a TRegistryIniFile (see page 3299) and creates an internal TRegIniFile (see page 3237) object used to access the system registry. TRegistryIniFile (see page 3299) uses this TRegIniFile (see page 3237) object as a helper object to provide much of its functionality.

FileName is used as the FileName property for the internal TRegIniFile (see page 3237) object in the RegIniFile (see page 3326) property.

AAccess initializes the Access property of the internal TRegIniFile (see page 3237) object.

RegIniFile (see page 3326)

System::TObject::Create

Access (see page 3293)

59.1.4.3 TRegistryIniFile.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistryIniFile();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free

59.1.4.4 TRegistryIniFile Methods

The methods of the TRegistryIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 3305)	Erases the data value associated with an INI file entry.
	EraseSection (see page 3306)	Erases an entire section of an INI file.
	ReadBinaryStream (see page 3306)	Retrieves a binary value from the registry.
	ReadDate (see page 3307)	Retrieves a date value from an INI file.
	ReadDateTime (see page 3307)	Retrieves a date-time value from an INI file.
	ReadFloat (see page 3308)	Retrieves a float value from an INI file.
	ReadInteger (see page 3308)	Retrieves an integer value from an INI file.
	ReadSection (see page 3311)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 3312)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 3313)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 3313)	Retrieves a string value from an INI file.
	ReadTime (see page 3316)	Retrieves a time value from an INI file.
	UpdateFile (see page 3317)	Flushes buffered INI file data to disk.
	WriteBinaryStream (see page 3317)	Writes a binary value to the registry.
	WriteDate (see page 3317)	Writes a date value to an INI file.
	WriteDateTime (see page 3318)	Writes a date-time value to an INI file.
	WriteFloat (see page 3319)	Writes a float value to an INI file.
	WriteInteger (see page 3319)	Writes an integer value to an INI file.
	WriteString (see page 3322)	Writes a string value to an INI file.
	WriteTime (see page 3325)	Writes a time value to an INI file.

59.1.4.4.1 TRegistryIniFile.DeleteKey Method

Erases the data value associated with an INI file entry.

Pascal

```
procedure DeleteKey(const Section: string; const Ident: string); override;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase a data value associated with an INI file entry. Section is string containing the name of an INI file section, and Ident is a string containing the name of the key from for which to set a nil (Delphi) or NULL (C++) value.

Note: Attempting to erase a data value in a nonexistent section or attempting to erase data from a nonexistent key are not errors. In these cases, DeleteKey creates the section and key and sets its initial value to an empty value.

See Also

EraseSection (see page 3306)

ValueExists (see page 736)

59.1.4.4.2 TRegistryIniFile.EraseSection Method

Erases an entire section of an INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

See Also

SectionExists (see page 736)

DeleteKey (see page 3305)

59.1.4.4.3 TRegistryIniFile.ReadBinaryStream Method

Retrieves a binary value from the registry.

Pascal

```
function ReadBinaryStream(const Section: string; const Name: string; Value: TStream): Integer;
override;
```

C++

```
virtual __fastcall int ReadBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

Call ReadBinaryStream to read a binary value into a specified stream. After reading the binary value from the INI file into the current position of the stream, ReadBinaryStream returns the number of bytes written to the stream. The stream is left positioned immediately after the new binary value.

Section is the key for the section that contains the binary data.

Name is the subkey under which the binary data is stored.

Value is a stream to which the binary value is written.

See Also

ReadString (see page 3313)

WriteBinaryStream (see page 3317)

59.1.4.4.4 TRegistryIniFile.ReadDate Method

Retrieves a date value from an INI file.

Pascal

```
function ReadDate(const Section: string; const Name: string; Default: TDateTime): TDateTime;
override;
```

C++

```
virtual __fastcall TDateTime ReadDate(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadDate to read a date value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date value. Default is the date value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

ReadDateTime (see page 3307)

ReadFloat (see page 3308)

ReadInteger (see page 3308)

ReadString (see page 3313)

ReadTime (see page 3316)

59.1.4.4.5 TRegistryIniFile.ReadDateTime Method

Retrieves a date-time value from an INI file.

Pascal

```
function ReadDateTime(const Section: string; const Name: string; Default: TDateTime):
TDateTime; override;
```

C++

```
virtual __fastcall TDateTime ReadDateTime(const UnicodeString Section, const UnicodeString
Name, TDateTime Default);
```

Description

Call ReadDateTime to read a date-time value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date-time value. Default is the date-time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

ReadDate (see page 3307)

ReadFloat (see page 3308)

ReadInteger (see page 3308)

ReadString (see page 3313)

ReadTime (see page 3316)

59.1.4.4.6 TRegistryIniFile.ReadFloat Method

Retrieves a float value from an INI file.

Pascal

```
function ReadFloat(const Section: string; const Name: string; Default: Double): Double;
override;
```

C++

```
virtual __fastcall Double ReadFloat(const UnicodeString Section, const UnicodeString Name,
Double Default);
```

Description

Call ReadFloat to read a float value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the float value. Default is the float value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 723)

ReadDate (see page 3307)

ReadDateTime (see page 3307)

ReadInteger (see page 3308)

ReadString (see page 3313)

ReadTime (see page 3316)

59.1.4.4.7 TRegistryIniFile.ReadInteger Method

Retrieves an integer value from an INI file.

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
override;
```

C++

```
virtual __fastcall Longint ReadInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Default);
```

Description

Call ReadInteger to read an integer value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the integer value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
```

```
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
```

```
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

ReadTime (see page 3316)

59.1.4.4.8 TRegistryIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object such as a string list, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

ReadSectionValues (see page 3313)

SectionExists (see page 736)

59.1.4.4.9 ReadSections Method

This is the overview for the ReadSections method overload.

Overload List

	Name	Description
	TRegistryIniFile.ReadSections (string, TStrings) (see page 3312)	Reads the names of all sections in an INI file into a string list.
	TRegistryIniFile.ReadSections (TStrings) (see page 3312)	Reads the names of all sections in an INI file into a string list.

59.1.4.4.9.1 TRegistryIniFile.ReadSections Method (TStrings)

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override; overload;
procedure ReadSections(const Section: string; Strings: TStrings); override; overload;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
virtual __fastcall ReadSections(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list object.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

ReadSection (see page 3311)

ReadSectionValues (see page 3313)

59.1.4.4.10 TRegistryIniFile.ReadSectionValues Method

Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read all data values associated with a specified key into a string object.

Section is the name of the key from which to retrieve data-values.

Strings specifies the string list object to hold the retrieved values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself. Use the Values property of the string object to access a specific string in the object.

See Also

ReadSection (see page 3311)

ReadSections (see page 3312)

SectionExists (see page 736)

59.1.4.4.11 TRegistryIniFile.ReadString Method

Retrieves a string value from an INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();
```

```
    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
```

```
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
```

```
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

ReadInteger (see page 3308)

ReadTime (see page 3316)

59.1.4.4.12 TRegistryIniFile.ReadTime Method

Retrieves a time value from an INI file.

Pascal

```
function ReadTime(const Section: string; const Name: string; Default: TDateTime): TDateTime;
override;
```

C++

```
virtual __fastcall TDateTime ReadTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadTime to read a time value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the time value. Default is the time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

ReadBool (see page 723)

ReadDate (see page 3307)

ReadDateTime (see page 3307)

ReadFloat (see page 3308)

ReadInteger (see page 3308)

ReadString (see page 3313)

59.1.4.4.13 TRegistryIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to flush buffered reads from and writes to the INI file to disk. UpdateFile is useful under Windows95, but has no effect under Windows NT as NT does not buffer INI file reads and writes.

See Also

FileName (see page 749)

59.1.4.4.14 TRegistryIniFile.WriteBinaryStream Method

Writes a binary value to the registry.

Pascal

```
procedure WriteBinaryStream(const Section: string; const Name: string; Value: TStream);
override;
```

C++

```
virtual __fastcall WriteBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

Call WriteBinaryStream to write a binary value from a specified stream to a specified key in the registry. WriteBinaryStream writes from the current position in the stream to the end.

Section is the key for the section that contains the subkey where the binary data should be written.

Name is the subkey under which the binary data is stored.

Value is a stream from which the binary value can be read.

Note: Attempting to write a value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBinaryStream creates the section and key and sets its initial value to the stream's data.

See Also

WriteString (see page 3322)

ReadBinaryStream (see page 3306)

59.1.4.4.15 TRegistryIniFile.WriteDate Method

Writes a date value to an INI file.

Pascal

```
procedure WriteDate(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteDate(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteDate to write a date value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDate creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 737)

WriteDateTime (see page 3318)

WriteFloat (see page 3319)

WriteInteger (see page 3319)

WriteString (see page 3322)

WriteTime (see page 3325)

59.1.4.4.16 TRegistryIniFile.WriteDateTime Method

Writes a date-time value to an INI file.

Pascal

```
procedure WriteDateTime(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteDateTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Value);
```

Description

Call WriteDateTime to write a date-time value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date-time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDateTime creates the section and key and sets its initial value to Value.

WriteInteger (see page 3319)

WriteString (see page 3322)

WriteTime (see page 3325)

59.1.4.4.17 TRegistryIniFile.WriteFloat Method

Writes a float value to an INI file.

Pascal

```
procedure WriteFloat(const Section: string; const Name: string; Value: Double); override;
```

C++

```
virtual __fastcall WriteFloat(const UnicodeString Section, const UnicodeString Name, Double
Value);
```

Description

Call WriteFloat to write a float value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the float value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteFloat creates the section and key and sets its initial value to Value.

WriteTime (see page 3325)

59.1.4.4.18 TRegistryIniFile.WriteInteger Method

Writes an integer value to an INI file.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint); override;
```

C++

```
virtual __fastcall WriteInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Value);
```

Description

Call WriteInteger to write an integer value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the integer value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteInteger creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
```

```
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
```

```
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
```

```
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

59.1.4.4.19 TRegistryIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: string; const Ident: string; const Value: string);
override;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
```

```
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
```

```
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
    }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;
```

```
end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

59.1.4.4.20 TRegistryIniFile.WriteTime Method

Writes a time value to an INI file.

Pascal

```
procedure WriteTime(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteTime(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteTime to write a time value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteTime creates the section and key and sets its initial value to Value.

59.1.4.5 TRegistryIniFile Properties

The properties of the TRegistryIniFile class are listed here.

Public Properties

	Name	Description
	RegIniFile (see page 3326)	Contains and internal instance of a TRegIniFile (see page 3237) object.

59.1.4.5.1 TRegistryIniFile.RegIniFile Property

Contains and internal instance of a TRegIniFile (see page 3237) object.

Pascal

```
property RegIniFile: TRegIniFile;
```

C++

```
__property TRegIniFile RegIniFile;
```

Description

RegIniFile is used internally by the TRegistryIniFile (see page 3299) object as the gateway connection between TRegistryIniFile (see page 3299) methods and the system registry.

See Also

Create (see page 3304)

59.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRegDataType (see page 3327)	TRegDataType is a type used by the GetDataInfo method of TRegistery.

Records

	Name	Description
	TRegDataInfo (see page 3327)	TRegDataInfo is a type used by the GetDataInfo method of TRegistery.
	TRegKeyInfo (see page 3328)	TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

59.2.1 Registry.TRegDataInfo Record

TRegDataInfo is a type used by the GetDataInfo method of TRegistery.

Pascal

```
TRegDataInfo = record
  RegData: TRegDataType;
  DataSize: Integer;
end;
```

C++

```
struct TRegDataInfo {
  TRegDataType RegData;
  int DataSize;
};
```

File

Registry

Description

TRegDataInfo is a type used by the GetDataInfo method of TRegistery. Records of type TRegDataInfo contain two fields: a field called RegData, of type TRegDataType (see page 3327), that specifies the data type of the data value; and a field called DataSize that specifies the size, in bytes, of the data value.

59.2.2 Registry.TRegDataType Enumeration

TRegDataType is a type used by the GetDataInfo method of TRegistery.

Pascal

```
TRegDataType = (
  rdUnknown,
  rdString,
  rdExpandString,
  rdInteger,
```

```
    rdBinary
  );
```

C++

```
  enum TRegDataType {
    rdUnknown,
    rdString,
    rdExpandString,
    rdInteger,
    rdBinary
  };
```

File

Registry

Description

TRegDataType is a type used by the GetDataInfo method of TRegistery.It can have the following values:

Value	Meaning
rdUnknown	Data value type is of no defined value type.
rdString	Data value type is a null-terminated string. It is a Unicode or ANSI string depending on whether the application calls the Unicode or ANSI string functions.
rdExpandString	Data value type is a null-terminated string that contains unexpanded references to environment variables (for example, "%PATH%"). It is a Unicode or ANSI string depending on whether the application calls the Unicode or ANSI string functions.
rdInteger	Data value type is a32-bit number.
rdBinary	Data value type is binary data, in any form.

59.2.3 Registry.TRegKeyInfo Record

TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

Pascal

```
  TRegKeyInfo = record
    NumSubKeys: Integer;
    MaxSubKeyLen: Integer;
    NumValues: Integer;
    MaxValueLen: Integer;
    MaxDataLen: Integer;
    FileTime: TFileTime;
  end;
```

C++

```
  struct TRegKeyInfo {
    int NumSubKeys;
    int MaxSubKeyLen;
    int NumValues;
    int MaxValueLen;
    int MaxDataLen;
    TFileTime FileTime;
  };
```

File

Registry

Description

TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery to return information about the current key:

Note: Number of subkeys

Note: Longest subkey name length, in characters

Note: Number of data values

Note: Longest data-value name length

Note: Longest data-value length

Note: Time of last write to the key

60 ReqFiles Namespace

This is namespace ReqFiles.

Topics

Name	Description
Classes (see page 3332)	The following table lists classes in this documentation.

Classes

	Name	Description
	TWebRequestFile (see page 3332)	TWebRequestFile describes the content of a file extracted from an HTTP request.
	TWebRequestFiles (see page 3336)	TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.
	TWebRequestFileStream (see page 3339)	This is class ReqFiles.TWebRequestFileStream.

60.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebRequestFile (see page 3332)	TWebRequestFile describes the content of a file extracted from an HTTP request.
	TWebRequestFiles (see page 3336)	TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.
	TWebRequestFileStream (see page 3339)	This is class ReqFiles.TWebRequestFileStream.

60.1.1 TWebRequestFile Class

TWebRequestFile describes the content of a file extracted from an HTTP request.

Class Hierarchy

Pascal

```
TWebRequestFile = class(TAbstractWebRequestFile);
```

C++

```
class TWebRequestFile : public TAbstractWebRequestFile;
```

File

ReqFiles

Description

TWebRequestFile describes and provides access to an uploaded file from an HTTP request. The following properties support this access:

FileName, which gives the name of the uploaded file.

FieldName, which gives the name of the adapter field whose value is the uploaded file.

ContentType, which describes how the file data is encoded.

Stream, which is a stream object from which you can read the file content.

Each TWebRequestFile object describes a single uploaded file. A collection of all the uploaded files from the current request is available as the Files property of TWebRequest. In addition, adapter fields that work with uploaded files surface those files using a TUpdateFileList object or IActionFieldValues interface.

See Also

TWebRequestFiles (see page 3336)

IActionFieldValues

TUpdateFileList

TAdapterFileField

60.1.1.1 TWebRequestFile Members

The following tables list the members exposed by TWebRequestFile.

Protected Methods

	Name	Description
	GetContentType (see page 3334)	Returns the value of the ContentType property.
	GetFieldName (see page 3334)	Returns the value of the FieldName property.
	GetFileName (see page 3335)	Returns the value of the FileName property.
	GetStream (see page 3335)	Returns the value of the Stream property.

Public Methods

	Name	Description
	Create (see page 3333)	Creates an initializes an instance of TWebRequestFile (see page 3332).
	Destroy (see page 3334)	Frees an instance of TWebRequestFile (see page 3332).

60.1.1.2 TWebRequestFile.Create Constructor

Creates an initializes an instance of TWebRequestFile (see page 3332).

Pascal

```
constructor Create(const AFieldName: AnsiString; const AFileName: AnsiString; const
AContentType: AnsiString; AContent: Pointer; AContentLength: Integer);
```

C++

```
__fastcall TWebRequestFile(const AnsiString AFieldName, const AnsiString AFileName, const
AnsiString AContentType, void * AContent, int AContentLength);
```

Description

Typically, applications do not call the TWebRequestFile (see page 3332) constructor. Instead, new Web request file objects are created by calling the Add method of a TWebRequestFiles (see page 3336) collection as the file uploads are extracted from the current Web request.

AFieldName is the name of the adapter field whose value this file represents. It becomes the value of the FieldName property.

AFileName is the name of the file this object represents. It becomes the value of the FileName property.

AContentType describes how the file content is encoded. It becomes the value of the ContentType property.

AContent is an array of bytes that is the content of the file. It is used to initialize the Stream property.

AContentLength is the number of bytes in AContent.

ContentType

Stream

Add (see page 3338)

60.1.1.3 TWebRequestFile.Destroy Destructor

Frees an instance of TWebRequestFile (see page 3332).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestFile();
```

Description

Do not free instances of TWebRequestFile (see page 3332). TWebRequestFile (see page 3332) objects are created and destroyed by the TWebRequestFiles (see page 3336) object that lists the uploaded files from the current request.

See Also

TWebRequestFiles (see page 3336)

60.1.1.4 TWebRequestFile Methods

The methods of the TWebRequestFile class are listed here.

Protected Methods

	Name	Description
	GetContentType (see page 3334)	Returns the value of the ContentType property.
	GetFieldName (see page 3334)	Returns the value of the FieldName property.
	GetFileName (see page 3335)	Returns the value of the FileName property.
	GetStream (see page 3335)	Returns the value of the Stream property.

60.1.1.4.1 TWebRequestFile.GetContentType Method

Returns the value of the ContentType property.

Pascal

```
function GetContentType: AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetContentType();
```

Description

GetContentType is the protected read implementation for the ContentType property.

In TAbstractWebRequestFile, GetContentType is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the ContentType property.

See Also

ContentType

60.1.1.4.2 TWebRequestFile.GetFieldName Method

Returns the value of the FieldName property.

Pascal

```
function GetFieldName: AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetFieldName();
```

Description

GetFieldName is the protected read implementation for the FieldName property.

In TAbstractWebRequestFile, GetFieldName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FieldName property.

See Also

FieldName

60.1.1.4.3 TWebRequestFile.GetFileName Method

Returns the value of the FileName property.

Pascal

```
function GetFileName: AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetFileName();
```

Description

GetFileName is the protected read implementation for the FileName property.

In TAbstractWebRequestFile, GetFileName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FileName property.

See Also

FileName

60.1.1.4.4 TWebRequestFile.GetStream Method

Returns the value of the Stream property.

Pascal

```
function GetStream: TStream; override;
```

C++

```
virtual __fastcall TStream GetStream();
```

Description

GetStream is the protected read implementation for the Stream property.

In TAbstractWebRequestFile, GetStream is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Stream property.

See Also

Stream

60.1.2 TWebRequestFiles Class

TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.

Class Hierarchy

Pascal

```
TWebRequestFiles = class(TAbstractWebRequestFiles);
```

C++

```
class TWebRequestFiles : public TAbstractWebRequestFiles;
```

File

ReqFiles

Description

TWebRequestFiles manages a set of Web request files objects (TWebRequestFile (see page 3332) objects). Each Web request file object in the collection describes an uploaded file that was extracted from the current HTTP request object.

See Also

TWebRequestFile (see page 3332)

TWebRequest

60.1.2.1 TWebRequestFiles Members

The following tables list the members exposed by TWebRequestFiles.

Protected Methods

	Name	Description
	GetCount (see page 3338)	Returns the value of the Count property.
	GetItem (see page 3339)	Returns the value of the Items property.

Public Methods

	Name	Description
	Add (see page 3337)	This is the overview for the Add method overload.
	Create (see page 3336)	Creates and initializes an instance of TWebRequestFiles (see page 3336).
	Destroy (see page 3337)	Frees an instance of TWebRequestFiles (see page 3336).

60.1.2.2 TWebRequestFiles.Create Constructor

Creates and initializes an instance of TWebRequestFiles (see page 3336).

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebRequestFiles();
```

Description

Call Create to instantiate TWebRequestFiles (see page 3336) at runtime. TWebRequestFiles (see page 3336) instances are created automatically by the Web request object to implement its Files property.

See Also

Files

60.1.2.3 TWebRequestFiles.Destroy Destructor

Frees an instance of TWebRequestFiles (see page 3336).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestFiles();
```

Description

Use the Free method to delete an instance of TWebRequestFiles (see page 3336). Free checks for a nil reference before calling Destroy.

See Also

System::TObject::Free

60.1.2.4 TWebRequestFiles Methods

The methods of the TWebRequestFiles class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 3338)	Returns the value of the Count property.
	GetItem (see page 3339)	Returns the value of the Items property.

Public Methods

	Name	Description
	Add (see page 3337)	This is the overview for the Add method overload.

60.1.2.4.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TWebRequestFiles.Add (AnsiString, AnsiString, AnsiString, Pointer, Integer) (see page 3338)	Adds a new Web request file object to the collection.
	TWebRequestFiles.Add (TWebRequestFile) (see page 3338)	Adds a new Web request file object to the collection.

60.1.2.4.1.1 TWebRequestFiles.Add Method (AnsiString, AnsiString, AnsiString, Pointer, Integer)

Adds a new Web request file object to the collection.

Pascal

```
procedure Add(const AName: AnsiString; const AFileName: AnsiString; const AContentType:
AnsiString; AContent: Pointer; AContentLength: Integer); overload;
procedure Add(AFile: TWebRequestFile); overload;
```

C++

```
__fastcall Add(const AnsiString AName, const AnsiString AFileName, const AnsiString
AContentType, void * AContent, int AContentLength);
__fastcall Add(TWebRequestFile AFile);
```

Description

Call Add to add a TWebRequestFile (see page 3332) object to the collection. Add inserts the new Web request file object at the end of the Items property array and increments the value of the Count property.

Use the first syntax to cause TWebRequestFiles (see page 3336) to create the Web request file object you are adding. Use the second syntax to add an existing TWebRequestFile (see page 3332) object. Using either syntax, TWebRequestFiles (see page 3336) assumes ownership of the new Web request file object and is responsible for freeing it.

AName is the name of the adapter field whose value the new file represents. It becomes the value of the FieldName property of the new TWebRequestFile (see page 3332) object.

AFileName is the name of the file to add. It becomes the value of the FileName property of the new TWebRequestFile (see page 3332) object.

AContentType describes how the file content is encoded. It becomes the value of the ContentType property of the new TWebRequestFile (see page 3332) object.

AContent is an array of bytes that is the content of the file. It is used to initialize the Stream property of the new TWebRequestFile (see page 3332) object.

AContentLength is the number of bytes in AContent.

AFile is an existing TWebRequestFile (see page 3332) object that describes the file you are adding.

Stream

60.1.2.4.2 TWebRequestFiles.GetCount Method

Returns the value of the Count property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TAbstractWebRequestFile, GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count property.

See Also

Count

60.1.2.4.3 TWebRequestFiles.GetItem Method

Returns the value of the Items property.

Pascal

```
function GetItem(I: Integer): TAbstractWebRequestFile; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFile GetItem(int I);
```

Description

GetItem is the protected read implementation of the Items property.

I is the index of the Web request file object to return.

In TAbstractWebRequestFile, GetItem is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Items property.

60.1.3 TWebRequestFileStream Class

Class Hierarchy

Pascal

```
TWebRequestFileStream = class(TCustomMemoryStream);
```

C++

```
class TWebRequestFileStream : public TCustomMemoryStream;
```

File

ReqFiles

Description

This is class ReqFiles.TWebRequestFileStream.

60.1.3.1 TWebRequestFileStream Members

The following tables list the members exposed by TWebRequestFileStream.

Public Methods

	Name	Description
	Create (see page 3340)	This is Create, a member of class TWebRequestFileStream.
V	Write (see page 3340)	Introduces a pure virtual method for writing to the stream.

60.1.3.2 TWebRequestFileStream.Create Constructor

Pascal

```
constructor Create(ABuffer: Pointer; Size: Integer);
```

C++

```
__fastcall TWebRequestFileStream(void * ABuffer, int Size);
```

Description

This is Create, a member of class TWebRequestFileStream.

60.1.3.3 TWebRequestFileStream Methods

The methods of the TWebRequestFileStream class are listed here.

Public Methods

	Name	Description
V	Write (see page 3340)	Introduces a pure virtual method for writing to the stream.

60.1.3.3.1 TWebRequestFileStream.Write Method

Introduces a pure virtual method for writing to the stream.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Each descendant stream object defines a Write method that writes data to its particular storage medium (such as memory or a disk file). Write attempts to write up to Count bytes from Buffer, and returns the number of bytes actually written.

All the other data-writing methods of a stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

See Also

WriteBuffer

WriteComponent

61 ReqMulti Namespace

This is namespace ReqMulti.

Topics

Name	Description
Classes (see page 3342)	The following table lists classes in this documentation.

Classes

	Name	Description
	TMultipartContentParser (see page 3342)	TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

61.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMultipartContentParser (see page 3342)	TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

61.1.1 TMultipartContentParser Class

TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

Class Hierarchy

Pascal

```
TMultipartContentParser = class(TAbstractContentParser);
```

C++

```
class TMultipartContentParser : public TAbstractContentParser;
```

File

ReqMulti

Description

Web request objects use TMultipartContentParser object to parse the content of an HTTP request message from a multipart form when that request may contain uploaded files. The Web request uses this content parser to assign values for its ContentFields and Files properties.

TMultipartContentParser is only used when the current HTTP request object has a content type of 'multipart/form-data'. Multipart forms built using a WebSnap application automatically use this content type.

To allow your WebSnap application to use TMultipartContentParser in Delphi, add the ReqMulti (see page 3341) unit to the end of your project uses clause. In C++, include ReqMulti.hpp in the header of your project source file.

TWebRequest

TContentParser

61.1.1.1 TMultipartContentParser Members

The following tables list the members exposed by TMultipartContentParser.

Protected Methods

	Name	Description
	BufferContent (see page 3344)	This is BufferContent, a member of class TMultipartContentParser.

	ExtractContentTypeFields (see page 3344)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 3345)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.
V	GetContentFields (see page 3345)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 3345)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 3346)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 3346)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 3346)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Public Methods

	Name	Description
V	CanParse (see page 3344)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
V	Destroy (see page 3343)	Frees the memory associated with the TMultipartContentParser (see page 3342) object.

61.1.1.2 TMultipartContentParser.Destroy Destructor

Frees the memory associated with the TMultipartContentParser (see page 3342) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMultipartContentParser();
```

Description

Do not free content parser instances. The Web request object frees the content parser when it no longer needs it.

61.1.1.3 TMultipartContentParser Methods

The methods of the TMultipartContentParser class are listed here.

Protected Methods

	Name	Description
	BufferContent (see page 3344)	This is BufferContent, a member of class TMultipartContentParser.
	ExtractContentTypeFields (see page 3344)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 3345)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.
V	GetContentFields (see page 3345)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 3345)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 3346)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 3346)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 3346)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Public Methods

	Name	Description
V	CanParse (see page 3344)	Indicates whether a specified request message contains information encoded in a way that this parser understands.

61.1.1.3.1 TMultipartContentParser.BufferContent Method

Pascal

```
procedure BufferContent;
```

C++

```
__fastcall BufferContent();
```

Description

This is BufferContent, a member of class TMultipartContentParser.

61.1.1.3.2 TMultipartContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a class method (Delphi) or static method (C++), which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered content parser until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TMultipartContentParser (see page 3342), CanParse returns true if AWebRequest has a content type of 'multipart/form-data'. If the Web request indicates some other content type, the Web request uses a different content parser class such as TContentParser.

See Also

ContentType

TContentParser

61.1.1.3.3 TMultipartContentParser.ExtractContentTypeFields Method

Pascal

```
procedure ExtractContentTypeFields(Strings: TStrings);
```

C++

```
__fastcall ExtractContentTypeFields(TStrings Strings);
```

Description

This is ExtractContentTypeFields, a member of class TMultipartContentParser.

61.1.1.3.4 TMultipartContentParser.ExtractMultipartContentFields Method

Pascal

```
procedure ExtractMultipartContentFields;
```

C++

```
__fastcall ExtractMultipartContentFields();
```

Description

This is ExtractMultipartContentFields, a member of class TMultipartContentParser.

61.1.1.3.5 TMultipartContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; override;
```

C++

```
virtual __fastcall TStrings GetContentFields();
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TAbstractContentParser, GetContentFields is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract name/value pairs from the current request and add them to the returned string list.

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields

WebRequest

ExtractContentFields

61.1.1.3.6 TMultipartContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles();
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TAbstractContentParser, GetFiles is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract uploaded files from the current request and add them to the

Web request files object.

Note: The content parser owns the list it returns. The caller should not free this list.

61.1.1.3.7 TMultipartContentParser.ParseMultiPart Method

Pascal

```
procedure ParseMultiPart(Part: Pointer; Size: Integer);
```

C++

```
__fastcall ParseMultiPart(void * Part, int Size);
```

Description

This is ParseMultiPart, a member of class TMultipartContentParser.

61.1.1.3.8 TMultipartContentParser.ParseMultiPartContent Method

Pascal

```
procedure ParseMultiPartContent;
```

C++

```
__fastcall ParseMultiPartContent();
```

Description

This is ParseMultiPartContent, a member of class TMultipartContentParser.

61.1.1.3.9 TMultipartContentParser.ParseMultipartHeaders Method

Pascal

```
procedure ParseMultipartHeaders(Parser: THTTPParser; AContent: Pointer; AContentLength:
Integer);
```

C++

```
__fastcall ParseMultipartHeaders(THTTPParser Parser, void * AContent, int AContentLength);
```

Description

This is ParseMultipartHeaders, a member of class TMultipartContentParser.

62 Ribbon Namespace

This is namespace Ribbon.

Topics

Classes

	Name	Description
	ERibbonException (see page 3349)	This is class Ribbon.ERibbonException.
	TApplicationMenu (see page 3350)	Contains properties associated with the Application Menu (see page 3355).
	TCustomActionControlBar (see page 3355)	This is class Ribbon.TCustomActionControlBar.
	TCustomRibbon (see page 3358)	Base class for all ribbon controls.
	TCustomRibbonColorMap (see page 3401)	This is class Ribbon.TCustomRibbonColorMap.
	TCustomRibbonGroup (see page 3405)	Align and display all controls on ribbon.
	TCustomRibbonPage (see page 3425)	Holds groups of controls.
	TCustomRibbonQuickAccessPopupToolbar (see page 3438)	This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.
	TCustomRibbonQuickAccessToolbar (see page 3441)	Quck Access Toolbar base class.
	TCustomTabData (see page 3453)	Encapsulates all functions and status to manage scrolling of tabs and selected group.
	THelpButton (see page 3459)	Button to activate help.
	TOffice2007Button (see page 3461)	This is class Ribbon.TOffice2007Button.
	TQuickAccessToolbar (see page 3469)	Quick Access Toolbar appearance.
	TQuickAccessToolbarGroupItem (see page 3475)	Display Quick Access Toolbar commands to display entire Ribbon group.
	TQuickAccessToolbarGroups (see page 3477)	This is class Ribbon.TQuickAccessToolbarGroups.
	TRibbon (see page 3480)	Implement ribbon control.
	TRibbonCustomizeDlg (see page 3499)	This is class Ribbon.TRibbonCustomizeDlg.
	TRibbonGroup (see page 3500)	Control used to display the user selectable commands for the ribbon.
	TRibbonGroupCollapsedControl (see page 3506)	Control used to represent a collapsed group on a tab.
	TRibbonGroupDockForm (see page 3519)	Display a collapsed group.
	TRibbonGroupScrollButton (see page 3521)	This is class Ribbon.TRibbonGroupScrollButton.
	TRibbonLunaColorMap (see page 3525)	Color map class for Luna.
	TRibbonObsidianColorMap (see page 3530)	Color map class for Obsidian.

	TRibbonPage (see page 3536)	Tab page for ribbon control.
	TRibbonQuickAccessPopupToolbar (see page 3545)	This is class Ribbon.TRibbonQuickAccessPopupToolbar.
	TRibbonQuickAccessToolbar (see page 3546)	Quck Access Toolbar.
	TRibbonSilverColorMap (see page 3549)	Color map class for Silver.
	TRibbonTabItem (see page 3555)	This is class Ribbon.TRibbonTabItem.
	TRibbonTabs (see page 3560)	Collection of information about ribbon pages.

Interfaces

	Name	Description
	IRibbon (see page 3566)	Interface for ribbon control.
	IRibbonGroup (see page 3568)	Interface for any ribbon-specific group.
	IRibbonQuickAccessToolbar (see page 3569)	This is class Ribbon.IRibbonQuickAccessToolbar.

Structs, Records, Enums

	Name	Description
	TCommandType (see page 3571)	TCommandType enumerates the possible types of items to be displayed in the right pane of the Application Menu.
	TIconSize (see page 3572)	This is record Ribbon.TIconSize.
	TRibbonGroupVariant (see page 3572)	This is record Ribbon.TRibbonGroupVariant.
	TRibbonMetric (see page 3573)	This is record Ribbon.TRibbonMetric.
	TRibbonScrollButton (see page 3573)	This is record Ribbon.TRibbonScrollButton.
	TTabActiveScrollButton (see page 3574)	This is record Ribbon.TTabActiveScrollButton.
	TTabSeparatorState (see page 3574)	Position of Quick Access Toolbar.

Types

Name	Description
TCustomRibbonClass (see page 3576)	This is type Ribbon.TCustomRibbonClass.
TRecentItemClickEvent (see page 3576)	This is type Ribbon.TRecentItemClickEvent.
TRibbonScrollButtons (see page 3577)	This is type Ribbon.TRibbonScrollButtons.

62.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERibbonException (see page 3349)	This is class Ribbon.ERibbonException.
	TApplicationMenu (see page 3350)	Contains properties associated with the Application Menu (see page 3355).
	TCustomActionControlBar (see page 3355)	This is class Ribbon.TCustomActionControlBar.
	TCustomRibbon (see page 3358)	Base class for all ribbon controls.
	TCustomRibbonColorMap (see page 3401)	This is class Ribbon.TCustomRibbonColorMap.
	TCustomRibbonGroup (see page 3405)	Align and display all controls on ribbon.
	TCustomRibbonPage (see page 3425)	Holds groups of controls.
	TCustomRibbonQuickAccessPopupToolbar (see page 3438)	This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.
	TCustomRibbonQuickAccessToolbar (see page 3441)	Quck Access Toolbar base class.
	TCustomTabData (see page 3453)	Encapsulates all functions and status to manage scrolling of tabs and selected group.
	THelpButton (see page 3459)	Button to activate help.
	TOffice2007Button (see page 3461)	This is class Ribbon.TOffice2007Button.
	TQuickAccessToolbar (see page 3469)	Quick Access Toolbar appearance.
	TQuickAccessToolbarGroupItem (see page 3475)	Display Quick Access Toolbar commands to display entire Ribbon (see page 3347) group.
	TQuickAccessToolbarGroups (see page 3477)	This is class Ribbon.TQuickAccessToolbarGroups.
	TRibbon (see page 3480)	Implement ribbon control.
	TRibbonCustomizeDlg (see page 3499)	This is class Ribbon.TRibbonCustomizeDlg.
	TRibbonGroup (see page 3500)	Control used to display the user selectable commands for the ribbon.
	TRibbonGroupCollapsedControl (see page 3506)	Control used to represent a collapsed group on a tab.
	TRibbonGroupDockForm (see page 3519)	Display a collapsed group.
	TRibbonGroupScrollButton (see page 3521)	This is class Ribbon.TRibbonGroupScrollButton.
	TRibbonLunaColorMap (see page 3525)	Color map class for Luna.
	TRibbonObsidianColorMap (see page 3530)	Color map class for Obsidian.
	TRibbonPage (see page 3536)	Tab page for ribbon control.
	TRibbonQuickAccessPopupToolbar (see page 3545)	This is class Ribbon.TRibbonQuickAccessPopupToolbar.
	TRibbonQuickAccessToolbar (see page 3546)	Quck Access Toolbar.
	TRibbonSilverColorMap (see page 3549)	Color map class for Silver.
	TRibbonTabItem (see page 3555)	This is class Ribbon.TRibbonTabItem.
	TRibbonTabs (see page 3560)	Collection of information about ribbon pages.

62.1.1 ERibbonException Class

Class Hierarchy

Pascal

```
ERibbonException = class(Exception);
```

C++

```
class ERibbonException : public Exception;
```

File

Ribbon

Description

This is class Ribbon.ERibbonException.

62.1.2 TApplicationMenu Class

Contains properties associated with the Application Menu (see page 3355).

Class Hierarchy

Pascal

```
TApplicationMenu = class(TPersistent);
```

C++

```
class TApplicationMenu : public TPersistent;
```

File

Ribbon

Description

TApplicationMenu Contains properties associated with the Application Menu (see page 3355) on a ribbon.

Use the properties to change the appearance and behavior of the Application Menu (see page 3355) as displayed on the ribbon.

See Also

Caption (see page 3353)

Icon (see page 3354)

KeyTip (see page 3355)

62.1.2.1 TApplicationMenu Members

The following tables list the members exposed by TApplicationMenu.

Protected Methods

	Name	Description
	GetActionClientItem (see page 3352)	This is GetActionClientItem, a member of class TApplicationMenu.
	Initialize (see page 3353)	This is Initialize, a member of class TApplicationMenu.

Public Methods

	Name	Description
	Assign (see page 3352)	Copies the contents of another, similar object.
	Create (see page 3351)	This is Create, a member of class TApplicationMenu.
	Destroy (see page 3351)	Destroys the TPersistent instance and frees its memory.
	Show (see page 3353)	This is Show, a member of class TApplicationMenu.

Published Properties

	Name	Description
	Caption (see page 3353)	Text displayed above Application Menu (see page 3355).
	CommandType (see page 3354)	CommandType specifies the type of items displayed in the Application Menu (see page 3355).
	Icon (see page 3354)	Icon to display on the Application Button.
	IconSize (see page 3354)	This is IconSize, a member of class TApplicationMenu.
	KeyTip (see page 3355)	KeyTip displayed in KeyTip mode.
	Menu (see page 3355)	This is Menu, a member of class TApplicationMenu.
	ScreenTip (see page 3355)	This is ScreenTip, a member of class TApplicationMenu.

62.1.2.2 TApplicationMenu.Create Constructor

Pascal

```
constructor Create(ARibbon: TCustomRibbon); reintroduce;
```

C++

```
__fastcall TApplicationMenu(TCustomRibbon ARibbon);
```

Description

This is Create, a member of class TApplicationMenu.

62.1.2.3 TApplicationMenu.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TApplicationMenu();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free

System::TObject::Destroy

62.1.2.4 TApplicationMenu Methods

The methods of the TApplicationMenu class are listed here.

Protected Methods

	Name	Description
	GetActionClientItem (see page 3352)	This is GetActionClientItem, a member of class TApplicationMenu.
	Initialize (see page 3353)	This is Initialize, a member of class TApplicationMenu.

Public Methods

	Name	Description
	Assign (see page 3352)	Copies the contents of another, similar object.
	Show (see page 3353)	This is Show, a member of class TApplicationMenu.

62.1.2.4.1 TApplicationMenu.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

62.1.2.4.2 TApplicationMenu.GetActionClientItem Method

Pascal

```
function GetActionClientItem: TActionClientItem;
```

C++

```
__fastcall TActionClientItem GetActionClientItem();
```

Description

This is GetActionClientItem, a member of class TApplicationMenu.

62.1.2.4.3 TApplicationMenu.Initialize Method

Pascal

```
procedure Initialize(AManager: TCustomScreenTipsManager);
```

C++

```
__fastcall Initialize(TCustomScreenTipsManager AManager);
```

Description

This is Initialize, a member of class TApplicationMenu.

62.1.2.4.4 TApplicationMenu.Show Method

Pascal

```
procedure Show(const Visible: Boolean);
```

C++

```
__fastcall Show(const Boolean Visible);
```

Description

This is Show, a member of class TApplicationMenu.

62.1.2.5 TApplicationMenu Properties

The properties of the TApplicationMenu class are listed here.

Published Properties

	Name	Description
	Caption (see page 3353)	Text displayed above Application Menu (see page 3355).
	CommandType (see page 3354)	CommandType specifies the type of items displayed in the Application Menu (see page 3355).
	Icon (see page 3354)	Icon to display on the Application Button.
	IconSize (see page 3354)	This is IconSize, a member of class TApplicationMenu.
	KeyTip (see page 3355)	KeyTip displayed in KeyTip mode.
	Menu (see page 3355)	This is Menu, a member of class TApplicationMenu.
	ScreenTip (see page 3355)	This is ScreenTip, a member of class TApplicationMenu.

62.1.2.5.1 TApplicationMenu.Caption Property

Text displayed above Application Menu (see page 3355).

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Caption is the text displayed above the right panel in the Application Menu (see page 3355).

62.1.2.5.2 TApplicationMenu.CommandType Property

CommandType specifies the type of items displayed in the Application Menu (see page 3355).

Pascal

```
property CommandType: TCommandType;
```

C++

```
__property TCommandType CommandType;
```

Description

Use the CommandType property to set or check the type of items displayed in the right pane of the Application Menu (see page 3355). The following table lists the possible values for the CommandType property and the meaning of each value.

Value	Description
ctRecent	A list of recently used items will be displayed in the right pane of the application menu.
ctCommands	A list of commands will be displayed in the right pane of the application menu.

See Also

TApplicationMenu (see page 3350)

TCommandType (see page 3571)

62.1.2.5.3 TApplicationMenu.Icon Property

Icon to display on the Application Button.

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

Icon is the icon to display on the Application Button. If no icon is assigned, the default application icon is used. The dimensions of the assigned icon are 24 x 24.

62.1.2.5.4 TApplicationMenu.IconSize Property

Pascal

```
property IconSize: TIconSize;
```

C++

```
__property TIconSize IconSize;
```

Description

This is IconSize, a member of class TApplicationMenu.

62.1.2.5.5 TApplicationMenu.KeyTip Property

KeyTip displayed in KeyTip mode.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the KeyTip that is displayed when the user has entered KeyTip mode.

62.1.2.5.6 TApplicationMenu.Menu Property

Pascal

```
property Menu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar Menu;
```

Description

This is Menu, a member of class TApplicationMenu.

62.1.2.5.7 TApplicationMenu.ScreenTip Property

Pascal

```
property ScreenTip: TScreenTipItem;
```

C++

```
__property TScreenTipItem ScreenTip;
```

Description

This is ScreenTip, a member of class TApplicationMenu.

62.1.3 TCustomActionControlBar Class

Class Hierarchy

Pascal

```
TCustomActionControlBar = class(TCustomActionToolbar);
```

C++

```
class TCustomActionControlBar : public TCustomActionToolbar;
```

File

Ribbon

Description

This is class Ribbon.TCustomActionControlBar.

62.1.3.1 TCustomActionControlBar Members

The following tables list the members exposed by TCustomActionControlBar.

Protected Methods

	Name	Description
	CMControlChange (see page 3357)	This is CMControlChange, a member of class TCustomActionControlBar.
V	CreateControls (see page 3357)	This is CreateControls, a member of class TCustomActionControlBar.
V	GetControlClass (see page 3357)	This is GetControlClass, a member of class TCustomActionControlBar.

Protected Properties

	Name	Description
R	CreatingControls (see page 3358)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
V	Create (see page 3356)	This is Create, a member of class TCustomActionControlBar.
V	CreateControl (see page 3357)	This is CreateControl, a member of class TCustomActionControlBar.

62.1.3.2 TCustomActionControlBar.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionControlBar(TComponent * AOwner);
```

Description

This is Create, a member of class TCustomActionControlBar.

62.1.3.3 TCustomActionControlBar Methods

The methods of the TCustomActionControlBar class are listed here.

Protected Methods

	Name	Description
	CMControlChange (see page 3357)	This is CMControlChange, a member of class TCustomActionControlBar.
V	CreateControls (see page 3357)	This is CreateControls, a member of class TCustomActionControlBar.
V	GetControlClass (see page 3357)	This is GetControlClass, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
V	CreateControl (see page 3357)	This is CreateControl, a member of class TCustomActionControlBar.

62.1.3.3.1 TCustomActionControlBar.CMControlChange Method

Pascal

```
procedure CMControlChange(var Message: TCMControlChange); message CM_CONTROLCHANGE;
```

C++

```
__fastcall CMControlChange(TCMControlChange Message);
```

Description

This is CMControlChange, a member of class TCustomActionControlBar.

62.1.3.3.2 TCustomActionControlBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionControlBar.

62.1.3.3.3 TCustomActionControlBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionControlBar.

62.1.3.3.4 TCustomActionControlBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomActionControlBar.

62.1.3.4 TCustomActionControlBar Properties

The properties of the TCustomActionControlBar class are listed here.

Protected Properties

	Name	Description
	CreatingControls (see page 3358)	This is CreatingControls, a member of class TCustomActionControlBar.

62.1.3.4.1 TCustomActionControlBar.CreatingControls Property

Pascal

```
property CreatingControls: Boolean;
```

C++

```
__property Boolean CreatingControls;
```

Description

This is CreatingControls, a member of class TCustomActionControlBar.

62.1.4 TCustomRibbon Class

Base class for all ribbon controls.

Class Hierarchy

Pascal

```
TCustomRibbon = class(TCustomControl);
```

C++

```
class TCustomRibbon : public TCustomControl;
```

File

Ribbon

Description

TCustomRibbon is the base class for all ribbon controls. A ribbon can hold controls, such as application menus, Quick Access Toolbars, and pages holding controls.

The following constants control ribbon appearance:

Value	Meaning
cRibbonHideWidth (see page 3365)	Parent width at which the Ribbon (see page 3347) must automatically hide.
cRibbonHideHeight (see page 3365)	Parent height at which the Ribbon (see page 3347) must automatically hide.
cRibbonQuickAccessToolbarTop (see page 3366)	Top position of the Quick Access Toolbar.
cRibbonQuickAccessToolbarLeft (see page 3366)	Left position of the Quick Access Toolbar.
cRibbonHeight (see page 3364)	Default height of the ribbon.
cRibbonQATHeight (see page 3366)	Height of the bottom aligned Quick Access Toolbar.
cRibbonUnthemedCaptionHeight (see page 3367)	Height of the caption section of the ribbon.

cRibbonFirstTabOffSet (see page 3364)	Position of the first tab that is displayed.
cRibbonTabSpacing (see page 3367)	Amount of spacing between tabs.
cRibbonTabHeight (see page 3366)	Height of the tabs.
cRibbonMinimizedHeight (see page 3365)	Minimized (see page 3397) height of the ribbon.

The following messages are used:

Value	Meaning
UM_DISPLAYKEYTIPS (see page 3368)	Message sent to display the KeyTips.
UM_CHECKSIZE (see page 3367)	Message sent after a `WMWindowPosChanged` (see page 3393) message.

62.1.4.1 TCustomRibbon Members

The following tables list the members exposed by TCustomRibbon.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 3400)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 3401)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 3371)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 3371)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 3371)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 3371)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 3372)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 3372)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 3372)	This is CMThemeChanged, a member of class TCustomRibbon.
V	ContextMenuPopupHandler (see page 3372)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.
V	CreateContextMenu (see page 3373)	This is CreateContextMenu, a member of class TCustomRibbon.
V	CustomFrameWndProc (see page 3373)	This is CustomFrameWndProc, a member of class TCustomRibbon.
V	DblClick (see page 3373)	OnDblClick event dispatcher.

	DefineProperties (see page 3374)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DisplayKeyTips (see page 3374)	This is DisplayKeyTips, a member of class TCustomRibbon.
	DoAddToQuickAccessToolbar (see page 3375)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
	DoChangeQuickAccessToolbarPosition (see page 3375)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
	DoContextPopup (see page 3375)	OnContextPopup event dispatcher.
	DoCustomizeQuickAccessToolbar (see page 3375)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
	DoGroupStyleChanged (see page 3376)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
	DoHelpButtonClick (see page 3376)	This is DoHelpButtonClick, a member of class TCustomRibbon.
	DoMinimizeRibbon (see page 3376)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
	DoMouseWheelDown (see page 3376)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 3377)	OnMouseWheelUp event dispatcher.
	DoRecentItemClick (see page 3377)	This is DoRecentItemClick, a member of class TCustomRibbon.
	DoScrollTabsLeft (see page 3378)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
	DoScrollTabsRight (see page 3378)	This is DoScrollTabsRight, a member of class TCustomRibbon.
	DoTabChange (see page 3378)	This is DoTabChange, a member of class TCustomRibbon.
	DrawCaption (see page 3378)	This is DrawCaption, a member of class TCustomRibbon.
	DrawQuickAccessToolbar (see page 3379)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 3379)	This is DrawSystemButtons, a member of class TCustomRibbon.
	DrawTab (see page 3379)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 3379)	This is GetContextMenuOptions, a member of class TCustomRibbon.
	GetHelpButtonRect (see page 3380)	This is GetHelpButtonRect, a member of class TCustomRibbon.
	GetRibbonHeight (see page 3380)	This is GetRibbonHeight, a member of class TCustomRibbon.
	GetTabAt (see page 3381)	This is GetTabAt, a member of class TCustomRibbon.
	GetTabRect (see page 3381)	This is GetTabRect, a member of class TCustomRibbon.
	GetTabWidth (see page 3381)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 3381)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 3382)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 3382)	This is Idle, a member of class TCustomRibbon.
	KeyDown (see page 3383)	Respond to key press events.
	Loaded (see page 3384)	Initializes the control after it is loaded from a stream.
	MouseDown (see page 3384)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 3385)	This is MouseInSystemMenu, a member of class TCustomRibbon.
	MouseMove (see page 3385)	Respond to mouse moving over control area..
	MouseUp (see page 3385)	OnMouseUp event dispatcher.
	Notification (see page 3386)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3387)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 3387)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
	Resize (see page 3388)	Respond to control resize.
	SetParent (see page 3389)	Sets the parent of the control.
	UMCheckResize (see page 3391)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 3391)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 3391)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 3391)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 3392)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 3392)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 3392)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 3392)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 3393)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 3393)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 3395)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.

	HideRibbon (see page 3396)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 3396)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 3397)	This is KeyTipsVisible, a member of class TCustomRibbon.
R	Menu (see page 3397)	This is Menu, a member of class TCustomRibbon.
R	ScaleFactor (see page 3398)	This is ScaleFactor, a member of class TCustomRibbon.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 3364)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 3364)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 3364)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 3364)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 3365)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 3365)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 3365)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 3365)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 3366)	This is cRibbonPageHeight, a member of class TCustomRibbon.
	cRibbonQATHeight (see page 3366)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 3366)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 3366)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 3366)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 3367)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 3367)	This is cRibbonTabSpacing, a member of class TCustomRibbon.
	cRibbonUnthemedCaptionHeight (see page 3367)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 3367)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 3368)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

Public Events

	Name	Description
	OnHelpButtonClick (see page 3400)	This is OnHelpButtonClick, a member of class TCustomRibbon.
	OnRecentItemClick (see page 3401)	This is OnRecentItemClick, a member of class TCustomRibbon.
	OnTabChange (see page 3401)	This is OnTabChange, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 3370)	Add new entry into Recent Items list.
	AddTab (see page 3370)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 3370)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 3370)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 3371)	This is ClearRecentItems, a member of class TCustomRibbon.
V	Create (see page 3362)	Creates an instance of TCustomControl.
	CustomFrameSupported (see page 3373)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 3374)	Delete tab at specified Index.
V	Destroy (see page 3363)	Destroys an instance of TCustomControl.
	DoMouseWheelEx (see page 3377)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 3379)	This is EndUpdate, a member of class TCustomRibbon.
V	GetIcon (see page 3380)	Return Icon used by Application Menu (see page 3397) Button.
	GetRibbonMetric (see page 3380)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 3382)	Invalidate header section of Ribbon (see page 3347).
	InvalidateScrollButtons (see page 3382)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 3383)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 3383)	Invalidate area that displays tabs.
	MoveGroup (see page 3386)	Move group to new page.
	RemoveAllTabs (see page 3387)	Remove all Tabs (see page 3399) from Ribbon (see page 3347).
	RemoveRecentItem (see page 3388)	This is RemoveRecentItem, a member of class TCustomRibbon.

	RemoveTab (see page 3388)	Remove tab with specified caption.
	SetBounds (see page 3389)	Sets the windowed control's boundary properties all at once.
	TabHandledKeyTips (see page 3390)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 3390)	Hide K**eyTip**s.
	TabShowKeyTips (see page 3390)	Display **KeyTip**s for **ktsTabs** State.

Public Nested Types

Name	Description
TTabChangeEvent (see page 3400)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

Public Properties

	Name	Description
	ActionManager (see page 3394)	This is ActionManager, a member of class TCustomRibbon.
	Active (see page 3394)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 3394)	Page currently displayed by ribbon control.
	ApplicationMenu (see page 3395)	Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 3942) control.
	ColorMap (see page 3395)	This is ColorMap, a member of class TCustomRibbon.
	DocumentName (see page 3396)	Text in Ribbon (see page 3347) caption.
	HideTabs (see page 3396)	Shows or hides Tab portion of Ribbon (see page 3347).
	Minimized (see page 3397)	Show Ribbon (see page 3347) in minimized state where tabs can be selected but are not visible.
	QuickAccessToolbar (see page 3397)	Properties associated with TQuickAccessToolbar (see page 3469).
	ScreenTips (see page 3398)	This is ScreenTips, a member of class TCustomRibbon.
	ShowHelpButton (see page 3398)	Determines whether ribbon displays Help Button.
	Style (see page 3398)	This is Style, a member of class TCustomRibbon.
	TabIndex (see page 3399)	Change the active page of ribbon.
	Tabs (see page 3399)	Collection of TRibbonTabs (see page 3560) visible on ribbon.
	UseCustomFrame (see page 3399)	Indicates whether to use a custom frame for ribbon controls.

62.1.4.2 TCustomRibbon.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbon(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

Canvas

Owner

62.1.4.3 TCustomRibbon.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbon();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

62.1.4.4 TCustomRibbon Constants

The constants of the TCustomRibbon class are listed here.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 3364)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 3364)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 3364)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 3364)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 3365)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 3365)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 3365)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 3365)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 3366)	This is cRibbonPageHeight, a member of class TCustomRibbon.

	cRibbonQATHeight (see page 3366)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 3366)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 3366)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 3366)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 3367)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 3367)	This is cRibbonTabSpacing, a member of class TCustomRibbon.
	cRibbonUnthemedCaptionHeight (see page 3367)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 3367)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 3368)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

62.1.4.4.1 TCustomRibbon.cRibbonFirstTabOffSet Constant

Pascal

```
const cRibbonFirstTabOffSet = 47;
```

C++

```
cRibbonFirstTabOffSet = 47;
```

Description

This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.

62.1.4.4.2 TCustomRibbon.cRibbonGroupCaptionHeight Constant

Pascal

```
const cRibbonGroupCaptionHeight = 16;
```

C++

```
cRibbonGroupCaptionHeight = 16;
```

Description

This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.

62.1.4.4.3 TCustomRibbon.cRibbonGroupHeight Constant

Pascal

```
const cRibbonGroupHeight = 86;
```

C++

```
cRibbonGroupHeight = 86;
```

Description

This is cRibbonGroupHeight, a member of class TCustomRibbon.

62.1.4.4.4 TCustomRibbon.cRibbonHeight Constant

Pascal

```
const cRibbonHeight = 117;
```

C++

```
cRibbonHeight = 117;
```

Description

This is cRibbonHeight, a member of class TCustomRibbon.

62.1.4.4.5 TCustomRibbon.cRibbonHideHeight Constant

Pascal

```
const cRibbonHideHeight = 250;
```

C++

```
cRibbonHideHeight = 250;
```

Description

This is cRibbonHideHeight, a member of class TCustomRibbon.

62.1.4.4.6 TCustomRibbon.cRibbonHideWidth Constant

Pascal

```
const cRibbonHideWidth = 300;
```

C++

```
cRibbonHideWidth = 300;
```

Description

This is cRibbonHideWidth, a member of class TCustomRibbon.

62.1.4.4.7 TCustomRibbon.cRibbonMinimizedHeight Constant

Pascal

```
const cRibbonMinimizedHeight = 27;
```

C++

```
cRibbonMinimizedHeight = 27;
```

Description

This is cRibbonMinimizedHeight, a member of class TCustomRibbon.

62.1.4.4.8 TCustomRibbon.cRibbonMinimumCaptionWidth Constant

Pascal

```
const cRibbonMinimumCaptionWidth = 50;
```

C++

```
cRibbonMinimumCaptionWidth = 50;
```

Description

This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.

62.1.4.4.9 TCustomRibbon.cRibbonPageHeight Constant

Pascal

```
const cRibbonPageHeight = 93;
```

C++

```
cRibbonPageHeight = 93;
```

Description

This is cRibbonPageHeight, a member of class TCustomRibbon.

62.1.4.4.10 TCustomRibbon.cRibbonQATHeight Constant

Pascal

```
const cRibbonQATHeight = 26;
```

C++

```
cRibbonQATHeight = 26;
```

Description

This is cRibbonQATHeight, a member of class TCustomRibbon.

62.1.4.4.11 TCustomRibbon.cRibbonQuickAccessToolbarLeft Constant

Pascal

```
const cRibbonQuickAccessToolbarLeft = 34;
```

C++

```
cRibbonQuickAccessToolbarLeft = 34;
```

Description

This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.

62.1.4.4.12 TCustomRibbon.cRibbonQuickAccessToolbarTop Constant

Pascal

```
const cRibbonQuickAccessToolbarTop = 5;
```

C++

```
cRibbonQuickAccessToolbarTop = 5;
```

Description

This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.

62.1.4.4.13 TCustomRibbon.cRibbonTabHeight Constant

Pascal

```
const cRibbonTabHeight = 23;
```

C++

```
cRibbonTabHeight = 23;
```

Description

This is cRibbonTabHeight, a member of class TCustomRibbon.

62.1.4.4.14 TCustomRibbon.cRibbonTabScrollButtonWidth Constant

Pascal

```
const cRibbonTabScrollButtonWidth = 12;
```

C++

```
cRibbonTabScrollButtonWidth = 12;
```

Description

This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.

62.1.4.4.15 TCustomRibbon.cRibbonTabSpacing Constant

Pascal

```
const cRibbonTabSpacing = 6;
```

C++

```
cRibbonTabSpacing = 6;
```

Description

This is cRibbonTabSpacing, a member of class TCustomRibbon.

62.1.4.4.16 TCustomRibbon.cRibbonUnthemedCaptionHeight Constant

Pascal

```
const cRibbonUnthemedCaptionHeight = 30;
```

C++

```
cRibbonUnthemedCaptionHeight = 30;
```

Description

This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.

62.1.4.4.17 TCustomRibbon.UM_CHECKSIZE Constant

Pascal

```
const UM_CHECKSIZE = WM_USER + 2;
```

C++

```
UM_CHECKSIZE = WM_USER + 2;
```

Description

This is UM_CHECKSIZE, a member of class TCustomRibbon.

62.1.4.4.18 TCustomRibbon.UM_DISPLAYKEYTIPS Constant

Pascal

```
const UM_DISPLAYKEYTIPS = WM_USER + 1;
```

C++

```
UM_DISPLAYKEYTIPS = WM_USER + 1;
```

Description

This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

62.1.4.5 TCustomRibbon Methods

The methods of the TCustomRibbon class are listed here.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 3371)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 3371)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 3371)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 3371)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 3372)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 3372)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 3372)	This is CMThemeChanged, a member of class TCustomRibbon.
	ContextMenuPopupHandler (see page 3372)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.
	CreateContextMenu (see page 3373)	This is CreateContextMenu, a member of class TCustomRibbon.
	CustomFrameWndProc (see page 3373)	This is CustomFrameWndProc, a member of class TCustomRibbon.
	DblClick (see page 3373)	OnDblClick event dispatcher.
	DefineProperties (see page 3374)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DisplayKeyTips (see page 3374)	This is DisplayKeyTips, a member of class TCustomRibbon.
	DoAddToQuickAccessToolbar (see page 3375)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
	DoChangeQuickAccessToolbarPosition (see page 3375)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
	DoContextPopup (see page 3375)	OnContextPopup event dispatcher.
	DoCustomizeQuickAccessToolbar (see page 3375)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
	DoGroupStyleChanged (see page 3376)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
	DoHelpButtonClick (see page 3376)	This is DoHelpButtonClick, a member of class TCustomRibbon.
	DoMinimizeRibbon (see page 3376)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
	DoMouseWheelDown (see page 3376)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 3377)	OnMouseWheelUp event dispatcher.
	DoRecentItemClick (see page 3377)	This is DoRecentItemClick, a member of class TCustomRibbon.
	DoScrollTabsLeft (see page 3378)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
	DoScrollTabsRight (see page 3378)	This is DoScrollTabsRight, a member of class TCustomRibbon.
	DoTabChange (see page 3378)	This is DoTabChange, a member of class TCustomRibbon.
	DrawCaption (see page 3378)	This is DrawCaption, a member of class TCustomRibbon.
	DrawQuickAccessToolbar (see page 3379)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 3379)	This is DrawSystemButtons, a member of class TCustomRibbon.
	DrawTab (see page 3379)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 3379)	This is GetContextMenuOptions, a member of class TCustomRibbon.
	GetHelpButtonRect (see page 3380)	This is GetHelpButtonRect, a member of class TCustomRibbon.
	GetRibbonHeight (see page 3380)	This is GetRibbonHeight, a member of class TCustomRibbon.
	GetTabAt (see page 3381)	This is GetTabAt, a member of class TCustomRibbon.

	GetTabRect (see page 3381)	This is GetTabRect, a member of class TCustomRibbon.
	GetTabWidth (see page 3381)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 3381)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 3382)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 3382)	This is Idle, a member of class TCustomRibbon.
	KeyDown (see page 3383)	Respond to key press events.
	Loaded (see page 3384)	Initializes the control after it is loaded from a stream.
	MouseDown (see page 3384)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 3385)	This is MouseInSystemMenu, a member of class TCustomRibbon.
	MouseMove (see page 3385)	Respond to mouse moving over control area..
	MouseUp (see page 3385)	OnMouseUp event dispatcher.
	Notification (see page 3386)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3387)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 3387)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
	Resize (see page 3388)	Respond to control resize.
	SetParent (see page 3389)	Sets the parent of the control.
	UMCheckResize (see page 3391)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 3391)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 3391)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 3391)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 3392)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 3392)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 3392)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 3392)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 3393)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 3393)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 3370)	Add new entry into Recent Items list.
	AddTab (see page 3370)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 3370)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 3370)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 3371)	This is ClearRecentItems, a member of class TCustomRibbon.
	CustomFrameSupported (see page 3373)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 3374)	Delete tab at specified Index.
	DoMouseWheelEx (see page 3377)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 3379)	This is EndUpdate, a member of class TCustomRibbon.
	GetIcon (see page 3380)	Return Icon used by Application Menu (see page 3397) Button.
	GetRibbonMetric (see page 3380)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 3382)	Invalidate header section of Ribbon (see page 3347).
	InvalidateScrollButtons (see page 3382)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 3383)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 3383)	Invalidate area that displays tabs.
	MoveGroup (see page 3386)	Move group to new page.
	RemoveAllTabs (see page 3387)	Remove all Tabs (see page 3399) from Ribbon (see page 3347).
	RemoveRecentItem (see page 3388)	This is RemoveRecentItem, a member of class TCustomRibbon.
	RemoveTab (see page 3388)	Remove tab with specified caption.
	SetBounds (see page 3389)	Sets the windowed control's boundary properties all at once.
	TabHandledKeyTips (see page 3390)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 3390)	Hide K**eyTip**s.
	TabShowKeyTips (see page 3390)	Display **KeyTip**s for **ktsTabs** State.

62.1.4.5.1 TCustomRibbon.AddRecentItem Method

Add new entry into Recent Items list.

Pascal

```
function AddRecentItem(const FileName: string): Integer;
```

C++

```
__fastcall int AddRecentItem(const UnicodeString FileName);
```

Description

Call AddRecentItem to add a new entry into the Recent Items list to the right of the Application Menu (see page 3397). The new entry is automatically added to the top of the Recent items list, and if an entry with the same filename already exists, it is deleted.

This method should only be called when the command type for the application menu is set to **ctRecent**.

62.1.4.5.2 TCustomRibbon.AddTab Method

Pascal

```
function AddTab(const APage: TCustomRibbonPage): TRibbonTabItem;
```

C++

```
__fastcall TRibbonTabItem AddTab(const TCustomRibbonPage APage);
```

Description

This is AddTab, a member of class TCustomRibbon.

62.1.4.5.3 TCustomRibbon.BeginUpdate Method

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

This is BeginUpdate, a member of class TCustomRibbon.

62.1.4.5.4 TCustomRibbon.CheckRibbonSize Method

Pascal

```
procedure CheckRibbonSize;
```

C++

```
__fastcall CheckRibbonSize();
```

Description

This is CheckRibbonSize, a member of class TCustomRibbon.

62.1.4.5.5 TCustomRibbon.ClearRecentItems Method

Pascal

```
procedure ClearRecentItems;
```

C++

```
__fastcall ClearRecentItems();
```

Description

This is ClearRecentItems, a member of class TCustomRibbon.

62.1.4.5.6 TCustomRibbon.CMBidimodechanged Method

Pascal

```
procedure CMBidimodechanged(var Message: TMessage); message CM_BIDIMODECHANGED;
```

C++

```
__fastcall CMBidimodechanged(TMessage Message);
```

Description

This is CMBidimodechanged, a member of class TCustomRibbon.

62.1.4.5.7 TCustomRibbon.CMDesignHitTest Method

Pascal

```
procedure CMDesignHitTest(var Message: TCMDesignHitTest); message CM_DESIGNHITTEST;
```

C++

```
__fastcall CMDesignHitTest(TCMDesignHitTest Message);
```

Description

This is CMDesignHitTest, a member of class TCustomRibbon.

62.1.4.5.8 TCustomRibbon.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbon.

62.1.4.5.9 TCustomRibbon.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbon.

62.1.4.5.10 TCustomRibbon.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbon.

62.1.4.5.11 TCustomRibbon.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbon.

62.1.4.5.12 TCustomRibbon.CMThemeChanged Method

Pascal

```
procedure CMThemeChanged(var Message: TMessage); message CM_THEMECHANGED;
```

C++

```
__fastcall CMThemeChanged(TMessage Message);
```

Description

This is CMThemeChanged, a member of class TCustomRibbon.

62.1.4.5.13 TCustomRibbon.ContextMenuPopupHandler Method

Pascal

```
procedure ContextMenuPopupHandler(Sender: TObject); virtual;
```

C++

```
virtual __fastcall ContextMenuPopupHandler(TObject * Sender);
```

Description

This is ContextMenuPopupHandler, a member of class TCustomRibbon.

62.1.4.5.14 TCustomRibbon.CreateContextMenu Method

Pascal

```
procedure CreateContextMenu; virtual;
```

C++

```
virtual __fastcall CreateContextMenu();
```

Description

This is CreateContextMenu, a member of class TCustomRibbon.

62.1.4.5.15 TCustomRibbon.CustomFrameSupported Method

Pascal

```
function CustomFrameSupported: Boolean;
```

C++

```
__fastcall Boolean CustomFrameSupported();
```

Description

This is CustomFrameSupported, a member of class TCustomRibbon.

62.1.4.5.16 TCustomRibbon.CustomFrameWndProc Method

Pascal

```
procedure CustomFrameWndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall CustomFrameWndProc(TMessage Message);
```

Description

This is CustomFrameWndProc, a member of class TCustomRibbon.

62.1.4.5.17 TCustomRibbon.DblClick Method

OnDblClick event dispatcher.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick calls any event handler attached to the OnDblClick event. Override DblClick to provide other responses in addition to the inherited event-handler call when the user double-clicks the control.

The DblClick method is triggered by left mouse-button double-click message (WM_LBUTTONDBLCLK) from Windows.

See Also

Click

OnDblClick

62.1.4.5.18 TCustomRibbon.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

DefineProperty

DefineProperties

IsControl

62.1.4.5.19 TCustomRibbon.DeleteTab Method

Delete tab at specified Index.

Pascal

```
procedure DeleteTab(const Index: Integer);
```

C++

```
__fastcall DeleteTab(const int Index);
```

Description

DeleteTab deletes the tab at the specified Index. The Page and any associated Groups are also deleted

62.1.4.5.20 TCustomRibbon.DisplayKeyTips Method

Pascal

```
procedure DisplayKeyTips(const State: TKeyTipState); virtual;
```

C++

```
virtual __fastcall DisplayKeyTips(const TKeyTipState State);
```

Description

This is DisplayKeyTips, a member of class TCustomRibbon.

62.1.4.5.21 TCustomRibbon.DoAddToQuickAccessToolbar Method

Pascal

```
procedure DoAddToQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DoAddToQuickAccessToolbar();
```

Description

This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.

62.1.4.5.22 TCustomRibbon.DoChangeQuickAccessToolbarPosition Method

Pascal

```
procedure DoChangeQuickAccessToolbarPosition; virtual;
```

C++

```
virtual __fastcall DoChangeQuickAccessToolbarPosition();
```

Description

This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.

62.1.4.5.23 TCustomRibbon.DoContextPopup Method

OnContextPopup event dispatcher.

Pascal

```
procedure DoContextPopup(MousePos: TPoint; var Handled: Boolean); override;
```

C++

```
virtual __fastcall DoContextPopup(TPoint MousePos, Boolean Handled);
```

Description

OnContextPopup calls any event handler attached to the OnContextPopup event. When creating a component that descends from TControl, override OnContextPopup to provide other responses in addition to the inherited event-handler call when the user invokes the control's context menu.

MousePos indicates the position where the user right-clicked the control. If the user invoked the context menu using the keyboard, MousePos is (-1,-1).

Handled returns a Boolean value indicating whether the control should continue with its default response to the user action.

See Also

OnContextPopup

62.1.4.5.24 TCustomRibbon.DoCustomizeQuickAccessToolbar Method

Pascal

```
procedure DoCustomizeQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DoCustomizeQuickAccessToolbar();
```

Description

This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.

62.1.4.5.25 TCustomRibbon.DoGroupStyleChanged Method

Pascal

```
procedure DoGroupStyleChanged; virtual;
```

C++

```
virtual __fastcall DoGroupStyleChanged();
```

Description

This is DoGroupStyleChanged, a member of class TCustomRibbon.

62.1.4.5.26 TCustomRibbon.DoHelpButtonClick Method

Pascal

```
procedure DoHelpButtonClick; virtual;
```

C++

```
virtual __fastcall DoHelpButtonClick();
```

Description

This is DoHelpButtonClick, a member of class TCustomRibbon.

62.1.4.5.27 TCustomRibbon.DoMinimizeRibbon Method

Pascal

```
procedure DoMinimizeRibbon; virtual;
```

C++

```
virtual __fastcall DoMinimizeRibbon();
```

Description

This is DoMinimizeRibbon, a member of class TCustomRibbon.

62.1.4.5.28 TCustomRibbon.DoMouseWheelDown Method

OnMouseWheelDown event dispatcher.

Pascal

```
function DoMouseWheelDown(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelDown(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelDown to generate an OnMouseWheelDown event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelDown returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelDown to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated downward.

See Also

OnMouseWheelDown

DoMouseWheel

62.1.4.5.29 TCustomRibbon.DoMouseWheelEx Method

Pascal

```
function DoMouseWheelEx(Shift: TShiftState; WheelDelta: Integer; MousePos: TPoint): Boolean;
```

C++

```
__fastcall Boolean DoMouseWheelEx(TShiftState Shift, int WheelDelta, TPoint MousePos);
```

Description

This is DoMouseWheelEx, a member of class TCustomRibbon.

62.1.4.5.30 TCustomRibbon.DoMouseWheelUp Method

OnMouseWheelUp event dispatcher.

Pascal

```
function DoMouseWheelUp(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelUp(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelUp to generate an OnMouseWheelUp event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelUp returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelUp to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated upward.

OnMouseWheelUp

DoMouseWheel

62.1.4.5.31 TCustomRibbon.DoRecentItemClick Method

Pascal

```
procedure DoRecentItemClick(const FileName: string; const Index: Integer); virtual;
```

C++

```
virtual __fastcall DoRecentItemClick(const UnicodeString FileName, const int Index);
```

Description

This is DoRecentItemClick, a member of class TCustomRibbon.

62.1.4.5.32 TCustomRibbon.DoScrollTabsLeft Method

Pascal

```
procedure DoScrollTabsLeft; virtual;
```

C++

```
virtual __fastcall DoScrollTabsLeft();
```

Description

This is DoScrollTabsLeft, a member of class TCustomRibbon.

62.1.4.5.33 TCustomRibbon.DoScrollTabsRight Method

Pascal

```
procedure DoScrollTabsRight; virtual;
```

C++

```
virtual __fastcall DoScrollTabsRight();
```

Description

This is DoScrollTabsRight, a member of class TCustomRibbon.

62.1.4.5.34 TCustomRibbon.DoTabChange Method

Pascal

```
procedure DoTabChange(const NewIndex: Integer; const OldIndex: Integer; var AllowChange:
Boolean); virtual;
```

C++

```
virtual __fastcall DoTabChange(const int NewIndex, const int OldIndex, Boolean AllowChange);
```

Description

This is DoTabChange, a member of class TCustomRibbon.

62.1.4.5.35 TCustomRibbon.DrawCaption Method

Pascal

```
procedure DrawCaption; virtual;
```

C++

```
virtual __fastcall DrawCaption();
```

Description

This is DrawCaption, a member of class TCustomRibbon.

62.1.4.5.36 TCustomRibbon.DrawQuickAccessToolbar Method

Pascal

```
procedure DrawQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DrawQuickAccessToolbar();
```

Description

This is DrawQuickAccessToolbar, a member of class TCustomRibbon.

62.1.4.5.37 TCustomRibbon.DrawSystemButtons Method

Pascal

```
procedure DrawSystemButtons;
```

C++

```
__fastcall DrawSystemButtons();
```

Description

This is DrawSystemButtons, a member of class TCustomRibbon.

62.1.4.5.38 TCustomRibbon.DrawTab Method

Pascal

```
procedure DrawTab(const Index: Integer); virtual;
```

C++

```
virtual __fastcall DrawTab(const int Index);
```

Description

This is DrawTab, a member of class TCustomRibbon.

62.1.4.5.39 TCustomRibbon.EndUpdate Method

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

This is EndUpdate, a member of class TCustomRibbon.

62.1.4.5.40 TCustomRibbon.GetContextMenuOptions Method

Pascal

```
function GetContextMenuOptions: TContextMenuOptions;
```

C++

```
__fastcall TContextMenuOptions GetContextMenuOptions();
```

Description

This is GetContextMenuOptions, a member of class TCustomRibbon.

62.1.4.5.41 TCustomRibbon.GetHelpButtonRect Method

Pascal

```
function GetHelpButtonRect: TRect; virtual;
```

C++

```
virtual __fastcall TRect GetHelpButtonRect();
```

Description

This is GetHelpButtonRect, a member of class TCustomRibbon.

62.1.4.5.42 TCustomRibbon.GetIcon Method

Return Icon used by Application Menu (see page 3397) Button.

Pascal

```
function GetIcon(out IconSize: TIconSize): TIcon; virtual;
```

C++

```
virtual __fastcall TIcon GetIcon(TIconSize IconSize);
```

Description

GetIcon returns the Icon used by the Application Menu (see page 3397) Button. If there is no Icon assigned to the TApplicationMenu.Icon property, the application's icon is used.

See Also

TApplicationMenu (see page 3350)

Icon (see page 3354)

62.1.4.5.43 TCustomRibbon.GetRibbonHeight Method

Pascal

```
function GetRibbonHeight: Integer;
```

C++

```
__fastcall int GetRibbonHeight();
```

Description

This is GetRibbonHeight, a member of class TCustomRibbon.

62.1.4.5.44 TCustomRibbon.GetRibbonMetric Method

Pascal

```
function GetRibbonMetric(const Metric: TRibbonMetric): Integer;
```

C++

```
__fastcall int GetRibbonMetric(const TRibbonMetric Metric);
```

Description

This is GetRibbonMetric, a member of class TCustomRibbon.

62.1.4.5.45 TCustomRibbon.GetTabAt Method

Pascal

```
function GetTabAt(const X: Integer; const Y: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetTabAt(const int X, const int Y);
```

Description

This is GetTabAt, a member of class TCustomRibbon.

62.1.4.5.46 TCustomRibbon.GetTabRect Method

Pascal

```
function GetTabRect(const Index: Integer): TRect; virtual;
```

C++

```
virtual __fastcall TRect GetTabRect(const int Index);
```

Description

This is GetTabRect, a member of class TCustomRibbon.

62.1.4.5.47 TCustomRibbon.GetTabWidth Method

Pascal

```
function GetTabWidth(const Index: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetTabWidth(const int Index);
```

Description

This is GetTabWidth, a member of class TCustomRibbon.

62.1.4.5.48 TCustomRibbon.HasApplicationMenu Method

Pascal

```
function HasApplicationMenu: Boolean;
```

C++

```
__fastcall Boolean HasApplicationMenu();
```

Description

This is HasApplicationMenu, a member of class TCustomRibbon.

62.1.4.5.49 TCustomRibbon.HasQuickAccessToolbar Method

Pascal

```
function HasQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean HasQuickAccessToolbar();
```

Description

This is HasQuickAccessToolbar, a member of class TCustomRibbon.

62.1.4.5.50 TCustomRibbon.Idle Method

Pascal

```
procedure Idle(const Msg: TMsg);
```

C++

```
__fastcall Idle(const TMsg Msg);
```

Description

This is Idle, a member of class TCustomRibbon.

62.1.4.5.51 TCustomRibbon.InvalidateHeaderArea Method

Invalidate header section of Ribbon (see page 3347).

Pascal

```
procedure InvalidateHeaderArea;
```

C++

```
__fastcall InvalidateHeaderArea();
```

Description

InvalidateHeaderArea invalidates the header section of the Ribbon (see page 3347). Invalidating the header of the ribbon is especially important when using a custom frame. When using a custom frame, the header section of the ribbon needs to react visually to additional non-client specific messages.

See Also

InvalidateTabArea (see page 3383)

62.1.4.5.52 TCustomRibbon.InvalidateScrollButtons Method

Pascal

```
procedure InvalidateScrollButtons;
```

C++

```
__fastcall InvalidateScrollButtons();
```

Description

This is InvalidateScrollButtons, a member of class TCustomRibbon.

62.1.4.5.53 TCustomRibbon.InvalidateSystemMenuArea Method

Pascal

```
procedure InvalidateSystemMenuArea;
```

C++

```
__fastcall InvalidateSystemMenuArea();
```

Description

This is InvalidateSystemMenuArea, a member of class TCustomRibbon.

62.1.4.5.54 TCustomRibbon.InvalidateTabArea Method

Invalidate area that displays tabs.

Pascal

```
procedure InvalidateTabArea;
```

C++

```
__fastcall InvalidateTabArea();
```

Description

InvalidateTabArea invalidates the area that displays the tabs.

See Also

InvalidateHeaderArea (see page 3382)

62.1.4.5.55 TCustomRibbon.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

62.1.4.5.56 TCustomRibbon.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

62.1.4.5.57 TCustomRibbon.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was

pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

62.1.4.5.58 TCustomRibbon.MouseInSystemMenu Method

Pascal

```
function MouseInSystemMenu(const LPt: TPoint): Boolean;
```

C++

```
__fastcall Boolean MouseInSystemMenu(const TPoint LPt);
```

Description

This is MouseInSystemMenu, a member of class TCustomRibbon.

62.1.4.5.59 TCustomRibbon.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

62.1.4.5.60 TCustomRibbon.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

MouseDown

MouseMove

OnMouseUp

62.1.4.5.61 TCustomRibbon.MoveGroup Method

Move group to new page.

Pascal

```
procedure MoveGroup(const GroupName: string; const PageName: string);
```

C++

```
__fastcall MoveGroup(const UnicodeString GroupName, const UnicodeString PageName);
```

Description

MoveGroup moves a group to a new page. The group to be moved is specified in the **GroupName** parameter. The destination page is specified in the **PageName** parameter.

62.1.4.5.62 TCustomRibbon.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu

Notification

62.1.4.5.63 TCustomRibbon.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

Canvas

PaintWindow

GetDeviceContext

ClipRect

62.1.4.5.64 TCustomRibbon.RebuildRibbonMetrics Method

Pascal

```
procedure RebuildRibbonMetrics;
```

C++

```
__fastcall RebuildRibbonMetrics();
```

Description

This is RebuildRibbonMetrics, a member of class TCustomRibbon.

62.1.4.5.65 TCustomRibbon.RemoveAllTabs Method

Remove all Tabs (see page 3399) from Ribbon (see page 3347).

Pascal

```
procedure RemoveAllTabs;
```

C++

```
__fastcall RemoveAllTabs();
```

Description

RemoveAllTabs removes all Tabs (see page 3399) from the Ribbon (see page 3347). All associated pages and groups are deleted.

See Also

RemoveTab (see page 3388)

62.1.4.5.66 TCustomRibbon.RemoveRecentItem Method

Pascal

```
function RemoveRecentItem(const FileName: string): Boolean;
```

C++

```
__fastcall Boolean RemoveRecentItem(const UnicodeString FileName);
```

Description

This is RemoveRecentItem, a member of class TCustomRibbon.

62.1.4.5.67 TCustomRibbon.RemoveTab Method

Remove tab with specified caption.

Pascal

```
procedure RemoveTab(const ACaption: string);
```

C++

```
__fastcall RemoveTab(const UnicodeString ACaption);
```

Description

RemoveTab removes the tab with the specified caption. RemoveTab deletes the associated page and any groups on that page.

See Also

RemoveAllTabs (see page 3387)

62.1.4.5.68 TCustomRibbon.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize

62.1.4.5.69 TCustomRibbon.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

62.1.4.5.70 TCustomRibbon.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

Destroy

InsertControl

Parent

RemoveControl

62.1.4.5.71 TCustomRibbon.TabHandledKeyTips Method

Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.

Pascal

```
procedure TabHandledKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall TabHandledKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

TabHandledKeyTips validates **KeyTip** input when the **KeyTip**s State is **ktsTabs**. **KeyTip**s can be in either **ktsTabs** or **ktsControls** state. When the **KeyTip**s state is **ktsTabs**, the user has the option of selecting which Tab to switch to and display the **KeyTip**s for the controls on that tab. When the State **ktsTabs**, the Application Button and Quick Access Toolbar are also displaying their **KeyTip**s.

The parameters are:

- KeyTip: The **KeyTip** the user has input that needs to be validated against.
- Full: A list of TKeyTipMatchItem (see page 3598) that contain details if any **KeyTip**s were matched.

See Also

TKeyTipMatchItem (see page 3598)

TKeyTipState (see page 3928)

62.1.4.5.72 TCustomRibbon.TabHideKeyTips Method

Hide K**eyTip**s.

Pascal

```
procedure TabHideKeyTips(const KeyTip: string; KeyTips: TKeyTipList);
```

C++

```
__fastcall TabHideKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

TabHideKeyTips hides the **KeyTip**s. If the **KeyTips** parameter is `nil`, all **KeyTip**s are hidden. Otherwise **KeyTips** contains TKeyTipMatchItem (see page 3598) that are not supposed to be hidden at this time. This would occur when there are a number of Partial **KeyTip** matches where the first character of a **KeyTip** matches many **KeyTip**s.

See Also

TKeyTipMatchItem (see page 3598)

TabShowKeyTips (see page 3390)

62.1.4.5.73 TCustomRibbon.TabShowKeyTips Method

Display **KeyTip**s for **ktsTabs** State.

Pascal

```
procedure TabShowKeyTips;
```

C++

```
__fastcall TabShowKeyTips();
```

Description

TabShowKeyTips displays the **KeyTip**s for the **ktsTabs** State. When called, **KeyTip**s are displayed for the Tabs (see page 3399), Application Button and Quick Access Toolbar.

See Also

TabHideKeyTips (see page 3390)

TKeyTipState (see page 3928)

62.1.4.5.74 TCustomRibbon.UMCheckResize Method

Pascal

```
procedure UMCheckResize(var Message: TMessage); message UM_CHECKSIZE;
```

C++

```
__fastcall UMCheckResize(TMessage Message);
```

Description

This is UMCheckResize, a member of class TCustomRibbon.

62.1.4.5.75 TCustomRibbon.UMDisplayKeyTips Method

Pascal

```
procedure UMDisplayKeyTips(var Message: TMessage); message UM_DISPLAYKEYTIPS;
```

C++

```
__fastcall UMDisplayKeyTips(TMessage Message);
```

Description

This is UMDisplayKeyTips, a member of class TCustomRibbon.

62.1.4.5.76 TCustomRibbon.UpdateQATPosition Method

Pascal

```
procedure UpdateQATPosition;
```

C++

```
__fastcall UpdateQATPosition();
```

Description

This is UpdateQATPosition, a member of class TCustomRibbon.

62.1.4.5.77 TCustomRibbon.UpdateSystemMenuInfo Method

Pascal

```
procedure UpdateSystemMenuInfo;
```

C++

```
__fastcall UpdateSystemMenuInfo();
```

Description

This is UpdateSystemMenuInfo, a member of class TCustomRibbon.

62.1.4.5.78 TCustomRibbon.ValidTab Method

Pascal

```
function ValidTab(const Index: Integer): Boolean;
```

C++

```
__fastcall Boolean ValidTab(const int Index);
```

Description

This is ValidTab, a member of class TCustomRibbon.

62.1.4.5.79 TCustomRibbon.WMEraseBkgnd Method

Pascal

```
procedure WMEraseBkgnd(var Message: TWMEraseBkgnd); message WM_ERASEBKGND;
```

C++

```
__fastcall WMEraseBkgnd(TWMEraseBkgnd Message);
```

Description

This is WMEraseBkgnd, a member of class TCustomRibbon.

62.1.4.5.80 TCustomRibbon.WMGetDlgCode Method

Pascal

```
procedure WMGetDlgCode(var Message: TWMGetDlgCode); message WM_GETDLGCODE;
```

C++

```
__fastcall WMGetDlgCode(TWMGetDlgCode Message);
```

Description

This is WMGetDlgCode, a member of class TCustomRibbon.

62.1.4.5.81 TCustomRibbon.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TCustomRibbon.

62.1.4.5.82 TCustomRibbon.WMSettingChange Method

Pascal

```
procedure WMSettingChange(var Message: TWMSettingChange); message WM_SETTINGCHANGE;
```

C++

```
__fastcall WMSettingChange(TWMSettingChange Message);
```

Description

This is WMSettingChange, a member of class TCustomRibbon.

62.1.4.5.83 TCustomRibbon.WMWindowPosChanged Method

Pascal

```
procedure WMWindowPosChanged(var Message: TWMWindowPosChanged); message WM_WINDOWPOSCHANGED;
```

C++

```
__fastcall WMWindowPosChanged(TWMWindowPosChanged Message);
```

Description

This is WMWindowPosChanged, a member of class TCustomRibbon.

62.1.4.6 TCustomRibbon Properties

The properties of the TCustomRibbon class are listed here.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 3395)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.
	HideRibbon (see page 3396)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 3396)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 3397)	This is KeyTipsVisible, a member of class TCustomRibbon.
R	Menu (see page 3397)	This is Menu, a member of class TCustomRibbon.
R	ScaleFactor (see page 3398)	This is ScaleFactor, a member of class TCustomRibbon.

Public Properties

	Name	Description
	ActionManager (see page 3394)	This is ActionManager, a member of class TCustomRibbon.
	Active (see page 3394)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 3394)	Page currently displayed by ribbon control.
	ApplicationMenu (see page 3395)	Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 3942) control.
	ColorMap (see page 3395)	This is ColorMap, a member of class TCustomRibbon.
	DocumentName (see page 3396)	Text in Ribbon (see page 3347) caption.
	HideTabs (see page 3396)	Shows or hides Tab portion of Ribbon (see page 3347).
	Minimized (see page 3397)	Show Ribbon (see page 3347) in minimized state where tabs can be selected but are not visible.
	QuickAccessToolbar (see page 3397)	Properties associated with TQuickAccessToolbar (see page 3469).
	ScreenTips (see page 3398)	This is ScreenTips, a member of class TCustomRibbon.
	ShowHelpButton (see page 3398)	Determines whether ribbon displays Help Button.
	Style (see page 3398)	This is Style, a member of class TCustomRibbon.
	TabIndex (see page 3399)	Change the active page of ribbon.

	Tabs (see page 3399)	Collection of TRibbonTabs (see page 3560) visible on ribbon.
	UseCustomFrame (see page 3399)	Indicates whether to use a custom frame for ribbon controls.

62.1.4.6.1 TCustomRibbon.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TCustomRibbon.

62.1.4.6.2 TCustomRibbon.Active Property

Indicates if form that ribbon is placed on is active form.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Active indicates if the form that the ribbon is placed on is the active form of the desktop.

There should be no need for a user to set the Active property unless they are not using the custom frame functionality of the ribbon. The appearance of the ribbon changes depending on the value of this property.

If the form that the ribbon is placed on does not descend from TRibbonForm, the user should update the Active property when the form gets activated and deactivated.

See Also

ActivePage (see page 3394)

62.1.4.6.3 TCustomRibbon.ActivePage Property

Page currently displayed by ribbon control.

Pascal

```
property ActivePage: TCustomRibbonPage;
```

C++

```
__property TCustomRibbonPage ActivePage;
```

Description

ActivePage is the page currently displayed by the ribbon control.

Read ActivePage to determine which page is selected by the user. The user selects a page by clicking the mouse on its tab or selects the page's associated keytip. Set ActivePage to bring a page to the foreground. Only one page can be active at a time.

Use TRibbonTabs.SelectNext and TRibbonTabs.SelectPrior to select the next and prior pages in the ribbon. If the active page does not change after a call to SelectNext or SelectPrior, the return value of those functions is False.

To change the active page of the ribbon by Index, set the TabIndex (see page 3399) property to the desired page index.

See Also

TRibbonTabs (see page 3560)

Active (see page 3394)

TabIndex (see page 3399)

SelectNext (see page 3563)

SelectPrior (see page 3563)

62.1.4.6.4 TCustomRibbon.AllowKeyboardNavigation Property

Pascal

```
property AllowKeyboardNavigation: Boolean;
```

C++

```
__property Boolean AllowKeyboardNavigation;
```

Description

This is AllowKeyboardNavigation, a member of class TCustomRibbon.

62.1.4.6.5 TCustomRibbon.ApplicationMenu Property

Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 3942) control.

Pascal

```
property ApplicationMenu: TApplicationMenu;
```

C++

```
__property TApplicationMenu ApplicationMenu;
```

Description

ApplicationMenu changes the appearance for the ribbon's associated TRibbonApplicationMenuBar (see page 3942) control.

Changing the values of the fields in ApplicationMenu changes the characteristics of the Application Menu (see page 3397) for the ribbon. The Application Menu (see page 3397) on the ribbon is represented by the round button in the top left corner.

See Also

TApplicationMenu (see page 3350)

TRibbonApplicationMenuBar (see page 3942)

62.1.4.6.6 TCustomRibbon.ColorMap Property

Pascal

```
property ColorMap: TCustomActionBarColorMap;
```

C++

```
__property TCustomActionBarColorMap ColorMap;
```

Description

This is ColorMap, a member of class TCustomRibbon.

62.1.4.6.7 TCustomRibbon.DocumentName Property

Text in Ribbon (see page 3347) caption.

Pascal

```
property DocumentName: string;
```

C++

```
__property UnicodeString DocumentName;
```

Description

DocumentName appears in the Ribbon (see page 3347) caption.

62.1.4.6.8 TCustomRibbon.HideRibbon Property

Pascal

```
property HideRibbon: Boolean;
```

C++

```
__property Boolean HideRibbon;
```

Description

This is HideRibbon, a member of class TCustomRibbon.

62.1.4.6.9 TCustomRibbon.HideTabs Property

Shows or hides Tab portion of Ribbon (see page 3347).

Pascal

```
property HideTabs: Boolean;
```

C++

```
__property Boolean HideTabs;
```

Description

HideTabs shows or hides the Tab portion of the Ribbon (see page 3347). When HideTabs is True, the user cannot access any of the Tabs (see page 3399) on the Ribbon (see page 3347).

62.1.4.6.10 TCustomRibbon.HotTabIndex Property

Pascal

```
property HotTabIndex: Integer;
```

C++

```
__property int HotTabIndex;
```

Description

This is HotTabIndex, a member of class TCustomRibbon.

62.1.4.6.11 TCustomRibbon.KeyTipsVisible Property

Pascal

```
property KeyTipsVisible: Boolean;
```

C++

```
__property Boolean KeyTipsVisible;
```

Description

This is KeyTipsVisible, a member of class TCustomRibbon.

62.1.4.6.12 TCustomRibbon.Menu Property

Pascal

```
property Menu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar Menu;
```

Description

This is Menu, a member of class TCustomRibbon.

62.1.4.6.13 TCustomRibbon.Minimized Property

Show Ribbon (see page 3347) in minimized state where tabs can be selected but are not visible.

Pascal

```
property Minimized: Boolean;
```

C++

```
__property Boolean Minimized;
```

Description

Minimized indicates whether to show the Ribbon (see page 3347) in a minimized state where tabs can be selected but are not visible. When Minimized is True, Tabs (see page 3399) still function. You can access the tabs by selecting the desired Tab with the mouse or switching to the tab by using tab allocated `KeyTips`.

62.1.4.6.14 TCustomRibbon.QuickAccessToolbar Property

Properties associated with TQuickAccessToolbar (see page 3469).

Pascal

```
property QuickAccessToolbar: TQuickAccessToolbar;
```

C++

```
__property TQuickAccessToolbar QuickAccessToolbar;
```

Description

QuickAccessToolbar has the properties associated with the TQuickAccessToolbar (see page 3469) on the ribbon. Use these properties to change the appearance of the Quick Access Toolbar as displayed on the ribbon.

See Also

TQuickAccessToolbar (see page 3469)

62.1.4.6.15 TCustomRibbon.ScaleFactor Property

Pascal

```
property ScaleFactor: Single;
```

C++

```
__property Single ScaleFactor;
```

Description

This is ScaleFactor, a member of class TCustomRibbon.

62.1.4.6.16 TCustomRibbon.ScreenTips Property

Pascal

```
property ScreenTips: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTips;
```

Description

This is ScreenTips, a member of class TCustomRibbon.

62.1.4.6.17 TCustomRibbon.ShowHelpButton Property

Determines whether ribbon displays Help Button.

Pascal

```
property ShowHelpButton: Boolean;
```

C++

```
__property Boolean ShowHelpButton;
```

Description

ShowHelpButton indicates whether or not the ribbon displays a Help Button in the top right hand corner.

See Also

THelpButton (see page 3459)

62.1.4.6.18 TCustomRibbon.Style Property

Pascal

```
property Style: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars Style;
```

Description

This is Style, a member of class TCustomRibbon.

62.1.4.6.19 TCustomRibbon.TabIndex Property

Change the active page of ribbon.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

TabIndex changes the active page of the ribbon. Set the TabIndex property to the desired page index.

See Also

Tabs (see page 3399)

62.1.4.6.20 TCustomRibbon.Tabs Property

Collection of TRibbonTabs (see page 3560) visible on ribbon.

Pascal

```
property Tabs: TRibbonTabs;
```

C++

```
__property TRibbonTabs Tabs;
```

Description

Tabs contains a collection of TRibbonTabs (see page 3560) visible on the ribbon.

Tabs is a linked list of TRibbonTabs (see page 3560) objects. TRibbonTabs (see page 3560) is a simple data structure that contains the caption for the tab, the keytip for the tab as well as a reference to the Tab object.

See Also

TRibbonTabs (see page 3560)

TabIndex (see page 3399)

62.1.4.6.21 TCustomRibbon.UseCustomFrame Property

Indicates whether to use a custom frame for ribbon controls.

Pascal

```
property UseCustomFrame: Boolean;
```

C++

```
__property Boolean UseCustomFrame;
```

Description

UseCustomFrame indicates whether or not to use a custom frame for ribbon controls.

62.1.4.7 TCustomRibbon Nested Types

The nested types of the TCustomRibbon class are listed here.

Public Nested Types

Name	Description
TTabChangeEvent (see page 3400)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

62.1.4.7.1 TCustomRibbon.TTabChangeEvent Nested Type

Pascal

```
TTabChangeEvent = procedure (Sender: TObject; const NewIndex, OldIndex: Integer; var
AllowChange: Boolean) of object;
```

C++

```
(Sender: TObject; const NewIndex, OldIndex: Integer; var AllowChange: Boolean) (
TTabChangeEvent)();
```

Description

This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

62.1.4.8 TCustomRibbon Events

The events of the TCustomRibbon class are listed here.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 3400)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 3401)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Public Events

	Name	Description
	OnHelpButtonClick (see page 3400)	This is OnHelpButtonClick, a member of class TCustomRibbon.
	OnRecentItemClick (see page 3401)	This is OnRecentItemClick, a member of class TCustomRibbon.
	OnTabChange (see page 3401)	This is OnTabChange, a member of class TCustomRibbon.

62.1.4.8.1 TCustomRibbon.OnHelpButtonClick Event

Pascal

```
property OnHelpButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHelpButtonClick;
```

Description

This is OnHelpButtonClick, a member of class TCustomRibbon.

62.1.4.8.2 TCustomRibbon.OnLeftTabScrollButtonClick Event

Pascal

```
property OnLeftTabScrollButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLeftTabScrollButtonClick;
```

Description

This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.

62.1.4.8.3 TCustomRibbon.OnRecentItemClick Event

Pascal

```
property OnRecentItemClick: TRecentItemClickEvent;
```

C++

```
__property TRecentItemClickEvent OnRecentItemClick;
```

Description

This is OnRecentItemClick, a member of class TCustomRibbon.

62.1.4.8.4 TCustomRibbon.OnRightTabScrollButtonClick Event

Pascal

```
property OnRightTabScrollButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRightTabScrollButtonClick;
```

Description

This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

62.1.4.8.5 TCustomRibbon.OnTabChange Event

Pascal

```
property OnTabChange: TTabChangeEvent;
```

C++

```
__property TTabChangeEvent OnTabChange;
```

Description

This is OnTabChange, a member of class TCustomRibbon.

62.1.5 TCustomRibbonColorMap Class

Class Hierarchy

Pascal

```
TCustomRibbonColorMap = class(TXPColorMap);
```

C++

```
class TCustomRibbonColorMap : public TXPColorMap;
```

File

Ribbon

Description

This is class Ribbon.TCustomRibbonColorMap.

62.1.5.1 TCustomRibbonColorMap Members

The following tables list the members exposed by TCustomRibbonColorMap.

Public Properties

	Name	Description
	ActiveTabFontColor (see page 3402)	This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.
	BevelMinimizedInner (see page 3403)	This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.
	BevelMinimizedOuter (see page 3403)	This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.
	CaptionFontColor (see page 3403)	This is CaptionFontColor, a member of class TCustomRibbonColorMap.
	ControlColor (see page 3403)	This is ControlColor, a member of class TCustomRibbonColorMap.
	ControlFrameColor (see page 3404)	This is ControlFrameColor, a member of class TCustomRibbonColorMap.
	ControlInactiveColor (see page 3404)	This is ControlInactiveColor, a member of class TCustomRibbonColorMap.
	DocumentFontColor (see page 3404)	This is DocumentFontColor, a member of class TCustomRibbonColorMap.
	GroupFontColor (see page 3404)	This is GroupFontColor, a member of class TCustomRibbonColorMap.
	InactiveTabFontColor (see page 3404)	This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3405)	This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreColor (see page 3405)	This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

62.1.5.2 TCustomRibbonColorMap Properties

The properties of the TCustomRibbonColorMap class are listed here.

Public Properties

	Name	Description
	ActiveTabFontColor (see page 3402)	This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.
	BevelMinimizedInner (see page 3403)	This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.
	BevelMinimizedOuter (see page 3403)	This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.
	CaptionFontColor (see page 3403)	This is CaptionFontColor, a member of class TCustomRibbonColorMap.
	ControlColor (see page 3403)	This is ControlColor, a member of class TCustomRibbonColorMap.
	ControlFrameColor (see page 3404)	This is ControlFrameColor, a member of class TCustomRibbonColorMap.
	ControlInactiveColor (see page 3404)	This is ControlInactiveColor, a member of class TCustomRibbonColorMap.
	DocumentFontColor (see page 3404)	This is DocumentFontColor, a member of class TCustomRibbonColorMap.
	GroupFontColor (see page 3404)	This is GroupFontColor, a member of class TCustomRibbonColorMap.
	InactiveTabFontColor (see page 3404)	This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3405)	This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreColor (see page 3405)	This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

62.1.5.2.1 TCustomRibbonColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.

62.1.5.2.2 TCustomRibbonColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.

62.1.5.2.3 TCustomRibbonColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.

62.1.5.2.4 TCustomRibbonColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TCustomRibbonColorMap.

62.1.5.2.5 TCustomRibbonColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TCustomRibbonColorMap.

62.1.5.2.6 TCustomRibbonColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TCustomRibbonColorMap.

62.1.5.2.7 TCustomRibbonColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TCustomRibbonColorMap.

62.1.5.2.8 TCustomRibbonColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TCustomRibbonColorMap.

62.1.5.2.9 TCustomRibbonColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TCustomRibbonColorMap.

62.1.5.2.10 TCustomRibbonColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.

62.1.5.2.11 TCustomRibbonColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.

62.1.5.2.12 TCustomRibbonColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

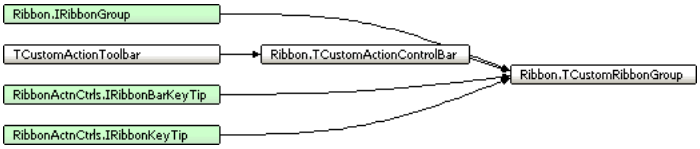
Description

This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

62.1.6 TCustomRibbonGroup Class

Align and display all controls on ribbon.

Class Hierarchy



Pascal

```
TCustomRibbonGroup = class(TCustomActionControlBar, IRibbonGroup, IRibbonBarKeyTip,
IRibbonKeyTip);
```

C++

```
class TCustomRibbonGroup : public TCustomActionControlBar, public IRibbonGroup, public
IRibbonBarKeyTip, public IRibbonKeyTip;
```

File

Ribbon

Description

TCustomRibbonGroup aligns and displays all controls available for use on the ribbon. Controls are displayed on a Ribbon (see

page 3347) Group.

See Also

Creating an Application that Uses Ribbon Controls

Adding Commands to the Ribbon

TGroupAlign (see page 3408)

62.1.6.1 TCustomRibbonGroup Members

The following tables list the members exposed by TCustomRibbonGroup.

Enumerations

	Name	Description
	TGroupAlign (see page 3408)	Alignment of ribbon group.

Protected Methods

	Name	Description
	AlignControls (see page 3409)	This is AlignControls, a member of class TCustomRibbonGroup.
	AutoSizingChanged (see page 3410)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMControlChange (see page 3357)	This is CMControlChange, a member of class TCustomActionControlBar.
	CMFontchanged (see page 3412)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 3412)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 3412)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 3412)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 3413)	This is CMTextchanged, a member of class TCustomRibbonGroup.
	CreateControls (see page 3413)	This is CreateControls, a member of class TCustomRibbonGroup.
	DoDropItem (see page 3414)	This is DoDropItem, a member of class TCustomRibbonGroup.
	DoEndDrag (see page 3414)	This is DoEndDrag, a member of class TCustomRibbonGroup.
	DrawShowDialogButton (see page 3414)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 3414)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
	GetControlClass (see page 3357)	This is GetControlClass, a member of class TCustomActionControlBar.
	GetGroupHeight (see page 3415)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
	HideControls (see page 3416)	This is HideControls, a member of class TCustomRibbonGroup.
	MouseDown (see page 3417)	This is MouseDown, a member of class TCustomRibbonGroup.
	MouseMove (see page 3417)	This is MouseMove, a member of class TCustomRibbonGroup.
	MouseUp (see page 3417)	This is MouseUp, a member of class TCustomRibbonGroup.
	Notification (see page 3417)	This is Notification, a member of class TCustomRibbonGroup.
	Paint (see page 3418)	This is Paint, a member of class TCustomRibbonGroup.
	Resize (see page 3418)	This is Resize, a member of class TCustomRibbonGroup.
	SetAutoSizing (see page 3418)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
	SetParent (see page 3419)	This is SetParent, a member of class TCustomRibbonGroup.
	SetupDropDownBtn (see page 3419)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
	ShowControls (see page 3419)	This is ShowControls, a member of class TCustomRibbonGroup.

Protected Properties

	Name	Description
	CreatingControls (see page 3358)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	AlignGroupControls (see page 3410)	Align controls in Ribbon (see page 3347) Group
	Assign (see page 3410)	This is Assign, a member of class TCustomRibbonGroup.

	BarHandleKeyTips (see page 3410)	Iterate over any visible **KeyTip (see page 3423)**s and perform validation to determine if one of **KeyTip (see page 3423)**s is partial or full match.
	BarHideKeyTips (see page 3411)	Hide any visible KeyTips that commands are displaying.
	BarShowKeyTips (see page 3411)	Show K**eyTip**s for commands.
	Clone (see page 3411)	This is Clone, a member of class TCustomRibbonGroup.
V	Create (see page 3407)	This is Create, a member of class TCustomRibbonGroup.
V	CreateControl (see page 3413)	Recreate specific control.
V	Destroy (see page 3408)	This is Destroy, a member of class TCustomRibbonGroup.
V	DockDrop (see page 3413)	This is DockDrop, a member of class TCustomRibbonGroup.
V	DragDrop (see page 3414)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 3415)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3415)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3416)	Hide **KeyTip** for command.
	KeyTipClick (see page 3416)	Handle clicking a **KeyTip**.
V	SetBounds (see page 3418)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 3418)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3419)	Shows **KeyTip** for command in specified position.
V	StyleChanged (see page 3420)	This is StyleChanged, a member of class TCustomRibbonGroup.

Public Nested Types

Name	Description
TRowPosition (see page 3424)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

Public Properties

	Name	Description
R	CanCollapse (see page 3421)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 3421)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	DialogAction (see page 3421)	Determines whether dialog button displayed in group.
	GroupAlign (see page 3421)	Determines how controls on group are aligned.
	GroupIndex (see page 3422)	Index of group within current tab.
	GroupVariant (see page 3422)	Current size variant ribbon group is using.
R	GroupWidth (see page 3422)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 3423)	Indicates if group has an in ribbon Gallery.
	Items (see page 3423)	This is Items, a member of class TCustomRibbonGroup.
	KeyTip (see page 3423)	Key tip for Dialog button of group.
R	Page (see page 3423)	Reference to Page group is on.
R	RequiredWidth (see page 3424)	Width required to display group.
	Rows (see page 3424)	Number of Rows in group has for controls.

62.1.6.2 TCustomRibbonGroup.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonGroup(TComponent * AOwner);
```

Description

This is Create, a member of class TCustomRibbonGroup.

62.1.6.3 TCustomRibbonGroup.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonGroup();
```

Description

This is Destroy, a member of class TCustomRibbonGroup.

62.1.6.4 TCustomRibbonGroup Enumerations

The enumerations of the TCustomRibbonGroup class are listed here.

Enumerations

	Name	Description
	TGroupAlign (see page 3408)	Alignment of ribbon group.

62.1.6.4.1 Ribbon.TCustomRibbonGroup.TGroupAlign Enumeration

Alignment of ribbon group.

Pascal

```
TGroupAlign = (
  gaHorizontal,
  gaVertical
);
```

C++

```
enum TGroupAlign {
  gaHorizontal,
  gaVertical
};
```

File

Ribbon

Description

TGroupAlign specifies the alignment of the TCustomRibbonGroup (see page 3405). It can have one of the following values:

Value	Meaning
gaHorizontal	Controls are aligned left to right in rows. The row ends when a control has the NewRow property set to True. The NewRow property can be ignored when a group is being minimized.
gaVertical	Controls are aligned top to bottom moving left to right. Groups aligned vertically are autosized.

62.1.6.5 TCustomRibbonGroup Methods

The methods of the TCustomRibbonGroup class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3409)	This is AlignControls, a member of class TCustomRibbonGroup.
	AutoSizingChanged (see page 3410)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMFontchanged (see page 3412)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 3412)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 3412)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 3412)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 3413)	This is CMTextchanged, a member of class TCustomRibbonGroup.
	CreateControls (see page 3413)	This is CreateControls, a member of class TCustomRibbonGroup.
	DoDropItem (see page 3414)	This is DoDropItem, a member of class TCustomRibbonGroup.
	DoEndDrag (see page 3414)	This is DoEndDrag, a member of class TCustomRibbonGroup.
	DrawShowDialogButton (see page 3414)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 3414)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
	GetGroupHeight (see page 3415)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
	HideControls (see page 3416)	This is HideControls, a member of class TCustomRibbonGroup.
	MouseDown (see page 3417)	This is MouseDown, a member of class TCustomRibbonGroup.
	MouseMove (see page 3417)	This is MouseMove, a member of class TCustomRibbonGroup.
	MouseUp (see page 3417)	This is MouseUp, a member of class TCustomRibbonGroup.
	Notification (see page 3417)	This is Notification, a member of class TCustomRibbonGroup.
	Paint (see page 3418)	This is Paint, a member of class TCustomRibbonGroup.
	Resize (see page 3418)	This is Resize, a member of class TCustomRibbonGroup.
	SetAutoSizing (see page 3418)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
	SetParent (see page 3419)	This is SetParent, a member of class TCustomRibbonGroup.
	SetupDropDownBtn (see page 3419)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
	ShowControls (see page 3419)	This is ShowControls, a member of class TCustomRibbonGroup.

Public Methods

	Name	Description
	AlignGroupControls (see page 3410)	Align controls in Ribbon (see page 3347) Group
	Assign (see page 3410)	This is Assign, a member of class TCustomRibbonGroup.
	BarHandleKeyTips (see page 3410)	Iterate over any visible **KeyTip (see page 3423)**s and perform validation to determine if one of **KeyTip (see page 3423)**s is partial or full match.
	BarHideKeyTips (see page 3411)	Hide any visible KeyTips that commands are displaying.
	BarShowKeyTips (see page 3411)	Show K**eyTip**s for commands.
	Clone (see page 3411)	This is Clone, a member of class TCustomRibbonGroup.
	CreateControl (see page 3413)	Recreate specific control.
	DockDrop (see page 3413)	This is DockDrop, a member of class TCustomRibbonGroup.
	DragDrop (see page 3414)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 3415)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 3415)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3416)	Hide **KeyTip** for command.
	KeyTipClick (see page 3416)	Handle clicking a **KeyTip**.
	SetBounds (see page 3418)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 3418)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3419)	Shows **KeyTip** for command in specified position.
	StyleChanged (see page 3420)	This is StyleChanged, a member of class TCustomRibbonGroup.

62.1.6.5.1 TCustomRibbonGroup.AlignControls Method

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

This is AlignControls, a member of class TCustomRibbonGroup.

62.1.6.5.2 TCustomRibbonGroup.AlignGroupControls Method

Align controls in Ribbon (see page 3347) Group

Pascal

```
procedure AlignGroupControls; virtual;
```

C++

```
virtual __fastcall AlignGroupControls();
```

Description

AlignGroupControls aligns the controls in the Ribbon (see page 3347) Group.

62.1.6.5.3 TCustomRibbonGroup.Assign Method

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

This is Assign, a member of class TCustomRibbonGroup.

62.1.6.5.4 TCustomRibbonGroup.AutoSizingChanged Method

Pascal

```
procedure AutoSizingChanged; override;
```

C++

```
virtual __fastcall AutoSizingChanged();
```

Description

This is AutoSizingChanged, a member of class TCustomRibbonGroup.

62.1.6.5.5 TCustomRibbonGroup.BarHandleKeyTips Method

Iterate over any visible **KeyTip (see page 3423)**s and perform validation to determine if one of **KeyTip (see page 3423)**s is partial or full match.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips iterates over any visible **KeyTip (see page 3423)**s and performs validation to determine if one of the **KeyTip (see page 3423)**s is a partial or full match. **KeyTip (see page 3423)**s that match are returned in the **List** parameter.

See Also

BarHideKeyTips (see page 3411)

BarShowKeyTips (see page 3411)

62.1.6.5.6 TCustomRibbonGroup.BarHideKeyTips Method

Hide any visible KeyTips that commands are displaying.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible KeyTips that commands are displaying. The **KeyTips** parameter contains a list of TKeyTipMatchItem (see page 3598) objects that indicate the **KeyTip (see page 3423)** associate with that command should not be close. When the **KeyTips** parameter is `nil`, all **KeyTip (see page 3423)**s are hidden.

See Also

TKeyTipMatchItem (see page 3598)

BarHandleKeyTips (see page 3410)

BarShowKeyTips (see page 3411)

62.1.6.5.7 TCustomRibbonGroup.BarShowKeyTips Method

Show K**eyTip**s for commands.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip (see page 3423)**s for the commands.

See Also

BarHandleKeyTips (see page 3410)

BarHideKeyTips (see page 3411)

62.1.6.5.8 TCustomRibbonGroup.Clone Method

Pascal

```
function Clone: TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup Clone();
```

Description

This is Clone, a member of class TCustomRibbonGroup.

62.1.6.5.9 TCustomRibbonGroup.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbonGroup.

62.1.6.5.10 TCustomRibbonGroup.CMItemDropPoint Method

Pascal

```
procedure CMItemDropPoint(var Message: TCMItemMsg); message CM_ITEMDROPPOINT;
```

C++

```
__fastcall CMItemDropPoint(TCMItemMsg Message);
```

Description

This is CMItemDropPoint, a member of class TCustomRibbonGroup.

62.1.6.5.11 TCustomRibbonGroup.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbonGroup.

62.1.6.5.12 TCustomRibbonGroup.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbonGroup.

62.1.6.5.13 TCustomRibbonGroup.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbonGroup.

62.1.6.5.14 TCustomRibbonGroup.CreateControl Method

Recreate specific control.

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

CreateControl recreates a specific control.

See Also

AlignGroupControls (see page 3568)

62.1.6.5.15 TCustomRibbonGroup.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonGroup.

62.1.6.5.16 TCustomRibbonGroup.DockDrop Method

Pascal

```
procedure DockDrop(Source: TDragDockObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DockDrop(TDragDockObject Source, int X, int Y);
```

Description

This is DockDrop, a member of class TCustomRibbonGroup.

62.1.6.5.17 TCustomRibbonGroup.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TCustomRibbonGroup.

62.1.6.5.18 TCustomRibbonGroup.DoEndDrag Method

Pascal

```
procedure DoEndDrag(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDrag(TObject * Target, int X, int Y);
```

Description

This is DoEndDrag, a member of class TCustomRibbonGroup.

62.1.6.5.19 TCustomRibbonGroup.DragDrop Method

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This is DragDrop, a member of class TCustomRibbonGroup.

62.1.6.5.20 TCustomRibbonGroup.DrawShowDialogButton Method

Pascal

```
procedure DrawShowDialogButton; virtual;
```

C++

```
virtual __fastcall DrawShowDialogButton();
```

Description

This is DrawShowDialogButton, a member of class TCustomRibbonGroup.

62.1.6.5.21 TCustomRibbonGroup.GetCaptionHeight Method

Pascal

```
function GetCaptionHeight: Integer;
```

C++

```
__fastcall int GetCaptionHeight();
```

Description

This is GetCaptionHeight, a member of class TCustomRibbonGroup.

62.1.6.5.22 TCustomRibbonGroup.GetGroupHeight Method

Pascal

```
function GetGroupHeight: Integer;
```

C++

```
__fastcall int GetGroupHeight();
```

Description

This is GetGroupHeight, a member of class TCustomRibbonGroup.

62.1.6.5.23 TCustomRibbonGroup.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 3922)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

62.1.6.5.24 TCustomRibbonGroup.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

62.1.6.5.25 TCustomRibbonGroup.HideControls Method

Pascal

```
procedure HideControls; virtual;
```

C++

```
virtual __fastcall HideControls();
```

Description

This is HideControls, a member of class TCustomRibbonGroup.

62.1.6.5.26 TCustomRibbonGroup.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

62.1.6.5.27 TCustomRibbonGroup.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

62.1.6.5.28 TCustomRibbonGroup.MouseDown Method

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseDown, a member of class TCustomRibbonGroup.

62.1.6.5.29 TCustomRibbonGroup.MouseMove Method

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

This is MouseMove, a member of class TCustomRibbonGroup.

62.1.6.5.30 TCustomRibbonGroup.MouseUp Method

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseUp, a member of class TCustomRibbonGroup.

62.1.6.5.31 TCustomRibbonGroup.Notification Method

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This is Notification, a member of class TCustomRibbonGroup.

62.1.6.5.32 TCustomRibbonGroup.Paint Method

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

This is Paint, a member of class TCustomRibbonGroup.

62.1.6.5.33 TCustomRibbonGroup.Resize Method

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

This is Resize, a member of class TCustomRibbonGroup.

62.1.6.5.34 TCustomRibbonGroup.SetAutoSizing Method

Pascal

```
procedure SetAutoSizing(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSizing(const Boolean Value);
```

Description

This is SetAutoSizing, a member of class TCustomRibbonGroup.

62.1.6.5.35 TCustomRibbonGroup.SetBounds Method

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

This is SetBounds, a member of class TCustomRibbonGroup.

62.1.6.5.36 TCustomRibbonGroup.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

62.1.6.5.37 TCustomRibbonGroup.SetParent Method

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

This is SetParent, a member of class TCustomRibbonGroup.

62.1.6.5.38 TCustomRibbonGroup.SetupDropDownBtn Method

Pascal

```
procedure SetupDropDownBtn; override;
```

C++

```
virtual __fastcall SetupDropDownBtn();
```

Description

This is SetupDropDownBtn, a member of class TCustomRibbonGroup.

62.1.6.5.39 TCustomRibbonGroup.ShowControls Method

Pascal

```
procedure ShowControls; virtual;
```

C++

```
virtual __fastcall ShowControls();
```

Description

This is ShowControls, a member of class TCustomRibbonGroup.

62.1.6.5.40 TCustomRibbonGroup.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

62.1.6.5.41 TCustomRibbonGroup.StyleChanged Method

Pascal

```
procedure StyleChanged(AStyle: TRibbonStyleActionBars); virtual;
```

C++

```
virtual __fastcall StyleChanged(TRibbonStyleActionBars AStyle);
```

Description

This is StyleChanged, a member of class TCustomRibbonGroup.

62.1.6.6 TCustomRibbonGroup Properties

The properties of the TCustomRibbonGroup class are listed here.

Public Properties

	Name	Description
R	CanCollapse (see page 3421)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 3421)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	DialogAction (see page 3421)	Determines whether dialog button displayed in group.
	GroupAlign (see page 3421)	Determines how controls on group are aligned.
	GroupIndex (see page 3422)	Index of group within current tab.
	GroupVariant (see page 3422)	Current size variant ribbon group is using.
R	GroupWidth (see page 3422)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 3423)	Indicates if group has an in ribbon Gallery.
	Items (see page 3423)	This is Items, a member of class TCustomRibbonGroup.
	KeyTip (see page 3423)	Key tip for Dialog button of group.
R	Page (see page 3423)	Reference to Page group is on.
R	RequiredWidth (see page 3424)	Width required to display group.
	Rows (see page 3424)	Number of Rows in group has for controls.

62.1.6.6.1 TCustomRibbonGroup.CanCollapse Property

Determine whether group can be displayed collapsed.

Pascal

```
property CanCollapse: Boolean;
```

C++

```
__property Boolean CanCollapse;
```

Description

CanCollapse determines whether the group can be displayed in the collapsed state. If there is only one control on the group, that group cannot be displayed as collapsed.

62.1.6.6.2 TCustomRibbonGroup.CollapsedControl Property

Pascal

```
property CollapsedControl: TRibbonGroupCollapsedControl;
```

C++

```
__property TRibbonGroupCollapsedControl CollapsedControl;
```

Description

This is CollapsedControl, a member of class TCustomRibbonGroup.

62.1.6.6.3 TCustomRibbonGroup.DialogAction Property

Determines whether dialog button displayed in group.

Pascal

```
property DialogAction: TContainedAction;
```

C++

```
__property TContainedAction DialogAction;
```

Description

DialogAction determines whether the dialog button is displayed in the lower right hand corner of the group.

See Also

KeyTip (see page 3423)

62.1.6.6.4 TCustomRibbonGroup.GroupAlign Property

Determines how controls on group are aligned.

Pascal

```
property GroupAlign: TGroupAlign;
```

C++

```
__property TGroupAlign GroupAlign;
```

Description

GroupAlign contains a TGroupAlign (see page 3408) that determines how controls on a group are aligned.

If alignment is **gaHorizontal**, controls are aligned left to right, top to bottom. To make a control start in a new row, set the NewRow property to true.

If alignment is **gaVertical**, controls are aligned top to bottom, left to right. Controls are automatically moved to the next column in the group if three controls are already in the column. You can also force a control to a new column by setting the NewCol property to true.

See Also

TGroupAlign (see page 3408)

62.1.6.6.5 TCustomRibbonGroup.GroupIndex Property

Index of group within current tab.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is the index of the group within the current tab. Set the GroupIndex property to change the position of the group within the current tab.

62.1.6.6.6 TCustomRibbonGroup.GroupVariant Property

Current size variant ribbon group is using.

Pascal

```
property GroupVariant: TRibbonGroupVariant;
```

C++

```
__property TRibbonGroupVariant GroupVariant;
```

Description

GroupVariant is the current size variant the ribbon group is using.

See Also

RequiredWidth (see page 3424)

62.1.6.6.7 TCustomRibbonGroup.GroupWidth Property

Pascal

```
property GroupWidth: Integer;
```

C++

```
__property int GroupWidth;
```

Description

This is GroupWidth, a member of class TCustomRibbonGroup.

62.1.6.6.8 TCustomRibbonGroup.HasGallery Property

Indicates if group has an in ribbon Gallery.

Pascal

```
property HasGallery: Boolean;
```

C++

```
__property Boolean HasGallery;
```

Description

HasGallery returns True if the group has an in ribbon Gallery to display, false otherwise.

62.1.6.6.9 TCustomRibbonGroup.Items Property

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

This is Items, a member of class TCustomRibbonGroup.

62.1.6.6.10 TCustomRibbonGroup.KeyTip Property

Key tip for Dialog button of group.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the key tip for the Dialog button of the group. It is only valid when DialogAction (see page 3421) has been set.

See Also

DialogAction (see page 3421)

62.1.6.6.11 TCustomRibbonGroup.Page Property

Reference to Page group is on.

Pascal

```
property Page: TRibbonPage;
```

C++

```
__property TRibbonPage Page;
```

Description

Page is a reference to the Page that the group is on.

62.1.6.6.12 TCustomRibbonGroup.RequiredWidth Property

Width required to display group.

Pascal

```
property RequiredWidth: Integer;
```

C++

```
__property int RequiredWidth;
```

Description

RequiredWidth is the width required to display the group in its large Variant.

See Also

GroupVariant (see page 3422)

62.1.6.6.13 TCustomRibbonGroup.Rows Property

Number of Rows in group has for controls.

Pascal

```
property Rows: Integer;
```

C++

```
__property int Rows;
```

Description

Rows is the number of Rows the group has for displaying controls. A group must have at least 1 row and a maximum of 3.

62.1.6.7 TCustomRibbonGroup Nested Types

The nested types of the TCustomRibbonGroup class are listed here.

Public Nested Types

Name	Description
TRowPosition (see page 3424)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

62.1.6.7.1 TCustomRibbonGroup.TRowPosition Nested Type

Pascal

```
TRowPosition = array [1..3] of Integer;
```

C++

```
array [1..3] of Integer TRowPosition;
```

Description

This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

62.1.7 TCustomRibbonPage Class

Holds groups of controls.

Class Hierarchy

Pascal

```
TCustomRibbonPage = class(TCustomControl);
```

C++

```
class TCustomRibbonPage : public TCustomControl;
```

File

Ribbon

Description

TCustomRibbonPage holds the groups of controls that are displayed.

62.1.7.1 TCustomRibbonPage Members

The following tables list the members exposed by TCustomRibbonPage.

Protected Methods

	Name	Description
	CMControlListChanging (see page 3429)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 3429)	This is CMTextchanged, a member of class TCustomRibbonPage.
V	CreateScrollButton (see page 3430)	This is CreateScrollButton, a member of class TCustomRibbonPage.
V	DoScrollButtonClick (see page 3430)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 3431)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 3431)	This is GetPageTop, a member of class TCustomRibbonPage.
V	Loaded (see page 3432)	Initializes the control after it is loaded from a stream.
V	Notification (see page 3433)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3433)	Renders the image of a custom control.
V	RequestAlign (see page 3434)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	Resize (see page 3434)	Respond to control resize.
V	SetParent (see page 3435)	Sets the parent of the control.
	UpdateScrollButtons (see page 3436)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Protected Properties

	Name	Description
	GroupOffset (see page 3437)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 3428)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 3428)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 3429)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 3429)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 3430)	This is CollapseGroup, a member of class TCustomRibbonPage.
V	Create (see page 3426)	Creates an instance of TCustomControl.
V	Destroy (see page 3427)	Destroys an instance of TCustomControl.
	FindGroup (see page 3430)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 3430)	This is FindGroupAt, a member of class TCustomRibbonPage.
	GetGroupPos (see page 3431)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 3431)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.
	HandleKeyTips (see page 3432)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 3432)	This is HideKeyTips, a member of class TCustomRibbonPage.
V	Invalidate (see page 3432)	Schedules a control repaint.
	RibbonStyle (see page 3434)	Return style class to use when drawing specific Ribbon (see page 3438) elements.
V	SetBounds (see page 3435)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 3436)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 3436)	This is UpdateActionManager, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
R	CollapseGroupCount (see page 3437)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
R	GroupCount (see page 3437)	This is GroupCount, a member of class TCustomRibbonPage.
R	Groups (see page 3437)	This is Groups, a member of class TCustomRibbonPage.
	Index (see page 3438)	This is Index, a member of class TCustomRibbonPage.
	KeyTip (see page 3438)	This is KeyTip, a member of class TCustomRibbonPage.
	Ribbon (see page 3438)	This is Ribbon, a member of class TCustomRibbonPage.

62.1.7.2 TCustomRibbonPage.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonPage(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create

Destroy

Canvas

Owner

62.1.7.3 TCustomRibbonPage.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonPage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

62.1.7.4 TCustomRibbonPage Constants

The constants of the TCustomRibbonPage class are listed here.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 3428)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 3428)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

62.1.7.4.1 TCustomRibbonPage.cRibbonGroupLeftOffset Constant

Pascal

```
const cRibbonGroupLeftOffset = 4;
```

C++

```
cRibbonGroupLeftOffset = 4;
```

Description

This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.

62.1.7.4.2 TCustomRibbonPage.cRibbonGroupSpacing Constant

Pascal

```
const cRibbonGroupSpacing = 2;
```

C++

```
cRibbonGroupSpacing = 2;
```

Description

This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

62.1.7.5 TCustomRibbonPage Methods

The methods of the TCustomRibbonPage class are listed here.

Protected Methods

	Name	Description
	CMControlListChanging (see page 3429)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 3429)	This is CMTextchanged, a member of class TCustomRibbonPage.
V	CreateScrollButton (see page 3430)	This is CreateScrollButton, a member of class TCustomRibbonPage.
V	DoScrollButtonClick (see page 3430)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 3431)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 3431)	This is GetPageTop, a member of class TCustomRibbonPage.
V	Loaded (see page 3432)	Initializes the control after it is loaded from a stream.
V	Notification (see page 3433)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3433)	Renders the image of a custom control.
V	RequestAlign (see page 3434)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	Resize (see page 3434)	Respond to control resize.
V	SetParent (see page 3435)	Sets the parent of the control.
	UpdateScrollButtons (see page 3436)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 3429)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 3429)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 3430)	This is CollapseGroup, a member of class TCustomRibbonPage.
	FindGroup (see page 3430)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 3430)	This is FindGroupAt, a member of class TCustomRibbonPage.
	GetGroupPos (see page 3431)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 3431)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.

	HandleKeyTips (see page 3432)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 3432)	This is HideKeyTips, a member of class TCustomRibbonPage.
	Invalidate (see page 3432)	Schedules a control repaint.
	RibbonStyle (see page 3434)	Return style class to use when drawing specific Ribbon (see page 3438) elements.
	SetBounds (see page 3435)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 3436)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 3436)	This is UpdateActionManager, a member of class TCustomRibbonPage.

62.1.7.5.1 TCustomRibbonPage.AddGroup Method

Pascal

```
procedure AddGroup(const Group: TCustomRibbonGroup);
```

C++

```
__fastcall AddGroup(const TCustomRibbonGroup Group);
```

Description

This is AddGroup, a member of class TCustomRibbonPage.

62.1.7.5.2 TCustomRibbonPage.AlignGroups Method

Pascal

```
procedure AlignGroups;
```

C++

```
__fastcall AlignGroups();
```

Description

This is AlignGroups, a member of class TCustomRibbonPage.

62.1.7.5.3 TCustomRibbonPage.CMControlListChanging Method

Pascal

```
procedure CMControlListChanging(var Message: TCMControlListChanging); message
CM_CONTROLLISTCHANGING;
```

C++

```
__fastcall CMControlListChanging(TCMControlListChanging Message);
```

Description

This is CMControlListChanging, a member of class TCustomRibbonPage.

62.1.7.5.4 TCustomRibbonPage.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbonPage.

62.1.7.5.5 TCustomRibbonPage.CollapseGroup Method

Pascal

```
procedure CollapseGroup(const Group: TCustomRibbonGroup);
```

C++

```
__fastcall CollapseGroup(const TCustomRibbonGroup Group);
```

Description

This is CollapseGroup, a member of class TCustomRibbonPage.

62.1.7.5.6 TCustomRibbonPage.CreateScrollButton Method

Pascal

```
function CreateScrollButton(const Direction: TScrollDirection): TRibbonGroupScrollButton;
virtual;
```

C++

```
virtual __fastcall TRibbonGroupScrollButton CreateScrollButton(const TScrollDirection
Direction);
```

Description

This is CreateScrollButton, a member of class TCustomRibbonPage.

62.1.7.5.7 TCustomRibbonPage.DoScrollButtonClick Method

Pascal

```
procedure DoScrollButtonClick(const Direction: TScrollDirection); virtual;
```

C++

```
virtual __fastcall DoScrollButtonClick(const TScrollDirection Direction);
```

Description

This is DoScrollButtonClick, a member of class TCustomRibbonPage.

62.1.7.5.8 TCustomRibbonPage.FindGroup Method

Pascal

```
function FindGroup(const GroupCaption: string): TControl;
```

C++

```
__fastcall TControl * FindGroup(const UnicodeString GroupCaption);
```

Description

This is FindGroup, a member of class TCustomRibbonPage.

62.1.7.5.9 TCustomRibbonPage.FindGroupAt Method

Pascal

```
function FindGroupAt(const Pt: TPoint): TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup FindGroupAt(const TPoint Pt);
```

Description

This is FindGroupAt, a member of class TCustomRibbonPage.

62.1.7.5.10 TCustomRibbonPage.GetGroupPos Method

Pascal

```
function GetGroupPos(Ignore: TControl): Integer;
```

C++

```
__fastcall int GetGroupPos(TControl * Ignore);
```

Description

This is GetGroupPos, a member of class TCustomRibbonPage.

62.1.7.5.11 TCustomRibbonPage.GetNextVisibleGroup Method

Pascal

```
function GetNextVisibleGroup: TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup GetNextVisibleGroup();
```

Description

This is GetNextVisibleGroup, a member of class TCustomRibbonPage.

62.1.7.5.12 TCustomRibbonPage.GetPageHeight Method

Pascal

```
function GetPageHeight: Integer;
```

C++

```
__fastcall int GetPageHeight();
```

Description

This is GetPageHeight, a member of class TCustomRibbonPage.

62.1.7.5.13 TCustomRibbonPage.GetPageTop Method

Pascal

```
function GetPageTop: Integer;
```

C++

```
__fastcall int GetPageTop();
```

Description

This is GetPageTop, a member of class TCustomRibbonPage.

62.1.7.5.14 TCustomRibbonPage.HandleKeyTips Method

Pascal

```
procedure HandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall HandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

This is HandleKeyTips, a member of class TCustomRibbonPage.

62.1.7.5.15 TCustomRibbonPage.HideKeyTips Method

Pascal

```
procedure HideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall HideKeyTips(TKeyTipList KeyTips);
```

Description

This is HideKeyTips, a member of class TCustomRibbonPage.

62.1.7.5.16 TCustomRibbonPage.Invalidate Method

Schedules a control repaint.

Pascal

```
procedure Invalidate; override;
```

C++

```
virtual __fastcall Invalidate();
```

Description

Invalidate informs a control that its entire surface needs to be repainted. Calling Invalidate can prevent flicker caused by a series of partial repaints. There is no performance penalty for calling Invalidate multiple times before the control is actually repainted.

The actual repaint does not occur until the control is updated. To force an immediate repaint, call Repaint instead.

See Also

Repaint

Update

62.1.7.5.17 TCustomRibbonPage.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

62.1.7.5.18 TCustomRibbonPage.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu

Notification

62.1.7.5.19 TCustomRibbonPage.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas

PaintWindow

GetDeviceContext

ClipRect

62.1.7.5.20 TCustomRibbonPage.RequestAlign Method

Instructs the parent of a control to reposition the control, enforcing its Align property.

Pascal

```
procedure RequestAlign; override;
```

C++

```
virtual __fastcall RequestAlign();
```

Description

Controls call RequestAlign internally when changes are made to the size or position of the control, so that they remain properly aligned within the parent control. Do not call RequestAlign in application code.

See Also

Align

Parent

62.1.7.5.21 TCustomRibbonPage.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize

62.1.7.5.22 TCustomRibbonPage.RibbonStyle Method

Return style class to use when drawing specific Ribbon (see page 3438) elements.

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

RibbonStyle returns the style class to use when drawing the specific Ribbon (see page 3438) elements.

62.1.7.5.23 TCustomRibbonPage.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

62.1.7.5.24 TCustomRibbonPage.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

Destroy

InsertControl

Parent

RemoveControl

62.1.7.5.25 TCustomRibbonPage.ShowKeyTips Method

Pascal

```
procedure ShowKeyTips;
```

C++

```
__fastcall ShowKeyTips();
```

Description

This is ShowKeyTips, a member of class TCustomRibbonPage.

62.1.7.5.26 TCustomRibbonPage.UpdateActionManager Method

Pascal

```
procedure UpdateActionManager(Value: TCustomActionManager);
```

C++

```
__fastcall UpdateActionManager(TCustomActionManager Value);
```

Description

This is UpdateActionManager, a member of class TCustomRibbonPage.

62.1.7.5.27 TCustomRibbonPage.UpdateScrollButtons Method

Pascal

```
procedure UpdateScrollButtons;
```

C++

```
__fastcall UpdateScrollButtons();
```

Description

This is UpdateScrollButtons, a member of class TCustomRibbonPage.

62.1.7.6 TCustomRibbonPage Properties

The properties of the TCustomRibbonPage class are listed here.

Protected Properties

	Name	Description
	GroupOffset (see page 3437)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
	CollapseGroupCount (see page 3437)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
	GroupCount (see page 3437)	This is GroupCount, a member of class TCustomRibbonPage.
	Groups (see page 3437)	This is Groups, a member of class TCustomRibbonPage.
	Index (see page 3438)	This is Index, a member of class TCustomRibbonPage.
	KeyTip (see page 3438)	This is KeyTip, a member of class TCustomRibbonPage.
	Ribbon (see page 3438)	This is Ribbon, a member of class TCustomRibbonPage.

62.1.7.6.1 TCustomRibbonPage.CollapseGroupCount Property

Pascal

```
property CollapseGroupCount: Integer;
```

C++

```
__property int CollapseGroupCount;
```

Description

This is CollapseGroupCount, a member of class TCustomRibbonPage.

62.1.7.6.2 TCustomRibbonPage.GroupCount Property

Pascal

```
property GroupCount: Integer;
```

C++

```
__property int GroupCount;
```

Description

This is GroupCount, a member of class TCustomRibbonPage.

62.1.7.6.3 TCustomRibbonPage.GroupOffset Property

Pascal

```
property GroupOffset: Integer;
```

C++

```
__property int GroupOffset;
```

Description

This is GroupOffset, a member of class TCustomRibbonPage.

62.1.7.6.4 TCustomRibbonPage.Groups Property

Pascal

```
property Groups [Index: Integer]: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Groups[int Index];
```

Description

This is Groups, a member of class TCustomRibbonPage.

62.1.7.6.5 TCustomRibbonPage.Index Property

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

This is Index, a member of class TCustomRibbonPage.

62.1.7.6.6 TCustomRibbonPage.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TCustomRibbonPage.

62.1.7.6.7 TCustomRibbonPage.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TCustomRibbonPage.

62.1.8 TCustomRibbonQuickAccessPopupToolbar Class

Class Hierarchy

Pascal

```
TCustomRibbonQuickAccessPopupToolbar = class(TCustomActionPopupMenu);
```

C++

```
class TCustomRibbonQuickAccessPopupToolbar : public TCustomActionPopupMenu;
```

File

Ribbon

Description

This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.

62.1.8.1 TCustomRibbonQuickAccessPopupToolbar Members

The following tables list the members exposed by TCustomRibbonQuickAccessPopupToolbar.

Protected Methods

	Name	Description
	CreateWnd (see page 3440)	Creates the underlying window.
	DrawBackground (see page 3440)	This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.
	GetControlClass (see page 3441)	This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.
	NCPaint (see page 3441)	This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.
	ValidOrientations (see page 3441)	This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

Public Methods

	Name	Description
	Create (see page 3439)	Creates and initializes a TCustomActionPopupMenu instance.
	CreateControl (see page 3440)	This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.2 TCustomRibbonQuickAccessPopupToolbar.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonQuickAccessPopupToolbar(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

62.1.8.3 TCustomRibbonQuickAccessPopupToolbar Methods

The methods of the TCustomRibbonQuickAccessPopupToolbar class are listed here.

Protected Methods

	Name	Description
	CreateWnd (see page 3440)	Creates the underlying window.
	DrawBackground (see page 3440)	This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.
	GetControlClass (see page 3441)	This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.

	NCPaint (see page 3441)	This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.
	ValidOrientations (see page 3441)	This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

Public Methods

	Name	Description
	CreateControl (see page 3440)	This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.3.1 TCustomRibbonQuickAccessPopupToolbar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.3.2 TCustomRibbonQuickAccessPopupToolbar.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

CreateWindowHandle

Perform

DestroyWnd

62.1.8.3.3 TCustomRibbonQuickAccessPopupToolbar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.3.4 TCustomRibbonQuickAccessPopupToolbar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.3.5 TCustomRibbonQuickAccessPopupToolbar.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.8.3.6 TCustomRibbonQuickAccessPopupToolbar.ValidOrientations Method

Pascal

```
function ValidOrientations: TBarOrientations; override;
```

C++

```
virtual __fastcall TBarOrientations ValidOrientations();
```

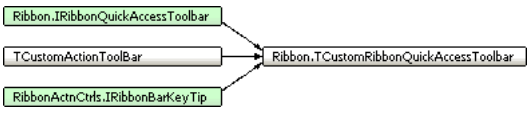
Description

This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

62.1.9 TCustomRibbonQuickAccessToolbar Class

Quck Access Toolbar base class.

Class Hierarchy



Pascal

```
TCustomRibbonQuickAccessToolbar = class(TCustomActionToolBar, IRibbonQuickAccessToolbar,
IRibbonBarKeyTip);
```

C++

```
class TCustomRibbonQuickAccessToolbar : public TCustomActionToolBar, public
IRibbonQuickAccessToolbar, public IRibbonBarKeyTip;
```

File

Ribbon

Description

TCustomRibbonQuickAccessToolbar is the base class Quck Access Toolbar.

62.1.9.1 TCustomRibbonQuickAccessToolbar Members

The following tables list the members exposed by TCustomRibbonQuickAccessToolbar.

Protected Methods

	Name	Description
	CMFontchanged (see page 3445)	This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.
V	CreateControls (see page 3446)	This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.
V	DoContextPopup (see page 3446)	OnContextPopup event dispatcher.
V	DoDropActions (see page 3446)	This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.
V	DoDropItem (see page 3447)	This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.
V	DoMoreCommands (see page 3447)	This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
V	DoScrollBtnClick (see page 3447)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
V	DrawBackground (see page 3448)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarHeight (see page 3448)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarWidth (see page 3449)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	GetScrollBtnClass (see page 3449)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
V	Notification (see page 3449)	Responds to notifications that components are being created or destroyed.
V	RequestAlign (see page 3450)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	SetParent (see page 3450)	Sets the parent of the control.
V	SetupDropDownBtn (see page 3451)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowCustomizeMenu (see page 3451)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowMoreControls (see page 3451)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
V	UpdateQATWidth (see page 3451)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 3444)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3444)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 3445)	Show **KeyTip**s for any commands that support them.
V	Create (see page 3443)	Creates and initializes a TCustomActionToolBar instance.

	CreateControl (see page 3445)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 3446)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropCategory (see page 3447)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 3448)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
	DragDrop (see page 3448)	Generates an OnDragDrop event.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 3453)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

Public Properties

	Name	Description
	Items (see page 3452)	Lists the action clients that correspond to the child controls of this action band.
	OnMoreCommands (see page 3452)	This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
R	Ribbon (see page 3452)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 3453)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 3453)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.2 TCustomRibbonQuickAccessToolbar.Create Constructor

Creates and initializes a TCustomActionToolBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonQuickAccessToolbar(TComponent * AOwner);
```

Description

Create generates a TCustomActionToolBar and initializes its properties.

```
__fastcall virtual TCustomActionToolBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

62.1.9.3 TCustomRibbonQuickAccessToolbar Methods

The methods of the TCustomRibbonQuickAccessToolbar class are listed here.

Protected Methods

	Name	Description
	CMFontchanged (see page 3445)	This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.
	CreateControls (see page 3446)	This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.
	DoContextPopup (see page 3446)	OnContextPopup event dispatcher.
	DoDropActions (see page 3446)	This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropItem (see page 3447)	This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.
	DoMoreCommands (see page 3447)	This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
	DoScrollBtnClick (see page 3447)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
	DrawBackground (see page 3448)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
	GetBarHeight (see page 3448)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
	GetBarWidth (see page 3449)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.

	GetScrollBtnClass (see page 3449)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
	Notification (see page 3449)	Responds to notifications that components are being created or destroyed.
	RequestAlign (see page 3450)	Instructs the parent of a control to reposition the control, enforcing its Align property.
	SetParent (see page 3450)	Sets the parent of the control.
	SetupDropDownBtn (see page 3451)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
	ShowCustomizeMenu (see page 3451)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
	ShowMoreControls (see page 3451)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
	UpdateQATWidth (see page 3451)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 3444)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3444)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 3445)	Show **KeyTip**s for any commands that support them.
	CreateControl (see page 3445)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 3446)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropCategory (see page 3447)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 3448)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
	DragDrop (see page 3448)	Generates an OnDragDrop event.

62.1.9.3.1 TCustomRibbonQuickAccessToolbar.BarHandleKeyTips Method

Check if any commands on Action Bar are partial or full match for **KeyTip**.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips checks if any commands on the Action Bar are a partial or full match for the **KeyTip**. Matches are returned as a TKeyTipMatchItem in the `List` parameter. If only one item is a match, that command is executed.

See Also

TKeyTipMatchItem (see page 3598)

BarHideKeyTips (see page 3913)

BarShowKeyTips (see page 3914)

62.1.9.3.2 TCustomRibbonQuickAccessToolbar.BarHideKeyTips Method

Hide any visible **KeyTip** windows.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible **KeyTip** windows. `ExceptList` may contain a list of TKeyTipMatchItem objects for commands that should not be hidden. These items are current partial matches and require additional handling.

See Also

TKeyTipMatchItem (see page 3598)

BarHandleKeyTips (see page 3913)

BarShowKeyTips (see page 3914)

62.1.9.3.3 TCustomRibbonQuickAccessToolbar.BarShowKeyTips Method

Show **KeyTip**s for any commands that support them.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip**s for any commands that support them.

See Also

BarHandleKeyTips (see page 3913)

BarHideKeyTips (see page 3913)

62.1.9.3.4 TCustomRibbonQuickAccessToolbar.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.5 TCustomRibbonQuickAccessToolbar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.6 TCustomRibbonQuickAccessToolbar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.7 TCustomRibbonQuickAccessToolbar.Customize Method

Pascal

```
procedure Customize;
```

C++

```
__fastcall Customize();
```

Description

This is Customize, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.8 TCustomRibbonQuickAccessToolbar.DoContextPopup Method

OnContextPopup event dispatcher.

Pascal

```
procedure DoContextPopup(MousePos: TPoint; var Handled: Boolean); override;
```

C++

```
virtual __fastcall DoContextPopup(TPoint MousePos, Boolean Handled);
```

Description

OnContextPopup calls any event handler attached to the OnContextPopup event. When creating a component that descends from TControl, override OnContextPopup to provide other responses in addition to the inherited event-handler call when the user invokes the control's context menu.

MousePos indicates the position where the user right-clicked the control. If the user invoked the context menu using the keyboard, MousePos is (-1,-1).

Handled returns a Boolean value indicating whether the control should continue with its default response to the user action.

See Also

OnContextPopup

62.1.9.3.9 TCustomRibbonQuickAccessToolbar.DoDropActions Method

Pascal

```
procedure DoDropActions(Source: TActionDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropActions(TActionDragObject Source, const int X, const int Y);
```

Description

This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.10 TCustomRibbonQuickAccessToolbar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.11 TCustomRibbonQuickAccessToolbar.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.12 TCustomRibbonQuickAccessToolbar.DoMoreCommands Method

Pascal

```
procedure DoMoreCommands; virtual;
```

C++

```
virtual __fastcall DoMoreCommands();
```

Description

This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.13 TCustomRibbonQuickAccessToolbar.DoScrollBtnClick Method

Pascal

```
procedure DoScrollBtnClick; override;
```

C++

```
virtual __fastcall DoScrollBtnClick();
```

Description

This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.14 TCustomRibbonQuickAccessToolbar.DoUpdateQATWidth Method

Pascal

```
procedure DoUpdateQATWidth;
```

C++

```
__fastcall DoUpdateQATWidth();
```

Description

This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.15 TCustomRibbonQuickAccessToolbar.DragDrop Method

Generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

DragDrop is called automatically when the user drags and drops a control onto the tool bar. This method generates an OnDragDrop event, and then updates its list of hidden controls to reflect the presence of the new child control.

Source is the dragged control that is dropped onto the tool bar.

X and Y are the mouse coordinates where Source was dropped.

DragCanceled

OnDragDrop

HiddenCount

62.1.9.3.16 TCustomRibbonQuickAccessToolbar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.17 TCustomRibbonQuickAccessToolbar.GetBarHeight Method

Pascal

```
function GetBarHeight: Integer; override;
```

C++

```
virtual __fastcall int GetBarHeight();
```

Description

This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.18 TCustomRibbonQuickAccessToolbar.GetBarWidth Method

Pascal

```
function GetBarWidth: Integer; override;
```

C++

```
virtual __fastcall int GetBarWidth();
```

Description

This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.19 TCustomRibbonQuickAccessToolbar.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.20 TCustomRibbonQuickAccessToolbar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

62.1.9.3.21 TCustomRibbonQuickAccessToolbar.RequestAlign Method

Instructs the parent of a control to reposition the control, enforcing its Align property.

Pascal

```
procedure RequestAlign; override;
```

C++

```
virtual __fastcall RequestAlign();
```

Description

Controls call RequestAlign internally when changes are made to the size or position of the control, so that they remain properly aligned within the parent control. Do not call RequestAlign in application code.

See Also

Align

Parent

62.1.9.3.22 TCustomRibbonQuickAccessToolbar.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

InsertControl

Parent

RemoveControl

62.1.9.3.23 TCustomRibbonQuickAccessToolbar.SetupDropDownBtn Method

Pascal

```
procedure SetupDropDownBtn; override;
```

C++

```
virtual __fastcall SetupDropDownBtn();
```

Description

This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.24 TCustomRibbonQuickAccessToolbar.ShowCustomizeMenu Method

Pascal

```
procedure ShowCustomizeMenu(AScrollBtn: TRibbonQATScrollButton); virtual;
```

C++

```
virtual __fastcall ShowCustomizeMenu(TRibbonQATScrollButton AScrollBtn);
```

Description

This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.25 TCustomRibbonQuickAccessToolbar.ShowMoreControls Method

Pascal

```
procedure ShowMoreControls; virtual;
```

C++

```
virtual __fastcall ShowMoreControls();
```

Description

This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.3.26 TCustomRibbonQuickAccessToolbar.UpdateQATWidth Method

Pascal

```
procedure UpdateQATWidth; virtual;
```

C++

```
virtual __fastcall UpdateQATWidth();
```

Description

This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.4 TCustomRibbonQuickAccessToolbar Properties

The properties of the TCustomRibbonQuickAccessToolbar class are listed here.

Public Properties

	Name	Description
	Items (see page 3452)	Lists the action clients that correspond to the child controls of this action band.
	OnMoreCommands (see page 3452)	This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
R	Ribbon (see page 3452)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 3453)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 3453)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.4.1 TCustomRibbonQuickAccessToolbar.Items Property

Lists the action clients that correspond to the child controls of this action band.

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

Items is used internally to access the components that the action manager lists to represent the child controls of this action band. Each action client object in the Items collection corresponds to one of the controls that the ActionControls property lists. The entire collection of items belongs to the action client specified by this action band's ActionClient property.

ContextBar

62.1.9.4.2 TCustomRibbonQuickAccessToolbar.OnMoreCommands Property

Pascal

```
property OnMoreCommands: TMoreCommandsEvent;
```

C++

```
__property TMoreCommandsEvent OnMoreCommands;
```

Description

This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.4.3 TCustomRibbonQuickAccessToolbar.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.4.4 TCustomRibbonQuickAccessToolbar.ScrollMode Property

Pascal

```
property ScrollMode: TQATScrollMode;
```

C++

```
__property TQATScrollMode ScrollMode;
```

Description

This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.4.5 TCustomRibbonQuickAccessToolbar.ShowBorder Property

Pascal

```
property ShowBorder: Boolean;
```

C++

```
__property Boolean ShowBorder;
```

Description

This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

62.1.9.5 TCustomRibbonQuickAccessToolbar Nested Types

The nested types of the TCustomRibbonQuickAccessToolbar class are listed here.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 3453)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

62.1.9.5.1 TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent Nested Type

Pascal

```
TMoreCommandsEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( TMoreCommandsEvent)();
```

Description

This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

62.1.10 TCustomTabData Class

Encapsulates all functions and status to manage scrolling of tabs and selected group.

Class Hierarchy

Pascal

```
TCustomTabData = class;
```

C++

```
class TCustomTabData;
```

File

Ribbon

Description

TCustomTabData encapsulates all the functions and status information needed to manage scrolling tabs and the selected group on a ribbon.

62.1.10.1 TCustomTabData Members

The following tables list the members exposed by TCustomTabData.

Public Methods

	Name	Description
	Add (see page 3455)	This is Add, a member of class TCustomTabData.
	CalculateTabWidths (see page 3455)	This is CalculateTabWidths, a member of class TCustomTabData.
	Clear (see page 3456)	This is Clear, a member of class TCustomTabData.
V	Create (see page 3454)	This is Create, a member of class TCustomTabData.
V	Destroy (see page 3455)	This is Destroy, a member of class TCustomTabData.

Public Properties

	Name	Description
R	AvailableSpace (see page 3456)	This is AvailableSpace, a member of class TCustomTabData.
	FirstVisibleTabIndex (see page 3456)	This is FirstVisibleTabIndex, a member of class TCustomTabData.
R	FullWidth (see page 3457)	This is FullWidth, a member of class TCustomTabData.
R	ItemCount (see page 3457)	This is ItemCount, a member of class TCustomTabData.
R	LastVisibleTabIndex (see page 3457)	This is LastVisibleTabIndex, a member of class TCustomTabData.
R	LeftTabScrollButtonRect (see page 3457)	This is LeftTabScrollButtonRect, a member of class TCustomTabData.
R	NewWidth (see page 3458)	This is NewWidth, a member of class TCustomTabData.
R	Owner (see page 3458)	This is Owner, a member of class TCustomTabData.
R	RightTabScrollButtonRect (see page 3458)	This is RightTabScrollButtonRect, a member of class TCustomTabData.
R	ScrollButtons (see page 3458)	This is ScrollButtons, a member of class TCustomTabData.
R	SeparatorOpacity (see page 3458)	This is SeparatorOpacity, a member of class TCustomTabData.
R	TabSeparatorState (see page 3459)	This is TabSeparatorState, a member of class TCustomTabData.
R	TabUpdateRect (see page 3459)	This is TabUpdateRect, a member of class TCustomTabData.

62.1.10.2 TCustomTabData.Create Constructor

Pascal

```
constructor Create(AOwner: TCustomRibbon); virtual; reintroduce;
```

C++

```
virtual __fastcall TCustomTabData(TCustomRibbon AOwner);
```

Description

This is Create, a member of class TCustomTabData.

62.1.10.3 TCustomTabData.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTabData();
```

Description

This is Destroy, a member of class TCustomTabData.

62.1.10.4 TCustomTabData Methods

The methods of the TCustomTabData class are listed here.

Public Methods

	Name	Description
	Add (see page 3455)	This is Add, a member of class TCustomTabData.
	CalculateTabWidths (see page 3455)	This is CalculateTabWidths, a member of class TCustomTabData.
	Clear (see page 3456)	This is Clear, a member of class TCustomTabData.

62.1.10.4.1 TCustomTabData.Add Method

Pascal

```
procedure Add(ATab: TRibbonTabItem);
```

C++

```
__fastcall Add(TRibbonTabItem ATab);
```

Description

This is Add, a member of class TCustomTabData.

62.1.10.4.2 TCustomTabData.CalculateTabWidths Method

Pascal

```
procedure CalculateTabWidths(AAvailableSpace: Integer; APages: TRibbonTabs);
```

C++

```
__fastcall CalculateTabWidths(int AAvailableSpace, TRibbonTabs APages);
```

Description

This is CalculateTabWidths, a member of class TCustomTabData.

62.1.10.4.3 TCustomTabData.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TCustomTabData.

62.1.10.5 TCustomTabData Properties

The properties of the TCustomTabData class are listed here.

Public Properties

	Name	Description
R	AvailableSpace (see page 3456)	This is AvailableSpace, a member of class TCustomTabData.
	FirstVisibleTabIndex (see page 3456)	This is FirstVisibleTabIndex, a member of class TCustomTabData.
R	FullWidth (see page 3457)	This is FullWidth, a member of class TCustomTabData.
R	ItemCount (see page 3457)	This is ItemCount, a member of class TCustomTabData.
R	LastVisibleTabIndex (see page 3457)	This is LastVisibleTabIndex, a member of class TCustomTabData.
R	LeftTabScrollButtonRect (see page 3457)	This is LeftTabScrollButtonRect, a member of class TCustomTabData.
R	NewWidth (see page 3458)	This is NewWidth, a member of class TCustomTabData.
R	Owner (see page 3458)	This is Owner, a member of class TCustomTabData.
R	RightTabScrollButtonRect (see page 3458)	This is RightTabScrollButtonRect, a member of class TCustomTabData.
R	ScrollButtons (see page 3458)	This is ScrollButtons, a member of class TCustomTabData.
R	SeparatorOpacity (see page 3458)	This is SeparatorOpacity, a member of class TCustomTabData.
R	TabSeparatorState (see page 3459)	This is TabSeparatorState, a member of class TCustomTabData.
R	TabUpdateRect (see page 3459)	This is TabUpdateRect, a member of class TCustomTabData.

62.1.10.5.1 TCustomTabData.AvailableSpace Property

Pascal

```
property AvailableSpace: Integer;
```

C++

```
__property int AvailableSpace;
```

Description

This is AvailableSpace, a member of class TCustomTabData.

62.1.10.5.2 TCustomTabData.FirstVisibleTabIndex Property

Pascal

```
property FirstVisibleTabIndex: Integer;
```

C++

```
__property int FirstVisibleTabIndex;
```

Description

This is FirstVisibleTabIndex, a member of class TCustomTabData.

62.1.10.5.3 TCustomTabData.FullWidth Property

Pascal

```
property FullWidth [Idx: Integer]: Integer;
```

C++

```
__property int FullWidth[int Idx];
```

Description

This is FullWidth, a member of class TCustomTabData.

62.1.10.5.4 TCustomTabData.ItemCount Property

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

This is ItemCount, a member of class TCustomTabData.

62.1.10.5.5 TCustomTabData.LastVisibleTabIndex Property

Pascal

```
property LastVisibleTabIndex: Integer;
```

C++

```
__property int LastVisibleTabIndex;
```

Description

This is LastVisibleTabIndex, a member of class TCustomTabData.

62.1.10.5.6 TCustomTabData.LeftTabScrollButtonRect Property

Pascal

```
property LeftTabScrollButtonRect: TRect;
```

C++

```
__property TRect LeftTabScrollButtonRect;
```

Description

This is LeftTabScrollButtonRect, a member of class TCustomTabData.

62.1.10.5.7 TCustomTabData.NewWidth Property

Pascal

```
property NewWidth [Idx: Integer]: Integer;
```

C++

```
__property int NewWidth[int Idx];
```

Description

This is NewWidth, a member of class TCustomTabData.

62.1.10.5.8 TCustomTabData.Owner Property

Pascal

```
property Owner: TCustomRibbon;
```

C++

```
__property TCustomRibbon Owner;
```

Description

This is Owner, a member of class TCustomTabData.

62.1.10.5.9 TCustomTabData.RightTabScrollButtonRect Property

Pascal

```
property RightTabScrollButtonRect: TRect;
```

C++

```
__property TRect RightTabScrollButtonRect;
```

Description

This is RightTabScrollButtonRect, a member of class TCustomTabData.

62.1.10.5.10 TCustomTabData.ScrollButtons Property

Pascal

```
property ScrollButtons: TRibbonScrollButtons;
```

C++

```
__property TRibbonScrollButtons ScrollButtons;
```

Description

This is ScrollButtons, a member of class TCustomTabData.

62.1.10.5.11 TCustomTabData.SeparatorOpacity Property

Pascal

```
property SeparatorOpacity: Byte;
```

C++

```
__property Byte SeparatorOpacity;
```

Description

This is SeparatorOpacity, a member of class TCustomTabData.

62.1.10.5.12 TCustomTabData.TabSeparatorState Property

Pascal

```
property TabSeparatorState: TTabSeparatorState;
```

C++

```
__property TTabSeparatorState TabSeparatorState;
```

Description

This is TabSeparatorState, a member of class TCustomTabData.

62.1.10.5.13 TCustomTabData.TabUpdateRect Property

Pascal

```
property TabUpdateRect: TRect;
```

C++

```
__property TRect TabUpdateRect;
```

Description

This is TabUpdateRect, a member of class TCustomTabData.

62.1.11 THelpButton Class

Button to activate help.

Class Hierarchy

Pascal

```
THelpButton = class(TOffice2007Button);
```

C++

```
class THelpButton : public TOffice2007Button;
```

File

Ribbon

Description

THelpButton represents the button used for activating help.

ShowHelpButton (see page 3398)

62.1.11.1 THelpButton Members

The following tables list the members exposed by THelpButton.

Protected Methods

	Name	Description
	CMMouseenter (see page 3463)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 3463)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 3463)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 3464)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 3460)	This is DrawImage, a member of class THelpButton.
V	MouseDown (see page 3464)	OnMouseDown event dispatcher.
V	MouseMove (see page 3465)	Respond to mouse moving over control area..
V	MouseUp (see page 3465)	OnMouseUp event dispatcher.
V	Paint (see page 3466)	Render control surface.
V	SetParent (see page 3466)	Sets the parent of the control.

Protected Properties

	Name	Description
	MouseInControl (see page 3467)	This is MouseInControl, a member of class TOffice2007Button.
R	RibbonStyle (see page 3467)	This is RibbonStyle, a member of class TOffice2007Button.

Public Events

	Name	Description
	OnClick (see page 3467)	Occurs when the user clicks the control.

Public Methods

	Name	Description
V	Create (see page 3462)	Creates an instance of TGraphicControl.
V	Destroy (see page 3462)	Destroys an instance of TGraphicControl.

62.1.11.2 THelpButton Methods

The methods of the THelpButton class are listed here.

Protected Methods

	Name	Description
V	DrawImage (see page 3460)	This is DrawImage, a member of class THelpButton.

62.1.11.2.1 THelpButton.DrawImage Method

Pascal

```
procedure DrawImage; override;
```

C++

```
virtual __fastcall DrawImage();
```

Description

This is DrawImage, a member of class THelpButton.

62.1.12 TOffice2007Button Class

Class Hierarchy

Pascal

```
TOffice2007Button = class(TGraphicControl);
```

C++

```
class TOffice2007Button : public TGraphicControl;
```

File

Ribbon

Description

This is class Ribbon.TOffice2007Button.

62.1.12.1 TOffice2007Button Members

The following tables list the members exposed by TOffice2007Button.

Protected Methods

	Name	Description
	CMMouseenter (see page 3463)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 3463)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 3463)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 3464)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 3464)	This is DrawImage, a member of class TOffice2007Button.
V	MouseDown (see page 3464)	OnMouseDown event dispatcher.
V	MouseMove (see page 3465)	Respond to mouse moving over control area..
V	MouseUp (see page 3465)	OnMouseUp event dispatcher.
V	Paint (see page 3466)	Render control surface.
V	SetParent (see page 3466)	Sets the parent of the control.

Protected Properties

	Name	Description
	MouseInControl (see page 3467)	This is MouseInControl, a member of class TOffice2007Button.
R	RibbonStyle (see page 3467)	This is RibbonStyle, a member of class TOffice2007Button.

Public Events

	Name	Description
	OnClick (see page 3467)	Occurs when the user clicks the control.

Public Methods

	Name	Description
V	Create (see page 3462)	Creates an instance of TGraphicControl.
V	Destroy (see page 3462)	Destroys an instance of TGraphicControl.

62.1.12.2 TOffice2007Button.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOffice2007Button(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

62.1.12.3 TOffice2007Button.Destroy Destructor

Destroys an instance of TGraphicControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOffice2007Button();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

System::TObject::Free

62.1.12.4 TOffice2007Button Methods

The methods of the TOffice2007Button class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 3463)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 3463)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 3463)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 3464)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 3464)	This is DrawImage, a member of class TOffice2007Button.
V	MouseDown (see page 3464)	OnMouseDown event dispatcher.
V	MouseMove (see page 3465)	Respond to mouse moving over control area..
V	MouseUp (see page 3465)	OnMouseUp event dispatcher.
V	Paint (see page 3466)	Render control surface.
V	SetParent (see page 3466)	Sets the parent of the control.

62.1.12.4.1 TOffice2007Button.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TOffice2007Button.

62.1.12.4.2 TOffice2007Button.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TOffice2007Button.

62.1.12.4.3 TOffice2007Button.DoClick Method

Pascal

```
procedure DoClick; virtual;
```

C++

```
virtual __fastcall DoClick();
```

Description

This is DoClick, a member of class TOffice2007Button.

62.1.12.4.4 TOffice2007Button.DrawBackground Method

Pascal

```
procedure DrawBackground; virtual;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TOffice2007Button.

62.1.12.4.5 TOffice2007Button.DrawImage Method

Pascal

```
procedure DrawImage; virtual;
```

C++

```
virtual __fastcall DrawImage();
```

Description

This is DrawImage, a member of class TOffice2007Button.

62.1.12.4.6 TOffice2007Button.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

62.1.12.4.7 TOffice2007Button.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

62.1.12.4.8 TOffice2007Button.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

MouseDown

MouseMove

OnMouseUp

62.1.12.4.9 TOffice2007Button.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

62.1.12.4.10 TOffice2007Button.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

62.1.12.5 TOffice2007Button Properties

The properties of the TOffice2007Button class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 3467)	This is MouseInControl, a member of class TOffice2007Button.
R	RibbonStyle (see page 3467)	This is RibbonStyle, a member of class TOffice2007Button.

62.1.12.5.1 TOffice2007Button.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TOffice2007Button.

62.1.12.5.2 TOffice2007Button.RibbonStyle Property

Pascal

```
property RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars RibbonStyle;
```

Description

This is RibbonStyle, a member of class TOffice2007Button.

62.1.12.6 TOffice2007Button Events

The events of the TOffice2007Button class are listed here.

Public Events

	Name	Description
	OnClick (see page 3467)	Occurs when the user clicks the control.

62.1.12.6.1 TOffice2007Button.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
```

```
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

62.1.13.1 TQuickAccessToolbar Members

The following tables list the members exposed by TQuickAccessToolbar.

Enumerations

	Name	Description
	TQATPosition (see page 3471)	Position (see page 3474) of Quick Access Toolbar.

Protected Methods

	Name	Description
	DoChange (see page 3472)	This is DoChange, a member of class TQuickAccessToolbar.

Public Events

	Name	Description
	OnChange (see page 3475)	This is OnChange, a member of class TQuickAccessToolbar.

Public Methods

	Name	Description
	Assign (see page 3472)	Copies the contents of another, similar object.
	Create (see page 3470)	This is Create, a member of class TQuickAccessToolbar.
	Show (see page 3473)	This is Show, a member of class TQuickAccessToolbar.
	TogglePosition (see page 3473)	This is TogglePosition, a member of class TQuickAccessToolbar.

Public Properties

	Name	Description
	BarWidth (see page 3474)	This is BarWidth, a member of class TQuickAccessToolbar.

Published Properties

	Name	Description
	ActionBar (see page 3473)	This is ActionBar, a member of class TQuickAccessToolbar.
	Position (see page 3474)	This is Position, a member of class TQuickAccessToolbar.
	ShowMinimize (see page 3474)	This is ShowMinimize, a member of class TQuickAccessToolbar.
	ShowMoreCommands (see page 3474)	This is ShowMoreCommands, a member of class TQuickAccessToolbar.
	ShowPosition (see page 3474)	This is ShowPosition, a member of class TQuickAccessToolbar.

62.1.13.2 TQuickAccessToolbar.Create Constructor

Pascal

```
constructor Create(ARibbon: TCustomRibbon); reintroduce;
```

C++

```
__fastcall TQuickAccessToolbar(TCustomRibbon ARibbon);
```

Description

This is Create, a member of class TQuickAccessToolbar.

62.1.13.3 TQuickAccessToolbar Enumerations

The enumerations of the TQuickAccessToolbar class are listed here.

Enumerations

	Name	Description
	TQATPosition (see page 3471)	Position (see page 3474) of Quick Access Toolbar.

62.1.13.3.1 Ribbon.TQuickAccessToolbar.TQATPosition Enumeration

Position (see page 3474) of Quick Access Toolbar.

Pascal

```
TQATPosition = (
  qpTop,
  qpBottom
);
```

C++

```
enum TQATPosition {
  qpTop,
  qpBottom
};
```

File

Ribbon

Description

TQATPosition specifies the position of the Quick Access Toolbar. It can have one of the following values:

Value	Meaning
qpTop	Quick Access Toolbar is positioned at the top of the ribbon.
gpBottom	Quick Access Toolbar is positioned at the base of the ribbon.

See Also

62.1.13.4 TQuickAccessToolbar Methods

The methods of the TQuickAccessToolbar class are listed here.

Protected Methods

	Name	Description
	DoChange (see page 3472)	This is DoChange, a member of class TQuickAccessToolbar.

Public Methods

	Name	Description
	Assign (see page 3472)	Copies the contents of another, similar object.
	Show (see page 3473)	This is Show, a member of class TQuickAccessToolbar.
	TogglePosition (see page 3473)	This is TogglePosition, a member of class TQuickAccessToolbar.

62.1.13.4.1 TQuickAccessToolbar.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

62.1.13.4.2 TQuickAccessToolbar.DoChange Method

Pascal

```
procedure DoChange; virtual;
```

C++

```
virtual __fastcall DoChange();
```

Description

This is DoChange, a member of class TQuickAccessToolbar.

62.1.13.4.3 TQuickAccessToolbar.Show Method

Pascal

```
procedure Show(const Visible: Boolean);
```

C++

```
__fastcall Show(const Boolean Visible);
```

Description

This is Show, a member of class TQuickAccessToolbar.

62.1.13.4.4 TQuickAccessToolbar.TogglePosition Method

Pascal

```
procedure TogglePosition;
```

C++

```
__fastcall TogglePosition();
```

Description

This is TogglePosition, a member of class TQuickAccessToolbar.

62.1.13.5 TQuickAccessToolbar Properties

The properties of the TQuickAccessToolbar class are listed here.

Public Properties

	Name	Description
	BarWidth (see page 3474)	This is BarWidth, a member of class TQuickAccessToolbar.

Published Properties

	Name	Description
	ActionBar (see page 3473)	This is ActionBar, a member of class TQuickAccessToolbar.
	Position (see page 3474)	This is Position, a member of class TQuickAccessToolbar.
	ShowMinimize (see page 3474)	This is ShowMinimize, a member of class TQuickAccessToolbar.
	ShowMoreCommands (see page 3474)	This is ShowMoreCommands, a member of class TQuickAccessToolbar.
	ShowPosition (see page 3474)	This is ShowPosition, a member of class TQuickAccessToolbar.

62.1.13.5.1 TQuickAccessToolbar.ActionBar Property

Pascal

```
property ActionBar: TCustomRibbonQuickAccessToolbar;
```

C++

```
__property TCustomRibbonQuickAccessToolbar ActionBar;
```

Description

This is ActionBar, a member of class TQuickAccessToolbar.

62.1.13.5.2 TQuickAccessToolbar.BarWidth Property

Pascal

```
property BarWidth: Integer;
```

C++

```
__property int BarWidth;
```

Description

This is BarWidth, a member of class TQuickAccessToolbar.

62.1.13.5.3 TQuickAccessToolbar.Position Property

Pascal

```
property Position: TQATPosition;
```

C++

```
__property TQATPosition Position;
```

Description

This is Position, a member of class TQuickAccessToolbar.

62.1.13.5.4 TQuickAccessToolbar.ShowMinimize Property

Pascal

```
property ShowMinimize: Boolean;
```

C++

```
__property Boolean ShowMinimize;
```

Description

This is ShowMinimize, a member of class TQuickAccessToolbar.

62.1.13.5.5 TQuickAccessToolbar.ShowMoreCommands Property

Pascal

```
property ShowMoreCommands: Boolean;
```

C++

```
__property Boolean ShowMoreCommands;
```

Description

This is ShowMoreCommands, a member of class TQuickAccessToolbar.

62.1.13.5.6 TQuickAccessToolbar.ShowPosition Property

Pascal

```
property ShowPosition: Boolean;
```

C++

```
__property Boolean ShowPosition;
```

Description

This is ShowPosition, a member of class TQuickAccessToolbar.

62.1.13.6 TQuickAccessToolbar Events

The events of the TQuickAccessToolbar class are listed here.

Public Events

	Name	Description
	OnChange (see page 3475)	This is OnChange, a member of class TQuickAccessToolbar.

62.1.13.6.1 TQuickAccessToolbar.OnChange Event

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

This is OnChange, a member of class TQuickAccessToolbar.

62.1.14 TQuickAccessToolbarGroupItem Class

Display Quick Access Toolbar commands to display entire Ribbon (see page 3347) group.

Class Hierarchy

Pascal

```
TQuickAccessToolbarGroupItem = class;
```

C++

```
class TQuickAccessToolbarGroupItem;
```

File

Ribbon

Description

TQuickAccessToolbarGroupItem is used to display Quick Access Toolbar commands that display an entire Ribbon (see page 3347) group when clicked.

62.1.14.1 TQuickAccessToolbarGroupItem Members

The following tables list the members exposed by TQuickAccessToolbarGroupItem.

Public Methods

	Name	Description
	Create (see page 3476)	This is Create, a member of class TQuickAccessToolbarGroupItem.
V	Destroy (see page 3476)	This is Destroy, a member of class TQuickAccessToolbarGroupItem.

Public Properties

	Name	Description
R	Action (see page 3476)	This is Action, a member of class TQuickAccessToolbarGroupItem.
R	Caption (see page 3477)	This is Caption, a member of class TQuickAccessToolbarGroupItem.
R	Group (see page 3477)	This is Group, a member of class TQuickAccessToolbarGroupItem.

62.1.14.2 TQuickAccessToolbarGroupItem.Create Constructor

Pascal

```
constructor Create(ActionList: TActionList; AGroup: TCustomRibbonGroup); reintroduce;
```

C++

```
__fastcall TQuickAccessToolbarGroupItem(TActionList ActionList, TCustomRibbonGroup AGroup);
```

Description

This is Create, a member of class TQuickAccessToolbarGroupItem.

62.1.14.3 TQuickAccessToolbarGroupItem.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQuickAccessToolbarGroupItem();
```

Description

This is Destroy, a member of class TQuickAccessToolbarGroupItem.

62.1.14.4 TQuickAccessToolbarGroupItem Properties

The properties of the TQuickAccessToolbarGroupItem class are listed here.

Public Properties

	Name	Description
R	Action (see page 3476)	This is Action, a member of class TQuickAccessToolbarGroupItem.
R	Caption (see page 3477)	This is Caption, a member of class TQuickAccessToolbarGroupItem.
R	Group (see page 3477)	This is Group, a member of class TQuickAccessToolbarGroupItem.

62.1.14.4.1 TQuickAccessToolbarGroupItem.Action Property

Pascal

```
property Action: TAction;
```

C++

```
__property TAction Action;
```

Description

This is Action, a member of class TQuickAccessToolbarGroupItem.

62.1.14.4.2 TQuickAccessToolbarGroupItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TQuickAccessToolbarGroupItem.

62.1.14.4.3 TQuickAccessToolbarGroupItem.Group Property

Pascal

```
property Group: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Group;
```

Description

This is Group, a member of class TQuickAccessToolbarGroupItem.

62.1.15 TQuickAccessToolbarGroups Class

Class Hierarchy

Pascal

```
TQuickAccessToolbarGroups = class;
```

C++

```
class TQuickAccessToolbarGroups;
```

File

Ribbon

Description

This is class Ribbon.TQuickAccessToolbarGroups.

62.1.15.1 TQuickAccessToolbarGroups Members

The following tables list the members exposed by TQuickAccessToolbarGroups.

Public Methods

	Name	Description
	Add (see page 3478)	This is Add, a member of class TQuickAccessToolbarGroups.
	Clean (see page 3479)	This is Clean, a member of class TQuickAccessToolbarGroups.
	Create (see page 3478)	This is Create, a member of class TQuickAccessToolbarGroups.
	Destroy (see page 3478)	This is Destroy, a member of class TQuickAccessToolbarGroups.
	Exists (see page 3479)	This is Exists, a member of class TQuickAccessToolbarGroups.
	Group (see page 3479)	This is Group, a member of class TQuickAccessToolbarGroups.
	Remove (see page 3479)	This is Remove, a member of class TQuickAccessToolbarGroups.

62.1.15.2 TQuickAccessToolbarGroups.Create Constructor

Pascal

```
constructor Create(Images: TCustomImageList); virtual;
```

C++

```
virtual __fastcall TQuickAccessToolbarGroups(TCustomImageList Images);
```

Description

This is Create, a member of class TQuickAccessToolbarGroups.

62.1.15.3 TQuickAccessToolbarGroups.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQuickAccessToolbarGroups();
```

Description

This is Destroy, a member of class TQuickAccessToolbarGroups.

62.1.15.4 TQuickAccessToolbarGroups Methods

The methods of the TQuickAccessToolbarGroups class are listed here.

Public Methods

	Name	Description
	Add (see page 3478)	This is Add, a member of class TQuickAccessToolbarGroups.
	Clean (see page 3479)	This is Clean, a member of class TQuickAccessToolbarGroups.
	Exists (see page 3479)	This is Exists, a member of class TQuickAccessToolbarGroups.
	Group (see page 3479)	This is Group, a member of class TQuickAccessToolbarGroups.
	Remove (see page 3479)	This is Remove, a member of class TQuickAccessToolbarGroups.

62.1.15.4.1 TQuickAccessToolbarGroups.Add Method

Pascal

```
function Add(AGroup: TCustomRibbonGroup): TQuickAccessToolbarGroupItem;
```

C++

```
__fastcall TQuickAccessToolbarGroupItem Add(TCustomRibbonGroup AGroup);
```

Description

This is Add, a member of class TQuickAccessToolbarGroups.

62.1.15.4.2 TQuickAccessToolbarGroups.Clean Method

Pascal

```
procedure Clean;
```

C++

```
__fastcall Clean();
```

Description

This is Clean, a member of class TQuickAccessToolbarGroups.

62.1.15.4.3 TQuickAccessToolbarGroups.Exists Method

Pascal

```
function Exists(const ACaption: string): Boolean;
```

C++

```
__fastcall Boolean Exists(const UnicodeString ACaption);
```

Description

This is Exists, a member of class TQuickAccessToolbarGroups.

62.1.15.4.4 TQuickAccessToolbarGroups.Group Method

Pascal

```
function Group(const ACaption: string): TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup Group(const UnicodeString ACaption);
```

Description

This is Group, a member of class TQuickAccessToolbarGroups.

62.1.15.4.5 TQuickAccessToolbarGroups.Remove Method

Pascal

```
procedure Remove(const ACaption: string);
```

C++

```
__fastcall Remove(const UnicodeString ACaption);
```

Description

This is Remove, a member of class TQuickAccessToolbarGroups.

62.1.16 TRibbon Class

Implement ribbon control.

Class Hierarchy

Pascal

```
TRibbon = class(TCustomRibbon);
```

C++

```
class TRibbon : public TCustomRibbon;
```

File

Ribbon

Description

TRibbon is a TCustomRibbon (see page 3358) that implements the ribbon control. Use TRibbon to create a user interface that looks and performs like the Microsoft Fluent User Interface.

Instead of the tradional user interface where the application has a top level menu, there is no top level menu when using TRibbon. Instead there is an Application Menu (see page 3397), represented by a large round button in the top left corner. Commands are displayed in groups in tabs. These groups are more like toolbars and can display a variety of user interface elements.

Adding Commands to the Ribbon

TCustomRibbon (see page 3358)

62.1.16.1 TRibbon Members

The following tables list the members exposed by TRibbon.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 3400)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 3401)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 3371)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 3371)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 3371)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 3371)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 3372)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 3372)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 3372)	This is CMThemeChanged, a member of class TCustomRibbon.
V	ContextMenuPopupHandler (see page 3372)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.

	CreateContextMenu (see page 3373)	This is CreateContextMenu, a member of class TCustomRibbon.
	CustomFrameWndProc (see page 3373)	This is CustomFrameWndProc, a member of class TCustomRibbon.
	DblClick (see page 3373)	OnDblClick event dispatcher.
	DefineProperties (see page 3374)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DisplayKeyTips (see page 3374)	This is DisplayKeyTips, a member of class TCustomRibbon.
	DoAddToQuickAccessToolbar (see page 3375)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
	DoChangeQuickAccessToolbarPosition (see page 3375)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
	DoContextPopup (see page 3375)	OnContextPopup event dispatcher.
	DoCustomizeQuickAccessToolbar (see page 3375)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
	DoGroupStyleChanged (see page 3376)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
	DoHelpButtonClick (see page 3376)	This is DoHelpButtonClick, a member of class TCustomRibbon.
	DoMinimizeRibbon (see page 3376)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
	DoMouseWheelDown (see page 3376)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 3377)	OnMouseWheelUp event dispatcher.
	DoRecentItemClick (see page 3377)	This is DoRecentItemClick, a member of class TCustomRibbon.
	DoScrollTabsLeft (see page 3378)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
	DoScrollTabsRight (see page 3378)	This is DoScrollTabsRight, a member of class TCustomRibbon.
	DoTabChange (see page 3378)	This is DoTabChange, a member of class TCustomRibbon.
	DrawCaption (see page 3378)	This is DrawCaption, a member of class TCustomRibbon.
	DrawQuickAccessToolbar (see page 3379)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 3379)	This is DrawSystemButtons, a member of class TCustomRibbon.
	DrawTab (see page 3379)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 3379)	This is GetContextMenuOptions, a member of class TCustomRibbon.
	GetHelpButtonRect (see page 3380)	This is GetHelpButtonRect, a member of class TCustomRibbon.
	GetRibbonHeight (see page 3380)	This is GetRibbonHeight, a member of class TCustomRibbon.
	GetTabAt (see page 3381)	This is GetTabAt, a member of class TCustomRibbon.
	GetTabRect (see page 3381)	This is GetTabRect, a member of class TCustomRibbon.
	GetTabWidth (see page 3381)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 3381)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 3382)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 3382)	This is Idle, a member of class TCustomRibbon.
	KeyDown (see page 3383)	Respond to key press events.
	Loaded (see page 3384)	Initializes the control after it is loaded from a stream.
	MouseDown (see page 3384)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 3385)	This is MouseInSystemMenu, a member of class TCustomRibbon.
	MouseMove (see page 3385)	Respond to mouse moving over control area..
	MouseUp (see page 3385)	OnMouseUp event dispatcher.
	Notification (see page 3386)	Responds to notifications that components are being created or destroyed.
	Paint (see page 3387)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 3387)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
	Resize (see page 3388)	Respond to control resize.
	SetParent (see page 3389)	Sets the parent of the control.
	UMCheckResize (see page 3391)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 3391)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 3391)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 3391)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 3392)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 3392)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 3392)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 3392)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 3393)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 3393)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 3395)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.
	HideRibbon (see page 3396)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 3396)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 3397)	This is KeyTipsVisible, a member of class TCustomRibbon.
R	Menu (see page 3397)	This is Menu, a member of class TCustomRibbon.
R	ScaleFactor (see page 3398)	This is ScaleFactor, a member of class TCustomRibbon.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 3364)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 3364)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 3364)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 3364)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 3365)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 3365)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 3365)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 3365)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 3366)	This is cRibbonPageHeight, a member of class TCustomRibbon.
	cRibbonQATHeight (see page 3366)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 3366)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 3366)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 3366)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 3367)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 3367)	This is cRibbonTabSpacing, a member of class TCustomRibbon.
	cRibbonUnthemedCaptionHeight (see page 3367)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 3367)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 3368)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 3370)	Add new entry into Recent Items list.
	AddTab (see page 3370)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 3370)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 3370)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 3371)	This is ClearRecentItems, a member of class TCustomRibbon.
V	Create (see page 3362)	Creates an instance of TCustomControl.
	CustomFrameSupported (see page 3373)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 3374)	Delete tab at specified Index.
V	Destroy (see page 3363)	Destroys an instance of TCustomControl.
	DoMouseWheelEx (see page 3377)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 3379)	This is EndUpdate, a member of class TCustomRibbon.
V	GetIcon (see page 3380)	Return Icon used by Application Menu (see page 3397) Button.
	GetRibbonMetric (see page 3380)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 3382)	Invalidate header section of Ribbon (see page 3347).
	InvalidateScrollButtons (see page 3382)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 3383)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 3383)	Invalidate area that displays tabs.
	MoveGroup (see page 3386)	Move group to new page.
	RemoveAllTabs (see page 3387)	Remove all Tabs (see page 3399) from Ribbon (see page 3347).
	RemoveRecentItem (see page 3388)	This is RemoveRecentItem, a member of class TCustomRibbon.
	RemoveTab (see page 3388)	Remove tab with specified caption.
V	SetBounds (see page 3389)	Sets the windowed control's boundary properties all at once.

	TabHandledKeyTips (see page 3390)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 3390)	Hide K**eyTip**s.
	TabShowKeyTips (see page 3390)	Display **KeyTip**s for **ktsTabs** State.

Public Nested Types

Name	Description
TTabChangeEvent (see page 3400)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

Public Properties

	Name	Description
	Active (see page 3394)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 3394)	Page currently displayed by ribbon control.
	ColorMap (see page 3395)	This is ColorMap, a member of class TCustomRibbon.
	Minimized (see page 3397)	Show Ribbon (see page 3347) in minimized state where tabs can be selected but are not visible.

Published Events

	Name	Description
	OnHelpButtonClick (see page 3498)	This is OnHelpButtonClick, a member of class TRibbon.
	OnRecentItemClick (see page 3498)	Recent item clicked.
	OnTabChange (see page 3498)	This is OnTabChange, a member of class TRibbon.

Published Properties

	Name	Description
	ActionManager (see page 3484)	This is ActionManager, a member of class TRibbon.
	Align (see page 3484)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3488)	Specifies how the control is anchored to its parent.
	ApplicationMenu (see page 3488)	Change appearance of ribbon's associated TRibbonApplicationMenuBar control.
	BiDiMode (see page 3488)	Specifies the bi-directional mode for the control.
	Caption (see page 3489)	Specifies a text string that identifies the control to the user.
	DocumentName (see page 3492)	Text in Ribbon caption.
	Enabled (see page 3492)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3492)	Controls the attributes of text written on or in the control.
	Height (see page 3493)	Specifies the vertical size of the control in pixels.
	HideTabs (see page 3495)	Shows or hides Tab portion of Ribbon.
	ParentBiDiMode (see page 3495)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 3495)	Determines where a control looks for its font information.
	QuickAccessToolbar (see page 3496)	Properties associated with TQuickAccessToolbar.
	ScreenTips (see page 3496)	This is ScreenTips, a member of class TRibbon.
	ShowHelpButton (see page 3496)	Determines whether ribbon displays Help Button.
	Style (see page 3497)	This is Style, a member of class TRibbon.
	TabIndex (see page 3497)	Change the active page of ribbon.
	Tabs (see page 3497)	Collection of TRibbonTabs visible on ribbon.
	UseCustomFrame (see page 3497)	Indicates whether to use a custom frame for ribbon controls.

62.1.16.2 TRibbon Properties

The properties of the TRibbon class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 3484)	This is ActionManager, a member of class TRibbon.
	Align (see page 3484)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3488)	Specifies how the control is anchored to its parent.

	ApplicationMenu (see page 3488)	Change appearance of ribbon's associated TRibbonApplicationMenuBar control.
	BiDiMode (see page 3488)	Specifies the bi-directional mode for the control.
	Caption (see page 3489)	Specifies a text string that identifies the control to the user.
	DocumentName (see page 3492)	Text in Ribbon caption.
	Enabled (see page 3492)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3492)	Controls the attributes of text written on or in the control.
	Height (see page 3493)	Specifies the vertical size of the control in pixels.
	HideTabs (see page 3495)	Shows or hides Tab portion of Ribbon.
	ParentBiDiMode (see page 3495)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 3495)	Determines where a control looks for its font information.
	QuickAccessToolbar (see page 3496)	Properties associated with TQuickAccessToolbar.
	ScreenTips (see page 3496)	This is ScreenTips, a member of class TRibbon.
	ShowHelpButton (see page 3496)	Determines whether ribbon displays Help Button.
	Style (see page 3497)	This is Style, a member of class TRibbon.
	TabIndex (see page 3497)	Change the active page of ribbon.
	Tabs (see page 3497)	Collection of TRibbonTabs visible on ribbon.
	UseCustomFrame (see page 3497)	Indicates whether to use a custom frame for ribbon controls.

62.1.16.2.1 TRibbon.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TRibbon.

62.1.16.2.2 TRibbon.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls

into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
```

```
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}
```

```
var
  I: Integer;

Parent

Anchors

62.1.16.2.3 TRibbon.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

62.1.16.2.4 TRibbon.ApplicationMenu Property

Change appearance of ribbon's associated TRibbonApplicationMenuBar control.

Pascal

```
property ApplicationMenu: TApplicationMenu;
```

C++

```
__property TApplicationMenu ApplicationMenu;
```

Description

ApplicationMenu changes the appearance for the ribbon's associated TRibbonApplicationMenuBar control.

Changing the values of the fields in ApplicationMenu changes the characteristics of the Application Menu for the ribbon. The Application Menu on the ribbon is represented by the round button in the top left corner.

See Also

TApplicationMenu (see page 3350)

TRibbonApplicationMenuBar (see page 3942)

62.1.16.2.5 TRibbon.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

62.1.16.2.6 TRibbon.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

Note: The Caption property inheritted from TControl is a protected property. Access to the Caption requires casting the class to an inheritted one where Caption is a published or public property.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
```

```
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
```

```
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
```

```
end;
```

62.1.16.2.7 TRibbon.DocumentName Property

Text in Ribbon caption.

Pascal

```
property DocumentName: string;
```

C++

```
__property UnicodeString DocumentName;
```

Description

DocumentName appears in the Ribbon caption.

62.1.16.2.8 TRibbon.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

62.1.16.2.9 TRibbon.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name,

Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

62.1.16.2.10 TRibbon.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

62.1.16.2.11 TRibbon.HideTabs Property

Shows or hides Tab portion of Ribbon.

Pascal

```
property HideTabs: Boolean;
```

C++

```
__property Boolean HideTabs;
```

Description

HideTabs shows or hides the Tab portion of the Ribbon. When HideTabs is True, the user cannot access any of the Tabs on the Ribbon.

62.1.16.2.12 TRibbon.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent

BiDiMode

62.1.16.2.13 TRibbon.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

62.1.16.2.15 TRibbon.ScreenTips Property

Pascal

```
property ScreenTips: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTips;
```

Description

This is ScreenTips, a member of class TRibbon.

62.1.16.2.16 TRibbon.ShowHelpButton Property

Determines whether ribbon displays Help Button.

Pascal

```
property ShowHelpButton: Boolean;
```

C++

```
__property Boolean ShowHelpButton;
```

Description

ShowHelpButton indicates whether or not the ribbon displays a Help Button in the top right hand corner.

See Also

THelpButton (see page 3459)

62.1.16.2.17 TRibbon.Style Property

Pascal

```
property Style: TRibbonStyleActionBars;
```

```
__property TRibbonStyleActionBars Style;
```

Description

This is Style, a member of class TRibbon.

62.1.16.2.18 TRibbon.TabIndex Property

Change the active page of ribbon.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

TabIndex changes the active page of the ribbon. Set the TabIndex property to the desired page index.

See Also

Tabs (see page 3399)

62.1.16.2.19 TRibbon.Tabs Property

Collection of TRibbonTabs visible on ribbon.

Pascal

```
property Tabs: TRibbonTabs;
```

C++

```
__property TRibbonTabs Tabs;
```

Description

Tabs contains a collection of TRibbonTabs visible on the ribbon.

Tabs is a linked list of TRibbonTabs objects. TRibbonTabs is a simple data structure that contains the caption for the tab, the keytip for the tab as well as a reference to the Tab object.

See Also

62.1.16.2.20 TRibbon.UseCustomFrame Property

Indicates whether to use a custom frame for ribbon controls.

Pascal

```
property UseCustomFrame: Boolean;
```

C++

```
__property Boolean UseCustomFrame;
```

Description

UseCustomFrame indicates whether or not to use a custom frame for ribbon controls.

62.1.16.3 TRibbon Events

The events of the TRibbon class are listed here.

Published Events

	Name	Description
	OnHelpButtonClick (see page 3498)	This is OnHelpButtonClick, a member of class TRibbon.
	OnRecentItemClick (see page 3498)	Recent item clicked.
	OnTabChange (see page 3498)	This is OnTabChange, a member of class TRibbon.

62.1.16.3.1 TRibbon.OnHelpButtonClick Event

Pascal

```
property OnHelpButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHelpButtonClick;
```

Description

This is OnHelpButtonClick, a member of class TRibbon.

62.1.16.3.2 TRibbon.OnRecentItemClick Event

Recent item clicked.

Pascal

```
property OnRecentItemClick: TRecentItemClickEvent;
```

C++

```
__property TRecentItemClickEvent OnRecentItemClick;
```

Description

OnRecentItemClick occurs when a recent item is clicked.

See Also

TRibbonApplicationMenuBar (see page 3942)

RecentItems (see page 3956)

62.1.16.3.3 TRibbon.OnTabChange Event

Pascal

```
property OnTabChange: TTabChangeEvent;
```

C++

```
__property TTabChangeEvent OnTabChange;
```

Description

This is OnTabChange, a member of class TRibbon.

62.1.17 TRibbonCustomizeDlg Class

Class Hierarchy

Pascal

```
TRibbonCustomizeDlg = class(TCustomizeDlg);
```

C++

```
class TRibbonCustomizeDlg : public TCustomizeDlg;
```

File

Ribbon

Description

This is class Ribbon.TRibbonCustomizeDlg.

62.1.17.1 TRibbonCustomizeDlg Members

The following tables list the members exposed by TRibbonCustomizeDlg.

Protected Methods

	Name	Description
	SetupDlg (see page 3499)	Sets up the customization dialog form.

62.1.17.2 TRibbonCustomizeDlg Methods

The methods of the TRibbonCustomizeDlg class are listed here.

Protected Methods

	Name	Description
	SetupDlg (see page 3499)	Sets up the customization dialog form.

62.1.17.2.1 TRibbonCustomizeDlg.SetupDlg Method

Sets up the customization dialog form.

Pascal

```
procedure SetupDlg; override;
```

C++

```
virtual __fastcall SetupDlg();
```

Description

SetupDlg is a protected method that sets up the customization dialog form.

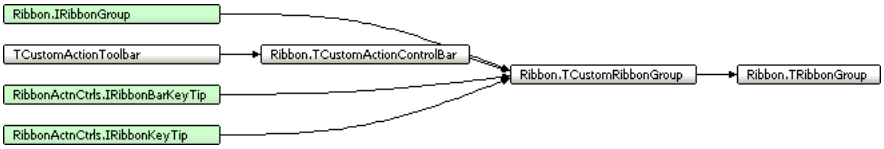
62.1.18 TRibbonGroup Class

Control used to display the user selectable commands for the ribbon.

Class Hierarchy



Pascal

```
TRibbonGroup = class(TCustomRibbonGroup);
```

C++

```
class TRibbonGroup : public TCustomRibbonGroup;
```

File

Ribbon

Description

TRibbonGroup is a TCustomRibbonGroup (see page 3405) that is used to display the user selectable commands for the ribbon.

When creating a user interface using TRibbon (see page 3480), you add commands to ribbon groups. Ribbon (see page 3347) groups are placed on a ribbon page. You can add new groups to a ribbon by right clicking on the ribbon page and selecting the Add Group component editor item.

The position of the ribbon group is determined by the ribbon page that it was placed on. You cannot freely move the ribbon group around the ribbon page. To change the position of the group within the same page, change the GroupIndex (see page 3504) property.

To move the ribbon group to another ribbon page, use the Move Group command available when right clicking on the ribbon page at design time.

62.1.18.1 TRibbonGroup Members

The following tables list the members exposed by TRibbonGroup.

Enumerations

	Name	Description
	TGroupAlign (see page 3408)	Alignment of ribbon group.

Protected Methods

	Name	Description
V	AlignControls (see page 3409)	This is AlignControls, a member of class TCustomRibbonGroup.
V	AutoSizingChanged (see page 3410)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMControlChange (see page 3357)	This is CMControlChange, a member of class TCustomActionControlBar.
	CMFontchanged (see page 3412)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 3412)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 3412)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 3412)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 3413)	This is CMTextchanged, a member of class TCustomRibbonGroup.
V	CreateControls (see page 3357)	This is CreateControls, a member of class TCustomActionControlBar.
V	CreateControls (see page 3413)	This is CreateControls, a member of class TCustomRibbonGroup.
V	DoDropItem (see page 3414)	This is DoDropItem, a member of class TCustomRibbonGroup.
V	DoEndDrag (see page 3414)	This is DoEndDrag, a member of class TCustomRibbonGroup.
V	DrawShowDialogButton (see page 3414)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 3414)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
V	GetControlClass (see page 3357)	This is GetControlClass, a member of class TCustomActionControlBar.
	GetGroupHeight (see page 3415)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
V	HideControls (see page 3416)	This is HideControls, a member of class TCustomRibbonGroup.
V	MouseDown (see page 3417)	This is MouseDown, a member of class TCustomRibbonGroup.
V	MouseMove (see page 3417)	This is MouseMove, a member of class TCustomRibbonGroup.
V	MouseUp (see page 3417)	This is MouseUp, a member of class TCustomRibbonGroup.
V	Notification (see page 3417)	This is Notification, a member of class TCustomRibbonGroup.
V	Paint (see page 3418)	This is Paint, a member of class TCustomRibbonGroup.
V	Resize (see page 3418)	This is Resize, a member of class TCustomRibbonGroup.
V	SetAutoSizing (see page 3418)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
V	SetParent (see page 3419)	This is SetParent, a member of class TCustomRibbonGroup.
V	SetupDropDownBtn (see page 3419)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
V	ShowControls (see page 3419)	This is ShowControls, a member of class TCustomRibbonGroup.

Protected Properties

	Name	Description
R	CreatingControls (see page 3358)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	AlignGroupControls (see page 3568)	Realign controls on group.
V	AlignGroupControls (see page 3410)	Align controls in Ribbon (see page 3347) Group
V	Assign (see page 3410)	This is Assign, a member of class TCustomRibbonGroup.
	BarHandleKeyTips (see page 3410)	Iterate over any visible **KeyTip (see page 3423)**s and perform validation to determine if one of **KeyTip (see page 3423)**s is partial or full match.
	BarHandleKeyTips (see page 3913)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 3411)	Hide any visible KeyTips that commands are displaying.
	BarHideKeyTips (see page 3913)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 3411)	Show K**eyTip**s for commands.

	BarShowKeyTips (see page 3914)	Show **KeyTip**s for any commands that support them.
	Clone (see page 3411)	This is Clone, a member of class TCustomRibbonGroup.
V	Create (see page 3356)	This is Create, a member of class TCustomActionControlBar.
V	Create (see page 3407)	This is Create, a member of class TCustomRibbonGroup.
	CreateControl (see page 3569)	Recreate specific control.
V	CreateControl (see page 3357)	This is CreateControl, a member of class TCustomActionControlBar.
V	CreateControl (see page 3413)	Recreate specific control.
V	Destroy (see page 3408)	This is Destroy, a member of class TCustomRibbonGroup.
V	DockDrop (see page 3413)	This is DockDrop, a member of class TCustomRibbonGroup.
V	DragDrop (see page 3414)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 3415)	Returns current **KeyTip** for command.
	GetKeyTip (see page 3919)	Returns current **KeyTip (see page 3922)** for command.
	HandleKeyTip (see page 3415)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HandleKeyTip (see page 3920)	Indicates if command's **KeyTip (see page 3922)** matches currently input KeyTip (see page 3922).
	HideKeyTip (see page 3416)	Hide **KeyTip** for command.
	HideKeyTip (see page 3920)	Hide **KeyTip (see page 3922)** for command.
	KeyTipClick (see page 3416)	Handle clicking a **KeyTip**.
	KeyTipClick (see page 3920)	Handle clicking a **KeyTip (see page 3922)**.
V	SetBounds (see page 3418)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 3418)	Sets **KeyTip** for command.
	SetKeyTip (see page 3921)	Sets **KeyTip (see page 3922)** for command.
	ShowKeyTip (see page 3419)	Shows **KeyTip** for command in specified position.
	ShowKeyTip (see page 3921)	Shows **KeyTip (see page 3922)** for command in specified position.
	StyleChanged (see page 3569)	This is StyleChanged, a member of class IRibbonGroup.
V	StyleChanged (see page 3420)	This is StyleChanged, a member of class TCustomRibbonGroup.

Public Nested Types

Name	Description
TRowPosition (see page 3424)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

Public Properties

	Name	Description
R	CanCollapse (see page 3421)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 3421)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	GroupVariant (see page 3422)	Current size variant ribbon group is using.
R	GroupWidth (see page 3422)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 3423)	Indicates if group has an in ribbon Gallery.
	Items (see page 3423)	This is Items, a member of class TCustomRibbonGroup.
R	Page (see page 3423)	Reference to Page group is on.
R	RequiredWidth (see page 3424)	Width required to display group.

Published Properties

	Name	Description
	ActionManager (see page 3503)	This is ActionManager, a member of class TRibbonGroup.
	BiDiMode (see page 3503)	This is BiDiMode, a member of class TRibbonGroup.
	Caption (see page 3503)	This is Caption, a member of class TRibbonGroup.
	DialogAction (see page 3504)	Determines whether dialog button displayed in group.
	GroupAlign (see page 3504)	Determines how controls on group are aligned.
	GroupIndex (see page 3504)	Index of group within current tab.
	Height (see page 3505)	This is Height, a member of class TRibbonGroup.
	KeyTip (see page 3505)	Key tip for Dialog button of group.
	ParentBiDiMode (see page 3505)	This is ParentBiDiMode, a member of class TRibbonGroup.
	Rows (see page 3505)	Number of Rows in group has for controls.

62.1.18.2 TRibbonGroup Properties

The properties of the TRibbonGroup class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 3503)	This is ActionManager, a member of class TRibbonGroup.
	BiDiMode (see page 3503)	This is BiDiMode, a member of class TRibbonGroup.
	Caption (see page 3503)	This is Caption, a member of class TRibbonGroup.
	DialogAction (see page 3504)	Determines whether dialog button displayed in group.
	GroupAlign (see page 3504)	Determines how controls on group are aligned.
	GroupIndex (see page 3504)	Index of group within current tab.
	Height (see page 3505)	This is Height, a member of class TRibbonGroup.
	KeyTip (see page 3505)	Key tip for Dialog button of group.
	ParentBiDiMode (see page 3505)	This is ParentBiDiMode, a member of class TRibbonGroup.
	Rows (see page 3505)	Number of Rows in group has for controls.

62.1.18.2.1 TRibbonGroup.ActionManager Property

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

This is ActionManager, a member of class TRibbonGroup.

62.1.18.2.2 TRibbonGroup.BiDiMode Property

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

This is BiDiMode, a member of class TRibbonGroup.

62.1.18.2.3 TRibbonGroup.Caption Property

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

This is Caption, a member of class TRibbonGroup.

62.1.18.2.4 TRibbonGroup.DialogAction Property

Determines whether dialog button displayed in group.

Pascal

```
property DialogAction: TContainedAction;
```

C++

```
__property TContainedAction DialogAction;
```

Description

DialogAction determines whether the dialog button is displayed in the lower right hand corner of the group.

See Also

KeyTip (see page 3423)

62.1.18.2.5 TRibbonGroup.GroupAlign Property

Determines how controls on group are aligned.

Pascal

```
property GroupAlign: TGroupAlign;
```

C++

```
__property TGroupAlign GroupAlign;
```

Description

GroupAlign contains a TGroupAlign that determines how controls on a group are aligned.

If alignment is **gaHorizontal**, controls are aligned left to right, top to bottom. To make a control start in a new row, set the NewRow property to true.

If alignment is **gaVertical**, controls are aligned top to bottom, left to right. Controls are automatically moved to the next column in the group if three controls are already in the column. You can also force a control to a new column by setting the NewCol property to true.

See Also

TGroupAlign (see page 3408)

62.1.18.2.6 TRibbonGroup.GroupIndex Property

Index of group within current tab.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is the index of the group within the current tab. Set the GroupIndex property to change the position of the group within the current tab.

62.1.18.2.7 TRibbonGroup.Height Property

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

This is Height, a member of class TRibbonGroup.

62.1.18.2.8 TRibbonGroup.KeyTip Property

Key tip for Dialog button of group.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;__property UnicodeString KeyTip;
```

Description

KeyTip is the key tip for the Dialog button of the group. It is only valid when DialogAction has been set.

See Also

DialogAction (see page 3421)

62.1.18.2.9 TRibbonGroup.ParentBiDiMode Property

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

This is ParentBiDiMode, a member of class TRibbonGroup.

62.1.18.2.10 TRibbonGroup.Rows Property

Number of Rows in group has for controls.

Pascal

```
property Rows: Integer;
```

C++

```
__property int Rows;
```

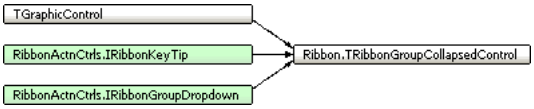
Description

Rows is the number of Rows the group has for displaying controls. A group must have at least 1 row and a maximum of 3.

62.1.19 TRibbonGroupCollapsedControl Class

Control used to represent a collapsed group on a tab.

Class Hierarchy



Pascal

```
TRibbonGroupCollapsedControl = class(TGraphicControl, IRibbonKeyTip, IRibbonGroupDropdown);
```

C++

```
class TRibbonGroupCollapsedControl : public TGraphicControl, public IRibbonKeyTip, public
IRibbonGroupDropdown;
```

File

Ribbon

Description

TRibbonGroupCollapsedControl is a control used to represent a collapsed group on a tab.

This class is used internally by the ribbon group to represent a group in the collapsed state. A group is collapsed when the GroupVariant property of the ribbon group is **rgvCollapsed**. This happens automatically when the ribbon is resized in such a way that the group is no longer completely visible within the current tab.

Note: This class is for internal use only.

See Also

GroupVariant (see page 3422)

62.1.19.1 TRibbonGroupCollapsedControl Members

The following tables list the members exposed by TRibbonGroupCollapsedControl.

Protected Methods

	Name	Description
	AdjustBounds (see page 3509)	This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.
V	Click (see page 3509)	Respond to user click.
	CMFontchanged (see page 3510)	This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.
	CMMouseenter (see page 3510)	This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.
	CMMouseleave (see page 3510)	This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.
	CMTextchanged (see page 3510)	This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.
V	Notification (see page 3512)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3513)	Render control surface.
	SetupGroupImage (see page 3514)	This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

Protected Properties

	Name	Description
	MouseInControl (see page 3518)	This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

Public Methods

	Name	Description
	CloseUp (see page 3509)	This is CloseUp, a member of class TRibbonGroupCollapsedControl.
	Create (see page 3507)	Creates an instance of TGraphicControl.
	Destroy (see page 3508)	Destroys an instance of TGraphicControl.
	GetKeyTip (see page 3510)	Returns current **KeyTip** for command.
	GetParentControl (see page 3511)	This is GetParentControl, a member of class TRibbonGroupCollapsedControl.
	GetTopPosition (see page 3511)	This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.
	HandleKeyTip (see page 3511)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3512)	Hide **KeyTip** for command.
	KeyTipClick (see page 3512)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3513)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3514)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ActionManager (see page 3515)	This is ActionManager, a member of class TRibbonGroupCollapsedControl.
	OldWidth (see page 3518)	This is OldWidth, a member of class TRibbonGroupCollapsedControl.

Published Properties

	Name	Description
	Caption (see page 3515)	Specifies a text string that identifies the control to the user.
	Group (see page 3518)	Group associated with collapsed button.
	KeyTip (see page 3518)	Current **KeyTip** for command

62.1.19.2 TRibbonGroupCollapsedControl.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupCollapsedControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

62.1.19.3 TRibbonGroupCollapsedControl.Destroy Destructor

Destroys an instance of TGraphicControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonGroupCollapsedControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

62.1.19.4 TRibbonGroupCollapsedControl Methods

The methods of the TRibbonGroupCollapsedControl class are listed here.

Protected Methods

	Name	Description
	AdjustBounds (see page 3509)	This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.
V	Click (see page 3509)	Respond to user click.
	CMFontchanged (see page 3510)	This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.
	CMMouseenter (see page 3510)	This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.
	CMMouseleave (see page 3510)	This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.
	CMTextchanged (see page 3510)	This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.
V	Notification (see page 3512)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 3513)	Render control surface.
	SetupGroupImage (see page 3514)	This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

Public Methods

	Name	Description
	CloseUp (see page 3509)	This is CloseUp, a member of class TRibbonGroupCollapsedControl.
	GetKeyTip (see page 3510)	Returns current **KeyTip** for command.
	GetParentControl (see page 3511)	This is GetParentControl, a member of class TRibbonGroupCollapsedControl.

	GetTopPosition (see page 3511)	This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.
	HandleKeyTip (see page 3511)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 3512)	Hide **KeyTip** for command.
	KeyTipClick (see page 3512)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 3513)	Sets **KeyTip** for command.
	ShowKeyTip (see page 3514)	Shows **KeyTip** for command in specified position.

62.1.19.4.1 TRibbonGroupCollapsedControl.AdjustBounds Method

Pascal

```
procedure AdjustBounds; dynamic;
```

C++

```
__fastcall AdjustBounds();
```

Description

This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.2 TRibbonGroupCollapsedControl.Click Method

Respond to user click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Click is called automatically when the user left-clicks the control. Component or application code can call Click to simulate a user mouse click. This is often done in menu actions and hotkey handlers.

As implemented in TControl, Click queries whether the OnClick event handler exists and is different from the OnExecute handler for the control's Action. If this is true, the OnClick event handler is called. If this is false, and the Action OnExecute event handler exists, the Action's Execute method is called. Override Click to provide additional behavior.

OnClick

62.1.19.4.3 TRibbonGroupCollapsedControl.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.4 TRibbonGroupCollapsedControl.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.5 TRibbonGroupCollapsedControl.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.6 TRibbonGroupCollapsedControl.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.7 TRibbonGroupCollapsedControl.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.8 TRibbonGroupCollapsedControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 3922)

HandleKeyTip (see page 3920)

62.1.19.4.9 TRibbonGroupCollapsedControl.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.10 TRibbonGroupCollapsedControl.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.11 TRibbonGroupCollapsedControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

62.1.19.4.12 TRibbonGroupCollapsedControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

SetKeyTip (see page 3921)

ShowKeyTip (see page 3921)

62.1.19.4.13 TRibbonGroupCollapsedControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

62.1.19.4.14 TRibbonGroupCollapsedControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

62.1.19.4.15 TRibbonGroupCollapsedControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

62.1.19.4.16 TRibbonGroupCollapsedControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

ShowKeyTip (see page 3921)

62.1.19.4.17 TRibbonGroupCollapsedControl.SetupGroupImage Method

Pascal

```
procedure SetupGroupImage;
```

C++

```
__fastcall SetupGroupImage();
```

Description

This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

62.1.19.4.18 TRibbonGroupCollapsedControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 3922)

GetKeyTip (see page 3919)

HandleKeyTip (see page 3920)

HideKeyTip (see page 3920)

SetKeyTip (see page 3921)

62.1.19.5 TRibbonGroupCollapsedControl Properties

The properties of the TRibbonGroupCollapsedControl class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 3518)	This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

Public Properties

	Name	Description
	ActionManager (see page 3515)	This is ActionManager, a member of class TRibbonGroupCollapsedControl.
	OldWidth (see page 3518)	This is OldWidth, a member of class TRibbonGroupCollapsedControl.

Published Properties

	Name	Description
	Caption (see page 3515)	Specifies a text string that identifies the control to the user.
	Group (see page 3518)	Group associated with collapsed button.
	KeyTip (see page 3518)	Current **KeyTip** for command

62.1.19.5.1 TRibbonGroupCollapsedControl.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TRibbonGroupCollapsedControl.

62.1.19.5.2 TRibbonGroupCollapsedControl.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

Note: The Caption property inheritted from TControl is a protected property. Access to the Caption requires casting the class to an inheritted one where Caption is a published or public property.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
```

```
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

62.1.19.5.3 TRibbonGroupCollapsedControl.Group Property

Group associated with collapsed button.

Pascal

```
property Group: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Group;
```

Description

Group is the group associated with the collapsed button.

62.1.19.5.4 TRibbonGroupCollapsedControl.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 3919)

SetKeyTip (see page 3921)

62.1.19.5.5 TRibbonGroupCollapsedControl.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

62.1.19.5.6 TRibbonGroupCollapsedControl.OldWidth Property

Pascal

```
property OldWidth: Integer;
```

C++

```
__property int OldWidth;
```

Description

This is OldWidth, a member of class TRibbonGroupCollapsedControl.

62.1.20 TRibbonGroupDockForm Class

Display a collapsed group.

Class Hierarchy

Pascal

```
TRibbonGroupDockForm = class(TXToolDockForm);
```

C++

```
class TRibbonGroupDockForm : public TXToolDockForm;
```

File

Ribbon

Description

TRibbonGroupDockForm is used to display a collapsed group.

When the user clicks on a groups collapsed button, the large group variant of the ribbon group is displayed as a child to an instance of this class.

Note: This class is for internal use only.

62.1.20.1 TRibbonGroupDockForm Members

The following tables list the members exposed by TRibbonGroupDockForm.

Protected Methods

	Name	Description
	CreateParams (see page 3520)	Initializes the window-creation parameter record when the form window is created.
	WMActivate (see page 3520)	This is WMActivate, a member of class TRibbonGroupDockForm.

Public Methods

	Name	Description
	Create (see page 3519)	Creates an instance of TToolDockForm.

Public Properties

	Name	Description
	Control (see page 3521)	Reference to invoking control.
	ParentControl (see page 3521)	This is ParentControl, a member of class TRibbonGroupDockForm.

62.1.20.2 TRibbonGroupDockForm.Create Constructor

Creates an instance of TToolDockForm.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupDockForm(TComponent * AOwner);
```

Description

AOwner is the dock form's owner, which is responsible for freeing the tool dock form.

The constructor initializes the BorderWidth property to 1.

See Also

BorderWidth

Owner

62.1.20.3 TRibbonGroupDockForm Methods

The methods of the TRibbonGroupDockForm class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 3520)	Initializes the window-creation parameter record when the form window is created.
	WMActivate (see page 3520)	This is WMActivate, a member of class TRibbonGroupDockForm.

62.1.20.3.1 TRibbonGroupDockForm.CreateParams Method

Initializes the window-creation parameter record when the form window is created.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams calls the inherited CreateParams method, and then adds WS_POPUP to the Style property.

62.1.20.3.2 TRibbonGroupDockForm.WMActivate Method

Pascal

```
procedure WMActivate(var Message: TWMActivate); message WM_ACTIVATE;
```

C++

```
__fastcall WMActivate(TWMActivate Message);
```

Description

This is WMActivate, a member of class TRibbonGroupDockForm.

62.1.20.4 TRibbonGroupDockForm Properties

The properties of the TRibbonGroupDockForm class are listed here.

Public Properties

	Name	Description
	Control (see page 3521)	Reference to invoking control.
	ParentControl (see page 3521)	This is ParentControl, a member of class TRibbonGroupDockForm.

62.1.20.4.1 TRibbonGroupDockForm.Control Property

Reference to invoking control.

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

Control is a reference to the control that invoked the floating group.

62.1.20.4.2 TRibbonGroupDockForm.ParentControl Property

Pascal

```
property ParentControl: TWinControl;
```

C++

```
__property TWinControl * ParentControl;
```

Description

This is ParentControl, a member of class TRibbonGroupDockForm.

62.1.21 TRibbonGroupScrollButton Class

Class Hierarchy

Pascal

```
TRibbonGroupScrollButton = class(TCustomControl);
```

C++

```
class TRibbonGroupScrollButton : public TCustomControl;
```

File

Ribbon

Description

This is class Ribbon.TRibbonGroupScrollButton.

62.1.21.1 TRibbonGroupScrollButton Members

The following tables list the members exposed by TRibbonGroupScrollButton.

Protected Methods

	Name	Description
	CMDesignHitTest (see page 3523)	This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.
	CMMouseenter (see page 3523)	This is CMMouseenter, a member of class TRibbonGroupScrollButton.
	CMMouseleave (see page 3523)	This is CMMouseleave, a member of class TRibbonGroupScrollButton.
V	Paint (see page 3523)	Renders the image of a custom control.

Protected Properties

	Name	Description
	Direction (see page 3524)	This is Direction, a member of class TRibbonGroupScrollButton.
	MouseInControl (see page 3524)	This is MouseInControl, a member of class TRibbonGroupScrollButton.
	RibbonStyle (see page 3524)	This is RibbonStyle, a member of class TRibbonGroupScrollButton.

Public Methods

	Name	Description
V	Create (see page 3522)	Creates an instance of TCustomControl.

62.1.21.2 TRibbonGroupScrollButton.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupScrollButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

Canvas

Owner

62.1.21.3 TRibbonGroupScrollButton Methods

The methods of the TRibbonGroupScrollButton class are listed here.

Protected Methods

	Name	Description
	CMDesignHitTest (see page 3523)	This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.
	CMMouseenter (see page 3523)	This is CMMouseenter, a member of class TRibbonGroupScrollButton.
	CMMouseleave (see page 3523)	This is CMMouseleave, a member of class TRibbonGroupScrollButton.
	Paint (see page 3523)	Renders the image of a custom control.

62.1.21.3.1 TRibbonGroupScrollButton.CMDesignHitTest Method

Pascal

```
procedure CMDesignHitTest(var Message: TCMDesignHitTest); message CM_DESIGNHITTEST;
```

C++

```
__fastcall CMDesignHitTest(TCMDesignHitTest Message);
```

Description

This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.

62.1.21.3.2 TRibbonGroupScrollButton.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonGroupScrollButton.

62.1.21.3.3 TRibbonGroupScrollButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonGroupScrollButton.

62.1.21.3.4 TRibbonGroupScrollButton.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT

messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

62.1.21.4 TRibbonGroupScrollButton Properties

The properties of the TRibbonGroupScrollButton class are listed here.

Protected Properties

	Name	Description
	Direction (see page 3524)	This is Direction, a member of class TRibbonGroupScrollButton.
	MouseInControl (see page 3524)	This is MouseInControl, a member of class TRibbonGroupScrollButton.
	RibbonStyle (see page 3524)	This is RibbonStyle, a member of class TRibbonGroupScrollButton.

62.1.21.4.1 TRibbonGroupScrollButton.Direction Property

Pascal

```
property Direction: TScrollDirection;
```

C++

```
__property TScrollDirection Direction;
```

Description

This is Direction, a member of class TRibbonGroupScrollButton.

62.1.21.4.2 TRibbonGroupScrollButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonGroupScrollButton.

62.1.21.4.3 TRibbonGroupScrollButton.RibbonStyle Property

Pascal

```
property RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars RibbonStyle;
```

Description

This is RibbonStyle, a member of class TRibbonGroupScrollButton.

62.1.22 TRibbonLunaColorMap Class

Color map class for Luna.

Class Hierarchy

Pascal

```
TRibbonLunaColorMap = class(TCustomRibbonColorMap);
```

C++

```
class TRibbonLunaColorMap : public TCustomRibbonColorMap;
```

File

Ribbon

Description

TRibbonLunaColorMap is the color map class for the Luna ribbon style.

See Also

TRibbonObsidianColorMap (see page 3530)

TRibbonSilverColorMap (see page 3549)

62.1.22.1 TRibbonLunaColorMap Members

The following tables list the members exposed by TRibbonLunaColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 3526)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3527)	This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.
	BevelMinimizedInner (see page 3527)	This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.
	BevelMinimizedOuter (see page 3527)	This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.
	BtnSelectedFont (see page 3527)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3528)	This is CaptionFontColor, a member of class TRibbonLunaColorMap.
	ControlColor (see page 3528)	This is ControlColor, a member of class TRibbonLunaColorMap.
	ControlFrameColor (see page 3528)	This is ControlFrameColor, a member of class TRibbonLunaColorMap.
	ControlInactiveColor (see page 3528)	This is ControlInactiveColor, a member of class TRibbonLunaColorMap.
	DisabledFontColor (see page 3528)	Changes the look and feel of your applications.
	DocumentFontColor (see page 3529)	This is DocumentFontColor, a member of class TRibbonLunaColorMap.

	FontColor (see page 3529)	Changes the look and feel of your applications.
	GroupFontColor (see page 3529)	This is GroupFontColor, a member of class TRibbonLunaColorMap.
	HighlightColor (see page 3529)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3530)	This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3530)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreColor (see page 3530)	This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

62.1.22.2 TRibbonLunaColorMap Methods

The methods of the TRibbonLunaColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 3526)	Updates an action component to reflect the current color property.

62.1.22.2.1 TRibbonLunaColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

62.1.22.3 TRibbonLunaColorMap Properties

The properties of the TRibbonLunaColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 3527)	This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.
	BevelMinimizedInner (see page 3527)	This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.
	BevelMinimizedOuter (see page 3527)	This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.
	BtnSelectedFont (see page 3527)	Changes the look and feel of your applications.
	CaptionFontColor (see page 3528)	This is CaptionFontColor, a member of class TRibbonLunaColorMap.
	ControlColor (see page 3528)	This is ControlColor, a member of class TRibbonLunaColorMap.
	ControlFrameColor (see page 3528)	This is ControlFrameColor, a member of class TRibbonLunaColorMap.
	ControlInactiveColor (see page 3528)	This is ControlInactiveColor, a member of class TRibbonLunaColorMap.
	DisabledFontColor (see page 3528)	Changes the look and feel of your applications.
	DocumentFontColor (see page 3529)	This is DocumentFontColor, a member of class TRibbonLunaColorMap.
	FontColor (see page 3529)	Changes the look and feel of your applications.
	GroupFontColor (see page 3529)	This is GroupFontColor, a member of class TRibbonLunaColorMap.
	HighlightColor (see page 3529)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 3530)	This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreBorderColor (see page 3530)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.

	QuickAccessToolbarMoreColor (see page 3530)	This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

62.1.22.3.1 TRibbonLunaColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.

62.1.22.3.2 TRibbonLunaColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.

62.1.22.3.3 TRibbonLunaColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.

62.1.22.3.4 TRibbonLunaColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.22.3.5 TRibbonLunaColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonLunaColorMap.

62.1.22.3.6 TRibbonLunaColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonLunaColorMap.

62.1.22.3.7 TRibbonLunaColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonLunaColorMap.

62.1.22.3.8 TRibbonLunaColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonLunaColorMap.

62.1.22.3.9 TRibbonLunaColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.22.3.10 TRibbonLunaColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonLunaColorMap.

62.1.22.3.11 TRibbonLunaColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.22.3.12 TRibbonLunaColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonLunaColorMap.

62.1.22.3.13 TRibbonLunaColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

62.1.22.3.14 TRibbonLunaColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.

62.1.22.3.15 TRibbonLunaColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.

62.1.22.3.16 TRibbonLunaColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

62.1.23 TRibbonObsidianColorMap Class

Color map class for Obsidian.

Class Hierarchy

Pascal

```
TRibbonObsidianColorMap = class(TCustomRibbonColorMap);
```

C++

```
