29.1.3.2.41 TMaskEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
```

```
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

29.1.3.3 TMaskEdit Events

The events of the TMaskEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 1142)	Occurs when the text for the edit control may have changed.
	OnClick (see page 1142)	Occurs when the user clicks the control.
	OnDblClick (see page 1144)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 1144)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 1147)	Occurs when the user drags an object over a control.
	OnEndDock (see page 1150)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 1151)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 1152)	Occurs when a control receives the input focus.
	OnExit (see page 1154)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 1158)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 1162)	Occurs when a key is pressed.
	OnKeyUp (see page 1163)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 1165)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 1166)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 1168)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 1168)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 1168)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 1171)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 1173)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 1173)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

29.1.3.3.1 TMaskEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

Change

Text

29.1.3.3.2 TMaskEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
```

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);

OnClick

Responding to User Actions at Runtime

29.1.3.3.4 TMaskEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
```

```
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*

29.1.3.3.5 TMaskEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*

29.1.3.3.7 TMaskEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

DragKind

29.1.3.3.8 TMaskEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
```

```
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/

```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
```

```
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,

Using a Single Navigator for Multiple Datasets

29.1.3.3.9 TMaskEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK

button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/

ActiveControl

29.1.3.3.10 TMaskEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys

that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/

OnKeyPress

OnKeyUp

29.1.3.3.11 TMaskEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
```

```
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}

OnKeyPress

29.1.3.3.13 TMaskEdit.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

29.1.3.3.14 TMaskEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
```

```
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

29.1.3.3.15 TMaskEdit.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

29.1.3.3.16 TMaskEdit.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

29.1.3.3.17 TMaskEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

29.1.3.3.19 TMaskEdit.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

29.1.3.3.20 TMaskEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

29.2 Types

The following table lists types in this documentation.

Types

Name	Description
TMaskedState (see page 1175)	TMaskedState is a set of flags that describe the current state of a masked edit control.

29.2.1 Mask.TMaskedState Type

TMaskedState is a set of flags that describe the current state of a masked edit control.

Pascal

```
TMaskedState = set of (msMasked, msReEnter, msDBSetText);
```

C++

```
(msMasked, msReEnter, msDBSetText) TMaskedState;
```

File

Mask

Description

The following table indicates the meaning of the various TMaskedState flags:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

30 Masks Namespace

This is namespace Masks.

Topics

Name	Description
Classes (see page 1178)	The following table lists classes in this documentation.
Functions (see page 1182)	The following table lists functions in this documentation.

Classes

	Name	Description
	EMaskException (see page 1178)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 1178)	TMask allows the comparison of strings containing wildcards to a file mask.

Functions

	Name	Description
	MatchesMask (see page 1182)	Indicates whether a file name conforms to the format specified by a filter string.

30.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMaskException (see page 1178)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 1178)	TMask allows the comparison of strings containing wildcards to a file mask.

30.1.1 EMaskException Class

EMaskException is the exception class for errors that occur when comparing a file name to a mask.

Class Hierarchy

Pascal

```
EMaskException = class(Exception);
```

C++

```
class EMaskException : public Exception;
```

File

Masks

Description

EMaskException is raised when the TMask (see page 1178) object or the global MatchesMask (see page 1182) function encounters an improperly formed mask string.

See Also

TMask (see page 1178)

MatchesMask (see page 1182)

30.1.2 TMask Class

TMask allows the comparison of strings containing wildcards to a file mask.

Class Hierarchy

Pascal

```
TMask = class;
```

C++

```
class TMask;
```

File

Masks

Description

Use TMask to determine if a string matches the format described by a mask. The mask contains literal characters, wildcards that can match any character, and sets that match a single character that is included in the set.

Note: Do not confuse TMask with the EditMask of a field or masked edit object. While both are used for comparing strings to a symbolic description of valid values, the special mask symbols and matching rules are completely different.

TField

30.1.2.1 TMask Members

The following tables list the members exposed by TMask.

Public Methods

	Name	Description
	Create (see page 1179)	Creates an instance of TMask (see page 1178) for a given mask.
	Destroy (see page 1180)	Destroys an instance of TMask (see page 1178).
	Matches (see page 1180)	Indicates whether a specified string matches the mask.

30.1.2.2 TMask.Create Constructor

Creates an instance of TMask (see page 1178) for a given mask.

Pascal

```
constructor Create(const MaskValue: string);
```

C++

```
__fastcall TMask(const UnicodeString MaskValue);
```

Description

Call Create to create a mask object for comparing strings to the mask given by the MaskValue parameter. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a

single arbitrary character.

See Also

Matches (see page 1180)

30.1.2.3 TMask.Destroy Destructor

Destroys an instance of TMask (see page 1178).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMask();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TMask (see page 1178) reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store a parsed image of the mask.

See Also

System::TObject::Free

30.1.2.4 TMask Methods

The methods of the TMask class are listed here.

Public Methods

	Name	Description
	Matches (see page 1180)	Indicates whether a specified string matches the mask.

30.1.2.4.1 TMask.Matches Method

Indicates whether a specified string matches the mask.

Pascal

```
function Matches(const Filename: string): Boolean;
```

C++

```
__fastcall Boolean Matches(const UnicodeString Filename);
```

Description

Call Matches to compare the Filename parameter to the mask that describes valid values. Matches returns true if the string matches the mask. Matches returns false if the string does not match the mask. Matches raises an exception if the mask is syntactically invalid.

The mask is set when the TMask (see page 1178) object is created.

Note: Filename parameter does not need to be a file name. TMask (see page 1178) can be used to check strings against any syntactically correct mask.

See Also

Create (see page 1179)

30.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	MatchesMask (see page 1182)	Indicates whether a file name conforms to the format specified by a filter string.

30.2.1 Masks.MatchesMask Function

Indicates whether a file name conforms to the format specified by a filter string.

Pascal

```
function MatchesMask(const Filename: string; const Mask: string): Boolean;
```

C++

```
Boolean MatchesMask(const UnicodeString Filename, const UnicodeString Mask);
```

File

Masks

Description

Call MatchesMask to check the Filename parameter using the Mask (see page 1079) parameter to describe valid values. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a single arbitrary character.

MatchesMask returns true if the string matches the mask. MatchesMask returns false if the string does not match the mask. MatchesMask raises an exception if the mask is syntactically invalid.

Note: The Filename parameter does not need to be a file name. MatchesMask can be used to check strings against any syntactically correct mask.

	PadInputLiterals (see page 1191)	PadInputLiterals is used internally.

31.1.1 MaskUtils.FormatMaskText Function

Returns a string formatted using an edit mask.

Pascal

```
function FormatMaskText(const EditMask: string; const Value: string): string;
```

C++

```
UnicodeString FormatMaskText(const UnicodeString EditMask, const UnicodeString Value);
```

File

MaskUtils

Description

Call FormatMaskText to apply the mask specified by the EditMask parameter to the text string specified by the Value parameter. The edit mask string consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of the mask are matched to characters in the Value parameter or are inserted into the Value string. The third part of the mask is the character used to represent missing characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the returned string as leading blanks. If a ! character is not present, optional characters are represented in the returned string as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.

<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case present in the Value parameter.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.
C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel, that character is substituted in the returned string.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel, that character is substituted in the returned string.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the returned string.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters are inserted automatically if the second field of the mask is 0, or matched to characters in the Value parameter if the second field is any other value. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask are included in the Value parameter. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Value parameter should consist of the 10 digits of the phone number, rather than the 14 characters that make up the final formatted string.

A 0 in the second field indicates that literals are inserted into the Value string, any other character indicates that they should be included. The character to indicate whether literals should be included can be changed by changing the MaskNoSave (see page 1197) constant that is declared in the MaskUtils (see page 1183) unit.

The third field of the mask is the character that appears in the returned string for blanks (characters that do not appear in Value). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in the returned string.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify double-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be doubled as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

31.1.2 MaskUtils.IsLiteralChar Function

IsLiteralChar is used internally.

Pascal

```
function IsLiteralChar(const EditMask: string; Offset: Integer): Boolean;
```

C++

```
Boolean IsLiteralChar(const UnicodeString EditMask, int Offset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call IsLiteralChar directly.

See Also

FormatMaskText (see page 1185)

31.1.3 MaskUtils.MaskDoFormatText Function

MaskDoFormatText is used internally.

Pascal

```
function MaskDoFormatText(const EditMask: string; const Value: string; Blank: Char): string;
```

C++

```
UnicodeString MaskDoFormatText(const UnicodeString EditMask, const UnicodeString Value, Char
Blank);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskDoFormatText directly.

See Also

FormatMaskText (see page 1185)

31.1.4 MaskUtils.MaskGetCharType Function

MaskGetCharType is used internally.

Pascal

```
function MaskGetCharType(const EditMask: string; MaskOffset: Integer): TMaskCharType;
```

C++

```
TMaskCharType MaskGetCharType(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskGetCharType directly.

See Also

FormatMaskText (see page 1185)

31.1.5 MaskUtils.MaskGetCurrentDirectives Function

MaskGetCurrentDirectives is used internally.

Pascal

```
function MaskGetCurrentDirectives(const EditMask: string; MaskOffset: Integer):
TMaskDirectives;
```

C++

```
TMaskDirectives MaskGetCurrentDirectives(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskGetCurrentDirectives directly.

See Also

FormatMaskText (see page 1185)

31.1.6 MaskUtils.MaskGetFldSeparator Function

MaskGetFldSeparator is used internally.

Pascal

```
function MaskGetFldSeparator(const EditMask: string): Integer;
```

C++

```
int MaskGetFldSeparator(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskGetFldSeparator directly.

See Also

FormatMaskText (see page 1185)

31.1.7 MaskUtils.MaskGetMaskBlank Function

MaskGetMaskBlank is used internally.

Pascal

```
function MaskGetMaskBlank(const EditMask: string): Char;
```

C++

```
Char MaskGetMaskBlank(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskGetMaskBlank directly.

See Also

FormatMaskText (see page 1185)

31.1.8 MaskUtils.MaskGetMaskSave Function

MaskGetMaskSave is used internally.

Pascal

```
function MaskGetMaskSave(const EditMask: string): Boolean;
```

C++

```
Boolean MaskGetMaskSave(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskGetMaskSave directly.

See Also

FormatMaskText (see page 1185)

31.1.9 MaskUtils.MaskIntlLiteralToChar Function

MaskIntlLiteralToChar is used internally.

Pascal

```
function MaskIntlLiteralToChar(IChar: Char): Char;
```

C++

```
Char MaskIntlLiteralToChar(Char IChar);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskIntlLiteralToChar directly.

See Also

FormatMaskText (see page 1185)

31.1.10 MaskUtils.MaskOffsetToOffset Function

MaskOffsetToOffset is used internally.

Pascal

```
function MaskOffsetToOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToOffset(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskOffsetToOffset directly.

See Also

FormatMaskText (see page 1185)

31.1.11 MaskUtils.MaskOffsetToWideOffset Function

MaskOffsetToWideOffset is used internally.

Pascal

```
function MaskOffsetToWideOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToWideOffset(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call MaskOffsetToWideOffset directly.

See Also

FormatMaskText (see page 1185)

31.1.12 MaskUtils.OffsetToMaskOffset Function

OffsetToMaskOffset is used internally.

Pascal

```
function OffsetToMaskOffset(const EditMask: string; Offset: Integer): Integer;
```

C++

```
int OffsetToMaskOffset(const UnicodeString EditMask, int Offset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call OffsetToMaskOffset directly.

See Also

FormatMaskText (see page 1185)

31.1.13 MaskUtils.PadInputLiterals Function

PadInputLiterals is used internally.

Pascal

```
function PadInputLiterals(const EditMask: String; const Value: string; Blank: Char): string;
```

C++

```
UnicodeString PadInputLiterals(const UnicodeString EditMask, const UnicodeString Value, Char
Blank);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 1185). Do not call PadInputLiterals directly.

See Also

FormatMaskText (see page 1185)

31.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMaskCharType (see page 1192)	TMaskCharType is used internally.

31.2.1 MaskUtils.TMaskCharType Enumeration

TMaskCharType is used internally.

Pascal

```
TMaskCharType = (
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
);
```

C++

```
enum TMaskCharType {
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
};
```

File

MaskUtils

Description

This record is used internally by FormatMaskText (see page 1185). Do not use TMaskCharType directly.

See Also

FormatMaskText (see page 1185)

31.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEditMask (see page 1193)	Represents the mask that validates and formats user input.
TMaskDirectives (see page 1194)	TMaskDirectives is used internally.
TMaskedText (see page 1195)	TMaskedText is the type for the text that is typed into a masked edit control.

31.3.1 MaskUtils.TEditMask Type

Represents the mask that validates and formats user input.

Pascal

```
TEditMask = type string;
```

C++

```
type string TEditMask;
```

File

MaskUtils

Description

TEditMask is a string that consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of a mask are saved as part of the data. The third part of the mask is the character used to represent unentered characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the text as leading blanks. If a ! character is not present, optional characters are represented in the text as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.
<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case the user uses to enter the data.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal in the data.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.

C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the text. When the user enters characters in the field, the cursor skips the _ character.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters must be matched exactly in the edit control. They are inserted automatically, and the cursor skips over them during editing. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask should be included as part of the text for the edit control. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Text property for the edit control would consist of the 10 digits that were entered, rather than the 14 characters that make up the telephone number as it appears in the edit control.

A 0 in the second field indicates that literals should not be included, any other character indicates that they should be included. The character that indicates whether literals should be included can be changed in the Edit Mask (see page 1079) property editor, or programmatically by changing the MaskNoSave (see page 1197) typed constant.

The third field of the mask is the character that appears in the edit control for blanks (characters that have not been entered). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in an edit window. However, when a user edits the text in a masked edit control, the cursor selects each blank character in turn, and skips over the space character.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify multi-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be duplicated as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

31.3.2 MaskUtils.TMaskDirectives Type

TMaskDirectives is used internally.

Pascal

```
TMaskDirectives = set of (mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar);
```

C++

```
(mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar) TMaskDirectives;
```

File

MaskUtils

Description

This record is used internally by FormatMaskText (see page 1185). Do not use TMaskDirectives directly.

See Also

FormatMaskText (see page 1185)

31.3.3 MaskUtils.TMaskedText Type

TMaskedText is the type for the text that is typed into a masked edit control.

Pascal

```
TMaskedText = type string;
```

C++

```
type string TMaskedText;
```

File

MaskUtils

Description

TMaskedText is the value of a masked edit control's text before the mask is applied.

31.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefaultBlank (see page 1196)	DefaultBlank is used internally.
MaskFieldSeparator (see page 1196)	MaskFieldSeparator is used internally.
MaskNoSave (see page 1197)	MaskNoSave is used internally.

31.4.1 MaskUtils.DefaultBlank Variable

DefaultBlank is used internally.

Pascal

```
DefaultBlank: Char = '_';
```

C++

```
Char DefaultBlank = '_';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 1185). Do not use DefaultBlank directly.

See Also

FormatMaskText (see page 1185)

31.4.2 MaskUtils.MaskFieldSeparator Variable

MaskFieldSeparator is used internally.

Pascal

```
MaskFieldSeparator: Char = ';';
```

C++

```
Char MaskFieldSeparator = ';';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 1185). Do not use MaskFieldSeparator directly.

See Also

FormatMaskText (see page 1185)

31.4.3 MaskUtils.MaskNoSave Variable

MaskNoSave is used internally.

Pascal

```
MaskNoSave: Char = '0';
```

C++

```
Char MaskNoSave = '0';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 1185). Do not use MaskNoSave directly.

See Also

FormatMaskText (see page 1185)

31.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
mDirLiteral (see page 1198)	mDirLiteral is used internally.
mDirLowerCase (see page 1198)	mDirLowerCase is used internally.
mDirReverse (see page 1199)	mDirReverse is used internally.
mDirUpperCase (see page 1199)	mDirUpperCase is used internally.
mMskAlpha (see page 1200)	mMskAlpha is used internally.
mMskAlphaNum (see page 1200)	mMskAlphaNum is used internally.
mMskAlphaNumOpt (see page 1200)	mMskAlphaNumOpt is used internally.
mMskAlphaOpt (see page 1201)	mMskAlphaOpt is used internally.
mMskAscii (see page 1201)	mMskAscii is used internally.
mMskAsciiOpt (see page 1202)	mMskAsciiOpt is used internally.
mMskDateSeparator (see page 1202)	mMskDateSeparator is used internally.
mMskNumeric (see page 1202)	mMskNumeric is used internally.
mMskNumericOpt (see page 1203)	mMskNumericOpt is used internally.
mMskNumSymOpt (see page 1203)	mMskNumSymOpt is used internally.
mMskTimeSeparator (see page 1204)	mMskTimeSeparator is used internally.

31.5.1 MaskUtils.mDirLiteral Constant

mDirLiteral is used internally.

Pascal

```
mDirLiteral = '\';
```

C++

```
mDirLiteral = '\';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mDirLiteral directly.

See Also

FormatMaskText (see page 1185)

31.5.2 MaskUtils.mDirLowerCase Constant

mDirLowerCase is used internally.

Pascal

```
mDirLowerCase = '<';
```

C++

```
mDirLowerCase = '<';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mDirLowerCase directly.

See Also

FormatMaskText (see page 1185)

31.5.3 MaskUtils.mDirReverse Constant

mDirReverse is used internally.

Pascal

```
mDirReverse = '!';
```

C++

```
mDirReverse = '!';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mDirReverse directly.

See Also

FormatMaskText (see page 1185)

31.5.4 MaskUtils.mDirUpperCase Constant

mDirUpperCase is used internally.

Pascal

```
mDirUpperCase = '>';
```

C++

```
mDirUpperCase = '>';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mDirUpperCase directly.

See Also

FormatMaskText (see page 1185)

31.5.5 MaskUtils.mMskAlpha Constant

mMskAlpha is used internally.

Pascal

```
mMskAlpha = 'L';
```

C++

```
mMskAlpha = 'L';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAlpha directly.

See Also

FormatMaskText (see page 1185)

31.5.6 MaskUtils.mMskAlphaNum Constant

mMskAlphaNum is used internally.

Pascal

```
mMskAlphaNum = 'A';
```

C++

```
mMskAlphaNum = 'A';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAlphaNum directly.

See Also

FormatMaskText (see page 1185)

31.5.7 MaskUtils.mMskAlphaNumOpt Constant

mMskAlphaNumOpt is used internally.

Pascal

```
mMskAlphaNumOpt = 'a';
```

C++

```
mMskAlphaNumOpt = 'a';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAlphaNumOpt directly.

See Also

FormatMaskText (see page 1185)

31.5.8 MaskUtils.mMskAlphaOpt Constant

mMskAlphaOpt is used internally.

Pascal

```
mMskAlphaOpt = 'l';
```

C++

```
mMskAlphaOpt = 'l';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAlphaOpt directly.

See Also

FormatMaskText (see page 1185)

31.5.9 MaskUtils.mMskAscii Constant

mMskAscii is used internally.

Pascal

```
mMskAscii = 'C';
```

C++

```
mMskAscii = 'C';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAscii directly.

See Also

FormatMaskText (see page 1185)

31.5.10 MaskUtils.mMskAsciiOpt Constant

mMskAsciiOpt is used internally.

Pascal

```
mMskAsciiOpt = 'c';
```

C++

```
mMskAsciiOpt = 'c';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskAsciiOpt directly.

See Also

FormatMaskText (see page 1185)

31.5.11 MaskUtils.mMskDateSeparator Constant

mMskDateSeparator is used internally.

Pascal

```
mMskDateSeparator = '/';
```

C++

```
mMskDateSeparator = '/';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskDateSeparator directly.

See Also

FormatMaskText (see page 1185)

31.5.12 MaskUtils.mMskNumeric Constant

mMskNumeric is used internally.

Pascal

```
mMskNumeric = '0';
```

C++

```
mMskNumeric = '0';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskNumeric directly.

See Also

FormatMaskText (see page 1185)

31.5.13 MaskUtils.mMskNumericOpt Constant

mMskNumericOpt is used internally.

Pascal

```
mMskNumericOpt = '9';
```

C++

```
mMskNumericOpt = '9';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskNumericOpt directly.

See Also

FormatMaskText (see page 1185)

31.5.14 MaskUtils.mMskNumSymOpt Constant

mMskNumSymOpt is used internally.

Pascal

```
mMskNumSymOpt = '#';
```

C++

```
mMskNumSymOpt = '#';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskNumSymOpt directly.

See Also

FormatMaskText (see page 1185)

31.5.15 MaskUtils.mMskTimeSeparator Constant

mMskTimeSeparator is used internally.

Pascal

```
mMskTimeSeparator = ':';
```

C++

```
mMskTimeSeparator = ':';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 1185). Do not use mMskTimeSeparator directly.

See Also

FormatMaskText (see page 1185)

32 Math Namespace

This is namespace Math.

Topics

Name	Description
Classes (see page 1209)	The following table lists classes in this documentation.
Functions (see page 1211)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 1263)	The following table lists structs, records, enums in this documentation.
Types (see page 1267)	The following table lists types in this documentation.
Constants (see page 1270)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 1209)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Constants

Name	Description
Infinity (see page 1270)	Infinity represents positive infinity.
MaxComp (see page 1271)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 1271)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 1271)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 1272)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 1272)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 1273)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 1273)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 1273)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 1274)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 1274)	NegativeValue defines a negative number result from using Sign (see page 1255).
NegInfinity (see page 1275)	NegInfinity represents negative infinity.
PositiveValue (see page 1275)	PositiveValue defines a positive number result from using Sign (see page 1255).
ZeroValue (see page 1276)	ZeroValue defines a zero value number result from using Sign (see page 1255).

Functions

	Name	Description
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 1214)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 1214)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 1215)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 1215)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 1216)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 1216)	Calculates the inverse secant of a given number.
	ArcSecH (see page 1216)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSinh (see page 1217)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 1218)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 1218)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 1219)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 1219)	Clears exception bits in FPU status word.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	Cosecant (see page 1220)	Returns the cosecant of an angle.
	Cosh (see page 1221)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 1221)	Calculates the cotangent of an angle.
	Cotan (see page 1222)	Calculates the cotangent of an angle.
	CotH (see page 1222)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 1223)	Returns the cosecant of an angle.
	CscH (see page 1223)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 1224)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 1224)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 1224)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 1225)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 1225)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 1226)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 1226)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 1226)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	Floor (see page 1227)	Rounds variables toward negative infinity.
	Frexp (see page 1228)	Separates the Mantissa and Exponent of X
	FutureValue (see page 1228)	Calculates the future value of an investment.
	GetExceptionMask (see page 1229)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 1229)	Returns the FPU precision control mode.
	GetRoundMode (see page 1230)	Returns the FPU rounding mode.
	GradToCycle (see page 1231)	Converts grad measurements to cycles.
	GradToDeg (see page 1231)	Converts grad measurements to degrees.
	GradToRad (see page 1231)	Converts grad measurements to radians.
	Hypot (see page 1232)	Calculates the length of the hypotenuse.

	IfThen (see page 1232)	Conditionally returns one of two specified values.
	IfThen (see page 1232)	Conditionally returns one of two specified values.
	IfThen (see page 1232)	Conditionally returns one of two specified values.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 1233)	Calculates the interest portion of a loan payment.
	InterestRate (see page 1234)	Returns the interest rate required to increase PresentValue (see page 1247) to FutureValue (see page 1228).
	InternalRateOfReturn (see page 1234)	Calculates the internal rate of return for an investment.
	IntPower (see page 1235)	Calculates the integral power of a base value.
	IsInfinite (see page 1235)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 1237)	Calculates X times (2 to the power of P).
	LnXP1 (see page 1237)	Returns the natural log of (X+1)
	Log10 (see page 1237)	Calculates log base 10.
	Log2 (see page 1238)	Calculates log base 2.
	LogN (see page 1238)	Calculates the log of X for a specified base.
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 1239)	Returns the largest signed value in an integer array.
	MaxValue (see page 1240)	Returns the largest signed value in an array.
	Mean (see page 1240)	Returns the average of all values in an array.
	MeanAndStdDev (see page 1241)	Calculates the mean and standard deviation of array elements.
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 1242)	Returns the smallest signed value in an integer array.
	MinValue (see page 1242)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 1243)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 1243)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 1244)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 1244)	Returns the number of payment periods for an investment.
	Payment (see page 1245)	Calculates a fully amortized payment.
	PeriodPayment (see page 1245)	Returns the principal amount from a full payment.
	Poly (see page 1245)	Evaluates a uniform polynomial of one variable at the value X.
	PopnStdDev (see page 1246)	Calculates the population standard deviation.
	PopnVariance (see page 1246)	Calculates the population variance.
	Power (see page 1247)	Raises Base to any power.
	Power (see page 1247)	Raises Base to any power.
	Power (see page 1247)	Raises Base to any power.
	PresentValue (see page 1247)	Calculates the present value of an investment.
	RadToCycle (see page 1248)	Converts radians to cycles.

	RadToDeg (see page 1248)	Converts radians to degrees.
	RadToGrad (see page 1248)	Converts radians to grads.
	RandG (see page 1249)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomRange (see page 1250)	Returns a random integer from a specified range.
	RoundTo (see page 1250)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 1252)	Calculates the secant of an angle.
	Secant (see page 1252)	Calculates the secant of an angle.
	SecH (see page 1253)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 1253)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 1254)	Sets the FPU precision control mode.
	SetRoundMode (see page 1254)	Sets the FPU rounding mode.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 1255)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 1256)	Returns sine and cosine of an angle.
	Sinh (see page 1256)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 1257)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 1257)	Returns the sample standard deviation for elements in an array.
	Sum (see page 1258)	Returns the sum of the elements in an array.
	SumInt (see page 1258)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 1259)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 1259)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 1260)	Calculates depreciation for an asset.
	Tan (see page 1260)	Returns the tangent of X.
	Tanh (see page 1261)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 1261)	Returns the statistical variance from an array of values.
	Variance (see page 1262)	Calculates statistical sample variance from an array of data.

Structs, Records, Enums

	Name	Description
	TFPUException (see page 1263)	TFPUException defines TFPUExceptionMask (see page 1267) values.
	TFPUPrecisionMode (see page 1264)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 1265)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 1266)	TPaymentTime is an enumerated type used as a parameter in financial functions.

Types

Name	Description
TFPUExceptionMask (see page 1267)	TFPUExceptionMask defines a set of TFPUException (see page 1263) values.
TRoundToEXRangeExtended (see page 1268)	This is type Math.TRoundToEXRangeExtended.
TRoundToRange (see page 1268)	TRoundToRange defines the RoundTo (see page 1250) rounding limits.
TValueSign (see page 1268)	TValueSign defines the Sign (see page 1255) returned value.

32.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 1209)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

32.1.1 EInvalidArgument Class

EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Class Hierarchy

Pascal

```
EInvalidArgument = class(EMathError);
```

C++

```
class EInvalidArgument : public EMathError;
```

File

Math

Description

EInvalidArgument is raised by some functions in the Math (see page 1205) unit (mostly financial functions) when one of the parameters is out of range or makes the calculation impossible.

Note: On Windows, because EInvalidArgument descends (indirectly) from EExternal, it saves the Windows exception record (if there is one) in its ExceptionRecord data structure.

EUnderflow

EZeroDivide

32.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCos (see page 1213)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 1214)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 1214)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 1215)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 1215)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 1216)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 1216)	Calculates the inverse secant of a given number.
	ArcSecH (see page 1216)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSin (see page 1217)	Calculates the inverse sine of a given number.
	ArcSinh (see page 1217)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 1218)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 1218)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 1219)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 1219)	Clears exception bits in FPU status word.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	CompareValue (see page 1220)	Returns the relationship between two numeric values.
	Cosecant (see page 1220)	Returns the cosecant of an angle.
	Cosh (see page 1221)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 1221)	Calculates the cotangent of an angle.
	Cotan (see page 1222)	Calculates the cotangent of an angle.
	CotH (see page 1222)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 1223)	Returns the cosecant of an angle.
	CscH (see page 1223)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 1224)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 1224)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 1224)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 1225)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 1225)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 1226)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 1226)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 1226)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 1227)	Returns the closest value to a specified value within a specified range.
	Floor (see page 1227)	Rounds variables toward negative infinity.
	Frexp (see page 1228)	Separates the Mantissa and Exponent of X
	FutureValue (see page 1228)	Calculates the future value of an investment.

	GetExceptionMask (see page 1229)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 1229)	Returns the FPU precision control mode.
	GetRoundMode (see page 1230)	Returns the FPU rounding mode.
	GradToCycle (see page 1231)	Converts grad measurements to cycles.
	GradToDeg (see page 1231)	Converts grad measurements to degrees.
	GradToRad (see page 1231)	Converts grad measurements to radians.
	Hypot (see page 1232)	Calculates the length of the hypotenuse.
	IfThen (see page 1232)	Conditionally returns one of two specified values.
	IfThen (see page 1232)	Conditionally returns one of two specified values.
	IfThen (see page 1232)	Conditionally returns one of two specified values.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InRange (see page 1232)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 1233)	Calculates the interest portion of a loan payment.
	InterestRate (see page 1234)	Returns the interest rate required to increase PresentValue (see page 1247) to FutureValue (see page 1228).
	InternalRateOfReturn (see page 1234)	Calculates the internal rate of return for an investment.
	IntPower (see page 1235)	Calculates the integral power of a base value.
	IsInfinite (see page 1235)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 1236)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 1236)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 1237)	Calculates X times (2 to the power of P).
	LnXP1 (see page 1237)	Returns the natural log of (X+1)
	Log10 (see page 1237)	Calculates log base 10.
	Log2 (see page 1238)	Calculates log base 2.
	LogN (see page 1238)	Calculates the log of X for a specified base.
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	Max (see page 1239)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 1239)	Returns the largest signed value in an integer array.
	MaxValue (see page 1240)	Returns the largest signed value in an array.
	Mean (see page 1240)	Returns the average of all values in an array.
	MeanAndStdDev (see page 1241)	Calculates the mean and standard deviation of array elements.
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 1241)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 1242)	Returns the smallest signed value in an integer array.
	MinValue (see page 1242)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 1243)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 1243)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 1244)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 1244)	Returns the number of payment periods for an investment.
	Payment (see page 1245)	Calculates a fully amortized payment.
	PeriodPayment (see page 1245)	Returns the principal amount from a full payment.
	Poly (see page 1245)	Evaluates a uniform polynomial of one variable at the value X.

	PopnStdDev (see page 1246)	Calculates the population standard deviation.
	PopnVariance (see page 1246)	Calculates the population variance.
	Power (see page 1247)	Raises Base to any power.
	Power (see page 1247)	Raises Base to any power.
	Power (see page 1247)	Raises Base to any power.
	PresentValue (see page 1247)	Calculates the present value of an investment.
	RadToCycle (see page 1248)	Converts radians to cycles.
	RadToDeg (see page 1248)	Converts radians to degrees.
	RadToGrad (see page 1248)	Converts radians to grads.
	RandG (see page 1249)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomFrom (see page 1249)	Returns a randomly selected element from an array.
	RandomRange (see page 1250)	Returns a random integer from a specified range.
	RoundTo (see page 1250)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 1251)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 1252)	Calculates the secant of an angle.
	Secant (see page 1252)	Calculates the secant of an angle.
	SecH (see page 1253)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 1253)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 1254)	Sets the FPU precision control mode.
	SetRoundMode (see page 1254)	Sets the FPU rounding mode.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 1255)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 1255)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 1256)	Returns sine and cosine of an angle.
	Sinh (see page 1256)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 1257)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 1257)	Returns the sample standard deviation for elements in an array.
	Sum (see page 1258)	Returns the sum of the elements in an array.
	SumInt (see page 1258)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 1259)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 1259)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 1260)	Calculates depreciation for an asset.
	Tan (see page 1260)	Returns the tangent of X.
	Tanh (see page 1261)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 1261)	Returns the statistical variance from an array of values.
	Variance (see page 1262)	Calculates statistical sample variance from an array of data.

32.2.1 Math.ArcCos Function

Calculates the inverse cosine of a given number.

Pascal

```
function ArcCos(const X: Extended): Extended; overload;
function ArcCos(const X: Double): Double; overload;
function ArcCos(const X: Single): Single; overload;
```

C++

```
Extended ArcCos(const Extended X);
Double ArcCos(const Double X);
Single ArcCos(const Single X);
```

File

Math

Description

ArcCos returns the inverse cosine of X.

X must be between -1 and 1.

The return value is in the range [0..Pi], in radians.

See Also

Cos

ArcCosh (see page 1214)

ArcSin (see page 1217)

32.2.2 Math.ArcCosh Function

Calculates the inverse hyperbolic cosine of a given number.

Pascal

```
function ArcCosh(const X: Extended): Extended;
```

C++

```
Extended ArcCosh(const Extended X);
```

File

Math

Description

ArcCosh returns the inverse hyperbolic cosine of X. The value of X must be greater than or equal to 1.

See Also

Cosh (see page 1221)

ArcCos (see page 1213)

32.2.3 Math.ArcCot Function

Calculates the inverse cotangent of a given number.

Pascal

```
function ArcCot(const X: Extended): Extended;
```

C++

```
Extended ArcCot(const Extended X);
```

File

Math

Description

ArcCot returns the inverse cotangent of X.

See Also

Cot (see page 1221)

ArcCotH (see page 1215)

32.2.4 Math.ArcCotH Function

Calculates the inverse hyperbolic cotangent of a given number.

Pascal

```
function ArcCotH(const X: Extended): Extended;
```

C++

```
Extended ArcCotH(const Extended X);
```

File

Math

Description

ArcCot (see page 1214) returns the inverse hyperbolic cotangent of X.

See Also

Cot (see page 1221)

32.2.5 Math.ArcCsc Function

Calculates the inverse cosecant of a given number.

Pascal

```
function ArcCsc(const X: Extended): Extended;
```

C++

```
Extended ArcCsc(const Extended X);
```

File

Math

Description

ArcCsc returns the inverse cosecant of X.

See Also

Csc (see page 1223)

ArcCscH (see page 1216)

32.2.6 Math.ArcCscH Function

Calculates the inverse hyperbolic cosecant of a given number.

Pascal

```
function ArcCscH(const X: Extended): Extended;
```

C++

```
Extended ArcCscH(const Extended X);
```

File

Math

Description

ArcCsc (see page 1215) returns the inverse hyperbolic cosecant of X.

See Also

Csc (see page 1223)

CscH (see page 1223)

32.2.7 Math.ArcSec Function

Calculates the inverse secant of a given number.

Pascal

```
function ArcSec(const X: Extended): Extended;
```

C++

```
Extended ArcSec(const Extended X);
```

File

Math

Description

ArcSec returns the inverse secant of X.

See Also

Sec (see page 1252)

ArcSecH (see page 1216)

32.2.8 Math.ArcSecH Function

Calculates the inverse hyperbolic secant of a given number.

Pascal

```
function ArcSecH(const X: Extended): Extended;
```

C++

```
Extended ArcSecH(const Extended X);
```

File

Math

Description

ArcSec (see page 1216) returns the inverse hyperbolic secant of X.

See Also

Sec (see page 1252)

SecH (see page 1253)

32.2.9 Math.ArcSin Function

Calculates the inverse sine of a given number.

Pascal

```
function ArcSin(const X: Extended): Extended; overload;
function ArcSin(const X: Double): Double; overload;
function ArcSin(const X: Single): Single; overload;
```

C++

```
Extended ArcSin(const Extended X);
Double ArcSin(const Double X);
Single ArcSin(const Single X);
```

File

Math

Description

ArcSin returns the inverse sine of X. X must be between -1 and 1. The return value will be in the range [-Pi/2..Pi/2], in radians.

See Also

Sin

ArcSinh (see page 1217)

ArcCos (see page 1213)

32.2.10 Math.ArcSinh Function

Calculates the inverse hyperbolic sine of a given number.

Pascal

```
function ArcSinh(const X: Extended): Extended;
```

C++

```
Extended ArcSinh(const Extended X);
```

File

Math

Description

ArcSinh returns the inverse hyperbolic sine of X.

See Also

Sinh (see page 1256)

32.2.11 Math.ArcTan2 Function

Calculates the arctangent angle and quadrant of a given number.

Pascal

```
function ArcTan2(const Y: Extended; const X: Extended): Extended;
```

C++

```
Extended ArcTan2(const Extended Y, const Extended X);
```

File

Math

Description

ArcTan2 calculates ArcTan(Y/X), and returns an angle in the correct quadrant. The values of X and Y must be between –2^64 and 2^64. In addition, the value of X can't be 0. The return value will fall in the range from -Pi to Pi radians.

32.2.12 Math.ArcTanh Function

Calculates the inverse hyperbolic tangent of a given number.

Pascal

```
function ArcTanh(const X: Extended): Extended;
```

C++

```
Extended ArcTanh(const Extended X);
```

File

Math

Description

ArcTanh returns the inverse hyperbolic tangent of X. The value of X must be between -1 and 1 (inclusive).

See Also

Tanh (see page 1261)

32.2.13 Math.Ceil Function

Rounds variables up toward positive infinity.

Pascal

```
function Ceil(const X: Extended): Integer;
```

C++

```
int Ceil(const Extended X);
```

File

Math

Description

Call Ceil to obtain the lowest integer greater than or equal to X. The absolute value of X must be less than MaxInt. For example:

Ceil(-2.8) = -2

Ceil(2.8) = 3

Ceil(-1.0) = -1

See Also

Trunc

Floor (see page 1227)

32.2.14 Math.ClearExceptions Function

Clears exception bits in FPU status word.

Pascal

```
procedure ClearExceptions(RaisePending: Boolean = True);
```

C++

```
ClearExceptions(Boolean RaisePending = True);
```

File

Math

Description

ClearExceptions clears the exception bits in the FPU status word. If RaisePending is true, any pending floating point exceptions cause an error to be raised.

See Also

GetExceptionMask (see page 1229)

SetExceptionMask (see page 1253)

Set8087CW

32.2.15 Math.CompareValue Function

Returns the relationship between two numeric values.

Pascal

```
function CompareValue(const A: Extended; const B: Extended; Epsilon: Extended = 0):
TValueRelationship; overload;
function CompareValue(const A: Double; const B: Double; Epsilon: Double = 0):
TValueRelationship; overload;
function CompareValue(const A: Single; const B: Single; Epsilon: Single = 0):
TValueRelationship; overload;
function CompareValue(const A: Integer; const B: Integer): TValueRelationship; overload;
function CompareValue(const A: Int64; const B: Int64): TValueRelationship; overload;
```

C++

```
TValueRelationship CompareValue(const Extended A, const Extended B, Extended Epsilon = 0);
TValueRelationship CompareValue(const Double A, const Double B, Double Epsilon = 0);
TValueRelationship CompareValue(const Single A, const Single B, Single Epsilon = 0);
TValueRelationship CompareValue(const int A, const int B);
TValueRelationship CompareValue(const Int64 A, const Int64 B);
```

File

Math

Description

Call CompareValue to determine the relationship between two numeric values. When comparing floating-point values, CompareValue lets you specify a maximum difference to use when comparing values, so that they are considered the same if they are within that amount.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

CompareValue returns

LessThanValue if A is less than B (by more than Epsilon if A and B are floating-point numbers).

EqualsValue if A is equivalent to B (the same, or within Epsilon if A and B are floating-point numbers).

GreaterThanValue if A is larger than B (by more than Epsilon if A and B are floating-point numbers).

See Also

SameValue (see page 1251)

VarCompareValue

32.2.16 Math.Cosecant Function

Returns the cosecant of an angle.

Pascal

```
function Cosecant(const X: Extended): Extended;
```

C++

```
Extended Cosecant(const Extended X);
```

File

Math

Description

Use the Cosecant to calculate the cosecant of X, where X is an angle in radians. The cosecant is calculated as 1/ Sin(X).

See Also

ArcCsc (see page 1215)

CscH (see page 1223)

Secant (see page 1252)

Sin

32.2.17 Math.Cosh Function

Calculates the hyperbolic cosine of an angle.

Pascal

```
function Cosh(const X: Extended): Extended;
```

C++

```
Extended Cosh(const Extended X);
```

File

Math

Description

Use the Cosh to calculate the hyperbolic cosine of X.

See Also

Cos

ArcCosh (see page 1214)

Sinh (see page 1256)

32.2.18 Math.Cot Function

Calculates the cotangent of an angle.

Pascal

```
function Cot(const X: Extended): Extended;
```

C++

```
Extended Cot(const Extended X);
```

File

Math

Description

Call Cot to obtain the cotangent of X. The cotangent is calculated using the formula 1 / Tan (see page 1260)(X).

See Also

Tan (see page 1260)

Sin

Cos

ArcTan

32.2.19 Math.Cotan Function

Calculates the cotangent of an angle.

Pascal

```
function Cotan(const X: Extended): Extended;
```

C++

```
Extended Cotan(const Extended X);
```

File

Math

Description

Call Cotan to obtain the cotangent of X. The cotangent is calculated using the formula

1 / Tan (see page 1260)(X)

Note: Do not call Cotan with X = 0.

See Also

Tan (see page 1260)

Sin

Cos

ArcTan

32.2.20 Math.CotH Function

Calculates the hyperbolic cotangent of an angle.

Pascal

```
function CotH(const X: Extended): Extended;
```

C++

```
Extended CotH(const Extended X);
```

File

Math

Description

Call CotH to obtain the hyperbolic cotangent of X, where X is an angle in Radians.

See Also

Cot (see page 1221)

ArcCot (see page 1214)

32.2.21 Math.Csc Function

Returns the cosecant of an angle.

Pascal

```
function Csc(const X: Extended): Extended;
```

C++

```
Extended Csc(const Extended X);
```

File

Math

Description

Use the Csc to calculate the cosecant of X, where X is an angle in radians.

See Also

ArcCsc (see page 1215)

CscH (see page 1223)

Sec (see page 1252)

Sin

32.2.22 Math.CscH Function

Returns the hyperbolic cosecant of an angle.

Pascal

```
function CscH(const X: Extended): Extended;
```

C++

```
Extended CscH(const Extended X);
```

File

Math

Description

Use the CscH to calculate the hyperbolic cosecant of X, where X is an angle in radians.

See Also

ArcCscH (see page 1216)

Csc (see page 1223)

SecH (see page 1253)

32.2.23 Math.CycleToDeg Function

Converts an angle measurement from cycles to degrees.

Pascal

```
function CycleToDeg(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToDeg(const Extended Cycles);
```

File

Math

Description

CycleToDeg converts angles measured in cycles into degrees, where

degrees = cycles * 360.

32.2.24 Math.CycleToGrad Function

Converts an angle measurement from cycles to grads.

Pascal

```
function CycleToGrad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToGrad(const Extended Cycles);
```

File

Math

Description

CycleToGrad converts angles measured in cycles into grads.

32.2.25 Math.CycleToRad Function

Converts an angle measurement from cycles to radians.

Pascal

```
function CycleToRad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToRad(const Extended Cycles);
```

File

Math

Description

CycleToRad converts angles measured in cycles into radians, where

radians = 2pi * cycles.

32.2.26 Math.DegToCycle Function

Returns the value of a degree measurement expressed in cycles.

Pascal

```
function DegToCycle(const Degrees: Extended): Extended;
```

C++

```
Extended DegToCycle(const Extended Degrees);
```

File

Math

Description

Use DegToCycle to convert angles expressed in degrees to the corresponding value in cycles.

32.2.27 Math.DegToGrad Function

Returns the value of a degree measurement expressed in grads.

Pascal

```
function DegToGrad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToGrad(const Extended Degrees);
```

File

Math

Description

Use DegToGrad to convert angles expressed in degrees to the corresponding value in grads.

32.2.28 Math.DegToRad Function

Returns the value of a degree measurement expressed in radians.

Pascal

```
function DegToRad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToRad(const Extended Degrees);
```

File

Math

Description

Use DegToRad to convert angles expressed in degrees to the corresponding value in radians, where

radians = degrees(pi/180).

32.2.29 Math.DivMod Function

Returns the result of an integer division, including the remainder.

Pascal

```
procedure DivMod(Dividend: Cardinal; Divisor: Word; var Result: Word; var Remainder: Word);
```

C++

```
DivMod(unsigned Dividend, Word Divisor, Word Result, Word Remainder);
```

File

Math

Description

Call DivMod to perform 16-bit integer division and fetch the remainder as well, all in one operation.

Dividend is the integer into which you are dividing.

Divisor is the value by which to divide Dividend.

Result returns the result of the integer division.

Remainder returns the remainder (the difference between Result * Divisor and Dividend).

32.2.30 Math.DoubleDecliningBalance Function

Calculates the depreciation of an asset using the double-declining balance method.

Pascal

```
function DoubleDecliningBalance(const Cost: Extended; const Salvage: Extended; Life: Integer;
Period: Integer): Extended;
```

C++

```
Extended DoubleDecliningBalance(const Extended Cost, const Extended Salvage, int Life, int
Period);
```

File

Math

Description

DoubleDecliningBalance determines accelerated depreciation values for an asset, given the initial cost, life expectancy, end value, and depreciation period.

32.2.31 Math.EnsureRange Function

Returns the closest value to a specified value within a specified range.

Pascal

```
function EnsureRange(const AValue: Integer; const AMin: Integer; const AMax: Integer):
Integer; overload;
function EnsureRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Int64;
overload;
function EnsureRange(const AValue: Double; const AMin: Double; const AMax: Double): Double;
overload;
```

C++

```
int EnsureRange(const int AValue, const int AMin, const int AMax);
Int64 EnsureRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Double EnsureRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

EnsureRange returns a value that is guaranteed to be within a specified range.

AValue is the value you want as long as it is in range. If AValue is in range, EnsureRange returns AValue.

AMin is the minimum acceptable value. If AValue is less than AMin, EnsureRange returns AMin.

AMax is the maximum acceptable value. If AValue is greater than AMax, EnsureRange returns AMax.

See Also

VarEnsureRange

InRange (see page 1232)

32.2.32 Math.Floor Function

Rounds variables toward negative infinity.

Pascal

```
function Floor(const X: Extended): Integer;
```

C++

```
int Floor(const Extended X);
```

File

Math

Description

Call Floor to obtain the highest integer less than or equal to X. For example:

Floor(-2.8) = -3

Floor(2.8) = 2

Floor(-1.0) = -1

Note: The absolute value of X must be less than MaxInt.

See Also

Trunc

Ceil (see page 1219)

32.2.33 Math.Frexp Function

Separates the Mantissa and Exponent of X

Pascal

```
procedure Frexp(const X: Extended; var Mantissa: Extended; var Exponent: Integer);
```

C++

```
Frexp(const Extended X, Extended Mantissa, int Exponent);
```

File

Math

Description

Frexp returns the mantissa of X as Mantissa and the exponent as Exponent.

32.2.34 Math.FutureValue Function

Calculates the future value of an investment.

Pascal

```
function FutureValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
PresentValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended FutureValue(const Extended Rate, int NPeriods, const Extended Payment, const Extended
PresentValue, TPaymentTime PaymentTime);
```

File

Math

Description

FutureValue returns the future value of an investment of PresentValue (see page 1247) where Payment (see page 1245) is invested for NPeriods at the rate of Rate per period. The PaymentTime parameter indicates whether the investment is an ordinary annuity or an annuity due (enter ptEndOfPeriod if payments are at the end of each period, ptStartOfPeriod if they are at the beginning).

32.2.35 Math.GetExceptionMask Function

Returns the exception mask from the FPU control word.

Pascal

```
function GetExceptionMask: TFPUExceptionMask;
```

C++

```
TFPUExceptionMask GetExceptionMask();
```

File

Math

Description

Call GetExceptionMask to ascertain the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 1274), Infinity (see page 1270), or NegInfinity (see page 1275). The value depends on the operation and the current rounding mode.

See Also

Set8087CW

SetExceptionMask (see page 1253)

NaN (see page 1274)

Infinity (see page 1270)

NegInfinity (see page 1275)

IsInfinite (see page 1235)

IsNan (see page 1236)

32.2.36 Math.GetPrecisionMode Function

Returns the FPU precision control mode.

Pascal

```
function GetPrecisionMode: TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode GetPrecisionMode();
```

File

Math

Description

Call GetPrecisionMode to ascertain the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

See Also

Set8087CW

SetPrecisionMode (see page 1254)

32.2.37 Math.GetRoundMode Function

Returns the FPU rounding mode.

Pascal

```
function GetRoundMode: TFPURoundingMode;
```

C++

```
TFPURoundingMode GetRoundMode();
```

File

Math

Description

Call GetRoundingMode to ascertain how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

SetRoundMode (see page 1254)

32.2.38 Math.GradToCycle Function

Converts grad measurements to cycles.

Pascal

```
function GradToCycle(const Grads: Extended): Extended;
```

C++

```
Extended GradToCycle(const Extended Grads);
```

File

Math

Description

GradToCycle converts angles measured in grads into cycles.

32.2.39 Math.GradToDeg Function

Converts grad measurements to degrees.

Pascal

```
function GradToDeg(const Grads: Extended): Extended;
```

C++

```
Extended GradToDeg(const Extended Grads);
```

File

Math

Description

GradToDeg converts angles measured in grads into degrees.

32.2.40 Math.GradToRad Function

Converts grad measurements to radians.

Pascal

```
function GradToRad(const Grads: Extended): Extended;
```

C++

```
Extended GradToRad(const Extended Grads);
```

File

Math

Description

GradToRad converts angles measured in grads into radians, where

radians = grads(pi/200).

32.2.41 Math.Hypot Function

Calculates the length of the hypotenuse.

Pascal

```
function Hypot(const X: Extended; const Y: Extended): Extended;
```

C++

```
Extended Hypot(const Extended X, const Extended Y);
```

File

Math

Description

Hypot returns the length of the hypotenuse of a right triangle. Specify the lengths of the sides adjacent to the right angle in X and Y. Hypot uses the formula

Sqrt(X**2 + Y**2)

32.2.42 Math.IfThen Function

Conditionally returns one of two specified values.

Pascal

```
function IfThen(AValue: Boolean; const ATrue: Integer; const AFalse: Integer = 0): Integer;
overload;
function IfThen(AValue: Boolean; const ATrue: Int64; const AFalse: Int64 = 0): Int64; overload;
function IfThen(AValue: Boolean; const ATrue: Double; const AFalse: Double = 0.0): Double;
overload;
```

C++

```
int IfThen(Boolean AValue, const int ATrue, const int AFalse = 0);
Int64 IfThen(Boolean AValue, const Int64 ATrue, const Int64 AFalse = 0);
Double IfThen(Boolean AValue, const Double ATrue, const Double AFalse = 0.0);
```

File

Math

Description

IfThen checks the expression passed as AValue and returns ATrue if it evaluates to true, or AFalse if it evaluates to false. In Delphi, if the AFalse parameter is omitted, IfThen returns 0 or an empty string when AValue evaluates to False.

32.2.43 Math.InRange Function

Indicates whether a value falls within a specified range.

Pascal

```
function InRange(const AValue: Integer; const AMin: Integer; const AMax: Integer): Boolean;
overload;
function InRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Boolean; overload;
function InRange(const AValue: Double; const AMin: Double; const AMax: Double): Boolean;
overload;
```

C++

```
Boolean InRange(const int AValue, const int AMin, const int AMax);
Boolean InRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Boolean InRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

InRange returns true if AValue is greater than or equal to AMin and less than or Equal to AMax. It returns false if AValue is less than AMin or greater than AMax.

See Also

VarInRange

EnsureRange (see page 1227)

32.2.44 Math.InterestPayment Function

Calculates the interest portion of a loan payment.

Pascal

```
function InterestPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Call InterestPayment to calculate the portion of a loan payment that reflects the interest.

Rate represents the fixed periodic interest rate.

Period identifies the payment period.

NPeriods is the number of periods of the loan.

PresentValue (see page 1247) represents the amount borrowed (the principal).

FutureValue (see page 1228) is the future value of the investment.

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

32.2.45 Math.InterestRate Function

Returns the interest rate required to increase PresentValue (see page 1247) to FutureValue (see page 1228).

Pascal

```
function InterestRate(NPeriods: Integer; const Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestRate(int NPeriods, const Extended Payment, const Extended PresentValue, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

InterestRate calculates the interest rate required in order for an investment of PresentValue (see page 1247), with periodic payments of Payment (see page 1245), to be worth FutureValue (see page 1228) within NPeriods compounding periods. If NPeriods represents years, an annual interest rate results; if NPeriods represents months, a monthly interest rate results, and so on. The PaymentTime parameter indicates whether the cash flows occur at the beginning or end of the period.

32.2.46 Math.InternalRateOfReturn Function

Calculates the internal rate of return for an investment.

Pascal

```
function InternalRateOfReturn(const Guess: Extended; const CashFlows: array of Double):
Extended;
```

C++

```
Extended InternalRateOfReturn(const Extended Guess, const array of Double CashFlows);
```

File

Math

Description

InternalRateOfReturn determines the internal rate of return on an investment. It references an array that contains cash flow information and uses the supplied internal rate of return estimate to calculate results.

Before using this function, define an array containing expected cash flow amounts over a period of time. It is assumed that the amounts are received at regular intervals. Negative amounts are interpreted as cash outflows, and positive amounts as inflows. The first amount must be a negative number, to reflect the initial investment. The following amounts can all be the same for each time period, or they can be different (including a mixture of negatives, positives, or zeros).

Specify the estimated rate of return as the Guess parameter. Pass the array of expected cash flow amounts as the CashFlows parameter. In C++, the CashFlows_Size parameter gives the index of the last entry in CashFlows (one less than the number of entries).

32.2.47 Math.IntPower Function

Calculates the integral power of a base value.

Pascal

```
function IntPower(const Base: Extended; const Exponent: Integer): Extended;
```

C++

```
Extended IntPower(const Extended Base, const int Exponent);
```

File

Math

Description

IntPower raises Base to the power specified by Exponent.

See Also

Power (see page 1247)

32.2.48 Math.IsInfinite Function

Indicates when a variable or expression represents an infinite value.

Pascal

```
function IsInfinite(const AValue: Double): Boolean;
```

C++

```
Boolean IsInfinite(const Double AValue);
```

File

Math

Description

Use IsInfinite to test whether the value specified by AValue represents positive or negative infinity. Use the Sign (see page 1255) function to distinguish positive infinity from negative infinity.

See Also

GetExceptionMask (see page 1229)

NegInfinity (see page 1275)

IsNan (see page 1236)

Infinity (see page 1270)

IsZero (see page 1236)

Sign (see page 1255)

32.2.49 Math.IsNan Function

Indicates when a variable or expression does not evaluate to a numeric value.

Pascal

```
function IsNan(const AValue: Double): Boolean; overload;
function IsNan(const AValue: Single): Boolean; overload;
function IsNan(const AValue: Extended): Boolean; overload;
```

C++

```
Boolean IsNan(const Double AValue);
Boolean IsNan(const Single AValue);
Boolean IsNan(const Extended AValue);
```

File

Math

Description

Use IsNan to test whether the value specified by AValue represents NaN (see page 1274) (not a number). Note that NaN (see page 1274) is distinct from positive and negative infinity, which can be detected using the IsInfinite (see page 1235) function.

See Also

GetExceptionMask (see page 1229)

NaN (see page 1274)

IsInfinite (see page 1235)

32.2.50 Math.IsZero Function

Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.

Pascal

```
function IsZero(const A: Extended; Epsilon: Extended = 0): Boolean; overload;
function IsZero(const A: Double; Epsilon: Double = 0): Boolean; overload;
function IsZero(const A: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean IsZero(const Extended A, Extended Epsilon = 0);
Boolean IsZero(const Double A, Double Epsilon = 0);
Boolean IsZero(const Single A, Single Epsilon = 0);
```

File

Math

Description

Use IsZero to test whether the value specified by AValue is zero, or differs from zero by at most Epsilon.

See Also

SameValue (see page 1251)

IsInfinite (see page 1235)

Sign (see page 1255)

32.2.51 Math.Ldexp Function

Calculates X times (2 to the power of P).

Pascal

```
function Ldexp(const X: Extended; const P: Integer): Extended;
```

C++

```
Extended Ldexp(const Extended X, const int P);
```

File

Math

Description

Ldexp returns X times (2 to the power of P).

32.2.52 Math.LnXP1 Function

Returns the natural log of (X+1)

Pascal

```
function LnXP1(const X: Extended): Extended;
```

C++

```
Extended LnXP1(const Extended X);
```

File

Math

Description

LnXP1 returns the natural logarithm of (X+1). Use LnXP1 when X is a value near 0.

32.2.53 Math.Log10 Function

Calculates log base 10.

Pascal

```
function Log10(const X: Extended): Extended;
```

C++

```
Extended Log10(const Extended X);
```

File

Math

Description

Log10 returns the log base 10 of X.

See Also

Log2 (see page 1238)

Ln

LogN (see page 1238)

32.2.54 Math.Log2 Function

Calculates log base 2.

Pascal

```
function Log2(const X: Extended): Extended;
```

C++

```
Extended Log2(const Extended X);
```

File

Math

Description

Log2 returns the log base 2 of X.

See Also

Log10 (see page 1237)

Ln

LogN (see page 1238)

32.2.55 Math.LogN Function

Calculates the log of X for a specified base.

Pascal

```
function LogN(const Base: Extended; const X: Extended): Extended;
```

C++

```
Extended LogN(const Extended Base, const Extended X);
```

File

Math

Description

LogN returns the log base Base of X.

See Also

Log2 (see page 1238)

Log10 (see page 1237)

Ln

32.2.56 Math.Max Function

Returns the greater of two numeric values (Delphi only).

Pascal

```
function Max(const A: Integer; const B: Integer): Integer; overload;
function Max(const A: Int64; const B: Int64): Int64; overload;
function Max(const A: Single; const B: Single): Single; overload;
function Max(const A: Double; const B: Double): Double; overload;
function Max(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Max(const int A, const int B);
Int64 Max(const Int64 A, const Int64 B);
Single Max(const Single A, const Single B);
Double Max(const Double A, const Double B);
Extended Max(const Extended A, const Extended B);
```

File

Math

Description

In Delphi, call Max to compare two numeric values. Max returns the greater value of the two.

See Also

MaxValue (see page 1240)

Min (see page 1241)

MaxIntValue (see page 1239)

32.2.57 Math.MaxIntValue Function

Returns the largest signed value in an integer array.

Pascal

```
function MaxIntValue(const Data: array of Integer): Integer;
```

C++

```
int MaxIntValue(const array of Integer Data);
```

File

Math

Description

Call MaxIntValue to obtain the largest integer from the Data array. In C++, Data_Size is the index of the last element in the array (one less than the number of elements).

See Also

MaxValue (see page 1240)

MinIntValue (see page 1242)

32.2.58 Math.MaxValue Function

Returns the largest signed value in an array.

Pascal

```
function MaxValue(const Data: array of Double): Double;
```

C++

```
Double MaxValue(const array of Double Data);
```

File

Math

Description

MaxValue returns the largest signed value in the Data array. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MaxIntValue (see page 1239)

MinValue (see page 1242)

32.2.59 Math.Mean Function

Returns the average of all values in an array.

Pascal

```
function Mean(const Data: array of Double): Extended;
```

C++

```
Extended Mean(const array of Double Data);
```

File

Math

Description

Mean calculates the arithmetic average of all the values in the Data array parameter. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MeanAndStdDev (see page 1241)

32.2.60 Math.MeanAndStdDev Function

Calculates the mean and standard deviation of array elements.

Pascal

```
procedure MeanAndStdDev(const Data: array of Double; var Mean: Extended; var StdDev: Extended);
```

C++

```
MeanAndStdDev(const array of Double Data, Extended Mean, Extended StdDev);
```

File

Math

Description

MeanAndStdDev calculates Mean (see page 1240) and standard deviation in one pass. Using this is twice as fast as calculating them separately. Precision may be lost when the Mean (see page 1240) is very large (> 10e7) or the variance is very small.

Data specifies the data to be summarized. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). The mean is returned as Mean (see page 1240) and the standard deviation is returned as StdDev (see page 1257).

Note: If the sample size is 1 (that is, if Data contains only one entry), StdDev (see page 1257) returns the value of Data[0] and not zero.

See Also

Mean (see page 1240)

StdDev (see page 1257)

32.2.61 Math.Min Function

Returns the lesser of two numeric values (Delphi only).

Pascal

```
function Min(const A: Integer; const B: Integer): Integer; overload;
function Min(const A: Int64; const B: Int64): Int64; overload;
function Min(const A: Single; const B: Single): Single; overload;
function Min(const A: Double; const B: Double): Double; overload;
function Min(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Min(const int A, const int B);
Int64 Min(const Int64 A, const Int64 B);
Single Min(const Single A, const Single B);
Double Min(const Double A, const Double B);
Extended Min(const Extended A, const Extended B);
```

File

Math

Description

Call Min to compare two numeric values in Delphi. Min returns the smaller value of the two.

See Also

MinValue (see page 1242)

Max (see page 1239)

MinIntValue (see page 1242)

32.2.62 Math.MinIntValue Function

Returns the smallest signed value in an integer array.

Pascal

```
function MinIntValue(const Data: array of Integer): Integer;
```

C++

```
int MinIntValue(const array of Integer Data);
```

File

Math

Description

Call MinIntValue to obtain the smallest integer in the Data array. In C++, the Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxIntValue (see page 1239)

MinValue (see page 1242)

32.2.63 Math.MinValue Function

Returns smallest signed value in an array.

Pascal

```
function MinValue(const Data: array of Double): Double;
```

C++

```
Double MinValue(const array of Double Data);
```

File

Math

Description

MinValue returns the smallest signed value in the Data array. The Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxValue (see page 1240)

MinIntValue (see page 1242)

32.2.64 Math.MomentSkewKurtosis Function

Calculates the mean, variance, skew, and kurtosis.

Pascal

```
procedure MomentSkewKurtosis(const Data: array of Double; var M1: Extended; var M2: Extended;
var M3: Extended; var M4: Extended; var Skew: Extended; var Kurtosis: Extended);
```

C++

```
MomentSkewKurtosis(const array of Double Data, Extended M1, Extended M2, Extended M3, Extended
M4, Extended Skew, Extended Kurtosis);
```

File

Math

Description

MomentSkewKurtosis calculates the core factors of statistical analysis: the first four moments plus the coefficients of skew and kurtosis.

Data specifies the data to be analyzed. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). M1, M2, M3 and M4 return the first four moments (M1 is the mean, M2 is the variance, and so on). Skew reflects symmetry of distribution. Kurtosis reflects flatness of distribution.

32.2.65 Math.NetPresentValue Function

Calculates the current value from an array of estimated cash flow values.

Pascal

```
function NetPresentValue(const Rate: Extended; const CashFlows: array of Double; PaymentTime:
TPaymentTime): Extended;
```

C++

```
Extended NetPresentValue(const Extended Rate, const array of Double CashFlows, TPaymentTime
PaymentTime);
```

File

Math

Description

NetPresentValue calculates the current value of an array of estimated cash flow values, discounted at the given interest rate of Rate.

CashFlows is the array of estimated cash flow values. In C++, CashFlows_Size is the index of the last element in that array (one less than the number of elements).

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

NetPresentValue helps determine how much an investment is currently worth, based on expected earnings, although its accuracy depends on the accuracy of the cash flows in the array.

32.2.66 Math.Norm Function

Returns the Euclidean 'L-2' norm.

Pascal

```
function Norm(const Data: array of Double): Extended;
```

C++

```
Extended Norm(const array of Double Data);
```

File

Math

Description

Norm returns the Euclidean 'L-2' norm for the values in the Data array. The 'L-2' norm is the square root of the sum of squares.

Note: In C++, Data is an array of values, and Data_Size is the index of the last value in the array (one less than the number of values).

See Also

SumOfSquares (see page 1259)

32.2.67 Math.NumberOfPeriods Function

Returns the number of payment periods for an investment.

Pascal

```
function NumberOfPeriods(const Rate: Extended; Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended NumberOfPeriods(const Extended Rate, Extended Payment, const Extended PresentValue,
const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

NumberOfPeriods computes the number of payment periods required for an investment of PresentValue (see page 1247) to reach a value of FutureValue (see page 1228), while making regular payments of Payment (see page 1245) and accruing interest at the rate of Rate per compounding period. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

32.2.68 Math.Payment Function

Calculates a fully amortized payment.

Pascal

```
function Payment(Rate: Extended; NPeriods: Integer; const PresentValue: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended Payment(Extended Rate, int NPeriods, const Extended PresentValue, const Extended
FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Payment calculates the fully amortized payment of borrowing PresentValue (see page 1247) at Rate percent per period over NPeriods. It assumes that interest is paid at the end of each period.

FutureValue (see page 1228) is the value that the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

32.2.69 Math.PeriodPayment Function

Returns the principal amount from a full payment.

Pascal

```
function PeriodPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PeriodPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PeriodPayment gives the part of the payment that is principal. The InterestPayment (see page 1233) function gives the part of the payment that is interest.

The Rate parameter is the interest rate. Period is the number of periods into the loan for which the principal is desired, and NPeriods is the number of periods of the loan. FutureValue (see page 1228) is the value the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

32.2.70 Math.Poly Function

Evaluates a uniform polynomial of one variable at the value X.

Pascal

```
function Poly(const X: Extended; const Coefficients: array of Double): Extended;
```

C++

```
Extended Poly(const Extended X, const array of Double Coefficients);
```

File

Math

Description

Call Poly to evaluate the polynomial represented by the Coefficients parameter at the point where the variable equals the value of the X parameter. The coefficients are ordered in increasing powers of X, as shown in the following Delphi-like example:

Coefficients[0] + Coefficients[1]*X + ... + Coefficients[N]*(X**N)

Note: In C++, the Coefficients_Size parameter is N, the highest power to which X is raised.

32.2.71 Math.PopnStdDev Function

Calculates the population standard deviation.

Pascal

```
function PopnStdDev(const Data: array of Double): Extended;
```

C++

```
Extended PopnStdDev(const array of Double Data);
```

File

Math

Description

PopnStdDev calculates the population standard deviation (the square root of the population variance) of all values in the Data array parameter. In C++, the Data_Size parameter indicates the index of the last element in Data (one less than the number of data points).

This function is used in some business and financial calculations.

See Also

StdDev (see page 1257)

PopnVariance (see page 1246)

32.2.72 Math.PopnVariance Function

Calculates the population variance.

Pascal

```
function PopnVariance(const Data: array of Double): Extended;
```

C++

```
Extended PopnVariance(const array of Double Data);
```

File

Math

Description

PopnVariance calculates the population variance of all values in the Data array parameter, using the n method (biased): TotalVariance (see page 1261) / n. In C++,. the Data_Size parameter is the index of the last value in the Data array (one less than the number of data items).

See Also

Variance (see page 1262)

TotalVariance (see page 1261)

PopnStdDev (see page 1246)

32.2.73 Math.Power Function

Raises Base to any power.

Pascal

```
function Power(const Base: Extended; const Exponent: Extended): Extended; overload;
function Power(const Base: Double; const Exponent: Double): Double; overload;
function Power(const Base: Single; const Exponent: Single): Single; overload;
```

C++

```
Extended Power(const Extended Base, const Extended Exponent);
Double Power(const Double Base, const Double Exponent);
Single Power(const Single Base, const Single Exponent);
```

File

Math

Description

Power raises Base to any power. For fractional exponents or exponents greater than MaxInt, Base must be greater than 0.

See Also

IntPower (see page 1235)

Sqrt

32.2.74 Math.PresentValue Function

Calculates the present value of an investment.

Pascal

```
function PresentValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PresentValue(const Extended Rate, int NPeriods, const Extended Payment, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PresentValue calculates the present value of an investment where Payment (see page 1245) is received for NPeriods and is discounted at the rate of Rate per period. FutureValue (see page 1228) is the value the investment may reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

32.2.75 Math.RadToCycle Function

Converts radians to cycles.

Pascal

```
function RadToCycle(const Radians: Extended): Extended;
```

C++

```
Extended RadToCycle(const Extended Radians);
```

File

Math

Description

Use RadToCycle to convert angles measured in radians into cycles, where

cycles = radians/(2pi).

32.2.76 Math.RadToDeg Function

Converts radians to degrees.

Pascal

```
function RadToDeg(const Radians: Extended): Extended;
```

C++

```
Extended RadToDeg(const Extended Radians);
```

File

Math

Description

Use RadToDeg to convert angles measured in radians to degrees, where

degrees = radians(180/pi).

32.2.77 Math.RadToGrad Function

Converts radians to grads.

Pascal

```
function RadToGrad(const Radians: Extended): Extended;
```

C++

```
Extended RadToGrad(const Extended Radians);
```

File

Math

Description

Use RadToGrad to convert angles measured in radians to grads, where

grads = radians(200/pi).

32.2.78 Math.RandG Function

Generates random numbers with Gaussian distribution.

Pascal

```
function RandG(Mean: Extended; StdDev: Extended): Extended;
```

C++

```
Extended RandG(Extended Mean, Extended StdDev);
```

File

Math

Description

RandG produces random numbers with Gaussian distribution about the Mean (see page 1240). This is useful for simulating data with sampling errors and expected deviations from the Mean (see page 1240).

32.2.79 Math.RandomFrom Function

Returns a randomly selected element from an array.

Pascal

```
function RandomFrom(const AValues: array of Integer): Integer; overload;
function RandomFrom(const AValues: array of Int64): Int64; overload;
function RandomFrom(const AValues: array of Double): Double; overload;
```

C++

```
int RandomFrom(const array of Integer AValues);
Int64 RandomFrom(const array of Int64 AValues);
Double RandomFrom(const array of Double AValues);
```

File

Math

Description

RandomFrom returns a randomly selected element from the array passed as the AValues argument. In C++, AValues_Size is

the index of the last array element (one less than the number of elements.)

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomFrom.

See Also

Randomize

RandSeed

32.2.80 Math.RandomRange Function

Returns a random integer from a specified range.

Pascal

```
function RandomRange(const AFrom: Integer; const ATo: Integer): Integer;
```

C++

```
int RandomRange(const int AFrom, const int ATo);
```

File

Math

Description

RandomRange returns a random integer from the range that extends between AFrom and ATo (non-inclusive). RandomRange can handle negative ranges (where AFrom is greater than ATo).

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomRange.

See Also

Randomize

RandSeed

RandomFrom (see page 1249)

Random

32.2.81 Math.RoundTo Function

Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".

Pascal

```
function RoundTo(const AValue: Extended; const ADigit: TRoundToEXRangeExtended): Extended;
```

C++

```
Extended RoundTo(const Extended AValue, const TRoundToEXRangeExtended ADigit);
```

File

Math

Description

Call RoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

RoundTo uses "Banker's Rounding" to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method rounds to an even number in the case that AValue is not nearer to either value.

The following examples illustrate the use of RoundTo:

Expression	Value
RoundTo(1234567, 3)	1235000
RoundTo(1.234, -2)	1.23
RoundTo(1.235, -2)	1.24
RoundTo(1.245, -2)	1.24

Note: The behavior of RoundTo can be affected by the Set8087CW procedure or SetRoundMode (see page 1254) function.

See Also

Round

SetRoundMode (see page 1254)

Set8087CW

SimpleRoundTo (see page 1255)

32.2.82 Math.SameValue Function

Indicates whether two floating-point values are (approximately) equal.

Pascal

```
function SameValue(const A: Extended; const B: Extended; Epsilon: Extended = 0): Boolean;
overload;
function SameValue(const A: Double; const B: Double; Epsilon: Double = 0): Boolean; overload;
function SameValue(const A: Single; const B: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean SameValue(const Extended A, const Extended B, Extended Epsilon = 0);
Boolean SameValue(const Double A, const Double B, Double Epsilon = 0);
Boolean SameValue(const Single A, const Single B, Single Epsilon = 0);
```

File

Math

Description

Call SameValue to determine when two floating-point values are equal, or approximately equal.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

See Also

CompareValue (see page 1220)

IsZero (see page 1236)

32.2.83 Math.Sec Function

Calculates the secant of an angle.

Pascal

```
function Sec(const X: Extended): Extended;
```

C++

```
Extended Sec(const Extended X);
```

File

Math

Description

Call Sec to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

Note: Sec is identical to the Secant (see page 1252) function.

See Also

ArcSec (see page 1216)

Secant (see page 1252)

SecH (see page 1253)

Cos

32.2.84 Math.Secant Function

Calculates the secant of an angle.

Pascal

```
function Secant(const X: Extended): Extended;
```

C++

```
Extended Secant(const Extended X);
```

File

Math

Description

Call Secant to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

See Also

Sec (see page 1252)

SecH (see page 1253)

Cos

32.2.85 Math.SecH Function

Calculates the hyperbolic secant of an angle.

Pascal

```
function SecH(const X: Extended): Extended;
```

C++

```
Extended SecH(const Extended X);
```

File

Math

Description

Call SecH to obtain the hyperbolic secant of X, where X is an angle in Radians.

See Also

Sec (see page 1252)

ArcSec (see page 1216)

32.2.86 Math.SetExceptionMask Function

Sets the exception mask on the FPU control word.

Pascal

```
function SetExceptionMask(const Mask: TFPUExceptionMask): TFPUExceptionMask;
```

C++

```
TFPUExceptionMask SetExceptionMask(const TFPUExceptionMask Mask);
```

File

Math

Description

Call SetExceptionMask to specify the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 1274), Infinity (see page 1270), or NegInfinity (see page 1275). The value depends on the operation and the current rounding mode.

SetExceptionMask returns the previous exception mask.

See Also

Set8087CW

GetExceptionMask (see page 1229)

NaN (see page 1274)

Infinity (see page 1270)

NegInfinity (see page 1275)

32.2.87 Math.SetPrecisionMode Function

Sets the FPU precision control mode.

Pascal

```
function SetPrecisionMode(const Precision: TFPUPrecisionMode): TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode SetPrecisionMode(const TFPUPrecisionMode Precision);
```

File

Math

Description

Call SetPrecisionMode to specify the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

SetPrecisionMode returns the previous precision control mode.

See Also

Set8087CW

GetPrecisionMode (see page 1229)

32.2.88 Math.SetRoundMode Function

Sets the FPU rounding mode.

Pascal

```
function SetRoundMode(const RoundMode: TFPURoundingMode): TFPURoundingMode;
```

C++

```
TFPURoundingMode SetRoundMode(const TFPURoundingMode RoundMode);
```

File

Math

Description

Call SetRoundingMode to specify how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

GetRoundMode (see page 1230)

32.2.89 Math.Sign Function

Indicates whether a numeric value is positive, negative, or zero.

Pascal

```
function Sign(const AValue: Integer): TValueSign; overload;
function Sign(const AValue: Int64): TValueSign; overload;
function Sign(const AValue: Double): TValueSign; overload;
```

C++

```
TValueSign Sign(const int AValue);
TValueSign Sign(const Int64 AValue);
TValueSign Sign(const Double AValue);
```

File

Math

Description

Use Sign to test the sign of a numeric value. Sign returns

0 if AValue is zero.

1 if AValue is greater than zero.

-1 if AValue is less than zero.

See Also

IsZero (see page 1236)

32.2.90 Math.SimpleRoundTo Function

Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.

Pascal

```
function SimpleRoundTo(const AValue: Extended; const ADigit: TRoundToRange = -2): Extended;
```

C++

```
Extended SimpleRoundTo(const Extended AValue, const TRoundToRange ADigit = -2);
```

File

Math

Description

Call SimpleRoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

SimpleRoundTo uses asymmetric arithmetic rounding to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method always rounds to the larger value.

The following examples illustrate the use of SimpleRoundTo:

Expression	Value
SimpleRoundTo(1234567, 3)	1234000
SimpleRoundTo(1.234, -2)	1.23
SimpleRoundTo(1.235, -2)	1.24
SimpleRoundTo(-1.235, -2)	-1.23

See Also

Round

RoundTo (see page 1250)

32.2.91 Math.SinCos Function

Returns sine and cosine of an angle.

Pascal

```
procedure SinCos(const Theta: Extended; var Sin: Extended; var Cos: Extended);
```

C++

```
SinCos(const Extended Theta, Extended Sin, Extended Cos);
```

File

Math

Description

Call SinCos to obtain the sine and cosine of an angle expressed in radians. Theta specifies the angle. The sine and cosine are returned in the Sin and Cos parameters, respectively.

SinCos is twice as fast as calling Sin and Cos separately for the same angle.

32.2.92 Math.Sinh Function

Returns the hyperbolic sine of an angle.

Pascal

```
function Sinh(const X: Extended): Extended;
```

C++

```
Extended Sinh(const Extended X);
```

File

Math

Description

Sinh calculates the hyperbolic sine of X.

32.2.93 Math.SLNDepreciation Function

Returns the straight-line depreciation allowance of an asset.

Pascal

```
function SLNDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer):
Extended;
```

C++

```
Extended SLNDepreciation(const Extended Cost, const Extended Salvage, int Life);
```

File

Math

Description

SLNDepreciation calculates the straight-line depreciation allowance for an asset over one period of its life. The function divides the Cost minus the Salvage by the number of years of useful Life of the asset. Cost is the amount initially paid for the asset. Salvage is the value of the asset at the end of its useful life.

To compute accelerated depreciation (allowing higher depreciation values in the first years of the assets life), use the SYDDepreciation (see page 1260) function.

See Also

SYDDepreciation (see page 1260)

32.2.94 Math.StdDev Function

Returns the sample standard deviation for elements in an array.

Pascal

```
function StdDev(const Data: array of Double): Extended;
```

C++

```
Extended StdDev(const array of Double Data);
```

File

Math

Description

StdDev calculates the sample standard deviation (the square root of the sample variance) of all values in the Data array parameter. In C++, Data_Size indicates the index of the last element in the array (one less than the number of elements).

See Also

TotalVariance (see page 1261)

Variance (see page 1262)

32.2.95 Math.Sum Function

Returns the sum of the elements in an array.

Pascal

```
function Sum(const Data: array of Double): Extended;
```

C++

```
Extended Sum(const array of Double Data);
```

File

Math

Description

Sum returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

SumInt (see page 1258)

32.2.96 Math.SumInt Function

Returns the sum of the elements in an integer array.

Pascal

```
function SumInt(const Data: array of Integer): Integer;
```

C++

```
int SumInt(const array of Integer Data);
```

File

Math

Description

Sum (see page 1258) returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 1258)

32.2.97 Math.SumOfSquares Function

Returns the sum of the squared values from a data array.

Pascal

```
function SumOfSquares(const Data: array of Double): Extended;
```

C++

```
Extended SumOfSquares(const array of Double Data);
```

File

Math

Description

SumOfSquares returns the sum of the squares of the Data values: Data[0]^2 + Data[1]^2 + Data[2]^2... In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 1258)

SumsAndSquares (see page 1259)

32.2.98 Math.SumsAndSquares Function

Returns the sum of the values and the sum of the squared values in an array.

Pascal

```
procedure SumsAndSquares(const Data: array of Double; var Sum: Extended; var SumOfSquares:
Extended);
```

C++

```
SumsAndSquares(const array of Double Data, Extended Sum, Extended SumOfSquares);
```

File

Math

Description

SumsAndSquares returns the sum of the Data values in Sum (see page 1258) and the sum of the squares in SumOfSquares (see page 1259). The data to sum is specified in the Data array parameter. In C++, Data_Size indicates the index of the last value (one less than the number of values in Data).

This function is faster than calculating the sums separately.

See Also

Sum (see page 1258)

SumOfSquares (see page 1259)

TotalVariance (see page 1261)

32.2.99 Math.SYDDepreciation Function

Calculates depreciation for an asset.

Pascal

```
function SYDDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer; Period: Integer): Extended;
```

C++

```
Extended SYDDepreciation(const Extended Cost, const Extended Salvage, int Life, int Period);
```

File

Math

Description

SYDDepreciation (for "sum-of-years-digits depreciation") calculates depreciation amounts for an asset using an accelerated depreciation method. This allows for higher depreciation in the earlier years of an asset's life.

Cost is the initial cost of the asset. Salvage is the value of the asset at the end of its life expectancy. Life is the length of the asset's life expectancy. Period is the period for which to calculate the depreciation.

See Also

SLNDepreciation (see page 1257)

32.2.100 Math.Tan Function

Returns the tangent of X.

Pascal

```
function Tan(const X: Extended): Extended;
```

C++

```
Extended Tan(const Extended X);
```

File

Math

Description

Tan returns the tangent of X. Tan(X) = Sin(X) / Cos(X).

See Also

Sin

Cos

ArcTan

32.2.101 Math.Tanh Function

Returns the hyperbolic tangent of X.

Pascal

```
function Tanh(const X: Extended): Extended;
```

C++

```
Extended Tanh(const Extended X);
```

File

Math

Description

Tanh calculates the hyperbolic tangent of X.

See Also

Cosh (see page 1221)

Sinh (see page 1256)

32.2.102 Math.TotalVariance Function

Returns the statistical variance from an array of values.

Pascal

```
function TotalVariance(const Data: array of Double): Extended;
```

C++

```
Extended TotalVariance(const array of Double Data);
```

File

Math

Description

TotalVariance returns the sum of the squares of the difference between each Data value and the mean of the data values.

Total Variance (see page 1262): SUM(i=1,N)[(X(i) - Mean (see page 1240))**2]

See Also

SumOfSquares (see page 1259)

Variance (see page 1262)

StdDev (see page 1257)

Mean (see page 1240)

32.2.103 Math.Variance Function

Calculates statistical sample variance from an array of data.

Pascal

```
function Variance(const Data: array of Double): Extended;
```

C++

```
Extended Variance(const array of Double Data);
```

File

Math

Description

Variance calculates the sample variance of all values in the Data array parameter, using the n-1 method (unbiased). In C++, Data_Size specifies the index of the last value in Data (on less than the number of data values).

See Also

TotalVariance (see page 1261)

StdDev (see page 1257)

Mean (see page 1240)

PopnVariance (see page 1246)

32.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFPUException (see page 1263)	TFPUException defines TFPUExceptionMask (see page 1267) values.
	TFPUPrecisionMode (see page 1264)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 1265)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 1266)	TPaymentTime is an enumerated type used as a parameter in financial functions.

32.3.1 Math.TFPUException Enumeration

TFPUException defines TFPUExceptionMask (see page 1267) values.

Pascal

```
TFPUException = (
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
);
```

C++

```
enum TFPUException {
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 1253) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 1274), Infinity (see page 1270), or NegInfinity (see page 1275). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 1230) and SetRoundMode (see page 1254)).

TFPUExceptionMask (see page 1267) can have none, one, some or all of the following TFPUException values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.

exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 1229)

GetRoundMode (see page 1230)

SetExceptionMask (see page 1253)

SetRoundMode (see page 1254)

TFPUExceptionMask (see page 1267)

32.3.2 Math.TFPUPrecisionMode Enumeration

TFPUPrecisionMode defines how the FPU handles precision.

Pascal

```
TFPUPrecisionMode = (
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
);
```

C++

```
enum TFPUPrecisionMode {
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetPrecisionMode (see page 1229) is used to read, and SetPrecisionMode (see page 1254) is used to set the precision control mode, with TFPUPrecisionMode defining this mode.

TFPUPrecisionMode can be one of the following values :

Value	Meaning
pmSingle	Single precision : 7 significant digits, exponent from -38 to +38.
pmReserved	Reserved for future use.
pmDouble	Double precision : 15 significant digits, exponent from -308 to +308.
pmExtended	Extended precision : 19 significant digits, exponent from -4932 to +4932.

See Also

GetPrecisionMode (see page 1229)

GetRoundMode (see page 1230)

SetPrecisionMode (see page 1254)

SetRoundMode (see page 1254)

32.3.3 Math.TFPURoundingMode Enumeration

TFPURoundingMode defines how the FPU handles rounding issues.

Pascal

```
TFPURoundingMode = (
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
);
```

C++

```
enum TFPURoundingMode {
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetRoundMode (see page 1230) is used to read, and SetRoundMode (see page 1254) is used to set the rounding mode, with TFPURoundingMode defining this mode.

TFPURoundingMode can be one of the following values :

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

GetPrecisionMode (see page 1229)

GetRoundMode (see page 1230)

SetPrecisionMode (see page 1254)

SetRoundMode (see page 1254)

32.3.4 Math.TPaymentTime Enumeration

TPaymentTime is an enumerated type used as a parameter in financial functions.

Pascal

```
TPaymentTime = (
  ptEndOfPeriod,
  ptStartOfPeriod
);
```

C++

```
enum TPaymentTime {
  ptEndOfPeriod,
  ptStartOfPeriod
};
```

File

Math

Description

TPaymentTime indicates when interest is calculated. The following table lists the possible values:

Value	Meaning
ptStartOfPeriod	Interest is calculated on the principle balance at the beginning of the payment period
ptEndOfPeriod	Interest is calculated at the end of the payment period

32.4 Types

The following table lists types in this documentation.

Types

Name	Description
TFPUExceptionMask (see page 1267)	TFPUExceptionMask defines a set of TFPUException (see page 1263) values.
TRoundToEXRangeExtended (see page 1268)	This is type Math.TRoundToEXRangeExtended.
TRoundToRange (see page 1268)	TRoundToRange defines the RoundTo (see page 1250) rounding limits.
TValueSign (see page 1268)	TValueSign defines the Sign (see page 1255) returned value.

32.4.1 Math.TFPUExceptionMask Type

TFPUExceptionMask defines a set of TFPUException (see page 1263) values.

Pascal

```
TFPUExceptionMask = set of TFPUException;
```

C++

```
TFPUException TFPUExceptionMask;
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 1253) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 1274), Infinity (see page 1270), or NegInfinity (see page 1275). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 1230) and SetRoundMode (see page 1254)).

TFPUExceptionMask can have none, one, some or all of the following TFPUException (see page 1263) values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.
exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 1229)

GetRoundMode (see page 1230)

SetExceptionMask (see page 1253)

SetRoundMode (see page 1254)

TFPUException (see page 1263)

32.4.2 Math.TRoundToEXRangeExtended Type

Pascal

```
TRoundToEXRangeExtended = -20..20;
```

C++

```
-20..20 TRoundToEXRangeExtended;
```

File

Math

Description

This is type Math.TRoundToEXRangeExtended.

32.4.3 Math.TRoundToRange Type

TRoundToRange defines the RoundTo (see page 1250) rounding limits.

Pascal

```
TRoundToRange = -37..37;
```

C++

```
-37..37 TRoundToRange;
```

File

Math

Description

The RoundTo (see page 1250) routine rounds a floating-point value to a specified digit or power of ten using "Banker's rounding". A negative TRoundToRange value rounds to this number of decimal places. A positive value removes all decimal places, and zeroes this number of significant digits to the left of the decimal point. Banker's rounding always rounds down to an even value last digit when it has a choice.

See Also

RoundTo (see page 1250)

32.4.4 Math.TValueSign Type

TValueSign defines the Sign (see page 1255) returned value.

Pascal

```
TValueSign = -1..1;
```

C++

```
-1..1 TValueSign;
```

File

Math

Description

The Sign (see page 1255) routine determines whether a number is negative, zero or positive. It returns the result in a TValueSign value as follows :

Value	Associated constant	Meaning
-1	NegativeValue (see page 1274)	Negative number.
0	ZeroValue (see page 1276)	Zero.
+1	PositiveValue (see page 1275)	Positive number.

See Also

NegativeValue (see page 1274)

PositiveValue (see page 1275)

ZeroValue (see page 1276)

RoundTo (see page 1250)

32.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Infinity (see page 1270)	Infinity represents positive infinity.
MaxComp (see page 1271)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 1271)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 1271)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 1272)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 1272)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 1273)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 1273)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 1273)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 1274)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 1274)	NegativeValue defines a negative number result from using Sign (see page 1255).
NegInfinity (see page 1275)	NegInfinity represents negative infinity.
PositiveValue (see page 1275)	PositiveValue defines a positive number result from using Sign (see page 1255).
ZeroValue (see page 1276)	ZeroValue defines a zero value number result from using Sign (see page 1255).

32.5.1 Math.Infinity Constant

Infinity represents positive infinity.

Pascal

```
Infinity = 1.0 / 0.0;
```

C++

```
Infinity = 1.0 / 0.0;
```

File

Math

Description

Infinity is literally defined as 1.0/0.0 : positive infinity.

Note: Only use Infinity in assignments : use IsInfinite (see page 1235).

See Also

IsInfinite (see page 1235)

NegInfinity (see page 1275)

32.5.2 Math.MaxComp Constant

MaxComp defines the maximum absolute value for a Comp variable.

Pascal

```
MaxComp = 9.223372036854775807e+18;
```

C++

```
MaxComp = 9.223372036854775807e+18;
```

File

Math

Description

MaxComp defines the maximum absolute value for a Comp variable.

See Also

MinComp (see page 1272)

32.5.3 Math.MaxDouble Constant

MaxDouble defines the maximum absolute value for a Double variable.

Pascal

```
MaxDouble = 1.7e+308;
```

C++

```
MaxDouble = 1.7e+308;
```

File

Math

Description

MaxDouble defines the maximum absolute value for a Double variable.

See Also

MinDouble (see page 1273)

32.5.4 Math.MaxExtended Constant

MaxExtended defines the maximum absolute value for an Extended variable.

Pascal

```
MaxExtended = 1.1e+4932;
```

C++

```
MaxExtended = 1.1e+4932;
```

File

Math

Description

MaxExtended defines the maximum absolute value for an Extended variable.

See Also

MinExtended (see page 1273)

32.5.5 Math.MaxSingle Constant

MaxSingle defines the maximum absolute value for a Single variable.

Pascal

```
MaxSingle = 3.4e+38;
```

C++

```
MaxSingle = 3.4e+38;
```

File

Math

Description

MaxSingle defines the maximum absolute value for a Single variable.

See Also

MinSingle (see page 1273)

32.5.6 Math.MinComp Constant

MinComp defines the smallest absolute value for a Comp variable.

Pascal

```
MinComp = -9.223372036854775807e+18;
```

C++

```
MinComp = -9.223372036854775807e+18;
```

File

Math

Description

MinComp defines the smallest absolute value for a Comp variable.

See Also

MaxComp (see page 1271)

32.5.7 Math.MinDouble Constant

MinDouble defines the smallest absolute value for a Double variable.

Pascal

```
MinDouble = 5.0e-324;
```

C++

```
MinDouble = 5.0e-324;
```

File

Math

Description

MinDouble defines the smallest absolute value for a Double variable.

See Also

MaxDouble (see page 1271)

32.5.8 Math.MinExtended Constant

MinExtended defines the smallest absolute value for an Extended variable.

Pascal

```
MinExtended = 3.4e-4932;
```

C++

```
MinExtended = 3.4e-4932;
```

File

Math

Description

MinExtended defines the smallest absolute value for an Extended variable.

See Also

MaxExtended (see page 1271)

32.5.9 Math.MinSingle Constant

MinSingle defines the smallest absolute value for a Single variable.

Pascal

```
MinSingle = 1.5e-45;
```

C++

```
MinSingle = 1.5e-45;
```

File

Math

Description

MinSingle defines the smallest absolute value for a Single variable.

See Also

MaxSingle (see page 1272)

32.5.10 Math.NaN Constant

NaN represents a value that cannot be represented as a valid number.

Pascal

```
NaN = 0.0 / 0.0;
```

C++

```
NaN = 0.0 / 0.0;
```

File

Math

Description

NaN is literally defined as 0.0/0.0 : an undefined value.

Note: Only use NaN in assignments : use IsNan (see page 1236).

See Also

IsNan (see page 1236)

32.5.11 Math.NegativeValue Constant

NegativeValue defines a negative number result from using Sign (see page 1255).

Pascal

```
NegativeValue = Low(TValueSign);
```

C++

```
NegativeValue = Low(TValueSign);
```

File

Math

Description

Sign (see page 1255) determines the sign of a number, returning the result in a TValueSign (see page 1268) value. TValueSign (see page 1268) will be NegativeValue if the number is negative.

See Also

PositiveValue (see page 1275)

Sign (see page 1255)

TValueSign (see page 1268)

ZeroValue (see page 1276)

32.5.12 Math.NegInfinity Constant

NegInfinity represents negative infinity.

Pascal

```
NegInfinity = -1.0 / 0.0;
```

C++

```
NegInfinity = -1.0 / 0.0;
```

File

Math

Description

NegInfinity is literally defined as -1.0/0.0 : negative infinity.

Note: Only use NegInfinity in assignments : use IsInfinite (see page 1235).

See Also

Infinity (see page 1270)

IsInfinite (see page 1235)

32.5.13 Math.PositiveValue Constant

PositiveValue defines a positive number result from using Sign (see page 1255).

Pascal

```
PositiveValue = High(TValueSign);
```

C++

```
PositiveValue = High(TValueSign);
```

File

Math

Description

Sign (see page 1255) determines the sign of a number, returning the result in a TValueSign (see page 1268) value. TValueSign (see page 1268) will be PositiveValue if the number is positive.

See Also

NegativeValue (see page 1274)

Sign (see page 1255)

TValueSign (see page 1268)

ZeroValue (see page 1276)

32.5.14 Math.ZeroValue Constant

ZeroValue defines a zero value number result from using Sign (see page 1255).

Pascal

```
ZeroValue = 0;
```

C++

```
ZeroValue = 0;
```

File

Math

Description

Sign (see page 1255) determines the sign of a number, returning the result in a TValueSign (see page 1268) value. TValueSign (see page 1268) will be ZeroValue if the number is zero.

See Also

NegativeValue (see page 1274)

PositiveValue (see page 1275)

Sign (see page 1255)

TValueSign (see page 1268)

33 MConnect Namespace

This is namespace MConnect.

Topics

Name	Description
Classes (see page 1278)	The following table lists classes in this documentation.
Functions (see page 1317)	The following table lists functions in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 1278)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 1281)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 1284)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 1289)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 1290)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 1305)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 1309)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Functions

	Name	Description
	GetMIDASAppServerList (see page 1317)	This is function MConnect.GetMIDASAppServerList.

33.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 1278)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 1281)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 1284)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 1289)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 1290)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 1305)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 1309)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

33.1.1 TCOMConnection Class

TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.

Class Hierarchy

Pascal

```
TCOMConnection = class(TDispatchConnection);
```

C++

```
class TCOMConnection : public TDispatchConnection;
```

File

MConnect

Description

Do not create instances of TCOMConnection. Instead, use TCOMConnection as a base class when created a custom component that forms a COM-based connection to an application server.

TCOMConnection adds to the ability to work with COM objects to the generic connection capabilities inherited from TDispatchConnection (see page 1290). It has two descendants: TDCOMConnection (see page 1284), which creates and manages connections using DCOM, and TOLEnterpriseConnection (see page 1305), which is provided for backward compatibility and handles connections using OLEnterprise.

See Also

TClientDataSet

TDCOMConnection (see page 1284)

TOLEnterpriseConnection (see page 1305)

TDataSetProvider (see page 3145)

Writing Applications Using COM

33.1.1.1 TCOMConnection Members

The following tables list the members exposed by TCOMConnection.

Protected Methods

	Name	Description
	DoConnect (see page 1280)	Connects to an application server.
	DoDisconnect (see page 1292)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.
	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1280)	Sets the Connected (see page 1296) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 1300)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 1291)	Creates an instance of a dispatch connection component.
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.

33.1.1.2 TCOMConnection Methods

The methods of the TCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 1280)	Connects to an application server.
	SetConnected (see page 1280)	Sets the Connected (see page 1296) property.

33.1.1.2.1 TCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected (see page 1296) property is set to true. DoConnect creates a COM object for the application server (based on the ServerName (see page 1301) or ServerGUID (see page 1301) property), and sets the value of the AppServer property to this COM object.

Descendants of TCOMConnection (see page 1278) override DoConnect to change the way the client application forms a connection to an application server.

See Also

AfterConnect

BeforeConnect

Connected (see page 1296)

AppServer

ServerName (see page 1301)

ServerGUID (see page 1301)

33.1.1.2.2 TCOMConnection.SetConnected Method

Sets the Connected (see page 1296) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 1296) property.

If Value is false, SetConnected generates a BeforeDisconnect (see page 1303) event, closes the connection, and generates an AfterDisconnect (see page 1302) event.

If Value is true, SetConnected performs the following actions:

1. It checks the value of the ServerGUID (see page 1301) or ServerName (see page 1301) property and raises an exception if these do not specify a valid application server.

2. If LoginPrompt (see page 1296) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 1304) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
3. It generates a BeforeConnect (see page 1303) event.
4. It opens the connection.
5. It generates an AfterConnect (see page 1302) event.
6. If LoginPrompt (see page 1296) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 1304) event.

OnLogin

33.1.2 TCustomObjectBroker Class

TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.

Class Hierarchy

Pascal

```
TCustomObjectBroker = class(TComponent);
```

C++

```
class TCustomObjectBroker : public TComponent;
```

File

MConnect

Description

TCustomObjectBroker defines the methods by which a connection component obtains information about available application servers. When a connection component uses an object broker, it does not save any properties that identify a particular server machine. Instead, when it needs to open a connection, it uses the methods of the object broker to get that identifying information. This process allows client applications to locate server systems dynamically at runtime. If there are redundant server systems, this allows client applications to continue functioning when a server goes down.

TCustomObjectBroker does not implement any of the methods that provide information to connection components. Instead,

descendants such as TSimpleObjectBroker implement a mechanism for choosing servers and identifying them to connection components. Application developers can derive more elaborate object brokers that provide additional benefits such as intelligent load balancing.

See Also

TDispatchConnection (see page 1290)

TSimpleObjectBroker (see page 2475)

33.1.2.1 TCustomObjectBroker Members

The following tables list the members exposed by TCustomObjectBroker.

Public Methods

	Name	Description
	GetComputerForGUID (see page 1282)	Returns a string that identifies a server machine for an interface identified by its GUID.
	GetComputerForProgID (see page 1283)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetPortForComputer (see page 1283)	Returns a port number for connecting to a specified remote server.
	SetConnectStatus (see page 1284)	Records whether a connection was established to a specified server.

33.1.2.2 TCustomObjectBroker Methods

The methods of the TCustomObjectBroker class are listed here.

Public Methods

	Name	Description
	GetComputerForGUID (see page 1282)	Returns a string that identifies a server machine for an interface identified by its GUID.
	GetComputerForProgID (see page 1283)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetPortForComputer (see page 1283)	Returns a port number for connecting to a specified remote server.
	SetConnectStatus (see page 1284)	Records whether a connection was established to a specified server.

33.1.2.2.1 TCustomObjectBroker.GetComputerForGUID Method

Returns a string that identifies a server machine for an interface identified by its GUID.

Pascal

```
function GetComputerForGUID(GUID: TGUID): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetComputerForGUID(TGUID GUID) = 0;
```

Description

Call GetComputerForGUID to obtain a string that identifies a server machine on which a given interface is registered. The GUID parameter specifies the global unique identifier of the desired interface.

TCustomObjectBroker (see page 1281) declares GetComputerForGUID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components call this method, passing in the value of their ServerGUID property. They use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForProgID (see page 1283)

ServerGUID (see page 1301)

ComputerName (see page 1287)

Address

Host

URL

33.1.2.2.2 TCustomObjectBroker.GetComputerForProgID Method

Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.

Pascal

```
function GetComputerForProgID(const ProgID): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetComputerForProgID(const  ProgID) = 0;
```

Description

Call GetComputerForProgID to obtain the name or address of a server machine on which a given interface is registered. The ProgID parameter specifies the name of the desired interface. If the server was created using one of the remote data module wizards, this is the value that was entered as the class name for the wizard.

TCustomObjectBroker (see page 1281) declares GetComputerForProgID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components can call this method, passing in the value of their ServerName property. They can use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForGUID (see page 1282)

ServerName (see page 1301)

ComputerName (see page 1287)

Address

Host

URL

33.1.2.2.3 TCustomObjectBroker.GetPortForComputer Method

Returns a port number for connecting to a specified remote server.

Pascal

```
function GetPortForComputer(const ComputerName: string): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetPortForComputer(const UnicodeString ComputerName) = 0;
```

Description

Socket connection components call GetPortForComputer to get a value for their Port property. The ComputerName parameter specifies a Host name or IP address that was returned by GetComputerForGUID (see page 1282) or GetComputerForProgID (see page 1283).

None of the connection components that work on Linux explicitly use a Port number. GetPortForComputer is included in TCustomObjectBroker (see page 1281) to allow for the possibility of connection components that use an explicit Port number. The ComputerName parameter is a Host name or IP address that is returned by the GetComputerForGUID (see page 1282) or GetComputerForProgID (see page 1283) method.

TCustomObjectBroker (see page 1281) declares GetPortForComputer as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Note: This interface assumes that a single socket dispatcher on each server system handles all client requests, even when they are destined for different application servers on the same host.

See Also

GetComputerForProgID (see page 1283)

GetComputerForGUID (see page 1282)

Port

33.1.2.2.4 TCustomObjectBroker.SetConnectStatus Method

Records whether a connection was established to a specified server.

Pascal

```
procedure SetConnectStatus(ComputerName: string; Success: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SetConnectStatus(UnicodeString ComputerName, Boolean Success) = 0;
```

Description

After calling GetComputerForGUID (see page 1282) or GetComputerForProgID (see page 1283), connection components use the returned value to open a connection to the identified server. They then call SetConnectStatus to tell the broker whether the connection was successfully opened.

TCustomObjectBroker (see page 1281) declares SetConnectStatus as an abstract (pure virtual) method. Descendants override this method to keep track of when server machines are down or to monitor the number of connections created for each server.

See Also

GetComputerForGUID (see page 1282)

GetComputerForProgID (see page 1283)

33.1.3 TDCOMConnection Class

TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.

Class Hierarchy

Pascal

```
TDCOMConnection = class(TCOMConnection);
```

C++

```
class TDCOMConnection : public TCOMConnection;
```

File

MConnect

Description

TDCOMConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The DCOM connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TDCOMConnection uses DCOM to establish the initial connection between the client application and a remote application server. In order to do so, the application server must be registered on the client machine.

Once the connection is established, the client registers any or all of its client datasets with TDCOMConnection, and these client datasets use the IAppServer interface from the DCOM connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection instead. To connect to remote application servers using HTTP, use the TWebConnection component. To connect to application servers using SOAP, use TSoapConnection.

Specifying a Connection Using DCOM

33.1.3.1 TDCOMConnection Members

The following tables list the members exposed by TDCOMConnection.

Protected Methods

	Name	Description
	DoConnect (see page 1287)	Connects to an application server.
	DoDisconnect (see page 1292)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.

	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1280)	Sets the Connected (see page 1296) property.
	SetConnected (see page 1295)	Sets the Connected (see page 1296) property.

Public Methods

	Name	Description
	Create (see page 1286)	Creates and initializes a DCOM connection component.
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	ComputerName (see page 1287)	Specifies the name of the machine on which the application server is located.
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ObjectBroker (see page 1288)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.

33.1.3.2 TDCOMConnection.Create Constructor

Creates and initializes a DCOM connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDCOMConnection(TComponent * AOwner);
```

Description

Call Create to instantiate TDCOMConnection (see page 1284) at runtime. DCOM connection components placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually the form or data module) that is responsible for freeing the DCOM connection component.

33.1.3.3 TDCOMConnection Methods

The methods of the TDCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 1287)	Connects to an application server.

33.1.3.3.1 TDCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 1296) property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName (see page 1287) property. If the ObjectBroker (see page 1288) property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

See Also

AfterConnect

BeforeConnect

Connected (see page 1296)

AppServer

ComputerName (see page 1287)

ObjectBroker (see page 1300)

33.1.3.4 TDCOMConnection Properties

The properties of the TDCOMConnection class are listed here.

Published Properties

	Name	Description
	ComputerName (see page 1287)	Specifies the name of the machine on which the application server is located.
	ObjectBroker (see page 1288)	Specifies an Object Broker that allows the connection component to choose from several application servers.

33.1.3.4.1 TDCOMConnection.ComputerName Property

Specifies the name of the machine on which the application server is located.

Pascal

```
property ComputerName: string;
```

C++

```
__property UnicodeString ComputerName;
```

Description

Set ComputerName to the machine name of the computer where the application server resides. If ComputerName is blank (the default), TDCOMConnection (see page 1284) assumes the application server can be found on the user's machine or that the computer name can be derived from the system registry based on the DCOM configuration. If ComputerName is not blank, it overrides any system registry entries.

Normally the client and the application server run on different machines, so ComputerName must be set by the client application or available as part of the registry's DCOM configuration.

See Also

ServerName (see page 1301)

33.1.3.4.2 TDCOMConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

Brokering Connections

Specifying a Connection Using HTTP

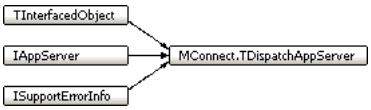
Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

33.1.4 TDispatchAppServer Class

Class Hierarchy



Pascal

```
TDispatchAppServer = class(TInterfacedObject, IAppServer, ISupportErrorInfo);
```

C++

```
class TDispatchAppServer : public TInterfacedObject, public IAppServer, public
ISupportErrorInfo;
```

File

MConnect

Description

This is class MConnect.TDispatchAppServer.

33.1.4.1 TDispatchAppServer Members

The following tables list the members exposed by TDispatchAppServer.

Public Methods

	Name	Description
	Create (see page 1289)	This is Create, a member of class TDispatchAppServer.
	SafeCallException (see page 1290)	Handles exceptions in methods declared using the safecall calling convention.

33.1.4.2 TDispatchAppServer.Create Constructor

Pascal

```
constructor Create(const AppServer: IAppServerDisp);
```

C++

```
__fastcall TDispatchAppServer(const IAppServerDisp AppServer);
```

Description

This is Create, a member of class TDispatchAppServer.

33.1.4.3 TDispatchAppServer Methods

The methods of the TDispatchAppServer class are listed here.

Public Methods

	Name	Description
	SafeCallException (see page 1290)	Handles exceptions in methods declared using the safecall calling convention.

33.1.4.3.1 TDispatchAppServer.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

System::TObject::SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur.

As implemented in System::TObject, System::TObject::SafeCallException simply returns E_UNEXPECTED. This is the appropriate response for classes that do no support interfaces

33.1.5 TDispatchConnection Class

TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.

Class Hierarchy

Pascal

```
TDispatchConnection = class(TCustomRemoteServer);
```

C++

```
class TDispatchConnection : public TCustomRemoteServer;
```

File

MConnect

Description

Do not create instances of TDispatchConnection. Instead, use TDispatchConnection as a base class when creating a custom component that forms a connection to a COM-based application server in a multi-tiered database application.

TDispatchConnection introduces the infrastructure for logging on to an application server, obtaining an IAppServer interface, calling the application server's interface, and managing a remote connection. Additionally, TCustomRemoteServer inherits the ability to work with one or more client datasets.

TDispatchConnection is not capable of connecting to an application server. This ability is added by descendants, which are specialized for different connection types. Once a connection is formed, however, TDispatchConnection makes the application server's IAppServer interface available to TClientDataSet components.

To enable a client application to connect to a COM-based application server, use a descendant of TDispatchConnection such as TSocketConnection, TWebConnection, or TDCOMConnection (see page 1284).

TWebConnection

TSoapConnection

33.1.5.1 TDispatchConnection Members

The following tables list the members exposed by TDispatchConnection.

Protected Methods

	Name	Description
	DoDisconnect (see page 1292)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.
	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1295)	Sets the Connected (see page 1296) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 1300)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 1291)	Creates an instance of a dispatch connection component.
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.

33.1.5.2 TDispatchConnection.Create Constructor

Creates an instance of a dispatch connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDispatchConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a dispatch connection component at runtime. Connection components placed in forms or data modules at design time are created automatically.

After calling the inherited constructor, Create initializes the LoginPrompt (see page 1296) property to false.

See Also

LoginPrompt

Create

33.1.5.3 TDispatchConnection Methods

The methods of the TDispatchConnection class are listed here.

Protected Methods

	Name	Description
	DoDisconnect (see page 1292)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.
	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1295)	Sets the Connected (see page 1296) property.

Public Methods

	Name	Description
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

33.1.5.3.1 TDispatchConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected (see page 1296) property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect

BeforeDisconnect

Connected (see page 1296)

AppServer

33.1.5.3.2 TDispatchConnection.GetConnected Method

Returns the value of the Connected (see page 1296) property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected implementation of the Connected (see page 1296) property. It uses the AppServer property (set by the DoConnect method of a TDispatchConnection (see page 1290) descendant) to determine whether a connection is established.

If a connection is established, GetConnected returns true. Otherwise, GetConnected returns false.

See Also

Connected (see page 1296)

DoConnect (see page 1280)

33.1.5.3.3 TDispatchConnection.GetServer Method

Returns the IAppServer interface of the application server.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Client datasets call GetServer to set the value of their AppServer property. This allows them to access providers on the remote application server.

GetServer ensures that there is a connection and then returns an IAppServer interface that can be used to communicate with providers on the application server. To use other methods of the application server's interface, use the AppServer property instead.

See Also

Connected (see page 1296)

AppServer

AppServer

33.1.5.3.4 TDispatchConnection.GetServerCLSID Method

Returns the GUID for the application server.

Pascal

```
function GetServerCLSID: TGUID;
```

C++

```
__fastcall TGUID GetServerCLSID();
```

Description

GetServerCLSID is used internally to obtain the GUID for the application server.

In most cases, GetServerCLSID returns the value of the ServerGUID (see page 1301) property. However, if the application server was specified using the ServerName (see page 1301) property, and the application server was not registered when the ServerName (see page 1301) property was set, ServerGUID (see page 1301) will not represent the application server's GUID. GetServerCLSID can return a GUID that only becomes available when a connection is opened.

If neither the ServerName (see page 1301) nor the ServerGUID (see page 1301) property is set, GetServerCLSID raises an exception.

See Also

ServerGUID (see page 1301)

ServerName (see page 1301)

33.1.5.3.5 TDispatchConnection.GetServerList Method

Returns a list of remote data modules to which the component can connect.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Connection components use GetServerList internally to fill the drop down list in the Object Inspector for the ServerName (see page 1301) property. GetServerList returns a variant array that lists all application servers that are on the local machine, registered in the system registry, or on the remote machine identified by the connection component.

See Also

ServerName (see page 1301)

33.1.5.3.6 TDispatchConnection.Notification Method

Responds when other objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically so objects can make internal adjustments when components are created or destroyed. TDispatchConnection (see page 1290) overrides the inherited method to set the ObjectBroker (see page 1300) property to nil (Delphi) or NULL (C++) when it receives notification that that object is about to be destroyed.

See Also

ObjectBroker (see page 1300)

33.1.5.3.7 TDispatchConnection.SetConnected Method

Sets the Connected (see page 1296) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 1296) property. It establishes a connection to the Application server if Value is true, and disconnects from the application server if Value is false.

If Value is false, SetConnected generates a BeforeDisconnect (see page 1303) event, closes the connection, and generates an AfterDisconnect (see page 1302) event.

If Value is true, SetConnected performs the following actions:

1. If LoginPrompt (see page 1296) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 1304) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
2. It generates a BeforeConnect (see page 1303) event.
3. It opens the connection.
4. It generates an AfterConnect (see page 1302) event.
5. If LoginPrompt (see page 1296) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 1304) event.

33.1.5.4 TDispatchConnection Properties

The properties of the TDispatchConnection class are listed here.

Protected Properties

	Name	Description
	ObjectBroker (see page 1300)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Published Properties

	Name	Description
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.

33.1.5.4.1 TDispatchConnection.Connected Property

Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.

Pascal

```
property Connected;
```

C++

```
__property Connected;
```

Description

Set Connected to true to establish a connection to the application server. Set Connected to false to terminate the connection.

When changing the value of Connected, TDispatchConnection (see page 1290) generates a BeforeConnect (see page 1303) and an AfterConnect (see page 1302) event, or a BeforeDisconnect (see page 1303) and an AfterDisconnect (see page 1302) event. In addition, when setting Connected to true, TDispatchConnection (see page 1290) may display a login dialog, depending on the value of LoginPrompt (see page 1296).

The Connected property uses the protected DoConnect and DoDisconnect (see page 1292) methods to connect to or disconnect from an application server. Descendants of TDispatchConnection (see page 1290) override DoConnect and DoDisconnect (see page 1292) to change the way the connection is formed or terminated.

See Also

DoDisconnect (see page 1292)

LoginPrompt

AfterConnect

AfterDisconnect

BeforeConnect

BeforeDisconnect

DoConnect (see page 1280)

33.1.5.4.2 TDispatchConnection.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt;
```

C++

```
__property LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER_NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

C++ Examples:

```
//
//This example demostrates the use of ADO for database conectivity.
//Example assumes that a TDBGrid is placed on the form.
//
void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Login details */
    String UserName = "db_user_name";
    String PassWord = "db_pass_word";
    String Server = "my.db.server";

    /* Connection String */
    String ConnString =
        "Provider=SQLOLEDB.1;Persist Security Info=False;";
    ConnString +=
        "User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;";
    ConnString +=
        "Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;";
    ConnString +=
```

```
        "Tag with column collation when possible=False";

    /* SQL Query */
    String SQLStr = "SELECT * FROM customer WHERE customer_id = :AnId;";

    /* All ADO variables */
    TADOConnection* ADOConn;
    TADOQuery* ADOQuery;
    TDataSource* DataSrc;
    TParameter* Param;

    /* Create an ADO connection */
    ADOConn = new TADOConnection(this);

    /* Setup the connection string */
    ADOConn->ConnectionString = Format(ConnString,
        ARRAYOFCONST((UserName, PassWord, Server)));

    /* Disable login prompt */
    ADOConn->LoginPrompt = False;

    try
    {
        ADOConn->Connected = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                   TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the query */
    ADOQuery = new TADOQuery(this);
    ADOQuery->Connection = ADOConn;
    ADOQuery->SQL->Add(SQLStr);

    /* Update the parameter that was parsed from the SQL query: AnId */
    Param = ADOQuery->Parameters->ParamByName("AnId");
    Param->DataType = ftInteger;
    Param->Value = 1;

    /* Set the query to Prepared - will improve performance */
    ADOQuery->Prepared = true;

    try
    {
        ADOQuery->Active = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                   TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the data source */
    DataSrc = new TDataSource(this);
    DataSrc->DataSet = ADOQuery;
    DataSrc->Enabled = true;

    /* Finally initilalize the grid */
    DBGrid1->DataSource = DataSrc;
}
```

Delphi Examples:

```
{
This example demostrates the use of ADO for database conectivity.
Example assumes that a TDBGrid is placed on the form.
}
procedure TForm2.FormCreate(Sender: TObject);
const
  { Connection string }
  ConnString =
  'Provider=SQLOLEDB.1;Persist Security Info=False;' +
  'User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;' +
  'Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;'+
  'Tag with column collation when possible=False';

  { SQL Query }
  SQLStr = 'SELECT * FROM customer WHERE customer_id = :AnId;';

  { User access }
  UserName = 'db_user_name';
  PassWord = 'db_pass_word';
  Server = 'my.db.server';

var
  ADOConn  : TADOConnection;
  ADOQuery : TADOQuery;
  DataSrc  : TDataSource;
  Param    : TParameter;

begin
  { Create an ADO connection }
  ADOConn := TADOConnection.Create(Self);
  { Setup the provider engine }

  { Setup the connection string }
  ADOConn.ConnectionString := Format(ConnString,
    [UserName, PassWord, Server]);

  { Disable login prompt }
  ADOConn.LoginPrompt := False;

  try
    ADOConn.Connected := True;
  except
    on e: EADOError do
    begin
      MessageDlg('Error while connecting', mtError,
                 [mbOK], 0);

      Exit;
    end;
  end;

  { Create the query }
  ADOQuery := TADOQuery.Create(Self);
  ADOQuery.Connection := ADOConn;
  ADOQuery.SQL.Add(SQLStr);

  { Update the parameter that was parsed from the SQL query: AnId }
  Param := ADOQuery.Parameters.ParamByName('AnId');
  Param.DataType := ftInteger;
  Param.Value := 1;

  { Set the query to Prepared - will improve performance }
  ADOQuery.Prepared := true;

  try
    ADOQuery.Active := True;
```

```
    except
      on e: EADOError do
      begin
        MessageDlg('Error while doing query', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the data source }
    DataSrc := TDataSource.Create(Self);
    DataSrc.DataSet := ADOQuery;
    DataSrc.Enabled := true;

    { Finally initilalize the grid }
    DBGrid1.DataSource := DataSrc;
  end;
```

Controlling Server Login

33.1.5.4.3 TDispatchConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName (see page 1301) or ServerGUID (see page 1301). When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection (see page 1290) define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker (see page 1281).

ServerName (see page 1301)

ServerGUID (see page 1301)

TSimpleObjectBroker (see page 2475)

Brokering Connections

Specifying a Connection Using HTTP

Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

33.1.5.4.4 TDispatchConnection.ServerGUID Property

Specifies the GUID of the application server with which to connect.

Pascal

```
property ServerGUID: string;
```

C++

```
__property UnicodeString ServerGUID;
```

Description

Use ServerGUID to specify the application server to which the client application should connect by its GUID (global unique identifier). If the value specifies a valid GUID for a registered application server, setting ServerGUID changes the value of ServerName (see page 1301) to the class name of the corresponding COM object.

Using ServerGUID rather than ServerName (see page 1301) to identify the application server is more robust because it does not require the application server to be registered on the client system.

Note: Either ServerName (see page 1301) or ServerGUID must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object.

See Also

ServerName (see page 1301)

Connecting to the Application Server

Connecting to the Application Server using DataSnap Components

33.1.5.4.5 TDispatchConnection.ServerName Property

Specifies the name of the application server with which to connect.

Pascal

```
property ServerName: string;
```

C++

```
__property UnicodeString ServerName;
```

Description

Use ServerName to specify the name of the application server to which the client application should connect. At design time, the Object Inspector provides a drop-down list of all available servers if one of the following conditions is met:

For DCOM and OLEnterprise connections, the servers must be registered in the system Registry (see page 3235).

For Socket connections, ScktSrvr.exe must be running on the server machine.

For Web connections, the connection component must have an URL for locating httpsrvr.dll.

If ServerName specifies a valid name for a registered application server, setting ServerName sets the ServerGUID (see page 1301) property to the GUID that corresponds to the named application server.

Note: Either ServerName or ServerGUID (see page 1301) must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object. Using ServerGUID (see page 1301) rather than ServerName to identify the application server is more robust because it does not require the application server to be registered on the client system when using a COM-based connection.

ServerGUID (see page 1301)

Connecting to the Application Server

33.1.5.5 TDispatchConnection Events

The events of the TDispatchConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

33.1.5.5.1 TDispatchConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect

Connected

Connecting to a Database Server

33.1.5.5.2 TDispatchConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect;
```

C++

```
__property AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

Connected

Connecting to a Database Server

33.1.5.5.4 TDispatchConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
```

```
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

Disconnecting from a Database Server

33.1.5.5.5 TDispatchConnection.OnGetUsername Event

Occurs immediately before the remote login dialog.

Pascal

```
property OnGetUsername;
```

C++

```
__property OnGetUsername;
```

Description

Write an OnGetUsername event handler to initialize the user name in the remote login dialog that appears when the LoginPrompt property is true. Set the Username parameter to provide the initial value for the user name. If no OnGetUsername event handler is provided, the user name is initialized to an empty string.

The remote login dialog occurs immediately before a new connection is established to the application server. If the user cancels from that dialog, the connection attempt is aborted.

Note: The OnGetUsername event does not occur unless the LoginPrompt property is true.

See Also

LoginPrompt

OnLogin

33.1.5.5.6 TDispatchConnection.OnLogin Event

Occurs when a communication channel opens to the server.

Pascal

```
property OnLogin;
```

C++

```
__property OnLogin;
```

Description

OnLogin occurs when connections are opened if the LoginPrompt property is true.

For DataSnap SOAP connection components, the following sequence of events occurs when opening a connection to an application server:

1. An OnGetUsername event occurs, where the application can supply an initial user name for the login dialog.
2. The login dialog appears, where the user can supply a user name and password.

3. A BeforeConnect event occurs, the connection is opened, and an AfterConnect event occurs.
4. The OnLogin event occurs, where you can write code to log in to the application server using the username and password that were provided in the remote login dialog.

   Note: Do not use the OnLogin event if the connection component provides a different scheme for logging in. For example, TWebConnection uses the Username and Password properties instead.

   For ADO connection components, the following sequence of events occurs when opening a connection to an application server:

1. A BeforeConnect event occurs.

2. An OnWillConnect event occurs, where the application can supply an initial user name and password for the login dialog, as well as the connection options and status.

3. The login dialog appears, where the user can supply a user name and password.

4. The OnLogin event occurs, where you can write code to respond to the user-supplied values. (For example, you could convert an application-specific user name and password to database user name and password).

5. The connection is opened, and an AfterConnect event occurs.

Note: Some

C connection components that do not connect to an application server in a multitiered database application replace the OnLogin event defined in TCustomConnection with a different event that occurs before a connection is established.

33.1.6 TOLEnterpriseConnection Class

TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.

Class Hierarchy

Pascal

```
TOLEnterpriseConnection = class(TCOMConnection);
```

C++

```
class TOLEnterpriseConnection : public TCOMConnection;
```

File

MConnect

Description

TOLEnterpriseConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server using OLEnterprise. This component is provided for backward compatibility.

TOLEnterpriseConnection establishes the initial connection between the client application and a remote application server using OLEnterprise. Once the connection is established, the client registers any or all of its client datasets with the remote server, and these client datasets use the IAppServer interface from the OLEnterprise connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection (see page 1284) component instead. To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection. To connect client applications to remote application servers using HTTP, use TWebConnection. To connect to remote application servers using SOAP, use TSOAPConnection.

33.1.6.1 TOLEnterpriseConnection Members

The following tables list the members exposed by TOLEnterpriseConnection.

Protected Methods

	Name	Description
	DoConnect (see page 1307)	Establishes a connection to the application server.
	DoDisconnect (see page 1292)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.
	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1280)	Sets the Connected (see page 1296) property.
	SetConnected (see page 1295)	Sets the Connected (see page 1296) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 1300)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 1291)	Creates an instance of a dispatch connection component.
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	BrokerName (see page 1308)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 1308)	Specifies the name of the machine on which the application server is located.
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.

33.1.6.2 TOLEnterpriseConnection Methods

The methods of the TOLEnterpriseConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 1307)	Establishes a connection to the application server.

33.1.6.2.1 TOLEnterpriseConnection.DoConnect Method

Establishes a connection to the application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 1296) property is set to true. DoConnect obtains the interface of the remote data module on the application server using OLEnterprise runtime. This interface can then be used to obtain interfaces for the providers on the application server or to make interface calls to the remote data module.

See Also

AfterConnect

BeforeConnect

Connected (see page 1296)

AppServer

33.1.6.3 TOLEnterpriseConnection Properties

The properties of the TOLEnterpriseConnection class are listed here.

Published Properties

	Name	Description
	BrokerName (see page 1308)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 1308)	Specifies the name of the machine on which the application server is located.

33.1.6.3.1 TOLEnterpriseConnection.BrokerName Property

Specifies the name of the Business Object Broker that locates the application server.

Pascal

```
property BrokerName: string;
```

C++

```
__property UnicodeString BrokerName;
```

Description

Use BrokerName to specify the OLEnterprise Business Object Broker with which the application server is registered. The Business Object Broker locates an available application server with the name specified by the ServerName (see page 1301) property.

If you are not using the Business Object Broker, use the ComputerName (see page 1308) property instead. You must specify a value for either BrokerName or ComputerName (see page 1308):

Note: Setting the value of BrokerName changes the ComputerName (see page 1308) property to blank, and vice versa.

See Also

ServerName (see page 1301)

ComputerName (see page 1308)

33.1.6.3.2 TOLEnterpriseConnection.ComputerName Property

Specifies the name of the machine on which the application server is located.

Pascal

```
property ComputerName: string;
```

C++

```
__property UnicodeString ComputerName;
```

Description

Use ComputerName to specify the machine where the application server resides if you are not using the Business Object Broker. If you are not using the Business Object Broker and ComputerName is blank (the default), TOLEnterpriseConnection (see page 1305) assumes the application server can be found on the user's machine or that the computer name can be derived from the system registry based on the DCOM configuration. If ComputerName is not blank, it overrides any system registry entries.

If you are using the Business Object Broker, use the BrokerName (see page 1308) property instead. BrokerName (see page 1308) and ComputerName are mutually exclusive: Setting the value of ComputerName changes the BrokerName (see page

1308) property to blank, and vice versa.

See Also

ServerName (see page 1301)

BrokerName (see page 1308)

33.1.7 TSharedConnection Class

TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Class Hierarchy

Pascal

```
TSharedConnection = class(TCustomRemoteServer);
```

C++

```
class TSharedConnection : public TCustomRemoteServer;
```

File

MConnect

Description

TSharedConnection manages a connection to a "child" remote data module that is managed by a single main remote data module on an application server. The client application does not connect directly to the "child" remote data module. Rather, it uses a single connection to the main remote data module on the server machine, and that main remote data module dispatches calls to the IAppServer interface of other "child" data modules. This allows the client application to use a single connection rather than one connection for each remote data module on the application server.

On the server-side, the interface for the child remote data module is surfaced as a property of the main remote data module's interface. The TSharedConnection component uses this property name to indicate which child remote data module is the actual target of its connection.

TSharedConnection uses a TDispatchConnection (see page 1290) descendant (TDCOMConnection (see page 1284), TWebConnection, or TSocketConnection) to form the connection to the main remote data module on the application server. When you use TSharedConnection to open a connection, it causes the associated dispatch connection to connect to the main remote data module if it has not already done so. When you close the connection maintained by TSharedConnection, however, it severs only the connection to the child remote data module, leaving the connection to the main remote data module open in case other components on the client application are still using it.

TSocketConnection

TWebConnection

TDCOMConnection (see page 1284)

Connecting to an Application Server That Uses Multiple Data Modules

33.1.7.1 TSharedConnection Members

The following tables list the members exposed by TSharedConnection.

Protected Methods

	Name	Description
	ConnectEvent (see page 1311)	This is ConnectEvent, a member of class TSharedConnection.
	DoConnect (see page 1311)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 1312)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 1312)	Returns the value of the Connected property.
	Notification (see page 1313)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	Destroy (see page 1311)	Destroys the TSharedConnection (see page 1309) instance.
	GetServer (see page 1313)	Returns the IAppServer interface of the child remote data module.

Published Events

	Name	Description
	AfterConnect (see page 1315)	Occurs after a connection is established.
	AfterDisconnect (see page 1315)	Occurs after the connection closes.
	BeforeConnect (see page 1315)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1316)	Occurs immediately before the connection closes.

Published Methods

	Name	Description
	Create (see page 1310)	Creates an instance of a remote server component.

Published Properties

	Name	Description
	ChildName (see page 1314)	Identifies the child remote data module on the application server with which you want to communicate.
	ParentConnection (see page 1314)	Specifies the connection component that establishes a connection to the main remote data module on the application server.

33.1.7.2 TSharedConnection.Create Constructor

Creates an instance of a remote server component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSharedConnection(TComponent * AOwner);
```

Description

Create instantiates an instance of a remote server component and initializes its properties.

AOwner is the component that is responsible for freeing the TCustomRemoteServer instance. It becomes the value of the Owner property.

See Also

Create

Owner

33.1.7.3 TSharedConnection.Destroy Destructor

Destroys the TSharedConnection (see page 1309) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSharedConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the reference to the shared connection component is not nil before calling Destroy

See Also

System::TObject::Free

33.1.7.4 TSharedConnection Methods

The methods of the TSharedConnection class are listed here.

Protected Methods

	Name	Description
	ConnectEvent (see page 1311)	This is ConnectEvent, a member of class TSharedConnection.
	DoConnect (see page 1311)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 1312)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 1312)	Returns the value of the Connected property.
	Notification (see page 1313)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	GetServer (see page 1313)	Returns the IAppServer interface of the child remote data module.

33.1.7.4.1 TSharedConnection.ConnectEvent Method

Pascal

```
procedure ConnectEvent(Sender: TObject; Connecting: Boolean);
```

C++

```
__fastcall ConnectEvent(TObject * Sender, Boolean Connecting);
```

Description

This is ConnectEvent, a member of class TSharedConnection.

33.1.7.4.2 TSharedConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected

DoDisconnect

33.1.7.4.3 TSharedConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected

DoConnect

33.1.7.4.4 TSharedConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected

SetConnected

33.1.7.4.5 TSharedConnection.GetServer Method

Returns the IAppServer interface of the child remote data module.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Call GetServer to obtain the interface of the remote data module on the application server. GetServer returns the IAppServer interface of the same remote data module as the one whose interface is the value of the AppServer property. Client applications can communicate directly with the child remote data module through this interface.

See Also

AppServer

33.1.7.4.6 TSharedConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

33.1.7.5 TSharedConnection Properties

The properties of the TSharedConnection class are listed here.

Published Properties

	Name	Description
	ChildName (see page 1314)	Identifies the child remote data module on the application server with which you want to communicate.
	ParentConnection (see page 1314)	Specifies the connection component that establishes a connection to the main remote data module on the application server.

33.1.7.5.1 TSharedConnection.ChildName Property

Identifies the child remote data module on the application server with which you want to communicate.

Pascal

```
property ChildName: String;
```

C++

```
__property UnicodeString ChildName;
```

Description

Set ChildName to the name of the property on the application server's main remote data module that exposes the interface for the desired child remote data module. TSharedConnection (see page 1309) uses this property to obtain the interface for the child remote data module, which it sets as the value of the AppServer property.

See Also

AppServer

ParentConnection (see page 1314)

33.1.7.5.2 TSharedConnection.ParentConnection Property

Specifies the connection component that establishes a connection to the main remote data module on the application server.

Pascal

```
property ParentConnection: TDispatchConnection;
```

C++

```
__property TDispatchConnection ParentConnection;
```

Description

Set ParentConnection to a connection component that connects to the main remote data module on the application server. TSharedConnection (see page 1309) uses this component's connection for communicating to the child remote data module.

The main remote data module with which ParentConnection communicates must expose the interface for the child remote data module as a property on its IAppServer interface.

See Also

AppServer

ChildName (see page 1314)

33.1.7.6 TSharedConnection Events

The events of the TSharedConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 1315)	Occurs after a connection is established.
	AfterDisconnect (see page 1315)	Occurs after the connection closes.
	BeforeConnect (see page 1315)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1316)	Occurs immediately before the connection closes.

33.1.7.6.1 TSharedConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect

Connected

Connecting to a Database Server

33.1.7.6.2 TSharedConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect;
```

C++

```
__property AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect

Connected

Disconnecting from a Database Server

33.1.7.6.3 TSharedConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect;
```

C++

```
__property BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect

Connected

Connecting to a Database Server

33.1.7.6.4 TSharedConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

33.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetMIDASAppServerList (see page 1317)	This is function MConnect.GetMIDASAppServerList.

33.2.1 MConnect.GetMIDASAppServerList Function

Pascal

```
procedure GetMIDASAppServerList(List: TStringList; const RegCheck: string);
```

C++

```
GetMIDASAppServerList(TStringList List, const UnicodeString RegCheck);
```

File

MConnect

Description

This is function MConnect.GetMIDASAppServerList.

34 Menus Namespace

This is namespace Menus.

Topics

Name	Description
Classes (see page 1321)	The following table lists classes in this documentation.
Functions (see page 1446)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 1460)	The following table lists structs, records, enums in this documentation.
Types (see page 1465)	The following table lists types in this documentation.
Variables (see page 1470)	The following table lists variables in this documentation.
Constants (see page 1472)	The following table lists constants in this documentation.

Classes

	Name	Description
	EMenuError (see page 1321)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 1322)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 1331)	TMenu is the base type for menu components such as TMainMenu (see page 1322) and TPopupMenu (see page 1430).
	TMenuActionLink (see page 1352)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 1363)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 1424)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 1426)	This is class Menus.TMenuItemStack.
	TPopupList (see page 1427)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 1430)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Constants

Name	Description
cDialogSuffix (see page 1472)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 1472)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 1472)	This is constant Menus.cLineCaption.

Functions

	Name	Description
	AnsiSameCaption (see page 1446)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

	DrawMenuItem (see page 1447)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 1447)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 1447)	This is function Menus.IsAltGRPressed.
	NewItem (see page 1448)	Creates and initializes a menu item.
	NewLine (see page 1449)	Creates a menu item for a separator.
	NewMenu (see page 1450)	Creates and initializes a main menu.
	NewPopupMenu (see page 1451)	Creates and initializes a popup menu.
	NewSubMenu (see page 1452)	Creates and initializes a menu item that represents a submenu.
	SameCaption (see page 1453)	This is function Menus.SameCaption.
	ShortCut (see page 1453)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 1454)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 1454)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 1456)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 1457)	Removes the accelerator character marker from a string.
	TextToShortCut (see page 1457)	Creates a menu shortcut from a text string.

Structs, Records, Enums

	Name	Description
	TFindItemKind (see page 1460)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 1461)	TMenuAnimation (see page 1466) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 1461)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 1462)	TMenuItemAutoFlag and TMenuAutoFlag (see page 1467) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 1463)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 1463)	TTrackButton specifies which mouse button activates a tool button menu.

Types

Name	Description
PMenuItem (see page 1465)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 1465)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 1466)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 1466)	TMenuAnimation and TMenuAnimations (see page 1461) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 1467)	TMenuItemAutoFlag (see page 1462) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 1467)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 1468)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuHandle (see page 1468)	This is type Menus.TMenuHandle.
TMenuMeasureItemEvent (see page 1469)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Variables

Name	Description
PopupList (see page 1470)	Provides centralized handling of Windows messages directed at popup menus.
ShortCutItems (see page 1470)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 1471)	Determines what accelerator keys can be automatically assigned to a menu item caption.

34.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMenuError (see page 1321)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 1322)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 1331)	TMenu is the base type for menu components such as TMainMenu (see page 1322) and TPopupMenu (see page 1430).
	TMenuActionLink (see page 1352)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 1363)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 1424)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 1426)	This is class Menus.TMenuItemStack.
	TPopupList (see page 1427)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 1430)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

34.1.1 EMenuError Class

EMenuError is the exception class for errors involving menu items.

Class Hierarchy

Pascal

```
EMenuError = class(Exception);
```

C++

```
class EMenuError : public Exception;
```

File

Menus

Description

EMenuError is raised if an error occurs while an application is working with menu items. For example, an EMenuError exception occurs if

An application tries to delete an item from an empty menu

A menu item attempts to insert itself into it's own list of items

An application attempts to reference a menu that does not exist

An application specifies an invalid GroupIndex for a menu item

See Also

TMenuItem (see page 1363)

TMenu (see page 1331)

34.1.2 TMainMenu Class

TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.

Class Hierarchy

Pascal

```
TMainMenu = class(TMenu);
```

C++

```
class TMainMenu : public TMenu;
```

File

Menus

Description

Use TMainMenu to provide the main menu for a form. To begin designing a menu, add a main menu to a form, and double-click the component.

TMainMenu introduces properties and methods for merging the drop-down menus of the main menu with the main menu of another form.

TMainMenu introduces properties and methods for assisting in the menu negotiation process of an OLE container.

Tip: To create a menu that users can configure at runtime, use the TActionMainMenuBar component with an action manager instead.

See Also

TMenuItem (see page 1363)

TPopupMenu (see page 1430)

TActionMainMenuBar

TActionManager

34.1.2.1 TMainMenu Members

The following tables list the members exposed by TMainMenu.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 1335)	Applies the BiDiMode (see page 1344) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 1336)	Updates the menu when the BiDiMode (see page 1344) property changes.
	DoChange (see page 1336)	Generates an OnChange (see page 1352) event.
	DoGetMenuString (see page 1337)	Returns the caption for an item in the menu.
	GetHandle (see page 1324)	Returns the value of the Handle property.
	IsOwnerDraw (see page 1339)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 1340)	Calls the DoChange (see page 1336) method when the menu is first loaded into memory.
	MenuChanged (see page 1325)	Responds when the menu changes.

	Notification (see page 1341)	Responds when components are added or deleted.
	SetChildOrder (see page 1342)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 1343)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	Create (see page 1333)	Creates an instance of TMenu (see page 1331).
	CreateMenuItem (see page 1335)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 1334)	Destroys the menu component.
	DispatchCommand (see page 1335)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 1336)	Dispatches a pop-up menu command.
	FindItem (see page 1337)	Locates and returns a menu item.
	GetChildren (see page 1338)	Executes a callback for child menu items.
	GetHelpContext (see page 1338)	Returns the help context ID associated with a menu item.
	GetOle2AcceleratorTable (see page 1324)	Returns the main menu's accelerator table.
	IsRightToLeft (see page 1339)	Indicates whether menu items read from right to left.
	IsShortCut (see page 1339)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	Merge (see page 1325)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	ParentBiDiModeChanged (see page 1341)	This is the overview for the ParentBiDiModeChanged method overload.
	PopulateOle2Menu (see page 1326)	Populates an OLE menu with items from the main menu.
	ProcessMenuChar (see page 1342)	Responds to keyboard input for the menu.
	SetOle2MenuHandle (see page 1326)	Associates the handle for an OLE menu with the main menu.
	Unmerge (see page 1326)	Reverses the merging of two menus in a non-MDI application.

Public Properties

	Name	Description
	Handle (see page 1345)	Provides access to the Windows menu handle for the menu.
	WindowHandle (see page 1351)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 1331)	Occurs when the menu changes.

Published Properties

	Name	Description
	AutoHotkeys (see page 1327)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1328)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoMerge (see page 1328)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 1329)	Determines the layout of the menu in Middle East locales.
	Images (see page 1329)	Lists the images that can appear beside individual menu items.
	Items (see page 1346)	Describes the elements of the menu.
	OwnerDraw (see page 1330)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1330)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.

34.1.2.2 TMainMenu Methods

The methods of the TMainMenu class are listed here.

Protected Methods

	Name	Description
	GetHandle (see page 1324)	Returns the value of the Handle property.
	MenuChanged (see page 1325)	Responds when the menu changes.

Public Methods

	Name	Description
	GetOle2AcceleratorTable (see page 1324)	Returns the main menu's accelerator table.
	Merge (see page 1325)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	PopulateOle2Menu (see page 1326)	Populates an OLE menu with items from the main menu.
	SetOle2MenuHandle (see page 1326)	Associates the handle for an OLE menu with the main menu.
	Unmerge (see page 1326)	Reverses the merging of two menus in a non-MDI application.

34.1.2.2.1 TMainMenu.GetHandle Method

Returns the value of the Handle property.

Pascal

```
function GetHandle: HMENU; override;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle property. Override this method to change the implementation of the handle property. For example, TMainMenu overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 1345)

34.1.2.2.2 TMainMenu.GetOle2AcceleratorTable Method

Returns the main menu's accelerator table.

Pascal

```
procedure GetOle2AcceleratorTable(var AccelTable: HAccel; var AccelCount: Integer; const
Groups: array of Integer);
```

C++

```
__fastcall GetOle2AcceleratorTable(HAccel AccelTable, int AccelCount, const array of Integer
Groups);
```

Description

Call GetOle2AcceleratorTable to obtain a handle to an accelerator table for all menu items with a GroupIndex value that appears in the Groups parameter. The AccelTable parameter is set to the accelerator table handle, and the AccelCount is set to the number of entries in the table. GetOle2AcceleratorTable is used by OLE containers when merging menus.

See Also

GroupIndex (see page 1408)

ShortCut (see page 1415)

34.1.2.2.3 TMainMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); override;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange method, which generates an OnChange event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems method instead of MenuChanged. For example, when the Images property changes, UpdateItems is called rather than MenuChanged.

See Also

Items (see page 1346)

UpdateItems (see page 1343)

DoChange (see page 1336)

34.1.2.2.4 TMainMenu.Merge Method

Combines the main menu of one form with the main menu of another in non-MDI applications.

Pascal

```
procedure Merge(Menu: TMainMenu);
```

C++

```
__fastcall Merge(TMainMenu Menu);
```

Description

Call Merge to merge another main menu with this one. Specify the menu you want merged with this menu as the Menu parameter.

For example, to use the main menu of the first form in an application as the main menu for the application, call Merge to merge the main menu of any additional forms in the application with the main menu of the first form.

Depending on the value of the GroupIndex property of menu items on the main menu, the merged menu items can replace menu items on the menu bar, or insert menu items into the menu bar. See GroupIndex for information on how to do these things.

To merge and unmerge main menus automatically when other forms are displayed, change the value of the AutoMerge (see page 1328) property to true on all forms whose menus should be merged in.

See Also

AutoMerge (see page 1328)

GroupIndex (see page 1408)

Unmerge (see page 1326)

34.1.2.2.5 TMainMenu.PopulateOle2Menu Method

Populates an OLE menu with items from the main menu.

Pascal

```
procedure PopulateOle2Menu(SharedMenu: HMenu; const Groups: array of Integer; var Widths:
array of Longint);
```

C++

```
__fastcall PopulateOle2Menu(HMenu SharedMenu, const array of Integer Groups, array of Longint
Widths);
```

Description

Call PopulateOle2Menu to merge the menu items with GroupIndex values specified by the Groups parameter into the menu that uses the SharedMenu handle. PopulateOle2Menu appends all menu items in the specified groups to the menu, and increments the corresponding entries in the Widths array for every menu item appended. PopulateOle2Menu is used by OLE containers when merging menus.

Note: PopulateOle2Menu populates the menu specified by the SharedMenu parameter but does not set this as the OLE menu associated with the menu.

See Also

GetOle2AcceleratorTable (see page 1324)

SetOle2MenuHandle (see page 1326)

GroupIndex (see page 1408)

34.1.2.2.6 TMainMenu.SetOle2MenuHandle Method

Associates the handle for an OLE menu with the main menu.

Pascal

```
procedure SetOle2MenuHandle(Handle: HMENU);
```

C++

```
__fastcall SetOle2MenuHandle(HMENU Handle);
```

Description

Call SetOle2MenuHandle to temporarily replace the menu of a form with the menu represented by the Handle (see page 1345) parameter. To restore the original menu, call SetOle2MenuHandle with the Handle (see page 1345) parameter set to 0. SetOle2MenuHandle allows an OLE container to use menu items provided by an OLE server.

See Also

GetOle2AcceleratorTable (see page 1324)

PopulateOle2Menu (see page 1326)

34.1.2.2.7 TMainMenu.Unmerge Method

Reverses the merging of two menus in a non-MDI application.

Pascal

```
procedure Unmerge(Menu: TMainMenu);
```

C++

```
__fastcall Unmerge(TMainMenu Menu);
```

Description

Call Unmerge to remove items from another main menu that were added using the Merge (see page 1325) method. The Menu parameter is the merged menu whose items should be removed from the main menu.

See Also

AutoMerge (see page 1328)

Merge (see page 1325)

34.1.2.3 TMainMenu Properties

The properties of the TMainMenu class are listed here.

Published Properties

	Name	Description
	AutoHotkeys (see page 1327)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1328)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoMerge (see page 1328)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 1329)	Determines the layout of the menu in Middle East locales.
	Images (see page 1329)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 1330)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1330)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.

34.1.2.3.1 TMainMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its

Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 1394)

Items (see page 1346)

RethinkHotkeys (see page 1388)

34.1.2.3.2 TMainMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 1395)

Items (see page 1346)

RethinkLines (see page 1389)

34.1.2.3.3 TMainMenu.AutoMerge Property

Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.

Pascal

```
property AutoMerge: Boolean;
```

C++

```
__property Boolean AutoMerge;
```

Description

To merge a form's menus with the main menu in the main form, set the AutoMerge property of each main menu you want merged to true. Make sure that the AutoMerge property of the main menu of the main form (the one other menus are merged

into) remains false. How menus merge depends on the value of the GroupIndex property for each menu item.

If the application is an MDI application (the FormStyle properties are set so the main form is a parent form and subsequent forms are child forms), menu merging occurs automatically without using the AutoMerge property.

See Also

FormStyle

GroupIndex (see page 1408)

Merge (see page 1325)

34.1.2.3.4 TMainMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 1351)

IsRightToLeft (see page 1339)

34.1.2.3.5 TMainMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 1411)

Images

Items (see page 1346)

34.1.2.3.6 TMainMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 1423)

OnDrawItem (see page 1422)

Images (see page 1345)

34.1.2.3.7 TMainMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 1344)

34.1.2.4 TMainMenu Events

The events of the TMainMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 1331)	Occurs when the menu changes.

34.1.2.4.1 TMainMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 1346)

34.1.3 TMenu Class

TMenu is the base type for menu components such as TMainMenu (see page 1322) and TPopupMenu (see page 1430).

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TMenu = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TMenu : public TComponent;
```

File

Menus

Description

Use TMenu as a base class when defining a component that represents a collection of menu items. TMenu introduces properties and methods to create a Windows menu that represents a set of menu items, dispatch commands associated with those menu items, and locate the help context id for any of those menu items.

See Also

TMainMenu (see page 1322)

34.1.3.1 TMenu Members

The following tables list the members exposed by TMenu.

Protected Events

	Name	Description
	OnChange (see page 1352)	Occurs when the menu changes.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 1335)	Applies the BiDiMode (see page 1344) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 1336)	Updates the menu when the BiDiMode (see page 1344) property changes.
	DoChange (see page 1336)	Generates an OnChange (see page 1352) event.
	DoGetMenuString (see page 1337)	Returns the caption for an item in the menu.
	GetHandle (see page 1338)	Returns the value of the Handle (see page 1345) property.
	IsOwnerDraw (see page 1339)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 1340)	Calls the DoChange (see page 1336) method when the menu is first loaded into memory.
	MenuChanged (see page 1340)	Responds when the menu changes.
	Notification (see page 1341)	Responds when components are added or deleted.
	SetChildOrder (see page 1342)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 1343)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	Create (see page 1333)	Creates an instance of TMenu (see page 1331).
	CreateMenuItem (see page 1335)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 1334)	Destroys the menu component.
	DispatchCommand (see page 1335)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 1336)	Dispatches a pop-up menu command.
	FindItem (see page 1337)	Locates and returns a menu item.
	GetChildren (see page 1338)	Executes a callback for child menu items.
	GetHelpContext (see page 1338)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 1339)	Indicates whether menu items read from right to left.
	IsShortCut (see page 1339)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 1341)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 1342)	Responds to keyboard input for the menu.

Public Properties

	Name	Description
	AutoHotkeys (see page 1343)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1344)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 1344)	Determines the layout of the menu in Middle East locales.
	Handle (see page 1345)	Provides access to the Windows menu handle for the menu.
	Images (see page 1345)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 1350)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1351)	Indicates whether the BiDiMode (see page 1344) property is inherited from the control that uses the menu.
	WindowHandle (see page 1351)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
	Items (see page 1346)	Describes the elements of the menu.

34.1.3.2 TMenu.Create Constructor

Creates an instance of TMenu (see page 1331).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenu(TComponent * AOwner);
```

Description

Call Create to create a menu at runtime. Menus (see page 1319) placed on forms at design time are created automatically. Create calls the inherited Create method, then sets the initial values for the menu component, including creating an Items (see page 1346) property.

The AOwner parameter indicates the component (usually a form) that is responsible for managing the memory associated with the menu.

See Also

Items (see page 1346)

34.1.3.3 TMenu.Destroy Destructor

Destroys the menu component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenu (see page 1331) reference is not nil, and only then calls Destroy. Destroy frees the Items (see page 1346) property, and then calls the inherited Destroy method.

See Also

System::TObject::Free

Items (see page 1346)

34.1.3.4 TMenu Methods

The methods of the TMenu class are listed here.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 1335)	Applies the BiDiMode (see page 1344) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 1336)	Updates the menu when the BiDiMode (see page 1344) property changes.
	DoChange (see page 1336)	Generates an OnChange (see page 1352) event.
	DoGetMenuString (see page 1337)	Returns the caption for an item in the menu.
	GetHandle (see page 1338)	Returns the value of the Handle (see page 1345) property.
	IsOwnerDraw (see page 1339)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 1340)	Calls the DoChange (see page 1336) method when the menu is first loaded into memory.
	MenuChanged (see page 1340)	Responds when the menu changes.
	Notification (see page 1341)	Responds when components are added or deleted.
	SetChildOrder (see page 1342)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 1343)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	CreateMenuItem (see page 1335)	This is CreateMenuItem, a member of class TMenu.
	DispatchCommand (see page 1335)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 1336)	Dispatches a pop-up menu command.
	FindItem (see page 1337)	Locates and returns a menu item.
	GetChildren (see page 1338)	Executes a callback for child menu items.
	GetHelpContext (see page 1338)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 1339)	Indicates whether menu items read from right to left.
	IsShortCut (see page 1339)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 1341)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 1342)	Responds to keyboard input for the menu.

34.1.3.4.1 TMenu.AdjustBiDiBehavior Method

Applies the BiDiMode (see page 1344) property to the menu when the Windows control is created.

Pascal

```
procedure AdjustBiDiBehavior;
```

C++

```
__fastcall AdjustBiDiBehavior();
```

Description

AdjustBiDiBehavior is called automatically when the Windows control for the menu is created. It ensures that the BiDiMode (see page 1344) property is properly reflected in the menu if the application is running in a Middle Eastern locale.

See Also

BiDiMode (see page 1344)

34.1.3.4.2 TMenu.CreateMenuItem Method

Pascal

```
function CreateMenuItem: TMenuItem; dynamic;
```

C++

```
__fastcall TMenuItem CreateMenuItem();
```

Description

This is CreateMenuItem, a member of class TMenu.

34.1.3.4.3 TMenu.DispatchCommand Method

Calls the Click method of the menu item with the specified value as its Command property.

Pascal

```
function DispatchCommand(ACommand: Word): Boolean;
```

C++

```
__fastcall Boolean DispatchCommand(Word ACommand);
```

Description

Call DispatchCommand to simulate a click on the menu item associated with a command ID. If DispatchCommand locates a menu item that matches the command ID, it calls the Click method for that menu item and returns true. If there is no such item, DispatchCommand returns false.

See Also

DispatchPopup (see page 1336)

IsShortCut (see page 1339)

Items (see page 1346)

Click (see page 1375)

Command (see page 1401)

34.1.3.4.4 TMenu.DispatchPopup Method

Dispatches a pop-up menu command.

Pascal

```
function DispatchPopup(AHandle: HMENU): Boolean;
```

C++

```
__fastcall Boolean DispatchPopup(HMENU AHandle);
```

Description

Call DispatchPopup to simulate a click on the menu item associated with the pop-up menu handle. If DispatchPopup locates a menu item that matches the pop-up menu handle, it calls the Click method for that menu item and returns true. If there is no such item, DispatchPopup returns false.

See Also

DispatchCommand (see page 1335)

IsShortCut (see page 1339)

Items (see page 1346)

Click (see page 1375)

34.1.3.4.5 TMenu.DoBiDiModeChanged Method

Updates the menu when the BiDiMode (see page 1344) property changes.

Pascal

```
procedure DoBiDiModeChanged;
```

C++

```
__fastcall DoBiDiModeChanged();
```

Description

Do not call DoBiDiModeChanged. It is called automatically when the menu's BiDiMode (see page 1344) property changes to update the menu to reflect the current setting.

See Also

BiDiMode (see page 1344)

34.1.3.4.6 TMenu.DoChange Method

Generates an OnChange (see page 1352) event.

Pascal

```
procedure DoChange(Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall DoChange(TMenuItem Source, Boolean Rebuild);
```

Description

DoChange is called automatically when the properties of any menu items change. The Source parameter specifies the menu item (if any) that changed. The Rebuild parameter indicates whether the change requires the menu to regenerate its items.

See Also

OnChange (see page 1352)

MenuChanged (see page 1340)

34.1.3.4.7 TMenu.DoGetMenuString Method

Returns the caption for an item in the menu.

Pascal

```
function DoGetMenuString(Menu: HMENU; ItemID: UINT; Str: PChar; MaxCount: Integer; Flag:
UINT): Integer;
```

C++

```
__fastcall int DoGetMenuString(HMENU Menu, UINT ItemID, const char * Str, int MaxCount, UINT
Flag);
```

Description

DoGetMenuString is used internally to obtain menu item captions, given the Windows menu handle. The Menu parameter indicates the menu's handle. The ItemID parameter specifies the menu item whose caption is desired. If the Flag parameter is MF_BYCOMMAND, ItemID is the Command property of the menu item. If Flag is MF_BYPOSITION, ItemID is the 0-based index of the menu item. The caption is returned in a buffer pointed to by the Str parameter. MaxCount indicates the size of that buffer.

Unlike the Windows API function GetMenuString, DoGetMenuString returns the correct caption for owner-draw menu items.

See Also

Caption (see page 1396)

Command (see page 1401)

34.1.3.4.8 TMenu.FindItem Method

Locates and returns a menu item.

Pascal

```
function FindItem(Value: Integer; Kind: TFindItemKind): TMenuItem;
```

C++

```
__fastcall TMenuItem FindItem(int Value, TFindItemKind Kind);
```

Description

Call FindItem to locate a menu item in the menu or one of its submenus. The menu item is identified by either a pop-up menu handle, command ID, or menu shortcut value. The Kind parameter specifies how the menu item is to be identified.

See Also

TMenuItem (see page 1363)

Command (see page 1401)

Handle (see page 1409)

ShortCut (see page 1415)

34.1.3.4.9 TMenu.GetChildren Method

Executes a callback for child menu items.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called automatically by the streaming system so that child menu items are saved and read with their parent menu.

See Also

GetParentComponent

SetChildOrder (see page 1342)

34.1.3.4.10 TMenu.GetHandle Method

Returns the value of the Handle (see page 1345) property.

Pascal

```
function GetHandle: HMENU; virtual;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle (see page 1345) property. Override this method to change the implementation of the handle property. For example, TMainMenu (see page 1322) overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 1345)

34.1.3.4.11 TMenu.GetHelpContext Method

Returns the help context ID associated with a menu item.

Pascal

```
function GetHelpContext(Value: Integer; ByCommand: Boolean): THelpContext;
```

C++

```
__fastcall THelpContext GetHelpContext(int Value, Boolean ByCommand);
```

Description

Call GetHelpContext to obtain the ID for context-sensitive help on a particular menu item. Identify the menu item as the item that matches the Value property. If ByCommand is true, Value is the Command property of the TMenuItem (see page 1363). If ByCommand is false, Value is the Handle (see page 1345) property.

See Also

FindItem (see page 1337)

Command (see page 1401)

Handle (see page 1409)

HelpContext (see page 1410)

HelpContext

34.1.3.4.12 TMenu.IsOwnerDraw Method

Indicates whether menu items can contain more than simple captions.

Pascal

```
function IsOwnerDraw: Boolean;
```

C++

```
__fastcall Boolean IsOwnerDraw();
```

Description

IsOwnerDraw returns true when the OwnerDraw (see page 1350) property is true or the Images (see page 1345) property is not nil (Delphi) or NULL (C++). This is used internally to determine how the menu should be painted.

See Also

OwnerDraw (see page 1350)

Images (see page 1345)

34.1.3.4.13 TMenu.IsRightToLeft Method

Indicates whether menu items read from right to left.

Pascal

```
function IsRightToLeft: Boolean;
```

C++

```
__fastcall Boolean IsRightToLeft();
```

Description

Call IsRightToLeft to determine the layout of main menu items. IsRightToLeft returns true if the application is running on a system with a Middle Eastern locale and the BiDiMode (see page 1344) property is not bdLeftToRight.

See Also

BiDiMode (see page 1344)

34.1.3.4.14 TMenu.IsShortCut Method

Dispatches a key message if it represents a shortcut key for an item in the menu.

Pascal

```
function IsShortCut(var Message: TWMKey): Boolean; dynamic;
```

C++

```
__fastcall Boolean IsShortCut(TWMKey Message);
```

Description

Call IsShortCut when processing a KeyDown message to identify shortcut keys and trigger the appropriate menu action. IsShortCut decodes the key message passed in the Message parameter. It then encodes the state of the Shift, Control, and Alt keys with the value of the character that was typed to obtain the ShortCut (see page 1453) property of a menu item. If IsShortCut locates a menu item associated with the shortcut key combination, it calls the item's Click method and returns true. If no item in the menu has a shortcut corresponding to the message, IsShortCut returns false.

See Also

DispatchCommand (see page 1335)

DispatchPopup (see page 1336)

FindItem (see page 1337)

Click (see page 1375)

34.1.3.4.15 TMenu.Loaded Method

Calls the DoChange (see page 1336) method when the menu is first loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically immediately after the menu is loaded into memory. It calls the DoChange (see page 1336) method to allow any necessary fixup.

See Also

DoChange (see page 1336)

34.1.3.4.16 TMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange (see page 1336) method, which generates an OnChange (see page 1352) event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems (see page 1343) method instead of MenuChanged. For example, when the Images (see page 1345) property changes, UpdateItems (see page 1343) is called rather than MenuChanged.

See Also

Items (see page 1346)

UpdateItems (see page 1343)

DoChange (see page 1336)

34.1.3.4.17 TMenu.Notification Method

Responds when components are added or deleted.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

TMenu (see page 1331) overrides the inherited method to set the Images (see page 1345) property to nil (Delphi) or NULL (C++) if the ImageList is deleted.

See Also

Notification

Images (see page 1345)

34.1.3.4.18 ParentBiDiModeChanged Method

This is the overview for the ParentBiDiModeChanged method overload.

Overload List

	Name	Description
	TMenu.ParentBiDiModeChanged () (see page 1341)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 1344) and ParentBiDiMode (see page 1351) properties.
	TMenu.ParentBiDiModeChanged (TObject) (see page 1341)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 1344) and ParentBiDiMode (see page 1351) properties.

34.1.3.4.18.1 TMenu.ParentBiDiModeChanged Method ()

Ensures that the menu's layout follows the current settings of the BiDiMode (see page 1344) and ParentBiDiMode (see page 1351) properties.

Pascal

```
procedure ParentBiDiModeChanged; overload;
procedure ParentBiDiModeChanged(AControl: TObject); overload;
```

C++

```
__fastcall ParentBiDiModeChanged();
__fastcall ParentBiDiModeChanged(TObject * AControl);
```

Description

ParentBiDiMode (see page 1351) changed is called when the menu's BiDiMode (see page 1344) property must be updated to reflect the bi-directional mode of its associated control.

See Also

BiDiMode (see page 1344)

ParentBiDiMode (see page 1351)

DoBiDiModeChanged (see page 1336)

34.1.3.4.19 TMenu.ProcessMenuChar Method

Responds to keyboard input for the menu.

Pascal

```
procedure ProcessMenuChar(var Message: TWMMenuChar);
```

C++

```
__fastcall ProcessMenuChar(TWMMenuChar Message);
```

Description

ProcessMenuChar handles keyboard messages from Windows. It checks whether the character typed is an accelerator character from one of the menu's items. If so, ProcessMenuChar executes the menu item (or, if the item is disabled, selects it). If the key is not an accelerator, ProcessMenuChar checks for captions that begin with the character. If there is only one, it is treated like an accelerator. Otherwise, the first item beginning with that character is selected.

When calling ProcessMenuChar programmatically, the User, MenuFlag, and Menu fields of Message parameter must be supplied.

See Also

Caption (see page 1396)

34.1.3.4.20 TMenu.SetChildOrder Method

Ensures that the menu item indexes reflect the order in which they are loaded and saved.

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

SetChildOrder is called automatically when menus are loaded into memory. The Child parameter specifies the child object that was just loaded. The Order parameter specifies the order in which it was loaded. SetChildOrder assigns the MenuIndex for each child to match the order in which the items are loaded.

See Also

MenuIndex (see page 1413)

34.1.3.4.21 TMenu.UpdateItems Method

Causes all menu items to update themselves.

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

UpdateItems is called automatically when changes occur that must be reflected by individual menu items. Changes that affect the menu as a whole trigger the MenuChanged (see page 1340) method instead.

See Also

MenuChanged (see page 1340)

34.1.3.5 TMenu Properties

The properties of the TMenu class are listed here.

Public Properties

	Name	Description
	AutoHotkeys (see page 1343)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1344)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 1344)	Determines the layout of the menu in Middle East locales.
R	Handle (see page 1345)	Provides access to the Windows menu handle for the menu.
	Images (see page 1345)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 1350)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1351)	Indicates whether the BiDiMode (see page 1344) property is inherited from the control that uses the menu.
	WindowHandle (see page 1351)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
R	Items (see page 1346)	Describes the elements of the menu.

34.1.3.5.1 TMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu (see page 1331)

tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items (see page 1346) property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items (see page 1346) property. Setting one sets the other.

See Also

AutoHotkeys (see page 1394)

Items (see page 1346)

RethinkHotkeys (see page 1388)

34.1.3.5.2 TMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items (see page 1346) property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items (see page 1346) property. Setting one sets the other.

See Also

AutoLineReduction (see page 1395)

Items (see page 1346)

RethinkLines (see page 1389)

34.1.3.5.3 TMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 1351)

IsRightToLeft (see page 1339)

34.1.3.5.4 TMenu.Handle Property

Provides access to the Windows menu handle for the menu.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle to call a Windows API function that requires a menu handle. Handle is the handle for the menu that contains only the items described by the Items (see page 1346) property. If no other menus have been merged with this menu, this is the same as the WindowHandle (see page 1351) property.

See Also

WindowHandle (see page 1351)

34.1.3.5.5 TMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 1411)

Images

Items (see page 1346)

34.1.3.5.6 TMenu.Items Property

Describes the elements of the menu.

Pascal

```
property Items: TMenuItem;
```

C++

```
__property TMenuItem Items;
```

Description

Use Items to access information about the elements in the menu. Items is a single TMenuItem (see page 1363) object that describes the elements of the menu in its own Items property.

Note: Because Items is the default property of TMenuItem (see page 1363), the Items property of TMenu (see page 1331) can be treated as an indexed array of menu items that describe the individual items in the menu. That is, instead of writing

Note: FirstItem := Menu1.Items.Items[0];

Note: you can use

Note: FirstItem := Menu1.Items[0];

Set the Items property at design time by clicking on the Items property in the Property Inspector. The Menu Designer automatically inserts a menu item. As each menu item is entered, outlined regions appear at the possible locations of additional menu items. Click in those regions to specify additional menu items. At runtime, create a TMenuItem (see page 1363) that describes the elements of the menu programmatically, and set the Items property of the menu.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
```

```
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}
```

```
void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
```

```
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
    procedure AddButtonClick(Sender: TObject);
    procedure EditButtonClick(Sender: TObject);
    procedure DestroyButtonClick(Sender: TObject);
    procedure FormCreate(Sender: TObject);
  private
    { Private declarations }
  public
    procedure PopupMenuItemsClick(Sender: TObject);

  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

TMenuItem (see page 1363)

Items (see page 1411)

34.1.3.5.7 TMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images (see page 1345) and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 1423)

OnDrawItem (see page 1422)

Images (see page 1345)

34.1.3.5.8 TMenu.ParentBiDiMode Property

Indicates whether the BiDiMode (see page 1344) property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode (see page 1344) setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode (see page 1344) setting and control the menu's layout independently.

See Also

BiDiMode (see page 1344)

34.1.3.5.9 TMenu.WindowHandle Property

Provides access to the handle of the window that uses the menu.

Pascal

```
property WindowHandle: HWND;
```

C++

```
__property HWND WindowHandle;
```

Description

Read WindowHandle to get the window handle of the control that receives WM_COMMAND (see page 1684) messages when the user clicks on an item in the menu. When menu items are selected, use this handle in an OnClick event handler to send messages to the control that uses the menu or to make Windows API calls that affect the control.

Set WindowHandle to associate the menu with a control.

See Also

DispatchCommand (see page 1335)

Command (see page 1401)

OnClick (see page 1417)

34.1.3.6 TMenu Events

The events of the TMenu class are listed here.

Protected Events

	Name	Description
	OnChange (see page 1352)	Occurs when the menu changes.

34.1.3.6.1 TMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 1346)

34.1.4 TMenuActionLink Class

TMenuActionLink links menu item clients to the corresponding menu action.

Class Hierarchy

Pascal

```
TMenuActionLink = class(TActionLink);
```

C++

```
class TMenuActionLink : public TActionLink;
```

File

Menus

Description

TMenuActionLink is designed to link actions to menu item clients. TMenuActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of and events of menu item clients.

TMenuActionLink overrides methods to support linking the following properties and events with menu item client properties or events, most of which have the same name:

Caption

Checked

Enabled

HelpContext

Hint

ImageIndex

ShortCut (see page 1453)

Visible

OnExecute

34.1.4.1 TMenuActionLink Members

The following tables list the members exposed by TMenuActionLink.

Protected Fields

	Name	Description
	FClient (see page 1354)	This is FClient, a member of class TMenuActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 1354)	Assigns a client menu item that is linked to the associated action.
	IsAutoCheckLinked (see page 1355)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 1355)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 1356)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 1356)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 1356)	Indicates whether the GroupIndex property for the action and the client are linked.
	IsHelpContextLinked (see page 1357)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHintLinked (see page 1357)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 1358)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 1358)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 1358)	Indicates whether the ShortCut (see page 1453) property for the action and the client are linked.
	IsVisibleLinked (see page 1359)	Indicates whether the visible state for the action and the client are linked.
	SetAutoCheck (see page 1359)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 1359)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 1360)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 1360)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetHelpContext (see page 1361)	Sets the Help context of a menu item that is the client of this action link.
	SetHint (see page 1361)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 1361)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 1362)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 1362)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 1362)	Sets the visible state of a menu item if the client is linked to the action for this property.

34.1.4.2 TMenuActionLink Fields

The fields of the TMenuActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 1354)	This is FClient, a member of class TMenuActionLink.

34.1.4.2.1 TMenuActionLink.FClient Field

Pascal

```
FClient: TMenuItem;
```

C++

```
TMenuItem FClient;
```

Description

This is FClient, a member of class TMenuActionLink.

34.1.4.3 TMenuActionLink Methods

The methods of the TMenuActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 1354)	Assigns a client menu item that is linked to the associated action.
	IsAutoCheckLinked (see page 1355)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 1355)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 1356)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 1356)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 1356)	Indicates whether the GroupIndex property for the action and the client are linked.
	IsHelpContextLinked (see page 1357)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHintLinked (see page 1357)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 1358)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 1358)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 1358)	Indicates whether the ShortCut (see page 1453) property for the action and the client are linked.
	IsVisibleLinked (see page 1359)	Indicates whether the visible state for the action and the client are linked.
	SetAutoCheck (see page 1359)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 1359)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 1360)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 1360)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetHelpContext (see page 1361)	Sets the Help context of a menu item that is the client of this action link.
	SetHint (see page 1361)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 1361)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 1362)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 1362)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 1362)	Sets the visible state of a menu item if the client is linked to the action for this property.

34.1.4.3.1 TMenuActionLink.AssignClient Method

Assigns a client menu item that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TMenuActionLink (see page 1352) overrides AssignClient to ensure that the client for the link is a menu item.

See Also

Action (see page 1393)

Create

34.1.4.3.2 TMenuActionLink.IsAutoCheckLinked Method

Indicates whether the AutoCheck state for the action and the client are linked.

Pascal

```
function IsAutoCheckLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsAutoCheckLinked();
```

Description

IsAutoCheckLinked indicates whether the AutoCheck property is linked to the appropriate client property. IsAutoCheckLinked returns true if the client requests that the action control this property, false otherwise.

See Also

AutoCheck

AutoCheck (see page 1394)

SetAutoCheck (see page 1359)

34.1.4.3.3 TMenuActionLink.IsCaptionLinked Method

Indicates whether the caption for the action and the client are linked.

Pascal

```
function IsCaptionLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCaptionLinked();
```

Description

IsCaptionLinked indicates whether the Caption property is linked to the appropriate client property. IsCaptionLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Caption

Caption (see page 1396)

SetCaption (see page 1359)

34.1.4.3.4 TMenuActionLink.IsCheckedLinked Method

Indicates whether the checked state for the action and the client are linked.

Pascal

```
function IsCheckedLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

IsCheckedLinked indicates whether the Checked property is linked to the appropriate client property. IsCheckedLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Checked

Checked (see page 1401)

SetChecked (see page 1360)

34.1.4.3.5 TMenuActionLink.IsEnabledLinked Method

Indicates whether the enabled state for the action and the client are linked.

Pascal

```
function IsEnabledLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsEnabledLinked();
```

Description

IsEnabledLinked indicates whether the Enabled property is linked to the appropriate client property. IsEnabledLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Enabled

Enabled (see page 1406)

SetEnabled (see page 1360)

34.1.4.3.6 TMenuActionLink.IsGroupIndexLinked Method

Indicates whether the GroupIndex property for the action and the client are linked.

Pascal

```
function IsGroupIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsGroupIndexLinked();
```

Description

IsGroupIndexLinked indicates whether the GroupIndex property is linked to the menu item's GroupIndex property. IsGroupIndexLinked returns true if the client menu item has a RadioItem property of true and the client requests that the action

control this property. It returns false if the client menu item has a RadioItem property of false or has severed its GroupIndex property from the action.

See Also

RadioItem (see page 1414)

GroupIndex (see page 1408)

34.1.4.3.7 TMenuActionLink.IsHelpContextLinked Method

Indicates whether the HelpContext properties for the action and client controls are linked.

Pascal

```
function IsHelpContextLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHelpContextLinked();
```

Description

TActionLink descendants can call IsHelpContextLinked to determine whether they need to propagate changes to the HelpContext property of the action so that they are reflected by the client object. When IsHelpContextLinked returns true, the action controls the HelpContext property: Changes to the HelpContext property of the action are reflected in the client object. When IsHelpContextLinked returns false, the client object is not influenced by the HelpContext property of its action.

As implemented in TActionLink, IsHelpContextLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

HelpContext

SetHelpContext

Action

IsHelpLinked

34.1.4.3.8 TMenuActionLink.IsHintLinked Method

Indicates whether the Hint property for the action and the client are linked.

Pascal

```
function IsHintLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHintLinked();
```

Description

IsHintLinked indicates whether the Hint property is linked to the appropriate client property. IsHintLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Hint

Hint (see page 1410)

SetHint (see page 1361)

34.1.4.3.9 TMenuActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

IsImageIndexLinked indicates whether the ImageIndex property is linked to the appropriate client property. IsImageIndexLinked returns true if the client requests that the action control this property, false otherwise.

See Also

ImageIndex

ImageIndex (see page 1411)

SetImageIndex (see page 1361)

34.1.4.3.10 TMenuActionLink.IsOnExecuteLinked Method

Indicates whether the OnExecute event handler for the action and the client are linked.

Pascal

```
function IsOnExecuteLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsOnExecuteLinked();
```

Description

IsOnExecuteLinked indicates whether the OnExecute event handler is linked to the appropriate client event. IsOnExecuteLinked returns true if the client requests that the action control this event, false otherwise.

See Also

OnExecute

OnClick (see page 1417)

SetOnExecute (see page 1362)

34.1.4.3.11 TMenuActionLink.IsShortCutLinked Method

Indicates whether the ShortCut (see page 1453) property for the action and the client are linked.

Pascal

```
function IsShortCutLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsShortCutLinked();
```

Description

IsShortCutLinked indicates whether the ShortCut (see page 1453) property is linked to the appropriate client property. IsVisibleLinked (see page 1359) returns true if the client requests that the action control this property, false otherwise.

See Also

ShortCut

ShortCut (see page 1415)

SetShortCut (see page 1362)

34.1.4.3.12 TMenuActionLink.IsVisibleLinked Method

Indicates whether the visible state for the action and the client are linked.

Pascal

```
function IsVisibleLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVisibleLinked();
```

Description

IsVisibleLinked indicates whether the Visible property is linked to the appropriate client property. IsVisibleLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Visible

Visible (see page 1416)

SetVisible (see page 1362)

34.1.4.3.13 TMenuActionLink.SetAutoCheck Method

Sets the AutoCheck property of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetAutoCheck(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoCheck(Boolean Value);
```

Description

SetAutoCheck sets the AutoCheck property of a menu item, and is called only if the client is linked for this event. Value specifies the AutoCheck new value of AutoCheck.

See Also

AutoCheck

AutoCheck (see page 1394)

IsAutoCheckLinked (see page 1355)

34.1.4.3.14 TMenuActionLink.SetCaption Method

Sets the caption of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString Value);
```

Description

SetCaption sets the caption of a menu item, and is called only if the client is linked for this event. Value is the string to which the caption should be set.

See Also

Caption

Caption (see page 1396)

IsCaptionLinked (see page 1355)

34.1.4.3.15 TMenuActionLink.SetChecked Method

Sets the checked state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked sets the checked state of a menu item, and is called only if the client is linked for this event. Value specifies whether the checked state should be set.

See Also

Checked

Checked (see page 1401)

IsCheckedLinked (see page 1356)

34.1.4.3.16 TMenuActionLink.SetEnabled Method

Sets the enabled state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled sets the enabled state of a menu item, and is called only if the client is linked for this event. Value specifies whether the enabled state should be set.

See Also

Enabled

Enabled (see page 1406)

IsEnabledLinked (see page 1356)

34.1.4.3.17 TMenuActionLink.SetHelpContext Method

Sets the Help context of a menu item that is the client of this action link.

Pascal

```
procedure SetHelpContext(Value: THelpContext); override;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

SetHelpContext sets the help context of a client menu item, and is called only if the client is linked for this property. Value specifies what the help context should be.

See Also

HelpContext

HelpContext (see page 1410)

IsHelpLinked

34.1.4.3.18 TMenuActionLink.SetHint Method

Sets the hint of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetHint(const Value: string); override;
```

C++

```
virtual __fastcall SetHint(const UnicodeString Value);
```

Description

SetHint sets the hint of a menu item, and is called only if the client is linked for this event. Value is the string that to which the hint should be set.

See Also

Hint

Hint (see page 1410)

IsHintLinked (see page 1357)

34.1.4.3.19 TMenuActionLink.SetImageIndex Method

Sets the image index of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

SetImageIndex sets the image index of a menu item, and is called only if the client is linked for this event. Value specifies what the image index should be.

See Also

ImageIndex

ImageIndex (see page 1411)

IsImageIndexLinked (see page 1358)

34.1.4.3.20 TMenuActionLink.SetOnExecute Method

Sets the execution event handler for a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetOnExecute(Value: TNotifyEvent); override;
```

C++

```
virtual __fastcall SetOnExecute(TNotifyEvent Value);
```

Description

SetOnExecute sets the appropriate execution event handler of a menu item, and is called only if the client is linked for this event. Value specifies the procedure that should be used for this event.

See Also

OnExecute

OnClick (see page 1417)

IsOnExecuteLinked (see page 1358)

34.1.4.3.21 TMenuActionLink.SetShortCut Method

Sets the shortcut of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetShortCut(Value: TShortCut); override;
```

C++

```
virtual __fastcall SetShortCut(TShortCut Value);
```

Description

SetShortCut sets the shortcut of a menu item, and is called only if the client is linked for this event. Value specifies what the shortcut should be.

See Also

ShortCut

ShortCut (see page 1415)

IsShortCutLinked (see page 1358)

34.1.4.3.22 TMenuActionLink.SetVisible Method

Sets the visible state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetVisible(Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

SetVisible sets the visible state of a menu item, and is called only if the client is linked for this event. Value specifies whether the visible state should be set.

See Also

Visible

Visible (see page 1416)

IsVisibleLinked (see page 1359)

34.1.5 TMenuItem Class

TMenuItem describes the properties of an item in a menu.

Class Hierarchy

Pascal

```
TMenuItem = class(TComponent);
```

C++

```
class TMenuItem : public TComponent;
```

File

Menus

Description

Use TMenuItem to specify the appearance and behavior of an item in a menu. Each TMainMenu (see page 1322) or TPopupMenu (see page 1430) component can contain multiple menu items. When a menu is defined at design time, the Menu Designer automatically creates menu item objects for each command on the menu.

See Also

TMainMenu (see page 1322)

TPopupMenu (see page 1430)

NewItem (see page 1448)

NewLine (see page 1449)

NewSubMenu (see page 1452)

34.1.5.1 TMenuItem Members

The following tables list the members exposed by TMenuItem.

Protected Methods

	Name	Description
	ActionChange (see page 1369)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 1374)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 1374)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 1375)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 1376)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 1377)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 1377)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 1378)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 1378)	This is GetAutoLineReduction, a member of class TMenuItem.
	GetCount (see page 1378)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 1379)	This is GetHandle, a member of class TMenuItem.
	GetItem (see page 1380)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 1380)	This is GetMenuIndex, a member of class TMenuItem.
	InsertNewLine (see page 1383)	This is InsertNewLine, a member of class TMenuItem.
V	Loaded (see page 1385)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 1386)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 1386)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 1387)	Forwards notification messages to all owned components.
	SetBreak (see page 1389)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 1389)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 1390)	This is SetChecked, a member of class TMenuItem.
V	SetChildOrder (see page 1390)	Sets the visual ordering of a child control.
	SetDefault (see page 1390)	This is SetDefault, a member of class TMenuItem.
	SetEnabled (see page 1390)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 1391)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 1391)	This is SetImageIndex, a member of class TMenuItem.
	SetMenuIndex (see page 1391)	This is SetMenuIndex, a member of class TMenuItem.
	SetRadioItem (see page 1392)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 1392)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 1392)	This is SetVisible, a member of class TMenuItem.
	UpdateItems (see page 1392)	This is UpdateItems, a member of class TMenuItem.

Protected Properties

	Name	Description
	ActionLink (see page 1394)	This is ActionLink, a member of class TMenuItem.

Public Methods

	Name	Description
	Add (see page 1369)	This is the overview for the Add method overload.
	Clear (see page 1375)	Removes and frees all menu items listed in the Items (see page 1411) property.
V	Click (see page 1375)	Simulates a mouse click.
V	Create (see page 1366)	Creates an instance of TMenuItem (see page 1363).
	Delete (see page 1376)	Removes a menu item from the Items (see page 1411) property array.
V	Destroy (see page 1367)	Destroys an instance of TMenuItem (see page 1363).
	Find (see page 1377)	Locates a menu item in the Items (see page 1411) property array given its caption.
V	GetChildren (see page 1378)	Enumerates all child components.
	GetEnumerator (see page 1379)	Returns a TComponent enumerator.
	GetImageList (see page 1379)	Returns the Image list that supplies an image for the menu item.
V	GetParentComponent (see page 1380)	Returns the parent component of the menu item.
	GetParentMenu (see page 1380)	Returns the main menu of which the menu item is part.

	HasParent (see page 1381)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 1381)	Returns the position of a menu item within the Items (see page 1411) array.
	InitiateAction (see page 1382)	Calls the action link's Update method if the menu item is associated with an action link.
	Insert (see page 1382)	Inserts a menu item into a specified position in the Items (see page 1411) array.
	InsertNewLineAfter (see page 1383)	Inserts a separator bar after a specified item from the Items (see page 1411) property array.
	InsertNewLineBefore (see page 1384)	Inserts a separator bar before a specified item from the Items (see page 1411) property array.
	IsLine (see page 1385)	Indicates whether the menu item represents a separator bar.
	NewBottomLine (see page 1386)	Inserts a separator bar at the end of the Items (see page 1411) property array.
	NewTopLine (see page 1387)	Inserts a separator bar at the beginning of the Items (see page 1411) property array.
	Remove (see page 1388)	Removes a menu item from the Items (see page 1411) property array
	RethinkHotkeys (see page 1388)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 1389)	Removes superfluous separator lines from the Items (see page 1411) property array.
	SetParentComponent (see page 1391)	Sets the parent component.

Public Properties

	Name	Description
	Command (see page 1401)	Specifies the Windows Command ID associated with the menu item.
	Count (see page 1402)	Indicates the number of subitems of the menu item.
	Handle (see page 1409)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
	Items (see page 1411)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 1413)	Indicates the index of the menu item within its parent menu.
	Parent (see page 1414)	Identifies the parent menu item of this menu item.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 1416)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 1417)	Occurs when the user clicks menu item.
	OnDrawItem (see page 1422)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 1423)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Published Properties

	Name	Description
	Action (see page 1393)	Designates the action associated with the menu item.
	AutoCheck (see page 1394)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 1394)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 1395)	Determines whether redundant separator bars are automatically removed from the submenu.
	Bitmap (see page 1395)	Designates a bitmap that is drawn for the menu item.
	Break (see page 1396)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 1396)	Specifies the text of the menu item.
	Checked (see page 1401)	Specifies whether a check mark should appear beside the Caption (see page 1396).
	Default (see page 1406)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 1406)	Specifies whether the menu item is enabled.
	GroupIndex (see page 1408)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 1410)	Specifies the help context ID associated with the menu item.

	Hint (see page 1410)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 1411)	Indicates which image maintained by the parent menu appears next to the menu item.
	RadioItem (see page 1414)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 1415)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 1415)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Visible (see page 1416)	Specifies whether the menu item appears in the menu.

34.1.5.2 TMenuItem.Create Constructor

Creates an instance of TMenuItem (see page 1363).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenuItem(TComponent * AOwner);
```

Description

Use Create to create a menu item at runtime. Menu items defined at design time using the Menu designer are created automatically.

AOwner is the component that is responsible for freeing the menu item. It becomes the value of the Owner property.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
```

```
  access FormCount in the mainform's FormCreate.  The other
  forms do not exist yet!
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    NewItem: TMenuItem;
    I : integer;
  begin
    { first create the separator }
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Name:= 'Separator';
    NewItem.Caption := '-';
    { add the new item to the Windows menu }
    MainMenu1.Items[1].Add(NewItem);
    { now create and add a menu item for each form }
    for  I := 0 to Screen.FormCount-1 do
    begin
      NewItem := TMenuItem.Create(MainMenu1.Items[1]);
      NewItem.Caption := Screen.Forms[I].Name + 'Item';
      NewItem.Name := Screen.Forms[I].Name;
      MainMenu1.Items[1].Add(NewItem);
     end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I : Integer;
  begin
    // Count down, not up!
    for  I := MainMenu1.Items[1].Count - 1 downto 0 do
    begin
      MainMenu1.Items[1].Items[I].Free;
    end;
  end;
```

Owner

NewItem (see page 1448)

34.1.5.3 TMenuItem.Destroy Destructor

Destroys an instance of TMenuItem (see page 1363).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenuItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenuItem (see page 1363) reference is not nil, and only then calls Destroy.

System::TObject::Free

34.1.5.4 TMenuItem Methods

The methods of the TMenuItem class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 1369)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 1374)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 1374)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 1375)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 1376)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 1377)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 1377)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 1378)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 1378)	This is GetAutoLineReduction, a member of class TMenuItem.
	GetCount (see page 1378)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 1379)	This is GetHandle, a member of class TMenuItem.
	GetItem (see page 1380)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 1380)	This is GetMenuIndex, a member of class TMenuItem.
	InsertNewLine (see page 1383)	This is InsertNewLine, a member of class TMenuItem.
V	Loaded (see page 1385)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 1386)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 1386)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 1387)	Forwards notification messages to all owned components.
	SetBreak (see page 1389)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 1389)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 1390)	This is SetChecked, a member of class TMenuItem.
V	SetChildOrder (see page 1390)	Sets the visual ordering of a child control.
	SetDefault (see page 1390)	This is SetDefault, a member of class TMenuItem.
	SetEnabled (see page 1390)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 1391)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 1391)	This is SetImageIndex, a member of class TMenuItem.
	SetMenuIndex (see page 1391)	This is SetMenuIndex, a member of class TMenuItem.
	SetRadioItem (see page 1392)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 1392)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 1392)	This is SetVisible, a member of class TMenuItem.
	UpdateItems (see page 1392)	This is UpdateItems, a member of class TMenuItem.

Public Methods

	Name	Description
	Add (see page 1369)	This is the overview for the Add method overload.
	Clear (see page 1375)	Removes and frees all menu items listed in the Items (see page 1411) property.
V	Click (see page 1375)	Simulates a mouse click.
	Delete (see page 1376)	Removes a menu item from the Items (see page 1411) property array.
	Find (see page 1377)	Locates a menu item in the Items (see page 1411) property array given its caption.
V	GetChildren (see page 1378)	Enumerates all child components.
	GetEnumerator (see page 1379)	Returns a TComponent enumerator.
	GetImageList (see page 1379)	Returns the Image list that supplies an image for the menu item.
V	GetParentComponent (see page 1380)	Returns the parent component of the menu item.
	GetParentMenu (see page 1380)	Returns the main menu of which the menu item is part.

	HasParent (see page 1381)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 1381)	Returns the position of a menu item within the Items (see page 1411) array.
	InitiateAction (see page 1382)	Calls the action link's Update method if the menu item is associated with an action link.
	Insert (see page 1382)	Inserts a menu item into a specified position in the Items (see page 1411) array.
	InsertNewLineAfter (see page 1383)	Inserts a separator bar after a specified item from the Items (see page 1411) property array.
	InsertNewLineBefore (see page 1384)	Inserts a separator bar before a specified item from the Items (see page 1411) property array.
	IsLine (see page 1385)	Indicates whether the menu item represents a separator bar.
	NewBottomLine (see page 1386)	Inserts a separator bar at the end of the Items (see page 1411) property array.
	NewTopLine (see page 1387)	Inserts a separator bar at the beginning of the Items (see page 1411) property array.
	Remove (see page 1388)	Removes a menu item from the Items (see page 1411) property array
	RethinkHotkeys (see page 1388)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 1389)	Removes superfluous separator lines from the Items (see page 1411) property array.
	SetParentComponent (see page 1391)	Sets the parent component.

34.1.5.4.1 TMenuItem.ActionChange Method

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); dynamic;
```

C++

```
__fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

This is ActionChange, a member of class TMenuItem.

34.1.5.4.2 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TMenuItem.Add (array of TMenuItem) (see page 1369)	Adds one or more menu items to the end of the Items (see page 1411) property array.
	TMenuItem.Add (TMenuItem) (see page 1369)	Adds one or more menu items to the end of the Items (see page 1411) property array.

34.1.5.4.2.1 TMenuItem.Add Method (TMenuItem)

Adds one or more menu items to the end of the Items (see page 1411) property array.

Pascal

```
procedure Add(Item: TMenuItem); overload;
procedure Add(const AItems: array of TMenuItem); overload;
```

C++

```
__fastcall Add(TMenuItem Item);
__fastcall Add(const array of TMenuItem AItems);
```

Description

Use Add to add new menu items to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 1411) property of a main menu or pop-up menu, Add adds the items to the end of the menu.

Specify a single new menu item to add as the value of the Item parameter, or an array of new menu items as the value of the AItems parameter. AItems_Size is the index of the last item in the AItems array (one less than the number of items).

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
```

```
  var
    NewItem: TMenuItem;
    I : integer;
  begin
    { first create the separator }
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Name:= 'Separator';
    NewItem.Caption := '-';
    { add the new item to the Windows menu }
    MainMenu1.Items[1].Add(NewItem);
    { now create and add a menu item for each form }
    for  I := 0 to Screen.FormCount-1 do
    begin
      NewItem := TMenuItem.Create(MainMenu1.Items[1]);
      NewItem.Caption := Screen.Forms[I].Name + 'Item';

NewItem (see page 1448)

NewSubMenu (see page 1452)

34.1.5.4.3 TMenuItem.AdvancedDrawItem Method

Pascal

```
procedure AdvancedDrawItem(ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState; TopLevel:
Boolean); virtual;
```

C++

```
virtual __fastcall AdvancedDrawItem(TCanvas ACanvas, TRect ARect, TOwnerDrawState State,
Boolean TopLevel);
```

Description

This is AdvancedDrawItem, a member of class TMenuItem.

34.1.5.4.4 TMenuItem.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

34.1.5.4.5 TMenuItem.Clear Method

Removes and frees all menu items listed in the Items (see page 1411) property.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use Clear to free all the items listed in the Items (see page 1411) property array.

See Also

Items (see page 1411)

Delete (see page 1376)

34.1.5.4.6 TMenuItem.Click Method

Simulates a mouse click.

Pascal

```
procedure Click; virtual;
```

C++

```
virtual __fastcall Click();
```

Description

Click generates an OnClick (see page 1417) event, as if the user had clicked the menu item. Unlike a real mouse click, Click does not generate a WM_COMMAND (see page 1684) message to the window associated with the menu.

Component writers can override click to provide a different response when the user selects the menu item.

See Also

Command (see page 1401)

OnClick (see page 1417)

34.1.5.4.7 TMenuItem.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor

DefineBinaryProperty

DefineProperties

DefineProperty

34.1.5.4.8 TMenuItem.Delete Method

Removes a menu item from the Items (see page 1411) property array.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Call Delete to remove a menu item and all its submenus from a menu. The Index parameter is the index of the item to be deleted, where 0 specifies the first item in the menu, 1 specifies the second item, and so on.

Delete does not free the removed item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 1416) property.

See Also

Add (see page 1369)

Insert (see page 1382)

Items (see page 1411)

Remove (see page 1388)

Visible (see page 1416)

System::TObject::Free

34.1.5.4.9 TMenuItem.DoDrawText Method

Pascal

```
procedure DoDrawText(ACanvas: TCanvas; const ACaption: string; var Rect: TRect; Selected:
Boolean; Flags: Longint);
```

C++

```
__fastcall DoDrawText(TCanvas ACanvas, const UnicodeString ACaption, TRect Rect, Boolean
Selected, Longint Flags);
```

Description

This is DoDrawText, a member of class TMenuItem.

34.1.5.4.10 TMenuItem.DrawItem Method

Pascal

```
procedure DrawItem(ACanvas: TCanvas; ARect: TRect; Selected: Boolean); virtual;
```

C++

```
virtual __fastcall DrawItem(TCanvas ACanvas, TRect ARect, Boolean Selected);
```

Description

This is DrawItem, a member of class TMenuItem.

34.1.5.4.11 TMenuItem.Find Method

Locates a menu item in the Items (see page 1411) property array given its caption.

Pascal

```
function Find(ACaption: string): TMenuItem;
```

C++

```
__fastcall TMenuItem Find(UnicodeString ACaption);
```

Description

Use Find to locate the menu item in the Items (see page 1411) property array with the caption specified by the ACaption parameter. Find ignores accelerator characters when comparing item captions to the ACaption parameter.

Find returns the first menu item in the Items (see page 1411) property array with the specified caption. If no item is found, Find returns nil (Delphi) or NULL (C++).

See Also

Items (see page 1411)

Caption (see page 1396)

34.1.5.4.12 TMenuItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TMenuActionLinkClass; dynamic;
```

C++

```
__fastcall TMenuActionLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TMenuItem.

34.1.5.4.13 TMenuItem.GetAutoHotkeys Method

Pascal

```
function GetAutoHotkeys: Boolean;
```

C++

```
__fastcall Boolean GetAutoHotkeys();
```

Description

This is GetAutoHotkeys, a member of class TMenuItem.

34.1.5.4.14 TMenuItem.GetAutoLineReduction Method

Pascal

```
function GetAutoLineReduction: Boolean;
```

C++

```
__fastcall Boolean GetAutoLineReduction();
```

Description

This is GetAutoLineReduction, a member of class TMenuItem.

34.1.5.4.15 TMenuItem.GetChildren Method

Enumerates all child components.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is used internally in the component streaming system. It is not necessary to call it directly.

GetChildren expects a TGetChildProc routine that receives all enumerated components.

`Root` represents the owner of the components that will be enumerated.

This method does nothing in TComponent and is expected to be overridden in descendants.

See Also

TGetChildProc

GetParentComponent

34.1.5.4.16 TMenuItem.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TMenuItem.

34.1.5.4.17 TMenuItem.GetEnumerator Method

Returns a TComponent enumerator.

Pascal

```
function GetEnumerator: TMenuItemEnumerator;
```

C++

```
__fastcall TMenuItemEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TComponentEnumerator reference, which enumerates the components contained within a specified containing component.

To process all these sub components, call the TComponentEnumerator GetCurrent method within a While MoveNext do loop.

See Also

TComponentEnumerator

34.1.5.4.18 TMenuItem.GetHandle Method

Pascal

```
function GetHandle: HMENU;
```

C++

```
__fastcall HMENU GetHandle();
```

Description

This is GetHandle, a member of class TMenuItem.

34.1.5.4.19 TMenuItem.GetImageList Method

Returns the Image list that supplies an image for the menu item.

Pascal

```
function GetImageList: TCustomImageList;
```

C++

```
__fastcall TCustomImageList GetImageList();
```

Description

Use GetImageList to access the list of images that contains the image for this menu item. The ImageIndex (see page 1411) property identifies a specific image from the list that GetImageList returns.

GetImageList first checks the Parent (see page 1414) of this menu item for a SubMenuImages (see page 1415) property. If the parent menu item does not maintain a list of images, it checks that menu item's parent, and so on until reaching a top-level menu item (a menu item where Parent (see page 1414) is not set). If none of the parent menu items has a SubMenuImages (see page 1415) property, GetImageList checks the top-level menu for an Images property.

GetImageList returns the first image list it finds. If it doesn't find an image list, GetImageList returns nil (Delphi) or NULL (C++).

See Also

ImageIndex (see page 1411)

SubMenuImages (see page 1415)

Images (see page 1345)

Parent (see page 1414)

34.1.5.4.20 TMenuItem.GetItem Method

Pascal

```
function GetItem(Index: Integer): TMenuItem;
```

C++

```
__fastcall TMenuItem GetItem(int Index);
```

Description

This is GetItem, a member of class TMenuItem.

34.1.5.4.21 TMenuItem.GetMenuIndex Method

Pascal

```
function GetMenuIndex: Integer;
```

C++

```
__fastcall int GetMenuIndex();
```

Description

This is GetMenuIndex, a member of class TMenuItem.

34.1.5.4.22 TMenuItem.GetParentComponent Method

Returns the parent component of the menu item.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

GetParentComponent is called by the streaming system that loads and saves components. It ensures that objects are loaded and saved with their parent objects. GetParentComponent is overridden in descendant classes to return the appropriate parent for their particular type of component. TMenuItem (see page 1363) overrides it to identify its associated menu, if it has one, as its parent.

34.1.5.4.23 TMenuItem.GetParentMenu Method

Returns the main menu of which the menu item is part.

Pascal

```
function GetParentMenu: TMenu;
```

C++

```
__fastcall TMenu GetParentMenu();
```

Description

GetParentMenu returns the menu that contains the menu item.

See Also

System::TObject::Free

34.1.5.4.24 TMenuItem.HasParent Method

Indicates that the menu item has a parent that is responsible for loading and saving its data.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TMenuItem (see page 1363) overrides HasParent to return true, indicating that menu items have a parent. Applications seldom call the HasParent method. It is used by the streaming system that loads and saves forms to determine when another object is responsible for writing a component to a stream.

See Also

Parent (see page 1414)

HasParent

34.1.5.4.25 TMenuItem.IndexOf Method

Returns the position of a menu item within the Items (see page 1411) array.

Pascal

```
function IndexOf(Item: TMenuItem): Integer;
```

C++

```
__fastcall int IndexOf(TMenuItem Item);
```

Description

Call IndexOf to locate a menu item in the submenu headed by this menu item. IndexOf returns 0 for the first menu item, 1 for the second menu item, and so on. If the menu item is not in the submenu, IndexOf returns -1.

Note: IndexOf may not correspond to the position of the item in the menu the user sees if the menu includes some items that are not visible.

See Also

Items (see page 1411)

MenuIndex (see page 1413)

Visible (see page 1416)

34.1.5.4.26 TMenuItem.InitiateAction Method

Calls the action link's Update method if the menu item is associated with an action link.

Pascal

```
procedure InitiateAction; virtual;
```

C++

```
virtual __fastcall InitiateAction();
```

Description

InitiateAction calls the action link, if there is one for the menu item, to update the association between the action and the menu item.

See Also

Items (see page 1411)

MenuIndex (see page 1413)

Visible (see page 1416)

34.1.5.4.27 TMenuItem.Insert Method

Inserts a menu item into a specified position in the Items (see page 1411) array.

Pascal

```
procedure Insert(Index: Integer; Item: TMenuItem);
```

C++

```
__fastcall Insert(int Index, TMenuItem Item);
```

Description

Use Insert to insert a new menu item to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 1411) property of a main menu or pop-up menu, Insert inserts an item into that menu. Specify the new menu item to add as the value of the Item parameter, and the position in the Items (see page 1411) array as the value of the Index parameter.

C++ Examples:

```
/*
This code inserts a menu item after the first item in a menu
named FileMenu:
*/
void __fastcall TForm1::InsertMenuItemClick(TObject *Sender)
{
  TMenuItem *NewItem = new TMenuItem(FileMenu);
  try
  {
    NewItem->Caption = "Form1";
    FileMenu->Insert(1, NewItem);
  }
  catch (Exception &e)
  {
    delete NewItem;
    throw;
  }
}
```

Delphi Examples:

```
{
This code inserts a menu item after the first item in a menu
named FileMenu:
}
procedure TForm1.InsertMenuItemClick(Sender: TObject);
var
  NewItem: TMenuItem;
begin
  NewItem := TMenuItem.Create(FileMenu);
  try
    NewItem.Caption := 'Do this';
    FileMenu.Insert(1, NewItem);
  except
    NewItem.Free; // Throw away the menu item if there is an error.
    raise; // reraise the exception
  end;
  // Don't free the menu item on success.  Need it for the menu!
end;

// Free all the menu items that we have created dynamically.
procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  for I := FileMenu.Count - 1 downto 0 do  // Index backwards because Count changes as you
remove items.
    if FileMenu.Items[I].Name = '' then  // Items created dynamically have not name.
      FileMenu.Items[I].Free;
end;
```

See Also

Add (see page 1369)

Delete (see page 1376)

Items (see page 1411)

Remove (see page 1388)

Items (see page 1346)

34.1.5.4.28 TMenuItem.InsertNewLine Method

Pascal

```
function InsertNewLine(ABefore: Boolean; AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLine(Boolean ABefore, TMenuItem AItem);
```

Description

This is InsertNewLine, a member of class TMenuItem.

34.1.5.4.29 TMenuItem.InsertNewLineAfter Method

Inserts a separator bar after a specified item from the Items (see page 1411) property array.

Pascal

```
function InsertNewLineAfter(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineAfter(TMenuItem AItem);
```

Description

Use InsertNewLineAfter to insert a separator bar after the menu item specified by AItem. If AItem is not an item in the Items (see page 1411) property array, InsertNewLineAfter raises an exception.

InsertNewLineAfter returns the index of the newly inserted separator item in the Items (see page 1411) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 1395) to true so that superfluous separators can be automatically removed.

See Also

Insert (see page 1382)

InsertNewLineBefore (see page 1384)

Items (see page 1411)

NewBottomLine (see page 1386)

NewTopLine (see page 1387)

AutoLineReduction (see page 1395)

34.1.5.4.30 TMenuItem.InsertNewLineBefore Method

Inserts a separator bar before a specified item from the Items (see page 1411) property array.

Pascal

```
function InsertNewLineBefore(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineBefore(TMenuItem AItem);
```

Description

Use InsertNewLineBefore to insert a separator bar before the menu item specified by AItem. If AItem is not an item in the Items (see page 1411) property array, InsertNewLineBefore raises an exception.

InsertNewLineBefore returns the index of the newly inserted separator item in the Items (see page 1411) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 1395) to true so that superfluous separators can be automatically removed.

See Also

Insert (see page 1382)

InsertNewLineAfter (see page 1383)

Items (see page 1411)

NewBottomLine (see page 1386)

NewTopLine (see page 1387)

AutoLineReduction (see page 1395)

34.1.5.4.31 TMenuItem.IsLine Method

Indicates whether the menu item represents a separator bar.

Pascal

```
function IsLine: Boolean;
```

C++

```
__fastcall Boolean IsLine();
```

Description

Call IsLine to determine whether the menu item is a separator bar. IsLine checks the Caption (see page 1396) of the menu item and returns true if the value of Caption (see page 1396) is '-'. Menu items with this Caption (see page 1396) appear as separator bars.

See Also

Caption (see page 1396)

34.1.5.4.32 TMenuItem.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

ComponentState

Create

TReader

34.1.5.4.33 TMenuItem.MeasureItem Method

Pascal

```
procedure MeasureItem(ACanvas: TCanvas; var Width: Integer; var Height: Integer); virtual;
```

C++

```
virtual __fastcall MeasureItem(TCanvas ACanvas, int Width, int Height);
```

Description

This is MeasureItem, a member of class TMenuItem.

34.1.5.4.34 TMenuItem.MenuChanged Method

Pascal

```
procedure MenuChanged(Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(Boolean Rebuild);
```

Description

This is MenuChanged, a member of class TMenuItem.

34.1.5.4.35 TMenuItem.NewBottomLine Method

Inserts a separator bar at the end of the Items (see page 1411) property array.

Pascal

```
function NewBottomLine: Integer;
```

C++

```
__fastcall int NewBottomLine();
```

Description

Use NewBottomLine to insert a separator bar at the end of the items property array. This is useful when building up submenus dynamically at runtime.

NewBottomLine returns the index of the newly inserted separator item in the Items (see page 1411) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 1395) to true so that superfluous separators can be automatically removed.

See Also

Add (see page 1369)

InsertNewLineBefore (see page 1384)

Items (see page 1411)

InsertNewLineAfter (see page 1383)

NewTopLine (see page 1387)

AutoLineReduction (see page 1395)

34.1.5.4.36 TMenuItem.NewTopLine Method

Inserts a separator bar at the beginning of the Items (see page 1411) property array.

Pascal

```
function NewTopLine: Integer;
```

C++

```
__fastcall int NewTopLine();
```

Description

Use NewTopLine to insert a separator bar at the beginning of the items property array. This is useful when building up submenus dynamically at runtime.

NewTopLine returns the index of the newly inserted separator item in the Items (see page 1411) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 1395) to true so that superfluous separators can be automatically removed.

See Also

Add (see page 1369)

InsertNewLineBefore (see page 1384)

Items (see page 1411)

InsertNewLineAfter (see page 1383)

NewBottomLine (see page 1386)

AutoLineReduction (see page 1395)

34.1.5.4.37 TMenuItem.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

34.1.5.4.38 TMenuItem.Remove Method

Removes a menu item from the Items (see page 1411) property array

Pascal

```
procedure Remove(Item: TMenuItem);
```

C++

```
__fastcall Remove(TMenuItem Item);
```

Description

Call Remove to remove a menu item and all its submenus from a menu. The Item parameter is the item to be removed. If Item is not a menu item in the Items (see page 1411) array, Remove raises an exception.

Remove does not free the item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 1416) property.

See Also

Add (see page 1369)

Delete (see page 1376)

EMenuError (see page 1321)

Insert (see page 1382)

Items (see page 1411)

Visible (see page 1416)

34.1.5.4.39 TMenuItem.RethinkHotkeys Method

Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.

Pascal

```
function RethinkHotkeys: Boolean;
```

C++

```
__fastcall Boolean RethinkHotkeys();
```

Description

Call RethinkHotkeys to adjust the accelerator keys for the items in the Items (see page 1411) property and in any submenu of those items. RethinkHotkeys checks for items that do not have an accelerator key or that have duplicate accelerator keys. It then replaces any duplicate accelerators with unique characters and adds accelerator keys to items that don't have them. RethinkHotkeys gives first priority to existing accelerator key mappings, but may change them if necessary to ensure uniqueness.

RethinkHotkeys lets a menu adjust the accelerator keys when the AutoHotkeys (see page 1394) property is false. For any menu or submenu that has AutoHotkeys (see page 1394) set to true, this adjustment occurs automatically.

RethinkHotkeys returns true if RethinkHotkeys changed the Caption (see page 1396) property of any menu items, false otherwise.

See Also

AutoHotkeys (see page 1394)

AutoHotkeys (see page 1343)

Caption (see page 1396)

Items (see page 1411)

34.1.5.4.40 TMenuItem.RethinkLines Method

Removes superfluous separator lines from the Items (see page 1411) property array.

Pascal

```
function RethinkLines: Boolean;
```

C++

```
__fastcall Boolean RethinkLines();
```

Description

Call RethinkLines to remove superfluous separators from the items in the Items (see page 1411) property and in any submenu of those items. RethinkLines removes separators that appear at the very beginning or end of a submenu and separators that immediately follow another separator.

RethinkLines lets a menu remove superfluous separators when the AutoLineReduction (see page 1395) property is false. For any menu or submenu that has AutoLineReduction (see page 1395) set to true, this adjustment occurs automatically.

RethinkLines returns true if RethinkLines removed any menu items, false otherwise.

See Also

AutoLineReduction (see page 1395)

AutoLineReduction (see page 1344)

IsLine (see page 1385)

Items (see page 1411)

34.1.5.4.41 TMenuItem.SetBreak Method

Pascal

```
procedure SetBreak(Value: TMenuBreak);
```

C++

```
__fastcall SetBreak(TMenuBreak Value);
```

Description

This is SetBreak, a member of class TMenuItem.

34.1.5.4.42 TMenuItem.SetCaption Method

Pascal

```
procedure SetCaption(const Value: string);
```

C++

```
__fastcall SetCaption(const UnicodeString Value);
```

Description

This is SetCaption, a member of class TMenuItem.

34.1.5.4.43 TMenuItem.SetChecked Method

Pascal

```
procedure SetChecked(Value: Boolean);
```

C++

```
__fastcall SetChecked(Boolean Value);
```

Description

This is SetChecked, a member of class TMenuItem.

34.1.5.4.44 TMenuItem.SetChildOrder Method

Sets the visual ordering of a child control.

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

SetChildOrder is used internally in the component streaming system. It is not necessary to call it directly.

Derived classes override this method to actually implement the ordering. TWinControl uses this ordering information to Z-align the controls.

See Also

SetZOrder

34.1.5.4.45 TMenuItem.SetDefault Method

Pascal

```
procedure SetDefault(Value: Boolean);
```

C++

```
__fastcall SetDefault(Boolean Value);
```

Description

This is SetDefault, a member of class TMenuItem.

34.1.5.4.46 TMenuItem.SetEnabled Method

Pascal

```
procedure SetEnabled(Value: Boolean);
```

C++

```
__fastcall SetEnabled(Boolean Value);
```

Description

This is SetEnabled, a member of class TMenuItem.

34.1.5.4.47 TMenuItem.SetGroupIndex Method

Pascal

```
procedure SetGroupIndex(Value: Byte);
```

C++

```
__fastcall SetGroupIndex(Byte Value);
```

Description

This is SetGroupIndex, a member of class TMenuItem.

34.1.5.4.48 TMenuItem.SetImageIndex Method

Pascal

```
procedure SetImageIndex(Value: TImageIndex);
```

C++

```
__fastcall SetImageIndex(TImageIndex Value);
```

Description

This is SetImageIndex, a member of class TMenuItem.

34.1.5.4.49 TMenuItem.SetMenuIndex Method

Pascal

```
procedure SetMenuIndex(Value: Integer);
```

C++

```
__fastcall SetMenuIndex(int Value);
```

Description

This is SetMenuIndex, a member of class TMenuItem.

34.1.5.4.50 TMenuItem.SetParentComponent Method

Sets the parent component.

Pascal

```
procedure SetParentComponent(Value: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * Value);
```

Description

SetParentComponent is used internally in the component streaming system. It is not necessary to call it directly.

Derived classes override this method to implement proper handling for parenting.

See Also

SetParent

Parent

34.1.5.4.51 TMenuItem.SetRadioItem Method

Pascal

```
procedure SetRadioItem(Value: Boolean);
```

C++

```
__fastcall SetRadioItem(Boolean Value);
```

Description

This is SetRadioItem, a member of class TMenuItem.

34.1.5.4.52 TMenuItem.SetShortCut Method

Pascal

```
procedure SetShortCut(Value: TShortCut);
```

C++

```
__fastcall SetShortCut(TShortCut Value);
```

Description

This is SetShortCut, a member of class TMenuItem.

34.1.5.4.53 TMenuItem.SetVisible Method

Pascal

```
procedure SetVisible(Value: Boolean);
```

C++

```
__fastcall SetVisible(Boolean Value);
```

Description

This is SetVisible, a member of class TMenuItem.

34.1.5.4.54 TMenuItem.UpdateItems Method

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

This is UpdateItems, a member of class TMenuItem.

34.1.5.5 TMenuItem Properties

The properties of the TMenuItem class are listed here.

Protected Properties

	Name	Description
	ActionLink (see page 1394)	This is ActionLink, a member of class TMenuItem.

Public Properties

	Name	Description
R	Command (see page 1401)	Specifies the Windows Command ID associated with the menu item.
R	Count (see page 1402)	Indicates the number of subitems of the menu item.
R	Handle (see page 1409)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
R	Items (see page 1411)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 1413)	Indicates the index of the menu item within its parent menu.
R	Parent (see page 1414)	Identifies the parent menu item of this menu item.

Published Properties

	Name	Description
	Action (see page 1393)	Designates the action associated with the menu item.
	AutoCheck (see page 1394)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 1394)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 1395)	Determines whether redundant separator bars are automatically removed from the submenu.
	Bitmap (see page 1395)	Designates a bitmap that is drawn for the menu item.
	Break (see page 1396)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 1396)	Specifies the text of the menu item.
	Checked (see page 1401)	Specifies whether a check mark should appear beside the Caption (see page 1396).
	Default (see page 1406)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 1406)	Specifies whether the menu item is enabled.
	GroupIndex (see page 1408)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 1410)	Specifies the help context ID associated with the menu item.
	Hint (see page 1410)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 1411)	Indicates which image maintained by the parent menu appears next to the menu item.
	RadioItem (see page 1414)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 1415)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 1415)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Visible (see page 1416)	Specifies whether the menu item appears in the menu.

34.1.5.5.1 TMenuItem.Action Property

Designates the action associated with the menu item.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action designates the action object that is associated with the menu item. Actions can be associated with a menu item by using the action list editor at design-time. Actions are a way of centralizing user responses to commands.

34.1.5.5.2 TMenuItem.ActionLink Property

Pascal

```
property ActionLink: TMenuActionLink;
```

C++

```
__property TMenuActionLink ActionLink;
```

Description

This is ActionLink, a member of class TMenuItem.

34.1.5.5.3 TMenuItem.AutoCheck Property

Indicates whether the menu item's checked state toggles automatically when the item is clicked.

Pascal

```
property AutoCheck: Boolean;
```

C++

```
__property Boolean AutoCheck;
```

Description

When AutoCheck is true, then every time the menu item is clicked, the value of the Checked (see page 1401) property toggles automatically before the OnClick (see page 1417) event occurs. When AutoCheck is false, the application must explicitly set the value of the Checked (see page 1401) property (for example, in an OnClick (see page 1417) event handler).

See Also

Checked (see page 1401)

OnClick (see page 1417)

34.1.5.5.4 TMenuItem.AutoHotkeys Property

Determines whether the accelerator keys for submenu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the accelerator keys for the items in the Items (see page 1411) property can be reset if necessary to ensure that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenuItem (see page 1363) tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change

some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, it checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic or if AutoHotkeys is maParent and the parent menu item adjusts accelerator key mappings. Otherwise, the menu does not alter the items listed in the Items (see page 1411) property, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

Note: When AutoHotkeys disallows automatic adjustment of accelerator keys, an application can still adjust the menu items by calling the RethinkHotkeys (see page 1388) method. AutoHotkeys merely controls whether this adjustment occurs automatically.

See Also

AutoHotkeys (see page 1343)

Items (see page 1411)

RethinkHotkeys (see page 1388)

34.1.5.5.5 TMenuItem.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the submenu.

Pascal

```
property AutoLineReduction: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu item should automatically ensure that the submenu defined by its Items (see page 1411) property does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, the menu item removes superfluous separator bars if AutoLineReduction is maAutomatic or AutoLineReduction is maParent and the parent menu item removes superfluous separator bars. Otherwise, the menu item does not remove separators from the Items (see page 1411) property, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

Note: When AutoLineReduction disallows automatic removal of separator bars, an application can still remove superfluous separators by calling the RethinkLines (see page 1389) method. AutoLineReduction merely controls whether this adjustment occurs automatically.

See Also

AutoLineReduction (see page 1344)

Items (see page 1411)

RethinkLines (see page 1389)

34.1.5.5.6 TMenuItem.Bitmap Property

Designates a bitmap that is drawn for the menu item.

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Use Bitmap to provide a custom image that appears next to the caption in the menu item. On owner-draw menus, Bitmap can be used from an OnDrawItem (see page 1422) event handler to represent the entire menu item or a portion of the menu item.

Note: If the ImageIndex (see page 1411) property is set and the parent menu has a non-nil (Delphi) or NULL (C++) Images property, the image identified by ImageIndex (see page 1411) is used instead of Bitmap.

See Also

ImageIndex (see page 1411)

Images (see page 1345)

Caption (see page 1396)

OwnerDraw (see page 1350)

OnDrawItem (see page 1422)

34.1.5.5.7 TMenuItem.Break Property

Determines whether the menu item starts a new column in the menu.

Pascal

```
property Break: TMenuBreak;
```

C++

```
__property TMenuBreak Break;
```

Description

Set Break to break a long menu into columns at the item described by this menu item. The value of Break indicates whether the menu is broken into columns, and if so, whether a bar appears between the columns of the parent menu.

The default is mbNone (no breaking into columns).

See Also

Caption (see page 1396)

Parent (see page 1414)

34.1.5.5.8 TMenuItem.Caption Property

Specifies the text of the menu item.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Set Caption to the string the user sees for this item in the menu. To underline a character in a string, include an ampersand (&) before the character. This type of character is called an accelerator character. If Caption includes an accelerator character, the user can select the menu item by pressing Alt while typing the underlined character.

Tip: To automatically assign or adjust the accelerator characters in menu item captions, use the RethinkHotkeys (see page 1388) method.

Use the Caption property to identify the menu item as a line that separates the menu into parts. Specify a hyphen character (-) as the value of Caption for the menu item to indicate that the menu item is a separator. To separate the menu into multiple columns, use the Break (see page 1396) property instead.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
```

```
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
```

```
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

See Also

Break (see page 1396)

Checked (see page 1401)

Caption

RethinkHotkeys (see page 1388)

34.1.5.5.9 TMenuItem.Checked Property

Specifies whether a check mark should appear beside the Caption (see page 1396).

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to allow a menu item to work like a check box. If Checked is true, the menu item appears checked. If Checked is false, the menu item remains unchecked.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Caption (see page 1396)

RadioItem (see page 1414)

Checked

AutoCheck (see page 1394)

34.1.5.5.10 TMenuItem.Command Property

Specifies the Windows Command ID associated with the menu item.

Pascal

```
property Command: Word;
```

C++

```
__property Word Command;
```

Description

Use Command in an application that directly handles WM_COMMAND (see page 1684) messages. When the user selects the menu item, Windows sends a WM_COMMAND (see page 1684) to the window associated with the menu. The ItemID of the message contains the value of the Command property of the menu item that was selected.

See Also

OnClick (see page 1417)

DispatchCommand (see page 1335)

WindowHandle (see page 1351)

34.1.5.5.11 TMenuItem.Count Property

Indicates the number of subitems of the menu item.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of subitems listed in the Items (see page 1411) property array. When the user clicks on a menu item that has subitems, a dropdown menu appears which displays those subitems. Each subitem can, in turn, contain additional subitems. The Count property counts only the immediate subitems of the menu item.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
  {
    File1->Items[i]->Enabled = false;
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}

void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
```

```
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/

        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
```

```
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)
      AddButton: TButton;
      EditButton: TButton;
      DestroyButton: TButton;
      PopupMenu1: TPopupMenu;
      procedure AddButtonClick(Sender: TObject);
      procedure EditButtonClick(Sender: TObject);
      procedure DestroyButtonClick(Sender: TObject);
      procedure FormCreate(Sender: TObject);
    private
      { Private declarations }
    public
      procedure PopupMenuItemsClick(Sender: TObject);

    end;

  var
    Form1: TForm1;

  implementation

  {$R *.dfm}

  procedure TForm1.AddButtonClick(Sender: TObject);
  var
    index: Integer;
    NewItem: TMenuItem;
  begin
      // The owner (PopupMenu1) will cleanup this menu item.
    NewItem := TMenuItem.Create(PopupMenu1); // create the new item
    index := PopupMenu1.Items.Count;
    PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
    NewItem.Caption := 'Menu Item ' + IntToStr(index);
    NewItem.Tag := index;
    NewItem.OnClick :=
      PopupMenuItemsClick; // assign it an event handler
  end;

  procedure TForm1.PopupMenuItemsClick(Sender: TObject);
  begin
    with Sender as TMenuItem do
    begin
      case Tag of
        0:  ShowMessage('first item clicked');
        1:  ShowMessage('second item clicked');
        2:  ShowMessage('third item clicked');
        3:  ShowMessage('fourth item clicked');
      end;
    end;
  end;

  {
  To edit or destroy an item, grab its pointer via the Items
  property.
  }
  procedure TForm1.EditButtonClick(Sender: TObject);
  var
    ItemToEdit: TMenuItem;
  begin
```

```
    ItemToEdit := PopupMenu.Items[1];
    ItemToEdit.Caption := 'Changed Caption';
  end;

  procedure TForm1.DestroyButtonClick(Sender: TObject);
  var
    ItemToDelete: TMenuItem;
  begin
    ItemToDelete := PopupMenu.Items[2];
    ItemToDelete.Free;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    index: Integer;
    NewItem: TMenuItem;
  begin
    for index := 0 to 3 do
    begin
        // The owner (PopupMenu1) will cleanup this menu item.
      NewItem := TMenuItem.Create(PopupMenu1); // create the new item
      PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
      NewItem.Caption := 'Menu Item ' + IntToStr(index);
      NewItem.Tag := index;
      NewItem.OnClick :=
        PopupMenuItemsClick; // assign it an event handler
    end;
  end;
```

See Also

Items (see page 1411)

MenuIndex (see page 1413)

34.1.5.5.12 TMenuItem.Default Property

Specifies whether the menu item is invoked when the parent item is double clicked.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Set Default to specify whether a menu item is the default item in a submenu. Default menu items are executed when the parent item is double-clicked, allowing users to avoid navigating the submenus that contain them.

The default item appears in boldface. A submenu can have only one default item. If the Items (see page 1411) list of the parent menu item already contains a default menu item, setting the Default property to true sets the Default property of the previous default item to false.

See Also

Click (see page 1375)

Parent (see page 1414)

34.1.5.5.13 TMenuItem.Enabled Property

Specifies whether the menu item is enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to enable or disable a menu item. If Enabled is true, the Click (see page 1375) method is called when the user selects the item with the mouse. If Enabled is false, the menu item appears dimmed and the user cannot select it. However, calling the Click (see page 1375) method works even when Enabled is false.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
  {
    File1->Items[i]->Enabled = false;
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}

void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
```

```
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

34.1.5.5.14 TMenuItem.GroupIndex Property

Identifies the logical group to which the menu item belongs.

Pascal

```
property GroupIndex: Byte;
```

C++

```
__property Byte GroupIndex;
```

Description

Use GroupIndex to control how menus are merged. In applications that contain multiple forms, items from the menus of secondary forms can be merged into the application's main menu as those forms become active. MDI applications always merge the menus of child windows with the main menu of the parent window.

By default, all menu items in a menu bar (main menu) have the same GroupIndex value. To use GroupIndex to merge menus, set the GroupIndex value of each successive menu item to a value equal to or greater than that of the previous menu item.

When a menu item in a menu bar that is merged into the application's main menu has the same GroupIndex value as a menu item in the main menu, the menu item in the application's main menu is replaced by the corresponding menu item. If multiple menu items in the application's main menu have the same GroupIndex value, they can be replaced only by separate menu items from the other form's menu that also have repeated GroupIndex values. Thus, the first main menu item with a given value is replaced by the first item in the second form with that value, the second item in the main form is replaced by the second item in the second form, and so on.

When a menu item in a menu bar that is merged into the application's main menu has a GroupIndex that falls between the GroupIndex values of two adjacent items on the application's main menu, that menu item is inserted between the two adjacent items. If the item's GroupIndex value is greater than all other GroupIndex values in the application's main menu, the item appears at the end of the main menu. If the GroupIndex value is less than all other GroupIndex values in the application's main menu, the menu item appears at the beginning of the main menu bar.

When an object created by an OLE 2.0 server application is activated, the server can try to merge its menus with the menus of the container application. The GroupIndex property is used to replace up to three main menu items with items from the server, in the manner described above. The server application uses the following predefined GroupIndex values to locate menu items to replace:

Group	Index	Description
Edit	1	Server menu items for editing the active OLE object
View	3	Server menu items for modifying the view of the OLE object.
Help	5	Server menu items for accessing the server's online Help.

Note: See the documentation for the OLE server for information about whether it attempts menu merge during in-place activation.

GroupIndex can also be used to define groups of menu items that act like radio buttons. To allow menu items to behave like radio buttons, set the RadioItem (see page 1414) property to all menu items in the group to true, and assign each menu item the same value of GroupIndex. Checking any menu item in the group will then uncheck the others.

See Also

MenuIndex (see page 1413)

RadioItem (see page 1414)

AutoMerge (see page 1328)

Merge (see page 1325)

PopulateOle2Menu (see page 1326)

34.1.5.5.15 TMenuItem.Handle Property

Indicates the Windows menu handle of the drop-down menu associated with the menu item.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle when calling a Windows API function that requires a menu handle. Handle is only valid if the Count (see page 1402) property is greater than 0.

See Also

Count (see page 1402)

Items (see page 1411)

34.1.5.5.16 TMenuItem.HelpContext Property

Specifies the help context ID associated with the menu item.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate the menu item with a screen in the Help system of the application. Each screen in the Help system should have a unique context ID. When a menu item is selected using the keyboard, pressing F1 displays a Help screen. Which Help screen appears depends on the value of the HelpContext property.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

HelpFile

HelpContext

HelpContext

34.1.5.5.17 TMenuItem.Hint Property

Specifies the text string that can appear when the user moves the mouse pointer over a menu item.

Pascal

```
property Hint: string;
```

C++

```
__property UnicodeString Hint;
```

Description

Set Hint to a string that provides more information about the meaning of the menu item than the Caption (see page 1396). The hint text appears in the **Status Bar** when the user pauses with the mouse over the menu item if Help Hints are enabled (that is, if the Form's and the Application's ShowHint properties are true). It is also available for the code in the application's OnHint event handler.

The value of Hint can specify both a short value for the Help Hint window and a longer string to be used by the OnHint event handler. To provide both a short and a long hint, set Hint to the short string, followed by a vertical bar (|), followed by the long string.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

34.1.5.5.18 TMenuItem.ImageIndex Property

Indicates which image maintained by the parent menu appears next to the menu item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to designate an image that should appear next to the caption when the menu item is drawn. On top-level menu items, ImageIndex specifies a zero-offset index into the Images property of the parent menu (TMenu (see page 1331) or TPopupMenu (see page 1430)). On submenu items, ImageIndex is the zero-offset index into the parent item's SubMenuImages (see page 1415) property.

If the parent menu or item does not maintain a list of images, use the Bitmap (see page 1395) property to provide an image for a single menu item. However, any image specified by ImageIndex takes precedence over the Bitmap (see page 1395) property. Bitmap (see page 1395) is only used when ImageIndex has a negative value or the parent's Images or SubMenuImages (see page 1415) property is nil (Delphi) or NULL (C++).

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Images (see page 1345)

Bitmap (see page 1395)

ImageIndex

SubMenuImages (see page 1415)

34.1.5.5.19 TMenuItem.Items Property

Lists the menu items in the submenu of the menu item.

Pascal

```
property Items [Index: Integer]: TMenuItem;
```

C++

```
__property TMenuItem Items[int Index];
```

Description

Use Items to access to a subitem by its position in the list of subitems. The value of Index is the position of the subitem within the Items array. For example, if an application has a File drop-down menu that contains the menu items New, Open, and Save, in that order, the expression

```
FileMenu.Items[2]
FileMenu->Items[2]
```

refers to the Save command.

Note: In Delphi, Items is the default property for TMenuItem (see page 1363). This means you can leave off the property name. Thus, instead of writing FileMenu.Items[2], you can write FileMenu[2].

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
  {
    File1->Items[i]->Enabled = false;
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}

void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;
```

```
procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

See Also

Count (see page 1402)

MenuIndex (see page 1413)

Parent (see page 1414)

34.1.5.5.20 TMenuItem.MenuIndex Property

Indicates the index of the menu item within its parent menu.

Pascal

```
property MenuIndex: Integer;
```

C++

```
__property int MenuIndex;
```

Description

Use MenuIndex to locate the menu item in the Items (see page 1411) property of its parent menu item. Changing this value moves the menu item within its menu.

Note: MenuIndex may not correspond to the position of the item in the menu the user sees. The menu can include items that are not visible.

See Also

Count (see page 1402)

GroupIndex (see page 1408)

Items (see page 1411)

Parent (see page 1414)

Visible (see page 1416)

34.1.5.5.21 TMenuItem.Parent Property

Identifies the parent menu item of this menu item.

Pascal

```
property Parent: TMenuItem;
```

C++

```
__property TMenuItem Parent;
```

Description

Read Parent to determine the menu item that represents the dropdown menu that contains this menu item. If the menu item is a top level menu item in a main menu or pop-up menu, Parent is the value of that menu's Items (see page 1411) property.

See Also

Items (see page 1411)

MenuIndex (see page 1413)

Items (see page 1346)

34.1.5.5.22 TMenuItem.RadioItem Property

Specifies whether the menu item is mutually exclusive with other menu items in its group.

Pascal

```
property RadioItem: Boolean;
```

C++

```
__property Boolean RadioItem;
```

Description

Use RadioItem to make the menu item behave like a radio button with a group of other menu items. The group of menu items is the set of all menu items in a pop-up or drop-down menu that have the same value of GroupIndex (see page 1408). When RadioItem is true, only one menu item in the group that contains the menu item can be checked at a time. The single selected menu item in the group is indicated by a round dot next to the Caption (see page 1396).

Note: RadioItem does not automatically select the item when the user clicks it at runtime: you must still explicitly set the Checked (see page 1401) property to true in response to the OnClick (see page 1417) event. RadioItem simply changes the appearance of the Checked (see page 1401) state (from a check mark to a round dot) and automatically unchecks other menu items in the same group when you set the Checked (see page 1401) property to true.

RadioItem does not work for the top-level items in a main menu.

Note: Under Windows NT 3.51, the round dot indicator only appears if the "new shell" has been installed.

See Also

Caption (see page 1396)

Checked (see page 1401)

GroupIndex (see page 1408)

TMainMenu (see page 1322)

OnClick (see page 1417)

34.1.5.5.23 TMenuItem.ShortCut Property

Specifies the key combination users can type to quickly access the menu item.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

Use ShortCut to allow the user to type a key combination instead of selecting the item using the menu. This key combination appears to the right of the menu item in the menu.

When setting menu shortcuts at design time, the Object Inspector provides a long list of key combinations to choose from. To create menu shortcuts at runtime, use the global ShortCut or TextToShortCut (see page 1457) function. For example, the following line creates a shortcut, Ctrl+C and assigns it to a menu item named CloseCommand.

```
CloseCommand.ShortCut := ShortCut(Word('C'), [ssCtrl]);
CloseCommand->ShortCut = ShortCut(Word('C'), TShiftState() << ssCtrl);
```

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

ShortCut (see page 1453)

ShortCutToKey (see page 1454)

ShortCutToText (see page 1456)

TextToShortCut (see page 1457)

IsShortCut (see page 1339)

ShortCut

34.1.5.5.24 TMenuItem.SubMenuImages Property

Lists the images that can appear beside individual items in a submenu of this menu item.

Pascal

```
property SubMenuImages: TCustomImageList;
```

C++

```
__property TCustomImageList SubMenuImages;
```

Description

Use SubMenuImages to supply a set of images that can appear beside items listed in the Items (see page 1411) property. Individual menu items set their ImageIndex (see page 1411) property to indicate which image in the list appears to the left of the menu item caption.

Tip: If the application uses action lists, this property can be the value of the command list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 1411)

Images

Items (see page 1411)

34.1.5.5.25 TMenuItem.Visible Property

Specifies whether the menu item appears in the menu.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use Visible to prevent the user from seeing an item in the menu. For example, remove menu items that do not apply to the current component of a pop-up menu in an OnPopup event handler.

If Visible is true, the menu item appears. If Visible is false, the menu item is hidden.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Enabled (see page 1406)

OnPopup (see page 1444)

PopupComponent (see page 1440)

Visible

34.1.5.6 TMenuItem Events

The events of the TMenuItem class are listed here.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 1416)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 1417)	Occurs when the user clicks menu item.
	OnDrawItem (see page 1422)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 1423)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

34.1.5.6.1 TMenuItem.OnAdvancedDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnAdvancedDrawItem: TAdvancedMenuDrawItemEvent;
```

C++

```
__property TAdvancedMenuDrawItemEvent OnAdvancedDrawItem;
```

Description

Write an OnAdvancedDrawItem event handler to render the image of a menu item in an owner-draw menu.

In the event handler, use the Bitmap (see page 1395) property or the ImageIndex (see page 1411) property to access a bitmap that represents the menu item.

Note: OnAdvancedDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

See Also

OnMeasureItem (see page 1423)

Bitmap (see page 1395)

ImageIndex (see page 1411)

Images (see page 1345)

OwnerDraw (see page 1350)

OnDrawItem (see page 1422)

34.1.5.6.2 TMenuItem.OnClick Event

Occurs when the user clicks menu item.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Write an OnClick event handler to implement the desired behavior for when the user selects the menu item. An advantage of using the OnClick event handler over directly handling WM_COMMAND (see page 1684) messages sent when the user selects the menu item, is that only the OnClick event occurs when the Click (see page 1375) method is called.

Note: This event handler is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.

        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

OnExecute

34.1.5.6.3 TMenuItem.OnDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnDrawItem: TMenuDrawItemEvent;
```

C++

```
__property TMenuDrawItemEvent OnDrawItem;
```

Description

Write an OnDrawItem event handler to render the image of a menu item in an owner-draw menu. In the event handler, use the Bitmap (see page 1395) property or the ImageIndex (see page 1411) property to access a bitmap that represents the menu item.

Note: OnDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

Tip: For more precise information about the menu item's state, use the OnAdvancedDrawItem (see page 1416) event instead.

See Also

OnMeasureItem (see page 1423)

Bitmap (see page 1395)

ImageIndex (see page 1411)

Images (see page 1345)

OwnerDraw (see page 1350)

OnAdvancedDrawItem (see page 1416)

34.1.5.6.4 TMenuItem.OnMeasureItem Event

Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Pascal

```
property OnMeasureItem: TMenuMeasureItemEvent;
```

C++

```
__property TMenuMeasureItemEvent OnMeasureItem;
```

Description

Write an OnMeasureItem event handler to indicate the size of owner-draw menu items. If the menu item is using a bitmap image, the event handler can use the Bitmap (see page 1395) property or the ImageIndex (see page 1411) property to access the bitmap to determine its size.

Note: OnMeasureItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

34.1.6 TMenuItemEnumerator Class

Class Hierarchy

Pascal

```
TMenuItemEnumerator = class;
```

C++

```
class TMenuItemEnumerator;
```

File

Menus

Description

This is class Menus.TMenuItemEnumerator.

34.1.6.1 TMenuItemEnumerator Members

The following tables list the members exposed by TMenuItemEnumerator.

Public Methods

	Name	Description
	Create (see page 1424)	This is Create, a member of class TMenuItemEnumerator.
	GetCurrent (see page 1425)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 1425)	This is MoveNext, a member of class TMenuItemEnumerator.

Public Properties

	Name	Description
R	Current (see page 1425)	This is Current, a member of class TMenuItemEnumerator.

34.1.6.2 TMenuItemEnumerator.Create Constructor

Pascal

```
constructor Create(AMenuItem: TMenuItem);
```

C++

```
__fastcall TMenuItemEnumerator(TMenuItem AMenuItem);
```

Description

This is Create, a member of class TMenuItemEnumerator.

34.1.6.3 TMenuItemEnumerator Methods

The methods of the TMenuItemEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 1425)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 1425)	This is MoveNext, a member of class TMenuItemEnumerator.

34.1.6.3.1 TMenuItemEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TMenuItem;
```

C++

```
__fastcall TMenuItem GetCurrent();
```

Description

This is GetCurrent, a member of class TMenuItemEnumerator.

34.1.6.3.2 TMenuItemEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TMenuItemEnumerator.

34.1.6.4 TMenuItemEnumerator Properties

The properties of the TMenuItemEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 1425)	This is Current, a member of class TMenuItemEnumerator.

34.1.6.4.1 TMenuItemEnumerator.Current Property

Pascal

```
property Current: TMenuItem;
```

C++

```
__property TMenuItem Current;
```

Description

This is Current, a member of class TMenuItemEnumerator.

34.1.7 TMenuItemStack Class

Class Hierarchy

Pascal

```
TMenuItemStack = class(TStack);
```

C++

```
class TMenuItemStack : public TStack;
```

File

Menus

Description

This is class Menus.TMenuItemStack.

34.1.7.1 TMenuItemStack Members

The following tables list the members exposed by TMenuItemStack.

Public Methods

	Name	Description
	ClearItem (see page 1426)	This is ClearItem, a member of class TMenuItemStack.

34.1.7.2 TMenuItemStack Methods

The methods of the TMenuItemStack class are listed here.

Public Methods

	Name	Description
	ClearItem (see page 1426)	This is ClearItem, a member of class TMenuItemStack.

34.1.7.2.1 TMenuItemStack.ClearItem Method

Pascal

```
procedure ClearItem(AItem: TMenuItem);
```

C++

```
__fastcall ClearItem(TMenuItem AItem);
```

Description

This is ClearItem, a member of class TMenuItemStack.

34.1.8 TPopupList Class

TPopupList manages the window that handles popup menu messages.

Class Hierarchy

Pascal

```
TPopupList = class(TList);
```

C++

```
class TPopupList : public TList;
```

File

Menus

Description

TPopupList is the type of the global PopupList (see page 1470) variable, which provides centralized message handling for all popup menus in an application.

See Also

TPopupMenu (see page 1430)

PopupList (see page 1470)

34.1.8.1 TPopupList Members

The following tables list the members exposed by TPopupList.

Protected Fields

	Name	Description
	FWindow (see page 1428)	This is FWindow, a member of class TPopupList.

Protected Methods

	Name	Description
	MainWndProc (see page 1429)	Wraps the WndProc (see page 1429) method with an exception-handling layer.
V	WndProc (see page 1429)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 1428)	Inserts a new popup menu at the end of the list.
	Remove (see page 1429)	Removes a popup menu from the list.

Public Properties

	Name	Description
R	Window (see page 1430)	Provides access to the Window handle of the hidden window that processes popup menu messages.

34.1.8.2 TPopupList Fields

The fields of the TPopupList class are listed here.

Protected Fields

	Name	Description
	FWindow (see page 1428)	This is FWindow, a member of class TPopupList.

34.1.8.2.1 TPopupList.FWindow Field

Pascal

```
FWindow: HWND;
```

C++

```
HWND FWindow;
```

Description

This is FWindow, a member of class TPopupList.

34.1.8.3 TPopupList Methods

The methods of the TPopupList class are listed here.

Protected Methods

	Name	Description
	MainWndProc (see page 1429)	Wraps the WndProc (see page 1429) method with an exception-handling layer.
V	WndProc (see page 1429)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 1428)	Inserts a new popup menu at the end of the list.
	Remove (see page 1429)	Removes a popup menu from the list.

34.1.8.3.1 TPopupList.Add Method

Inserts a new popup menu at the end of the list.

Pascal

```
procedure Add(Popup: TPopupMenu);
```

C++

```
__fastcall Add(TPopupMenu Popup);
```

Description

Do not call the Add method. Popup menus automatically add themselves to the list when they are created.

Add increments Count and, if necessary, allocates memory by increasing the value of Capacity. When the first popup menu is added to the list, Add creates the hidden window whose handle is available as the Window (see page 1430) property.

See Also

Remove (see page 1429)

Window (see page 1430)

34.1.8.3.2 TPopupList.MainWndProc Method

Wraps the WndProc (see page 1429) method with an exception-handling layer.

Pascal

```
procedure MainWndProc(var Message: TMessage);
```

C++

```
__fastcall MainWndProc(TMessage Message);
```

Description

Do not use the protected MainWndProc method. It is used internally when creating the hidden window that responds to popup menu messages. To subclass the window procedure that handles messages sent to popup menus, override the WndProc (see page 1429) method instead.

See Also

WndProc (see page 1429)

34.1.8.3.3 TPopupList.Remove Method

Removes a popup menu from the list.

Pascal

```
procedure Remove(Popup: TPopupMenu);
```

C++

```
__fastcall Remove(TPopupMenu Popup);
```

Description

Do not call the Remove method. It is called automatically by popup menus from their destructors, to remove themselves from the list.

See Also

Add (see page 1428)

34.1.8.3.4 TPopupList.WndProc Method

Provides centralized message handling for all popup menus in the application.

Pascal

```
procedure WndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to subclass the window procedure that handles messages directed at the popup menus in an application. WndProc handles messages by dispatching commands, displaying help, painting menu item, and so on.

34.1.8.4 TPopupList Properties

The properties of the TPopupList class are listed here.

Public Properties

	Name	Description
	Window (see page 1430)	Provides access to the Window handle of the hidden window that processes popup menu messages.

34.1.8.4.1 TPopupList.Window Property

Provides access to the Window handle of the hidden window that processes popup menu messages.

Pascal

```
property Window: HWND;
```

C++

```
__property HWND Window;
```

Description

Use Window for Windows API calls that require a window handle. The hidden window that processes messages for the popup menus in an application is not created until the first popup menu is added to the list. If the list contains no popup menus (that is, if no popup menus are created by the application), Window is 0.

34.1.9 TPopupMenu Class

TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Class Hierarchy

Pascal

```
TPopupMenu = class(TMenu);
```

C++

```
class TPopupMenu : public TMenu;
```

File

Menus

Description

Use TPopupMenu to define the pop-up menu that appears when the user clicks on a control with the right mouse button. To make a pop-up menu available, assign the TPopupMenu object to the control's PopupMenu property.

Tip: To create a popup menu that users can configure at runtime, use the TStandardMenuPopup component with an action manager instead.

Note: If the popup menu's ParentBiDiMode (see page 1440) is true, the popup menu's BiDiMode (see page 1438) is set to the BiDiMode (see page 1438) of the control that activates it. If a control cannot be found, the BiDiMode (see page 1438) is

set to the value of the Application object's BiDiMode (see page 1438). The popup menu's BiDiMode (see page 1438) affects all of its menu items.

34.1.9.1 TPopupMenu Members

The following tables list the members exposed by TPopupMenu.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 1335)	Applies the BiDiMode (see page 1344) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 1336)	Updates the menu when the BiDiMode (see page 1344) property changes.
	DoChange (see page 1336)	Generates an OnChange (see page 1352) event.
	DoGetMenuString (see page 1337)	Returns the caption for an item in the menu.
	DoPopup (see page 1433)	Generates an OnPopup (see page 1444) event.
	GetHandle (see page 1338)	Returns the value of the Handle (see page 1345) property.
	IsOwnerDraw (see page 1339)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 1340)	Calls the DoChange (see page 1336) method when the menu is first loaded into memory.
	MenuChanged (see page 1340)	Responds when the menu changes.
	Notification (see page 1341)	Responds when components are added or deleted.
	SetChildOrder (see page 1342)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetPopupPoint (see page 1434)	This is SetPopupPoint, a member of class TPopupMenu.
	UpdateItems (see page 1343)	Causes all menu items to update themselves.
	UseRightToLeftAlignment (see page 1435)	Specifies whether the control's alignment is in a right-to-left mode.

Public Methods

	Name	Description
	Create (see page 1432)	Creates an instance of TPopupMenu (see page 1430).
	CreateMenuItem (see page 1335)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 1433)	Destroys an instance of TPopupMenu (see page 1430).
	DispatchCommand (see page 1335)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 1336)	Dispatches a pop-up menu command.
	FindItem (see page 1337)	Locates and returns a menu item.
	GetChildren (see page 1338)	Executes a callback for child menu items.
	GetHelpContext (see page 1338)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 1339)	Indicates whether menu items read from right to left.
	IsShortCut (see page 1339)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 1341)	This is the overview for the ParentBiDiModeChanged method overload.
	Popup (see page 1434)	Displays the pop-up menu onscreen.

	ProcessMenuChar (see page 1342)	Responds to keyboard input for the menu.

Public Properties

	Name	Description
R	Handle (see page 1345)	Provides access to the Windows menu handle for the menu.
	PopupComponent (see page 1440)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 1443)	Indicates the location where the pop-up menu appears.
	WindowHandle (see page 1351)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 1443)	Occurs when the menu changes.
	OnPopup (see page 1444)	Occurs just before the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 1436)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 1436)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1437)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 1437)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 1438)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 1438)	Specifies a context ID for the entire pop-up menu.
	Images (see page 1439)	Lists the images that can appear beside individual menu items.
R	Items (see page 1346)	Describes the elements of the menu.
	MenuAnimation (see page 1439)	Specifies how the menu appears when it is first displayed.
	OwnerDraw (see page 1440)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1440)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	TrackButton (see page 1443)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

34.1.9.2 TPopupMenu.Create Constructor

Creates an instance of TPopupMenu (see page 1430).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPopupMenu(TComponent * AOwner);
```

Description

Call Create to create to create a pop-up menu at runtime. Pop-up menus placed in forms or data modules at design time are created automatically.

See Also

Create (see page 1333)

34.1.9.3 TPopupMenu.Destroy Destructor

Destroys an instance of TPopupMenu (see page 1430).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TPopupMenu (see page 1430) reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

34.1.9.4 TPopupMenu Methods

The methods of the TPopupMenu class are listed here.

Protected Methods

	Name	Description
	DoPopup (see page 1433)	Generates an OnPopup (see page 1444) event.
	SetPopupPoint (see page 1434)	This is SetPopupPoint, a member of class TPopupMenu.
	UseRightToLeftAlignment (see page 1435)	Specifies whether the control's alignment is in a right-to-left mode.

Public Methods

	Name	Description
	Popup (see page 1434)	Displays the pop-up menu onscreen.

34.1.9.4.1 TPopupMenu.DoPopup Method

Generates an OnPopup (see page 1444) event.

Pascal

```
procedure DoPopup(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DoPopup(TObject * Sender);
```

Description

DoPopup is called automatically just before the pop-up menu appears to generate an OnPopup (see page 1444) event. Override DoPopup in a descendant class to change the event.

See Also

OnPopup (see page 1444)

Popup (see page 1434)

34.1.9.4.2 TPopupMenu.Popup Method

Displays the pop-up menu onscreen.

Pascal

```
procedure Popup(X: Integer; Y: Integer); virtual;
```

C++

```
virtual __fastcall Popup(int X, int Y);
```

Description

Call Popup to bring up the pop-up menu. The menu appears at the screen coordinates indicated by the values (in pixels) of X and Y.

C++ Examples:

```
/*
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = false;
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(Left + X, Top + Y);
}
```

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Alignment (see page 1436)

AutoPopup (see page 1437)

OnPopup (see page 1444)

34.1.9.4.3 TPopupMenu.SetPopupPoint Method

Pascal

```
procedure SetPopupPoint(APopupPoint: TPoint);
```

C++

```
__fastcall SetPopupPoint(TPoint APopupPoint);
```

Description

This is SetPopupPoint, a member of class TPopupMenu.

34.1.9.4.4 TPopupMenu.UseRightToLeftAlignment Method

Specifies whether the control's alignment is in a right-to-left mode.

Pascal

```
function UseRightToLeftAlignment: Boolean;
```

C++

```
__fastcall Boolean UseRightToLeftAlignment();
```

Description

Call UseRightToLeftAlignment to determine whether the control's alignment is in a right-to-left mode. This information can be used when painting the control or when responding to mouse events.

UseRightToLeftAlignment returns the setting from the control that activated the popup. If the popup was not activated by a control, UseRightToLeftAlignment returns the setting used in the global Application object.

34.1.9.5 TPopupMenu Properties

The properties of the TPopupMenu class are listed here.

Public Properties

	Name	Description
	PopupComponent (see page 1440)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 1443)	Indicates the location where the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 1436)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 1436)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 1437)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 1437)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 1438)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 1438)	Specifies a context ID for the entire pop-up menu.
	Images (see page 1439)	Lists the images that can appear beside individual menu items.
	MenuAnimation (see page 1439)	Specifies how the menu appears when it is first displayed.
	OwnerDraw (see page 1440)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 1440)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	TrackButton (see page 1443)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

34.1.9.5.1 TPopupMenu.Alignment Property

Determines where the pop-up menu appears when the user clicks the right mouse button.

Pascal

```
property Alignment: TPopupAlignment;
```

C++

```
__property TPopupAlignment Alignment;
```

Description

Set Alignment to control the placement of the popup menu. Alignment controls whether the menu appears to the left of the mouse, to the right of the mouse, or centered over the mouse.

By default, the menu appears with its top left corner under the mouse (paLeft).

See Also

AutoPopup (see page 1437)

OnPopup (see page 1444)

34.1.9.5.2 TPopupMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 1394)

Items (see page 1346)

RethinkHotkeys (see page 1388)

34.1.9.5.3 TPopupMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 1395)

Items (see page 1346)

RethinkLines (see page 1389)

34.1.9.5.4 TPopupMenu.AutoPopup Property

Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.

Pascal

```
property AutoPopup: Boolean;
```

C++

```
__property Boolean AutoPopup;
```

Description

Set AutoPopup to true to cause the pop-up menu to appear automatically when the user clicks the right mouse button on a control that has the pop-up menu specified as its PopupMenu property. The application key present on keyboards specifically designed for 32-bit Windows will also show this menu when pressed.

Set AutoPopup to false if the appearance of the pop-up menu should be controlled programmatically. To display a pop-up menu when AutoPopup is false, use the Popup (see page 1434) method.

C++ Examples:

```
/*
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = false;
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(Left + X, Top + Y);
}
```

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Popup (see page 1434)

OnPopup (see page 1444)

PopupMenu

34.1.9.5.5 TPopupMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 1351)

IsRightToLeft (see page 1339)

34.1.9.5.6 TPopupMenu.HelpContext Property

Specifies a context ID for the entire pop-up menu.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate a help screen with the entire pop-up menu. Each screen in the Help system should have a unique context ID. When a component is selected in the application, pressing F1 displays the Help screen associated with the value of HelpContext.

To associate a help screen with the individual items in the pop-up menu, use the HelpContext property of the associated TMenuItem (see page 1363) objects.

See Also

GetHelpContext (see page 1338)

HelpFile

HelpContext (see page 1410)

34.1.9.5.7 TPopupMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 1411)

Images

Items (see page 1346)

34.1.9.5.8 TPopupMenu.MenuAnimation Property

Specifies how the menu appears when it is first displayed.

Pascal

```
property MenuAnimation: TMenuAnimation;
```

C++

```
__property TMenuAnimation MenuAnimation;
```

Description

Use MenuAnimation to specify how the popup menu appears on the screen. The menu can simply appear as a whole, or can

slide into view like a window shade being drawn from any edge.

Note: MenuAnimation only has an effect when running on Windows 98, NT 5.0, or later.

See Also

Popup (see page 1434)

34.1.9.5.9 TPopupMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 1423)

OnDrawItem (see page 1422)

Images (see page 1345)

34.1.9.5.10 TPopupMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 1344)

34.1.9.5.11 TPopupMenu.PopupComponent Property

Indicates the component that last displayed the popup menu in response to a right mouse click.

Pascal

```
property PopupComponent: TComponent;
```

C++

```
__property TComponent * PopupComponent;
```

Description

Read PopupComponent to determine which control is currently using the popup menu. In applications where multiple controls share the same pop-up menu, use PopupComponent to determine which of them displayed the menu.

Set PopupComponent to associate a control with the menu before calling the Popup (see page 1434) method programmatically to bring up the pop-up menu.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
```

```
void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
```

```
end;
```

See Also

AutoPopup (see page 1437)

OnPopup (see page 1444)

Popup (see page 1434)

PopupMenu

34.1.9.5.12 TPopupMenu.PopupPoint Property

Indicates the location where the pop-up menu appears.

Pascal

```
property PopupPoint: TPoint;
```

C++

```
__property TPoint PopupPoint;
```

Description

This public property is used internally to locate the popup menu. Its value is set by the Popup (see page 1434) method.

See Also

Popup (see page 1434)

34.1.9.5.13 TPopupMenu.TrackButton Property

Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

Pascal

```
property TrackButton: TTrackButton;
```

C++

```
__property TTrackButton TrackButton;
```

Description

Use TrackButton to specify which mouse button activates the popup menu when it is associated with a toolbar button.

34.1.9.6 TPopupMenu Events

The events of the TPopupMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 1443)	Occurs when the menu changes.
	OnPopup (see page 1444)	Occurs just before the pop-up menu appears.

34.1.9.6.1 TPopupMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 1346)

34.1.9.6.2 TPopupMenu.OnPopup Event

Occurs just before the pop-up menu appears.

Pascal

```
property OnPopup: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPopup;
```

Description

Write an OnPopup event handler to take specific action just before the pop-up menu appears. For example, use an OnPopup event handler to set the Checked, Enabled, or Visible property of individual items in the menu so that they are appropriate to the PopupComponent (see page 1440).

C++ Examples:

```
/*
The following code enables the Copy item from the pop-up
menu if the edit control has a nonempty selection.
Note: A portion of the edit control text must be highlighted.
*/
void __fastcall TForm1::PopupMenu1Popup(TObject *Sender)
{
  Copy1->Enabled = (Edit1->SelLength > 0);
}

void __fastcall TForm1::Copy1Click(TObject *Sender)
{
    ListBox1->Items->Add("'Copy' menu");
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(X, Y);
}
```

Delphi Examples:

```
{
The following code enables the Copy item from the pop-up
menu if the edit control has a nonempty selection.
Note: A portion of the edit control text must be highlighted.
}
procedure TForm1.PopupMenu1Popup(Sender: TObject);
begin
```

```
  Copy1.Enabled := Edit1.SelLength > 0;
end;

procedure TForm1.Copy1Click(Sender: TObject);
begin
    ListBox1.Items.Add('"Copy" menu');
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

34.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnsiSameCaption (see page 1446)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.
	DrawMenuItem (see page 1447)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 1447)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 1447)	This is function Menus.IsAltGRPressed.
	NewItem (see page 1448)	Creates and initializes a menu item.
	NewLine (see page 1449)	Creates a menu item for a separator.
	NewMenu (see page 1450)	Creates and initializes a main menu.
	NewPopupMenu (see page 1451)	Creates and initializes a popup menu.
	NewSubMenu (see page 1452)	Creates and initializes a menu item that represents a submenu.
	SameCaption (see page 1453)	This is function Menus.SameCaption.
	ShortCut (see page 1453)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 1454)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 1454)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 1456)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 1457)	Removes the accelerator character marker from a string.
	TextToShortCut (see page 1457)	Creates a menu shortcut from a text string.

34.2.1 Menus.AnsiSameCaption Function

Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

Pascal

```
function AnsiSameCaption(const Text1: string; const Text2: string): Boolean;
```

C++

```
Boolean AnsiSameCaption(const UnicodeString Text1, const UnicodeString Text2);
```

File

Menus

Description

AnsiSameCaption compares Text1 to Text2, without case sensitivity and ignoring any ampersands (&) that are included to create accelerator characters. The compare operation is controlled by the current locale. The return value is true if the two strings have the same value, false otherwise.

See Also

StringReplace

IsAccel

AnsiSameText

34.2.2 Menus.DrawMenuItem Function

Pascal

```
procedure DrawMenuItem(MenuItem: TMenuItem; ACanvas: TCanvas; ARect: TRect; State:
TOwnerDrawState);
```

C++

```
DrawMenuItem(TMenuItem MenuItem, TCanvas ACanvas, TRect ARect, TOwnerDrawState State);
```

File

Menus

Description

This is function Menus.DrawMenuItem.

34.2.3 Menus.GetHotkey Function

Returns the last character in a string marked with an ampersand (&).

Pascal

```
function GetHotkey(const Text: string): string;
```

C++

```
UnicodeString GetHotkey(const UnicodeString Text);
```

File

Menus

Description

GetHotKey searches Text, starting at the end, for a character that is identified as an accelerator key by a preceding ampersand (&). If it locates a character marked with an ampersand, GetHotkey returns that character. Otherwise, it returns an empty string.

See Also

AnsiSameCaption (see page 1446)

StripHotkey (see page 1457)

IsAccel

34.2.4 Menus.IsAltGRPressed Function

Pascal

```
function IsAltGRPressed: boolean;
```

C++

```
boolean IsAltGRPressed();
```

File

Menus

Description

This is function Menus.IsAltGRPressed.

34.2.5 Menus.NewItem Function

Creates and initializes a menu item.

Pascal

```
function NewItem(const ACaption: string; AShortCut: TShortCut; AChecked: Boolean; AEnabled:
Boolean; AOnClick: TNotifyEvent; hCtx: THelpContext; const AName: string): TMenuItem;
```

C++

```
TMenuItem NewItem(const UnicodeString ACaption, TShortCut AShortCut, Boolean AChecked, Boolean
AEnabled, TNotifyEvent AOnClick, THelpContext hCtx, const UnicodeString AName);
```

File

Menus

Description

Call NewItem to create and initialize a menu item when constructing a menu programmatically.

The ACaption parameter specifies the string that should appear for the menu item.

The AShortCut parameter specifies any associated shortcut.

The AChecked parameter indicates whether the menu item appears with a check mark.

The AEnabled parameter specifies whether the menu item is enabled or grayed.

The AOnClick parameter specifies an event handler that executes when the user clicks the menu item.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The menu item returned by NewItem can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 1450), NewPopupMenu (see page 1451), or NewSubMenu (see page 1452) function.

Warning: The item returned by NewItem does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 1363) do not free memory.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
```

```
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewSubMenu (see page 1452)

NewLine (see page 1449)

NewMenu (see page 1450)

NewPopupMenu (see page 1451)

TMenuItem (see page 1363)

34.2.6 Menus.NewLine Function

Creates a menu item for a separator.

Pascal

```
function NewLine: TMenuItem;
```

C++

```
TMenuItem NewLine();
```

File

Menus

Description

Call NewLine to create a separator that divides the items in a menu into logical groups. Once the menu item for the separator has been created using NewLine, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 1450), NewPopupMenu (see page 1451), or NewSubMenu (see page 1452) function.

Warning: The item returned by NewLine does not have an owner. You are responsible for freeing its memory when it is no

longer needed. The Delete and Remove methods of TMenuItem (see page 1363) do not free memory.

See Also

NewItem (see page 1448)

NewPopupMenu (see page 1451)

NewSubMenu (see page 1452)

TMenuItem (see page 1363)

34.2.7 Menus.NewMenu Function

Creates and initializes a main menu.

Pascal

```
function NewMenu(Owner: TComponent; const AName: string; const Items: array of TMenuItem):
TMainMenu;
```

C++

```
TMainMenu NewMenu(TComponent * Owner, const UnicodeString AName, const array of TMenuItem
Items);
```

File

Menus

Description

Call NewMenu to create and initialize a main menu programmatically. NewMenu returns the TMainMenu (see page 1322) component that represents the menu.

The Owner parameter specifies the component that is responsible for freeing the menu (typically the form).

The AName parameter specifies the name of the menu, which is used to refer to it in code.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 1448) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewPopupMenu (see page 1451)

NewSubMenu (see page 1452)

NewItem (see page 1448)

34.2.8 Menus.NewPopupMenu Function

Creates and initializes a popup menu.

Pascal

```
function NewPopupMenu(Owner: TComponent; const AName: string; Alignment: TPopupAlignment;
AutoPopup: Boolean; const Items: array of TMenuItem): TPopupMenu;
```

C++

```
TPopupMenu NewPopupMenu(TComponent * Owner, const UnicodeString AName, TPopupAlignment
Alignment, Boolean AutoPopup, const array of TMenuItem Items);
```

File

Menus

Description

Call NewPopupMenu to create and initialize a popup menu programmatically. NewPopupMenu returns the TPopupMenu (see page 1430) component that represents the popup menu, but does not associate that popup menu with any control.

The Owner parameter specifies the component that is responsible for freeing the menu.

The AName parameter specifies the name of the popup menu, which is used to refer to it in code.

The Alignment parameter determines where the menu appears relative to the mouse when the user right clicks on the control that uses the menu.

The AutoPopup parameter specifies whether the menu should appear automatically when the user right clicks the associated control.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 1448) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

See Also

NewMenu (see page 1450)

NewSubMenu (see page 1452)

NewItem (see page 1448)

34.2.9 Menus.NewSubMenu Function

Creates and initializes a menu item that represents a submenu.

Pascal

```
function NewSubMenu(const ACaption: string; hCtx: THelpContext; const AName: string; const
Items: array of TMenuItem; AEnabled: Boolean = True): TMenuItem;
```

C++

```
TMenuItem NewSubMenu(const UnicodeString ACaption, THelpContext hCtx, const UnicodeString
AName, const array of TMenuItem Items, Boolean AEnabled = True);
```

File

Menus

Description

Call NewSubMenu to create a menu item that represents a submenu when constructing a menu programmatically at runtime.

The ACaption parameter indicates the string that appears in the parent menu for the submenu.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The Items parameter specifies an array of menu items that make up the submenu and that appear when the user clicks the submenu item in the parent menu.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

The AEnabled parameter specifies whether the menu item that appears in the parent menu is enabled.

Once a submenu has been created using NewSubMenu, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 1450), NewPopupMenu (see page 1451), or NewSubMenu function.

Warning: The item returned by NewSubMenu does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 1363) do not free memory.

See Also

NewItem (see page 1448)

TMenuItem (see page 1363)

NewLine (see page 1449)

NewMenu (see page 1450)

NewPopupMenu (see page 1451)

34.2.10 Menus.SameCaption Function

Pascal

```
function SameCaption(const Text1: string; const Text2: string): Boolean;
```

C++

```
Boolean SameCaption(const UnicodeString Text1, const UnicodeString Text2);
```

File

Menus

Description

This is function Menus.SameCaption.

34.2.11 Menus.ShortCut Function

Creates a menu shortcut for a specified key combination.

Pascal

```
function ShortCut(Key: Word; Shift: TShiftState): TShortCut;
```

C++

```
TShortCut ShortCut(Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCut to create a menu shortcut at runtime.

Specify a Key value using a virtual key code (Menus (see page 1319) version) or Qt key code (QMenus version).

Specify the values for the Shift, Control, and Alt keys by using a set of type TShiftState. For example, to specify the Shift key, use the set [ssShift]. To specify a Shift and Ctrl key combination, use the set [ssShift, ssCtrl].

Assign the value returned by ShortCut as the value of the ShortCut property of a menu item.

Note: TextToShortCut (see page 1457) can also create a shortcut. TextToShortCut (see page 1457) converts a string to a shortcut, so it can be used to let the user specify the shortcut. However, TextToShortCut (see page 1457) executes much more slowly than ShortCut. Use ShortCut whenever possible.

C++ Examples:

```
/*
This example creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
*/
void __fastcall TForm1::OpenCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Open command has been selected.",
```

```
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenCommand->ShortCut =
    ShortCut(Word('O'), TShiftState() << ssCtrl);
}
```

Delphi Examples:

```
{
This example creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCutToKey (see page 1454)

ShortCutToText (see page 1456)

TextToShortCut (see page 1457)

TMenuItem (see page 1363)

34.2.12 Menus.ShortCutFromMessage Function

Pascal

```
function ShortCutFromMessage(Message: TWMKey): TShortCut;
```

C++

```
TShortCut ShortCutFromMessage(TWMKey Message);
```

File

Menus

Description

This is function Menus.ShortCutFromMessage.

34.2.13 Menus.ShortCutToKey Function

Returns the key code and shift state of a menu shortcut.

Pascal

```
procedure ShortCutToKey(ShortCut: TShortCut; var Key: Word; var Shift: TShiftState);
```

C++

```
ShortCutToKey(TShortCut ShortCut, Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCutToKey to parse a menu shortcut into its virtual key code and shift state parts.

ShortCut (see page 1453) is the value of the menu shortcut.

Key returns the virtual key code (Menus (see page 1319) version) or Qt key code (QMenus version) for the key.

Shirt returns the associated combination of Shift, Ctrl, and Alt keys.

C++ Examples:

```
/*
The following code redefines the ShortCut of CloseCommand if
the original short cut used the [ssCtrl] shift state.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Word TheKey;

  TShiftState TheShiftState;

  ShortCutToKey(CloseCommand->ShortCut, TheKey, TheShiftState);
  if (TheShiftState.Contains(ssCtrl))
    CloseCommand->ShortCut = ShortCut(Word('C'), TShiftState() << ssShift);}

void __fastcall TForm1::CloseCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Close command has been selected.",
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CloseCommand->ShortCut =
    ShortCut(Word('C'), TShiftState() << ssCtrl);
}
```

Delphi Examples:

```
{
The following code redefines the ShortCut of CloseCommand if
the original short cut used the [ssCtrl] shift state.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  TheKey: Word;
  TheShiftState: TShiftState;
begin
  Menus.ShortCutToKey(CloseCommand.ShortCut, TheKey, TheShiftState);
  if TheShiftState = [ssCtrl] then
   CloseCommand.ShortCut := ShortCut(Word('C'), [ssShift]);
end;
```

```
procedure TForm1.CloseCommandClick(Sender: TObject);
begin
  MessageDlg('The Close command has been selected.', mtInformation, [mbOk], 0);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  CloseCommand.ShortCut := Menus.ShortCut(Word('C'), [ssCtrl]);
end;
```

See Also

ShortCut (see page 1453)

ShortCutToText (see page 1456)

TextToShortCut (see page 1457)

TMenuItem (see page 1363)

34.2.14 Menus.ShortCutToText Function

Converts a menu shortcut into a string that describes the shortcut.

Pascal

```
function ShortCutToText(ShortCut: TShortCut): string;
```

C++

```
UnicodeString ShortCutToText(TShortCut ShortCut);
```

File

Menus

Description

Call ShortCutToText to obtain a text description of the shortcut associated with a menu item. Use this function when the application needs to display a description of a shortcut to the user.

C++ Examples:

```
/*
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->Text = ShortCutToText(OpenCommand->ShortCut);}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenCommand->ShortCut =
    ShortCut(Word('O'), TShiftState() << ssCtrl);
}

void __fastcall TForm1::OpenCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Open command has been selected.",
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}
```

Delphi Examples:

```
{
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.Text := Menus.ShortCutToText(OpenCommand.ShortCut);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCut (see page 1453)

ShortCutToKey (see page 1454)

TextToShortCut (see page 1457)

TMenuItem (see page 1363)

34.2.15 Menus.StripHotkey Function

Removes the accelerator character marker from a string.

Pascal

```
function StripHotkey(const Text: string): string;
```

C++

```
UnicodeString StripHotkey(const UnicodeString Text);
```

File

Menus

Description

StripHotkey removes the & escape char that marks the accelerator characters in Text. When the current locale is Asian, this function also looks for and removes any parentheses around the accelerator, which are common in Asian locales.

See Also

StringReplace

IsAccel

34.2.16 Menus.TextToShortCut Function

Creates a menu shortcut from a text string.

Pascal

```
function TextToShortCut(Text: string): TShortCut;
```

C++

```
TShortCut TextToShortCut(UnicodeString Text);
```

File

Menus

Description

Call TextToShortCut to create a menu shortcut from a descriptive string. For example, an application can allow users to specify the value of a shortcut in an edit box control, and then call TextToShortCut to create a menu shortcut for the value entered by the user.

Note: TextToShortCut executes slowly. When possible, use the ShortCut (see page 1453) function to create a menu shortcut instead.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

ShortCut (see page 1453)

ShortCutToText (see page 1456)

TMenuItem (see page 1363)

34.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFindItemKind (see page 1460)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 1461)	TMenuAnimation (see page 1466) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 1461)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 1462)	TMenuItemAutoFlag and TMenuAutoFlag (see page 1467) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 1463)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 1463)	TTrackButton specifies which mouse button activates a tool button menu.

34.3.1 Menus.TFindItemKind Enumeration

TFindItemKind indicates the criterion to use when locating menu items.

Pascal

```
TFindItemKind = (
  fkCommand,
  fkHandle,
  fkShortCut
);
```

C++

```
enum TFindItemKind {
  fkCommand,
  fkHandle,
  fkShortCut
};
```

File

Menus

Description

TFindItemKind values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
fkID	Identify the item by its Windows command ID (parameter to WM_COMMAND (see page 1684) message).
fkHandle	Identify the item by its pop-up menu handle.
fkShortCut	Identify the item by its menu shortcut key code.

34.3.2 Menus.TMenuAnimations Enumeration

TMenuAnimation (see page 1466) and TMenuAnimations indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimations = (
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
);
```

C++

```
enum TMenuAnimations {
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
};
```

File

Menus

Description

TMenuAnimations indicates the direction in which a menu can "slide" into view. TMenuAnimation (see page 1466) is a set of TMenuAnimations values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.
maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

See Also

TPopupMenu (see page 1430)

34.3.3 Menus.TMenuBreak Enumeration

TMenuBreak indicates the criterion to use when locating menu items.

Pascal

```
TMenuBreak = (
  mbNone,
  mbBreak,
  mbBarBreak
```

```
);
```

C++

```
enum TMenuBreak {
  mbNone,
  mbBreak,
  mbBarBreak
};
```

File

Menus

Description

TMenuBreak values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
mbNone	No menu breaking occurs.
mbBarBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. A bar separates the new and the old columns.
mbBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. Only space separates the new and the old columns.

34.3.4 Menus.TMenuItemAutoFlag Enumeration

TMenuItemAutoFlag and TMenuAutoFlag (see page 1467) Indicate when menu items are automatically maintained.

Pascal

```
TMenuItemAutoFlag = (
  maAutomatic,
  maManual,
  maParent
);
```

C++

```
enum TMenuItemAutoFlag {
  maAutomatic,
  maManual,
  maParent
};
```

File

Menus

Description

TMenuItemAutoFlag indicates when a submenu is checked for problems and updated. TMenuAutoFlag (see page 1467) provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.

maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

See Also

AutoHotkeys (see page 1343)

AutoLineReduction (see page 1344)

34.3.5 Menus.TPopupAlignment Enumeration

TPopupAlignment represents the position of a popup menu relative to the mouse.

Pascal

```
TPopupAlignment = (
  paLeft,
  paRight,
  paCenter
);
```

C++

```
enum TPopupAlignment {
  paLeft,
  paRight,
  paCenter
};
```

File

Menus

Description

These are the possible values:

Value	Meaning
paLeft	The pop-up menu appears with its top left corner under the mouse.
paCenter	The pop-up menu appears with the top center of the menu under the mouse.
paRight	The pop-up menu appears with its top right corner under the mouse.

34.3.6 Menus.TTrackButton Enumeration

TTrackButton specifies which mouse button activates a tool button menu.

Pascal

```
TTrackButton = (
  tbRightButton,
  tbLeftButton
);
```

C++

```
enum TTrackButton {
```

```
    tbRightButton,
    tbLeftButton
};
```

File

Menus

Description

TTrackButton can have one of the following values:

Value	Meaning
tbRightButton	The right mouse button activates the tool button menu.
tbLeftButton	The left mouse button activates the tool button menu.

34.4 Types

The following table lists types in this documentation.

Types

Name	Description
PMenuItem (see page 1465)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 1465)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 1466)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 1466)	TMenuAnimation and TMenuAnimations (see page 1461) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 1467)	TMenuItemAutoFlag (see page 1462) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 1467)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 1468)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuHandle (see page 1468)	This is type Menus.TMenuHandle.
TMenuMeasureItemEvent (see page 1469)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

34.4.1 Menus.PMenuItem Type

Pascal

```
PMenuItem = ^TMenuItem;
```

C++

```
^TMenuItem PMenuItem;
```

File

Menus

Description

This is type Menus.PMenuItem.

34.4.2 Menus.TAdvancedMenuDrawItemEvent Type

TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TAdvancedMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect;
State: TOwnerDrawState) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState) (
TAdvancedMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 1363) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

State is a set indicating various aspects of the menu items state such as whether it is selected, checked, grayed, and so on.

See Also

Procedural types

Creating events

34.4.3 Menus.TMenuActionLinkClass Type

Pascal

```
TMenuActionLinkClass = class of TMenuActionLink;
```

C++

```
TMenuActionLink TMenuActionLinkClass;
```

File

Menus

Description

This is type Menus.TMenuActionLinkClass.

34.4.4 Menus.TMenuAnimation Type

TMenuAnimation and TMenuAnimations (see page 1461) indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimation = set of TMenuAnimations;
```

C++

```
TMenuAnimations TMenuAnimation;
```

File

Menus

Description

TMenuAnimations (see page 1461) indicates the direction in which a menu can "slide" into view. TMenuAnimation is a set of TMenuAnimations (see page 1461) values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations (see page 1461) values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.
maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

TPopupMenu (see page 1430)

34.4.5 Menus.TMenuAutoFlag Type

TMenuItemAutoFlag (see page 1462) and TMenuAutoFlag Indicate when menu items are automatically maintained.

Pascal

```
TMenuAutoFlag = maAutomatic..maManual;
```

C++

```
maAutomatic..maManual TMenuAutoFlag;
```

File

Menus

Description

TMenuItemAutoFlag (see page 1462) indicates when a submenu is checked for problems and updated. TMenuAutoFlag provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.
maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

AutoHotkeys (see page 1343)

AutoLineReduction (see page 1344)

34.4.6 Menus.TMenuChangeEvent Type

Pascal

```
TMenuChangeEvent = procedure (Sender: TObject; Source: TMenuItem; Rebuild: Boolean) of object;
```

C++

```
(Sender: TObject; Source: TMenuItem; Rebuild: Boolean) ( TMenuChangeEvent)();
```

File

Menus

Description

This is type Menus.TMenuChangeEvent.

34.4.7 Menus.TMenuDrawItemEvent Type

TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected:
Boolean) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected: Boolean) ( TMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 1363) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

Selected indicates whether the menu item is selected (that is, if it will be clicked if the user presses return)

Creating events

34.4.8 Menus.TMenuHandle Type

Pascal

```
TMenuHandle = HMENU;
```

C++

```
HMENU TMenuHandle;
```

File

Menus

Description

This is type Menus.TMenuHandle.

34.4.9 Menus.TMenuMeasureItemEvent Type

TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Pascal

```
TMenuMeasureItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; var Width, Height:
Integer) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; var Width, Height: Integer) ( TMenuMeasureItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 1363) instance that represents the menu item to be measured.

ACanvas represents the canvas where the menu item will be drawn. Use its methods, if necessary, to determine the size of the menu item.

Width and Height return the dimensions, in pixels, that should be used to draw the menu item.

34.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
PopupList (see page 1470)	Provides centralized handling of Windows messages directed at popup menus.
ShortCutItems (see page 1470)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 1471)	Determines what accelerator keys can be automatically assigned to a menu item caption.

34.5.1 Menus.PopupList Variable

Provides centralized handling of Windows messages directed at popup menus.

Pascal

```
PopupList: TPopupList;
```

C++

```
TPopupList PopupList;
```

File

Menus

Description

Use PopupList to access all the popup menus in the application or access the window handle of the window that responds to popup menu messages. PopupList maintains a list of all the popup menu components created in an application. It holds the handle of a hidden window that centralizes the processing of Windows messages directed at these popup menus.

See Also

TPopupMenu (see page 1430)

34.5.2 Menus.ShortCutItems Variable

Pascal

```
ShortCutItems: TMenuItemStack;
```

C++

```
TMenuItemStack ShortCutItems;
```

File

Menus

Description

This is variable Menus.ShortCutItems.

34.5.3 Menus.ValidMenuHotkeys Variable

Determines what accelerator keys can be automatically assigned to a menu item caption.

Pascal

```
ValidMenuHotkeys: string = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

C++

```
UnicodeString ValidMenuHotkeys = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

File

Menus

Description

ValidMenuHotkeys is used to limit the characters that a menu considers when automatically assigning accelerator keys to menu items. This variable is used at runtime when the AutoHotkeys property is true or when an application calls RethinkHotkeys.

By default, ValidMenuHotkeys limits accelerator keys to alphanumeric values (digits and letters). Change this variable to redefine the keys that can be used when assigning accelerator keys automatically.

34.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cDialogSuffix (see page 1472)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 1472)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 1472)	This is constant Menus.cLineCaption.

34.6.1 Menus.cDialogSuffix Constant

Pascal

```
cDialogSuffix = '...';
```

C++

```
cDialogSuffix = '...';
```

File

Menus

Description

This is constant Menus.cDialogSuffix.

34.6.2 Menus.cHotkeyPrefix Constant

Pascal

```
cHotkeyPrefix = '&';
```

C++

```
cHotkeyPrefix = '&';
```

File

Menus

Description

This is constant Menus.cHotkeyPrefix.

34.6.3 Menus.cLineCaption Constant

Pascal

```
cLineCaption = '-';
```

C++

```
cLineCaption = '-';
```

File

Menus

Description

This is constant Menus.cLineCaption.

35 Messages Namespace

This is namespace Messages.

Topics

Name	Description

Structs, Records, Enums (see page 1511)	The following table lists structs, records, enums in this documentation.
Types (see page 1568)	The following table lists types in this documentation.
Constants (see page 1595)	The following table lists constants in this documentation.

Constants

Name	Description
BM_CLICK (see page 1602)	Represents the Windows message BM_CLICK.
BM_GETCHECK (see page 1603)	Represents the Windows message BM_GETCHECK.
BM_GETIMAGE (see page 1603)	Represents the Windows message BM_GETIMAGE.
BM_GETSTATE (see page 1604)	Represents the Windows message BM_GETSTATE.
BM_SETCHECK (see page 1604)	Represents the Windows message BM_SETCHECK.
BM_SETIMAGE (see page 1604)	Represents the Windows message BM_SETIMAGE.
BM_SETSTATE (see page 1605)	Represents the Windows message BM_SETSTATE.
BM_SETSTYLE (see page 1605)	Represents the Windows message BM_SETSTYLE.
BN_CLICKED (see page 1606)	Represents the Windows message BN_CLICKED.
BN_DBLCLK (see page 1606)	Represents the Windows message BN_DBLCLK.
BN_DISABLE (see page 1607)	Represents the Windows message BN_DISABLE.
BN_DOUBLECLICKED (see page 1607)	Represents the Windows message BN_DOUBLECLICKED.
BN_HILITE (see page 1607)	Represents the Windows message BN_HILITE.
BN_KILLFOCUS (see page 1608)	Represents the Windows message BN_KILLFOCUS.
BN_PAINT (see page 1608)	Represents the Windows message BN_PAINT.
BN_PUSHED (see page 1609)	Represents the Windows message BN_PUSHED.
BN_SETFOCUS (see page 1609)	Represents the Windows message BN_SETFOCUS.
BN_UNHILITE (see page 1610)	Represents the Windows message BN_UNHILITE.
BN_UNPUSHED (see page 1610)	Represents the Windows message BN_UNPUSHED.
CB_ADDSTRING (see page 1610)	Represents the Windows message CB_ADDSTRING.
CB_DELETESTRING (see page 1611)	Represents the Windows message CB_DELETESTRING.
CB_DIR (see page 1611)	Represents the Windows message CB_DIR.
CB_FINDSTRING (see page 1612)	Represents the Windows message CB_FINDSTRING.
CB_FINDSTRINGEXACT (see page 1612)	Represents the Windows message CB_FINDSTRINGEXACT.

CB_GETCOUNT (see page 1613)	Represents the Windows message CB_GETCOUNT.
CB_GETCURSEL (see page 1613)	Represents the Windows message CB_GETCURSEL.
CB_GETDROPPEDCONTROLRECT (see page 1613)	Represents the Windows message CB_GETDROPPEDCONTROLRECT.
CB_GETDROPPEDSTATE (see page 1614)	Represents the Windows message CB_GETDROPPEDSTATE.
CB_GETDROPPEDWIDTH (see page 1614)	Represents the Windows message CB_GETDROPPEDWIDTH.
CB_GETEDITSEL (see page 1615)	Represents the Windows message CB_GETEDITSEL.
CB_GETEXTENDEDUI (see page 1615)	Represents the Windows message CB_GETEXTENDEDUI.
CB_GETHORIZONTALEXTENT (see page 1616)	Represents the Windows message CB_GETHORIZONTALEXTENT.
CB_GETITEMDATA (see page 1616)	Represents the Windows message CB_GETITEMDATA.
CB_GETITEMHEIGHT (see page 1617)	Represents the Windows message CB_GETITEMHEIGHT.
CB_GETLBTEXT (see page 1617)	Represents the Windows message CB_GETLBTEXT.
CB_GETLBTEXTLEN (see page 1617)	Represents the Windows message CB_GETLBTEXTLEN.
CB_GETLOCALE (see page 1618)	Represents the Windows message CB_GETLOCALE.
CB_GETTOPINDEX (see page 1618)	Represents the Windows message CB_GETTOPINDEX.
CB_INITSTORAGE (see page 1619)	Represents the Windows message CB_INITSTORAGE.
CB_INSERTSTRING (see page 1619)	Represents the Windows message CB_INSERTSTRING.
CB_LIMITTEXT (see page 1620)	Represents the Windows message CB_LIMITTEXT.
CB_MSGMAX (see page 1620)	Represents the Windows message CB_MSGMAX.
CB_RESETCONTENT (see page 1620)	Represents the Windows message CB_RESETCONTENT.
CB_SELECTSTRING (see page 1621)	Represents the Windows message CB_SELECTSTRING.
CB_SETCURSEL (see page 1621)	Represents the Windows message CB_SETCURSEL.
CB_SETDROPPEDWIDTH (see page 1622)	Represents the Windows message CB_SETDROPPEDWIDTH.
CB_SETEDITSEL (see page 1622)	Represents the Windows message CB_SETEDITSEL.
CB_SETEXTENDEDUI (see page 1623)	Represents the Windows message CB_SETEXTENDEDUI.
CB_SETHORIZONTALEXTENT (see page 1623)	Represents the Windows message CB_SETHORIZONTALEXTENT.
CB_SETITEMDATA (see page 1623)	Represents the Windows message CB_SETITEMDATA.
CB_SETITEMHEIGHT (see page 1624)	Represents the Windows message CB_SETITEMHEIGHT.
CB_SETLOCALE (see page 1624)	Represents the Windows message CB_SETLOCALE.
CB_SETTOPINDEX (see page 1625)	Represents the Windows message CB_SETTOPINDEX.
CB_SHOWDROPDOWN (see page 1625)	Represents the Windows message CB_SHOWDROPDOWN.
CBN_CLOSEUP (see page 1626)	Represents the Windows message CBN_CLOSEUP.
CBN_DBLCLK (see page 1626)	Represents the Windows message CBN_DBLCLK.
CBN_DROPDOWN (see page 1626)	Represents the Windows message CBN_DROPDOWN.
CBN_EDITCHANGE (see page 1627)	Represents the Windows message CBN_EDITCHANGE.
CBN_EDITUPDATE (see page 1627)	Represents the Windows message CBN_EDITUPDATE.
CBN_ERRSPACE (see page 1628)	Represents the Windows message CBN_ERRSPACE.
CBN_KILLFOCUS (see page 1628)	Represents the Windows message CBN_KILLFOCUS.
CBN_SELCHANGE (see page 1629)	Represents the Windows message CBN_SELCHANGE.
CBN_SELENDCANCEL (see page 1629)	Represents the Windows message CBN_SELENDCANCEL.
CBN_SELENDOK (see page 1629)	Represents the Windows message CBN_SELENDOK.
CBN_SETFOCUS (see page 1630)	Represents the Windows message CBN_SETFOCUS.
DM_GETDEFID (see page 1630)	Represents the Windows message DM_GETDEFID.
DM_REPOSITION (see page 1631)	Represents the Windows message DM_REPOSITION.
DM_SETDEFID (see page 1631)	Represents the Windows message DM_SETDEFID.
EM_CANUNDO (see page 1632)	Represents the Windows message EM_CANUNDO.
EM_CHARFROMPOS (see page 1632)	Represents the Windows message EM_CHARFROMPOS.
EM_EMPTYUNDOBUFFER (see page 1632)	Represents the Windows message EM_EMPTYUNDOBUFFER.
EM_FMTLINES (see page 1633)	Represents the Windows message EM_FMTLINES.
EM_GETFIRSTVISIBLELINE (see page 1633)	Represents the Windows message EM_GETFIRSTVISIBLELINE.
EM_GETHANDLE (see page 1634)	Represents the Windows message EM_GETHANDLE.
EM_GETIMESTATUS (see page 1634)	Represents the Windows message EM_GETIMESTATUS.
EM_GETLIMITTEXT (see page 1635)	Represents the Windows message EM_GETLIMITTEXT.
EM_GETLINE (see page 1635)	Represents the Windows message EM_GETLINE.
EM_GETLINECOUNT (see page 1635)	Represents the Windows message EM_GETLINECOUNT.

EM_GETMARGINS (see page 1636)	Represents the Windows message EM_GETMARGINS.
EM_GETMODIFY (see page 1636)	Represents the Windows message EM_GETMODIFY.
EM_GETPASSWORDCHAR (see page 1637)	Represents the Windows message EM_GETPASSWORDCHAR.
EM_GETRECT (see page 1637)	Represents the Windows message EM_GETRECT.
EM_GETSEL (see page 1638)	Represents the Windows message EM_GETSEL.
EM_GETTHUMB (see page 1638)	Represents the Windows message EM_GETTHUMB.
EM_GETWORDBREAKPROC (see page 1638)	Represents the Windows message EM_GETWORDBREAKPROC.
EM_LIMITTEXT (see page 1639)	Represents the Windows message EM_LIMITTEXT.
EM_LINEFROMCHAR (see page 1639)	Represents the Windows message EM_LINEFROMCHAR.
EM_LINEINDEX (see page 1640)	Represents the Windows message EM_LINEINDEX.
EM_LINELENGTH (see page 1640)	Represents the Windows message EM_LINELENGTH.
EM_LINESCROLL (see page 1641)	Represents the Windows message EM_LINESCROLL.
EM_POSFROMCHAR (see page 1641)	Represents the Windows message EM_POSFROMCHAR.
EM_REPLACESEL (see page 1641)	Represents the Windows message EM_REPLACESEL.
EM_SCROLL (see page 1642)	Represents the Windows message EM_SCROLL.
EM_SCROLLCARET (see page 1642)	Represents the Windows message EM_SCROLLCARET.
EM_SETHANDLE (see page 1643)	Represents the Windows message EM_SETHANDLE.
EM_SETIMESTATUS (see page 1643)	Represents the Windows message EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 1644)	Represents the Windows message EM_SETLIMITTEXT.
EM_SETMARGINS (see page 1644)	Represents the Windows message EM_SETMARGINS.
EM_SETMODIFY (see page 1644)	Represents the Windows message EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 1645)	Represents the Windows message EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 1645)	Represents the Windows message EM_SETREADONLY.
EM_SETRECT (see page 1646)	Represents the Windows message EM_SETRECT.
EM_SETRECTNP (see page 1646)	Represents the Windows message EM_SETRECTNP.
EM_SETSEL (see page 1647)	Represents the Windows message EM_SETSEL.
EM_SETTABSTOPS (see page 1647)	Represents the Windows message EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 1647)	Represents the Windows message EM_SETWORDBREAKPROC.
EM_UNDO (see page 1648)	Represents the Windows message EM_UNDO.
EN_CHANGE (see page 1648)	Represents the Windows message EN_CHANGE.
EN_ERRSPACE (see page 1649)	Represents the Windows message EN_ERRSPACE.
EN_HSCROLL (see page 1649)	Represents the Windows message EN_HSCROLL.
EN_KILLFOCUS (see page 1650)	Represents the Windows message EN_KILLFOCUS.
EN_MAXTEXT (see page 1650)	Represents the Windows message EN_MAXTEXT.
EN_SETFOCUS (see page 1650)	Represents the Windows message EN_SETFOCUS.
EN_UPDATE (see page 1651)	Represents the Windows message EN_UPDATE.
EN_VSCROLL (see page 1651)	Represents the Windows message EN_VSCROLL.
LB_ADDFILE (see page 1652)	Represents the Windows message LB_ADDFILE.
LB_ADDSTRING (see page 1652)	Represents the Windows message LB_ADDSTRING.
LB_DELETESTRING (see page 1653)	Represents the Windows message LB_DELETESTRING.
LB_DIR (see page 1653)	Represents the Windows message LB_DIR.
LB_FINDSTRING (see page 1653)	Represents the Windows message LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 1654)	Represents the Windows message LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 1654)	Represents the Windows message LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 1655)	Represents the Windows message LB_GETCARETINDEX.
LB_GETCOUNT (see page 1655)	Represents the Windows message LB_GETCOUNT.
LB_GETCURSEL (see page 1656)	Represents the Windows message LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 1656)	Represents the Windows message LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 1656)	Represents the Windows message LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 1657)	Represents the Windows message LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 1657)	Represents the Windows message LB_GETITEMRECT.
LB_GETLOCALE (see page 1658)	Represents the Windows message LB_GETLOCALE.
LB_GETSEL (see page 1658)	Represents the Windows message LB_GETSEL.
LB_GETSELCOUNT (see page 1659)	Represents the Windows message LB_GETSELCOUNT.

LB_GETSELITEMS (see page 1659)	Represents the Windows message LB_GETSELITEMS.
LB_GETTEXT (see page 1659)	Represents the Windows message LB_GETTEXT.
LB_GETTEXTLEN (see page 1660)	Represents the Windows message LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 1660)	Represents the Windows message LB_GETTOPINDEX.
LB_INITSTORAGE (see page 1661)	Represents the Windows message LB_INITSTORAGE.
LB_INSERTSTRING (see page 1661)	Represents the Windows message LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 1662)	Represents the Windows message LB_ITEMFROMPOINT.
LB_MSGMAX (see page 1662)	Represents the Windows message LB_MSGMAX.
LB_RESETCONTENT (see page 1662)	Represents the Windows message LB_RESETCONTENT.
LB_SELECTSTRING (see page 1663)	Represents the Windows message LB_SELECTSTRING.
LB_SELITEMRANGE (see page 1663)	Represents the Windows message LB_SELITEMRANGE.
LB_SELITEMRANGEEX (see page 1664)	Represents the Windows message LB_SELITEMRANGEEX.
LB_SETANCHORINDEX (see page 1664)	Represents the Windows message LB_SETANCHORINDEX.
LB_SETCARETINDEX (see page 1665)	Represents the Windows message LB_SETCARETINDEX.
LB_SETCOLUMNWIDTH (see page 1665)	Represents the Windows message LB_SETCOLUMNWIDTH.
LB_SETCOUNT (see page 1665)	Represents the Windows message LB_SETCOUNT.
LB_SETCURSEL (see page 1666)	Represents the Windows message LB_SETCURSEL.
LB_SETHORIZONTALEXTENT (see page 1666)	Represents the Windows message LB_SETHORIZONTALEXTENT.
LB_SETITEMDATA (see page 1667)	Represents the Windows message LB_SETITEMDATA.
LB_SETITEMHEIGHT (see page 1667)	Represents the Windows message LB_SETITEMHEIGHT.
LB_SETLOCALE (see page 1668)	Represents the Windows message LB_SETLOCALE.
LB_SETSEL (see page 1668)	Represents the Windows message LB_SETSEL.
LB_SETTABSTOPS (see page 1668)	Represents the Windows message LB_SETTABSTOPS.
LB_SETTOPINDEX (see page 1669)	Represents the Windows message LB_SETTOPINDEX.
LBN_DBLCLK (see page 1669)	Represents the Windows message LBN_DBLCLK.
LBN_ERRSPACE (see page 1670)	Represents the Windows message LBN_ERRSPACE.
LBN_KILLFOCUS (see page 1670)	Represents the Windows message LBN_KILLFOCUS.
LBN_SELCANCEL (see page 1671)	Represents the Windows message LBN_SELCANCEL.
LBN_SELCHANGE (see page 1671)	Represents the Windows message LBN_SELCHANGE.
LBN_SETFOCUS (see page 1671)	Represents the Windows message LBN_SETFOCUS.
PSM_PAGEINFO (see page 1672)	Represents the Windows message PSM_PAGEINFO.
PSM_SHEETINFO (see page 1672)	Represents the Windows message PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 1673)	Represents the Windows message SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 1673)	Represents the Windows message SBM_GETPOS.
SBM_GETRANGE (see page 1674)	Represents the Windows message SBM_GETRANGE.
SBM_GETSCROLLBARINFO (see page 1674)	Represents the Windows message SBM_GETSCROLLBARINFO.
SBM_GETSCROLLINFO (see page 1674)	Represents the Windows message SBM_GETSCROLLINFO.
SBM_SETPOS (see page 1675)	Represents the Windows message SBM_SETPOS.
SBM_SETRANGE (see page 1675)	Represents the Windows message SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 1676)	Represents the Windows message SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 1676)	Represents the Windows message SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 1677)	Represents the Windows message WM_ACTIVATE.
WM_ACTIVATEAPP (see page 1677)	Represents the Windows message WM_ACTIVATEAPP.
WM_APP (see page 1678)	Represents the Windows message WM_APP.
WM_APPCOMMAND (see page 1678)	Represents the Windows message WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 1678)	Represents the Windows message WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 1679)	Represents the Windows message WM_CANCELJOURNAL.
WM_CANCELMODE (see page 1679)	Represents the Windows message WM_CANCELMODE.
WM_CAPTURECHANGED (see page 1680)	Represents the Windows message WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 1680)	Represents the Windows message WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 1681)	Represents the Windows message WM_CHANGEUISTATE.
WM_CHAR (see page 1681)	Represents the Windows message WM_CHAR.
WM_CHARTOITEM (see page 1681)	Represents the Windows message WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 1682)	Represents the Windows message WM_CHILDACTIVATE.

WM_CLEAR (see page 1682)	Represents the Windows message WM_CLEAR.
WM_CLOSE (see page 1683)	Represents the Windows message WM_CLOSE.
WM_COALESCE_FIRST (see page 1683)	Represents the Windows message WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 1684)	Represents the Windows message WM_COALESCE_LAST.
WM_COMMAND (see page 1684)	Represents the Windows message WM_COMMAND.
WM_COMMNOTIFY (see page 1685)	Represents the Windows message WM_COMMNOTIFY.
WM_COMPACTING (see page 1685)	Represents the Windows message WM_COMPACTING.
WM_COMPAREITEM (see page 1685)	Represents the Windows message WM_COMPAREITEM.
WM_CONTEXTMENU (see page 1686)	Represents the Windows message WM_CONTEXTMENU.
WM_COPY (see page 1686)	Represents the Windows message WM_COPY.
WM_COPYDATA (see page 1687)	Represents the Windows message WM_COPYDATA.
WM_CREATE (see page 1687)	Represents the Windows message WM_CREATE.
WM_CTLCOLOR (see page 1688)	Represents the Windows message WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 1688)	Represents the Windows message WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 1688)	Represents the Windows message WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 1689)	Represents the Windows message WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 1689)	Represents the Windows message WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 1690)	Represents the Windows message WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 1690)	Represents the Windows message WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 1691)	Represents the Windows message WM_CTLCOLORSTATIC.
WM_CUT (see page 1691)	Represents the Windows message WM_CUT.
WM_DDE_ACK (see page 1691)	Represents the Windows message WM_DDE_ACK.
WM_DDE_ADVISE (see page 1692)	Represents the Windows message WM_DDE_ADVISE.
WM_DDE_DATA (see page 1692)	Represents the Windows message WM_DDE_DATA.
WM_DDE_EXECUTE (see page 1693)	Represents the Windows message WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 1693)	Represents the Windows message WM_DDE_FIRST.
WM_DDE_INITIATE (see page 1694)	Represents the Windows message WM_DDE_INITIATE.
WM_DDE_LAST (see page 1694)	Represents the Windows message WM_DDE_LAST.
WM_DDE_POKE (see page 1695)	Represents the Windows message WM_DDE_POKE.
WM_DDE_REQUEST (see page 1695)	Represents the Windows message WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 1695)	Represents the Windows message WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 1696)	Represents the Windows message WM_DDE_UNADVISE.
WM_DEADCHAR (see page 1696)	Represents the Windows message WM_DEADCHAR.
WM_DELETEITEM (see page 1697)	Represents the Windows message WM_DELETEITEM.
WM_DESTROY (see page 1697)	Represents the Windows message WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 1698)	Represents the Windows message WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 1698)	Represents the Windows message WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 1698)	Represents the Windows message WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 1699)	Represents the Windows message WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 1699)	Represents the Windows message WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 1700)	Represents the Windows message WM_DRAWITEM.
WM_DROPFILES (see page 1700)	Represents the Windows message WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 1701)	Represents the Windows message WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 1701)	Represents the Windows message WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 1702)	Represents the Windows message WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 1702)	Represents the Windows message WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 1703)	Represents the Windows message WM_ENABLE.
WM_ENDSESSION (see page 1703)	Represents the Windows message WM_ENDSESSION.
WM_ENTERIDLE (see page 1703)	Represents the Windows message WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 1704)	Represents the Windows message WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 1704)	Represents the Windows message WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 1705)	Represents the Windows message WM_ERASEBKGND.
WM_EXITMENULOOP (see page 1705)	Represents the Windows message WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 1706)	Represents the Windows message WM_EXITSIZEMOVE.

WM_FONTCHANGE (see page 1706)	Represents the Windows message WM_FONTCHANGE.
WM_GETDLGCODE (see page 1707)	Represents the Windows message WM_GETDLGCODE.
WM_GETFONT (see page 1707)	Represents the Windows message WM_GETFONT.
WM_GETHOTKEY (see page 1707)	Represents the Windows message WM_GETHOTKEY.
WM_GETICON (see page 1708)	Represents the Windows message WM_GETICON.
WM_GETMINMAXINFO (see page 1708)	Represents the Windows message WM_GETMINMAXINFO.
WM_GETOBJECT (see page 1709)	Represents the Windows message WM_GETOBJECT.
WM_GETTEXT (see page 1709)	Represents the Windows message WM_GETTEXT.
WM_GETTEXTLENGTH (see page 1710)	Represents the Windows message WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 1710)	Represents the Windows message WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 1711)	Represents the Windows message WM_HANDHELDLAST.
WM_HELP (see page 1711)	Represents the Windows message WM_HELP.
WM_HOTKEY (see page 1711)	Represents the Windows message WM_HOTKEY.
WM_HSCROLL (see page 1712)	Represents the Windows message WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 1712)	Represents the Windows message WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 1713)	Represents the Windows message WM_ICONERASEBKGND.
WM_IME_CHAR (see page 1713)	Represents the Windows message WM_IME_CHAR.
WM_IME_COMPOSITION (see page 1714)	Represents the Windows message WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 1714)	Represents the Windows message WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 1715)	Represents the Windows message WM_IME_CONTROL.
WM_IME_ENDCOMPOSITION (see page 1715)	Represents the Windows message WM_IME_ENDCOMPOSITION.
WM_IME_KEYDOWN (see page 1715)	Represents the Windows message WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 1716)	Represents the Windows message WM_IME_KEYLAST.
WM_IME_KEYUP (see page 1716)	Represents the Windows message WM_IME_KEYUP.
WM_IME_NOTIFY (see page 1717)	Represents the Windows message WM_IME_NOTIFY.
WM_IME_REQUEST (see page 1717)	Represents the Windows message WM_IME_REQUEST.
WM_IME_SELECT (see page 1718)	Represents the Windows message WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 1718)	Represents the Windows message WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 1718)	Represents the Windows message WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 1719)	Represents the Windows message WM_INITDIALOG.
WM_INITMENU (see page 1719)	Represents the Windows message WM_INITMENU.
WM_INITMENUPOPUP (see page 1720)	Represents the Windows message WM_INITMENUPOPUP.
WM_INPUT (see page 1720)	Represents the Windows message WM_INPUT.
WM_INPUTLANGCHANGE (see page 1721)	Represents the Windows message WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 1721)	Represents the Windows message WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 1722)	Represents the Windows message WM_KEYDOWN.
WM_KEYFIRST (see page 1722)	Represents the Windows message WM_KEYFIRST.
WM_KEYLAST (see page 1722)	Represents the Windows message WM_KEYLAST.
WM_KEYUP (see page 1723)	Represents the Windows message WM_KEYUP.
WM_KILLFOCUS (see page 1723)	Represents the Windows message WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 1724)	Represents the Windows message WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 1724)	Represents the Windows message WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 1725)	Represents the Windows message WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 1725)	Represents the Windows message WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 1726)	Represents the Windows message WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 1726)	Represents the Windows message WM_MBUTTONUP.
WM_MDIACTIVATE (see page 1726)	Represents the Windows message WM_MDIACTIVATE.
WM_MDICASCADE (see page 1727)	Represents the Windows message WM_MDICASCADE.
WM_MDICREATE (see page 1727)	Represents the Windows message WM_MDICREATE.
WM_MDIDESTROY (see page 1728)	Represents the Windows message WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 1728)	Represents the Windows message WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 1729)	Represents the Windows message WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 1729)	Represents the Windows message WM_MDIMAXIMIZE.
WM_MDINEXT (see page 1729)	Represents the Windows message WM_MDINEXT.

WM_MDIREFRESHMENU (see page 1730)	Represents the Windows message WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 1730)	Represents the Windows message WM_MDIRESTORE.
WM_MDISETMENU (see page 1731)	Represents the Windows message WM_MDISETMENU.
WM_MDITILE (see page 1731)	Represents the Windows message WM_MDITILE.
WM_MEASUREITEM (see page 1732)	Represents the Windows message WM_MEASUREITEM.
WM_MENUCHAR (see page 1732)	Represents the Windows message WM_MENUCHAR.
WM_MENUCOMMAND (see page 1732)	Represents the Windows message WM_MENUCOMMAND.
WM_MENUDRAG (see page 1733)	Represents the Windows message WM_MENUDRAG.
WM_MENUGETOBJECT (see page 1733)	Represents the Windows message WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 1734)	Represents the Windows message WM_MENURBUTTONUP.
WM_MENUSELECT (see page 1734)	Represents the Windows message WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 1735)	Represents the Windows message WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 1735)	Represents the Windows message WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 1736)	Represents the Windows message WM_MOUSEHOVER.
WM_MOUSELAST (see page 1736)	Represents the Windows message WM_MOUSELAST.
WM_MOUSELEAVE (see page 1736)	Represents the Windows message WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 1737)	Represents the Windows message WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 1737)	Represents the Windows message WM_MOUSEWHEEL.
WM_MOVE (see page 1738)	Represents the Windows message WM_MOVE.
WM_MOVING (see page 1738)	Represents the Windows message WM_MOVING.
WM_NCACTIVATE (see page 1739)	Represents the Windows message WM_NCACTIVATE.
WM_NCCALCSIZE (see page 1739)	Represents the Windows message WM_NCCALCSIZE.
WM_NCCREATE (see page 1739)	Represents the Windows message WM_NCCREATE.
WM_NCDESTROY (see page 1740)	Represents the Windows message WM_NCDESTROY.
WM_NCHITTEST (see page 1740)	Represents the Windows message WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 1741)	Represents the Windows message WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 1741)	Represents the Windows message WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 1742)	Represents the Windows message WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 1742)	Represents the Windows message WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 1742)	Represents the Windows message WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 1743)	Represents the Windows message WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 1743)	Represents the Windows message WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 1744)	Represents the Windows message WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 1744)	Represents the Windows message WM_NCMOUSEMOVE.
WM_NCPAINT (see page 1745)	Represents the Windows message WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 1745)	Represents the Windows message WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 1746)	Represents the Windows message WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 1746)	Represents the Windows message WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 1746)	Represents the Windows message WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 1747)	Represents the Windows message WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 1747)	Represents the Windows message WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 1748)	Represents the Windows message WM_NEXTDLGCTL.
WM_NEXTMENU (see page 1748)	Represents the Windows message WM_NEXTMENU.
WM_NOTIFY (see page 1749)	Represents the Windows message WM_NOTIFY.
WM_NOTIFYFORMAT (see page 1749)	Represents the Windows message WM_NOTIFYFORMAT.
WM_NULL (see page 1749)	Represents the Windows message WM_NULL.
WM_PAINT (see page 1750)	Represents the Windows message WM_PAINT.
WM_PAINTCLIPBOARD (see page 1750)	Represents the Windows message WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 1751)	Represents the Windows message WM_PAINTICON.
WM_PALETTECHANGED (see page 1751)	Represents the Windows message WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 1752)	Represents the Windows message WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 1752)	Represents the Windows message WM_PARENTNOTIFY.
WM_PASTE (see page 1752)	Represents the Windows message WM_PASTE.
WM_PENWINFIRST (see page 1753)	Represents the Windows message WM_PENWINFIRST.

WM_PENWINLAST (see page 1753)	Represents the Windows message WM_PENWINLAST.
WM_POWER (see page 1754)	Represents the Windows message WM_POWER.
WM_POWERBROADCAST (see page 1754)	Represents the Windows message WM_POWERBROADCAST.
WM_PRINT (see page 1755)	Represents the Windows message WM_PRINT.
WM_PRINTCLIENT (see page 1755)	Represents the Windows message WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 1756)	Represents the Windows message WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 1756)	Represents the Windows message WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 1756)	Represents the Windows message WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 1757)	Represents the Windows message WM_QUERYOPEN.
WM_QUERYUISTATE (see page 1757)	Represents the Windows message WM_QUERYUISTATE.
WM_QUEUESYNC (see page 1758)	Represents the Windows message WM_QUEUESYNC.
WM_QUIT (see page 1758)	Represents the Windows message WM_QUIT.
WM_RBUTTONDBLCLK (see page 1759)	Represents the Windows message WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 1759)	Represents the Windows message WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 1759)	Represents the Windows message WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 1760)	Represents the Windows message WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 1760)	Represents the Windows message WM_RENDERFORMAT.
WM_SETCURSOR (see page 1761)	Represents the Windows message WM_SETCURSOR.
WM_SETFOCUS (see page 1761)	Represents the Windows message WM_SETFOCUS.
WM_SETFONT (see page 1762)	Represents the Windows message WM_SETFONT.
WM_SETHOTKEY (see page 1762)	Represents the Windows message WM_SETHOTKEY.
WM_SETICON (see page 1763)	Represents the Windows message WM_SETICON.
WM_SETREDRAW (see page 1763)	Represents the Windows message WM_SETREDRAW.
WM_SETTEXT (see page 1763)	Represents the Windows message WM_SETTEXT.
WM_SETTINGCHANGE (see page 1764)	Represents the Windows message WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 1764)	Represents the Windows message WM_SHOWWINDOW.
WM_SIZE (see page 1765)	Represents the Windows message WM_SIZE.
WM_SIZECLIPBOARD (see page 1765)	Represents the Windows message WM_SIZECLIPBOARD.
WM_SIZING (see page 1766)	Represents the Windows message WM_SIZING.
WM_SPOOLERSTATUS (see page 1766)	Represents the Windows message WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 1766)	Represents the Windows message WM_STYLECHANGED.
WM_STYLECHANGING (see page 1767)	Represents the Windows message WM_STYLECHANGING.
WM_SYSCHAR (see page 1767)	Represents the Windows message WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 1768)	Represents the Windows message WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 1768)	Represents the Windows message WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 1769)	Represents the Windows message WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 1769)	Represents the Windows message WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 1770)	Represents the Windows message WM_SYSKEYUP.
WM_SYSTEMERROR (see page 1770)	Represents the Windows message WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 1770)	Represents the Windows message WM_TABLET_FIRST.
WM_TABLET_LAST (see page 1771)	Represents the Windows message WM_TABLET_LAST.
WM_TCARD (see page 1771)	Represents the Windows message WM_TCARD.
WM_THEMECHANGED (see page 1772)	Represents the Windows message WM_THEMECHANGED.
WM_TIMECHANGE (see page 1772)	Represents the Windows message WM_TIMECHANGE.
WM_TIMER (see page 1773)	Represents the Windows message WM_TIMER.
WM_UNDO (see page 1773)	Represents the Windows message WM_UNDO.
WM_UNICHAR (see page 1774)	Represents the Windows message WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 1774)	Represents the Windows message WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 1774)	Represents the Windows message WM_UPDATEUISTATE.
WM_USER (see page 1775)	Represents the Windows message WM_USER.
WM_USERCHANGED (see page 1775)	Represents the Windows message WM_USERCHANGED.
WM_VKEYTOITEM (see page 1776)	Represents the Windows message WM_VKEYTOITEM.
WM_VSCROLL (see page 1776)	Represents the Windows message WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 1777)	Represents the Windows message WM_VSCROLLCLIPBOARD.

WM_WINDOWPOSCHANGED (see page 1777)	Represents the Windows message WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 1778)	Represents the Windows message WM_WINDOWPOSCHANGING.
WM_WININICHANGE (see page 1778)	Represents the Windows message WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 1778)	Represents the Windows message WM_WTSSESSION_CHANGE.

Functions

	Name	Description
	SendGetIntMessage (see page 1487)	Send Windows message, sending and receiving integer values.
	SendGetStructMessage (see page 1493)	Send Windows message, sending and receiving data structure.
	SendStructMessage (see page 1499)	Send Windows message, sending data structure.
	SendTextMessage (see page 1505)	Send Windows message, sending text.

Structs, Records, Enums

	Name	Description
	TMessage (see page 1513)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 1514)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 1514)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 1515)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 1515)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 1516)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 1516)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 1517)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 1517)	This is record Messages.TWMCommand.
	TWMCompacting (see page 1518)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 1518)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 1519)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 1519)	This is record Messages.TWMCopyData.
	TWMCreate (see page 1520)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 1520)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 1521)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 1521)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 1522)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 1522)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 1523)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 1523)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 1524)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 1524)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 1525)	This is record Messages.TWMDDE_Unadvise.
	TWMDeleteItem (see page 1525)	This is record Messages.TWMDeleteItem.
	TWMDevModeChange (see page 1526)	This is record Messages.TWMDevModeChange.
	TWMDisplayChange (see page 1526)	This is record Messages.TWMDisplayChange.
	TWMDrawItem (see page 1527)	This is record Messages.TWMDrawItem.
	TWMDropFiles (see page 1527)	This is record Messages.TWMDropFiles.
	TWMEnable (see page 1528)	This is record Messages.TWMEnable.
	TWMEndSession (see page 1528)	This is record Messages.TWMEndSession.
	TWMEnterIdle (see page 1529)	This is record Messages.TWMEnterIdle.
	TWMEnterMenuLoop (see page 1529)	This is record Messages.TWMEnterMenuLoop.
	TWMEraseBkgnd (see page 1530)	This is record Messages.TWMEraseBkgnd.
	TWMGetIcon (see page 1530)	This is record Messages.TWMGetIcon.
	TWMGetMinMaxInfo (see page 1531)	This is record Messages.TWMGetMinMaxInfo.
	TWMGetText (see page 1531)	This is record Messages.TWMGetText.
	TWMHelp (see page 1532)	This is record Messages.TWMHelp.
	TWMHotKey (see page 1532)	This is record Messages.TWMHotKey.
	TWMHScrollClipboard (see page 1533)	This is record Messages.TWMHScrollClipboard.
	TWMInitDialog (see page 1533)	This is record Messages.TWMInitDialog.

	TWMInitMenu (see page 1534)	This is record Messages.TWMInitMenu.
	TWMInitMenuPopup (see page 1534)	This is record Messages.TWMInitMenuPopup.
	TWMKey (see page 1535)	TWMKey represents a Windows Keystroke message.
	TWMKillFocus (see page 1536)	This is record Messages.TWMKillFocus.
	TWMMDIActivate (see page 1536)	This is record Messages.TWMMDIActivate.
	TWMMDICascade (see page 1537)	This is record Messages.TWMMDICascade.
	TWMMDICreate (see page 1537)	This is record Messages.TWMMDICreate.
	TWMMDIDestroy (see page 1538)	This is record Messages.TWMMDIDestroy.
	TWMMDIMaximize (see page 1538)	This is record Messages.TWMMDIMaximize.
	TWMMDINext (see page 1539)	This is record Messages.TWMMDINext.
	TWMMDIRestore (see page 1539)	This is record Messages.TWMMDIRestore.
	TWMMDISetMenu (see page 1540)	This is record Messages.TWMMDISetMenu.
	TWMMDITile (see page 1540)	This is record Messages.TWMMDITile.
	TWMMeasureItem (see page 1541)	This is record Messages.TWMMeasureItem.
	TWMMenuChar (see page 1541)	TWMMenuChar represents a Windows Keystroke message directed at a menu.
	TWMMenuSelect (see page 1542)	This is record Messages.TWMMenuSelect.
	TWMMouse (see page 1543)	TWMMouse represents a Windows mouse message.
	TWMMouseActivate (see page 1544)	This is record Messages.TWMMouseActivate.
	TWMMouseWheel (see page 1544)	This is record Messages.TWMMouseWheel.
	TWMMove (see page 1545)	This is record Messages.TWMMove.
	TWMMoving (see page 1545)	This is record Messages.TWMMoving.
	TWMNCActivate (see page 1546)	This is record Messages.TWMNCActivate.
	TWMNCCalcSize (see page 1546)	This is record Messages.TWMNCCalcSize.
	TWMNCCreate (see page 1547)	This is record Messages.TWMNCCreate.
	TWMNCHitMessage (see page 1547)	This is record Messages.TWMNCHitMessage.
	TWMNCHitTest (see page 1548)	This is record Messages.TWMNCHitTest.
	TWMNCPaint (see page 1548)	This is record Messages.TWMNCPaint.
	TWMNextDlgCtl (see page 1549)	This is record Messages.TWMNextDlgCtl.
	TWMNoParams (see page 1549)	This is record Messages.TWMNoParams.
	TWMNotify (see page 1550)	TWMNotify represents a Windows notification message.
	TWMNotifyFormat (see page 1550)	This is record Messages.TWMNotifyFormat.
	TWMPaint (see page 1551)	TWMPaint represents a Windows Paint message.
	TWMPaintClipboard (see page 1551)	This is record Messages.TWMPaintClipboard.
	TWMPaletteChanged (see page 1552)	This is record Messages.TWMPaletteChanged.
	TWMPaletteIsChanging (see page 1552)	This is record Messages.TWMPaletteIsChanging.
	TWMParentNotify (see page 1553)	This is record Messages.TWMParentNotify.
	TWMPower (see page 1554)	This is record Messages.TWMPower.
	TWMPrint (see page 1554)	This is record Messages.TWMPrint.
	TWMQueryEndSession (see page 1555)	This is record Messages.TWMQueryEndSession.
	TWMQuit (see page 1555)	This is record Messages.TWMQuit.
	TWMRenderFormat (see page 1556)	This is record Messages.TWMRenderFormat.
	TWMScroll (see page 1556)	This is record Messages.TWMScroll.
	TWMSetCursor (see page 1557)	This is record Messages.TWMSetCursor.
	TWMSetFocus (see page 1557)	This is record Messages.TWMSetFocus.
	TWMSetFont (see page 1558)	This is record Messages.TWMSetFont.
	TWMSetHotKey (see page 1558)	This is record Messages.TWMSetHotKey.
	TWMSetIcon (see page 1559)	This is record Messages.TWMSetIcon.
	TWMSetRedraw (see page 1559)	This is record Messages.TWMSetRedraw.
	TWMSetText (see page 1560)	This is record Messages.TWMSetText.
	TWMSettingChange (see page 1560)	This is record Messages.TWMSettingChange.
	TWMShowWindow (see page 1561)	This is record Messages.TWMShowWindow.
	TWMSize (see page 1561)	This is record Messages.TWMSize.
	TWMSizeClipboard (see page 1562)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 1562)	This is record Messages.TWMSpoolerStatus.

	TWMStyleChange (see page 1563)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 1563)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 1564)	This is record Messages.TWMSysDeadChar.
	TWMSystemError (see page 1564)	This is record Messages.TWMSystemError.
	TWMTimer (see page 1565)	This is record Messages.TWMTimer.
	TWMUIState (see page 1565)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 1566)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 1566)	This is record Messages.TWMWindowPosMsg.
	TWMWinIniChange (see page 1567)	This is record Messages.TWMWinIniChange.

Types

Name	Description
PMessage (see page 1569)	This is type Messages.PMessage.
TWMCancelMode (see page 1570)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 1570)	This is type Messages.TWMChangeUIState.
TWMChar (see page 1570)	This is type Messages.TWMChar.
TWMChildActivate (see page 1571)	This is type Messages.TWMChildActivate.
TWMClear (see page 1571)	This is type Messages.TWMClear.
TWMClose (see page 1571)	This is type Messages.TWMClose.
TWMCopy (see page 1572)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 1572)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 1572)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 1573)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 1573)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 1573)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 1574)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 1574)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 1574)	This is type Messages.TWMCut.
TWMDeadChar (see page 1575)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 1575)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 1575)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 1576)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 1576)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 1576)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 1577)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 1577)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 1577)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 1578)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 1578)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 1578)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 1579)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 1579)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 1579)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 1580)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 1580)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 1580)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 1581)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 1581)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 1581)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 1582)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 1582)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 1582)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 1583)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 1583)	This is type Messages.TWMNCLButtonDblClk.

TWMNCLButtonDown (see page 1583)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 1584)	This is type Messages.TWMNCLButtonUp.
TWMNCMButtonDblClk (see page 1584)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 1584)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 1585)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 1585)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 1585)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 1586)	This is type Messages.TWMNCRButtonDown.
TWMNCRButtonUp (see page 1586)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 1586)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 1587)	This is type Messages.TWMPaste.
TWMPrintClient (see page 1587)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 1587)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 1588)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 1588)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 1588)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 1589)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 1589)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 1589)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 1590)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 1590)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 1590)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 1591)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 1591)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 1591)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 1592)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 1592)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 1592)	This is type Messages.TWMTimeChange.
TWMUndo (see page 1593)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 1593)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 1593)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 1594)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 1594)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 1594)	This is type Messages.TWMWindowPosChanging.

35.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	SendGetIntMessage (see page 1487)	Send Windows message, sending and receiving integer values.
	SendGetStructMessage (see page 1493)	Send Windows message, sending and receiving data structure.
	SendStructMessage (see page 1499)	Send Windows message, sending data structure.
	SendTextMessage (see page 1505)	Send Windows message, sending text.

35.1.1 Messages.SendGetIntMessage Function

Send Windows message, sending and receiving integer values.

Pascal

```
function SendGetIntMessage(Handle: HWND; Msg: UINT; var WParam: Integer; var LParam: Integer):
LRESULT;
```

C++

```
LRESULT SendGetIntMessage(HWND Handle, UINT Msg, int WParam, int LParam);
```

File

Messages

Description

SendGetIntMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. A value may be sent and returned.

LParam is an integer **LPARAM** for the message, depending on **Msg**. A value may be sent and returned.

Various records have been defined in the **Messages (see page 1475)** unit to represent Windows messages. For instance, **TWMCopy (see page 1572)** represents the message **WM_COPY (see page 1686)**, **TWMKeyDown (see page 1579)** represents **WM_KEYDOWN (see page 1722)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

C++ Examples:

```
/*
This is an example demonstrating the usage of the SendGetIntMessage,
SendStructMessage, SendGetStructMessage and SendTextMessage message
functions.
This example uses four buttons and six text edit boxes as follows:
- Button1 //SendGetIntMessage
```

```
- Button2 //SendStructMessage
- Button3 //SendGetStructMessage
- Button4 //SendTextMessage

- IntEdit //for int inputs
- StructEdit1 & StructEdit2 //for struct inputs (ints)
- GetStructEdit1 & GetStructEdit2 //for struct inputs (ints)
- TextEdit //for text input

Note: This example generates unresolved external errors with the
default NO_STRICT conditional define set.  The work around is
to use the STRICT conditional define.  This problem is addressed
in the RAID bug #267447.

This example uses three custom message structures defined in the header:
struct TMyIntMessage {
    Cardinal Msg;
    int* wparam;
    int* lparam;
    LRESULT Result;
};

struct TMyTextMessage {
    Cardinal Msg;
    int wparam;
    String lparam;
    LRESULT Result;
};

struct MStruct {
    int m_a;
    int m_b;
};

struct TMyStruct {
    Cardinal Msg;
    int wparam;
    MStruct* lparam;
    LRESULT Result;
};

Furthermore it uses 4 message handling functions described in the
header along with a message map:

MESSAGE void __fastcall UserIntHandler(TMyIntMessage &msg);
MESSAGE void __fastcall UserStructHandler(TMyStruct &msg);
MESSAGE void __fastcall UserGetStructHandler(TMyStruct &msg);
MESSAGE void __fastcall UserTextHandler(TMyTextMessage &msg);

BEGIN_MESSAGE_MAP
    MESSAGE_HANDLER(WM_INTMESSAGE, TMyIntMessage, UserIntHandler);
    MESSAGE_HANDLER(WM_GETSTRUCTMESSAGE, TMyStruct, UserGetStructHandler);
    MESSAGE_HANDLER(WM_STRUCTMESSAGE, TMyStruct, UserStructHandler);
    MESSAGE_HANDLER(WM_TEXTMESSAGE, TMyTextMessage, UserTextHandler);
END_MESSAGE_MAP(TComponent)

*/

void __fastcall TForm4::UserIntHandler(TMyIntMessage &msg){
    MessageDlg("Int message received: " + IntToStr(*msg.lparam),
            mtInformation, TMsgDlgButtons() << mbOK, 0);

    *msg.lparam = *msg.lparam + 50;
}
void __fastcall TForm4::UserStructHandler(TMyStruct &msg){
    MessageDlg("Struct received: " + IntToStr(msg.lparam->m_a) +
```

```
                " " + IntToStr(msg.lparam->m_b),
            mtInformation, TMsgDlgButtons() << mbOK, 0);
}
void __fastcall TForm4::UserGetStructHandler(TMyStruct &msg){

Handling messages

35.1.2 Messages.SendGetStructMessage Function

Send Windows message, sending and receiving data structure.

Pascal

```
function SendGetStructMessage(Handle: HWND; Msg: UINT; WParam: WPARAM; var LParam; Unused:
Boolean = False): LRESULT;
```

C++

```
LRESULT SendGetStructMessage(HWND Handle, UINT Msg, WPARAM WParam,  LParam, Boolean Unused =
False);
```

File

Messages

Description

SendGetStructMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. The value is sent.

LParam is a data structure **LPARAM** for the message, depending on **Msg**. A value may be sent and returned.

Unused is not used and is optional.

Various records have been defined in the **Messages (see page 1475)** unit to represent Windows messages. For instance, **TWMCopy (see page 1572)** represents the message **WM_COPY (see page 1686)**, **TWMKeyDown (see page 1579)** represents **WM_KEYDOWN (see page 1722)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

Handling messages

35.1.3 Messages.SendStructMessage Function

Send Windows message, sending data structure.

Pascal

```
function SendStructMessage(Handle: HWND; Msg: UINT; WParam: WPARAM; const LParam): LRESULT;
```

C++

```
LRESULT SendStructMessage(HWND Handle, UINT Msg, WPARAM WParam, const  LParam);
```

File

Messages

Description

SendStructMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. The value is sent.

LParam is a data structure **LPARAM** for the message, depending on **Msg**. The value is sent.

Various records have been defined in the **Messages (see page 1475)** unit to represent Windows messages. For instance, **TWMCopy (see page 1572)** represents the message **WM_COPY (see page 1686)**, **TWMKeyDown (see page 1579)** represents **WM_KEYDOWN (see page 1722)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

C++ Examples:

```
/*
This is an example demonstrating the usage of the SendGetIntMessage,
SendStructMessage, SendGetStructMessage and SendTextMessage message
functions.
This example uses four buttons and six text edit boxes as follows:
- Button1 //SendGetIntMessage
- Button2 //SendStructMessage
- Button3 //SendGetStructMessage
- Button4 //SendTextMessage

- IntEdit //for int inputs
- StructEdit1 & StructEdit2 //for struct inputs (ints)
- GetStructEdit1 & GetStructEdit2 //for struct inputs (ints)
- TextEdit //for text input
```

```
Note: This example generates unresolved external errors with the
default NO_STRICT conditional define set.  The work around is
to use the STRICT conditional define.  This problem is addressed
in the RAID bug #267447.

This example uses three custom message structures defined in the header:
struct TMyIntMessage {
    Cardinal Msg;
    int* wparam;
    int* lparam;
    LRESULT Result;
};

struct TMyTextMessage {

```

Delphi Examples:

```
{
This is an example demonstrating the usage of the SendGetIntMessage,
SendStructMessage, SendGetStructMessage and SendTextMessage message
functions.
```

```
  This example uses four buttons and six text edit boxes as follows:
  - Button1 //SendGetIntMessage
  - Button2 //SendStructMessage
  - Button3 //SendGetStructMessage
  - Button4 //SendTextMessage

  - IntEdit //for int inputs
  - StructEdit1 & StructEdit2 //for struct inputs (ints)
  - GetStructEdit1 & GetStructEdit2 //for struct inputs (ints)
  - TextEdit //for text input
  }

  const

35.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TMessage (see page 1513)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 1514)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 1514)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 1515)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 1515)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 1516)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 1516)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 1517)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 1517)	This is record Messages.TWMCommand.
	TWMCompacting (see page 1518)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 1518)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 1519)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 1519)	This is record Messages.TWMCopyData.
	TWMCreate (see page 1520)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 1520)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 1521)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 1521)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 1522)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 1522)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 1523)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 1523)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 1524)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 1524)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 1525)	This is record Messages.TWMDDE_Unadvise.
	TWMDeleteItem (see page 1525)	This is record Messages.TWMDeleteItem.
	TWMDevModeChange (see page 1526)	This is record Messages.TWMDevModeChange.
	TWMDisplayChange (see page 1526)	This is record Messages.TWMDisplayChange.
	TWMDrawItem (see page 1527)	This is record Messages.TWMDrawItem.
	TWMDropFiles (see page 1527)	This is record Messages.TWMDropFiles.
	TWMEnable (see page 1528)	This is record Messages.TWMEnable.
	TWMEndSession (see page 1528)	This is record Messages.TWMEndSession.
	TWMEnterIdle (see page 1529)	This is record Messages.TWMEnterIdle.
	TWMEnterMenuLoop (see page 1529)	This is record Messages.TWMEnterMenuLoop.
	TWMEraseBkgnd (see page 1530)	This is record Messages.TWMEraseBkgnd.
	TWMGetIcon (see page 1530)	This is record Messages.TWMGetIcon.
	TWMGetMinMaxInfo (see page 1531)	This is record Messages.TWMGetMinMaxInfo.
	TWMGetText (see page 1531)	This is record Messages.TWMGetText.
	TWMHelp (see page 1532)	This is record Messages.TWMHelp.
	TWMHotKey (see page 1532)	This is record Messages.TWMHotKey.
	TWMHScrollClipboard (see page 1533)	This is record Messages.TWMHScrollClipboard.
	TWMInitDialog (see page 1533)	This is record Messages.TWMInitDialog.
	TWMInitMenu (see page 1534)	This is record Messages.TWMInitMenu.
	TWMInitMenuPopup (see page 1534)	This is record Messages.TWMInitMenuPopup.
	TWMKey (see page 1535)	TWMKey represents a Windows Keystroke message.

	TWMKillFocus (see page 1536)	This is record Messages.TWMKillFocus.
	TWMMDIActivate (see page 1536)	This is record Messages.TWMMDIActivate.
	TWMMDICascade (see page 1537)	This is record Messages.TWMMDICascade.
	TWMMDICreate (see page 1537)	This is record Messages.TWMMDICreate.
	TWMMDIDestroy (see page 1538)	This is record Messages.TWMMDIDestroy.
	TWMMDIMaximize (see page 1538)	This is record Messages.TWMMDIMaximize.
	TWMMDINext (see page 1539)	This is record Messages.TWMMDINext.
	TWMMDIRestore (see page 1539)	This is record Messages.TWMMDIRestore.
	TWMMDISetMenu (see page 1540)	This is record Messages.TWMMDISetMenu.
	TWMMDITile (see page 1540)	This is record Messages.TWMMDITile.
	TWMMeasureItem (see page 1541)	This is record Messages.TWMMeasureItem.
	TWMMenuChar (see page 1541)	TWMMenuChar represents a Windows Keystroke message directed at a menu.
	TWMMenuSelect (see page 1542)	This is record Messages.TWMMenuSelect.
	TWMMouse (see page 1543)	TWMMouse represents a Windows mouse message.
	TWMMouseActivate (see page 1544)	This is record Messages.TWMMouseActivate.
	TWMMouseWheel (see page 1544)	This is record Messages.TWMMouseWheel.
	TWMMove (see page 1545)	This is record Messages.TWMMove.
	TWMMoving (see page 1545)	This is record Messages.TWMMoving.
	TWMNCActivate (see page 1546)	This is record Messages.TWMNCActivate.
	TWMNCCalcSize (see page 1546)	This is record Messages.TWMNCCalcSize.
	TWMNCCreate (see page 1547)	This is record Messages.TWMNCCreate.
	TWMNCHitMessage (see page 1547)	This is record Messages.TWMNCHitMessage.
	TWMNCHitTest (see page 1548)	This is record Messages.TWMNCHitTest.
	TWMNCPaint (see page 1548)	This is record Messages.TWMNCPaint.
	TWMNextDlgCtl (see page 1549)	This is record Messages.TWMNextDlgCtl.
	TWMNoParams (see page 1549)	This is record Messages.TWMNoParams.
	TWMNotify (see page 1550)	TWMNotify represents a Windows notification message.
	TWMNotifyFormat (see page 1550)	This is record Messages.TWMNotifyFormat.
	TWMPaint (see page 1551)	TWMPaint represents a Windows Paint message.
	TWMPaintClipboard (see page 1551)	This is record Messages.TWMPaintClipboard.
	TWMPaletteChanged (see page 1552)	This is record Messages.TWMPaletteChanged.
	TWMPaletteIsChanging (see page 1552)	This is record Messages.TWMPaletteIsChanging.
	TWMParentNotify (see page 1553)	This is record Messages.TWMParentNotify.
	TWMPower (see page 1554)	This is record Messages.TWMPower.
	TWMPrint (see page 1554)	This is record Messages.TWMPrint.
	TWMQueryEndSession (see page 1555)	This is record Messages.TWMQueryEndSession.
	TWMQuit (see page 1555)	This is record Messages.TWMQuit.
	TWMRenderFormat (see page 1556)	This is record Messages.TWMRenderFormat.
	TWMScroll (see page 1556)	This is record Messages.TWMScroll.
	TWMSetCursor (see page 1557)	This is record Messages.TWMSetCursor.
	TWMSetFocus (see page 1557)	This is record Messages.TWMSetFocus.
	TWMSetFont (see page 1558)	This is record Messages.TWMSetFont.
	TWMSetHotKey (see page 1558)	This is record Messages.TWMSetHotKey.
	TWMSetIcon (see page 1559)	This is record Messages.TWMSetIcon.
	TWMSetRedraw (see page 1559)	This is record Messages.TWMSetRedraw.
	TWMSetText (see page 1560)	This is record Messages.TWMSetText.
	TWMSettingChange (see page 1560)	This is record Messages.TWMSettingChange.
	TWMShowWindow (see page 1561)	This is record Messages.TWMShowWindow.
	TWMSize (see page 1561)	This is record Messages.TWMSize.
	TWMSizeClipboard (see page 1562)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 1562)	This is record Messages.TWMSpoolerStatus.
	TWMStyleChange (see page 1563)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 1563)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 1564)	This is record Messages.TWMSysDeadChar.

	TWMSystemError (see page 1564)	This is record Messages.TWMSystemError.
	TWMTimer (see page 1565)	This is record Messages.TWMTimer.
	TWMUIState (see page 1565)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 1566)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 1566)	This is record Messages.TWMWindowPosMsg.
	TWMWinIniChange (see page 1567)	This is record Messages.TWMWinIniChange.

35.2.1 Messages.TMessage Record

TMessage represents a Windows message.

Pascal

```
TMessage = packed record
  Msg: Cardinal;
  case Integer of
    0: (WParam: WPARAM;
        LParam: LPARAM;
        Result: LRESULT;);
    1: (WParamLo: Word;
        WParamHi: Word;
        LParamLo: Word;
        LParamHi: Word;
        ResultLo: Word;
        ResultHi: Word;);
end;
```

C++

```
struct TMessage {
  unsigned Msg;
  WPARAM WParam;
  LPARAM LParam;
  LRESULT Result;
  Word WParamLo;
  Word WParamHi;
  Word LParamLo;
  Word LParamHi;
  Word ResultLo;
  Word ResultHi;
};
```

File

Messages

Description

The TMessage type represents a Windows message in WndProc and other methods.

The TMessage contains the following fields:

Field	Meaning
Msg	Represents the Windows Message code.
WParam	Represents the WParam of the message. To access the low and high words of this field, use the WParamLo and WParamHi fields instead.
LParam	Represents the LParam of the message. To access the low and high words of this field, use the LParamLo and LParamHi fields instead.
Result	Holds the return value. To access the low and high words of this field, use the ResultLo and ResultHi fields instead.

35.2.2 Messages.TMSHMouseWheel Record

Pascal

```
TMSHMouseWheel = packed record
  Msg: Cardinal;
  WheelDelta: Integer;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TMSHMouseWheel {
  unsigned Msg;
  int WheelDelta;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TMSHMouseWheel.

35.2.3 Messages.TWMActivate Record

Pascal

```
TWMActivate = packed record
  Msg: Cardinal;
  Active: Word;
  Minimized: WordBool;
  ActiveWindow: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMActivate {
  unsigned Msg;
  Word Active;
  WordBool Minimized;
  HWND ActiveWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivate.

35.2.4 Messages.TWMActivateApp Record

Pascal

```
TWMActivateApp = packed record
  Msg: Cardinal;
  Active: BOOL;
  ThreadId: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMActivateApp {
  unsigned Msg;
  BOOL Active;
  Longint ThreadId;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivateApp.

35.2.5 Messages.TWMAskCBFormatName Record

Pascal

```
TWMAskCBFormatName = packed record
  Msg: Cardinal;
  NameLen: Word;
  Unused: Word;
  FormatName: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMAskCBFormatName {
```

```
    unsigned Msg;
    Word NameLen;
    Word Unused;
    const char * FormatName;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMAskCBFormatName.

35.2.6 Messages.TWMChangeCBChain Record

Pascal

```
  TWMChangeCBChain = packed record
    Msg: Cardinal;
    Remove: HWND;
    Next: HWND;
    Result: Longint;
  end;
```

C++

```
  struct TWMChangeCBChain {
    unsigned Msg;
    HWND Remove;
    HWND Next;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMChangeCBChain.

35.2.7 Messages.TWMCharToItem Record

Pascal

```
  TWMCharToItem = packed record
    Msg: Cardinal;
    Key: Word;
    CaretPos: Word;
    ListBox: HWND;
    Result: Longint;
  end;
```

C++

```
  struct TWMCharToItem {
    unsigned Msg;
    Word Key;
    Word CaretPos;
    HWND ListBox;
```

```
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCharToItem.

35.2.8 Messages.TWMChooseFont_GetLogFont Record

Pascal

```
TWMChooseFont_GetLogFont = packed record
  Msg: Cardinal;
  Unused: Longint;
  LogFont: PLogFont;
  Result: Longint;
end;
```

C++

```
struct TWMChooseFont_GetLogFont {
  unsigned Msg;
  Longint Unused;
  PLogFont LogFont;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMChooseFont_GetLogFont.

35.2.9 Messages.TWMCommand Record

Pascal

```
TWMCommand = packed record
  Msg: Cardinal;
  ItemID: Word;
  NotifyCode: Word;
  Ctl: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCommand {
  unsigned Msg;
  Word ItemID;
  Word NotifyCode;
  HWND Ctl;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCommand.

35.2.10 Messages.TWMCompacting Record

Pascal

```
TWMCompacting = packed record
  Msg: Cardinal;
  CompactRatio: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMCompacting {
  unsigned Msg;
  Longint CompactRatio;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompacting.

35.2.11 Messages.TWMCompareItem Record

Pascal

```
TWMCompareItem = packed record
  Msg: Cardinal;
  Ctl: HWnd;
  CompareItemStruct: PCompareItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCompareItem {
  unsigned Msg;
  HWnd Ctl;
  PCompareItemStruct CompareItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompareItem.

35.2.12 Messages.TWMContextMenu Record

Pascal

```
TWMContextMenu = packed record
  Msg: Cardinal;
  hWnd: HWND;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMContextMenu {
  unsigned Msg;
  HWND hWnd;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMContextMenu.

35.2.13 Messages.TWMCopyData Record

Pascal

```
TWMCopyData = packed record
  Msg: Cardinal;
  From: HWND;
  CopyDataStruct: PCopyDataStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCopyData {
  unsigned Msg;
  HWND From;
  PCopyDataStruct CopyDataStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCopyData.

35.2.14 Messages.TWMCreate Record

Pascal

```
TWMCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCreate.

35.2.15 Messages.TWMCtlColor Record

Pascal

```
TWMCtlColor = packed record
  Msg: Cardinal;
  ChildDC: HDC;
  ChildWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCtlColor {
  unsigned Msg;
  HDC ChildDC;

  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Terminate.

35.2.24 Messages.TWMDDE_Unadvise Record

Pascal

```
TWMDDE_Unadvise = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Format: Word;
  Item: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Unadvise {
  unsigned Msg;
  HWND PostingApp;
  Word Format;
  Word Item;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Unadvise.

35.2.25 Messages.TWMDeleteItem Record

Pascal

```
TWMDeleteItem = packed record
  Msg: Cardinal;
  Ctl: HWND;
  DeleteItemStruct: PDeleteItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMDeleteItem {
  unsigned Msg;
  HWND Ctl;
  PDeleteItemStruct DeleteItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDeleteItem.

35.2.26 Messages.TWMDevModeChange Record

Pascal

```
TWMDevModeChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Device: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMDevModeChange {
  unsigned Msg;

};
```

File

Messages

Description

This is record Messages.TWMDrawItem.

35.2.29 Messages.TWMDropFiles Record

Pascal

```
TWMDropFiles = packed record
  Msg: Cardinal;
  Drop: THANDLE;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDropFiles {
  unsigned Msg;
  THANDLE Drop;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDropFiles.

35.2.30 Messages.TWMEnable Record

Pascal

```
TWMEnable = packed record
  Msg: Cardinal;
  Enabled: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnable {
  unsigned Msg;
  LongBool Enabled;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnable.

35.2.31 Messages.TWMEndSession Record

Pascal

```
TWMEndSession = packed record
  Msg: Cardinal;
  EndSession: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEndSession {
  unsigned Msg;
  LongBool EndSession;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEndSession.

35.2.32 Messages.TWMEnterIdle Record

Pascal

```
TWMEnterIdle = packed record
  Msg: Cardinal;
  Source: Longint;
  IdleWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMEnterIdle {
  unsigned Msg;
  Longint Source;
  HWND IdleWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterIdle.

35.2.33 Messages.TWMEnterMenuLoop Record

Pascal

```
TWMEnterMenuLoop = packed record
  Msg: Cardinal;
  IsTrackPopupMenu: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnterMenuLoop {
  unsigned Msg;
  LongBool IsTrackPopupMenu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterMenuLoop.

35.2.34 Messages.TWMEraseBkgnd Record

Pascal

```
TWMEraseBkgnd = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEraseBkgnd {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEraseBkgnd.

35.2.35 Messages.TWMGetIcon Record

Pascal

```
TWMGetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMGetIcon {
  unsigned Msg;
  Longbool BigIcon;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetIcon.

35.2.36 Messages.TWMGetMinMaxInfo Record

Pascal

```
TWMGetMinMaxInfo = packed record
  Msg: Cardinal;
  Unused: Integer;
  MinMaxInfo: PMinMaxInfo;
  Result: Longint;
end;
```

C++

```
struct TWMGetMinMaxInfo {
  unsigned Msg;
  int Unused;
  PMinMaxInfo MinMaxInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetMinMaxInfo.

35.2.37 Messages.TWMGetText Record

Pascal

```
TWMGetText = packed record
  Msg: Cardinal;
  TextMax: Integer;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMGetText {
  unsigned Msg;
  int TextMax;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetText.

35.2.38 Messages.TWMHelp Record

Pascal

```
TWMHelp = packed record
  Msg: Cardinal;
  Unused: Integer;
  HelpInfo: PHelpInfo;
  Result: Longint;
end;
```

C++

```
struct TWMHelp {
  unsigned Msg;
  int Unused;
  PHelpInfo HelpInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHelp.

35.2.39 Messages.TWMHotKey Record

Pascal

```
TWMHotKey = packed record
  Msg: Cardinal;
  HotKey: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMHotKey {
  unsigned Msg;
  Longint HotKey;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHotKey.

35.2.40 Messages.TWMHScrollClipboard Record

Pascal

```
TWMHScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScrollCode: Word;
  Pos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMHScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScrollCode;
  Word Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHScrollClipboard.

35.2.41 Messages.TWMInitDialog Record

Pascal

```
TWMInitDialog = packed record
  Msg: Cardinal;
  Focus: HWND;
  InitParam: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitDialog {
  unsigned Msg;
  HWND Focus;
  Longint InitParam;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitDialog.

35.2.42 Messages.TWMInitMenu Record

Pascal

```
TWMInitMenu = packed record
  Msg: Cardinal;
  Menu: HMENU;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenu {
  unsigned Msg;
  HMENU Menu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenu.

35.2.43 Messages.TWMInitMenuPopup Record

Pascal

```
TWMInitMenuPopup = packed record
  Msg: Cardinal;
  MenuPopup: HMENU;
  Pos: Smallint;
  SystemMenu: WordBool;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenuPopup {
  unsigned Msg;
  HMENU MenuPopup;
  Smallint Pos;
  WordBool SystemMenu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenuPopup.

35.2.44 Messages.TWMKey Record

TWMKey represents a Windows Keystroke message.

Pascal

```
TWMKey = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMKey {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

TWMKey is the data structure used in some Windows keyboard messages.

TWMKey contains the following fields.

Field	Meaning
Msg	Represents the Windows message code.
CharCode	Specifies the virtual key code for the key pressed by the user. This is either an ANSI character or a virtual key constant, such as VK_CANCEL.
Unused	Unused.
KeyData	Indicates the repeat count, scan code, extended-key flag, context code and so on. See the Windows help system for a keystroke message such as WM_KEYDOWN (see page 1722) for details on the possible values.
Result	Holds the value returned by the application processing the message.

  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIMaximize.

35.2.51 Messages.TWMMDINext Record

Pascal

```
TWMMDINext = packed record
  Msg: Cardinal;
  Child: HWND;
  Next: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDINext {
  unsigned Msg;
  HWND Child;
  Longint Next;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDINext.

35.2.52 Messages.TWMMDIRestore Record

Pascal

```
TWMMDIRestore = packed record
  Msg: Cardinal;
  IDChild: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIRestore {
  unsigned Msg;
  HWND IDChild;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIRestore.

35.2.53 Messages.TWMMDISetMenu Record

Pascal

```
TWMMDISetMenu = packed record
  Msg: Cardinal;
  MenuFrame: HMENU;
  MenuWindow: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMDISetMenu {
  unsigned Msg;
  HMENU MenuFrame;
  HMENU MenuWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDISetMenu.

35.2.54 Messages.TWMMDITile Record

Pascal

```
TWMMDITile = packed record
  Msg: Cardinal;
  Tile: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDITile {
  unsigned Msg;
  Longint Tile;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDITile.

35.2.55 Messages.TWMMeasureItem Record

Pascal

```
TWMMeasureItem = packed record
  Msg: Cardinal;
  IDCtl: HWnd;
  MeasureItemStruct: PMeasureItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMMeasureItem {
  unsigned Msg;
  HWnd IDCtl;
  PMeasureItemStruct MeasureItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMeasureItem.

35.2.56 Messages.TWMMenuChar Record

TWMMenuChar represents a Windows Keystroke message directed at a menu.

Pascal

```
TWMMenuChar = packed record
  Msg: Cardinal;
  User: Char;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuChar {
  unsigned Msg;
  Char User;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

TWMMenuChar is the data structure used for all Windows keyboard messages that are sent to menu items. The `Msg` field is the Windows message code. The `User` field specifies the virtual key code for the key pressed by the user. This is either a character or a virtual key constant, such as `VK_CANCEL`. The `Unused` field is ignored. The `MenuFlag` field indicates the type of menu to

which the message is directed. It should always be MF_POPUP, indicating a drop-down menu, submenu, or shortcut menu. (Earlier versions of Windows also supported MF_SYSMENU for the system menu, but the use of this flag is obsolete). The Menu field is the handle of the menu to which the message is directed. The Result field holds the value returned by the application processing the message. The following table lists the possible values and their meaning.

Value	Meaning
MNC_IGNORE	Tells Windows to discard the character the user pressed and create a short beep on the system speaker.
MNC_CLOSE	Tells Windows to close the active menu.
MNC_EXECUTE	Combined with an index in the low-order word, tells Windows to choose the item specified by that index. The owner window receives a WM_COMMAND (see page 1684) message.
MNC_SELECT	Combined with an index in the low-order word, tells Windows to select the item specified by that index.

35.2.57 Messages.TWMMenuSelect Record

Pascal

```
TWMMenuSelect = packed record
  Msg: Cardinal;
  IDItem: Word;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuSelect {
  unsigned Msg;
  Word IDItem;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMenuSelect.

35.2.58 Messages.TWMMouse Record

TWMMouse represents a Windows mouse message.

Pascal

```
TWMMouse = packed record
  Msg: Cardinal;
  Keys: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMouse {
  unsigned Msg;
  Longint Keys;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

TWMMouse is the data structure used for all Windows mouse messages. The `Msg` field is the Windows message code. The `Keys` field indicates whether various keys are down. It is a combination of the values listed in the following table.

Value	Meaning
`MK_CONTROL`	The Control key is down.
`MK_LBUTTON`	The left mouse button is down.
`MK_MBUTTON`	The middle mouse button is down.
`MK_RBUTTON`	The right mouse button is down.
`MK_SHIFT`	The Shift key is down.

The `Pos` field (or the `XPos` and `YPos` fields) indicates the global coordinates of the mouse pointer. The `Result` field holds the value returned by the application processing the message.

end;
```

C++

```
struct TWMNCActivate {
  unsigned Msg;
  BOOL Active;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCActivate.

35.2.64 Messages.TWMNCCalcSize Record

Pascal

```
TWMNCCalcSize = packed record
  Msg: Cardinal;
  CalcValidRects: BOOL;
  CalcSize_Params: PNCCalcSizeParams;
  Result: Longint;
end;
```

C++

```
struct TWMNCCalcSize {
  unsigned Msg;
  BOOL CalcValidRects;
  PNCCalcSizeParams CalcSize_Params;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCalcSize.

35.2.65 Messages.TWMNCCreate Record

Pascal

```
TWMNCCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMNCCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCreate.

35.2.66 Messages.TWMNCHitMessage Record

Pascal

```
TWMNCHitMessage = packed record
  Msg: Cardinal;
  HitTest: Longint;
  XCursor: Smallint;
  YCursor: Smallint;
  Result: Longint;
end;
```

C++

```
struct TWMNCHitMessage {
  unsigned Msg;
  Longint HitTest;
  Smallint XCursor;
  Smallint YCursor;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitMessage.

35.2.67 Messages.TWMNCHitTest Record

Pascal

```
TWMNCHitTest = packed record
  Msg: Cardinal;
  Unused: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMNCHitTest {
  unsigned Msg;
  Longint Unused;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitTest.

35.2.68 Messages.TWMNCPaint Record

Pascal

```
TWMNCPaint = packed record
  Msg: Cardinal;
  RGN: HRGN;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNCPaint {
  unsigned Msg;
  HRGN RGN;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCPaint.

35.2.69 Messages.TWMNextDlgCtl Record

Pascal

```
TWMNextDlgCtl = packed record
  Msg: Cardinal;
  CtlFocus: Longint;
  Handle: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMNextDlgCtl {
  unsigned Msg;
  Longint CtlFocus;
  WordBool Handle;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNextDlgCtl.

35.2.70 Messages.TWMNoParams Record

Pascal

```
TWMNoParams = packed record
  Msg: Cardinal;
  Unused: array[0..3] of Word;
  Result: Longint;
end;
```

C++

```
struct TWMNoParams {
  unsigned Msg;
  array[0..3] of Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNoParams.

35.2.71 Messages.TWMNotify Record

TWMNotify represents a Windows notification message.

Pascal

```
TWMNotify = packed record
  Msg: Cardinal;
  IDCtrl: Longint;
  NMHdr: PNMHdr;
  Result: Longint;
end;
```

C++

```
struct TWMNotify {
  unsigned Msg;
  Longint IDCtrl;
  PNMHdr NMHdr;
  Longint Result;
};
```

File

Messages

Description

TWMNotify is the data structure used for all Windows notification messages. The `Msg` field is the Windows message code. The `IDCtrl` field is the resource ID of the control that sent the notification. The `NMHdr` field is a pointer to a notification header. This data structure has three members: `hwndFrom`, which is the window handle of the control that sent the notification, `idFrom`, which is the same as the `IDCtrl` field of TWMNotify, and `code`, which is the notification code. The notification code's meaning depends on the type of control that sent the message. The `Result` field holds the value returned by the application processing the message.

35.2.72 Messages.TWMNotifyFormat Record

Pascal

```
TWMNotifyFormat = packed record
  Msg: Cardinal;
  From: HWND;
  Command: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNotifyFormat {
  unsigned Msg;
```

```
  HWND From;
  Longint Command;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNotifyFormat.

35.2.73 Messages.TWMPaint Record

TWMPaint represents a Windows Paint message.

Pascal

```
TWMPaint = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaint {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

TWMPaint is the data structure used for all Windows Paint messages. The `Msg` field is the Windows message code. The `DC` field specifies handle to the device context that should be used for painting. This value should be assigned as the Handle property of the canvas of the object that needs painting. If `DC` is null, a valid device context must be obtained by calling the Windows API BeginPaint. The `Unused` field is not used. The `Result` field holds the value returned by the application processing the message.

35.2.74 Messages.TWMPaintClipboard Record

Pascal

```
TWMPaintClipboard = packed record
```

```
    Msg: Cardinal;
    Viewer: HWND;
    PaintStruct: THandle;
    Result: Longint;
  end;
```

C++

```
  struct TWMPaintClipboard {
    unsigned Msg;
    HWND Viewer;
    THandle PaintStruct;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMPaintClipboard.

35.2.75 Messages.TWMPaletteChanged Record

Pascal

```
  TWMPaletteChanged = packed record
    Msg: Cardinal;
    PalChg: HWND;
    Unused: Longint;
    Result: Longint;
  end;
```

C++

```
  struct TWMPaletteChanged {
    unsigned Msg;
    HWND PalChg;
    Longint Unused;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMPaletteChanged.

35.2.76 Messages.TWMPaletteIsChanging Record

Pascal

```
  TWMPaletteIsChanging = packed record
    Msg: Cardinal;
    Realize: HWND;
    Unused: Longint;
    Result: Longint;
  end;
```

C++

```
struct TWMPaletteIsChanging {
  unsigned Msg;
  HWND Realize;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaletteIsChanging.

35.2.77 Messages.TWMParentNotify Record

Pascal

```
TWMParentNotify = packed record
  Msg: Cardinal;
  Event: Word;
  case Word of
    0: (Value1: Word;
        Value2: Longint;
        Result: Longint;);
    WM_DESTROY: (ChildID: Word;
                 ChildWnd: HWnd;);
    WM_RBUTTONDOWN: (Value: Word;
                     XPos: Smallint;
                     YPos: Smallint;);
end;
```

C++

```
struct TWMParentNotify {
  unsigned Msg;
  Word Event;
  Word ChildID;
  HWnd ChildWnd;
  Word Value;
  Smallint XPos;
  Smallint YPos;
  Word Value1;
  Longint Value2;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMParentNotify.

35.2.78 Messages.TWMPower Record

Pascal

```
TWMPower = packed record
  Msg: Cardinal;
  PowerEvt: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPower {
  unsigned Msg;
  Longint PowerEvt;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPower.

35.2.79 Messages.TWMPrint Record

Pascal

```
TWMPrint = packed record
  Msg: Cardinal;
  DC: HDC;
  Flags: Cardinal;
  Result: Integer;
end;
```

C++

```
struct TWMPrint {
  unsigned Msg;
  HDC DC;
  unsigned Flags;
  int Result;
};
```

File

Messages

Description

This is record Messages.TWMPrint.

35.2.80 Messages.TWMQueryEndSession Record

Pascal

```
TWMQueryEndSession = packed record
  Msg: Cardinal;
  Source: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQueryEndSession {
  unsigned Msg;
  Longint Source;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQueryEndSession.

35.2.81 Messages.TWMQuit Record

Pascal

```
TWMQuit = packed record
  Msg: Cardinal;
  ExitCode: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQuit {
  unsigned Msg;
  Longint ExitCode;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQuit.

35.2.82 Messages.TWMRenderFormat Record

Pascal

```
TWMRenderFormat = packed record
  Msg: Cardinal;
  Format: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMRenderFormat {
  unsigned Msg;
  Longint Format;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMRenderFormat.

35.2.83 Messages.TWMScroll Record

Pascal

```
TWMScroll = packed record
  Msg: Cardinal;
  ScrollCode: Smallint;
  Pos: Smallint;
  ScrollBar: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMScroll {
  unsigned Msg;
  Smallint ScrollCode;
  Smallint Pos;
  HWND ScrollBar;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMScroll.

35.2.84 Messages.TWMSetCursor Record

Pascal

```
TWMSetCursor = packed record
  Msg: Cardinal;
  CursorWnd: HWND;
  HitTest: SmallInt;
  MouseMsg: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetCursor {
  unsigned Msg;
  HWND CursorWnd;
  SmallInt HitTest;
  Word MouseMsg;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetCursor.

35.2.85 Messages.TWMSetFocus Record

Pascal

```
TWMSetFocus = packed record
  Msg: Cardinal;
  FocusedWnd: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetFocus {
  unsigned Msg;
  HWND FocusedWnd;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFocus.

35.2.86 Messages.TWMSetFont Record

Pascal

```
TWMSetFont = packed record
  Msg: Cardinal;
  Font: HFONT;
  Redraw: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetFont {
  unsigned Msg;
  HFONT Font;
  WordBool Redraw;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFont.

35.2.87 Messages.TWMSetHotKey Record

Pascal

```
TWMSetHotKey = packed record
  Msg: Cardinal;
  Key: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetHotKey {
  unsigned Msg;
  Longint Key;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetHotKey.

35.2.88 Messages.TWMSetIcon Record

Pascal

```
TWMSetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Icon: HICON;
  Result: Longint;
end;
```

C++

```
struct TWMSetIcon {
  unsigned Msg;
  Longbool BigIcon;
  HICON Icon;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetIcon.

35.2.89 Messages.TWMSetRedraw Record

Pascal

```
TWMSetRedraw = packed record
  Msg: Cardinal;
  Redraw: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetRedraw {
  unsigned Msg;
  Longint Redraw;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetRedraw.

35.2.90 Messages.TWMSetText Record

Pascal

```
TWMSetText = packed record
  Msg: Cardinal;
  Unused: Longint;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSetText {
  unsigned Msg;
  Longint Unused;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetText.

35.2.91 Messages.TWMSettingChange Record

Pascal

```
TWMSettingChange = packed record
  Msg: Cardinal;
  Flag: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSettingChange {
  unsigned Msg;
  int Flag;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSettingChange.

35.2.92 Messages.TWMShowWindow Record

Pascal

```
TWMShowWindow = packed record
  Msg: Cardinal;
  Show: BOOL;
  Status: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMShowWindow {
  unsigned Msg;
  BOOL Show;
  Longint Status;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMShowWindow.

35.2.93 Messages.TWMSize Record

Pascal

```
TWMSize = packed record
  Msg: Cardinal;
  SizeType: Longint;
  Width: Word;
  Height: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSize {
  unsigned Msg;
  Longint SizeType;
  Word Width;
  Word Height;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSize.

35.2.94 Messages.TWMSizeClipboard Record

Pascal

```
TWMSizeClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  RC: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMSizeClipboard {
  unsigned Msg;
  HWND Viewer;
  THandle RC;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSizeClipboard.

35.2.95 Messages.TWMSpoolerStatus Record

Pascal

```
TWMSpoolerStatus = packed record
  Msg: Cardinal;
  JobStatus: Longint;
  JobsLeft: Word;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSpoolerStatus {
  unsigned Msg;
  Longint JobStatus;
  Word JobsLeft;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSpoolerStatus.

35.2.96 Messages.TWMStyleChange Record

Pascal

```
TWMStyleChange = packed record
  Msg: Cardinal;
  StyleType: Longint;
  StyleStruct: PStyleStruct;
  Result: Longint;
end;
```

C++

```
struct TWMStyleChange {
  unsigned Msg;
  Longint StyleType;
  PStyleStruct StyleStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMStyleChange.

35.2.97 Messages.TWMSysCommand Record

Pascal

```
TWMSysCommand = packed record
  Msg: Cardinal;
  CmdType: Longint;
  case Longint of
    SC_HOTKEY: (ActivateWnd: HWND;);
    SC_KEYMENU: (Key: Word;);
    SC_VSCROLL: (XPos: Smallint;
                 YPos: Smallint;
                 Result: Longint;);
end;
```

C++

```
struct TWMSysCommand {
  unsigned Msg;
  Longint CmdType;
  HWND ActivateWnd;
  Word Key;
  Smallint XPos;
  Smallint YPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysCommand.

35.2.98 Messages.TWMSysDeadChar Record

Pascal

```
TWMSysDeadChar = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSysDeadChar {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysDeadChar.

35.2.99 Messages.TWMSystemError Record

Pascal

```
TWMSystemError = packed record
  Msg: Cardinal;
  ErrSpec: Word;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSystemError {
  unsigned Msg;
  Word ErrSpec;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSystemError.

35.2.100 Messages.TWMTimer Record

Pascal

```
TWMTimer = packed record
  Msg: Cardinal;
  TimerID: Longint;
  TimerProc: TFarProc;
  Result: Longint;
end;
```

C++

```
struct TWMTimer {
  unsigned Msg;
  Longint TimerID;
  TFarProc TimerProc;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMTimer.

35.2.101 Messages.TWMUIState Record

Pascal

```
TWMUIState = packed record
  Msg: Cardinal;
  Action: Word;
  Flags: Word;
  Unused: Longint;
end;
```

C++

```
struct TWMUIState {
  unsigned Msg;
  Word Action;
  Word Flags;
  Longint Unused;
};
```

File

Messages

Description

This is record Messages.TWMUIState.

35.2.102 Messages.TWMVScrollClipboard Record

Pascal

```
TWMVScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScollCode: Word;
  ThumbPos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMVScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScollCode;
  Word ThumbPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMVScrollClipboard.

35.2.103 Messages.TWMWindowPosMsg Record

Pascal

```
TWMWindowPosMsg = packed record
  Msg: Cardinal;
  Unused: Integer;
  WindowPos: PWindowPos;
  Result: Longint;
end;
```

C++

```
struct TWMWindowPosMsg {
  unsigned Msg;
  int Unused;
  PWindowPos WindowPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWindowPosMsg.

35.2.104 Messages.TWMWinIniChange Record

Pascal

```
TWMWinIniChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMWinIniChange {
  unsigned Msg;
  int Unused;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWinIniChange.

35.3 Types

The following table lists types in this documentation.

Types

Name	Description
PMessage (see page 1569)	This is type Messages.PMessage.
TWMCancelMode (see page 1570)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 1570)	This is type Messages.TWMChangeUIState.
TWMChar (see page 1570)	This is type Messages.TWMChar.
TWMChildActivate (see page 1571)	This is type Messages.TWMChildActivate.
TWMClear (see page 1571)	This is type Messages.TWMClear.
TWMClose (see page 1571)	This is type Messages.TWMClose.
TWMCopy (see page 1572)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 1572)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 1572)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 1573)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 1573)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 1573)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 1574)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 1574)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 1574)	This is type Messages.TWMCut.
TWMDeadChar (see page 1575)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 1575)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 1575)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 1576)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 1576)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 1576)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 1577)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 1577)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 1577)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 1578)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 1578)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 1578)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 1579)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 1579)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 1579)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 1580)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 1580)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 1580)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 1581)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 1581)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 1581)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 1582)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 1582)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 1582)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 1583)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 1583)	This is type Messages.TWMNCLButtonDblClk.
TWMNCLButtonDown (see page 1583)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 1584)	This is type Messages.TWMNCLButtonUp.

TWMNCMButtonDblClk (see page 1584)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 1584)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 1585)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 1585)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 1585)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 1586)	This is type Messages.TWMNCRButtonDown.
TWMNCRButtonUp (see page 1586)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 1586)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 1587)	This is type Messages.TWMPaste.
TWMPrintClient (see page 1587)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 1587)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 1588)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 1588)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 1588)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 1589)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 1589)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 1589)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 1590)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 1590)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 1590)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 1591)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 1591)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 1591)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 1592)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 1592)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 1592)	This is type Messages.TWMTimeChange.
TWMUndo (see page 1593)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 1593)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 1593)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 1594)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 1594)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 1594)	This is type Messages.TWMWindowPosChanging.

35.3.1 Messages.PMessage Type

Pascal

```
PMessage = ^TMessage;
```

C++

```
^TMessage PMessage;
```

File

Messages

Description

This is type Messages.PMessage.

35.3.2 Messages.TWMCancelMode Type

Pascal

```
TWMCancelMode = TWMNoParams;
```

C++

```
TWMNoParams TWMCancelMode;
```

File

Messages

Description

This is type Messages.TWMCancelMode.

35.3.3 Messages.TWMChangeUIState Type

Pascal

```
TWMChangeUIState = TWMUIState;
```

C++

```
TWMUIState TWMChangeUIState;
```

File

Messages

Description

This is type Messages.TWMChangeUIState.

35.3.4 Messages.TWMChar Type

Pascal

```
TWMChar = TWMKey;
```

C++

```
TWMKey TWMChar;
```

File

Messages

Description

This is type Messages.TWMChar.

35.3.5 Messages.TWMChildActivate Type

Pascal

```
TWMChildActivate = TWMNoParams;
```

C++

```
TWMNoParams TWMChildActivate;
```

File

Messages

Description

This is type Messages.TWMChildActivate.

35.3.6 Messages.TWMClear Type

Pascal

```
TWMClear = TWMNoParams;
```

C++

```
TWMNoParams TWMClear;
```

File

Messages

Description

This is type Messages.TWMClear.

35.3.7 Messages.TWMClose Type

Pascal

```
TWMClose = TWMNoParams;
```

C++

```
TWMNoParams TWMClose;
```

File

Messages

Description

This is type Messages.TWMClose.

35.3.8 Messages.TWMCopy Type

Pascal

```
TWMCopy = TWMNoParams;
```

C++

```
TWMNoParams TWMCopy;
```

File

Messages

Description

This is type Messages.TWMCopy.

35.3.9 Messages.TWMCtlColorBtn Type

Pascal

```
TWMCtlColorBtn = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorBtn;
```

File

Messages

Description

This is type Messages.TWMCtlColorBtn.

35.3.10 Messages.TWMCtlColorDlg Type

Pascal

```
TWMCtlColorDlg = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorDlg;
```

File

Messages

Description

This is type Messages.TWMCtlColorDlg.

35.3.11 Messages.TWMCtlColorEdit Type

Pascal

```
TWMCtlColorEdit = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorEdit;
```

File

Messages

Description

This is type Messages.TWMCtlColorEdit.

35.3.12 Messages.TWMCtlColorListbox Type

Pascal

```
TWMCtlColorListbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorListbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorListbox.

35.3.13 Messages.TWMCtlColorMsgbox Type

Pascal

```
TWMCtlColorMsgbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorMsgbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorMsgbox.

35.3.14 Messages.TWMCtlColorScrollbar Type

Pascal

```
TWMCtlColorScrollbar = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorScrollbar;
```

File

Messages

Description

This is type Messages.TWMCtlColorScrollbar.

35.3.15 Messages.TWMCtlColorStatic Type

Pascal

```
TWMCtlColorStatic = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorStatic;
```

File

Messages

Description

This is type Messages.TWMCtlColorStatic.

35.3.16 Messages.TWMCut Type

Pascal

```
TWMCut = TWMNoParams;
```

C++

```
TWMNoParams TWMCut;
```

File

Messages

Description

This is type Messages.TWMCut.

35.3.17 Messages.TWMDeadChar Type

Pascal

```
TWMDeadChar = TWMChar;
```

C++

```
TWMChar TWMDeadChar;
```

File

Messages

Description

This is type Messages.TWMDeadChar.

35.3.18 Messages.TWMDestroy Type

Pascal

```
TWMDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroy;
```

File

Messages

Description

This is type Messages.TWMDestroy.

35.3.19 Messages.TWMDestroyClipboard Type

Pascal

```
TWMDestroyClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroyClipboard;
```

File

Messages

Description

This is type Messages.TWMDestroyClipboard.

35.3.20 Messages.TWMDrawClipboard Type

Pascal

```
TWMDrawClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDrawClipboard;
```

File

Messages

Description

This is type Messages.TWMDrawClipboard.

35.3.21 Messages.TWMExitMenuLoop Type

Pascal

```
TWMExitMenuLoop = TWMEnterMenuLoop;
```

C++

```
TWMEnterMenuLoop TWMExitMenuLoop;
```

File

Messages

Description

This is type Messages.TWMExitMenuLoop.

35.3.22 Messages.TWMFontChange Type

Pascal

```
TWMFontChange = TWMNoParams;
```

C++

```
TWMNoParams TWMFontChange;
```

File

Messages

Description

This is type Messages.TWMFontChange.

35.3.23 Messages.TWMGetDlgCode Type

Pascal

```
TWMGetDlgCode = TWMNoParams;
```

C++

```
TWMNoParams TWMGetDlgCode;
```

File

Messages

Description

This is type Messages.TWMGetDlgCode.

35.3.24 Messages.TWMGetFont Type

Pascal

```
TWMGetFont = TWMNoParams;
```

C++

```
TWMNoParams TWMGetFont;
```

File

Messages

Description

This is type Messages.TWMGetFont.

35.3.25 Messages.TWMGetHotKey Type

Pascal

```
TWMGetHotKey = TWMNoParams;
```

C++

```
TWMNoParams TWMGetHotKey;
```

File

Messages

Description

This is type Messages.TWMGetHotKey.

35.3.26 Messages.TWMGetTextLength Type

Pascal

```
TWMGetTextLength = TWMNoParams;
```

C++

```
TWMNoParams TWMGetTextLength;
```

File

Messages

Description

This is type Messages.TWMGetTextLength.

35.3.27 Messages.TWMHScroll Type

Pascal

```
TWMHScroll = TWMScroll;
```

C++

```
TWMScroll TWMHScroll;
```

File

Messages

Description

This is type Messages.TWMHScroll.

35.3.28 Messages.TWMIconEraseBkgnd Type

Pascal

```
TWMIconEraseBkgnd = TWMEraseBkgnd;
```

C++

```
TWMEraseBkgnd TWMIconEraseBkgnd;
```

File

Messages

Description

This is type Messages.TWMIconEraseBkgnd.

35.3.29 Messages.TWMKeyDown Type

Pascal

```
TWMKeyDown = TWMKey;
```

C++

```
TWMKey TWMKeyDown;
```

File

Messages

Description

This is type Messages.TWMKeyDown.

35.3.30 Messages.TWMKeyUp Type

Pascal

```
TWMKeyUp = TWMKey;
```

C++

```
TWMKey TWMKeyUp;
```

File

Messages

Description

This is type Messages.TWMKeyUp.

35.3.31 Messages.TWMLButtonDblClk Type

Pascal

```
TWMLButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMLButtonDblClk.

35.3.32 Messages.TWMLButtonDown Type

TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.

Pascal

```
TWMLButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDown;
```

File

Messages

Description

TWMLButtonDown is the data structure that CLX uses for Windows messages informing an application that the user just clicked the left mouse button. It is the same as all mouse messages.

See Also

TMessage (see page 1513)

TWMMouse (see page 1543)

TWMPaint (see page 1551)

TWMMenuChar (see page 1541)

TWMNotify (see page 1550)

TWMKey (see page 1535)

35.3.33 Messages.TWMLButtonUp Type

Pascal

```
TWMLButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMLButtonUp;
```

File

Messages

Description

This is type Messages.TWMLButtonUp.

35.3.34 Messages.TWMMButtonDblClk Type

Pascal

```
TWMMButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMMButtonDblClk.

35.3.35 Messages.TWMMButtonDown Type

Pascal

```
TWMMButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDown;
```

File

Messages

Description

This is type Messages.TWMMButtonDown.

35.3.36 Messages.TWMMButtonUp Type

Pascal

```
TWMMButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMMButtonUp;
```

File

Messages

Description

This is type Messages.TWMMButtonUp.

35.3.37 Messages.TWMMDIGetActive Type

Pascal

```
TWMMDIGetActive = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIGetActive;
```

File

Messages

Description

This is type Messages.TWMMDIGetActive.

35.3.38 Messages.TWMMDIIconArrange Type

Pascal

```
TWMMDIIconArrange = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIIconArrange;
```

File

Messages

Description

This is type Messages.TWMMDIIconArrange.

35.3.39 Messages.TWMMDIRefreshMenu Type

Pascal

```
TWMMDIRefreshMenu = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIRefreshMenu;
```

File

Messages

Description

This is type Messages.TWMMDIRefreshMenu.

35.3.40 Messages.TWMMouseMove Type

Pascal

```
TWMMouseMove = TWMMouse;
```

C++

```
TWMMouse TWMMouseMove;
```

File

Messages

Description

This is type Messages.TWMMouseMove.

35.3.41 Messages.TWMNCDestroy Type

Pascal

```
TWMNCDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMNCDestroy;
```

File

Messages

Description

This is type Messages.TWMNCDestroy.

35.3.42 Messages.TWMNCLButtonDblClk Type

Pascal

```
TWMNCLButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDblClk.

35.3.43 Messages.TWMNCLButtonDown Type

Pascal

```
TWMNCLButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDown.

35.3.44 Messages.TWMNCLButtonUp Type

Pascal

```
TWMNCLButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCLButtonUp.

35.3.45 Messages.TWMNCMButtonDblClk Type

Pascal

```
TWMNCMButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDblClk.

35.3.46 Messages.TWMNCMButtonDown Type

Pascal

```
TWMNCMButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDown.

35.3.47 Messages.TWMNCMButtonUp Type

Pascal

```
TWMNCMButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCMButtonUp.

35.3.48 Messages.TWMNCMouseMove Type

Pascal

```
TWMNCMouseMove = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMouseMove;
```

File

Messages

Description

This is type Messages.TWMNCMouseMove.

35.3.49 Messages.TWMNCRButtonDblClk Type

Pascal

```
TWMNCRButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDblClk.

35.3.50 Messages.TWMNCRButtonDown Type

Pascal

```
TWMNCRButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDown.

35.3.51 Messages.TWMNCRButtonUp Type

Pascal

```
TWMNCRButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCRButtonUp.

35.3.52 Messages.TWMPaintIcon Type

Pascal

```
TWMPaintIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMPaintIcon;
```

File

Messages

Description

This is type Messages.TWMPaintIcon.

35.3.53 Messages.TWMPaste Type

Pascal

```
TWMPaste = TWMNoParams;
```

C++

```
TWMNoParams TWMPaste;
```

File

Messages

Description

This is type Messages.TWMPaste.

35.3.54 Messages.TWMPrintClient Type

Pascal

```
TWMPrintClient = TWMPrint;
```

C++

```
TWMPrint TWMPrintClient;
```

File

Messages

Description

This is type Messages.TWMPrintClient.

35.3.55 Messages.TWMQueryDragIcon Type

Pascal

```
TWMQueryDragIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryDragIcon;
```

File

Messages

Description

This is type Messages.TWMQueryDragIcon.

35.3.56 Messages.TWMQueryNewPalette Type

Pascal

```
TWMQueryNewPalette = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryNewPalette;
```

File

Messages

Description

This is type Messages.TWMQueryNewPalette.

35.3.57 Messages.TWMQueryOpen Type

Pascal

```
TWMQueryOpen = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryOpen;
```

File

Messages

Description

This is type Messages.TWMQueryOpen.

35.3.58 Messages.TWMQueryUIState Type

Pascal

```
TWMQueryUIState = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryUIState;
```

File

Messages

Description

This is type Messages.TWMQueryUIState.

35.3.59 Messages.TWMQueueSync Type

Pascal

```
TWMQueueSync = TWMNoParams;
```

C++

```
TWMNoParams TWMQueueSync;
```

File

Messages

Description

This is type Messages.TWMQueueSync.

35.3.60 Messages.TWMRButtonDblClk Type

Pascal

```
TWMRButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMRButtonDblClk.

35.3.61 Messages.TWMRButtonDown Type

Pascal

```
TWMRButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDown;
```

File

Messages

Description

This is type Messages.TWMRButtonDown.

35.3.62 Messages.TWMRButtonUp Type

Pascal

```
TWMRButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMRButtonUp;
```

File

Messages

Description

This is type Messages.TWMRButtonUp.

35.3.63 Messages.TWMRenderAllFormats Type

Pascal

```
TWMRenderAllFormats = TWMNoParams;
```

C++

```
TWMNoParams TWMRenderAllFormats;
```

File

Messages

Description

This is type Messages.TWMRenderAllFormats.

35.3.64 Messages.TWMStyleChanged Type

Pascal

```
TWMStyleChanged = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanged;
```

File

Messages

Description

This is type Messages.TWMStyleChanged.

35.3.65 Messages.TWMStyleChanging Type

Pascal

```
TWMStyleChanging = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanging;
```

File

Messages

Description

This is type Messages.TWMStyleChanging.

35.3.66 Messages.TWMSysChar Type

Pascal

```
TWMSysChar = TWMKey;
```

C++

```
TWMKey TWMSysChar;
```

File

Messages

Description

This is type Messages.TWMSysChar.

35.3.67 Messages.TWMSysColorChange Type

Pascal

```
TWMSysColorChange = TWMNoParams;
```

C++

```
TWMNoParams TWMSysColorChange;
```

File

Messages

Description

This is type Messages.TWMSysColorChange.

35.3.68 Messages.TWMSysKeyDown Type

Pascal

```
TWMSysKeyDown = TWMKey;
```

C++

```
TWMKey TWMSysKeyDown;
```

File

Messages

Description

This is type Messages.TWMSysKeyDown.

35.3.69 Messages.TWMSysKeyUp Type

Pascal

```
TWMSysKeyUp = TWMKey;
```

C++

```
TWMKey TWMSysKeyUp;
```

File

Messages

Description

This is type Messages.TWMSysKeyUp.

35.3.70 Messages.TWMTimeChange Type

Pascal

```
TWMTimeChange = TWMNoParams;
```

C++

```
TWMNoParams TWMTimeChange;
```

File

Messages

Description

This is type Messages.TWMTimeChange.

35.3.71 Messages.TWMUndo Type

Pascal

```
TWMUndo = TWMNoParams;
```

C++

```
TWMNoParams TWMUndo;
```

File

Messages

Description

This is type Messages.TWMUndo.

35.3.72 Messages.TWMUpdateUIState Type

Pascal

```
TWMUpdateUIState = TWMUIState;
```

C++

```
TWMUIState TWMUpdateUIState;
```

File

Messages

Description

This is type Messages.TWMUpdateUIState.

35.3.73 Messages.TWMVKeyToItem Type

Pascal

```
TWMVKeyToItem = TWMCharToItem;
```

C++

```
TWMCharToItem TWMVKeyToItem;
```

File

Messages

Description

This is type Messages.TWMVKeyToItem.

35.3.74 Messages.TWMVScroll Type

Pascal

```
TWMVScroll = TWMScroll;
```

C++

```
TWMScroll TWMVScroll;
```

File

Messages

Description

This is type Messages.TWMVScroll.

35.3.75 Messages.TWMWindowPosChanged Type

Pascal

```
TWMWindowPosChanged = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanged;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanged.

35.3.76 Messages.TWMWindowPosChanging Type

Pascal

```
TWMWindowPosChanging = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanging;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanging.

35.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BM_CLICK (see page 1602)	Represents the Windows message BM_CLICK.
BM_GETCHECK (see page 1603)	Represents the Windows message BM_GETCHECK.
BM_GETIMAGE (see page 1603)	Represents the Windows message BM_GETIMAGE.
BM_GETSTATE (see page 1604)	Represents the Windows message BM_GETSTATE.
BM_SETCHECK (see page 1604)	Represents the Windows message BM_SETCHECK.
BM_SETIMAGE (see page 1604)	Represents the Windows message BM_SETIMAGE.
BM_SETSTATE (see page 1605)	Represents the Windows message BM_SETSTATE.
BM_SETSTYLE (see page 1605)	Represents the Windows message BM_SETSTYLE.
BN_CLICKED (see page 1606)	Represents the Windows message BN_CLICKED.
BN_DBLCLK (see page 1606)	Represents the Windows message BN_DBLCLK.
BN_DISABLE (see page 1607)	Represents the Windows message BN_DISABLE.
BN_DOUBLECLICKED (see page 1607)	Represents the Windows message BN_DOUBLECLICKED.
BN_HILITE (see page 1607)	Represents the Windows message BN_HILITE.
BN_KILLFOCUS (see page 1608)	Represents the Windows message BN_KILLFOCUS.
BN_PAINT (see page 1608)	Represents the Windows message BN_PAINT.
BN_PUSHED (see page 1609)	Represents the Windows message BN_PUSHED.
BN_SETFOCUS (see page 1609)	Represents the Windows message BN_SETFOCUS.
BN_UNHILITE (see page 1610)	Represents the Windows message BN_UNHILITE.
BN_UNPUSHED (see page 1610)	Represents the Windows message BN_UNPUSHED.
CB_ADDSTRING (see page 1610)	Represents the Windows message CB_ADDSTRING.
CB_DELETESTRING (see page 1611)	Represents the Windows message CB_DELETESTRING.
CB_DIR (see page 1611)	Represents the Windows message CB_DIR.
CB_FINDSTRING (see page 1612)	Represents the Windows message CB_FINDSTRING.
CB_FINDSTRINGEXACT (see page 1612)	Represents the Windows message CB_FINDSTRINGEXACT.
CB_GETCOUNT (see page 1613)	Represents the Windows message CB_GETCOUNT.
CB_GETCURSEL (see page 1613)	Represents the Windows message CB_GETCURSEL.
CB_GETDROPPEDCONTROLRECT (see page 1613)	Represents the Windows message CB_GETDROPPEDCONTROLRECT.
CB_GETDROPPEDSTATE (see page 1614)	Represents the Windows message CB_GETDROPPEDSTATE.
CB_GETDROPPEDWIDTH (see page 1614)	Represents the Windows message CB_GETDROPPEDWIDTH.
CB_GETEDITSEL (see page 1615)	Represents the Windows message CB_GETEDITSEL.
CB_GETEXTENDEDUI (see page 1615)	Represents the Windows message CB_GETEXTENDEDUI.
CB_GETHORIZONTALEXTENT (see page 1616)	Represents the Windows message CB_GETHORIZONTALEXTENT.
CB_GETITEMDATA (see page 1616)	Represents the Windows message CB_GETITEMDATA.
CB_GETITEMHEIGHT (see page 1617)	Represents the Windows message CB_GETITEMHEIGHT.
CB_GETLBTEXT (see page 1617)	Represents the Windows message CB_GETLBTEXT.
CB_GETLBTEXTLEN (see page 1617)	Represents the Windows message CB_GETLBTEXTLEN.
CB_GETLOCALE (see page 1618)	Represents the Windows message CB_GETLOCALE.
CB_GETTOPINDEX (see page 1618)	Represents the Windows message CB_GETTOPINDEX.
CB_INITSTORAGE (see page 1619)	Represents the Windows message CB_INITSTORAGE.
CB_INSERTSTRING (see page 1619)	Represents the Windows message CB_INSERTSTRING.
CB_LIMITTEXT (see page 1620)	Represents the Windows message CB_LIMITTEXT.
CB_MSGMAX (see page 1620)	Represents the Windows message CB_MSGMAX.
CB_RESETCONTENT (see page 1620)	Represents the Windows message CB_RESETCONTENT.
CB_SELECTSTRING (see page 1621)	Represents the Windows message CB_SELECTSTRING.

CB_SETCURSEL (see page 1621)	Represents the Windows message CB_SETCURSEL.
CB_SETDROPPEDWIDTH (see page 1622)	Represents the Windows message CB_SETDROPPEDWIDTH.
CB_SETEDITSEL (see page 1622)	Represents the Windows message CB_SETEDITSEL.
CB_SETEXTENDEDUI (see page 1623)	Represents the Windows message CB_SETEXTENDEDUI.
CB_SETHORIZONTALEXTENT (see page 1623)	Represents the Windows message CB_SETHORIZONTALEXTENT.
CB_SETITEMDATA (see page 1623)	Represents the Windows message CB_SETITEMDATA.
CB_SETITEMHEIGHT (see page 1624)	Represents the Windows message CB_SETITEMHEIGHT.
CB_SETLOCALE (see page 1624)	Represents the Windows message CB_SETLOCALE.
CB_SETTOPINDEX (see page 1625)	Represents the Windows message CB_SETTOPINDEX.
CB_SHOWDROPDOWN (see page 1625)	Represents the Windows message CB_SHOWDROPDOWN.
CBN_CLOSEUP (see page 1626)	Represents the Windows message CBN_CLOSEUP.
CBN_DBLCLK (see page 1626)	Represents the Windows message CBN_DBLCLK.
CBN_DROPDOWN (see page 1626)	Represents the Windows message CBN_DROPDOWN.
CBN_EDITCHANGE (see page 1627)	Represents the Windows message CBN_EDITCHANGE.
CBN_EDITUPDATE (see page 1627)	Represents the Windows message CBN_EDITUPDATE.
CBN_ERRSPACE (see page 1628)	Represents the Windows message CBN_ERRSPACE.
CBN_KILLFOCUS (see page 1628)	Represents the Windows message CBN_KILLFOCUS.
CBN_SELCHANGE (see page 1629)	Represents the Windows message CBN_SELCHANGE.
CBN_SELENDCANCEL (see page 1629)	Represents the Windows message CBN_SELENDCANCEL.
CBN_SELENDOK (see page 1629)	Represents the Windows message CBN_SELENDOK.
CBN_SETFOCUS (see page 1630)	Represents the Windows message CBN_SETFOCUS.
DM_GETDEFID (see page 1630)	Represents the Windows message DM_GETDEFID.
DM_REPOSITION (see page 1631)	Represents the Windows message DM_REPOSITION.
DM_SETDEFID (see page 1631)	Represents the Windows message DM_SETDEFID.
EM_CANUNDO (see page 1632)	Represents the Windows message EM_CANUNDO.
EM_CHARFROMPOS (see page 1632)	Represents the Windows message EM_CHARFROMPOS.
EM_EMPTYUNDOBUFFER (see page 1632)	Represents the Windows message EM_EMPTYUNDOBUFFER.
EM_FMTLINES (see page 1633)	Represents the Windows message EM_FMTLINES.
EM_GETFIRSTVISIBLELINE (see page 1633)	Represents the Windows message EM_GETFIRSTVISIBLELINE.
EM_GETHANDLE (see page 1634)	Represents the Windows message EM_GETHANDLE.
EM_GETIMESTATUS (see page 1634)	Represents the Windows message EM_GETIMESTATUS.
EM_GETLIMITTEXT (see page 1635)	Represents the Windows message EM_GETLIMITTEXT.
EM_GETLINE (see page 1635)	Represents the Windows message EM_GETLINE.
EM_GETLINECOUNT (see page 1635)	Represents the Windows message EM_GETLINECOUNT.
EM_GETMARGINS (see page 1636)	Represents the Windows message EM_GETMARGINS.
EM_GETMODIFY (see page 1636)	Represents the Windows message EM_GETMODIFY.
EM_GETPASSWORDCHAR (see page 1637)	Represents the Windows message EM_GETPASSWORDCHAR.
EM_GETRECT (see page 1637)	Represents the Windows message EM_GETRECT.
EM_GETSEL (see page 1638)	Represents the Windows message EM_GETSEL.
EM_GETTHUMB (see page 1638)	Represents the Windows message EM_GETTHUMB.
EM_GETWORDBREAKPROC (see page 1638)	Represents the Windows message EM_GETWORDBREAKPROC.
EM_LIMITTEXT (see page 1639)	Represents the Windows message EM_LIMITTEXT.
EM_LINEFROMCHAR (see page 1639)	Represents the Windows message EM_LINEFROMCHAR.
EM_LINEINDEX (see page 1640)	Represents the Windows message EM_LINEINDEX.
EM_LINELENGTH (see page 1640)	Represents the Windows message EM_LINELENGTH.
EM_LINESCROLL (see page 1641)	Represents the Windows message EM_LINESCROLL.
EM_POSFROMCHAR (see page 1641)	Represents the Windows message EM_POSFROMCHAR.
EM_REPLACESEL (see page 1641)	Represents the Windows message EM_REPLACESEL.
EM_SCROLL (see page 1642)	Represents the Windows message EM_SCROLL.
EM_SCROLLCARET (see page 1642)	Represents the Windows message EM_SCROLLCARET.
EM_SETHANDLE (see page 1643)	Represents the Windows message EM_SETHANDLE.
EM_SETIMESTATUS (see page 1643)	Represents the Windows message EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 1644)	Represents the Windows message EM_SETLIMITTEXT.
EM_SETMARGINS (see page 1644)	Represents the Windows message EM_SETMARGINS.

EM_SETMODIFY (see page 1644)	Represents the Windows message EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 1645)	Represents the Windows message EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 1645)	Represents the Windows message EM_SETREADONLY.
EM_SETRECT (see page 1646)	Represents the Windows message EM_SETRECT.
EM_SETRECTNP (see page 1646)	Represents the Windows message EM_SETRECTNP.
EM_SETSEL (see page 1647)	Represents the Windows message EM_SETSEL.
EM_SETTABSTOPS (see page 1647)	Represents the Windows message EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 1647)	Represents the Windows message EM_SETWORDBREAKPROC.
EM_UNDO (see page 1648)	Represents the Windows message EM_UNDO.
EN_CHANGE (see page 1648)	Represents the Windows message EN_CHANGE.
EN_ERRSPACE (see page 1649)	Represents the Windows message EN_ERRSPACE.
EN_HSCROLL (see page 1649)	Represents the Windows message EN_HSCROLL.
EN_KILLFOCUS (see page 1650)	Represents the Windows message EN_KILLFOCUS.
EN_MAXTEXT (see page 1650)	Represents the Windows message EN_MAXTEXT.
EN_SETFOCUS (see page 1650)	Represents the Windows message EN_SETFOCUS.
EN_UPDATE (see page 1651)	Represents the Windows message EN_UPDATE.
EN_VSCROLL (see page 1651)	Represents the Windows message EN_VSCROLL.
LB_ADDFILE (see page 1652)	Represents the Windows message LB_ADDFILE.
LB_ADDSTRING (see page 1652)	Represents the Windows message LB_ADDSTRING.
LB_DELETESTRING (see page 1653)	Represents the Windows message LB_DELETESTRING.
LB_DIR (see page 1653)	Represents the Windows message LB_DIR.
LB_FINDSTRING (see page 1653)	Represents the Windows message LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 1654)	Represents the Windows message LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 1654)	Represents the Windows message LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 1655)	Represents the Windows message LB_GETCARETINDEX.
LB_GETCOUNT (see page 1655)	Represents the Windows message LB_GETCOUNT.
LB_GETCURSEL (see page 1656)	Represents the Windows message LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 1656)	Represents the Windows message LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 1656)	Represents the Windows message LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 1657)	Represents the Windows message LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 1657)	Represents the Windows message LB_GETITEMRECT.
LB_GETLOCALE (see page 1658)	Represents the Windows message LB_GETLOCALE.
LB_GETSEL (see page 1658)	Represents the Windows message LB_GETSEL.
LB_GETSELCOUNT (see page 1659)	Represents the Windows message LB_GETSELCOUNT.
LB_GETSELITEMS (see page 1659)	Represents the Windows message LB_GETSELITEMS.
LB_GETTEXT (see page 1659)	Represents the Windows message LB_GETTEXT.
LB_GETTEXTLEN (see page 1660)	Represents the Windows message LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 1660)	Represents the Windows message LB_GETTOPINDEX.
LB_INITSTORAGE (see page 1661)	Represents the Windows message LB_INITSTORAGE.
LB_INSERTSTRING (see page 1661)	Represents the Windows message LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 1662)	Represents the Windows message LB_ITEMFROMPOINT.
LB_MSGMAX (see page 1662)	Represents the Windows message LB_MSGMAX.
LB_RESETCONTENT (see page 1662)	Represents the Windows message LB_RESETCONTENT.
LB_SELECTSTRING (see page 1663)	Represents the Windows message LB_SELECTSTRING.
LB_SELITEMRANGE (see page 1663)	Represents the Windows message LB_SELITEMRANGE.
LB_SELITEMRANGEEX (see page 1664)	Represents the Windows message LB_SELITEMRANGEEX.
LB_SETANCHORINDEX (see page 1664)	Represents the Windows message LB_SETANCHORINDEX.
LB_SETCARETINDEX (see page 1665)	Represents the Windows message LB_SETCARETINDEX.
LB_SETCOLUMNWIDTH (see page 1665)	Represents the Windows message LB_SETCOLUMNWIDTH.
LB_SETCOUNT (see page 1665)	Represents the Windows message LB_SETCOUNT.
LB_SETCURSEL (see page 1666)	Represents the Windows message LB_SETCURSEL.
LB_SETHORIZONTALEXTENT (see page 1666)	Represents the Windows message LB_SETHORIZONTALEXTENT.
LB_SETITEMDATA (see page 1667)	Represents the Windows message LB_SETITEMDATA.
LB_SETITEMHEIGHT (see page 1667)	Represents the Windows message LB_SETITEMHEIGHT.

LB_SETLOCALE (see page 1668)	Represents the Windows message LB_SETLOCALE.
LB_SETSEL (see page 1668)	Represents the Windows message LB_SETSEL.
LB_SETTABSTOPS (see page 1668)	Represents the Windows message LB_SETTABSTOPS.
LB_SETTOPINDEX (see page 1669)	Represents the Windows message LB_SETTOPINDEX.
LBN_DBLCLK (see page 1669)	Represents the Windows message LBN_DBLCLK.
LBN_ERRSPACE (see page 1670)	Represents the Windows message LBN_ERRSPACE.
LBN_KILLFOCUS (see page 1670)	Represents the Windows message LBN_KILLFOCUS.
LBN_SELCANCEL (see page 1671)	Represents the Windows message LBN_SELCANCEL.
LBN_SELCHANGE (see page 1671)	Represents the Windows message LBN_SELCHANGE.
LBN_SETFOCUS (see page 1671)	Represents the Windows message LBN_SETFOCUS.
PSM_PAGEINFO (see page 1672)	Represents the Windows message PSM_PAGEINFO.
PSM_SHEETINFO (see page 1672)	Represents the Windows message PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 1673)	Represents the Windows message SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 1673)	Represents the Windows message SBM_GETPOS.
SBM_GETRANGE (see page 1674)	Represents the Windows message SBM_GETRANGE.
SBM_GETSCROLLBARINFO (see page 1674)	Represents the Windows message SBM_GETSCROLLBARINFO.
SBM_GETSCROLLINFO (see page 1674)	Represents the Windows message SBM_GETSCROLLINFO.
SBM_SETPOS (see page 1675)	Represents the Windows message SBM_SETPOS.
SBM_SETRANGE (see page 1675)	Represents the Windows message SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 1676)	Represents the Windows message SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 1676)	Represents the Windows message SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 1677)	Represents the Windows message WM_ACTIVATE.
WM_ACTIVATEAPP (see page 1677)	Represents the Windows message WM_ACTIVATEAPP.
WM_APP (see page 1678)	Represents the Windows message WM_APP.
WM_APPCOMMAND (see page 1678)	Represents the Windows message WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 1678)	Represents the Windows message WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 1679)	Represents the Windows message WM_CANCELJOURNAL.
WM_CANCELMODE (see page 1679)	Represents the Windows message WM_CANCELMODE.
WM_CAPTURECHANGED (see page 1680)	Represents the Windows message WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 1680)	Represents the Windows message WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 1681)	Represents the Windows message WM_CHANGEUISTATE.
WM_CHAR (see page 1681)	Represents the Windows message WM_CHAR.
WM_CHARTOITEM (see page 1681)	Represents the Windows message WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 1682)	Represents the Windows message WM_CHILDACTIVATE.
WM_CLEAR (see page 1682)	Represents the Windows message WM_CLEAR.
WM_CLOSE (see page 1683)	Represents the Windows message WM_CLOSE.
WM_COALESCE_FIRST (see page 1683)	Represents the Windows message WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 1684)	Represents the Windows message WM_COALESCE_LAST.
WM_COMMAND (see page 1684)	Represents the Windows message WM_COMMAND.
WM_COMMNOTIFY (see page 1685)	Represents the Windows message WM_COMMNOTIFY.
WM_COMPACTING (see page 1685)	Represents the Windows message WM_COMPACTING.
WM_COMPAREITEM (see page 1685)	Represents the Windows message WM_COMPAREITEM.
WM_CONTEXTMENU (see page 1686)	Represents the Windows message WM_CONTEXTMENU.
WM_COPY (see page 1686)	Represents the Windows message WM_COPY.
WM_COPYDATA (see page 1687)	Represents the Windows message WM_COPYDATA.
WM_CREATE (see page 1687)	Represents the Windows message WM_CREATE.
WM_CTLCOLOR (see page 1688)	Represents the Windows message WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 1688)	Represents the Windows message WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 1688)	Represents the Windows message WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 1689)	Represents the Windows message WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 1689)	Represents the Windows message WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 1690)	Represents the Windows message WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 1690)	Represents the Windows message WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 1691)	Represents the Windows message WM_CTLCOLORSTATIC.

WM_CUT (see page 1691)	Represents the Windows message WM_CUT.
WM_DDE_ACK (see page 1691)	Represents the Windows message WM_DDE_ACK.
WM_DDE_ADVISE (see page 1692)	Represents the Windows message WM_DDE_ADVISE.
WM_DDE_DATA (see page 1692)	Represents the Windows message WM_DDE_DATA.
WM_DDE_EXECUTE (see page 1693)	Represents the Windows message WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 1693)	Represents the Windows message WM_DDE_FIRST.
WM_DDE_INITIATE (see page 1694)	Represents the Windows message WM_DDE_INITIATE.
WM_DDE_LAST (see page 1694)	Represents the Windows message WM_DDE_LAST.
WM_DDE_POKE (see page 1695)	Represents the Windows message WM_DDE_POKE.
WM_DDE_REQUEST (see page 1695)	Represents the Windows message WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 1695)	Represents the Windows message WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 1696)	Represents the Windows message WM_DDE_UNADVISE.
WM_DEADCHAR (see page 1696)	Represents the Windows message WM_DEADCHAR.
WM_DELETEITEM (see page 1697)	Represents the Windows message WM_DELETEITEM.
WM_DESTROY (see page 1697)	Represents the Windows message WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 1698)	Represents the Windows message WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 1698)	Represents the Windows message WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 1698)	Represents the Windows message WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 1699)	Represents the Windows message WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 1699)	Represents the Windows message WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 1700)	Represents the Windows message WM_DRAWITEM.
WM_DROPFILES (see page 1700)	Represents the Windows message WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 1701)	Represents the Windows message WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 1701)	Represents the Windows message WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 1702)	Represents the Windows message WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 1702)	Represents the Windows message WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 1703)	Represents the Windows message WM_ENABLE.
WM_ENDSESSION (see page 1703)	Represents the Windows message WM_ENDSESSION.
WM_ENTERIDLE (see page 1703)	Represents the Windows message WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 1704)	Represents the Windows message WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 1704)	Represents the Windows message WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 1705)	Represents the Windows message WM_ERASEBKGND.
WM_EXITMENULOOP (see page 1705)	Represents the Windows message WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 1706)	Represents the Windows message WM_EXITSIZEMOVE.
WM_FONTCHANGE (see page 1706)	Represents the Windows message WM_FONTCHANGE.
WM_GETDLGCODE (see page 1707)	Represents the Windows message WM_GETDLGCODE.
WM_GETFONT (see page 1707)	Represents the Windows message WM_GETFONT.
WM_GETHOTKEY (see page 1707)	Represents the Windows message WM_GETHOTKEY.
WM_GETICON (see page 1708)	Represents the Windows message WM_GETICON.
WM_GETMINMAXINFO (see page 1708)	Represents the Windows message WM_GETMINMAXINFO.
WM_GETOBJECT (see page 1709)	Represents the Windows message WM_GETOBJECT.
WM_GETTEXT (see page 1709)	Represents the Windows message WM_GETTEXT.
WM_GETTEXTLENGTH (see page 1710)	Represents the Windows message WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 1710)	Represents the Windows message WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 1711)	Represents the Windows message WM_HANDHELDLAST.
WM_HELP (see page 1711)	Represents the Windows message WM_HELP.
WM_HOTKEY (see page 1711)	Represents the Windows message WM_HOTKEY.
WM_HSCROLL (see page 1712)	Represents the Windows message WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 1712)	Represents the Windows message WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 1713)	Represents the Windows message WM_ICONERASEBKGND.
WM_IME_CHAR (see page 1713)	Represents the Windows message WM_IME_CHAR.
WM_IME_COMPOSITION (see page 1714)	Represents the Windows message WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 1714)	Represents the Windows message WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 1715)	Represents the Windows message WM_IME_CONTROL.

WM_IME_ENDCOMPOSITION (see page 1715)	Represents the Windows message WM_IME_ENDCOMPOSITION.
WM_IME_KEYDOWN (see page 1715)	Represents the Windows message WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 1716)	Represents the Windows message WM_IME_KEYLAST.
WM_IME_KEYUP (see page 1716)	Represents the Windows message WM_IME_KEYUP.
WM_IME_NOTIFY (see page 1717)	Represents the Windows message WM_IME_NOTIFY.
WM_IME_REQUEST (see page 1717)	Represents the Windows message WM_IME_REQUEST.
WM_IME_SELECT (see page 1718)	Represents the Windows message WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 1718)	Represents the Windows message WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 1718)	Represents the Windows message WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 1719)	Represents the Windows message WM_INITDIALOG.
WM_INITMENU (see page 1719)	Represents the Windows message WM_INITMENU.
WM_INITMENUPOPUP (see page 1720)	Represents the Windows message WM_INITMENUPOPUP.
WM_INPUT (see page 1720)	Represents the Windows message WM_INPUT.
WM_INPUTLANGCHANGE (see page 1721)	Represents the Windows message WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 1721)	Represents the Windows message WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 1722)	Represents the Windows message WM_KEYDOWN.
WM_KEYFIRST (see page 1722)	Represents the Windows message WM_KEYFIRST.
WM_KEYLAST (see page 1722)	Represents the Windows message WM_KEYLAST.
WM_KEYUP (see page 1723)	Represents the Windows message WM_KEYUP.
WM_KILLFOCUS (see page 1723)	Represents the Windows message WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 1724)	Represents the Windows message WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 1724)	Represents the Windows message WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 1725)	Represents the Windows message WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 1725)	Represents the Windows message WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 1726)	Represents the Windows message WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 1726)	Represents the Windows message WM_MBUTTONUP.
WM_MDIACTIVATE (see page 1726)	Represents the Windows message WM_MDIACTIVATE.
WM_MDICASCADE (see page 1727)	Represents the Windows message WM_MDICASCADE.
WM_MDICREATE (see page 1727)	Represents the Windows message WM_MDICREATE.
WM_MDIDESTROY (see page 1728)	Represents the Windows message WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 1728)	Represents the Windows message WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 1729)	Represents the Windows message WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 1729)	Represents the Windows message WM_MDIMAXIMIZE.
WM_MDINEXT (see page 1729)	Represents the Windows message WM_MDINEXT.
WM_MDIREFRESHMENU (see page 1730)	Represents the Windows message WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 1730)	Represents the Windows message WM_MDIRESTORE.
WM_MDISETMENU (see page 1731)	Represents the Windows message WM_MDISETMENU.
WM_MDITILE (see page 1731)	Represents the Windows message WM_MDITILE.
WM_MEASUREITEM (see page 1732)	Represents the Windows message WM_MEASUREITEM.
WM_MENUCHAR (see page 1732)	Represents the Windows message WM_MENUCHAR.
WM_MENUCOMMAND (see page 1732)	Represents the Windows message WM_MENUCOMMAND.
WM_MENUDRAG (see page 1733)	Represents the Windows message WM_MENUDRAG.
WM_MENUGETOBJECT (see page 1733)	Represents the Windows message WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 1734)	Represents the Windows message WM_MENURBUTTONUP.
WM_MENUSELECT (see page 1734)	Represents the Windows message WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 1735)	Represents the Windows message WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 1735)	Represents the Windows message WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 1736)	Represents the Windows message WM_MOUSEHOVER.
WM_MOUSELAST (see page 1736)	Represents the Windows message WM_MOUSELAST.
WM_MOUSELEAVE (see page 1736)	Represents the Windows message WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 1737)	Represents the Windows message WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 1737)	Represents the Windows message WM_MOUSEWHEEL.
WM_MOVE (see page 1738)	Represents the Windows message WM_MOVE.
WM_MOVING (see page 1738)	Represents the Windows message WM_MOVING.

WM_NCACTIVATE (see page 1739)	Represents the Windows message WM_NCACTIVATE.
WM_NCCALCSIZE (see page 1739)	Represents the Windows message WM_NCCALCSIZE.
WM_NCCREATE (see page 1739)	Represents the Windows message WM_NCCREATE.
WM_NCDESTROY (see page 1740)	Represents the Windows message WM_NCDESTROY.
WM_NCHITTEST (see page 1740)	Represents the Windows message WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 1741)	Represents the Windows message WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 1741)	Represents the Windows message WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 1742)	Represents the Windows message WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 1742)	Represents the Windows message WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 1742)	Represents the Windows message WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 1743)	Represents the Windows message WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 1743)	Represents the Windows message WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 1744)	Represents the Windows message WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 1744)	Represents the Windows message WM_NCMOUSEMOVE.
WM_NCPAINT (see page 1745)	Represents the Windows message WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 1745)	Represents the Windows message WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 1746)	Represents the Windows message WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 1746)	Represents the Windows message WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 1746)	Represents the Windows message WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 1747)	Represents the Windows message WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 1747)	Represents the Windows message WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 1748)	Represents the Windows message WM_NEXTDLGCTL.
WM_NEXTMENU (see page 1748)	Represents the Windows message WM_NEXTMENU.
WM_NOTIFY (see page 1749)	Represents the Windows message WM_NOTIFY.
WM_NOTIFYFORMAT (see page 1749)	Represents the Windows message WM_NOTIFYFORMAT.
WM_NULL (see page 1749)	Represents the Windows message WM_NULL.
WM_PAINT (see page 1750)	Represents the Windows message WM_PAINT.
WM_PAINTCLIPBOARD (see page 1750)	Represents the Windows message WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 1751)	Represents the Windows message WM_PAINTICON.
WM_PALETTECHANGED (see page 1751)	Represents the Windows message WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 1752)	Represents the Windows message WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 1752)	Represents the Windows message WM_PARENTNOTIFY.
WM_PASTE (see page 1752)	Represents the Windows message WM_PASTE.
WM_PENWINFIRST (see page 1753)	Represents the Windows message WM_PENWINFIRST.
WM_PENWINLAST (see page 1753)	Represents the Windows message WM_PENWINLAST.
WM_POWER (see page 1754)	Represents the Windows message WM_POWER.
WM_POWERBROADCAST (see page 1754)	Represents the Windows message WM_POWERBROADCAST.
WM_PRINT (see page 1755)	Represents the Windows message WM_PRINT.
WM_PRINTCLIENT (see page 1755)	Represents the Windows message WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 1756)	Represents the Windows message WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 1756)	Represents the Windows message WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 1756)	Represents the Windows message WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 1757)	Represents the Windows message WM_QUERYOPEN.
WM_QUERYUISTATE (see page 1757)	Represents the Windows message WM_QUERYUISTATE.
WM_QUEUESYNC (see page 1758)	Represents the Windows message WM_QUEUESYNC.
WM_QUIT (see page 1758)	Represents the Windows message WM_QUIT.
WM_RBUTTONDBLCLK (see page 1759)	Represents the Windows message WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 1759)	Represents the Windows message WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 1759)	Represents the Windows message WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 1760)	Represents the Windows message WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 1760)	Represents the Windows message WM_RENDERFORMAT.
WM_SETCURSOR (see page 1761)	Represents the Windows message WM_SETCURSOR.
WM_SETFOCUS (see page 1761)	Represents the Windows message WM_SETFOCUS.
WM_SETFONT (see page 1762)	Represents the Windows message WM_SETFONT.

WM_SETHOTKEY (see page 1762)	Represents the Windows message WM_SETHOTKEY.
WM_SETICON (see page 1763)	Represents the Windows message WM_SETICON.
WM_SETREDRAW (see page 1763)	Represents the Windows message WM_SETREDRAW.
WM_SETTEXT (see page 1763)	Represents the Windows message WM_SETTEXT.
WM_SETTINGCHANGE (see page 1764)	Represents the Windows message WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 1764)	Represents the Windows message WM_SHOWWINDOW.
WM_SIZE (see page 1765)	Represents the Windows message WM_SIZE.
WM_SIZECLIPBOARD (see page 1765)	Represents the Windows message WM_SIZECLIPBOARD.
WM_SIZING (see page 1766)	Represents the Windows message WM_SIZING.
WM_SPOOLERSTATUS (see page 1766)	Represents the Windows message WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 1766)	Represents the Windows message WM_STYLECHANGED.
WM_STYLECHANGING (see page 1767)	Represents the Windows message WM_STYLECHANGING.
WM_SYSCHAR (see page 1767)	Represents the Windows message WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 1768)	Represents the Windows message WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 1768)	Represents the Windows message WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 1769)	Represents the Windows message WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 1769)	Represents the Windows message WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 1770)	Represents the Windows message WM_SYSKEYUP.
WM_SYSTEMERROR (see page 1770)	Represents the Windows message WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 1770)	Represents the Windows message WM_TABLET_FIRST.
WM_TABLET_LAST (see page 1771)	Represents the Windows message WM_TABLET_LAST.
WM_TCARD (see page 1771)	Represents the Windows message WM_TCARD.
WM_THEMECHANGED (see page 1772)	Represents the Windows message WM_THEMECHANGED.
WM_TIMECHANGE (see page 1772)	Represents the Windows message WM_TIMECHANGE.
WM_TIMER (see page 1773)	Represents the Windows message WM_TIMER.
WM_UNDO (see page 1773)	Represents the Windows message WM_UNDO.
WM_UNICHAR (see page 1774)	Represents the Windows message WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 1774)	Represents the Windows message WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 1774)	Represents the Windows message WM_UPDATEUISTATE.
WM_USER (see page 1775)	Represents the Windows message WM_USER.
WM_USERCHANGED (see page 1775)	Represents the Windows message WM_USERCHANGED.
WM_VKEYTOITEM (see page 1776)	Represents the Windows message WM_VKEYTOITEM.
WM_VSCROLL (see page 1776)	Represents the Windows message WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 1777)	Represents the Windows message WM_VSCROLLCLIPBOARD.
WM_WINDOWPOSCHANGED (see page 1777)	Represents the Windows message WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 1778)	Represents the Windows message WM_WINDOWPOSCHANGING.
WM_WININICHANGE (see page 1778)	Represents the Windows message WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 1778)	Represents the Windows message WM_WTSSESSION_CHANGE.

35.4.1 Messages.BM_CLICK Constant

Represents the Windows message BM_CLICK.

Pascal

```
BM_CLICK = $00F5;
```

C++

```
BM_CLICK = 0x00F5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BM_CLICK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.2 Messages.BM_GETCHECK Constant

Represents the Windows message BM_GETCHECK.

Pascal

```
BM_GETCHECK = $00F0;
```

C++

```
BM_GETCHECK = 0x00F0;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BM_GETCHECK notification.

See Also

35.4.11 Messages.BN_DISABLE Constant

Represents the Windows message BN_DISABLE.

Pascal

```
BN_DISABLE = 4;
```

C++

```
BN_DISABLE = 4;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_DISABLE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.12 Messages.BN_DOUBLECLICKED Constant

Represents the Windows message BN_DOUBLECLICKED.

Pascal

```
BN_DOUBLECLICKED = 5;
```

C++

```
BN_DOUBLECLICKED = 5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_DOUBLECLICKED notification.

See Also

SendMessage (MSDN)

35.4.13 Messages.BN_HILITE Constant

Represents the Windows message BN_HILITE.

Pascal

```
BN_HILITE = 2;
```

C++

```
BN_HILITE = 2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_HILITE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.14 Messages.BN_KILLFOCUS Constant

Represents the Windows message BN_KILLFOCUS.

Pascal

```
BN_KILLFOCUS = 7;
```

C++

```
BN_KILLFOCUS = 7;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_KILLFOCUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.15 Messages.BN_PAINT Constant

Represents the Windows message BN_PAINT.

Pascal

```
BN_PAINT = 1;
```

C++

```
BN_PAINT = 1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_PAINT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.16 Messages.BN_PUSHED Constant

Represents the Windows message BN_PUSHED.

Pascal

```
BN_PUSHED = BN_HILITE;
```

C++

```
BN_PUSHED = BN_HILITE;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_PUSHED notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.17 Messages.BN_SETFOCUS Constant

Represents the Windows message BN_SETFOCUS.

Pascal

```
BN_SETFOCUS = 6;
```

C++

```
BN_SETFOCUS = 6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_SETFOCUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.18 Messages.BN_UNHILITE Constant

Represents the Windows message BN_UNHILITE.

Pascal

```
BN_UNHILITE = 3;
```

C++

```
BN_UNHILITE = 3;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_UNHILITE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.19 Messages.BN_UNPUSHED Constant

Represents the Windows message BN_UNPUSHED.

Pascal

```
BN_UNPUSHED = BN_UNHILITE;
```

C++

```
BN_UNPUSHED = BN_UNHILITE;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for BN_UNPUSHED notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.20 Messages.CB_ADDSTRING Constant

Represents the Windows message CB_ADDSTRING.

Pascal

```
CB_ADDSTRING = $0143;
```

C++

```
CB_ADDSTRING = 0x0143;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_ADDSTRING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.21 Messages.CB_DELETESTRING Constant

Represents the Windows message CB_DELETESTRING.

Pascal

```
CB_DELETESTRING = $0144;
```

C++

```
CB_DELETESTRING = 0x0144;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_DELETESTRING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.22 Messages.CB_DIR Constant

Represents the Windows message CB_DIR.

Pascal

```
CB_DIR = $0145;
```

C++

```
CB_DIR = 0x0145;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_DIR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.23 Messages.CB_FINDSTRING Constant

Represents the Windows message CB_FINDSTRING.

Pascal

```
CB_FINDSTRING = $014C;
```

C++

```
CB_FINDSTRING = 0x014C;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_FINDSTRING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.24 Messages.CB_FINDSTRINGEXACT Constant

Represents the Windows message CB_FINDSTRINGEXACT.

Pascal

```
CB_FINDSTRINGEXACT = $0158;
```

C++

```
CB_FINDSTRINGEXACT = 0x0158;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_FINDSTRINGEXACT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.25 Messages.CB_GETCOUNT Constant

Represents the Windows message CB_GETCOUNT.

Pascal

```
CB_GETCOUNT = $0146;
```

C++

```
CB_GETCOUNT = 0x0146;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETCOUNT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.26 Messages.CB_GETCURSEL Constant

Represents the Windows message CB_GETCURSEL.

Pascal

```
CB_GETCURSEL = $0147;
```

C++

```
CB_GETCURSEL = 0x0147;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETCURSEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.27 Messages.CB_GETDROPPEDCONTROLRECT Constant

Represents the Windows message CB_GETDROPPEDCONTROLRECT.

Pascal

```
CB_GETDROPPEDCONTROLRECT = $0152;
```

C++

```
CB_GETDROPPEDCONTROLRECT = 0x0152;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETDROPPEDCONTROLRECT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.28 Messages.CB_GETDROPPEDSTATE Constant

Represents the Windows message CB_GETDROPPEDSTATE.

Pascal

```
CB_GETDROPPEDSTATE = $0157;
```

C++

```
CB_GETDROPPEDSTATE = 0x0157;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETDROPPEDSTATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.29 Messages.CB_GETDROPPEDWIDTH Constant

Represents the Windows message CB_GETDROPPEDWIDTH.

Pascal

```
CB_GETDROPPEDWIDTH = 351;
```

C++

```
CB_GETDROPPEDWIDTH = 351;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETDROPPEDWIDTH notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.30 Messages.CB_GETEDITSEL Constant

Represents the Windows message CB_GETEDITSEL.

Pascal

```
CB_GETEDITSEL = $0140;
```

C++

```
CB_GETEDITSEL = 0x0140;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETEDITSEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.31 Messages.CB_GETEXTENDEDUI Constant

Represents the Windows message CB_GETEXTENDEDUI.

Pascal

```
CB_GETEXTENDEDUI = $0156;
```

C++

```
CB_GETEXTENDEDUI = 0x0156;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETEXTENDEDUI notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.32 Messages.CB_GETHORIZONTALEXTENT Constant

Represents the Windows message CB_GETHORIZONTALEXTENT.

Pascal

```
CB_GETHORIZONTALEXTENT = 349;
```

C++

```
CB_GETHORIZONTALEXTENT = 349;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETHORIZONTALEXTENT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.33 Messages.CB_GETITEMDATA Constant

Represents the Windows message CB_GETITEMDATA.

Pascal

```
CB_GETITEMDATA = $0150;
```

C++

```
CB_GETITEMDATA = 0x0150;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETITEMDATA notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.34 Messages.CB_GETITEMHEIGHT Constant

Represents the Windows message CB_GETITEMHEIGHT.

Pascal

```
CB_GETITEMHEIGHT = $0154;
```

C++

```
CB_GETITEMHEIGHT = 0x0154;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETITEMHEIGHT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.35 Messages.CB_GETLBTEXT Constant

Represents the Windows message CB_GETLBTEXT.

Pascal

```
CB_GETLBTEXT = $0148;
```

C++

```
CB_GETLBTEXT = 0x0148;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETLBTEXT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.36 Messages.CB_GETLBTEXTLEN Constant

Represents the Windows message CB_GETLBTEXTLEN.

Pascal

```
CB_GETLBTEXTLEN = $0149;
```

C++

```
CB_GETLBTEXTLEN = 0x0149;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETLBTEXTLEN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.37 Messages.CB_GETLOCALE Constant

Represents the Windows message CB_GETLOCALE.

Pascal

```
CB_GETLOCALE = 346;
```

C++

```
CB_GETLOCALE = 346;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETLOCALE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.38 Messages.CB_GETTOPINDEX Constant

Represents the Windows message CB_GETTOPINDEX.

Pascal

```
CB_GETTOPINDEX = 347;
```

C++

```
CB_GETTOPINDEX = 347;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_GETTOPINDEX notification.

See Also

SendMessage (MSDN)

Represents the Windows message CB_SETITEMDATA.

Pascal

```
CB_SETITEMDATA = $0151;
```

C++

```
CB_SETITEMDATA = 0x0151;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_SETITEMDATA notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.51 Messages.CB_SETITEMHEIGHT Constant

Represents the Windows message CB_SETITEMHEIGHT.

Pascal

```
CB_SETITEMHEIGHT = $0153;
```

C++

```
CB_SETITEMHEIGHT = 0x0153;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_SETITEMHEIGHT notification.

35.4.53 Messages.CB_SETTOPINDEX Constant

Represents the Windows message CB_SETTOPINDEX.

Pascal

```
CB_SETTOPINDEX = 348;
```

C++

```
CB_SETTOPINDEX = 348;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_SETTOPINDEX notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.54 Messages.CB_SHOWDROPDOWN Constant

Represents the Windows message CB_SHOWDROPDOWN.

Pascal

```
CB_SHOWDROPDOWN = $014F;
```

C++

```
CB_SHOWDROPDOWN = 0x014F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CB_SHOWDROPDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.55 Messages.CBN_CLOSEUP Constant

Represents the Windows message CBN_CLOSEUP.

Pascal

```
CBN_CLOSEUP = 8;
```

C++

```
CBN_CLOSEUP = 8;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_CLOSEUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.56 Messages.CBN_DBLCLK Constant

Represents the Windows message CBN_DBLCLK.

Pascal

```
CBN_DBLCLK = 2;
```

C++

```
CBN_DBLCLK = 2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_DBLCLK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.57 Messages.CBN_DROPDOWN Constant

Represents the Windows message CBN_DROPDOWN.

Pascal

```
CBN_DROPDOWN = 7;
```

C++

```
CBN_DROPDOWN = 7;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_DROPDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.58 Messages.CBN_EDITCHANGE Constant

Represents the Windows message CBN_EDITCHANGE.

Pascal

```
CBN_EDITCHANGE = 5;
```

C++

```
CBN_EDITCHANGE = 5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_EDITCHANGE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.59 Messages.CBN_EDITUPDATE Constant

Represents the Windows message CBN_EDITUPDATE.

Pascal

```
CBN_EDITUPDATE = 6;
```

C++

```
CBN_EDITUPDATE = 6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_EDITUPDATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.60 Messages.CBN_ERRSPACE Constant

Represents the Windows message CBN_ERRSPACE.

Pascal

```
CBN_ERRSPACE = (-1);
```

C++

```
CBN_ERRSPACE = (-1);
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_ERRSPACE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.61 Messages.CBN_KILLFOCUS Constant

Represents the Windows message CBN_KILLFOCUS.

Pascal

```
CBN_KILLFOCUS = 4;
```

C++

```
CBN_KILLFOCUS = 4;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_KILLFOCUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.62 Messages.CBN_SELCHANGE Constant

Represents the Windows message CBN_SELCHANGE.

Pascal

```
CBN_SELCHANGE = 1;
```

C++

```
CBN_SELCHANGE = 1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_SELCHANGE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.63 Messages.CBN_SELENDCANCEL Constant

Represents the Windows message CBN_SELENDCANCEL.

Pascal

```
CBN_SELENDCANCEL = 10;
```

C++

```
CBN_SELENDCANCEL = 10;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_SELENDCANCEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.64 Messages.CBN_SELENDOK Constant

Represents the Windows message CBN_SELENDOK.

Pascal

```
CBN_SELENDOK = 9;
```

C++

```
CBN_SELENDOK = 9;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_SELENDOK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.65 Messages.CBN_SETFOCUS Constant

Represents the Windows message CBN_SETFOCUS.

Pascal

```
CBN_SETFOCUS = 3;
```

C++

```
CBN_SETFOCUS = 3;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for CBN_SETFOCUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.66 Messages.DM_GETDEFID Constant

Represents the Windows message DM_GETDEFID.

Pascal

```
DM_GETDEFID = (WM_USER+0);
```

C++

```
DM_GETDEFID = (WM_USER+0);
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for DM_GETDEFID notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.67 Messages.DM_REPOSITION Constant

Represents the Windows message DM_REPOSITION.

Pascal

```
DM_REPOSITION = (WM_USER+2);
```

C++

```
DM_REPOSITION = (WM_USER+2);
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for DM_REPOSITION notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.68 Messages.DM_SETDEFID Constant

Represents the Windows message DM_SETDEFID.

Pascal

```
DM_SETDEFID = (WM_USER+1);
```

C++

```
DM_SETDEFID = (WM_USER+1);
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for DM_SETDEFID notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.69 Messages.EM_CANUNDO Constant

Represents the Windows message EM_CANUNDO.

Pascal

```
EM_CANUNDO = $00C6;
```

C++

```
EM_CANUNDO = 0x00C6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_CANUNDO notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.70 Messages.EM_CHARFROMPOS Constant

Represents the Windows message EM_CHARFROMPOS.

Pascal

```
EM_CHARFROMPOS = 215;
```

C++

```
EM_CHARFROMPOS = 215;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_CHARFROMPOS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.71 Messages.EM_EMPTYUNDOBUFFER Constant

Represents the Windows message EM_EMPTYUNDOBUFFER.

Pascal

```
EM_EMPTYUNDOBUFFER = $00CD;
```

C++

```
EM_EMPTYUNDOBUFFER = 0x00CD;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_EMPTYUNDOBUFFER notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.72 Messages.EM_FMTLINES Constant

Represents the Windows message EM_FMTLINES.

Pascal

```
EM_FMTLINES = $00C8;
```

C++

```
EM_FMTLINES = 0x00C8;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_FMTLINES notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.73 Messages.EM_GETFIRSTVISIBLELINE Constant

Represents the Windows message EM_GETFIRSTVISIBLELINE.

Pascal

```
EM_GETFIRSTVISIBLELINE = $00CE;
```

C++

```
EM_GETFIRSTVISIBLELINE = 0x00CE;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETFIRSTVISIBLELINE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.74 Messages.EM_GETHANDLE Constant

Represents the Windows message EM_GETHANDLE.

Pascal

```
EM_GETHANDLE = $00BD;
```

C++

```
EM_GETHANDLE = 0x00BD;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETHANDLE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.75 Messages.EM_GETIMESTATUS Constant

Represents the Windows message EM_GETIMESTATUS.

Pascal

```
EM_GETIMESTATUS = 217;
```

C++

```
EM_GETIMESTATUS = 217;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETIMESTATUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.76 Messages.EM_GETLIMITTEXT Constant

Represents the Windows message EM_GETLIMITTEXT.

Pascal

```
EM_GETLIMITTEXT = 213;
```

C++

```
EM_GETLIMITTEXT = 213;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETLIMITTEXT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.77 Messages.EM_GETLINE Constant

Represents the Windows message EM_GETLINE.

Pascal

```
EM_GETLINE = $00C4;
```

C++

```
EM_GETLINE = 0x00C4;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETLINE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.78 Messages.EM_GETLINECOUNT Constant

Represents the Windows message EM_GETLINECOUNT.

Pascal

```
EM_GETLINECOUNT = $00BA;
```

C++

```
EM_GETLINECOUNT = 0x00BA;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETLINECOUNT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.79 Messages.EM_GETMARGINS Constant

Represents the Windows message EM_GETMARGINS.

Pascal

```
EM_GETMARGINS = 212;
```

C++

```
EM_GETMARGINS = 212;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETMARGINS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.80 Messages.EM_GETMODIFY Constant

Represents the Windows message EM_GETMODIFY.

Pascal

```
EM_GETMODIFY = $00B8;
```

C++

```
EM_GETMODIFY = 0x00B8;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETMODIFY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.81 Messages.EM_GETPASSWORDCHAR Constant

Represents the Windows message EM_GETPASSWORDCHAR.

Pascal

```
EM_GETPASSWORDCHAR = $00D2;
```

C++

```
EM_GETPASSWORDCHAR = 0x00D2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETPASSWORDCHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.82 Messages.EM_GETRECT Constant

Represents the Windows message EM_GETRECT.

Pascal

```
EM_GETRECT = $00B2;
```

C++

```
EM_GETRECT = 0x00B2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETRECT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.83 Messages.EM_GETSEL Constant

Represents the Windows message EM_GETSEL.

Pascal

```
EM_GETSEL = $00B0;
```

C++

```
EM_GETSEL = 0x00B0;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETSEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.84 Messages.EM_GETTHUMB Constant

Represents the Windows message EM_GETTHUMB.

Pascal

```
EM_GETTHUMB = $00BE;
```

C++

```
EM_GETTHUMB = 0x00BE;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETTHUMB notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.85 Messages.EM_GETWORDBREAKPROC Constant

Represents the Windows message EM_GETWORDBREAKPROC.

Pascal

```
EM_GETWORDBREAKPROC = $00D1;
```

C++

```
EM_GETWORDBREAKPROC = 0x00D1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_GETWORDBREAKPROC notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.86 Messages.EM_LIMITTEXT Constant

Represents the Windows message EM_LIMITTEXT.

Pascal

```
EM_LIMITTEXT = $00C5;
```

C++

```
EM_LIMITTEXT = 0x00C5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_LIMITTEXT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.87 Messages.EM_LINEFROMCHAR Constant

Represents the Windows message EM_LINEFROMCHAR.

Pascal

```
EM_LINEFROMCHAR = $00C9;
```

C++

```
EM_LINEFROMCHAR = 0x00C9;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_LINEFROMCHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.88 Messages.EM_LINEINDEX Constant

Represents the Windows message EM_LINEINDEX.

Pascal

```
EM_LINEINDEX = $00BB;
```

C++

```
EM_LINEINDEX = 0x00BB;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_LINEINDEX notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.89 Messages.EM_LINELENGTH Constant

Represents the Windows message EM_LINELENGTH.

Pascal

```
EM_LINELENGTH = $00C1;
```

C++

```
EM_LINELENGTH = 0x00C1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_LINELENGTH notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.90 Messages.EM_LINESCROLL Constant

Represents the Windows message EM_LINESCROLL.

Pascal

```
EM_LINESCROLL = $00B6;
```

C++

```
EM_LINESCROLL = 0x00B6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_LINESCROLL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.91 Messages.EM_POSFROMCHAR Constant

Represents the Windows message EM_POSFROMCHAR.

Pascal

```
EM_POSFROMCHAR = 214;
```

C++

```
EM_POSFROMCHAR = 214;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_POSFROMCHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.92 Messages.EM_REPLACESEL Constant

Represents the Windows message EM_REPLACESEL.

Pascal

```
EM_REPLACESEL = $00C2;
```

C++

```
EM_REPLACESEL = 0x00C2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_REPLACESEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.93 Messages.EM_SCROLL Constant

Represents the Windows message EM_SCROLL.

Pascal

```
EM_SCROLL = $00B5;
```

C++

```
EM_SCROLL = 0x00B5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SCROLL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.94 Messages.EM_SCROLLCARET Constant

Represents the Windows message EM_SCROLLCARET.

Pascal

```
EM_SCROLLCARET = $00B7;
```

C++

```
EM_SCROLLCARET = 0x00B7;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SCROLLCARET notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.95 Messages.EM_SETHANDLE Constant

Represents the Windows message EM_SETHANDLE.

Pascal

```
EM_SETHANDLE = $00BC;
```

C++

```
EM_SETHANDLE = 0x00BC;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SETHANDLE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.96 Messages.EM_SETIMESTATUS Constant

Represents the Windows message EM_SETIMESTATUS.

Pascal

```
EM_SETIMESTATUS = 216;
```

C++

```
EM_SETIMESTATUS = 216;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SETIMESTATUS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.97 Messages.EM_SETLIMITTEXT Constant

Represents the Windows message EM_SETLIMITTEXT.

Pascal

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

C++

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SETLIMITTEXT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.98 Messages.EM_SETMARGINS Constant

Represents the Windows message EM_SETMARGINS.

Pascal

```
EM_SETMARGINS = 211;
```

C++

```
EM_SETMARGINS = 211;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SETMARGINS notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.99 Messages.EM_SETMODIFY Constant

Represents the Windows message EM_SETMODIFY.

Pascal

```
EM_SETMODIFY = $00B9;
```

C++

```
EM_SETMODIFY = 0x00B9;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for EM_SETMODIFY notification.

See Also

SendMessage (MSDN)

35.4.139 Messages.LB_ITEMFROMPOINT Constant

Represents the Windows message LB_ITEMFROMPOINT.

Pascal

```
LB_ITEMFROMPOINT = $01A9;
```

C++

```
LB_ITEMFROMPOINT = 0x01A9;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for LB_ITEMFROMPOINT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.140 Messages.LB_MSGMAX Constant

Represents the Windows message LB_MSGMAX.

Pascal

```
LB_MSGMAX = 432;
```

C++

```
LB_MSGMAX = 432;
```

File

Messages

Description

This constant is used by Windows messaging. LB_MSGMAX is obsolete for Win32-Based Applications.

35.4.143 Messages.LB_SELITEMRANGE Constant

Represents the Windows message LB_SELITEMRANGE.

Pascal

```
LB_SELITEMRANGE = $019B;
```

C++

```
LB_SELITEMRANGE = 0x019B;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for LB_SELITEMRANGE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.144 Messages.LB_SELITEMRANGEEX Constant

Represents the Windows message LB_SELITEMRANGEEX.

Pascal

```
LB_SELITEMRANGEEX = $0183;
```

C++

```
LB_SELITEMRANGEEX = 0x0183;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for LB_SELITEMRANGEEX notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.145 Messages.LB_SETANCHORINDEX Constant

Represents the Windows message LB_SETANCHORINDEX.

Pascal

```
LB_SETANCHORINDEX = $019C;
```

C++

```
LB_SETANCHORINDEX = 0x019C;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for LB_SETANCHORINDEX notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.178 Messages.WM_ASKCBFORMATNAME Constant

Represents the Windows message WM_ASKCBFORMATNAME.

Pascal

```
WM_ASKCBFORMATNAME = $030C;
```

C++

```
WM_ASKCBFORMATNAME = 0x030C;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_ASKCBFORMATNAME notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.179 Messages.WM_CANCELJOURNAL Constant

Represents the Windows message WM_CANCELJOURNAL.

Pascal

```
WM_CANCELJOURNAL = $004B;
```

C++

```
WM_CANCELJOURNAL = 0x004B;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CANCELJOURNAL notification.

35.4.180 Messages.WM_CANCELMODE Constant

Represents the Windows message WM_CANCELMODE.

Pascal

```
WM_CANCELMODE = $001F;
```

C++

```
WM_CANCELMODE = 0x001F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CANCELMODE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.181 Messages.WM_CAPTURECHANGED Constant

Represents the Windows message WM_CAPTURECHANGED.

Pascal

```
WM_CAPTURECHANGED = 533;
```

C++

```
WM_CAPTURECHANGED = 533;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CAPTURECHANGED notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.182 Messages.WM_CHANGECBCHAIN Constant

Represents the Windows message WM_CHANGECBCHAIN.

Pascal

```
WM_CHANGECBCHAIN = $030D;
```

C++

```
WM_CHANGECBCHAIN = 0x030D;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CHANGECBCHAIN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.183 Messages.WM_CHANGEUISTATE Constant

Represents the Windows message WM_CHANGEUISTATE.

Pascal

```
WM_CHANGEUISTATE = $0127;
```

C++

```
WM_CHANGEUISTATE = 0x0127;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CHANGEUISTATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.184 Messages.WM_CHAR Constant

Represents the Windows message WM_CHAR.

Pascal

```
WM_CHAR = $0102;
```

C++

```
WM_CHAR = 0x0102;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.185 Messages.WM_CHARTOITEM Constant

Represents the Windows message WM_CHARTOITEM.

Pascal

```
WM_CHARTOITEM = $002F;
```

C++

```
WM_CHARTOITEM = 0x002F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CHARTOITEM notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.186 Messages.WM_CHILDACTIVATE Constant

Represents the Windows message WM_CHILDACTIVATE.

Pascal

```
WM_CHILDACTIVATE = $0022;
```

C++

```
WM_CHILDACTIVATE = 0x0022;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CHILDACTIVATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.187 Messages.WM_CLEAR Constant

Represents the Windows message WM_CLEAR.

Pascal

```
WM_CLEAR = $0303;
```

C++

```
WM_CLEAR = 0x0303;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CLEAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.188 Messages.WM_CLOSE Constant

Represents the Windows message WM_CLOSE.

Pascal

```
WM_CLOSE = $0010;
```

C++

```
WM_CLOSE = 0x0010;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CLOSE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.189 Messages.WM_COALESCE_FIRST Constant

Represents the Windows message WM_COALESCE_FIRST.

Pascal

```
WM_COALESCE_FIRST = $0390;
```

C++

```
WM_COALESCE_FIRST = 0x0390;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

GetMessage (MSDN)

PeekMessage (MSDN)

Handling messages

35.4.190 Messages.WM_COALESCE_LAST Constant

Represents the Windows message WM_COALESCE_LAST.

Pascal

```
WM_COALESCE_LAST = $039F;
```

C++

```
WM_COALESCE_LAST = 0x039F;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

PeekMessage (MSDN)

Handling messages

35.4.191 Messages.WM_COMMAND Constant

Represents the Windows message WM_COMMAND.

Pascal

```
WM_COMMAND = $0111;
```

C++

```
WM_COMMAND = 0x0111;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_COMMAND notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.192 Messages.WM_COMMNOTIFY Constant

Represents the Windows message WM_COMMNOTIFY.

Pascal

```
WM_COMMNOTIFY = $0044;
```

C++

```
WM_COMMNOTIFY = 0x0044;
```

File

Messages

Description

This constant is used by Windows messaging. WM_COMMNOTIFY is obsolete for Win32-Based Applications.

See Also

SendMessage (MSDN)

Handling messages

35.4.193 Messages.WM_COMPACTING Constant

Represents the Windows message WM_COMPACTING.

Pascal

```
WM_COMPACTING = $0041;
```

C++

```
WM_COMPACTING = 0x0041;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_COMPACTING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.194 Messages.WM_COMPAREITEM Constant

Represents the Windows message WM_COMPAREITEM.

Pascal

```
WM_COMPAREITEM = $0039;
```

C++

```
WM_COMPAREITEM = 0x0039;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_COMPAREITEM notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.195 Messages.WM_CONTEXTMENU Constant

Represents the Windows message WM_CONTEXTMENU.

Pascal

```
WM_CONTEXTMENU = $007B;
```

C++

```
WM_CONTEXTMENU = 0x007B;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CONTEXTMENU notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.196 Messages.WM_COPY Constant

Represents the Windows message WM_COPY.

Pascal

```
WM_COPY = $0301;
```

C++

```
WM_COPY = 0x0301;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_COPY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.197 Messages.WM_COPYDATA Constant

Represents the Windows message WM_COPYDATA.

Pascal

```
WM_COPYDATA = $004A;
```

C++

```
WM_COPYDATA = 0x004A;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_COPYDATA notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.198 Messages.WM_CREATE Constant

Represents the Windows message WM_CREATE.

Pascal

```
WM_CREATE = $0001;
```

C++

```
WM_CREATE = 0x0001;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CREATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.199 Messages.WM_CTLCOLOR Constant

Represents the Windows message WM_CTLCOLOR.

Pascal

```
WM_CTLCOLOR = $0019;
```

C++

```
WM_CTLCOLOR = 0x0019;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLOR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.200 Messages.WM_CTLCOLORBTN Constant

Represents the Windows message WM_CTLCOLORBTN.

Pascal

```
WM_CTLCOLORBTN = $0135;
```

C++

```
WM_CTLCOLORBTN = 0x0135;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLORBTN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.201 Messages.WM_CTLCOLORDLG Constant

Represents the Windows message WM_CTLCOLORDLG.

Pascal

```
WM_CTLCOLORDLG = $0136;
```

C++

```
WM_CTLCOLORDLG = 0x0136;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLORDLG notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.202 Messages.WM_CTLCOLOREDIT Constant

Represents the Windows message WM_CTLCOLOREDIT.

Pascal

```
WM_CTLCOLOREDIT = $0133;
```

C++

```
WM_CTLCOLOREDIT = 0x0133;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLOREDIT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.203 Messages.WM_CTLCOLORLISTBOX Constant

Represents the Windows message WM_CTLCOLORLISTBOX.

Pascal

```
WM_CTLCOLORLISTBOX = $0134;
```

C++

```
WM_CTLCOLORLISTBOX = 0x0134;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLORLISTBOX

notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.204 Messages.WM_CTLCOLORMSGBOX Constant

Represents the Windows message WM_CTLCOLORMSGBOX.

Pascal

```
WM_CTLCOLORMSGBOX = $0132;
```

C++

```
WM_CTLCOLORMSGBOX = 0x0132;
```

File

Messages

Description

This constant is used by Windows messaging. WM_CTLCOLORMSGBOX is obsolete for Win32-Based Applications.

See Also

SendMessage (MSDN)

Handling messages

35.4.205 Messages.WM_CTLCOLORSCROLLBAR Constant

Represents the Windows message WM_CTLCOLORSCROLLBAR.

Pascal

```
WM_CTLCOLORSCROLLBAR = $0137;
```

C++

```
WM_CTLCOLORSCROLLBAR = 0x0137;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLORSCROLLBAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.206 Messages.WM_CTLCOLORSTATIC Constant

Represents the Windows message WM_CTLCOLORSTATIC.

Pascal

```
WM_CTLCOLORSTATIC = $0138;
```

C++

```
WM_CTLCOLORSTATIC = 0x0138;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CTLCOLORSTATIC notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.207 Messages.WM_CUT Constant

Represents the Windows message WM_CUT.

Pascal

```
WM_CUT = $0300;
```

C++

```
WM_CUT = 0x0300;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_CUT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.208 Messages.WM_DDE_ACK Constant

Represents the Windows message WM_DDE_ACK.

Pascal

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

C++

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_ACK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.209 Messages.WM_DDE_ADVISE Constant

Represents the Windows message WM_DDE_ADVISE.

Pascal

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

C++

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_ADVISE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.210 Messages.WM_DDE_DATA Constant

Represents the Windows message WM_DDE_DATA.

Pascal

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

C++

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_DATA notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.211 Messages.WM_DDE_EXECUTE Constant

Represents the Windows message WM_DDE_EXECUTE.

Pascal

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_EXECUTE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.212 Messages.WM_DDE_FIRST Constant

Represents the Windows message WM_DDE_FIRST.

Pascal

```
WM_DDE_FIRST = $03E0;
```

C++

```
WM_DDE_FIRST = 0x03E0;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

GetMessage (MSDN)

PeekMessage (MSDN)

35.4.213 Messages.WM_DDE_INITIATE Constant

Represents the Windows message WM_DDE_INITIATE.

Pascal

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

C++

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_INITIATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.214 Messages.WM_DDE_LAST Constant

Represents the Windows message WM_DDE_LAST.

Pascal

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

GetMessage (MSDN)

PeekMessage (MSDN)

35.4.215 Messages.WM_DDE_POKE Constant

Represents the Windows message WM_DDE_POKE.

Pascal

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

C++

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_POKE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.216 Messages.WM_DDE_REQUEST Constant

Represents the Windows message WM_DDE_REQUEST.

Pascal

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

C++

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_REQUEST notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.217 Messages.WM_DDE_TERMINATE Constant

Represents the Windows message WM_DDE_TERMINATE.

Pascal

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

C++

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_TERMINATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.218 Messages.WM_DDE_UNADVISE Constant

Represents the Windows message WM_DDE_UNADVISE.

Pascal

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

C++

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DDE_UNADVISE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.219 Messages.WM_DEADCHAR Constant

Represents the Windows message WM_DEADCHAR.

Pascal

```
WM_DEADCHAR = $0103;
```

C++

```
WM_DEADCHAR = 0x0103;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DEADCHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.220 Messages.WM_DELETEITEM Constant

Represents the Windows message WM_DELETEITEM.

Pascal

```
WM_DELETEITEM = $002D;
```

C++

```
WM_DELETEITEM = 0x002D;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DELETEITEM notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.221 Messages.WM_DESTROY Constant

Represents the Windows message WM_DESTROY.

Pascal

```
WM_DESTROY = $0002;
```

C++

```
WM_DESTROY = 0x0002;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DESTROY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.222 Messages.WM_DESTROYCLIPBOARD Constant

Represents the Windows message WM_DESTROYCLIPBOARD.

Pascal

```
WM_DESTROYCLIPBOARD = $0307;
```

C++

```
WM_DESTROYCLIPBOARD = 0x0307;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_DESTROYCLIPBOARD notification.

35.4.257 Messages.WM_IME_CHAR Constant

Represents the Windows message WM_IME_CHAR.

Pascal

```
WM_IME_CHAR = $0286;
```

C++

```
WM_IME_CHAR = 0x0286;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_CHAR notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.258 Messages.WM_IME_COMPOSITION Constant

Represents the Windows message WM_IME_COMPOSITION.

Pascal

```
WM_IME_COMPOSITION = $010F;
```

C++

```
WM_IME_COMPOSITION = 0x010F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_COMPOSITION notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.259 Messages.WM_IME_COMPOSITIONFULL Constant

Represents the Windows message WM_IME_COMPOSITIONFULL.

Pascal

```
WM_IME_COMPOSITIONFULL = $0284;
```

C++

```
WM_IME_COMPOSITIONFULL = 0x0284;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_COMPOSITIONFULL notification.

See Also

Handling messages

35.4.260 Messages.WM_IME_CONTROL Constant

Represents the Windows message WM_IME_CONTROL.

Pascal

```
WM_IME_CONTROL = $0283;
```

C++

```
WM_IME_CONTROL = 0x0283;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_CONTROL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.261 Messages.WM_IME_ENDCOMPOSITION Constant

Represents the Windows message WM_IME_ENDCOMPOSITION.

Pascal

```
WM_IME_ENDCOMPOSITION = $010E;
```

C++

```
WM_IME_ENDCOMPOSITION = 0x010E;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_ENDCOMPOSITION notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.262 Messages.WM_IME_KEYDOWN Constant

Represents the Windows message WM_IME_KEYDOWN.

Pascal

```
WM_IME_KEYDOWN = $0290;
```

C++

```
WM_IME_KEYDOWN = 0x0290;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_KEYDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.263 Messages.WM_IME_KEYLAST Constant

Represents the Windows message WM_IME_KEYLAST.

Pascal

```
WM_IME_KEYLAST = $010F;
```

C++

```
WM_IME_KEYLAST = 0x010F;
```

File

Messages

Description

This constant is used by Windows messaging. WM_IME_KEYLAST is obsolete for Win32-Based Applications.

See Also

SendMessage (MSDN)

35.4.264 Messages.WM_IME_KEYUP Constant

Represents the Windows message WM_IME_KEYUP.

Pascal

```
WM_IME_KEYUP = $0291;
```

C++

```
WM_IME_KEYUP = 0x0291;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_KEYUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.265 Messages.WM_IME_NOTIFY Constant

Represents the Windows message WM_IME_NOTIFY.

Pascal

```
WM_IME_NOTIFY = $0282;
```

C++

```
WM_IME_NOTIFY = 0x0282;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_NOTIFY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.266 Messages.WM_IME_REQUEST Constant

Represents the Windows message WM_IME_REQUEST.

Pascal

```
WM_IME_REQUEST = $0288;
```

C++

```
WM_IME_REQUEST = 0x0288;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_REQUEST notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.267 Messages.WM_IME_SELECT Constant

Represents the Windows message WM_IME_SELECT.

Pascal

```
WM_IME_SELECT = $0285;
```

C++

```
WM_IME_SELECT = 0x0285;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_SELECT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.268 Messages.WM_IME_SETCONTEXT Constant

Represents the Windows message WM_IME_SETCONTEXT.

Pascal

```
WM_IME_SETCONTEXT = $0281;
```

C++

```
WM_IME_SETCONTEXT = 0x0281;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_SETCONTEXT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.269 Messages.WM_IME_STARTCOMPOSITION Constant

Represents the Windows message WM_IME_STARTCOMPOSITION.

Pascal

```
WM_IME_STARTCOMPOSITION = $010D;
```

C++

```
WM_IME_STARTCOMPOSITION = 0x010D;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_IME_STARTCOMPOSITION notification.

See Also

SendMessage (MSDN)

SendMessage (MSDN)

Handling messages

35.4.301 Messages.WM_MENUCOMMAND Constant

Represents the Windows message WM_MENUCOMMAND.

Pascal

```
WM_MENUCOMMAND = $0126;
```

C++

```
WM_MENUCOMMAND = 0x0126;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MENUCOMMAND notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.302 Messages.WM_MENUDRAG Constant

Represents the Windows message WM_MENUDRAG.

Pascal

```
WM_MENUDRAG = $0123;
```

C++

```
WM_MENUDRAG = 0x0123;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MENUDRAG notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.303 Messages.WM_MENUGETOBJECT Constant

Represents the Windows message WM_MENUGETOBJECT.

Pascal

```
WM_MENUGETOBJECT = $0124;
```

C++

```
WM_MENUGETOBJECT = 0x0124;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MENUGETOBJECT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.304 Messages.WM_MENURBUTTONUP Constant

Represents the Windows message WM_MENURBUTTONUP.

Pascal

```
WM_MENURBUTTONUP = $0122;
```

C++

```
WM_MENURBUTTONUP = 0x0122;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MENURBUTTONUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.305 Messages.WM_MENUSELECT Constant

Represents the Windows message WM_MENUSELECT.

Pascal

```
WM_MENUSELECT = $011F;
```

C++

```
WM_MENUSELECT = 0x011F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MENUSELECT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.306 Messages.WM_MOUSEACTIVATE Constant

Represents the Windows message WM_MOUSEACTIVATE.

Pascal

```
WM_MOUSEACTIVATE = $0021;
```

C++

```
WM_MOUSEACTIVATE = 0x0021;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOUSEACTIVATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.307 Messages.WM_MOUSEFIRST Constant

Represents the Windows message WM_MOUSEFIRST.

Pascal

```
WM_MOUSEFIRST = $0200;
```

C++

```
WM_MOUSEFIRST = 0x0200;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

GetMessage (MSDN)

PeekMessage (MSDN)

Handling messages

35.4.308 Messages.WM_MOUSEHOVER Constant

Represents the Windows message WM_MOUSEHOVER.

Pascal

```
WM_MOUSEHOVER = $02A1;
```

C++

```
WM_MOUSEHOVER = 0x02A1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOUSEHOVER notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.309 Messages.WM_MOUSELAST Constant

Represents the Windows message WM_MOUSELAST.

Pascal

```
WM_MOUSELAST = $020A;
```

C++

```
WM_MOUSELAST = 0x020A;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

GetMessage (MSDN)

PeekMessage (MSDN)

Handling messages

35.4.310 Messages.WM_MOUSELEAVE Constant

Represents the Windows message WM_MOUSELEAVE.

Pascal

```
WM_MOUSELEAVE = $02A3;
```

C++

```
WM_MOUSELEAVE = 0x02A3;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOUSELEAVE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.311 Messages.WM_MOUSEMOVE Constant

Represents the Windows message WM_MOUSEMOVE.

Pascal

```
WM_MOUSEMOVE = $0200;
```

C++

```
WM_MOUSEMOVE = 0x0200;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOUSEMOVE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.312 Messages.WM_MOUSEWHEEL Constant

Represents the Windows message WM_MOUSEWHEEL.

Pascal

```
WM_MOUSEWHEEL = $020A;
```

C++

```
WM_MOUSEWHEEL = 0x020A;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOUSEWHEEL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.313 Messages.WM_MOVE Constant

Represents the Windows message WM_MOVE.

Pascal

```
WM_MOVE = $0003;
```

C++

```
WM_MOVE = 0x0003;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOVE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.314 Messages.WM_MOVING Constant

Represents the Windows message WM_MOVING.

Pascal

```
WM_MOVING = 534;
```

C++

```
WM_MOVING = 534;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_MOVING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.315 Messages.WM_NCACTIVATE Constant

Represents the Windows message WM_NCACTIVATE.

Pascal

```
WM_NCACTIVATE = $0086;
```

C++

```
WM_NCACTIVATE = 0x0086;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCACTIVATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.316 Messages.WM_NCCALCSIZE Constant

Represents the Windows message WM_NCCALCSIZE.

Pascal

```
WM_NCCALCSIZE = $0083;
```

C++

```
WM_NCCALCSIZE = 0x0083;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCCALCSIZE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.317 Messages.WM_NCCREATE Constant

Represents the Windows message WM_NCCREATE.

Pascal

```
WM_NCCREATE = $0081;
```

C++

```
WM_NCCREATE = 0x0081;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCCREATE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.318 Messages.WM_NCDESTROY Constant

Represents the Windows message WM_NCDESTROY.

Pascal

```
WM_NCDESTROY = $0082;
```

C++

```
WM_NCDESTROY = 0x0082;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCDESTROY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.319 Messages.WM_NCHITTEST Constant

Represents the Windows message WM_NCHITTEST.

Pascal

```
WM_NCHITTEST = $0084;
```

C++

```
WM_NCHITTEST = 0x0084;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCHITTEST notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.320 Messages.WM_NCLBUTTONDBLCLK Constant

Represents the Windows message WM_NCLBUTTONDBLCLK.

Pascal

```
WM_NCLBUTTONDBLCLK = $00A3;
```

C++

```
WM_NCLBUTTONDBLCLK = 0x00A3;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCLBUTTONDBLCLK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.321 Messages.WM_NCLBUTTONDOWN Constant

Represents the Windows message WM_NCLBUTTONDOWN.

Pascal

```
WM_NCLBUTTONDOWN = $00A1;
```

C++

```
WM_NCLBUTTONDOWN = 0x00A1;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCLBUTTONDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.322 Messages.WM_NCLBUTTONUP Constant

Represents the Windows message WM_NCLBUTTONUP.

Pascal

```
WM_NCLBUTTONUP = $00A2;
```

C++

```
WM_NCLBUTTONUP = 0x00A2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCLBUTTONUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.323 Messages.WM_NCMBUTTONDBLCLK Constant

Represents the Windows message WM_NCMBUTTONDBLCLK.

Pascal

```
WM_NCMBUTTONDBLCLK = $00A9;
```

C++

```
WM_NCMBUTTONDBLCLK = 0x00A9;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMBUTTONDBLCLK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.324 Messages.WM_NCMBUTTONDOWN Constant

Represents the Windows message WM_NCMBUTTONDOWN.

Pascal

```
WM_NCMBUTTONDOWN = $00A7;
```

C++

```
WM_NCMBUTTONDOWN = 0x00A7;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMBUTTONDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.325 Messages.WM_NCMBUTTONUP Constant

Represents the Windows message WM_NCMBUTTONUP.

Pascal

```
WM_NCMBUTTONUP = $00A8;
```

C++

```
WM_NCMBUTTONUP = 0x00A8;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMBUTTONUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.326 Messages.WM_NCMOUSEHOVER Constant

Represents the Windows message WM_NCMOUSEHOVER.

Pascal

```
WM_NCMOUSEHOVER = $02A0;
```

C++

```
WM_NCMOUSEHOVER = 0x02A0;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMOUSEHOVER notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.327 Messages.WM_NCMOUSELEAVE Constant

Represents the Windows message WM_NCMOUSELEAVE.

Pascal

```
WM_NCMOUSELEAVE = $02A2;
```

C++

```
WM_NCMOUSELEAVE = 0x02A2;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMOUSELEAVE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.328 Messages.WM_NCMOUSEMOVE Constant

Represents the Windows message WM_NCMOUSEMOVE.

Pascal

```
WM_NCMOUSEMOVE = $00A0;
```

C++

```
WM_NCMOUSEMOVE = 0x00A0;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCMOUSEMOVE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.329 Messages.WM_NCPAINT Constant

Represents the Windows message WM_NCPAINT.

Pascal

```
WM_NCPAINT = $0085;
```

C++

```
WM_NCPAINT = 0x0085;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCPAINT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.330 Messages.WM_NCRBUTTONDBLCLK Constant

Represents the Windows message WM_NCRBUTTONDBLCLK.

Pascal

```
WM_NCRBUTTONDBLCLK = $00A6;
```

C++

```
WM_NCRBUTTONDBLCLK = 0x00A6;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCRBUTTONDBLCLK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.331 Messages.WM_NCRBUTTONDOWN Constant

Represents the Windows message WM_NCRBUTTONDOWN.

Pascal

```
WM_NCRBUTTONDOWN = $00A4;
```

C++

```
WM_NCRBUTTONDOWN = 0x00A4;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCRBUTTONDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.332 Messages.WM_NCRBUTTONUP Constant

Represents the Windows message WM_NCRBUTTONUP.

Pascal

```
WM_NCRBUTTONUP = $00A5;
```

C++

```
WM_NCRBUTTONUP = 0x00A5;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCRBUTTONUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.333 Messages.WM_NCXBUTTONDBLCLK Constant

Represents the Windows message WM_NCXBUTTONDBLCLK.

Pascal

```
WM_NCXBUTTONDBLCLK = $00AD;
```

C++

```
WM_NCXBUTTONDBLCLK = 0x00AD;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCXBUTTONDBLCLK notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.334 Messages.WM_NCXBUTTONDOWN Constant

Represents the Windows message WM_NCXBUTTONDOWN.

Pascal

```
WM_NCXBUTTONDOWN = $00AB;
```

C++

```
WM_NCXBUTTONDOWN = 0x00AB;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCXBUTTONDOWN notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.335 Messages.WM_NCXBUTTONUP Constant

Represents the Windows message WM_NCXBUTTONUP.

Pascal

```
WM_NCXBUTTONUP = $00AC;
```

C++

```
WM_NCXBUTTONUP = 0x00AC;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NCXBUTTONUP notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.336 Messages.WM_NEXTDLGCTL Constant

Represents the Windows message WM_NEXTDLGCTL.

Pascal

```
WM_NEXTDLGCTL = $0028;
```

C++

```
WM_NEXTDLGCTL = 0x0028;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NEXTDLGCTL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.337 Messages.WM_NEXTMENU Constant

Represents the Windows message WM_NEXTMENU.

Pascal

```
WM_NEXTMENU = $0213;
```

C++

```
WM_NEXTMENU = 0x0213;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NEXTMENU notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.338 Messages.WM_NOTIFY Constant

Represents the Windows message WM_NOTIFY.

Pascal

```
WM_NOTIFY = $004E;
```

C++

```
WM_NOTIFY = 0x004E;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NOTIFY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.339 Messages.WM_NOTIFYFORMAT Constant

Represents the Windows message WM_NOTIFYFORMAT.

Pascal

```
WM_NOTIFYFORMAT = $0055;
```

C++

```
WM_NOTIFYFORMAT = 0x0055;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NOTIFYFORMAT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.340 Messages.WM_NULL Constant

Represents the Windows message WM_NULL.

Pascal

```
WM_NULL = $0000;
```

C++

```
WM_NULL = 0x0000;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_NULL notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.341 Messages.WM_PAINT Constant

Represents the Windows message WM_PAINT.

Pascal

```
WM_PAINT = $000F;
```

C++

```
WM_PAINT = 0x000F;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PAINT notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.342 Messages.WM_PAINTCLIPBOARD Constant

Represents the Windows message WM_PAINTCLIPBOARD.

Pascal

```
WM_PAINTCLIPBOARD = $0309;
```

C++

```
WM_PAINTCLIPBOARD = 0x0309;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PAINTCLIPBOARD notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.343 Messages.WM_PAINTICON Constant

Represents the Windows message WM_PAINTICON.

Pascal

```
WM_PAINTICON = $0026;
```

C++

```
WM_PAINTICON = 0x0026;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PAINTICON notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.344 Messages.WM_PALETTECHANGED Constant

Represents the Windows message WM_PALETTECHANGED.

Pascal

```
WM_PALETTECHANGED = $0311;
```

C++

```
WM_PALETTECHANGED = 0x0311;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PALETTECHANGED notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.345 Messages.WM_PALETTEISCHANGING Constant

Represents the Windows message WM_PALETTEISCHANGING.

Pascal

```
WM_PALETTEISCHANGING = $0310;
```

C++

```
WM_PALETTEISCHANGING = 0x0310;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PALETTEISCHANGING notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.346 Messages.WM_PARENTNOTIFY Constant

Represents the Windows message WM_PARENTNOTIFY.

Pascal

```
WM_PARENTNOTIFY = $0210;
```

C++

```
WM_PARENTNOTIFY = 0x0210;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PARENTNOTIFY notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.347 Messages.WM_PASTE Constant

Represents the Windows message WM_PASTE.

Pascal

```
WM_PASTE = $0302;
```

C++

```
WM_PASTE = 0x0302;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_PASTE notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.348 Messages.WM_PENWINFIRST Constant

Represents the Windows message WM_PENWINFIRST.

Pascal

```
WM_PENWINFIRST = $0380;
```

C++

```
WM_PENWINFIRST = 0x0380;
```

File

Messages

Description

This constant is used by Windows messaging. Functions like GetMessage or PeekMessage use this constant for filtering purposes.

See Also

35.4.350 Messages.WM_POWER Constant

Represents the Windows message WM_POWER.

Pascal

```
WM_POWER = $0048;
```

C++

```
WM_POWER = 0x0048;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_POWER notification.

See Also

SendMessage (MSDN)

Handling messages

35.4.351 Messages.WM_POWERBROADCAST Constant

Represents the Windows message WM_POWERBROADCAST.

Pascal

```
WM_POWERBROADCAST = 536;
```

C++

```
WM_POWERBROADCAST = 536;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_POWERBROADCAST

notification.

See Also

SendMessage (MSDN)

35.4.363 Messages.WM_RBUTTONUP Constant

Represents the Windows message WM_RBUTTONUP.

Pascal

```
WM_RBUTTONUP = $0205;
```

C++

```
WM_RBUTTONUP = 0x0205;
```

File

Messages

Description

This constant is used by Windows messaging. For more information see the MSDN article for WM_RBUTTONUP notification.

36 MidasCon Namespace

This is namespace MidasCon.

Topics

Name	Description
Classes (see page 1782)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 1789)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 1782)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 1787)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Structs, Records, Enums

	Name	Description
	TConnectType (see page 1789)	This is record MidasCon.TConnectType.

36.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 1782)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 1787)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

36.1.1 TMidasConnection Class

TMidasConnection handles a server connection for the client of a multi-tiered application.

Class Hierarchy

Pascal

```
TMidasConnection = class(TDCOMConnection);
```

C++

```
class TMidasConnection : public TDCOMConnection;
```

File

MidasCon

Description

TMidasConnection is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection (see page 1284) instead. When writing client applications that connect to application servers using sockets, use TSocketConnection instead. When writing client applications that connect to application servers using HTTP, use TWebConnection instead.

See Also

TClientDataSet

TDCOMConnection (see page 1284)

TSocketConnection

TWebConnection

36.1.1.1 TMidasConnection Members

The following tables list the members exposed by TMidasConnection.

Protected Methods

	Name	Description
	DoConnect (see page 1784)	Connects to an application server.
	DoDisconnect (see page 1785)	Drops a connection to an application server.
	GetConnected (see page 1293)	Returns the value of the Connected (see page 1296) property.
	GetServerCLSID (see page 1293)	Returns the GUID for the application server.
	Notification (see page 1294)	Responds when other objects are created or destroyed.
	SetConnected (see page 1280)	Sets the Connected (see page 1296) property.
	SetConnected (see page 1295)	Sets the Connected (see page 1296) property.
	SetConnectType (see page 1785)	This is SetConnectType, a member of class TMidasConnection.
	SetUseBroker (see page 1785)	This is SetUseBroker, a member of class TMidasConnection.

Protected Properties

	Name	Description
	ObjectBroker (see page 1300)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 1783)	Creates and initializes an instance of TMidasConnection (see page 1782).
	GetServer (see page 1293)	Returns the IAppServer interface of the application server.
	GetServerList (see page 1294)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 1302)	Occurs after a connection is established.
	AfterDisconnect (see page 1302)	Occurs after the connection closes.
	BeforeConnect (see page 1303)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1303)	Occurs immediately before the connection closes.
	OnGetUsername (see page 1304)	Occurs immediately before the remote login dialog.
	OnLogin (see page 1304)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	ComputerName (see page 1287)	Specifies the name of the machine on which the application server is located.
	Connected (see page 1296)	Indicates whether the TDispatchConnection (see page 1290) object is connected to an application server.
	ConnectType (see page 1786)	Specifies the protocol to use to establish the connection to the application server.
	LoginPrompt (see page 1296)	Specifies whether a login dialog appears immediately before opening a new connection.
	ObjectBroker (see page 1288)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	ServerGUID (see page 1301)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 1301)	Specifies the name of the application server with which to connect.
	ServerPort (see page 1786)	Specifies the port used by the listening socket on the server machine.
	UseBroker (see page 1787)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

36.1.1.2 TMidasConnection.Create Constructor

Creates and initializes an instance of TMidasConnection (see page 1782).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMidasConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TMidasConnection (see page 1782) component at runtime. TMidasConnection (see page 1782) components placed in forms or data modules at design time are created automatically.

Create initializes the value of the ServerPort (see page 1786) property to 211. This is also the default port number for ScktSrvr.exe and ScktSrvc.exe.

See Also

ServerPort (see page 1786)

Create (see page 1291)

Port

36.1.1.3 TMidasConnection Methods

The methods of the TMidasConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 1784)	Connects to an application server.
	DoDisconnect (see page 1785)	Drops a connection to an application server.
	SetConnectType (see page 1785)	This is SetConnectType, a member of class TMidasConnection.
	SetUseBroker (see page 1785)	This is SetUseBroker, a member of class TMidasConnection.

36.1.1.3.1 TMidasConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName property. If the ObjectBroker property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

See Also

AfterConnect

BeforeConnect

Connected (see page 1296)

AppServer

ComputerName (see page 1287)

ObjectBroker (see page 1300)

36.1.1.3.2 TMidasConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect

BeforeDisconnect

Connected (see page 1296)

AppServer

36.1.1.3.3 TMidasConnection.SetConnectType Method

Pascal

```
procedure SetConnectType(Value: TConnectType); virtual;
```

C++

```
virtual __fastcall SetConnectType(TConnectType Value);
```

Description

This is SetConnectType, a member of class TMidasConnection.

36.1.1.3.4 TMidasConnection.SetUseBroker Method

Pascal

```
procedure SetUseBroker(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetUseBroker(Boolean Value);
```

Description

This is SetUseBroker, a member of class TMidasConnection.

36.1.1.4 TMidasConnection Properties

The properties of the TMidasConnection class are listed here.

Published Properties

	Name	Description
	ConnectType (see page 1786)	Specifies the protocol to use to establish the connection to the application server.
	ServerPort (see page 1786)	Specifies the port used by the listening socket on the server machine.
	UseBroker (see page 1787)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

36.1.1.4.1 TMidasConnection.ConnectType Property

Specifies the protocol to use to establish the connection to the application server.

Pascal

```
property ConnectType: TConnectType;
```

C++

```
__property TConnectType ConnectType;
```

Description

Use ConnectType to specify the desired protocol for connecting with the application server.

See Also

ServerPort (see page 1786)

ComputerName (see page 1287)

UseBroker (see page 1787)

ServerName (see page 1301)

36.1.1.4.2 TMidasConnection.ServerPort Property

Specifies the port used by the listening socket on the server machine.

Pascal

```
property ServerPort: Integer;
```

C++

```
__property int ServerPort;
```

Description

When establishing connections to the application server using TCP/IP sockets, the application server must have a socket dispatcher listening on a predefined port for requests from client applications. If the value of ConnectType (see page 1786) is ctSockets, set ServerPort to the port number used by Scktsrvr.exe or SckTSrvc.exe on the server system. TMidasConnection (see page 1782) attempts to connect to the application server by sending a message to the system specified by the ComputerName property at the port specified by ServerPort.

Note: ServerPort has no effect if ConnectType (see page 1786) is not ctSockets.

See Also

ConnectType (see page 1786)

ComputerName (see page 1287)

Port

36.1.1.4.3 TMidasConnection.UseBroker Property

Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

Pascal

```
property UseBroker: Boolean;
```

C++

```
__property Boolean UseBroker;
```

Description

When establishing connections to the application server using OLEnterprise, UseBroker specifies whether the connection should use the Business Object Broker. If UseBroker is true, TMidasConnection (see page 1782) uses the Business Object Broker, and the ComputerName property specifies the name of the Business Object Broker. If UseBroker is false, TMidasConnection (see page 1782) uses OLEnterprise, but does not go through the Business Object Broker. When UseBroker is false, ComputerName specifies the name of the OLEnterprise server.

For more information about using OLEnterprise, see the OLEnterprise documentation.

Note: The value of UseBroker has no effect unless ConnectType (see page 1786) is ctOLEnterprise.

See Also

ConnectType (see page 1786)

ComputerName (see page 1287)

36.1.2 TRemoteServer Class

TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Class Hierarchy

Pascal

```
TRemoteServer = class(TDCOMConnection);
```

C++

```
class TRemoteServer : public TDCOMConnection;
```

File

MidasCon

Description

TRemoteServer is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection (see page 1284) instead.

See Also

TClientDataSet

TDCOMConnection (see page 1284)

TSocketConnection

TWebConnection

TDataSetProvider (see page 3145)

36.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectType (see page 1789)	This is record MidasCon.TConnectType.

36.2.1 MidasCon.TConnectType Enumeration

Pascal

```
TConnectType = (
  ctDCOM,
  ctSockets,
  ctOLEnterprise
);
```

C++

```
enum TConnectType {
  ctDCOM,
  ctSockets,
  ctOLEnterprise
};
```

File

MidasCon

Description

This is record MidasCon.TConnectType.

37 MidItems Namespace

This is namespace MidItems.

Topics

Name	Description
Classes (see page 1796)	The following table lists classes in this documentation.
Interfaces (see page 2200)	The following table lists interfaces in this documentation.
Functions (see page 2232)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2237)	The following table lists structs, records, enums in this documentation.

Constants (see page 2242)	The following table lists constants in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 1798)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 1804)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 1808)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 1811)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 1819)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.
	TCustomFieldGroup (see page 1824)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 1830)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 1836)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.
	TCustomQueryForm (see page 1841)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 1847)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 1850)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 1855)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.
	TDataSetButton (see page 1859)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

	TDeleteButton (see page 1867)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 1869)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 1874)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 1884)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 1894)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 1899)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 1905)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 1913)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 1915)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 1923)	TGridAttributes describes the options the TDataGrid (see page 1850) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 1929)	TGridRowAttributes describes the options the TDataGrid (see page 1850) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 1935)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 1937)	TLastButton generates an HTML control that moves to the last record in an XML data packet.
	TLayoutGroup (see page 1939)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 1943)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 1945)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 1947)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 1949)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 1951)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 1953)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 1962)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.
	TQueryFieldGroup (see page 1965)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 1971)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 1976)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 1989)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 2000)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 2010)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 2022)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 2024)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 2033)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 2038)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 2041)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

	TTextColumn (see page 2049)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 2055)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 2058)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 2064)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 2073)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 2087)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 2095)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 2098)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 2102)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 2113)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 2122)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 2128)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 2133)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 2138)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.
	TWebTextInput (see page 2145)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 2151)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 2157)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 2161)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 2164)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 2172)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 2176)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 2188)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 2191)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 2197)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

Constants

Name	Description
FormMethodNames (see page 2242)	This is constant MidItems.FormMethodNames.
HTMLAlignValues (see page 2243)	This is constant MidItems.HTMLAlignValues.
HTMLVAlignValues (see page 2243)	This is constant MidItems.HTMLVAlignValues.
sActionAttr (see page 2243)	This is constant MidItems.sActionAttr.
sAlignAttr (see page 2244)	This is constant MidItems.sAlignAttr.
sBgColorAttr (see page 2244)	This is constant MidItems.sBgColorAttr.
sBorderAttr (see page 2244)	This is constant MidItems.sBorderAttr.
sCellPaddingAttr (see page 2245)	This is constant MidItems.sCellPaddingAttr.
sCellSpacingAttr (see page 2245)	This is constant MidItems.sCellSpacingAttr.
sCheckedAttr (see page 2245)	This is constant MidItems.sCheckedAttr.
sClassAttr (see page 2246)	This is constant MidItems.sClassAttr.
sColsAttr (see page 2246)	This is constant MidItems.sColsAttr.
sColSpanAttr (see page 2246)	This is constant MidItems.sColSpanAttr.
sEncTypeAttr (see page 2247)	This is constant MidItems.sEncTypeAttr.
sImageHeightAttr (see page 2247)	This is constant MidItems.sImageHeightAttr.

sImageWidthAttr (see page 2247)	This is constant MidItems.sImageWidthAttr.
sMaxLengthAttr (see page 2248)	This is constant MidItems.sMaxLengthAttr.
sMethodAttr (see page 2248)	This is constant MidItems.sMethodAttr.
sMultipleAttr (see page 2248)	This is constant MidItems.sMultipleAttr.
sNameAttr (see page 2249)	This is constant MidItems.sNameAttr.
sOnClickAttr (see page 2249)	This is constant MidItems.sOnClickAttr.
sReadOnlyAttr (see page 2249)	This is constant MidItems.sReadOnlyAttr.
sRowsAttr (see page 2250)	This is constant MidItems.sRowsAttr.
sSelectedAttr (see page 2250)	This is constant MidItems.sSelectedAttr.
sSizeAttr (see page 2250)	This is constant MidItems.sSizeAttr.
sStyleAttr (see page 2251)	This is constant MidItems.sStyleAttr.
sTabIndexAttr (see page 2251)	This is constant MidItems.sTabIndexAttr.
sTypeAttr (see page 2251)	This is constant MidItems.sTypeAttr.
sVAlignAttr (see page 2252)	This is constant MidItems.sVAlignAttr.
sValueAttr (see page 2252)	This is constant MidItems.sValueAttr.
sWidthAttr (see page 2252)	This is constant MidItems.sWidthAttr.
sWrapAttr (see page 2253)	This is constant MidItems.sWrapAttr.
TextAreaWrap (see page 2253)	This is constant MidItems.TextAreaWrap.

Functions

	Name	Description
	AddBoolAttrib (see page 2232)	This is function MidItems.AddBoolAttrib.
	AddCustomAttrib (see page 2232)	This is function MidItems.AddCustomAttrib.
	AddIntAttrib (see page 2233)	This is function MidItems.AddIntAttrib.
	AddQuotedAttrib (see page 2233)	This is function MidItems.AddQuotedAttrib.
	AddStringAttrib (see page 2233)	This is function MidItems.AddStringAttrib.
	CanAddClassHelper (see page 2234)	This is function MidItems.CanAddClassHelper.
	CreateDefaultButtonClasses (see page 2234)	This is function MidItems.CreateDefaultButtonClasses.
	DeclareSubmitForm (see page 2234)	This is function MidItems.DeclareSubmitForm.
	FindDispatcher (see page 2235)	This is function MidItems.FindDispatcher.
	FindProducer (see page 2235)	This is function MidItems.FindProducer.
	FormatColumnData (see page 2235)	This is function MidItems.FormatColumnData.
	FormatColumnHeading (see page 2236)	This is function MidItems.FormatColumnHeading.
	GetItemValuesFromDataSet (see page 2236)	This is function MidItems.GetItemValuesFromDataSet.

Interfaces

	Name	Description
	IDataSetComponent (see page 2200)	IDataSetComponent defines the methods that bind a Web item to an XML broker.
	IDataSetField (see page 2204)	This is class MidItems.IDataSetField.
	IDataSetFields (see page 2206)	This is class MidItems.IDataSetFields.
	IFormatColumn (see page 2208)	This is class MidItems.IFormatColumn.
	IHTMLField (see page 2209)	IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.
	IHTMLForm (see page 2211)	IHTMLForm is an interface that must be implemented by Web items that generate forms.
	IInetXWebDataSet (see page 2213)	IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.
	IQueryField (see page 2217)	This is class MidItems.IQueryField.
	IQueryFields (see page 2220)	This is class MidItems.IQueryFields.
	IQueryForm (see page 2221)	This is class MidItems.IQueryForm.
	IRestoreDefaults (see page 2221)	IRestoreDefaults enables the Web Page editor to restore a Web item to a default state.
	IStatusField (see page 2223)	This is class MidItems.IStatusField.
	IValidateField (see page 2223)	This is class MidItems.IValidateField.
	IValidateFields (see page 2224)	This is class MidItems.IValidateFields.
	IWebDisplay (see page 2226)	

	IWebDisplayReference (see page 2227)	
	IXMLDisplay (see page 2229)	This is class MidItems.IXMLDisplay.

Structs, Records, Enums

	Name	Description
	TCaptionPosition (see page 2237)	TCaptionPosition indicates the relative position of a label to the HTML control it labels.
	TFormMethod (see page 2238)	TFormMethod represents the method attribute on the <form> tag of an HTML form.
	TLayoutState (see page 2238)	This is record MidItems.TLayoutState.
	TTextAreaWrap (see page 2239)	TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

Types

Name	Description
IMidasWebDataSet (see page 2240)	This is type MidItems.IMidasWebDataSet.
TWebButtonClass (see page 2240)	This is type MidItems.TWebButtonClass.
TWebDataDisplayClass (see page 2241)	This is type MidItems.TWebDataDisplayClass.
TWebDataInputClass (see page 2241)	This is type MidItems.TWebDataInputClass.
TWebStatusClass (see page 2241)	This is type MidItems.TWebStatusClass.

37.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 1798)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 1804)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 1808)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 1811)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 1819)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.
	TCustomFieldGroup (see page 1824)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 1830)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 1836)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.
	TCustomQueryForm (see page 1841)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 1847)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 1850)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 1855)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.
	TDataSetButton (see page 1859)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.
	TDeleteButton (see page 1867)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 1869)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 1874)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 1884)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 1894)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 1899)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 1905)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 1913)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 1915)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 1923)	TGridAttributes describes the options the TDataGrid (see page 1850) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 1929)	TGridRowAttributes describes the options the TDataGrid (see page 1850) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 1935)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 1937)	TLastButton generates an HTML control that moves to the last record in an XML data packet.

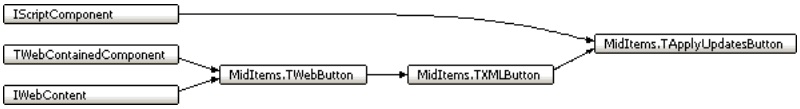
	TLayoutGroup (see page 1939)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 1943)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 1945)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 1947)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 1949)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 1951)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 1953)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 1962)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.
	TQueryFieldGroup (see page 1965)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 1971)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 1976)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 1989)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 2000)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 2010)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 2022)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 2024)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 2033)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 2038)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 2041)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.
	TTextColumn (see page 2049)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 2055)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 2058)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 2064)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 2073)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 2087)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 2095)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 2098)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 2102)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 2113)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 2122)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 2128)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 2133)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 2138)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.

	TWebTextInput (see page 2145)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 2151)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 2157)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 2161)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 2164)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 2172)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 2176)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 2188)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 2191)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 2197)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

37.1.1 TApplyUpdatesButton Class

TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.

Class Hierarchy



Pascal

```
TApplyUpdatesButton = class(TXMLButton, IScriptComponent);
```

C++

```
class TApplyUpdatesButton : public TXMLButton, public IScriptComponent;
```

File

MidItems

Description

Add TApplyUpdatesButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to submit changes made by end users. The resulting HTML button's action generates an HTTP message that forwards all changes to a specific XML data packet back to the XML broker on the InternetExpress application.

Use the properties of TApplyUpdatesButton to customize the appearance of the button and associate it with an XML broker. The associated XML broker adds the XML data packet to the HTML document and responds to update messages generated by the apply updates button on the HTML form.

TXMLBroker

TDataNavigator (see page 1855)

TLayoutGroup (see page 1939)

Using the Web Page Editor

37.1.1.1 TApplyUpdatesButton Members

The following tables list the members exposed by TApplyUpdatesButton.

Protected Methods

	Name	Description
	AddElements (see page 1800)	This is AddElements, a member of class TApplyUpdatesButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
V	GetCaption (see page 2154)	Returns the value of the Caption property.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetSubComponents (see page 1800)	This is GetSubComponents, a member of class TApplyUpdatesButton.
	GetXMLBroker (see page 2154)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 2154)	This is GetXMLUseParent, a member of class TXMLButton.
V	ImplAddElements (see page 1800)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 1800)	Provides the underlying implementation for the Content method.
V	Notification (see page 2154)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetXMLBroker (see page 2155)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 2155)	This is SetXMLUseParent, a member of class TXMLButton.

Protected Properties

	Name	Description
	DefaultCaption (see page 2156)	This is DefaultCaption, a member of class TXMLButton.
R	XMLData (see page 2156)	This is XMLData, a member of class TXMLButton.

Public Methods

	Name	Description
V	Create (see page 1799)	Creates and initializes an instance of TApplyUpdatesButton (see page 1798).
V	Destroy (see page 2153)	Frees an instance of TXMLButton (see page 2151).

Published Properties

	Name	Description
	Caption (see page 1801)	Specifies the caption that appears on the button.
	Custom (see page 1802)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1802)	Adds style attributes to the generated button control.
	StyleRule (see page 1802)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 1803)	Associates the XML button with an XML broker.
	XMLUseParent (see page 1803)	Specifies whether the XML button is associated with its parent's XML broker.

37.1.1.2 TApplyUpdatesButton.Create Constructor

Creates and initializes an instance of TApplyUpdatesButton (see page 1798).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TApplyUpdatesButton(TComponent * AOwner);
```

Description

Call Create to instantiate TApplyUpdatesButton (see page 1798) at runtime. Buttons added at design time using the Web

Page editor are instantiated automatically.

37.1.1.3 TApplyUpdatesButton Methods

The methods of the TApplyUpdatesButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 1800)	This is AddElements, a member of class TApplyUpdatesButton.
	GetSubComponents (see page 1800)	This is GetSubComponents, a member of class TApplyUpdatesButton.
V	ImplAddElements (see page 1800)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 1800)	Provides the underlying implementation for the Content method.

37.1.1.3.1 TApplyUpdatesButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TApplyUpdatesButton.

37.1.1.3.2 TApplyUpdatesButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TApplyUpdatesButton.

37.1.1.3.3 TApplyUpdatesButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TApplyUpdatesButton.

37.1.1.3.4 TApplyUpdatesButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 2060)

ILayoutWebContent

37.1.1.4 TApplyUpdatesButton Properties

The properties of the TApplyUpdatesButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 1801)	Specifies the caption that appears on the button.
	Custom (see page 1802)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1802)	Adds style attributes to the generated button control.
	StyleRule (see page 1802)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 1803)	Associates the XML button with an XML broker.
	XMLUseParent (see page 1803)	Specifies whether the XML button is associated with its parent's XML broker.

37.1.1.4.1 TApplyUpdatesButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 2062)

GetCaption (see page 2060)

SetCaption (see page 2061)

37.1.1.4.2 TApplyUpdatesButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 2062)

Style (see page 2063)

37.1.1.4.3 TApplyUpdatesButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 2062)

StyleRule (see page 2063)

37.1.1.4.4 TApplyUpdatesButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 2063)

Styles (see page 2272)

StylesFile (see page 2273)

Styles

StylesFile

37.1.1.4.5 TApplyUpdatesButton.XMLBroker Property

Associates the XML button with an XML broker.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Set XMLBroker to specify the XML broker whose data packets the XML button manipulates.

When XML buttons are used by TDataNavigator, the data navigator already establishes a connection (indirectly) to an XML broker. If the XML button uses this same XML broker, you do not need to set the XMLBroker property. Instead, setting the XMLUseParent property to true (the default) automatically associates the XML button with the same broker as the one associated with the navigator.

See Also

XMLUseParent (see page 2156)

37.1.1.4.6 TApplyUpdatesButton.XMLUseParent Property

Specifies whether the XML button is associated with its parent's XML broker.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the XML button determines the XML broker whose data packets it manipulates. When XMLUseParent is false, the XMLBroker property must be set to indicate the XML broker. When XMLUseParent is true, the XML broker associated with the XML button's parent determines the associated XML broker.

The XML button's parent is the Web item (typically TDataNavigator) that uses the XML button to assemble its own HTML content. The parent's associated broker may be defined through an indirect association. For example, the data navigator acts on another component, such as a field group, which has an associated broker.

If the parent does not have an associated XML broker, setting XMLUseParent to true sets the XMLBroker property to nil (Delphi) or NULL (C++).

See Also

XMLBroker (see page 2156)

37.1.2 TCaptionAttributes Class

TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.

Class Hierarchy

Pascal

```
TCaptionAttributes = class(TPersistent);
```

C++

```
class TCaptionAttributes : public TPersistent;
```

File

MidItems

Description

TCaptionAttributes is the type of the CaptionAttributes property of Web items that generate display controls. It defines several properties that customize the appearance of the label generated by the Web item.

See Also

CaptionAttributes

37.1.2.1 TCaptionAttributes Members

The following tables list the members exposed by TCaptionAttributes.

Public Methods

	Name	Description
	Create (see page 1805)	Creates an instance of TCaptionAttributes (see page 1804).

Public Properties

	Name	Description
R	Parent (see page 1806)	Indicates the Web item that uses TCaptionAttributes (see page 1804) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 1805)	Represents the Align option of an HTML tag.
	Custom (see page 1806)	Represents a tag option and its value.

	Style (see page 1806)	Adds style attributes to the generated caption.
	StyleRule (see page 1807)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 1807)	Represents the VAlign option of an HTML tag.

37.1.2.2 TCaptionAttributes.Create Constructor

Creates an instance of TCaptionAttributes (see page 1804).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TCaptionAttributes(TComponent * AParent);
```

Description

Do not create instances of TCaptionAttributes (see page 1804). This object is instantiated by the Web item that uses it to implement its CaptionAttributes property.

The AParent parameter specifies the Web item that creates a TCaptionAttributes (see page 1804) instance for its CaptionAttributes property. This becomes the value of the Parent (see page 1806) property.

See Also

CaptionAttributes (see page 2084)

Parent (see page 1806)

37.1.2.3 TCaptionAttributes Properties

The properties of the TCaptionAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 1806)	Indicates the Web item that uses TCaptionAttributes (see page 1804) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 1805)	Represents the Align option of an HTML tag.
	Custom (see page 1806)	Represents a tag option and its value.
	Style (see page 1806)	Adds style attributes to the generated caption.
	StyleRule (see page 1807)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 1807)	Represents the VAlign option of an HTML tag.

37.1.2.3.1 TCaptionAttributes.Align Property

Represents the Align option of an HTML tag.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Use Align to add an Align option to the tag that surrounds the caption. The Align option influences the horizontal alignment of the caption text.

The Web item that generates the caption inserts the specified Align option into the HTML tag when it generates its content.

See Also

VAlign (see page 1807)

37.1.2.3.2 TCaptionAttributes.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the caption. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces.

The Web item that generates the caption inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 1806)

StyleRule (see page 1807)

37.1.2.3.3 TCaptionAttributes.Parent Property

Indicates the Web item that uses TCaptionAttributes (see page 1804) to customize the appearance of its generated caption.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Use Parent to access the Web item that uses the TCaptionAttributes (see page 1804) object.

See Also

Create (see page 1805)

37.1.2.3.4 TCaptionAttributes.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated caption. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the caption as the value of a STYLE option.

See Also

Custom (see page 1806)

StyleRule (see page 1807)

37.1.2.3.5 TCaptionAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated caption.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated caption. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 1806) property instead.

See Also

Style (see page 1806)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

37.1.2.3.6 TCaptionAttributes.VAlign Property

Represents the VAlign option of an HTML tag.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Use VAlign to add an VAlign option to the tag that surrounds the caption. The VAlign option influences the vertical alignment of the caption text.

The Web item that generates the caption inserts the specified VAlign option into the HTML tag when it generates its content.

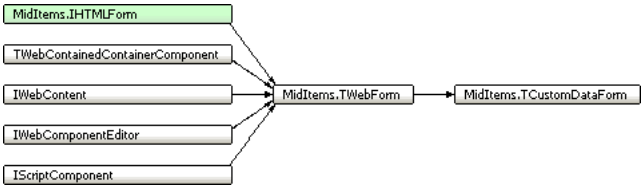
See Also

Align (see page 1805)

37.1.3 TCustomDataForm Class

TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.

Class Hierarchy



Pascal

```
TCustomDataForm = class(TWebForm);
```

C++

```
class TCustomDataForm : public TWebForm;
```

File

MidItems

Description

TCustomDataForm is the base class for components that generate HTML forms to display database information that users can view and edit. Such forms can be added to the items of an InternetExpress page producer (InetXPageProducer).

TCustomDataForm implements the ability to generate an HTML form that contains controls for displaying information from an XML data packet. Buttons on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TCustomDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that generate data displays (TDataGrid (see page 1850) or TFieldGroup (see page 1869)), components that contain buttons which operate on those displays (TDataNavigator (see page 1855)), and components that manage the layout of HTML controls (TLayoutGroup (see page 1939)). At design time, you can add these Web items to the form using the Web page editor.

See Also

IWebContent

TInetXPageProducer (see page 2285)

37.1.3.1 TCustomDataForm Members

The following tables list the members exposed by TCustomDataForm.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 1810)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
V	ImplAddElements (see page 2108)	Provides the underlying implementation for the AddElements (see page 2105) method.
V	ImplCanAddClass (see page 1810)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1810)	Provides the underlying implementation for the Content method.
V	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
V	Create (see page 2104)	Creates and initializes an instance of TWebForm (see page 2102).
V	Destroy (see page 2104)	Frees an instance of TWebForm (see page 2102).
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	Custom (see page 2110)	Represents a tag option and its value in the generated FORM tag.
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.
	Style (see page 2111)	Adds style attributes to the generated form.
	StyleRule (see page 2111)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

37.1.3.2 TCustomDataForm Methods

The methods of the TCustomDataForm class are listed here.

Protected Methods

	Name	Description
V	GetHTMLFormTag (see page 1810)	This is GetHTMLFormTag, a member of class TCustomDataForm.
V	ImplCanAddClass (see page 1810)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1810)	Provides the underlying implementation for the Content method.

37.1.3.2.1 TCustomDataForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomDataForm.

37.1.3.2.2 TCustomDataForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 2105)

WebComponents (see page 2112)

37.1.3.2.3 TCustomDataForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

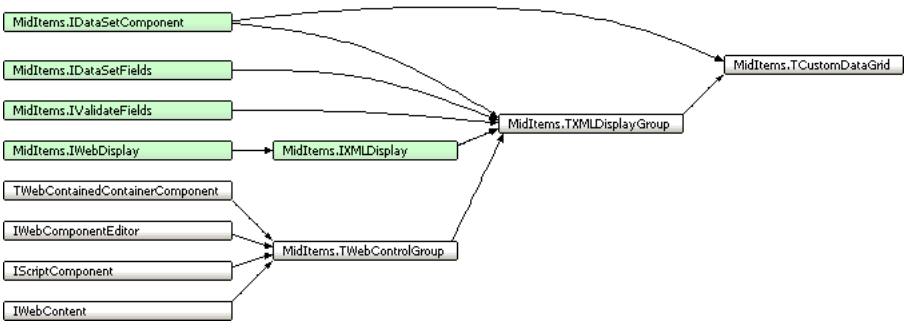
Content (see page 2106)

AddElements (see page 2105)

37.1.4 TCustomDataGrid Class

TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.

Class Hierarchy



Pascal

```
TCustomDataGrid = class(TXMLDisplayGroup, IDataSetComponent);
```

C++

```
class TCustomDataGrid : public TXMLDisplayGroup, public IDataSetComponent;
```

File

MidItems

Description

Use TCustomDataGrid as a base class for Web items that generate an HTML table to display multiple records from a dataset as a set of rows and columns. Each TCustomDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 2049), TSelectOptionColumn, TTextAreaColumn (see page 2041), and TStatusColumn (see page 2033).

You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

TCustomDataGrid introduces a number of properties that affect the appearance of the generated table.

In order to let other Web items use the HTML table that the data grid generates, TCustomDataGrid inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TCustomDataGrid. Instead, use a descendant of TCustomDataGrid such as TDataGrid (see page 1850).

See Also

TDataGrid (see page 1850)

IWebContent

TSelectOptionsColumn (see page 2024)

TStatusColumn (see page 2033)

TTextAreaColumn (see page 2041)

TTextColumn (see page 2049)

37.1.4.1 TCustomDataGrid Members

The following tables list the members exposed by TCustomDataGrid.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 1814)	This is FormatTable, a member of class TCustomDataGrid.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 1815)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1815)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1815)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 1816)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 1816)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 1816)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 1817)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 1814)	Creates and initializes an instance of TCustomDataGrid (see page 1811).
V	Destroy (see page 1814)	Frees an instance of TCustomDataGrid (see page 1811).
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
	DisplayRows (see page 1817)	Limits the number of rows in the HTML table.
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.
	HeadingAttributes (see page 1817)	Determines the display characteristics of the table's header.
R	IsMultipleRecordView (see page 2227)	
R	IsMultipleRecordView (see page 2230)	
	RowAttributes (see page 1818)	Determines the display characteristics of the table's body.
	TableAttributes (see page 1818)	Determines the basic display characteristics of the table.
R	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.4.2 TCustomDataGrid.Create Constructor

Creates and initializes an instance of TCustomDataGrid (see page 1811).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataGrid(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomDataGrid (see page 1811) at runtime. TCustomDataGrid (see page 1811) components added at design time using the Web Page editor are instantiated automatically.

37.1.4.3 TCustomDataGrid.Destroy Destructor

Frees an instance of TCustomDataGrid (see page 1811).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataGrid();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is nil before calling Destroy.

See Also

System::TObject::Free

37.1.4.4 TCustomDataGrid Methods

The methods of the TCustomDataGrid class are listed here.

Protected Methods

	Name	Description
	FormatTable (see page 1814)	This is FormatTable, a member of class TCustomDataGrid.
V	ImplAddElements (see page 1815)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1815)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1815)	Provides the underlying implementation for the Content method.
V	ImplIsMultipleRecordView (see page 1816)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	SetHeadingAttributes (see page 1816)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 1816)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 1817)	This is SetTableAttributes, a member of class TCustomDataGrid.

37.1.4.4.1 TCustomDataGrid.FormatTable Method

Pascal

```
function FormatTable(Layout: TLayoutWebContent; Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatTable(TLayoutWebContent Layout, TWebContentOptions Options);
```

Description

This is FormatTable, a member of class TCustomDataGrid.

37.1.4.4.2 TCustomDataGrid.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.4.4.3 TCustomDataGrid.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.4.4.4 TCustomDataGrid.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.4.4.5 TCustomDataGrid.ImplIsMultipleRecordView Method

Pascal

```
function ImplIsMultipleRecordView: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsMultipleRecordView();
```

Description

This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.

37.1.4.4.6 TCustomDataGrid.SetHeadingAttributes Method

Pascal

```
procedure SetHeadingAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetHeadingAttributes(const TGridRowAttributes Value);
```

Description

This is SetHeadingAttributes, a member of class TCustomDataGrid.

37.1.4.4.7 TCustomDataGrid.SetRowAttributes Method

Pascal

```
procedure SetRowAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetRowAttributes(const TGridRowAttributes Value);
```

Description

This is SetRowAttributes, a member of class TCustomDataGrid.

37.1.4.4.8 TCustomDataGrid.SetTableAttributes Method

Pascal

```
procedure SetTableAttributes(const Value: TGridAttributes);
```

C++

```
__fastcall SetTableAttributes(const TGridAttributes Value);
```

Description

This is SetTableAttributes, a member of class TCustomDataGrid.

37.1.4.5 TCustomDataGrid Properties

The properties of the TCustomDataGrid class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 1817)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 1817)	Determines the display characteristics of the table's header.
	RowAttributes (see page 1818)	Determines the display characteristics of the table's body.
	TableAttributes (see page 1818)	Determines the basic display characteristics of the table.

37.1.4.5.1 TCustomDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton (see page 1945) or TPriorPageButton (see page 1951) lets end users scroll through the records in the data packet.

See Also

MaxRecords

TNextPageButton (see page 1945)

TPriorPageButton (see page 1951)

37.1.4.5.2 TCustomDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes (see page 1818) or RowAttributes (see page 1818) property instead.

See Also

TableAttributes (see page 1818)

RowAttributes (see page 1818)

37.1.4.5.3 TCustomDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes (see page 1818) or HeadingAttributes (see page 1817) property instead.

See Also

TableAttributes (see page 1818)

HeadingAttributes (see page 1817)

37.1.4.5.4 TCustomDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any

custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes (see page 1817) property instead.

See Also

RowAttributes (see page 1818)

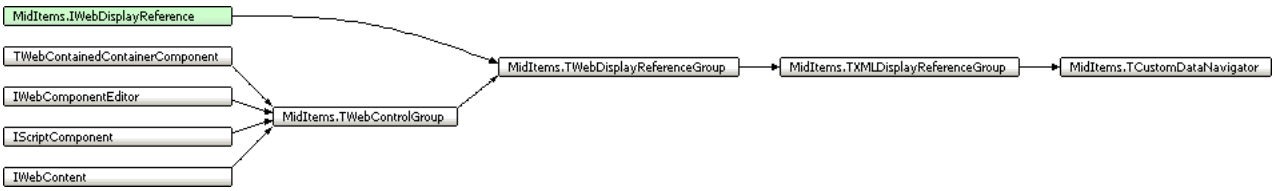
DisplayRows (see page 1817)

HeadingAttributes (see page 1817)

37.1.5 TCustomDataNavigator Class

TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.

Class Hierarchy



Pascal

```
TCustomDataNavigator = class(TXMLDisplayReferenceGroup);
```

C++

```
class TCustomDataNavigator : public TXMLDisplayReferenceGroup;
```

File

MidItems

Description

Use TCustomDataNavigator as a base class for Web items that generate the HTML to arrange a collection of button controls in a data form. Each TCustomDataNavigator object has an associated Web item that generates display controls in the form. The buttons arranged by the data navigator component manipulate the information these display controls show.

TCustomDataNavigator introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomDataNavigator. TCustomDataNavigator is intended to act as a base class. Instead, instantiate a descendant class such as TDataNavigator (see page 1855).

See Also

TDataForm (see page 1847)

TFieldGroup (see page 1869)

TDataGrid (see page 1850)

IWebContent

37.1.5.1 TCustomDataNavigator Members

The following tables list the members exposed by TCustomDataNavigator.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 1821)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetWebDisplayComponent (see page 2100)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplAddElements (see page 2198)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1821)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1821)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 1822)	Provides the underlying implementation for the GetSubComponents method.
V	Notification (see page 2101)	Forwards notification messages to all owned components.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
V	SetWebDisplayComponent (see page 2101)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	VisibleButtons (see page 1822)	This is VisibleButtons, a member of class TCustomDataNavigator.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
R	WebDisplay (see page 2102)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 2102)	

Public Methods

	Name	Description
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Create (see page 2100)	Creates an instance of TWebDisplayReferenceGroup (see page 2098).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2100)	Frees an instance of TWebDisplayReferenceGroup (see page 2098).
	GetWebDisplayComponent (see page 2228)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
	Custom (see page 1823)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1823)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1824)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebDisplayComponent (see page 2228)	
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
	XMLComponent (see page 2199)	Associates the group with a component that generates HTML display controls.

37.1.5.2 TCustomDataNavigator Methods

The methods of the TCustomDataNavigator class are listed here.

Protected Methods

	Name	Description
	GetDefaultButtons (see page 1821)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
	ImplCanAddClass (see page 1821)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 1821)	Provides the underlying implementation for the Content method.
	ImplGetSubComponents (see page 1822)	Provides the underlying implementation for the GetSubComponents method.
	VisibleButtons (see page 1822)	This is VisibleButtons, a member of class TCustomDataNavigator.

37.1.5.2.1 TCustomDataNavigator.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomDataNavigator.

37.1.5.2.2 TCustomDataNavigator.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.5.2.3 TCustomDataNavigator.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.5.2.4 TCustomDataNavigator.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents method.

Pascal

```
function ImplGetSubComponents: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents method calls ImplGetSubComponents to retrieve the value of WebFieldControls as a TObject. TWebControlGroup descendants override this method if the list is not simply the value of WebFieldControls. For example, some TWebControlGroup descendants supply a default value (DefaultWebComponents) when the WebFieldControls property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 2069)

DefaultWebComponents (see page 2072)

WebFieldControls (see page 2072)

37.1.5.2.5 TCustomDataNavigator.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomDataNavigator.

37.1.5.3 TCustomDataNavigator Properties

The properties of the TCustomDataNavigator class are listed here.

Public Properties

	Name	Description
	Custom (see page 1823)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1823)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1824)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.5.3.1 TCustomDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomDataNavigator (see page 1819) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1823)

StyleRule (see page 1824)

WebFieldControls (see page 2072)

37.1.5.3.2 TCustomDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomDataNavigator (see page 1819) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1823)

StyleRule (see page 1824)

WebFieldControls (see page 2072)

37.1.5.3.3 TCustomDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomDataNavigator (see page 1819) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 1823) property.

See Also

Style (see page 1823)

Styles (see page 2272)

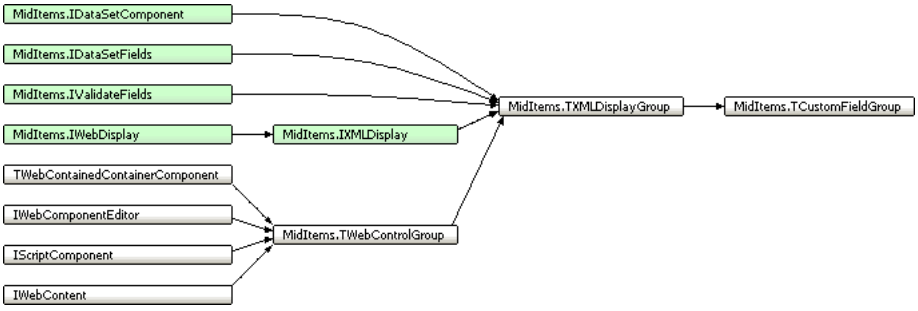
StylesFile (see page 2273)

WebFieldControls (see page 2072)

37.1.6 TCustomFieldGroup Class

TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TCustomFieldGroup = class(TXMLDisplayGroup);
```

C++

```
class TCustomFieldGroup : public TXMLDisplayGroup;
```

File

MidItems

Description

Use TCustomFieldGroup as a base class for Web items that display information in labeled fields on an HTML form. Each TCustomFieldGroup object maintains a list of Web items that generate the individual display fields. These Web items are restricted to classes that are appropriate for the specific TCustomFieldGroup descendant.

If the controls generated for TCustomFieldGroup by its Web items represent database information, you can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can use that binding to determine the source of the data they display.

TCustomFieldGroup introduces a number of properties that affect the appearance of the generated set of fields.

In order to let other Web items use the HTML that the TCustomFieldGroup object generates, TCustomFieldGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TCustomFieldGroup. Instead, use a descendant of TCustomFieldGroup such as TFieldGroup (see page 1869) or TQueryFieldGroup (see page 1965).

TQueryFieldGroup (see page 1965)

37.1.6.1 TCustomFieldGroup Members

The following tables list the members exposed by TCustomFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 1828)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.

	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplAddElements (see page 2183)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 1828)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 1827)	Creates and initializes an instance of TCustomFieldGroup (see page 1824).
V	Destroy (see page 1827)	Frees an instance of TCustomFieldGroup (see page 1824).
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	Custom (see page 1829)	Represents a tag option and its value in the generated TABLE tag.
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.

	IsMultipleRecordView (see page 2227)	
	IsMultipleRecordView (see page 2230)	
	Style (see page 1829)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1830)	Applies a style in the page producer's style sheet to the table.
	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.6.2 TCustomFieldGroup.Create Constructor

Creates and initializes an instance of TCustomFieldGroup (see page 1824).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFieldGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomFieldGroup (see page 1824) at runtime. TCustomFieldGroup (see page 1824) components added at design time using the Web Page editor are instantiated automatically.

37.1.6.3 TCustomFieldGroup.Destroy Destructor

Frees an instance of TCustomFieldGroup (see page 1824).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomFieldGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is not nil before calling Destroy.

See Also

System::TObject::Free

37.1.6.4 TCustomFieldGroup Methods

The methods of the TCustomFieldGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 1828)	Returns an object that specifies how the generated group of controls should look.
	ImplContent (see page 1828)	Provides the underlying implementation for the Content method.

37.1.6.4.1 TCustomFieldGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 2068)

37.1.6.4.2 TCustomFieldGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.6.5 TCustomFieldGroup Properties

The properties of the TCustomFieldGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 1829)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1829)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1830)	Applies a style in the page producer's style sheet to the table.

37.1.6.5.1 TCustomFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup (see page 1824) generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1829)

StyleRule (see page 1830)

37.1.6.5.2 TCustomFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup (see page 1824) generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1829)

StyleRule (see page 1830)

37.1.6.5.3 TCustomFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 1829) property.

See Also

Style (see page 1829)

Styles (see page 2272)

StylesFile (see page 2273)

37.1.7 TCustomLayoutGroup Class

TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.

Class Hierarchy

Pascal

```
TCustomLayoutGroup = class(TWebControlGroup);
```

C++

```
class TCustomLayoutGroup : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomLayoutGroup as a base class for Web items that are used purely for layout. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated

by other Web items.

TCustomLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to let the parent component use the HTML that TCustomLayoutGroup generates, TCustomLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TCustomLayoutGroup. Instead, use a descendant of TCustomLayoutGroup such as TLayoutGroup (see page 1939).

See Also

TLayoutGroup (see page 1939)

IWebContent

37.1.7.1 TCustomLayoutGroup Members

The following tables list the members exposed by TCustomLayoutGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 1832)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 1833)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1833)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 1832)	Creates and initializes an instance of TCustomLayoutGroup (see page 1830).
V	Destroy (see page 1832)	Frees an instance of TCustomLayoutGroup (see page 1830).

Public Properties

	Name	Description
	Custom (see page 1834)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 1834)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 1835)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1835)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

37.1.7.2 TCustomLayoutGroup.Create Constructor

Creates and initializes an instance of TCustomLayoutGroup (see page 1830).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TCustomLayoutGroup(TComponent * AComponent);
```

Description

Call Create to instantiate TCustomLayoutGroup (see page 1830) at runtime. TCustomLayoutGroup (see page 1830) components added at design time using the Web Page editor are instantiated automatically.

37.1.7.3 TCustomLayoutGroup.Destroy Destructor

Frees an instance of TCustomLayoutGroup (see page 1830).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomLayoutGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the layout group is nil before calling Destroy.

See Also

System::TObject::Free

37.1.7.4 TCustomLayoutGroup Methods

The methods of the TCustomLayoutGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 1832)	Returns an object that specifies how the generated group of controls should look.
	ImplCanAddClass (see page 1833)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 1833)	Provides the underlying implementation for the Content method.

37.1.7.4.1 TCustomLayoutGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 2068)

37.1.7.4.2 TCustomLayoutGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.7.4.3 TCustomLayoutGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.7.5 TCustomLayoutGroup Properties

The properties of the TCustomLayoutGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 1834)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 1834)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 1835)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1835)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.7.5.1 TCustomLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomLayoutGroup (see page 1830) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 2072) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1835)

StyleRule (see page 1835)

WebFieldControls (see page 2072)

DisplayColumns (see page 1834)

37.1.7.5.2 TCustomLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup (see page 1830) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 2072) property. It adds the HTML generated by each Web item listed in WebFieldControls (see page 2072) to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 2072)

37.1.7.5.3 TCustomLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomLayoutGroup (see page 1830) generates an HTML table to lay out the controls generated by the Web items in WebFieldControls (see page 2072). Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1834)

StyleRule (see page 1835)

WebFieldControls (see page 2072)

37.1.7.5.4 TCustomLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomLayoutGroup (see page 1830) generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 1835) property.

See Also

Style (see page 1835)

Styles

StylesFile

WebFieldControls (see page 2072)

37.1.8 TCustomQueryButtons Class

TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.

Class Hierarchy

Pascal

```
TCustomQueryButtons = class(TWebControlGroup);
```

C++

```
class TCustomQueryButtons : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomQueryButtons as a base class for Web items that generate the HTML to arrange a collection of button controls in a query form. The buttons arranged by the query buttons component manipulate information shown by display controls in the parent Query form.

TCustomQueryButtons introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomQueryButtons. TCustomQueryButtons is intended to act as a base class. Instead, instantiate a descendant class such as TQueryButtons (see page 1962).

See Also

TQueryForm (see page 1971)

TQueryFieldGroup (see page 1965)

IWebContent

37.1.8.1 TCustomQueryButtons Members

The following tables list the members exposed by TCustomQueryButtons.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 1837)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 1838)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1838)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1838)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	VisibleButtons (see page 1839)	This is VisibleButtons, a member of class TCustomQueryButtons.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).

Public Properties

	Name	Description
	Custom (see page 1839)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1840)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1840)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

37.1.8.2 TCustomQueryButtons Methods

The methods of the TCustomQueryButtons class are listed here.

Protected Methods

	Name	Description
V	GetDefaultButtons (see page 1837)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	ImplAddElements (see page 1838)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1838)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1838)	Provides the underlying implementation for the Content method.
	VisibleButtons (see page 1839)	This is VisibleButtons, a member of class TCustomQueryButtons.

37.1.8.2.1 TCustomQueryButtons.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomQueryButtons.

37.1.8.2.2 TCustomQueryButtons.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.8.2.3 TCustomQueryButtons.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.8.2.4 TCustomQueryButtons.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.8.2.5 TCustomQueryButtons.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomQueryButtons.

37.1.8.3 TCustomQueryButtons Properties

The properties of the TCustomQueryButtons class are listed here.

Public Properties

	Name	Description
	Custom (see page 1839)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1840)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1840)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.8.3.1 TCustomQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomQueryButtons (see page 1836) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1840)

StyleRule (see page 1840)

WebFieldControls (see page 2072)

37.1.8.3.2 TCustomQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomQueryButtons (see page 1836) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1839)

StyleRule (see page 1840)

WebFieldControls (see page 2072)

37.1.8.3.3 TCustomQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomQueryButtons (see page 1836) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 2072) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the

generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 1840) property.

See Also

Style (see page 1840)

Styles (see page 2272)

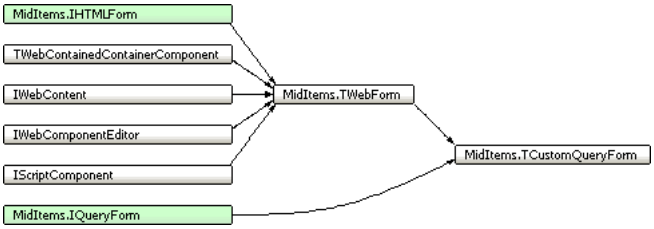
StylesFile (see page 2273)

WebFieldControls (see page 2072)

37.1.9 TCustomQueryForm Class

TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.

Class Hierarchy



Pascal

```
TCustomQueryForm = class(TWebForm, IQueryForm);
```

C++

```
class TCustomQueryForm : public TWebForm, public IQueryForm;
```

File

MidItems

Description

Use TCustomQueryForm as a base class for components that generate an HTML form that displays application-defined values and submits them to an InternetExpress application. TCustomQueryForm introduces properties for specifying the method and target URL of messages submitted by the form.

When building an HTML form, TCustomQueryForm makes use of content generated by the components listed in its WebComponents (see page 2112) property. These components can include Web items that display application-defined values (TQueryFieldGroup (see page 1965)) or that generate buttons to operate on those values (TQueryButtons (see page 1962)). They can also include components that manage the layout of other HTML controls (TLayoutGroup (see page 1939)).

In order to let an InternetExpress page producer use the generated HTML query form, TCustomQueryForm inherits support for the IWebContent interface from TWebForm (see page 2102).

Do not create instances of TCustomQueryForm. Instead, create descendants of TCustomQueryForm, such as TQueryForm (see page 1971).

See Also

TQueryForm (see page 1971)

IWebContent

TInetXPageProducer (see page 2285)

37.1.9.1 TCustomQueryForm Members

The following tables list the members exposed by TCustomQueryForm.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 1844)	This is AssignStringsCallback, a member of class TCustomQueryForm.
	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 1844)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
V	ImplAddElements (see page 1844)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1845)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1845)	Provides the underlying implementation for the Content method.
	MethodString (see page 1846)	This is MethodString, a member of class TCustomQueryForm.
V	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
	AssignStrings (see page 1843)	Assigns values to display controls from a list of name/value pairs.
V	Create (see page 1843)	Creates and initializes an instance of TCustomQueryForm (see page 1841).
V	Destroy (see page 2104)	Frees an instance of TWebForm (see page 2102).
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	Action (see page 1846)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 2110)	Represents a tag option and its value in the generated FORM tag.
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.
	Method (see page 1846)	Specifies the METHOD header of messages that the query form submits.
	Style (see page 2111)	Adds style attributes to the generated form.
	StyleRule (see page 2111)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

37.1.9.2 TCustomQueryForm.Create Constructor

Creates and initializes an instance of TCustomQueryForm (see page 1841).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomQueryForm(TComponent * AOwner);
```

Description

Call Create to instantiate a query form at runtime. Query forms added at design time using the Web Page editor are instantiated automatically.

37.1.9.3 TCustomQueryForm Methods

The methods of the TCustomQueryForm class are listed here.

Protected Methods

	Name	Description
	AssignStringsCallback (see page 1844)	This is AssignStringsCallback, a member of class TCustomQueryForm.
V	GetHTMLFormTag (see page 1844)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
V	ImplAddElements (see page 1844)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1845)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1845)	Provides the underlying implementation for the Content method.
	MethodString (see page 1846)	This is MethodString, a member of class TCustomQueryForm.

Public Methods

	Name	Description
	AssignStrings (see page 1843)	Assigns values to display controls from a list of name/value pairs.

37.1.9.3.1 TCustomQueryForm.AssignStrings Method

Assigns values to display controls from a list of name/value pairs.

Pascal

```
procedure AssignStrings(Value: TStrings);
```

C++

```
__fastcall AssignStrings(TStrings Value);
```

Description

Use AssignStrings to initialize the values displayed by the controls in the query form. For each display control named in the specified list of strings, AssignStrings initializes its Text property with the associated value.

Value is a list of strings with the form Name=Value. The Name portion identifies the Web item for a display control that is listed in the WebComponents (see page 2112) property list or is a child of one of those Web items. Name must match the string returned by the component's GetHTMLControlName method. The Value portion of the string specifies the value that is assigned to the Web item's Text property.

Note: AssignStrings is a convenient way to initialize the values in a query form before the HTML document is sent to a Web browser. When the browser returns values that are entered by the end user, the Web server application must extract them from

the request message's ContentFields property.

See Also

ContentFields

WebComponents (see page 2112)

GetHTMLControlName (see page 2078)

Text (see page 1987)

Text (see page 1999)

Text (see page 2010)

37.1.9.3.2 TCustomQueryForm.AssignStringsCallback Method

Pascal

```
procedure AssignStringsCallback(AComponent: TComponent);
```

C++

```
__fastcall AssignStringsCallback(TComponent * AComponent);
```

Description

This is AssignStringsCallback, a member of class TCustomQueryForm.

37.1.9.3.3 TCustomQueryForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomQueryForm.

37.1.9.3.4 TCustomQueryForm.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any javascript declarations by calling the AddIntf interface. These declarations allow the generated display control to call javascript methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebForm, ImplAddElements does nothing. TWebForm descendants can override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2105)

37.1.9.3.5 TCustomQueryForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 2105)

WebComponents (see page 2112)

37.1.9.3.6 TCustomQueryForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

Content (see page 2106)

AddElements (see page 2105)

37.1.9.3.7 TCustomQueryForm.MethodString Method

Pascal

```
function MethodString: string;
```

C++

```
__fastcall UnicodeString MethodString();
```

Description

This is MethodString, a member of class TCustomQueryForm.

37.1.9.4 TCustomQueryForm Properties

The properties of the TCustomQueryForm class are listed here.

Public Properties

	Name	Description
	Action (see page 1846)	Specifies the path info portion of the URL to which the query submits request messages.
	Method (see page 1846)	Specifies the METHOD header of messages that the query form submits.

37.1.9.4.1 TCustomQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property UnicodeString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 1841)

PathInfo

PathInfo

37.1.9.4.2 TCustomQueryForm.Method Property

Specifies the METHOD header of messages that the query form submits.

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

Description

Set Method to specify the METHOD header for messages that the query form submits. This value gives rise to the MethodType property of the HTTP request message. By matching this to the MethodType property of Web action items, a Web dispatcher determines what objects handle these messages.

See Also

TCustomQueryForm (see page 1841)

PathInfo

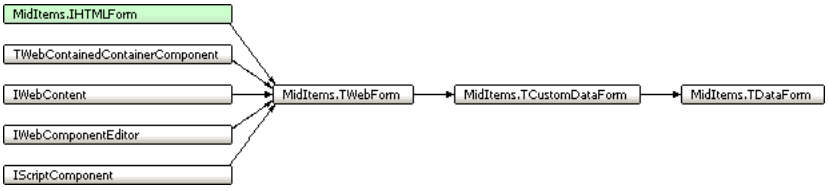
37.1.10 TDataForm Class

TDataForm generates an HTML form that displays database information and lets users apply updates.

Class Hierarchy



Pascal

```
TDataForm = class(TCustomDataForm);
```

C++

```
class TDataForm : public TCustomDataForm;
```

File

MidItems

Description

Add TDataForm to the Web items of an Internet Express page producer (TInetXPageProducer (see page 2285)) to add an HTML form that displays database information that users can view and edit.

Data forms generate an HTML form that contains controls which display information from an XML data packet. Buttons on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that generate data displays (TDataGrid (see page 1850) or TFieldGroup (see page 1869)), components that contain buttons which operate on those displays (TDataNavigator (see page 1855)), and components that manage the layout of HTML controls (TLayoutGroup (see page 1939)). At design time, you can add these Web items to the form using the Web page editor.

Using the Web Page Editor

37.1.10.1 TDataForm Members

The following tables list the members exposed by TDataForm.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 1810)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
V	ImplAddElements (see page 2108)	Provides the underlying implementation for the AddElements (see page 2105) method.
V	ImplCanAddClass (see page 1810)	Provides the underlying implementation for the CanAddClass method.
A	ImplCanAddClass (see page 2109)	Provides the underlying implementation for the CanAddClass (see page 2105) method.
V	ImplContent (see page 1810)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2109)	Provides the underlying implementation for the Content (see page 2106) method.
V	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
V	Create (see page 2104)	Creates and initializes an instance of TWebForm (see page 2102).
V	Destroy (see page 2104)	Frees an instance of TWebForm (see page 2102).
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.
R	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

Published Properties

	Name	Description
	Custom (see page 1849)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 1849)	Adds style attributes to the generated form.
	StyleRule (see page 1850)	Applies a style in the page producer's style sheet to the button.

37.1.10.2 TDataForm Properties

The properties of the TDataForm class are listed here.

Published Properties

	Name	Description
	Custom (see page 1849)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 1849)	Adds style attributes to the generated form.
	StyleRule (see page 1850)	Applies a style in the page producer's style sheet to the button.

37.1.10.2.1 TDataForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 2111)

37.1.10.2.2 TDataForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 2110)

StyleRule (see page 2111)

37.1.10.2.3 TDataForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 2111)

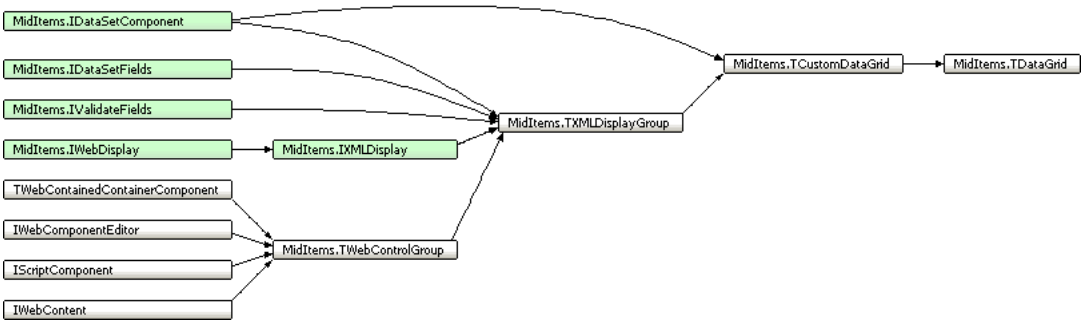
Styles (see page 2272)

StylesFile (see page 2273)

37.1.11 TDataGrid Class

TDataGrid generates an HTML table to display a dataset in an XML data packet.

Class Hierarchy



Pascal

```
TDataGrid = class(TCustomDataGrid);
```

C++

```
class TDataGrid : public TCustomDataGrid;
```

File

MidItems

Description

Add TDataGrid to the Web items of a TDataForm (see page 1847) component (or a layout group that is a child of a TDataForm (see page 1847) component.) TDataGrid generates an HTML table that displays multiple records from a dataset as a set of rows and columns.

Each TDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 2049), TSelectOptionColumn, TTextAreaColumn (see page 2041), and TStatusColumn (see page 2033). You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TDataGrid to affect the appearance of the generated table.

See Also

TSelectOptionsColumn (see page 2024)

TStatusColumn (see page 2033)

TTextAreaColumn (see page 2041)

TTextColumn (see page 2049)

TDataForm (see page 1847)

TLayoutGroup (see page 1939)

TWebDataDisplay (see page 2073)

Using the Web Page Editor

37.1.11.1 TDataGrid Members

The following tables list the members exposed by TDataGrid.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 1814)	This is FormatTable, a member of class TCustomDataGrid.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.

	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
	ImplAddElements (see page 1815)	Provides the underlying implementation for the AddElements method.
	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
	ImplAddElements (see page 2183)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 1815)	Provides the underlying implementation for the CanAddClass method.
	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
	ImplContent (see page 1815)	Provides the underlying implementation for the Content method.
	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 1816)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 1816)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 1816)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 1817)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	Create (see page 1814)	Creates and initializes an instance of TCustomDataGrid (see page 1811).
	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
	Create (see page 2178)	Creates and initializes an instance of TXMLDisplayGroup (see page 2176).
	Destroy (see page 1814)	Frees an instance of TCustomDataGrid (see page 1811).
	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
	Destroy (see page 2178)	Frees an instance of TXMLDisplayGroup (see page 2176).
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.

	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.
R	IsMultipleRecordView (see page 2227)	
R	IsMultipleRecordView (see page 2230)	
R	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	DisplayRows (see page 1853)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 1854)	Determines the display characteristics of the table's header.
	RowAttributes (see page 1854)	Determines the display characteristics of the table's body.
	TableAttributes (see page 1855)	Determines the basic display characteristics of the table.
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.11.2 TDataGrid Properties

The properties of the TDataGrid class are listed here.

Published Properties

	Name	Description
	DisplayRows (see page 1853)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 1854)	Determines the display characteristics of the table's header.
	RowAttributes (see page 1854)	Determines the display characteristics of the table's body.
	TableAttributes (see page 1855)	Determines the basic display characteristics of the table.

37.1.11.2.1 TDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton or TPriorPageButton lets end users scroll through the records in the data packet.

See Also

MaxRecords

TNextPageButton (see page 1945)

TPriorPageButton (see page 1951)

37.1.11.2.2 TDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes or RowAttributes property instead.

See Also

TableAttributes (see page 1818)

RowAttributes (see page 1818)

37.1.11.2.3 TDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes

determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes or HeadingAttributes property instead.

See Also

TableAttributes (see page 1818)

HeadingAttributes (see page 1817)

37.1.11.2.4 TDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes property instead.

See Also

RowAttributes (see page 1818)

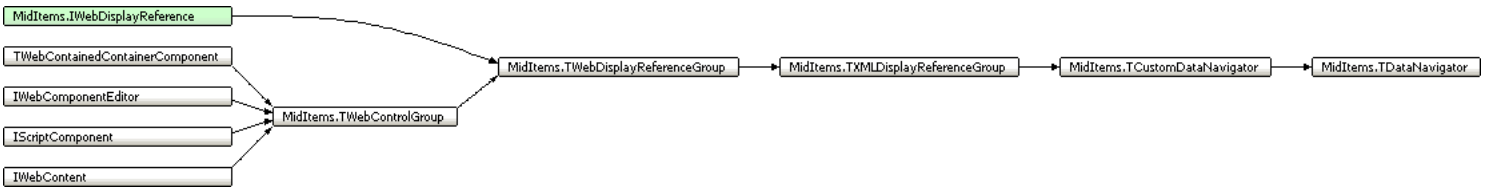
DisplayRows (see page 1817)

HeadingAttributes (see page 1817)

37.1.12 TDataNavigator Class

TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 1859) and TXMLButton (see page 2151) descendants.

Class Hierarchy



Pascal

```
TDataNavigator = class(TCustomDataNavigator);
```

C++

```
class TDataNavigator : public TCustomDataNavigator;
```

File

MidItems

Description

Add TDataNavigator as the child of a TDataForm (see page 1847) component (or a layout group that is a child of a TDataForm (see page 1847) component) to enable the generated HTML form to navigate the displayed data and apply updates that end users make to the data. TDataNavigator can be associated with the Web item that displays the data, such as TDataGrid (see page 1850) or TFieldGroup (see page 1869).

TDataNavigator generates HTML containing the controls generated by its children. These children must be descendants of TDataSetButton (see page 1859) or TXMLButton (see page 2151), such as TInsertButton (see page 1935) and TApplyUpdatesButton (see page 1798).

Use the properties of TDataNavigator to customize the appearance of the group of buttons.

See Also

TDataForm (see page 1847)

TFieldGroup (see page 1869)

TDataGrid (see page 1850)

Using the Web Page Editor

37.1.12.1 TDataNavigator Members

The following tables list the members exposed by TDataNavigator.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 1821)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetWebDisplayComponent (see page 2100)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplAddElements (see page 2198)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1821)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 1821)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 1822)	Provides the underlying implementation for the GetSubComponents method.

	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
	Notification (see page 2101)	Forwards notification messages to all owned components.
	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetWebDisplayComponent (see page 2101)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	VisibleButtons (see page 1822)	This is VisibleButtons, a member of class TCustomDataNavigator.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
R	WebDisplay (see page 2102)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 2102)	

Public Methods

	Name	Description
	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
	Create (see page 2100)	Creates an instance of TWebDisplayReferenceGroup (see page 2098).
	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
	Destroy (see page 2100)	Frees an instance of TWebDisplayReferenceGroup (see page 2098).
	GetWebDisplayComponent (see page 2228)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 2228)	
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 1857)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1858)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1858)	Applies a style in the page producer's style sheet to the group of buttons.
	XMLComponent (see page 1859)	Associates the group with a component that generates HTML display controls.

37.1.12.2 TDataNavigator Properties

The properties of the TDataNavigator class are listed here.

Published Properties

	Name	Description
	Custom (see page 1857)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1858)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1858)	Applies a style in the page producer's style sheet to the group of buttons.
	XMLComponent (see page 1859)	Associates the group with a component that generates HTML display controls.

37.1.12.2.1 TDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1823)

StyleRule (see page 1824)

WebFieldControls (see page 2072)

37.1.12.2.2 TDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1823)

StyleRule (see page 1824)

WebFieldControls (see page 2072)

37.1.12.2.3 TDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule

to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 1823)

Styles (see page 2272)

StylesFile (see page 2273)

WebFieldControls (see page 2072)

37.1.12.2.4 TDataNavigator.XMLComponent Property

Associates the group with a component that generates HTML display controls.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Use XMLComponent to associate the group of buttons with a Web item that generates the display controls those buttons influence. Typical values of XMLComponent are TFieldGroup or TDataGrid.

If all the buttons arranged by the TXMLDisplayReferenceGroup object operate on the same set of display controls, it is most efficient to specify the Web item generating these controls as the value of XMLComponent. Then, each button uses this value to determine its associated display controls when its XMLUseParent property is true. Any buttons that do not operate on the display controls generated by XMLComponent can set their own XMLComponent property to another Web item.

See Also

XMLComponent (see page 2195)

XMLUseParent (see page 2196)

TFieldGroup (see page 1869)

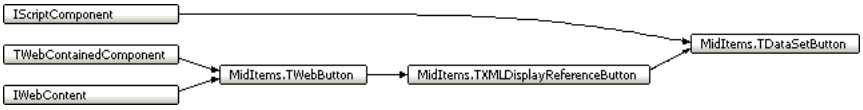
TDataGrid (see page 1850)

TQueryFieldGroup (see page 1965)

37.1.13 TDataSetButton Class

TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

Class Hierarchy



Pascal

```
TDataSetButton = class(TXMLDisplayReferenceButton, IScriptComponent);
```

C++

```
class TDataSetButton : public TXMLDisplayReferenceButton, public IScriptComponent;
```

File

MidItems

Description

Use TDataSetButton as a base class for components that generate the HTML statements defining a specialized button control for working with the data displayed by another Web item. TDataSetButton objects are used by TDataNavigator (see page 1855), which organizes the generated buttons.

TDataSetButton defines properties and methods for

Generating the HTML code to define the button control.

Associating the button with another Web item that generates HTML for displaying the data that the button manipulates.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TDataSetButton inherits support for the IWebContent interface from TWebButton (see page 2058).

Do not create instances of TDataSetButton. TDataSetButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TDataSetButton, such as TNextButton (see page 1943), TPostButton (see page 1947), TInsertButton (see page 1935), and so on.

See Also

TFirstButton (see page 1913)

TNextButton (see page 1943)

TPriorButton (see page 1949)

TLastButton (see page 1937)

TNextPageButton (see page 1945)

TPriorPageButton (see page 1951)

TInsertButton (see page 1935)

TDeleteButton (see page 1867)

TUndoButton (see page 2055)

TPostButton (see page 1947)

IWebContent

TDataNavigator (see page 1855)

37.1.13.1 TDataSetButton Members

The following tables list the members exposed by TDataSetButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 2059)	Creates and initializes an instance of TWebButton (see page 2058).
V	Create (see page 2193)	Creates and initializes an instance of TXMLDisplayReferenceButton (see page 2191).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.13.2 TDataSetButton Fields

The fields of the TDataSetButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

37.1.13.2.1 TDataSetButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
UnicodeString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TDataSetButton.

37.1.13.2.2 TDataSetButton.XMLMethodName Field

Pascal

```
XMLMethodName: string;
```

C++

```
UnicodeString XMLMethodName;
```

Description

This is XMLMethodName, a member of class TDataSetButton.

37.1.13.3 TDataSetButton Methods

The methods of the TDataSetButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.

37.1.13.3.1 TDataSetButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TDataSetButton.

37.1.13.3.2 TDataSetButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 2062)

SetCaption (see page 2061)

37.1.13.3.3 TDataSetButton.GetMethodName Method

Pascal

```
function GetMethodName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetMethodName();
```

Description

This is GetMethodName, a member of class TDataSetButton.

37.1.13.3.4 TDataSetButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TDataSetButton.

37.1.13.3.5 TDataSetButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TDataSetButton.

37.1.13.3.6 TDataSetButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

Content (see page 2060)

ILayoutWebContent

37.1.13.4 TDataSetButton Properties

The properties of the TDataSetButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.13.4.1 TDataSetButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 2062)

37.1.13.4.2 TDataSetButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 2062)

Style (see page 2063)

37.1.13.4.3 TDataSetButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 2062)

StyleRule (see page 2063)

37.1.13.4.4 TDataSetButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 2063)

Styles (see page 2272)

StylesFile (see page 2273)

Styles

StylesFile

37.1.13.4.5 TDataSetButton.XMLComponent Property

Associates the button with the component that generates the display control it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates a display control that the button influences.

Note: Typically, descendants of TXMLDisplayReferenceButton are used by a descendant of TXMLDisplayReferenceGroup, which has its own XMLComponent property. If the button influences this same component, you need not set the XMLComponent property. Instead, setting the XMLUseParent property to true (the default) sets XMLComponent to the value of the parent's XMLComponent property.

See Also

XMLUseParent (see page 2196)

37.1.13.4.6 TDataSetButton.XMLUseParent Property

Specifies whether the button is associated with its parent's display object.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the dataset button determines the component that it influences. When XMLUseParent is false, the XMLComponent property must be set to indicate the display component. When XMLUseParent is true, the button influences the component specified by its parent's XMLComponent property.

The button's parent is the Web item that uses the button to assemble its own HTML content (typically a TDataNavigator or TQueryButtons object). If the parent does not have an associated display component, setting XMLUseParent to true sets the XMLComponent property to nil (Delphi) or NULL (C++).

See Also

XMLComponent (see page 2195)

XMLComponent (see page 2199)

37.1.14 TDeleteButton Class

TDeleteButton generates an HTML control that deletes a record from an XML data packet.

Class Hierarchy

Pascal

```
TDeleteButton = class(TDataSetButton);
```

C++

```
class TDeleteButton : public TDataSetButton;
```

File

MidItems

Description

Add TDeleteButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to delete records. The resulting HTML button's action adds the record deletion to the emerging delta packet, which can then be submitted using an apply updates button.

Use the properties of TDeleteButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the delete button can delete.

See Also

TXMLBroker

TDataNavigator (see page 1855)

TLayoutGroup (see page 1939)

TApplyUpdatesButton (see page 1798)

37.1.14.1 TDeleteButton Members

The following tables list the members exposed by TDeleteButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1869)	Creates and initializes an instance of TDeleteButton (see page 1867).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.14.2 TDeleteButton.Create Constructor

Creates and initializes an instance of TDeleteButton (see page 1867).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDeleteButton(TComponent * AOwner);
```

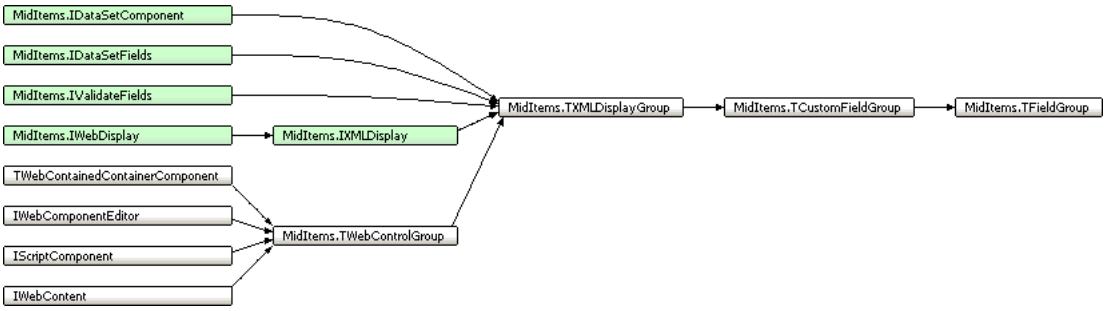
Description

Call Create to instantiate TDeleteButton (see page 1867) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.15 TFieldGroup Class

TFieldGroup arranges database information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TFieldGroup = class(TCustomFieldGroup);
```

C++

```
class TFieldGroup : public TCustomFieldGroup;
```

File

MidItems

Description

Add TFieldGroup to a data form component (TDataForm (see page 1847)) or a layout group (TLayoutGroup (see page 1939)) that is a child for a data form. TFieldGroup generates the HTML to display information from an XML data packet in labeled fields.

TFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the following classes: TFieldText (see page 1899), TFieldTextArea (see page 1905), TFieldSelectOptions (see page 1884), TFieldRadioGroup (see page 1874), and TFieldStatus (see page 1894). You can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TFieldGroup to affect the overall appearance of the set of fields.

See Also

TDataForm (see page 1847)

TLayoutGroup (see page 1939)

TFieldRadioGroup (see page 1874)

TFieldStatus (see page 1894)

TFieldSelectOptions (see page 1884)

TFieldText (see page 1899)

TFieldTextArea (see page 1905)

Using the Web Page Editor

37.1.15.1 TFieldGroup Members

The following tables list the members exposed by TFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 1828)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 1872)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1872)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1828)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.

	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	Create (see page 1827)	Creates and initializes an instance of TCustomFieldGroup (see page 1824).
	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
	Create (see page 2178)	Creates and initializes an instance of TXMLDisplayGroup (see page 2176).
	Destroy (see page 1827)	Frees an instance of TCustomFieldGroup (see page 1824).
	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
	Destroy (see page 2178)	Frees an instance of TXMLDisplayGroup (see page 2176).
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.
	IsMultipleRecordView (see page 2227)	
	IsMultipleRecordView (see page 2230)	
	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.

	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 1873)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1873)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1874)	Applies a style in the page producer's style sheet to the table.
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.15.2 TFieldGroup Methods

The methods of the TFieldGroup class are listed here.

Protected Methods

	Name	Description
	ImplAddElements (see page 1872)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 1872)	Provides the underlying implementation for the CanAddClass method.

37.1.15.2.1 TFieldGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.15.2.2 TFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the

component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.15.3 TFieldGroup Properties

The properties of the TFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 1873)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1873)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1874)	Applies a style in the page producer's style sheet to the table.

37.1.15.3.1 TFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1829)

StyleRule (see page 1830)

37.1.15.3.2 TFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1829)

StyleRule (see page 1830)

37.1.15.3.3 TFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 1829)

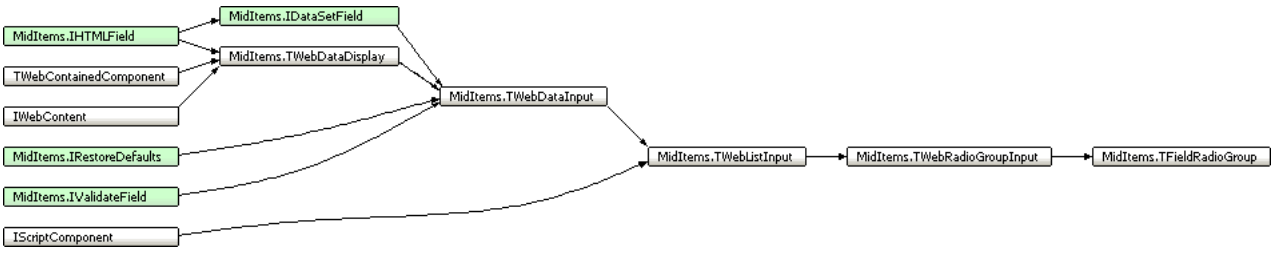
Styles (see page 2272)

StylesFile (see page 2273)

37.1.16 TFieldRadioGroup Class

TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldRadioGroup = class(TWebRadioGroupInput);
```

C++

```
class TFieldRadioGroup : public TWebRadioGroupInput;
```

File

MidItems

Description

Add TFieldRadioGroup as the child of a TFieldGroup (see page 1869) component to add a radio group control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldRadioGroup to

Specify the field whose value the radio group displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 1869)

TXMLDisplayGroup (see page 2176)

37.1.16.1 TFieldRadioGroup Members

The following tables list the members exposed by TFieldRadioGroup.

Protected Methods

	Name	Description
V	AddAttributes (see page 2125)	This is AddAttributes, a member of class TWebRadioGroupInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 2126)	This is EventContent, a member of class TWebRadioGroupInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
A	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 2126)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
V	GetCheckIndex (see page 2126)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.

	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 2126)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 2126)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
V	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
V	Create (see page 2125)	Creates and initializes an instance of TWebRadioGroupInput (see page 2122).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
V	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1878)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1878)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1878)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1879)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1879)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 1880)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 1880)	Specifies the width of the radio group, in characters.
	FieldName (see page 1880)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1881)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1881)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ReadOnly (see page 1882)	Indicates whether end users can use the generated control to set values.
	Style (see page 1882)	Adds style attributes to the generated display control.
	StyleRule (see page 1883)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1883)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 1883)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1884)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.16.2 TFieldRadioGroup Properties

The properties of the TFieldRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 1878)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1878)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1878)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1879)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1879)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 1880)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 1880)	Specifies the width of the radio group, in characters.
	FieldName (see page 1880)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1881)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1881)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ReadOnly (see page 1882)	Indicates whether end users can use the generated control to set values.
	Style (see page 1882)	Adds style attributes to the generated display control.
	StyleRule (see page 1883)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1883)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 1883)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1884)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.16.2.1 TFieldRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.16.2.2 TFieldRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.16.2.3 TFieldRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.16.2.4 TFieldRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.16.2.5 TFieldRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.16.2.6 TFieldRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 2120)

Items (see page 2120)

DisplayWidth (see page 2127)

37.1.16.2.7 TFieldRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 2127)

Custom (see page 2084)

37.1.16.2.8 TFieldRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.16.2.9 TFieldRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.16.2.10 TFieldRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is

assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.16.2.11 TFieldRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 2127)

Custom (see page 2084)

37.1.16.2.12 TFieldRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.16.2.13 TFieldRadioGroup.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.16.2.14 TFieldRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.16.2.15 TFieldRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.16.2.16 TFieldRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

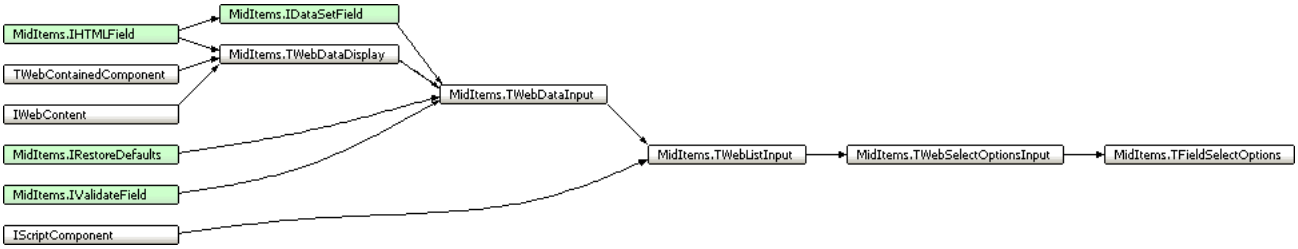
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.17 TFieldSelectOptions Class

TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldSelectOptions = class(TWebSelectOptionsInput);
```

C++

```
class TFieldSelectOptions : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TFieldSelectOptions as the child of a TFieldGroup (see page 1869) component to add a list control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldSelectOptions to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 1869)

TXMLDisplayGroup (see page 2176)

37.1.17.1 TFieldSelectOptions Members

The following tables list the members exposed by TFieldSelectOptions.

Protected Methods

	Name	Description
	AddAttributes (see page 2131)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 2132)	This is EventContent, a member of class TWebSelectOptionsInput.

	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 2132)	This is FormatInputs, a member of class TWebSelectOptionsInput.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSelectIndex (see page 2132)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
	Create (see page 2131)	Creates and initializes an instance of TWebSelectOptionsInput (see page 2128).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).

	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1888)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1888)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1888)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1889)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1889)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 1890)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 1890)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1891)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1891)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 1891)	Adds style attributes to the generated display control.
	StyleRule (see page 1892)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1892)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 1893)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1893)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.17.2 TFieldSelectOptions Properties

The properties of the TFieldSelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 1888)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1888)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1888)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1889)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1889)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 1890)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 1890)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1891)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1891)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 1891)	Adds style attributes to the generated display control.

	StyleRule (see page 1892)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1892)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 1893)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1893)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.17.2.1 TFieldSelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.17.2.2 TFieldSelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.17.2.3 TFieldSelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.17.2.4 TFieldSelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.17.2.5 TFieldSelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections

that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.17.2.6 TFieldSelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 2120)

Items (see page 2120)

37.1.17.2.7 TFieldSelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.17.2.8 TFieldSelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.17.2.9 TFieldSelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.17.2.10 TFieldSelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.17.2.11 TFieldSelectOptions.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.17.2.12 TFieldSelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.17.2.13 TFieldSelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.17.2.14 TFieldSelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

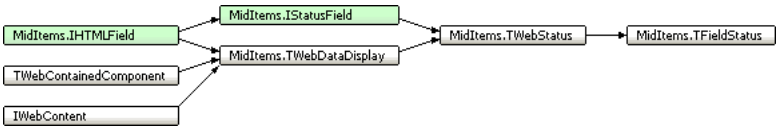
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.18 TFieldStatus Class

TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.

Class Hierarchy



Pascal

```
TFieldStatus = class(TWebStatus);
```

C++

```
class TFieldStatus : public TWebStatus;
```

File

MidItems

Description

Add TFieldStatus as the child of a TFieldGroup (see page 1869) component to provide feedback about whether the current record has been modified. The generated control displays an M if the user has edited the record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TFieldStatus to

Specify a caption that labels the status control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 1869)

TXMLDisplayGroup (see page 2176)

37.1.18.1 TFieldStatus Members

The following tables list the members exposed by TFieldStatus.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2135)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2136)	Returns the value of the Caption property.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2136)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Create (see page 2135)	Creates and initializes an instance of TWebStatus (see page 2133).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	Identifier (see page 2136)	Returns the name under which record status information is stored in the XML data packet.
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	DisplayWidth (see page 2138)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

Published Properties

	Name	Description
	Caption (see page 1896)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1896)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1897)	Specifies where the label appears relative to the generated display control.

	Custom (see page 1897)	Represents a tag option and its value in the tag for the display control.
	Style (see page 1897)	Adds style attributes to the generated display control.
	StyleRule (see page 1898)	Applies a style in the page producer's style sheet to the generated display control.

37.1.18.2 TFieldStatus Properties

The properties of the TFieldStatus class are listed here.

Published Properties

	Name	Description
	Caption (see page 1896)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1896)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1897)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1897)	Represents a tag option and its value in the tag for the display control.
	Style (see page 1897)	Adds style attributes to the generated display control.
	StyleRule (see page 1898)	Applies a style in the page producer's style sheet to the generated display control.

37.1.18.2.1 TFieldStatus.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.18.2.2 TFieldStatus.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.18.2.3 TFieldStatus.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.18.2.4 TFieldStatus.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.18.2.5 TFieldStatus.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.18.2.6 TFieldStatus.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

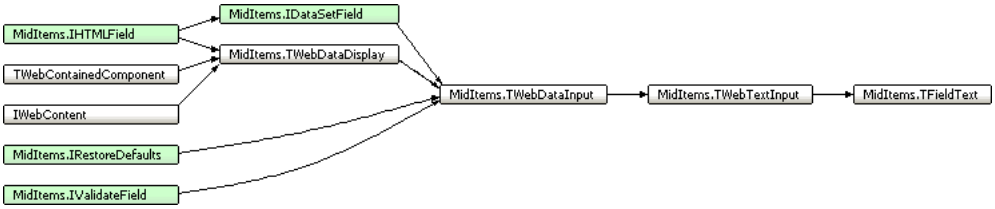
StylesFile

CaptionAttributes (see page 2084)

37.1.19 TFieldText Class

TFieldText creates a single-line HTML input control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldText = class(TWebTextInput);
```

C++

```
class TFieldText : public TWebTextInput;
```

File

MidItems

Description

Add TFieldText as the child of a TFieldGroup (see page 1869) component to add a single-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldText to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 1869)

TXMLDisplayGroup (see page 2176)

37.1.19.1 TFieldText Members

The following tables list the members exposed by TFieldText.

Protected Methods

	Name	Description
	AddAttributes (see page 2148)	This is AddAttributes, a member of class TWebTextInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2148)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.

	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2149)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2149)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2147)	Creates and initializes an instance of TWebTextInput (see page 2145).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.

	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1901)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1902)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1902)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1902)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 1903)	Specifies the horizontal size of the generated control.
	FieldName (see page 1903)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 1904)	Indicates whether end users can use the generated control to set values.
	Style (see page 1904)	Adds style attributes to the generated display control.
	StyleRule (see page 1904)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1905)	Determines the position of the generated control in the HTML form's tab order.

37.1.19.2 TFieldText Properties

The properties of the TFieldText class are listed here.

Published Properties

	Name	Description
	Caption (see page 1901)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1902)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1902)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1902)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 1903)	Specifies the horizontal size of the generated control.
	FieldName (see page 1903)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 1904)	Indicates whether end users can use the generated control to set values.
	Style (see page 1904)	Adds style attributes to the generated display control.
	StyleRule (see page 1904)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1905)	Determines the position of the generated control in the HTML form's tab order.

37.1.19.2.1 TFieldText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.19.2.2 TFieldText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.19.2.3 TFieldText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.19.2.4 TFieldText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.19.2.5 TFieldText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

37.1.19.2.6 TFieldText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.19.2.7 TFieldText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

37.1.19.2.8 TFieldText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.19.2.9 TFieldText.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The

value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.19.2.10 TFieldText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

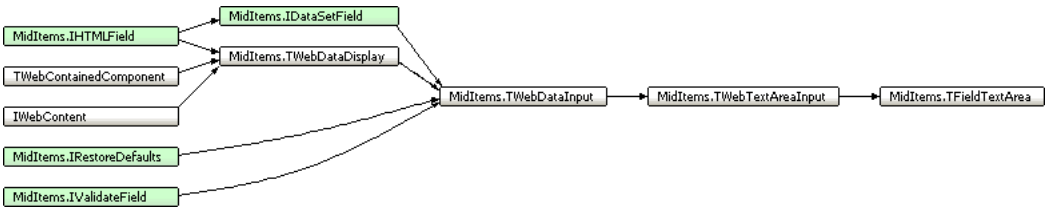
Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.20 TFieldTextArea Class

TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldTextArea = class(TWebTextAreaInput);
```

C++

```
class TFieldTextArea : public TWebTextAreaInput;
```

File

MidItems

Description

Add TFieldTextArea as the child of a TFieldGroup (see page 1869) component to add a multi-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldTextArea to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TQueryTextArea (see page 2010)

TTextAreaColumn (see page 2041)

37.1.20.1 TFieldTextArea Members

The following tables list the members exposed by TFieldTextArea.

Protected Methods

	Name	Description
	AddAttributes (see page 2142)	This is AddAttributes, a member of class TWebTextAreaInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2142)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 2142)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.

	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2143)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2143)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2141)	Creates and initializes an instance of TWebTextAreaInput (see page 2138).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1908)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1908)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1909)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1909)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 1910)	Specifies the height of the generated control.
	DisplayWidth (see page 1910)	Specifies the horizontal size of the generated control.
	FieldName (see page 1910)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 1911)	Indicates whether end users can use the generated control to set values.

	Style (see page 1911)	Adds style attributes to the generated display control.
	StyleRule (see page 1911)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1912)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 1912)	Specifies how the generated control treats lines that are longer than the display width.

37.1.20.2 TFieldTextArea Properties

The properties of the TFieldTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 1908)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1908)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1909)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1909)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 1910)	Specifies the height of the generated control.
	DisplayWidth (see page 1910)	Specifies the horizontal size of the generated control.
	FieldName (see page 1910)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 1911)	Indicates whether end users can use the generated control to set values.
	Style (see page 1911)	Adds style attributes to the generated display control.
	StyleRule (see page 1911)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1912)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 1912)	Specifies how the generated control treats lines that are longer than the display width.

37.1.20.2.1 TFieldTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.20.2.2 TFieldTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.20.2.3 TFieldTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.20.2.4 TFieldTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.20.2.5 TFieldTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 2144)

37.1.20.2.6 TFieldTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 2143)

37.1.20.2.7 TFieldTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a

parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.20.2.8 TFieldTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

37.1.20.2.9 TFieldTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.20.2.10 TFieldTextArea.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.20.2.11 TFieldTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.20.2.12 TFieldTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 2144)

37.1.21 TFirstButton Class

TFirstButton generates an HTML control that moves to the first record in an XML data packet.

Class Hierarchy

Pascal

```
TFirstButton = class(TDataSetButton);
```

C++

```
class TFirstButton : public TDataSetButton;
```

File

MidItems

Description

Add TFirstButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to move quickly to the first record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the first record as current.

Use the properties of TFirstButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the first button navigates.

See Also

TXMLBroker

TDataNavigator (see page 1855)

TLayoutGroup (see page 1939)

37.1.21.1 TFirstButton Members

The following tables list the members exposed by TFirstButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1915)	Creates and initializes an instance of TFirstButton (see page 1913).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.21.2 TFirstButton.Create Constructor

Creates and initializes an instance of TFirstButton (see page 1913).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFirstButton(TComponent * AOwner);
```

Description

Call Create to instantiate TFirstButton (see page 1913) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.22 TFormLayout Class

TFormLayout lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

Pascal

```
TFormLayout = class(TLayoutWebContent);
```

C++

```
class TFormLayout : public TLayoutWebContent;
```

File

MidItems

Description

TFormLayout is the default implementation of the ILayoutWebContent interface for InternetExpress applications. The Web items that belong to an InetXPageProducer object pass a TFormLayout instance to their child Web items as the ParentLayout parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure.

Use the TFormLayout properties to configure how the ILayoutWebContent methods convert HTML that child Web items generate into a final form.

ILayoutWebContent

TInetXPageProducer (see page 2285)

37.1.22.1 TFormLayout Members

The following tables list the members exposed by TFormLayout.

Protected Methods

	Name	Description
	EndButtons (see page 1917)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 1917)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 1918)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 1918)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 1918)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 1919)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 1919)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 1920)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 1920)	This is NextColumn, a member of class TFormLayout.
	StartButtons (see page 1920)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 1921)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 1921)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 1921)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
	Create (see page 1916)	Creates a new TFormLayout (see page 1915) object.
	EndLayout (see page 1917)	Returns the string of HTML to insert after laying out all child items.

Public Properties

	Name	Description
	BreakButtons (see page 1922)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
	ColumnCount (see page 1922)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
	TableHeader (see page 1922)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

37.1.22.2 TFormLayout.Create Constructor

Creates a new TFormLayout (see page 1915) object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TFormLayout(TLayout AParentLayout);
```

Description

Call Create to instantiate a TFormLayout (see page 1915) object to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout property.

See Also

ParentLayout

37.1.22.3 TFormLayout Methods

The methods of the TFormLayout class are listed here.

Protected Methods

	Name	Description
	EndButtons (see page 1917)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 1917)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 1918)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 1918)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 1918)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 1919)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 1919)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 1920)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 1920)	This is NextColumn, a member of class TFormLayout.
	StartButtons (see page 1920)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 1921)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 1921)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 1921)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
	EndLayout (see page 1917)	Returns the string of HTML to insert after laying out all child items.

37.1.22.3.1 TFormLayout.EndButtons Method

Pascal

```
function EndButtons: string;
```

C++

```
__fastcall UnicodeString EndButtons();
```

Description

This is EndButtons, a member of class TFormLayout.

37.1.22.3.2 TFormLayout.EndFields Method

Pascal

```
function EndFields: string;
```

C++

```
__fastcall UnicodeString EndFields();
```

Description

This is EndFields, a member of class TFormLayout.

37.1.22.3.3 TFormLayout.EndLayout Method

Returns the string of HTML to insert after laying out all child items.

Pascal

```
function EndLayout: string;
```

C++

```
__fastcall UnicodeString EndLayout();
```

Description

EndLayout generates the tags that must be inserted after all the content that child Web items generate. TFormLayout (see page 1915) keeps track of the ILayoutWebContent method calls that are made so that it can know what tags need to be closed.

See Also

ILayoutWebContent

37.1.22.3.4 TFormLayout.EndRow Method

Pascal

```
function EndRow: string;
```

C++

```
__fastcall UnicodeString EndRow();
```

Description

This is EndRow, a member of class TFormLayout.

37.1.22.3.5 TFormLayout.EndTable Method

Pascal

```
function EndTable: string;
```

C++

```
__fastcall UnicodeString EndTable();
```

Description

This is EndTable, a member of class TFormLayout.

37.1.22.3.6 TFormLayout.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutButton(const UnicodeString HTMLButton,
TLayoutAttributes Attributes);
```

Description

The LayoutButton method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton method.

See Also

LayoutButton

37.1.22.3.7 TFormLayout.ImplLayoutField Method

Provides the underlying implementation for the LayoutField method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutField(const UnicodeString HTMLField,
TLayoutAttributes Attributes);
```

Description

The LayoutField method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField method.

See Also

LayoutField

37.1.22.3.8 TFormLayout.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes);
```

Description

The LayoutLabelAndField method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField method.

See Also

LayoutLabelAndField

37.1.22.3.9 TFormLayout.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutTable(const UnicodeString HTMLTable,
TLayoutAttributes Attributes);
```

Description

The LayoutTable method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable method.

See Also

LayoutTable

37.1.22.3.10 TFormLayout.NextColumn Method

Pascal

```
function NextColumn(SubItemCount: Integer): string;
```

C++

```
__fastcall UnicodeString NextColumn(int SubItemCount);
```

Description

This is NextColumn, a member of class TFormLayout.

37.1.22.3.11 TFormLayout.StartButtons Method

Pascal

```
function StartButtons: string;
```

C++

```
__fastcall UnicodeString StartButtons();
```

Description

This is StartButtons, a member of class TFormLayout.

37.1.22.3.12 TFormLayout.StartFields Method

Pascal

```
function StartFields(ColCount: Integer): string;
```

C++

```
__fastcall UnicodeString StartFields(int ColCount);
```

Description

This is StartFields, a member of class TFormLayout.

37.1.22.3.13 TFormLayout.StartRow Method

Pascal

```
function StartRow: string;
```

C++

```
__fastcall UnicodeString StartRow();
```

Description

This is StartRow, a member of class TFormLayout.

37.1.22.3.14 TFormLayout.StartTable Method

Pascal

```
function StartTable: string;
```

C++

```
__fastcall UnicodeString StartTable();
```

Description

This is StartTable, a member of class TFormLayout.

37.1.22.4 TFormLayout Properties

The properties of the TFormLayout class are listed here.

Public Properties

	Name	Description
	BreakButtons (see page 1922)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
	ColumnCount (see page 1922)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
	TableHeader (see page 1922)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

37.1.22.4.1 TFormLayout.BreakButtons Property

Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.

Pascal

```
property BreakButtons: Boolean;
```

C++

```
__property Boolean BreakButtons;
```

Description

Set BreakButtons to true if the Web item that supplies this object to its child Web items uses an HTML table to position HTML buttons that those child Web items generate. Set BreakButtons to false if the Web item does not use an HTML table to position child buttons.

BreakButtons affects the whether the LayoutButton method on this object's ILayoutWebContent interface adds <TD> tags to the HTML that child Web items generate for HTML buttons.

See Also

LayoutButton

37.1.22.4.2 TFormLayout.ColumnCount Property

Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.

Pascal

```
property ColumnCount: Integer;
```

C++

```
__property int ColumnCount;
```

Description

Set ColumnCount to the number of child elements that appear in a single row when laying out child controls by rows.

ColumnCount affects where the LayoutField or LayoutButton method on this object's ILayoutWebContent interface adds <TR> and </TR> tags to the HTML that child Web items generate.

Note: ColumnCount only affects the LayoutButton method if the value of the BreakButtons (see page 1922) property is true.

See Also

LayoutButton

LayoutField

BreakButtons (see page 1922)

37.1.22.4.3 TFormLayout.TableHeader Property

Specifies the HTML to generate at the beginning of a table that lays out child elements.

Pascal

```
property TableHeader: string;
```

C++

```
__property UnicodeString TableHeader;
```

Description

Set TableHeader to the HTML tag that appears at the beginning of the HTML table used to control the layout of child elements. TableHeader is a string that includes the <table> tag, along with any attributes (such as alignment) that affect the layout of child items.

See Also

LayoutButton

LayoutField

BreakButtons (see page 1922)

37.1.23 TGridAttributes Class

TGridAttributes describes the options the TDataGrid (see page 1850) component adds to an HTML <TABLE> tag.

Class Hierarchy

Pascal

```
TGridAttributes = class(TPersistent);
```

C++

```
class TGridAttributes : public TPersistent;
```

File

MidItems

Description

TGridAttributes implements the TableAttributes property of a TDataGrid (see page 1850) or TAdapterGrid component. It describes display attributes that apply to an HTML table generated by TDataGrid (see page 1850) or TAdapterGrid. The properties of TGridAttributes specify the options added to the generated HTML <TABLE> tag, as well as any styles that should be applied.

See Also

TCustomDataGrid (see page 1811)

TCustomAdapterGrid

37.1.23.1 TGridAttributes Members

The following tables list the members exposed by TGridAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 1924)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	Create (see page 1924)	Creates an instance of TGridAttributes (see page 1923).

Public Properties

	Name	Description
	Parent (see page 1928)	Indicates the TDataGrid (see page 1850) object that uses this TGridAttributes (see page 1923) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 1926)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 1926)	Specifies the background color of the HTML table.
	Border (see page 1926)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 1927)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 1927)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 1928)	Represents a tag option and its value in an HTML tag.
	Style (see page 1928)	Adds style attributes to the generated table.
	StyleRule (see page 1929)	Applies a style in the page producer's style sheet to the generated table.

37.1.23.2 TGridAttributes.Create Constructor

Creates an instance of TGridAttributes (see page 1923).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridAttributes (see page 1923). TGridAttributes (see page 1923) is instantiated by the TDataGrid (see page 1850) component that uses it.

The AParent parameter is the TDataGrid (see page 1850) or TAdapterGrid component that uses the TGridAttributes (see page 1923) instance. This parameter becomes the value of the Parent (see page 1928) property.

See Also

Parent (see page 1928)

TDataGrid (see page 1850)

TAdapterGrid

37.1.23.3 TGridAttributes Methods

The methods of the TGridAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 1924)	Copies the properties of an object to a destination object.

37.1.23.3.1 TGridAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

37.1.23.4 TGridAttributes Properties

The properties of the TGridAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 1928)	Indicates the TDataGrid (see page 1850) object that uses this TGridAttributes (see page 1923) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 1926)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 1926)	Specifies the background color of the HTML table.
	Border (see page 1926)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 1927)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 1927)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 1928)	Represents a tag option and its value in an HTML tag.
	Style (see page 1928)	Adds style attributes to the generated table.
	StyleRule (see page 1929)	Applies a style in the page producer's style sheet to the generated table.

37.1.23.4.1 TGridAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the table within the HTML document, or within the cell of a surrounding HTML table in a layout group. Align indicates the desired value of the Align option of the HTML table tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the HTML table where it wants.

See Also

CellPadding (see page 1927)

Border (see page 1926)

37.1.23.4.2 TGridAttributes.BgColor Property

Specifies the background color of the HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: The row or heading attributes can override this background color for a portion of the HTML table.

See Also

BgColor (see page 1932)

37.1.23.4.3 TGridAttributes.Border Property

Specifies the thickness of the border drawn around the HTML table.

Pascal

```
property Border: Integer;
```

C++

```
__property int Border;
```

Description

Set Border to specify whether a border should be drawn around the table, and if so, how thick it should be. The thickness specified by any particular value of border depends on the web browser that views the HTML table. For any browser, however, larger numbers indicate thicker borders. A value of -1 indicates that no border should be drawn around the table.

See Also

CellSpacing (see page 1927)

37.1.23.4.4 TGridAttributes.CellPadding Property

Specifies the amount of space to leave around the contents of each cell in the HTML table.

Pascal

```
property CellPadding: Integer;
```

C++

```
__property int CellPadding;
```

Description

Set CellPadding to specify how many pixels of whitespace should appear between a cell's contents and the edges of the cell. A value of -1 indicates that the web browser should decide how to pad the cells of the HTML table.

See Also

CellSpacing (see page 1927)

37.1.23.4.5 TGridAttributes.CellSpacing Property

Specifies the amount of space to leave between cells in the HTML table.

Pascal

```
property CellSpacing: Integer;
```

C++

```
__property int CellSpacing;
```

Description

Set CellSpacing to specify how many pixels of whitespace should appear between the cells in the table. A value of -1 indicates that the web browser should decide how to separate the cells of the HTML table.

Note: CellSpacing refers to the whitespace between cells in an HTML table, not the thickness of the lines drawn to separate rows and columns.

See Also

Border (see page 1926)

CellPadding (see page 1927)

37.1.23.4.6 TGridAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TABLE> tag. Each option and its value should have the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to hide the side borders and add row dividers, you can set Custom to

```
FRAME=HSIDES RULES=ROWS
```

See Also

Style (see page 1928)

StyleRule (see page 1929)

37.1.23.4.7 TGridAttributes.Parent Property

Indicates the TDataGrid (see page 1850) object that uses this TGridAttributes (see page 1923) to describe its attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 1850) that uses this TGridAttributes (see page 1923) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 1850)

Create (see page 1924)

TAdapterGrid

37.1.23.4.8 TGridAttributes.Style Property

Adds style attributes to the generated table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the entire table. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the <TABLE> tag as the value of a STYLE option.

See Also

Custom (see page 1928)

StyleRule (see page 1929)

37.1.23.4.9 TGridAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 1928) property instead.

See Also

Style (see page 1928)

Styles (see page 2272)

37.1.24 TGridRowAttributes Class

TGridRowAttributes describes the options the TDataGrid (see page 1850) component adds to its HTML row tags (<TR>).

Class Hierarchy

Pascal

```
TGridRowAttributes = class(TPersistent);
```

C++

```
class TGridRowAttributes : public TPersistent;
```

File

MidItems

Description

TGridRowAttributes implements the RowAttributes and HeadingAttributes properties of a TDataGrid (see page 1850) or TAdapterGrid component. It describes display attributes that apply to the generated HTML table's rows. The properties of TGridRowAttributes specify the options added to the generated HTML <TR> tag, as well as any styles that should be applied to the header or body of the table.

See Also

TCustomDataGrid (see page 1811)

TCustomAdapterGrid

37.1.24.1 TGridRowAttributes Members

The following tables list the members exposed by TGridRowAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 1931)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	Create (see page 1930)	Creates an instance of TGridRowAttributes (see page 1929).

Public Properties

	Name	Description
	Parent (see page 1933)	Indicates the TDataGrid (see page 1850) or TAdapterGrid object that uses this TGridRowAttributes (see page 1929) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 1932)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 1932)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 1933)	Represents a tag option and its value in an HTML tag.
	Style (see page 1934)	Adds style attributes to the generated table body or header.
	StyleRule (see page 1934)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 1934)	Specifies the vertical alignment within the cells of the HTML table body or header.

37.1.24.2 TGridRowAttributes.Create Constructor

Creates an instance of TGridRowAttributes (see page 1929).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridRowAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridRowAttributes (see page 1929). TGridRowAttributes (see page 1929) is

instantiated by the TDataGrid (see page 1850) or TAdapterGrid component that uses it.

The AParent parameter is the TDataGrid (see page 1850) or TAdapterGrid component that uses the TGridRowAttributes (see page 1929) instance. This parameter becomes the value of the Parent (see page 1933) property.

See Also

Parent (see page 1933)

TDataGrid (see page 1850)

TAdapterGrid

37.1.24.3 TGridRowAttributes Methods

The methods of the TGridRowAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 1931)	Copies the properties of an object to a destination object.

37.1.24.3.1 TGridRowAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

Assign

EConvertError

37.1.24.4 TGridRowAttributes Properties

The properties of the TGridRowAttributes class are listed here.

Public Properties

	Name	Description
	Parent (see page 1933)	Indicates the TDataGrid (see page 1850) or TAdapterGrid object that uses this TGridRowAttributes (see page 1929) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 1932)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 1932)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 1933)	Represents a tag option and its value in an HTML tag.
	Style (see page 1934)	Adds style attributes to the generated table body or header.
	StyleRule (see page 1934)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 1934)	Specifies the vertical alignment within the cells of the HTML table body or header.

37.1.24.4.1 TGridRowAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the contents of each cell in the table row or header. Align indicates the desired value of the Align option of the <TR> tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the cell contents wherever it wants horizontally.

See Also

VAlign (see page 1934)

37.1.24.4.2 TGridRowAttributes.BgColor Property

Specifies the background color of the rows or header of an HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the rows or heading of an HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: This property overrides the background color option of the HTML table itself.

See Also

BgColor (see page 1926)

37.1.24.4.3 TGridRowAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TR> tag. Each option and its value should have the form

```
OPTIONNAME=Value
```

To specify multiple options, separate the Name/value pairs with spaces.

See Also

Style (see page 1934)

StyleRule (see page 1934)

37.1.24.4.4 TGridRowAttributes.Parent Property

Indicates the TDataGrid (see page 1850) or TAdapterGrid object that uses this TGridRowAttributes (see page 1929) to describe its header or row attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 1850) or TAdapterGrid that uses this TGridRowAttributes (see page 1929) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 1850)

TAdapterGrid

Create (see page 1930)

37.1.24.4.5 TGridRowAttributes.Style Property

Adds style attributes to the generated table body or header.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the rows or header of the HTML table. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the <TR> tag as the value of a STYLE option.

See Also

Custom (see page 1933)

StyleRule (see page 1934)

37.1.24.4.6 TGridRowAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated table body or header.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table body or header. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 1934) property instead.

See Also

Style (see page 1934)

Styles (see page 2272)

StylesFile (see page 2273)

Styles

StylesFile

37.1.24.4.7 TGridRowAttributes.VAlign Property

Specifies the vertical alignment within the cells of the HTML table body or header.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Set VAlign to indicate the desired vertical alignment of the contents of each cell. VAlign indicates the desired value of the VAlign option of the <TR> tag for the table rows or header.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document positions the contents of cells in the table element wherever it wishes vertically.

See Also

Align (see page 1932)

37.1.25 TInsertButton Class

TInsertButton generates an HTML control that inserts a new record in an XML data packet.

Class Hierarchy

Pascal

```
TInsertButton = class(TDataSetButton);
```

C++

```
class TInsertButton : public TDataSetButton;
```

File

MidItems

Description

Add TInsertButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to add records to an XML data packet. The resulting HTML button's action adds a new blank record to the emerging XML delta packet and causes the associated display control to display that new record.

Use the properties of TInsertButton to customize the appearance of the button and associate it with a Web item. The associated Web item generates the HTML control that displays the newly inserted record.

TLayoutGroup (see page 1939)

TApplyUpdatesButton (see page 1798)

37.1.25.1 TInsertButton Members

The following tables list the members exposed by TInsertButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1937)	Creates and initializes an instance of TInsertButton (see page 1935).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.

	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.25.2 TInsertButton.Create Constructor

Creates and initializes an instance of TInsertButton (see page 1935).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInsertButton(TComponent * AOwner);
```

Description

Call Create to instantiate TInsertButton (see page 1935) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.26 TLastButton Class

TLastButton generates an HTML control that moves to the last record in an XML data packet.

Class Hierarchy

Pascal

```
TLastButton = class(TDataSetButton);
```

C++

```
class TLastButton : public TDataSetButton;
```

File

MidItems

Description

Add TLastButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to move quickly to the last record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the last record as current.

Use the properties of TLastButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the last button navigates.

TXMLBroker

TDataNavigator (see page 1855)

TLayoutGroup (see page 1939)

37.1.26.1 TLastButton Members

The following tables list the members exposed by TLastButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1939)	Creates and initializes an instance of TLastButton (see page 1937).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.26.2 TLastButton.Create Constructor

Creates and initializes an instance of TLastButton (see page 1937).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLastButton(TComponent * AOwner);
```

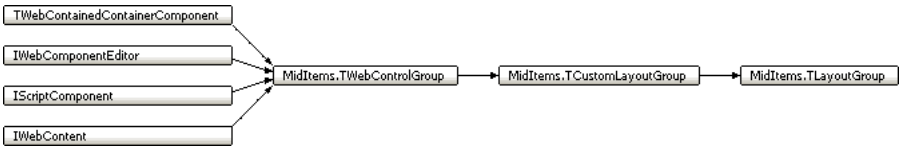
Description

Call Create to instantiate TLastButton (see page 1937) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.27 TLayoutGroup Class

TLayoutGroup generates the HTML to arrange content produced by other Web items.

Class Hierarchy



Pascal

```
TLayoutGroup = class(TCustomLayoutGroup);
```

C++

```
class TLayoutGroup : public TCustomLayoutGroup;
```

File

MidItems

Description

Use TLayoutGroup to adjust the layout of items in an HTML document. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated by other Web items.

TLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to

let the parent component use the HTML that TLayoutGroup generates, TLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

See Also

IWebContent

Using the Web Page Editor

37.1.27.1 TLayoutGroup Members

The following tables list the members exposed by TLayoutGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 1832)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 1833)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 1833)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 1832)	Creates and initializes an instance of TCustomLayoutGroup (see page 1830).
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 1832)	Frees an instance of TCustomLayoutGroup (see page 1830).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).

Public Properties

	Name	Description
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 1941)	Represents a tag option and its value in the generated TABLE tag.

	DisplayColumns (see page 1941)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 1942)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1942)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.27.2 TLayoutGroup Properties

The properties of the TLayoutGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 1941)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 1941)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 1942)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1942)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.27.2.1 TLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1835)

StyleRule (see page 1835)

WebFieldControls (see page 2072)

DisplayColumns (see page 1834)

37.1.27.2.2 TLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. It adds the HTML generated by each Web item listed in WebFieldControls to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 2072)

37.1.27.2.3 TLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in WebFieldControls. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1834)

StyleRule (see page 1835)

WebFieldControls (see page 2072)

37.1.27.2.4 TLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

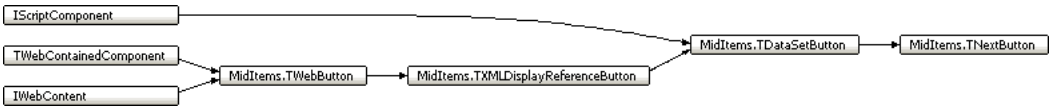
WebFieldControls (see page 2072)

37.1.28 TNextButton Class

TNextButton generates an HTML control that moves to the next record in an XML data packet.

Class Hierarchy



Pascal

```
TNextButton = class(TDataSetButton);
```

C++

```
class TNextButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable an associated control to move to the next record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TNextButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the next button navigates.

37.1.28.1 TNextButton Members

The following tables list the members exposed by TNextButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.

	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1944)	Creates and initializes an instance of TNextButton (see page 1943).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.28.2 TNextButton.Create Constructor

Creates and initializes an instance of TNextButton (see page 1943).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextButton (see page 1943) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.29 TNextPageButton Class

TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.

Class Hierarchy

Pascal

```
TNextPageButton = class(TDataSetButton);
```

C++

```
class TNextPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextPageButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to display the next group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 1850)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 1869)), the current record changes to the next record in the data packet.

Use the properties of TNextPageButton to customize the appearance of the button and associate it with a display component.

37.1.29.1 TNextPageButton Members

The following tables list the members exposed by TNextPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1947)	Creates and initializes an instance of TNextPageButton (see page 1945).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.29.2 TNextPageButton.Create Constructor

Creates and initializes an instance of TNextPageButton (see page 1945).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextPageButton (see page 1945) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.30 TPostButton Class

TPostButton generates an HTML control that posts changes to an XML delta packet.

Class Hierarchy

Pascal

```
TPostButton = class(TDataSetButton);
```

C++

```
class TPostButton : public TDataSetButton;
```

File

MidItems

Description

Add TPostButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to commit the edits on the current record of an associated display control. The resulting HTML button's action posts all edits to the current record to the emerging delta packet, which can then be submitted using an apply updates button.

Use the properties of TPostButton to customize the appearance of the button and associate it with a Web item that generates the display control.

37.1.30.1 TPostButton Members

The following tables list the members exposed by TPostButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1949)	Creates and initializes an instance of TPostButton (see page 1947).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.

	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.30.2 TPostButton.Create Constructor

Creates and initializes an instance of TPostButton (see page 1947).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPostButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPostButton (see page 1947) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.31 TPriorButton Class

TPriorButton generates an HTML control that moves to the previous record in an XML data packet.

Class Hierarchy

Pascal

```
TPriorButton = class(TDataSetButton);
```

C++

```
class TPriorButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable an associated control to move to the previous record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TPriorButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the prior button navigates.

37.1.31.1 TPriorButton Members

The following tables list the members exposed by TPriorButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1951)	Creates and initializes an instance of TPriorButton (see page 1949).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.31.2 TPriorButton.Create Constructor

Creates and initializes an instance of TPriorButton (see page 1949).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorButton (see page 1949) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.32 TPriorPageButton Class

TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.

Class Hierarchy

Pascal

```
TPriorPageButton = class(TDataSetButton);
```

C++

```
class TPriorPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorPageButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to display the previous group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 1850)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 1869)), the current record changes to the previous record in the data packet.

Use the properties of TNextPageButton (see page 1945) to customize the appearance of the button and associate it with a

display component.

37.1.32.1 TPriorPageButton Members

The following tables list the members exposed by TPriorPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 1953)	Creates and initializes an instance of TPriorPageButton (see page 1951).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.32.2 TPriorPageButton.Create Constructor

Creates and initializes an instance of TPriorPageButton (see page 1951).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorPageButton (see page 1951) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.33 TQueryButton Class

TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.

Class Hierarchy

Pascal

```
TQueryButton = class(TWebButton);
```

C++

```
class TQueryButton : public TWebButton;
```

File

MidItems

Description

Use TQueryButton as a base class in an InternetExpress application for components that generate the HTML statements defining a specialized button control for managing the application-defined input controls. TQueryButton objects are used by TQueryForm (see page 1971), which organizes the generated buttons and the input controls they manipulate.

TQueryButton defines properties and methods for

Generating the HTML code to define the button control.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Associating the button with a Query form whose controls it influences.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TQueryButton inherits support for the IWebContent interface from TWebButton (see page 2058).

Do not create instances of TQueryButton. TQueryButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TQueryButton, such as TResetQueryButton (see page 2022) or TSubmitQueryButton (see page 2038).

TQueryForm (see page 1971)

37.1.33.1 TQueryButton Members

The following tables list the members exposed by TQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1955)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 1956)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
V	EventContent (see page 1956)	This is EventContent, a member of class TQueryButton.
V	GetCaption (see page 1956)	Returns the value of the Caption property.
V	GetHTMLControlName (see page 1957)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 1957)	This is GetHTMLForm, a member of class TQueryButton.
V	GetInputType (see page 1957)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 1957)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 1958)	Provides the underlying implementation for the Content method.
V	Notification (see page 1958)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 1959)	This is ParentXMLComponent, a member of class TQueryButton.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetXMLComponent (see page 1959)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 1959)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
	Create (see page 1955)	Creates and initializes an instance of TQueryButton (see page 1953).

Published Properties

	Name	Description
	Caption (see page 1959)	Specifies the caption that appears on the button.
	Custom (see page 1960)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1960)	Adds style attributes to the generated button control.
	StyleRule (see page 1961)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1961)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 1962)	Specifies whether the button is associated with its parent's query form.

37.1.33.2 TQueryButton.Create Constructor

Creates and initializes an instance of TQueryButton (see page 1953).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset button at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

AOwner is the component that is responsible for freeing the query button. Typically, this is the Web module that contains the InterenetExpress page producer that uses the query button's generated HTML.

37.1.33.3 TQueryButton Fields

The fields of the TQueryButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 1955)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 1956)	This is InputType, a member of class TQueryButton.

37.1.33.3.1 TQueryButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
UnicodeString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TQueryButton.

37.1.33.3.2 TQueryButton.InputType Field

Pascal

```
InputType: string;
```

C++

```
UnicodeString InputType;
```

Description

This is InputType, a member of class TQueryButton.

37.1.33.4 TQueryButton Methods

The methods of the TQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 1956)	This is EventContent, a member of class TQueryButton.
	GetCaption (see page 1956)	Returns the value of the Caption property.
	GetHTMLControlName (see page 1957)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 1957)	This is GetHTMLForm, a member of class TQueryButton.
	GetInputType (see page 1957)	This is GetInputType, a member of class TQueryButton.
	GetXMLComponent (see page 1957)	This is GetXMLComponent, a member of class TQueryButton.
	ImplContent (see page 1958)	Provides the underlying implementation for the Content method.
	Notification (see page 1958)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 1959)	This is ParentXMLComponent, a member of class TQueryButton.
	SetXMLComponent (see page 1959)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 1959)	This is SetXMLUseParent, a member of class TQueryButton.

37.1.33.4.1 TQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TQueryButton.

37.1.33.4.2 TQueryButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 2062)

SetCaption (see page 2061)

37.1.33.4.3 TQueryButton.GetHTMLControlName Method

Pascal

```
function GetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLControlName();
```

Description

This is GetHTMLControlName, a member of class TQueryButton.

37.1.33.4.4 TQueryButton.GetHTMLForm Method

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

This is GetHTMLForm, a member of class TQueryButton.

37.1.33.4.5 TQueryButton.GetInputType Method

Pascal

```
function GetInputType: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetInputType();
```

Description

This is GetInputType, a member of class TQueryButton.

37.1.33.4.6 TQueryButton.GetXMLComponent Method

Pascal

```
function GetXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * GetXMLComponent();
```

Description

This is GetXMLComponent, a member of class TQueryButton.

37.1.33.4.7 TQueryButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 2060)

ILayoutWebContent

37.1.33.4.8 TQueryButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.33.4.9 TQueryButton.ParentXMLComponent Method

Pascal

```
function ParentXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * ParentXMLComponent();
```

Description

This is ParentXMLComponent, a member of class TQueryButton.

37.1.33.4.10 TQueryButton.SetXMLComponent Method

Pascal

```
procedure SetXMLComponent(const Value: TComponent);
```

C++

```
__fastcall SetXMLComponent(const TComponent * Value);
```

Description

This is SetXMLComponent, a member of class TQueryButton.

37.1.33.4.11 TQueryButton.SetXMLUseParent Method

Pascal

```
procedure SetXMLUseParent(const Value: Boolean);
```

C++

```
__fastcall SetXMLUseParent(const Boolean Value);
```

Description

This is SetXMLUseParent, a member of class TQueryButton.

37.1.33.5 TQueryButton Properties

The properties of the TQueryButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 1959)	Specifies the caption that appears on the button.
	Custom (see page 1960)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1960)	Adds style attributes to the generated button control.
	StyleRule (see page 1961)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1961)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 1962)	Specifies whether the button is associated with its parent's query form.

37.1.33.5.1 TQueryButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 2062)

37.1.33.5.2 TQueryButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 2062)

Style (see page 2063)

37.1.33.5.3 TQueryButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 2062)

StyleRule (see page 2063)

37.1.33.5.4 TQueryButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 2063)

Styles (see page 2272)

StylesFile (see page 2273)

Styles

StylesFile

37.1.33.5.5 TQueryButton.XMLComponent Property

Associates the button with the query form whose display controls it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates the form whose controls the query button influences. If this query form contains the TQueryButtons (see page 1962) object that formats the query button with its siblings, you need not set the XMLComponent property. Instead, setting the XMLUseParent (see page 1962) property to true (the default) sets XMLComponent to the Query form that contains the parent TQueryButtons (see page 1962) object.

See Also

XMLUseParent (see page 1962)

TQueryForm (see page 1971)

37.1.33.5.6 TQueryButton.XMLUseParent Property

Specifies whether the button is associated with its parent's query form.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the query button determines the form whose controls it influences. When XMLUseParent is false, the XMLComponent (see page 1961) property must be set to indicate the query form. When XMLUseParent is true, the button influences controls on the query form that contains its parent TQueryButtons (see page 1962) component.

See Also

XMLComponent (see page 1961)

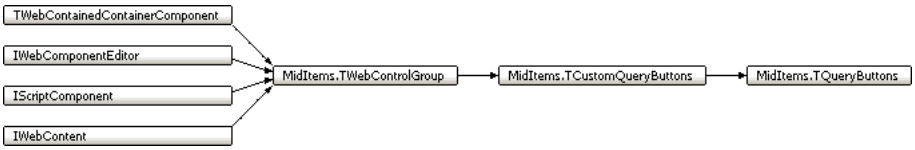
TQueryForm (see page 1971)

TQueryButtons (see page 1962)

37.1.34 TQueryButtons Class

TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 1953) descendants.

Class Hierarchy



Pascal

```
TQueryButtons = class(TCustomQueryButtons);
```

C++

```
class TQueryButtons : public TCustomQueryButtons;
```

File

MidItems

Description

Add TQueryButtons as the child of a TQueryForm (see page 1971) component (or a layout group that is a child of a TQueryForm (see page 1971) component) to enable the generated HTML form to undo or submit changes made by end users. TQueryButtons generates HTML containing the controls generated by its children. These children must be descendants of TQueryButton (see page 1953), such as TSubmitQueryButton (see page 2038) and TResetQueryButton (see page 2022).

In order to let other Web items to use the HTML that defines the organized collection of controls, TQueryButtons inherits the IWebContent interface from TWebControlGroup (see page 2064).

Use the properties of TQueryButtons to customize the appearance of the group of buttons.

TQueryForm (see page 1971)

TResetQueryButton (see page 2022)

TSubmitQueryButton (see page 2038)

IWebContent

TQueryFieldGroup (see page 1965)

Using the Web Page Editor

37.1.34.1 TQueryButtons Members

The following tables list the members exposed by TQueryButtons.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 1837)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 1838)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 1838)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 1838)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	VisibleButtons (see page 1839)	This is VisibleButtons, a member of class TCustomQueryButtons.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).

Public Properties

	Name	Description
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 1964)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1964)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1965)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.34.2 TQueryButtons Properties

The properties of the TQueryButtons class are listed here.

Published Properties

	Name	Description
	Custom (see page 1964)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1964)	Adds style attributes to the generated HTML table.
	StyleRule (see page 1965)	Applies a style in the page producer's style sheet to the group of buttons.

37.1.34.2.1 TQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1840)

StyleRule (see page 1840)

WebFieldControls (see page 2072)

37.1.34.2.2 TQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1839)

StyleRule (see page 1840)

WebFieldControls (see page 2072)

37.1.34.2.3 TQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

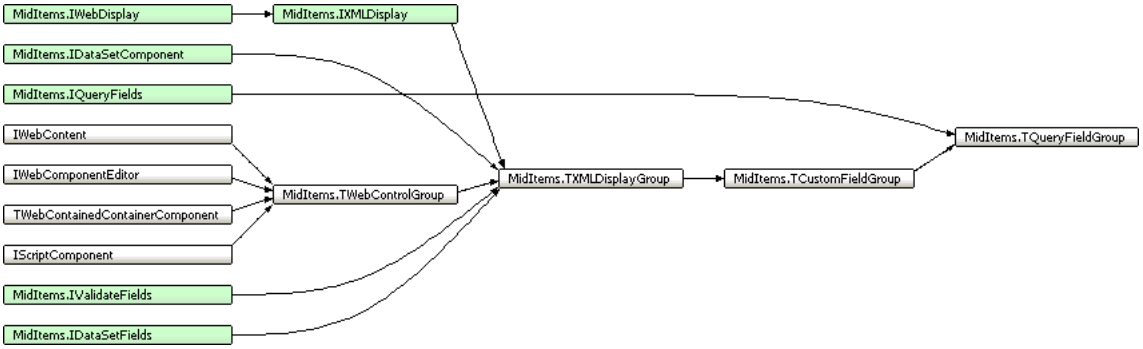
37.1.35 TQueryFieldGroup Class

TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TQueryFieldGroup = class(TCustomFieldGroup, IQueryFields);
```

C++

```
class TQueryFieldGroup : public TCustomFieldGroup, public IQueryFields;
```

File

MidItems

Description

Add TQueryFieldGroup to a query form component (TQueryForm (see page 1971)) or a layout group (TLayoutGroup (see page 1939)) that is a child for a query form. TQueryFieldGroup generates the HTML to display information in labeled fields. By default, TQueryFieldGroup displays information about the parameters for an XML broker, but it can be used to display any application-defined named values.

TQueryFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the following classes: TQueryText (see page 2000), TQueryTextArea (see page 2010), TQuerySelectOptions (see page 1989), and TQueryRadioGroup (see page 1976). If the query field group displays parameter values, you can bind the query field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to determine the source of the parameters they display.

You can also use the properties of TQueryFieldGroup to affect the overall appearance of the set of fields.

37.1.35.1 TQueryFieldGroup Members

The following tables list the members exposed by TQueryFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	FindParam (see page 1969)	This is FindParam, a member of class TQueryFieldGroup.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 1828)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetParamsList (see page 1969)	This is GetParamsList, a member of class TQueryFieldGroup.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplAddElements (see page 2183)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 1969)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 1828)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	IsParamInUse (see page 1970)	This is IsParamInUse, a member of class TQueryFieldGroup.
V	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 1827)	Creates and initializes an instance of TCustomFieldGroup (see page 1824).
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Create (see page 2178)	Creates and initializes an instance of TXMLDisplayGroup (see page 2176).
V	Destroy (see page 1827)	Frees an instance of TCustomFieldGroup (see page 1824).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2178)	Frees an instance of TXMLDisplayGroup (see page 2176).
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateDataSet (see page 2221)	This is ValidateDataSet, a member of class IQueryFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.
R	IsMultipleRecordView (see page 2227)	
R	IsMultipleRecordView (see page 2230)	
R	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 1970)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1971)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1971)	Applies a style in the page producer's style sheet to the table.

	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.35.2 TQueryFieldGroup Methods

The methods of the TQueryFieldGroup class are listed here.

Protected Methods

	Name	Description
	FindParam (see page 1969)	This is FindParam, a member of class TQueryFieldGroup.
	GetParamsList (see page 1969)	This is GetParamsList, a member of class TQueryFieldGroup.
V	ImplCanAddClass (see page 1969)	Provides the underlying implementation for the CanAddClass method.
	IsParamInUse (see page 1970)	This is IsParamInUse, a member of class TQueryFieldGroup.

37.1.35.2.1 TQueryFieldGroup.FindParam Method

Pascal

```
function FindParam(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindParam(const UnicodeString AName);
```

Description

This is FindParam, a member of class TQueryFieldGroup.

37.1.35.2.2 TQueryFieldGroup.GetParamsList Method

Pascal

```
procedure GetParamsList(List: TStrings);
```

C++

```
__fastcall GetParamsList(TStrings List);
```

Description

This is GetParamsList, a member of class TQueryFieldGroup.

37.1.35.2.3 TQueryFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to

indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.35.2.4 TQueryFieldGroup.IsParamInUse Method

Pascal

```
function IsParamInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsParamInUse(UnicodeString AName);
```

Description

This is IsParamInUse, a member of class TQueryFieldGroup.

37.1.35.3 TQueryFieldGroup Properties

The properties of the TQueryFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 1970)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 1971)	Adds style attributes to the generated set of fields.
	StyleRule (see page 1971)	Applies a style in the page producer's style sheet to the table.

37.1.35.3.1 TQueryFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 1829)

StyleRule (see page 1830)

37.1.35.3.2 TQueryFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 1829)

StyleRule (see page 1830)

37.1.35.3.3 TQueryFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 1829)

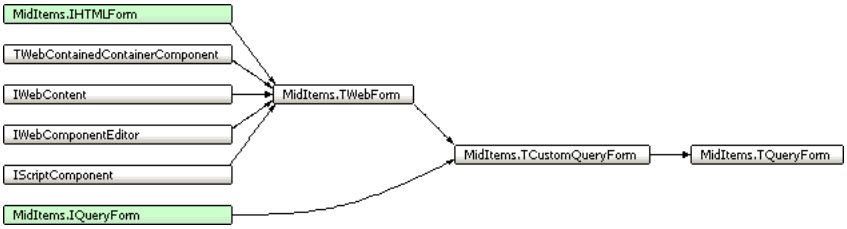
Styles (see page 2272)

StylesFile (see page 2273)

37.1.36 TQueryForm Class

TQueryForm generates HTML forms for letting users enter application-defined values.

Class Hierarchy



Pascal

```
TQueryForm = class(TCustomQueryForm);
```

C++

```
class TQueryForm : public TCustomQueryForm;
```

File

MidItems

Description

Add TQueryForm to the Web items of an InternetExpress page producer to add an HTML form that displays application-defined values that users can view and edit. Query forms submit these values to the InternetExpress application using a specified URL and method type.

TQueryForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that display application-defined values (TQueryFieldGroup (see page 1965)), components that contain buttons to operate on those displays (TQueryButtons (see page 1962)), and components that manage the layout of HTML controls (TLayoutGroup (see page 1939)). At design time, you can add these Web items to the form using the Web page editor.

Using the Web Page Editor

37.1.36.1 TQueryForm Members

The following tables list the members exposed by TQueryForm.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 1844)	This is AssignStringsCallback, a member of class TCustomQueryForm.
	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.

	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
	GetHTMLFormTag (see page 1844)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
	ImplAddElements (see page 1844)	Provides the underlying implementation for the AddElements method.
	ImplAddElements (see page 2108)	Provides the underlying implementation for the AddElements (see page 2105) method.
	ImplCanAddClass (see page 1845)	Provides the underlying implementation for the CanAddClass method.
	ImplCanAddClass (see page 2109)	Provides the underlying implementation for the CanAddClass (see page 2105) method.
	ImplContent (see page 1845)	Provides the underlying implementation for the Content method.
	ImplContent (see page 2109)	Provides the underlying implementation for the Content (see page 2106) method.
	MethodString (see page 1846)	This is MethodString, a member of class TCustomQueryForm.
	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
	AssignStrings (see page 1843)	Assigns values to display controls from a list of name/value pairs.
	Create (see page 1843)	Creates and initializes an instance of TCustomQueryForm (see page 1841).
	Create (see page 2104)	Creates and initializes an instance of TWebForm (see page 2102).
	Destroy (see page 2104)	Frees an instance of TWebForm (see page 2102).
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.
	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

Published Properties

	Name	Description
	Action (see page 1974)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 1974)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 1975)	Specifies the METHOD header of messages that the query form submits.
	Style (see page 1975)	Adds style attributes to the generated form.
	StyleRule (see page 1975)	Applies a style in the page producer's style sheet to the button.

37.1.36.2 TQueryForm Properties

The properties of the TQueryForm class are listed here.

Published Properties

	Name	Description
	Action (see page 1974)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 1974)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 1975)	Specifies the METHOD header of messages that the query form submits.
	Style (see page 1975)	Adds style attributes to the generated form.
	StyleRule (see page 1975)	Applies a style in the page producer's style sheet to the button.

37.1.36.2.1 TQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property UnicodeString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 1841)

PathInfo

PathInfo

37.1.36.2.2 TQueryForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 2111)

37.1.36.2.3 TQueryForm.Method Property

Specifies the METHOD header of messages that the query form submits.

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

Description

Set Method to specify the METHOD header for messages that the query form submits. This value gives rise to the MethodType property of the HTTP request message. By matching this to the MethodType property of Web action items, a Web dispatcher determines what objects handle these messages.

See Also

TCustomQueryForm (see page 1841)

PathInfo

PathInfo

37.1.36.2.4 TQueryForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 2110)

StyleRule (see page 2111)

37.1.36.2.5 TQueryForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 2111)

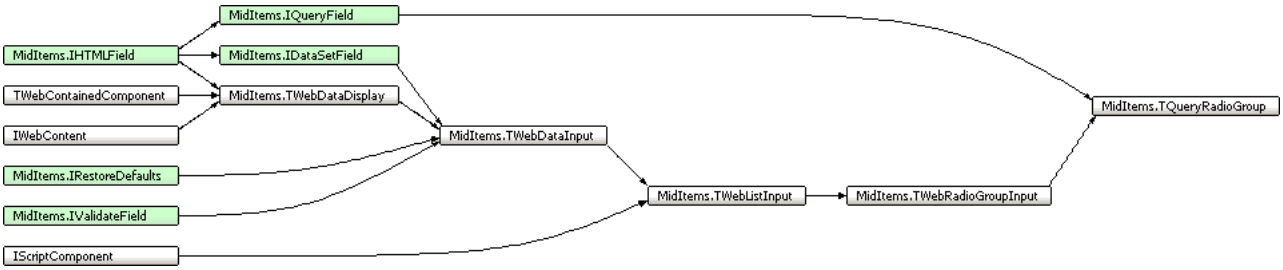
Styles (see page 2272)

StylesFile (see page 2273)

37.1.37 TQueryRadioGroup Class

TQueryRadioGroup creates an HTML radio group control to represent named parameter.

Class Hierarchy



Pascal

```
TQueryRadioGroup = class(TWebRadioGroupInput, IQueryField);
```

C++

```
class TQueryRadioGroup : public TWebRadioGroupInput, public IQueryField;
```

File

MidItems

Description

Add TQueryRadioGroup as the child of a TQueryFieldGroup (see page 1965) component to add a radio group control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 1965) represent the parameters of an XML broker. However, TQueryRadioGroup can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryRadioGroup to

Specify the field or parameter whose value the radio group displays.

Specify the possible values from which the user can choose.

Initialize the value of the radio group.

Specify a caption that describes the value of the radio group.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 1965)

TXMLDisplayGroup (see page 2176)

TXMLBroker

37.1.37.1 TQueryRadioGroup Members

The following tables list the members exposed by TQueryRadioGroup.

Protected Methods

	Name	Description
	AddAttributes (see page 1979)	This is AddAttributes, a member of class TQueryRadioGroup.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 2126)	This is EventContent, a member of class TWebRadioGroupInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 2126)	This is FormatInputs, a member of class TWebRadioGroupInput.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetCheckIndex (see page 1979)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 1980)	This is GetText, a member of class TQueryRadioGroup.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2126)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.

	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2126)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 1980)	This is SetText, a member of class TQueryRadioGroup.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
	Create (see page 2125)	Creates and initializes an instance of TWebRadioGroupInput (see page 2122).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 1980)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1981)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1981)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1982)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1982)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1982)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 1983)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 1983)	Specifies the width of the radio group, in characters.
	FieldName (see page 1984)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1984)	Lists the possible selections that appear in the generated control.

	ItemsField (see page 1985)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 1985)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 1986)	Indicates whether end users can use the generated control to set values.
	Style (see page 1986)	Adds style attributes to the generated display control.
	StyleRule (see page 1986)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1987)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 1987)	Specifies the initial value of the radio group.
	Values (see page 1988)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1988)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.37.2 TQueryRadioGroup Methods

The methods of the TQueryRadioGroup class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 1979)	This is AddAttributes, a member of class TQueryRadioGroup.
	GetCheckIndex (see page 1979)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetText (see page 1980)	This is GetText, a member of class TQueryRadioGroup.
	SetText (see page 1980)	This is SetText, a member of class TQueryRadioGroup.

Public Methods

	Name	Description
	IsQueryField (see page 1980)	Indicates whether the component generates a control that can appear in a query form.

37.1.37.2.1 TQueryRadioGroup.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryRadioGroup.

37.1.37.2.2 TQueryRadioGroup.GetCheckIndex Method

Pascal

```
function GetCheckIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetCheckIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetCheckIndex, a member of class TQueryRadioGroup.

37.1.37.2.3 TQueryRadioGroup.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryRadioGroup.

37.1.37.2.4 TQueryRadioGroup.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 1971)). IsQueryField returns true, because TQueryRadioGroup (see page 1976) is designed specifically for use by TQueryFieldGroup (see page 1965).

See Also

IsColumn (see page 2081)

TQueryFieldGroup (see page 1965)

TQueryForm (see page 1971)

37.1.37.2.5 TQueryRadioGroup.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryRadioGroup.

37.1.37.3 TQueryRadioGroup Properties

The properties of the TQueryRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 1981)	Specifies the text of a label that indicates what information the generated control displays.

	CaptionAttributes (see page 1981)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1982)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1982)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1982)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 1983)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 1983)	Specifies the width of the radio group, in characters.
	FieldName (see page 1984)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1984)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1985)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 1985)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 1986)	Indicates whether end users can use the generated control to set values.
	Style (see page 1986)	Adds style attributes to the generated display control.
	StyleRule (see page 1986)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1987)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 1987)	Specifies the initial value of the radio group.
	Values (see page 1988)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 1988)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.37.3.1 TQueryRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.37.3.2 TQueryRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.37.3.3 TQueryRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.37.3.4 TQueryRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.37.3.5 TQueryRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.37.3.6 TQueryRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 2120)

Items (see page 2120)

DisplayWidth (see page 2127)

37.1.37.3.7 TQueryRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 2127)

Custom (see page 2084)

37.1.37.3.8 TQueryRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.37.3.9 TQueryRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.37.3.10 TQueryRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.37.3.11 TQueryRadioGroup.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 2094)

IsQueryField (see page 2081)

Params

XMLBroker (see page 2187)

Setting Web Item Properties

37.1.37.3.12 TQueryRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 2127)

Custom (see page 2084)

37.1.37.3.13 TQueryRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.37.3.14 TQueryRadioGroup.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.37.3.15 TQueryRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.37.3.16 TQueryRadioGroup.Text Property

Specifies the initial value of the radio group.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value that appears in the generated radio group. This should be one of the values listed in the Items (see page 1984) property or in the field referenced by the ItemsField (see page 1985) property.

See Also

Items (see page 2120)

ItemsField (see page 2120)

37.1.37.3.17 TQueryRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.37.3.18 TQueryRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

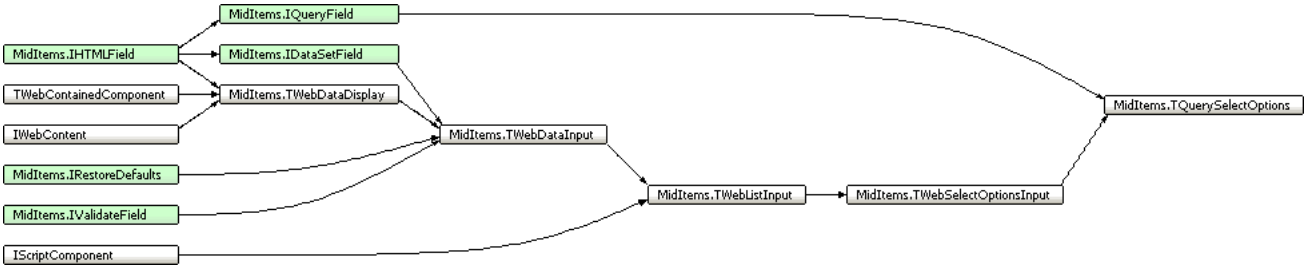
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.38 TQuerySelectOptions Class

TQuerySelectOptions creates an HTML list control to represent a named parameter.

Class Hierarchy



Pascal

```
TQuerySelectOptions = class(TWebSelectOptionsInput, IQueryField);
```

C++

```
class TQuerySelectOptions : public TWebSelectOptionsInput, public IQueryField;
```

File

MidItems

Description

Add TQuerySelectOptions as the child of a TQueryFieldGroup (see page 1965) component to add a list control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 1965) represent the parameters of an XML broker. However, TQuerySelectOptions can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQuerySelectOptions to

Specify the field or parameter whose value the list box displays.

Specify the possible values from which the user can choose.

Assign an initial value to the list box.

Specify a caption that describes the value of the list box.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 1965)

TXMLDisplayGroup (see page 2176)

TXMLBroker

37.1.38.1 TQuerySelectOptions Members

The following tables list the members exposed by TQuerySelectOptions.

Protected Methods

	Name	Description
V	AddAttributes (see page 2131)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 2132)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
A	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 2132)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 1992)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 1992)	This is GetText, a member of class TQuerySelectOptions.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
V	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 1993)	This is SetText, a member of class TQuerySelectOptions.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
	Create (see page 2131)	Creates and initializes an instance of TWebSelectOptionsInput (see page 2128).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 1992)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 1993)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1994)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1994)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1994)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1995)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 1995)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 1996)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1996)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1997)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 1997)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 1998)	Adds style attributes to the generated display control.
	StyleRule (see page 1998)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1999)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 1999)	Specifies the initial value selected in the list box.
	Values (see page 1999)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2000)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.38.2 TQuerySelectOptions Methods

The methods of the TQuerySelectOptions class are listed here.

Protected Methods

	Name	Description
	GetSelectIndex (see page 1992)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetText (see page 1992)	This is GetText, a member of class TQuerySelectOptions.
	SetText (see page 1993)	This is SetText, a member of class TQuerySelectOptions.

Public Methods

	Name	Description
	IsQueryField (see page 1992)	Indicates whether the component generates a control that can appear in a query form.

37.1.38.2.1 TQuerySelectOptions.GetSelectIndex Method

Pascal

```
function GetSelectIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetSelectIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetSelectIndex, a member of class TQuerySelectOptions.

37.1.38.2.2 TQuerySelectOptions.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQuerySelectOptions.

37.1.38.2.3 TQuerySelectOptions.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 1971)). IsQueryField returns true, because TQuerySelectOptions (see page 1989) is designed specifically for use by TQueryFieldGroup (see page 1965).

See Also

IsColumn (see page 2081)

TQueryFieldGroup (see page 1965)

TQueryForm (see page 1971)

37.1.38.2.4 TQuerySelectOptions.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQuerySelectOptions.

37.1.38.3 TQuerySelectOptions Properties

The properties of the TQuerySelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 1993)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 1994)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 1994)	Specifies where the label appears relative to the generated display control.
	Custom (see page 1994)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 1995)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 1995)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 1996)	Specifies the name of the field whose value the generated control represents.
	Items (see page 1996)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 1997)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 1997)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 1998)	Adds style attributes to the generated display control.
	StyleRule (see page 1998)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 1999)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 1999)	Specifies the initial value selected in the list box.
	Values (see page 1999)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2000)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.38.3.1 TQuerySelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.38.3.2 TQuerySelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.38.3.3 TQuerySelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.38.3.4 TQuerySelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.38.3.5 TQuerySelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.38.3.6 TQuerySelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 2120)

Items (see page 2120)

37.1.38.3.7 TQuerySelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.38.3.8 TQuerySelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to

assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.38.3.9 TQuerySelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.38.3.10 TQuerySelectOptions.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the

broker that uses the parameter.

See Also

FieldName (see page 2094)

IsQueryField (see page 2081)

Params

XMLBroker (see page 2187)

Setting Web Item Properties

37.1.38.3.11 TQuerySelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.38.3.12 TQuerySelectOptions.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.38.3.13 TQuerySelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.38.3.14 TQuerySelectOptions.Text Property

Specifies the initial value selected in the list box.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value of the generated list control. Text should specify one of the values listed in the Items (see page 1996) property or referenced by the ItemsField (see page 1997) property.

See Also

Items (see page 2120)

ItemsField (see page 2120)

37.1.38.3.15 TQuerySelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.38.3.16 TQuerySelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

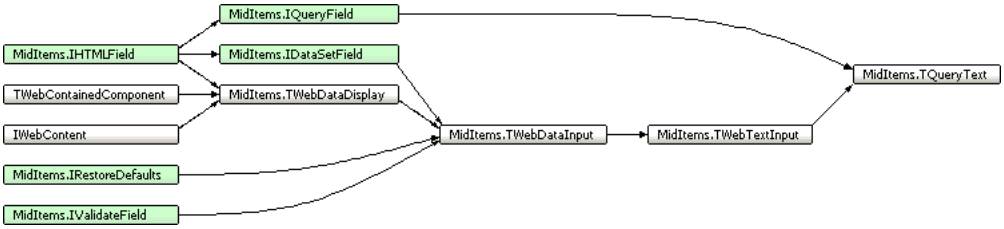
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.39 TQueryText Class

TQueryText creates a single-line HTML input control to represent a named parameter.

Class Hierarchy



Pascal

```
TQueryText = class(TWebTextInput, IQueryField);
```

C++

```
class TQueryText : public TWebTextInput, public IQueryField;
```

File

MidItems

Description

Add TQueryText as the child of a TQueryFieldGroup (see page 1965) component to add an edit control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 1965) represent the parameters of an XML broker. However, TQueryText can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryText to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the input control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 1965)

TXMLDisplayGroup (see page 2176)

TXMLBroker

37.1.39.1 TQueryText Members

The following tables list the members exposed by TQueryText.

Protected Methods

	Name	Description
	AddAttributes (see page 2004)	This is AddAttributes, a member of class TQueryText.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2148)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.

	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 2004)	This is GetText, a member of class TQueryText.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2149)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2149)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 2004)	This is SetText, a member of class TQueryText.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 2003)	Creates and initializes an instance of TQueryText (see page 2000).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2004)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.

	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 2005)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2005)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2006)	Specifies where the label appears relative to the generated display control.
	Custom (see page 2006)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2007)	Specifies the horizontal size of the generated control.
	FieldName (see page 2007)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 2007)	Limits the length of text users can type into the control.
	ParamName (see page 2008)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 2008)	Indicates whether end users can use the generated control to set values.
	Style (see page 2009)	Adds style attributes to the generated display control.
	StyleRule (see page 2009)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2010)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 2010)	Specifies the initial value of the generated control.

37.1.39.2 TQueryText.Create Constructor

Creates and initializes an instance of TQueryText (see page 2000).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryText(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryText (see page 2000) at runtime. TQueryText (see page 2000) components added at design time using the Web Page editor are instantiated automatically.

37.1.39.3 TQueryText Methods

The methods of the TQueryText class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 2004)	This is AddAttributes, a member of class TQueryText.
	GetText (see page 2004)	This is GetText, a member of class TQueryText.
	SetText (see page 2004)	This is SetText, a member of class TQueryText.

Public Methods

	Name	Description
V	IsQueryField (see page 2004)	Indicates whether the component generates a control that can appear in a query form.

37.1.39.3.1 TQueryText.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryText.

37.1.39.3.2 TQueryText.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryText.

37.1.39.3.3 TQueryText.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 1971)). IsQueryField returns true, because TQueryText (see page 2000) is designed specifically for TQueryFieldGroup (see page 1965) to use.

See Also

IsColumn (see page 2081)

TQueryFieldGroup (see page 1965)

TQueryForm (see page 1971)

37.1.39.3.4 TQueryText.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryText.

37.1.39.4 TQueryText Properties

The properties of the TQueryText class are listed here.

Published Properties

	Name	Description
	Caption (see page 2005)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2005)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2006)	Specifies where the label appears relative to the generated display control.
	Custom (see page 2006)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2007)	Specifies the horizontal size of the generated control.
	FieldName (see page 2007)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 2007)	Limits the length of text users can type into the control.
	ParamName (see page 2008)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 2008)	Indicates whether end users can use the generated control to set values.
	Style (see page 2009)	Adds style attributes to the generated display control.
	StyleRule (see page 2009)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2010)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 2010)	Specifies the initial value of the generated control.

37.1.39.4.1 TQueryText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.39.4.2 TQueryText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.39.4.3 TQueryText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.39.4.4 TQueryText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.39.4.5 TQueryText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

37.1.39.4.6 TQueryText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.39.4.7 TQueryText.MaxWidth Property

Limits the length of text users can type into the control.

Pascal

```
property MaxWidth: Integer;
```

C++

```
__property int MaxWidth;
```

Description

Use MaxWidth to limit the length of strings (in characters) that users can type into the generated control.

Note: MaxWidth has no effect on the size of the generated control. To limit the size of the control, use the DisplayWidth (see page 2007) property.

See Also

DisplayWidth (see page 2150)

37.1.39.4.8 TQueryText.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 2094)

IsQueryField (see page 2081)

Params

XMLBroker (see page 2187)

Setting Web Item Properties

37.1.39.4.9 TQueryText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

37.1.39.4.10 TQueryText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.39.4.11 TQueryText.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.39.4.12 TQueryText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.39.4.13 TQueryText.Text Property

Specifies the initial value of the generated control.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value that appears in the generated display control.

See Also

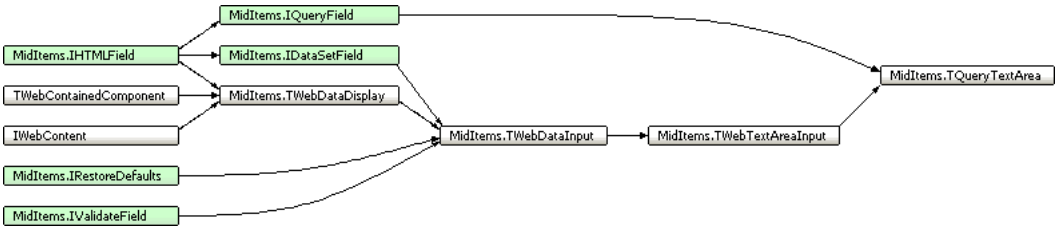
FieldName (see page 2094)

ParamName (see page 2094)

37.1.40 TQueryTextArea Class

TQueryTextArea creates a multi-line HTML input control to represent named parameter.

Class Hierarchy



Pascal

```
TQueryTextArea = class(TWebTextAreaInput, IQueryField);
```

C++

```
class TQueryTextArea : public TWebTextAreaInput, public IQueryField;
```

File

MidItems

Description

Add TQueryTextArea as the child of a TQueryFieldGroup (see page 1965) component to add a multi-line edit control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 1965) represent the parameters of an XML broker. However, TQueryTextArea can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryTextArea to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 1965)

TXMLDisplayGroup (see page 2176)

TXMLBroker

37.1.40.1 TQueryTextArea Members

The following tables list the members exposed by TQueryTextArea.

Protected Methods

	Name	Description
	AddAttributes (see page 2014)	This is AddAttributes, a member of class TQueryTextArea.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2014)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 2142)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 2014)	This is GetText, a member of class TQueryTextArea.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.

	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2143)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2143)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetLines (see page 2015)	This is SetLines, a member of class TQueryTextArea.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 2015)	This is SetText, a member of class TQueryTextArea.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 2013)	Creates and initializes an instance of TQueryTextArea (see page 2010).
	Destroy (see page 2013)	Frees an instance of TQueryTextArea (see page 2010).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2015)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Text (see page 2219)	This is Text, a member of class IQueryField.

Published Properties

	Name	Description
	Caption (see page 2016)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2016)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2017)	Specifies where the label appears relative to the generated display control.
	Custom (see page 2017)	Represents a tag option and its value in the tag for the display control.

	DisplayRows (see page 2017)	Specifies the height of the generated control.
	DisplayWidth (see page 2018)	Specifies the horizontal size of the generated control.
	FieldName (see page 2018)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 2019)	Specifies the initial value that appears in the multi-line edit control.
	ParamName (see page 2019)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 2020)	Indicates whether end users can use the generated control to set values.
	Style (see page 2020)	Adds style attributes to the generated display control.
	StyleRule (see page 2020)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2021)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 2021)	Specifies how the generated control treats lines that are longer than the display width.

37.1.40.2 TQueryTextArea.Create Constructor

Creates and initializes an instance of TQueryTextArea (see page 2010).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryTextArea(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryTextArea (see page 2010) at runtime. TQueryTextArea (see page 2010) components added at design time using the Web Page editor are instantiated automatically.

37.1.40.3 TQueryTextArea.Destroy Destructor

Frees an instance of TQueryTextArea (see page 2010).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQueryTextArea();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

37.1.40.4 TQueryTextArea Methods

The methods of the TQueryTextArea class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 2014)	This is AddAttributes, a member of class TQueryTextArea.
	ControlContent (see page 2014)	Returns the HTML that defines the display control (without its caption).

	GetText (see page 2014)	This is GetText, a member of class TQueryTextArea.
	SetLines (see page 2015)	This is SetLines, a member of class TQueryTextArea.
	SetText (see page 2015)	This is SetText, a member of class TQueryTextArea.

Public Methods

	Name	Description
	IsQueryField (see page 2015)	Indicates whether the component generates a control that can appear in a query form.

37.1.40.4.1 TQueryTextArea.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryTextArea.

37.1.40.4.2 TQueryTextArea.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.40.4.3 TQueryTextArea.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryTextArea.

37.1.40.4.4 TQueryTextArea.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 1971)). IsQueryField returns true, because TQueryTextArea (see page 2010) is designed specifically for TQueryFieldGroup (see page 1965) to use.

See Also

IsColumn (see page 2081)

TQueryFieldGroup (see page 1965)

TQueryForm (see page 1971)

37.1.40.4.5 TQueryTextArea.SetLines Method

Pascal

```
procedure SetLines(const Value: TStrings);
```

C++

```
__fastcall SetLines(const TStrings Value);
```

Description

This is SetLines, a member of class TQueryTextArea.

37.1.40.4.6 TQueryTextArea.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryTextArea.

37.1.40.5 TQueryTextArea Properties

The properties of the TQueryTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 2016)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2016)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2017)	Specifies where the label appears relative to the generated display control.
	Custom (see page 2017)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 2017)	Specifies the height of the generated control.
	DisplayWidth (see page 2018)	Specifies the horizontal size of the generated control.
	FieldName (see page 2018)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 2019)	Specifies the initial value that appears in the multi-line edit control.
	ParamName (see page 2019)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 2020)	Indicates whether end users can use the generated control to set values.
	Style (see page 2020)	Adds style attributes to the generated display control.
	StyleRule (see page 2020)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2021)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 2021)	Specifies how the generated control treats lines that are longer than the display width.

37.1.40.5.1 TQueryTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.40.5.2 TQueryTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.40.5.3 TQueryTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.40.5.4 TQueryTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.40.5.5 TQueryTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 2144)

37.1.40.5.6 TQueryTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 2143)

37.1.40.5.7 TQueryTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.40.5.8 TQueryTextArea.Lines Property

Specifies the initial value that appears in the multi-line edit control.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Use Lines to initialize the value that appears in the generated display control.

Each string in the TStrings object designates a line in the text value. This may affect the formatting, depending on the value of Wrap (see page 2021).

See Also

FieldName (see page 2094)

ParamName (see page 2094)

Wrap (see page 2144)

37.1.40.5.9 TQueryTextArea.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 2094)

IsQueryField (see page 2081)

Params

XMLBroker (see page 2187)

Setting Web Item Properties

37.1.40.5.10 TQueryTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

37.1.40.5.11 TQueryTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.40.5.12 TQueryTextArea.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.40.5.13 TQueryTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.40.5.14 TQueryTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 2144)

37.1.41 TResetQueryButton Class

TResetQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TResetQueryButton = class(TQueryButton);
```

C++

```
class TResetQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TResetQueryButton as the child of a TQueryButtons (see page 1962) component (or a layout group that is a child of a TQueryButtons (see page 1962) component) to enable the generated HTML form to undo edits made in the query form's display fields. The resulting HTML button's action backs out all edits to the values displayed on the query form.

Use the properties of TResetQueryButton to customize the appearance of the button.

See Also

TXMLBroker

TQueryForm (see page 1971)

TQueryButtons (see page 1962)

TLayoutGroup (see page 1939)

37.1.41.1 TResetQueryButton Members

The following tables list the members exposed by TResetQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1955)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 1956)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
V	EventContent (see page 2024)	This is EventContent, a member of class TResetQueryButton.
V	GetCaption (see page 1956)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.

	GetHTMLControlName (see page 1957)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 1957)	This is GetHTMLForm, a member of class TQueryButton.
	GetInputType (see page 1957)	This is GetInputType, a member of class TQueryButton.
	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 1957)	This is GetXMLComponent, a member of class TQueryButton.
	ImplContent (see page 1958)	Provides the underlying implementation for the Content method.
	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
	Notification (see page 1958)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 1959)	This is ParentXMLComponent, a member of class TQueryButton.
	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetXMLComponent (see page 1959)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 1959)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
	Create (see page 2023)	Creates and initializes an instance of TResetQueryButton (see page 2022).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.

Published Properties

	Name	Description
	Caption (see page 1959)	Specifies the caption that appears on the button.
	Custom (see page 1960)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1960)	Adds style attributes to the generated button control.
	StyleRule (see page 1961)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1961)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 1962)	Specifies whether the button is associated with its parent's query form.

37.1.41.2 TResetQueryButton.Create Constructor

Creates and initializes an instance of TResetQueryButton (see page 2022).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TResetQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TResetQueryButton (see page 2022) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.41.3 TResetQueryButton Methods

The methods of the TResetQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 2024)	This is EventContent, a member of class TResetQueryButton.

37.1.41.3.1 TResetQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

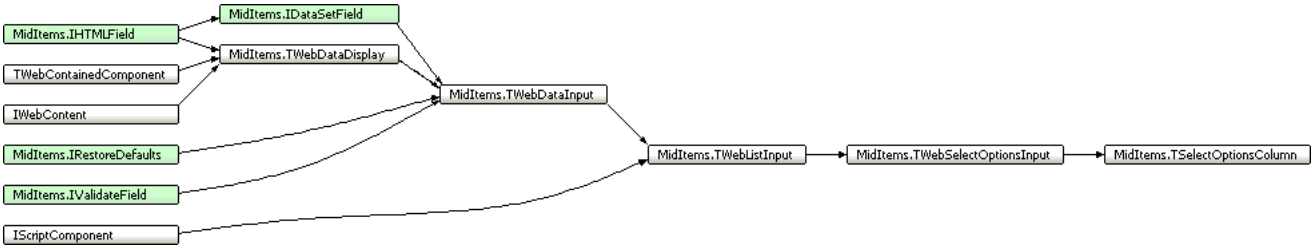
Description

This is EventContent, a member of class TResetQueryButton.

37.1.42 TSelectOptionsColumn Class

TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TSelectOptionsColumn = class(TWebSelectOptionsInput);
```

C++

```
class TSelectOptionsColumn : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TSelectOptionsColumn as the child of a TDataGrid (see page 1850) component to add a list control as the display control for a column. TSelectOptionsColumn represents the value of a field in the TDataGrid (see page 1850)'s associated dataset.

Use the properties and methods of TSelectOptionsColumn to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify the caption that appears at the top of the column.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TDataGrid (see page 1850)

TXMLDisplayGroup (see page 2176)

37.1.42.1 TSelectOptionsColumn Members

The following tables list the members exposed by TSelectOptionsColumn.

Protected Methods

	Name	Description
V	AddAttributes (see page 2131)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 2132)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
A	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 2132)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 2132)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
V	SetCaption (see page 2092)	Sets the value of the Caption property.

	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
V	Create (see page 2131)	Creates and initializes an instance of TWebSelectOptionsInput (see page 2128).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
V	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 2027)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 2028)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2028)	Customizes the appearance of the generated control's label.
	Custom (see page 2028)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 2029)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 2029)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 2030)	Specifies the name of the field whose value the generated control represents.
	Items (see page 2030)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2031)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 2031)	Adds style attributes to the generated display control.
	StyleRule (see page 2032)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2032)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 2032)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2033)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.42.2 TSelectOptionsColumn Methods

The methods of the TSelectOptionsColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 2027)	Indicates whether the component generates a control that can appear in the column of a data grid.

37.1.42.2.1 TSelectOptionsColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 1850)). IsColumn returns true, because TSelectOptionsColumn (see page 2024) is designed specifically for TDataGrid (see page 1850) to use.

See Also

IsColumn (see page 2081)

TDataGrid (see page 1850)

37.1.42.3 TSelectOptionsColumn Properties

The properties of the TSelectOptionsColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 2028)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2028)	Customizes the appearance of the generated control's label.
	Custom (see page 2028)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 2029)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 2029)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 2030)	Specifies the name of the field whose value the generated control represents.
	Items (see page 2030)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2031)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 2031)	Adds style attributes to the generated display control.
	StyleRule (see page 2032)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2032)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 2032)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2033)	Indicates which field in DataSet supplies the possible values for the generated control.

37.1.42.3.1 TSelectOptionsColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.42.3.2 TSelectOptionsColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.42.3.3 TSelectOptionsColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator

key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.42.3.4 TSelectOptionsColumn.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.42.3.5 TSelectOptionsColumn.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 2120)

Items (see page 2120)

37.1.42.3.6 TSelectOptionsColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.42.3.7 TSelectOptionsColumn.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.42.3.8 TSelectOptionsColumn.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.42.3.9 TSelectOptionsColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.42.3.10 TSelectOptionsColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.42.3.11 TSelectOptionsColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.42.3.12 TSelectOptionsColumn.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.42.3.13 TSelectOptionsColumn.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

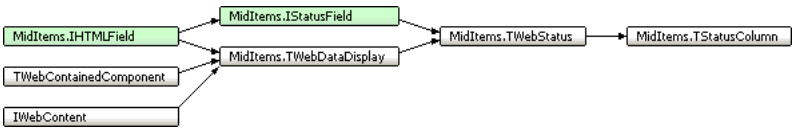
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.43 TStatusColumn Class

TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.

Class Hierarchy



Pascal

```
TStatusColumn = class(TWebStatus);
```

C++

```
class TStatusColumn : public TWebStatus;
```

File

MidItems

Description

Add TStatusColumn as the child of a TDataGrid (see page 1850) component to provide feedback about whether records in the grid have been modified. The generated control displays an M if the user has edited a record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TStatusColumn to

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 1850)

TXMLDisplayGroup (see page 2176)

37.1.43.1 TStatusColumn Members

The following tables list the members exposed by TStatusColumn.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2135)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2136)	Returns the value of the Caption property.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2136)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.

	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Create (see page 2135)	Creates and initializes an instance of TWebStatus (see page 2133).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	Identifier (see page 2136)	Returns the name under which record status information is stored in the XML data packet.
V	IsColumn (see page 2035)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	CaptionPosition (see page 2138)	Specifies where the label appears relative to the generated display control.
	DisplayWidth (see page 2138)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

Published Properties

	Name	Description
	Caption (see page 2036)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2036)	Customizes the appearance of the generated control's label.
	Custom (see page 2037)	Represents a tag option and its value in the tag for the display control.
	Style (see page 2037)	Adds style attributes to the generated display control.
	StyleRule (see page 2038)	Applies a style in the page producer's style sheet to the generated display control.

37.1.43.2 TStatusColumn Methods

The methods of the TStatusColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 2035)	Indicates whether the component generates a control that can appear in the column of a data grid.

37.1.43.2.1 TStatusColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web item generates a control that represents a column in a data grid (TDataGrid (see page 1850)). IsColumn returns true, because TStatusColumn (see page 2033) is designed specifically for TDataGrid (see page 1850) to use.

See Also

IsColumn (see page 2081)

TDataGrid (see page 1850)

37.1.43.3 TStatusColumn Properties

The properties of the TStatusColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 2036)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2036)	Customizes the appearance of the generated control's label.
	Custom (see page 2037)	Represents a tag option and its value in the tag for the display control.
	Style (see page 2037)	Adds style attributes to the generated display control.
	StyleRule (see page 2038)	Applies a style in the page producer's style sheet to the generated display control.

37.1.43.3.1 TStatusColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.43.3.2 TStatusColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are

added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.43.3.3 TStatusColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.43.3.4 TStatusColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.43.3.5 TStatusColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.44 TSubmitQueryButton Class

TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TSubmitQueryButton = class(TQueryButton);
```

C++

```
class TSubmitQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TSubmitQueryButton as the child of a TQueryButtons (see page 1962) component (or a layout group that is a child of a TQueryButtons (see page 1962) component) to enable the generated HTML form to send the values entered in the query form back to the Web application. When the user presses the generated button, the values in the query form are sent to the Web application, using the path info specified by the query form's Action property.

Use the properties of TSubmitQueryButton to customize the appearance of the button.

See Also

TXMLBroker

TQueryForm (see page 1971)

TQueryButtons (see page 1962)

TLayoutGroup (see page 1939)

TCustomQueryForm (see page 1841)

37.1.44.1 TSubmitQueryButton Members

The following tables list the members exposed by TSubmitQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1955)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 1956)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
V	EventContent (see page 2040)	This is EventContent, a member of class TSubmitQueryButton.
V	GetCaption (see page 1956)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
V	GetHTMLControlName (see page 1957)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 1957)	This is GetHTMLForm, a member of class TQueryButton.
V	GetInputType (see page 1957)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 1957)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 1958)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 1958)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 1959)	This is ParentXMLComponent, a member of class TQueryButton.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetXMLComponent (see page 1959)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 1959)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
V	Create (see page 2040)	Creates and initializes an instance of TSubmitQueryButton (see page 2038).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.

Published Properties

	Name	Description
	Caption (see page 1959)	Specifies the caption that appears on the button.
	Custom (see page 1960)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1960)	Adds style attributes to the generated button control.
	StyleRule (see page 1961)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1961)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 1962)	Specifies whether the button is associated with its parent's query form.

37.1.44.2 TSubmitQueryButton.Create Constructor

Creates and initializes an instance of TSubmitQueryButton (see page 2038).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSubmitQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TSubmitQueryButton (see page 2038) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.44.3 TSubmitQueryButton Methods

The methods of the TSubmitQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 2040)	This is EventContent, a member of class TSubmitQueryButton.

37.1.44.3.1 TSubmitQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

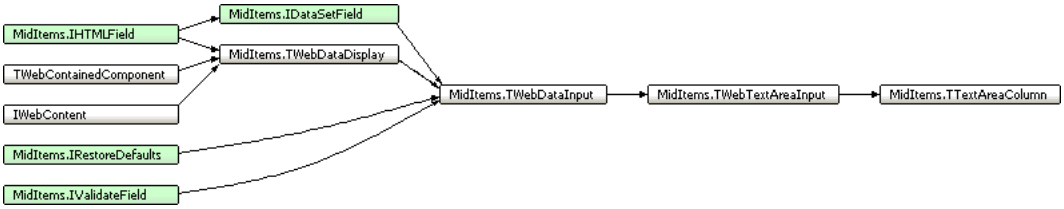
Description

This is EventContent, a member of class TSubmitQueryButton.

37.1.45 TTextAreaColumn Class

TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TTextAreaColumn = class(TWebTextAreaInput);
```

C++

```
class TTextAreaColumn : public TWebTextAreaInput;
```

File

MidItems

Description

Add TTextAreaColumn as the child of a TDataGrid (see page 1850) component to add a multi-line edit control as the display control for a column. TTextAreaColumn represents the value of a field in the TDataGrid (see page 1850)'s associated dataset.

Use the properties and methods of TTextAreaColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TQueryTextArea (see page 2010)

37.1.45.1 TTextAreaColumn Members

The following tables list the members exposed by TTextAreaColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 2142)	This is AddAttributes, a member of class TWebTextAreaInput.

	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2142)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 2142)	This is EventContent, a member of class TWebTextAreaInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 2143)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 2143)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
V	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Create (see page 2141)	Creates and initializes an instance of TWebTextAreaInput (see page 2138).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.

	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 2043)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 2044)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2044)	Customizes the appearance of the generated control's label.
	Custom (see page 2045)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 2045)	Specifies the height of the generated control.
	DisplayWidth (see page 2046)	Specifies the horizontal size of the generated control.
	FieldName (see page 2046)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 2046)	Indicates whether end users can use the generated control to set values.
	Style (see page 2047)	Adds style attributes to the generated display control.
	StyleRule (see page 2047)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2048)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 2048)	Specifies how the generated control treats lines that are longer than the display width.

37.1.45.2 TTextAreaColumn Methods

The methods of the TTextAreaColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 2043)	Indicates whether the component generates a control that can appear in the column of a data grid.

37.1.45.2.1 TTextAreaColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 1850)). IsColumn returns true, because TTextAreaColumn (see page 2041) is designed specifically for TDataGrid (see page 1850) to use.

See Also

IsColumn (see page 2081)

TDataGrid (see page 1850)

37.1.45.3 TTextAreaColumn Properties

The properties of the TTextAreaColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 2044)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2044)	Customizes the appearance of the generated control's label.
	Custom (see page 2045)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 2045)	Specifies the height of the generated control.
	DisplayWidth (see page 2046)	Specifies the horizontal size of the generated control.
	FieldName (see page 2046)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 2046)	Indicates whether end users can use the generated control to set values.
	Style (see page 2047)	Adds style attributes to the generated display control.
	StyleRule (see page 2047)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2048)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 2048)	Specifies how the generated control treats lines that are longer than the display width.

37.1.45.3.1 TTextAreaColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.45.3.2 TTextAreaColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.45.3.3 TTextAreaColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.45.3.4 TTextAreaColumn.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 2144)

37.1.45.3.5 TTextAreaColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 2143)

37.1.45.3.6 TTextAreaColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.45.3.7 TTextAreaColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

37.1.45.3.8 TTextAreaColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.45.3.9 TTextAreaColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.45.3.10 TTextAreaColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.45.3.11 TTextAreaColumn.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

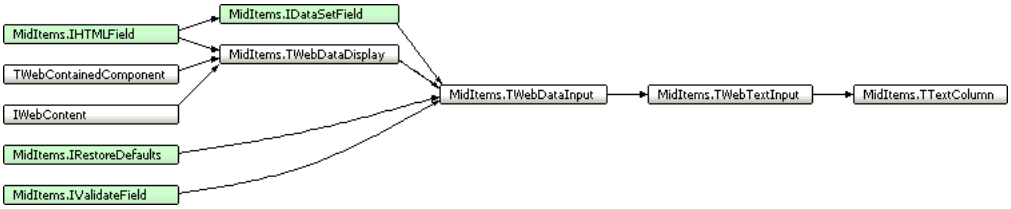
See Also

DisplayWidth (see page 2144)

37.1.46 TTextColumn Class

TTextColumn creates a single-line HTML input control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TTextColumn = class(TWebTextInput);
```

C++

```
class TTextColumn : public TWebTextInput;
```

File

MidItems

Description

Add TTextColumn as the child of a TDataGrid (see page 1850) component to add an edit control as the display control for a column. TTextColumn represents the value of a field in the TDataGrid (see page 1850)'s associated dataset.

Use the properties and methods of TTextColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 1850)

TXMLDisplayGroup (see page 2176)

37.1.46.1 TTextColumn Members

The following tables list the members exposed by TTextColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 2148)	This is AddAttributes, a member of class TWebTextInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
	ControlContent (see page 2148)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.

	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 2149)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 2149)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
	Create (see page 2147)	Creates and initializes an instance of TWebTextInput (see page 2145).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2051)	Indicates whether the component generates a control that can appear in the column of a data grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.

	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 2052)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2052)	Customizes the appearance of the generated control's label.
	Custom (see page 2053)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2053)	Specifies the horizontal size of the generated control.
	FieldName (see page 2053)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 2054)	Indicates whether end users can use the generated control to set values.
	Style (see page 2054)	Adds style attributes to the generated display control.
	StyleRule (see page 2055)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2055)	Determines the position of the generated control in the HTML form's tab order.

37.1.46.2 TTextColumn Methods

The methods of the TTextColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 2051)	Indicates whether the component generates a control that can appear in the column of a data grid.

37.1.46.2.1 TTextColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 1850)). IsColumn returns true, because TTextColumn (see page 2049) is designed specifically for TDataGrid (see page 1850) to use.

See Also

IsColumn (see page 2081)

TDataGrid (see page 1850)

37.1.46.3 TTextColumn Properties

The properties of the TTextColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 2052)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2052)	Customizes the appearance of the generated control's label.
	Custom (see page 2053)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2053)	Specifies the horizontal size of the generated control.
	FieldName (see page 2053)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 2054)	Indicates whether end users can use the generated control to set values.
	Style (see page 2054)	Adds style attributes to the generated display control.
	StyleRule (see page 2055)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2055)	Determines the position of the generated control in the HTML form's tab order.

37.1.46.3.1 TTextColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.46.3.2 TTextColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.46.3.3 TTextColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.46.3.4 TTextColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

37.1.46.3.5 TTextColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.46.3.6 TTextColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

37.1.46.3.7 TTextColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.46.3.8 TTextColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.46.3.9 TTextColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.47 TUndoButton Class

TUndoButton generates an HTML control that backs out changes to the current record.

Class Hierarchy

Pascal

```
TUndoButton = class(TDataSetButton);
```

C++

```
class TUndoButton : public TDataSetButton;
```

File

MidItems

Description

Add TUndoButton as the child of a TDataNavigator (see page 1855) component (or a layout group that is a child of a TDataNavigator (see page 1855) component) to enable the generated HTML form to undo edits made in an associated display control or controls. The resulting HTML button's action backs out all edits to the current record.

Use the properties of TUndoButton to customize the appearance of the button and associate it with a Web item that generates the display controls.

See Also

TXMLBroker

TDataNavigator (see page 1855)

TLayoutGroup (see page 1939)

37.1.47.1 TUndoButton Members

The following tables list the members exposed by TUndoButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 1862)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 1862)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 1862)	This is AddElements, a member of class TDataSetButton.
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 1862)	Returns the value of the Caption property.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 1863)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 1863)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 1863)	This is ImplAddElements, a member of class TDataSetButton.

	ImplContent (see page 1863)	Provides the underlying implementation for the Content method.
	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
	Notification (see page 2194)	Forwards notification messages to all owned components.
	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 2057)	Creates and initializes an instance of TUndoButton (see page 2055).
	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 1864)	Specifies the caption that appears on the button.
	Custom (see page 1865)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 1865)	Adds style attributes to the generated button control.
	StyleRule (see page 1865)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 1866)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 1866)	Specifies whether the button is associated with its parent's display object.

37.1.47.2 TUndoButton.Create Constructor

Creates and initializes an instance of TUndoButton (see page 2055).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TUndoButton(TComponent * AOwner);
```

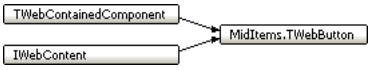
Description

Call Create to instantiate TUndoButton (see page 2055) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.48 TWebButton Class

TWebButton is the base class for Web items that create HTML button controls.

Class Hierarchy



Pascal

```
TWebButton = class(TWebContainedComponent, IWebContent);
```

C++

```
class TWebButton : public TWebContainedComponent, public IWebContent;
```

File

MidItems

Description

Use TWebButton as a base class for components that generate the HTML statements defining a specialized button control in a WebSnap or InternetExpress application. TWebButton introduces the properties and methods for

Generating the HTML code to define the button control.

Defining a button caption.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

In order to allow other Web items to use the HTML generated by the button control, TWebButton implements the IWebContent interface.

Do not create instances of TWebButton. TWebButton relies on an abstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TWebButton that represent buttons with specific purposes.

See Also

TDeleteButton (see page 1867)

TFirstButton (see page 1913)

TInsertButton (see page 1935)

TLastButton (see page 1937)

TNextButton (see page 1943)

TNextPageButton (see page 1945)

TPostButton (see page 1947)

TPriorButton (see page 1949)

TPriorPageButton (see page 1951)

TUndoButton (see page 2055)

TResetQueryButton (see page 2022)

TSubmitQueryButton (see page 2038)

TApplyUpdatesButton (see page 1798)

IWebContent

37.1.48.1 TWebButton Members

The following tables list the members exposed by TWebButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.

Public Methods

	Name	Description
	Create (see page 2059)	Creates and initializes an instance of TWebButton (see page 2058).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.

37.1.48.2 TWebButton.Create Constructor

Creates and initializes an instance of TWebButton (see page 2058).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebButton(TComponent * AOwner);
```

Description

Call Create to instantiate a Web button at runtime. Web buttons added at design time using the Web Page editor are instantiated automatically.

37.1.48.3 TWebButton Methods

The methods of the TWebButton class are listed here.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.

	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.

37.1.48.3.1 TWebButton.Content Method

Returns the HTML that defines the button control.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Content implements the IWebContent method of the same name. This method allows the Web button's parent to extract the HTML defining the button.

Content calls the virtual ImplContent (see page 2061) method to provide the content it returns. Each TWebButton (see page 2058) descendant overrides ImplContent (see page 2061) to generate the definition of its particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the button control.

See Also

ImplContent (see page 2061)

IWebContent

ILayoutWebContent

37.1.48.3.2 TWebButton.GetCaption Method

Returns the value of the Caption (see page 2062) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 2062) property.

See Also

Caption (see page 2062)

SetCaption (see page 2061)

37.1.48.3.3 TWebButton.GetLayoutAttributes Method

Returns the layout object that specifies how the generated control should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 2060) method) to take into account layout properties of the child component.

As implemented by TWebButton (see page 2058), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout of buttons does not make use of layout attributes.

See Also

Content (see page 2060)

37.1.48.3.4 TWebButton.ImplContent Method

Provides the underlying implementation for the Content (see page 2060) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout Layout) = 0;
```

Description

The Content (see page 2060) method calls ImplContent to generate the HTML that defines the button control. TWebButton (see page 2058) introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton (see page 2058) descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 2060)

ILayoutWebContent

37.1.48.3.5 TWebButton.SetCaption Method

Sets the value of the Caption (see page 2062) property.

Pascal

```
procedure SetCaption(const AValue: string); virtual;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString AValue);
```

Description

SetCaption is the protected write implementation for the Caption (see page 2062) property.

See Also

Caption (see page 2062)

GetCaption (see page 2060)

37.1.48.4 TWebButton Properties

The properties of the TWebButton class are listed here.

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.

37.1.48.4.1 TWebButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 2062)

GetCaption (see page 2060)

SetCaption (see page 2061)

37.1.48.4.2 TWebButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption

and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 2062)

Style (see page 2063)

37.1.48.4.3 TWebButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 2062)

StyleRule (see page 2063)

37.1.48.4.4 TWebButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style (see page 2063) property.

See Also

Style (see page 2063)

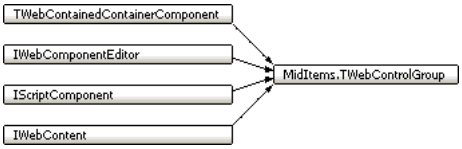
37.1.49 TWebControlGroup Class

TWebControlGroup is the base class for Web items that arrange HTML controls.

Class Hierarchy



Pascal

```
TWebControlGroup = class(TWebContainedContainerComponent, IWebComponentEditor,
IScriptComponent, IWebContent);
```

C++

```
class TWebControlGroup : public TWebContainedContainerComponent, public IWebComponentEditor,
public IScriptComponent, public IWebContent;
```

File

MidItems

Description

Use TWebControlGroup as a base class for components that generate organized portions of the HTML document containing one or more related HTML controls. TWebControlGroup introduces the properties and methods for managing a collection of Web items that generate the HTML controls that make up the group.

In order to let other Web items to use the HTML that defines the organized collection of controls, TWebControlGroup implements the IWebContent interface.

Do not create instances of TWebControlGroup. TWebControlGroup manages the Web items that generate HTML defining controls, but does not combine the generated content into any content of its own. Instead, use a descendant of TWebControlGroup for a set of specialized controls. These descendants are listed in the See also list.

TAdapterForm

37.1.49.1 TWebControlGroup Members

The following tables list the members exposed by TWebControlGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).

Public Properties

	Name	Description
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

37.1.49.2 TWebControlGroup.Create Constructor

Creates and initializes an instance of TWebControlGroup (see page 2064).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebControlGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TWebControlGroup (see page 2064) at runtime. TWebControlGroup (see page 2064) descendants added at design time are instantiated automatically.

37.1.49.3 TWebControlGroup.Destroy Destructor

Frees an instance of TWebControlGroup (see page 2064).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebControlGroup();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

37.1.49.4 TWebControlGroup Methods

The methods of the TWebControlGroup class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.

37.1.49.4.1 TWebControlGroup.AddElements Method

Used internally to generate any script declarations needed by the group of controls.

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

The page producer calls AddElements when it generates the block of declarations for the script language it uses. This method allows the generated group of controls to use classes and methods in the scripting language of the page producer.

AddElements calls on the virtual ImplAddElements (see page 2069) method, which uses the provided interface to return its

declarations. Each TWebControlGroup (see page 2064) descendant overrides ImplAddElements (see page 2069) to add any declarations it needs.

See Also

ImplAddElements (see page 2069)

TAdapterPageProducer

TInetXPageProducer (see page 2285)

37.1.49.4.2 TWebControlGroup.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the TWebControlGroup (see page 2064) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 2070) method to determine whether a class of Web item is valid.

AParent is the TWebControlGroup (see page 2064) descendant to whose WebFieldControls (see page 2072) property the Web item will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the TWebControlGroup (see page 2064) descendant can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 2070)

WebFieldControls (see page 2072)

37.1.49.4.3 TWebControlGroup.ChangeFieldControls Method

Responds when the group of HTML controls changes.

Pascal

```
procedure ChangeFieldControls(Sender: TObject);
```

C++

```
__fastcall ChangeFieldControls(TObject * Sender);
```

Description

ChangeFieldControls is called automatically when the list of Web items that generate HTML controls in this group changes. (It is assigned as the OnChange event handler to the TWebComponentList object that implements the WebFieldControls (see page 2072) property.)

ChangeFieldControls sets the DefaultWebComponents (see page 2072) property to nil (Delphi) or NULL (C++) when an application explicitly assigns child items to the WebFieldControls (see page 2072) property.

See Also

OnChange

WebFieldControls (see page 2072)

DefaultWebComponents (see page 2072)

37.1.49.4.4 TWebControlGroup.Content Method

Returns the HTML that defines the group of HTML controls.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebControlGroup (see page 2064) object's parent to extract the HTML that defines and lays out a set of controls.

Content calls the virtual ImplContent (see page 2070) method to provide the HTML it returns. Each TWebControlGroup (see page 2064) descendant overrides ImplContent (see page 2070) to generate its particular group of controls. The generated HTML can make use of any script declarations supplied by the AddElements (see page 2066) method.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the group of controls.

See Also

ImplContent (see page 2070)

IWebContent

AddElements (see page 2066)

ILayoutWebContent

37.1.49.4.5 TWebControlGroup.GetDefaultWebComponents Method

Returns the value of the DefaultWebComponents (see page 2072) property.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents returns the value of DefaultWebComponents (see page 2072). When no Web items have explicitly been added to the control group, this is a list of controls that appear by default. Once an application explicitly assigns controls to the WebFieldControls (see page 2072) property, GetDefaultWebComponents returns nil (Delphi) or NULL (C++).

See Also

WebFieldControls (see page 2072)

DefaultWebComponents (see page 2072)

SetDefaultWebComponents (see page 2071)

37.1.49.4.6 TWebControlGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 2068) method) to take into account layout properties of the child component.

As implemented by TWebControlGroup (see page 2064), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup (see page 2064) descendants not make use of layout attributes.

See Also

Content (see page 2068)

37.1.49.4.7 TWebControlGroup.GetSubComponents Method

Returns the value of the WebFieldControls (see page 2072) property.

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

GetSubComponents returns the TWebControlGroup (see page 2064)'s list of Web items that it uses to generate HTML content. This method is part of the mechanism that fits TWebControlGroup (see page 2064) into a hierarchy of Web items, each of which generates part of a larger HTML document.

See Also

WebFieldControls (see page 2072)

ImplGetSubComponents (see page 2071)

37.1.49.4.8 TWebControlGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements (see page 2066) method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements (see page 2066) method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup (see page 2064), ImplAddElements does nothing. TWebControlGroup (see page 2064) descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.49.4.9 TWebControlGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 2067) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 2067) method calls ImpleCanAddClass to determine whether the TWebControlGroup (see page 2064) descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup (see page 2064) instance to which the component will be added.

In TWebControlGroup (see page 2064), ImplCanAddClass always returns true. TWebControlGroup (see page 2064) descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 2067)

WebFieldControls (see page 2072)

37.1.49.4.10 TWebControlGroup.ImplContent Method

Provides the underlying implementation for the Content (see page 2068) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 2068) method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup (see page 2064), ImplContent returns an empty string. TWebControlGroup (see page 2064) descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup (see page 2064)

should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 2068)

AddElements (see page 2066)

ILayoutWebContent

37.1.49.4.11 TWebControlGroup.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents (see page 2069) method.

Pascal

```
function ImplGetSubComponents: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents (see page 2069) method calls ImplGetSubComponents to retrieve the value of WebFieldControls (see page 2072) as a TObject. TWebControlGroup (see page 2064) descendants override this method if the list is not simply the value of WebFieldControls (see page 2072). For example, some TWebControlGroup (see page 2064) descendants supply a default value (DefaultWebComponents (see page 2072)) when the WebFieldControls (see page 2072) property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 2069)

DefaultWebComponents (see page 2072)

WebFieldControls (see page 2072)

37.1.49.4.12 TWebControlGroup.SetDefaultWebComponents Method

Sets the value of the DefaultWebComponents (see page 2072) property.

Pascal

```
procedure SetDefaultWebComponents(Value: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList Value);
```

Description

SetDefaultWebComponents assigns a list of Web items as the value of the DefaultWebComponents (see page 2072) property. This list specifies the controls that appear in the control group if the application does not explicitly assign any controls to the WebFieldControls (see page 2072) property.

See Also

DefaultWebComponents (see page 2072)

GetDefaultWebComponents (see page 2068)

WebFieldControls (see page 2072)

37.1.49.5 TWebControlGroup Properties

The properties of the TWebControlGroup class are listed here.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Public Properties

	Name	Description
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

37.1.49.5.1 TWebControlGroup.DefaultWebComponents Property

Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Most TWebControlGroup (see page 2064) descendants have a default set of values for the WebFieldControls (see page 2072) property.

Note: For example, on Windows, TDataNavigator (see page 1855) has a default set of buttons and TFieldGroup (see page 1869) defaults to a control for each field in the associated data packet.

TWebControlGroup (see page 2064) descendants that supply default sets of Web items store these default sets as the value of the protected DefaultWebComponents property. Then, if the value of WebFieldControls (see page 2072) is not set, the TWebControlGroup (see page 2064) descendant uses DefaultWebComponents instead.

See Also

WebFieldControls (see page 2072)

37.1.49.5.2 TWebControlGroup.WebFieldControls Property

Lists the components that generate HTML controls for the Web control group.

Pascal

```
property WebFieldControls: TWebComponentList;
```

C++

```
__property TWebComponentList WebFieldControls;
```

Description

WebFieldControls lists the components that generate the related HTML controls that the Web control group assembles into a single unit. Each of these components supports the IWebContent interface, and some can contain their own list of Web items that help them generate their content.

The type of items that can be added to the WebFieldControls list are restricted by the CanAddClass (see page 2067) method. TWebControlGroup (see page 2064) does not restrict the items in the list at all, but descendant classes add restrictions to limit the list to related types of controls.

Note: For example, on Windows, TDataNavigator (see page 1855) limits the list to button generators that are descendants of TDataSetButton (see page 1859) or TXMLButton (see page 2151).

At design time, add components to the WebFieldControls property by bringing up the Web page editor for the containing page producer. Select the Web control group in the editor, and use the editor to add child controls.

TInetXPageProducer (see page 2285)

TAdapterPageProducer

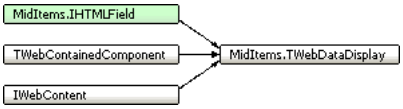
IWebContent

CanAddClass (see page 2067)

37.1.50 TWebDataDisplay Class

TWebDataDisplay is the base class for Web items that create HTML display controls.

Class Hierarchy



Pascal

```
TWebDataDisplay = class(TWebContainedComponent, IWebContent, IHTMLField);
```

C++

```
class TWebDataDisplay : public TWebContainedComponent, public IWebContent, public IHTMLField;
```

File

MidItems

Description

Use TWebDataDisplay as a base class for components that generate HTML controls which display information in a WebSnap or InternetExpress application. TWebDataDisplay descendants generate the individual controls that are organized by TAdapterGrid or TAdapterFieldGroup.

Note: On Windows, additional descendants, TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965), can be used to generate the individual controls.

TWebDataDisplay introduces the properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataDisplay implements the IWebContent interface.

Do not create instances of TWebDataDisplay. TWebDataDisplay relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataDisplay that generates an HTML control of the desired type.

IWebContent

TAdapterGrid

TAdapterFieldGroup

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

37.1.50.1 TWebDataDisplay Members

The following tables list the members exposed by TWebDataDisplay.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

37.1.50.2 TWebDataDisplay.Create Constructor

Creates and initializes an instance of TWebDataDisplay (see page 2073).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebDataDisplay(TComponent * AOwner);
```

Description

Call Create to instantiate TWebDataDisplay (see page 2073) at runtime. TWebDataDisplay (see page 2073) descendants added at design time are instantiated automatically.

37.1.50.3 TWebDataDisplay.Destroy Destructor

Frees an instance of TWebDataDisplay (see page 2073).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDataDisplay();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component is not nil, and only then calls Destroy.

See Also

System::TObject::Free

37.1.50.4 TWebDataDisplay Methods

The methods of the TWebDataDisplay class are listed here.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.

	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

Public Methods

	Name	Description
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

37.1.50.4.1 TWebDataDisplay.Content Method

Returns the HTML that defines the display control.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebDataDisplay (see page 2073) component's parent to extract the HTML defining the display control.

Content calls the virtual ImplContent (see page 2080) method to provide the HTML content that it returns. Each TWebDataDisplay (see page 2073) descendant overrides ImplContent (see page 2080) to generate the definition of its particular control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML control it generates. It supports the ILayoutWebContent interface.

Content returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

IWebContent

ILayoutWebContent

37.1.50.4.2 TWebDataDisplay.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options) = 0;
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption (see page 2077) method.

TWebDataDisplay (see page 2073) introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.50.4.3 TWebDataDisplay.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataDisplay.

37.1.50.4.4 TWebDataDisplay.FormatCaption Method

Returns the HTML for the display control's caption.

Pascal

```
function FormatCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString FormatCaption();
```

Description

FormatCaption generates the HTML for the display control's caption, using the attributes specified by the CaptionAttributes (see page 2084) property. FormatCaption returns the resulting string of HTML.

In addition, FormatCaption encodes the layout properties of the caption and the value of the CaptionPosition (see page 2084) property into the LayoutAttributes (see page 2085) property. The TWebDataDisplay (see page 2073) component uses this

value later to lay out the control and its caption appropriately.

See Also

Caption (see page 2083)

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

LayoutAttributes (see page 2085)

37.1.50.4.5 TWebDataDisplay.GetCaption Method

Returns the value of the Caption (see page 2083) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 2083) property.

See Also

Caption (see page 2083)

37.1.50.4.6 TWebDataDisplay.GetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function GetHTMLControlName: string;
```

C++

```
__fastcall UnicodeString GetHTMLControlName();
```

Description

GetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

GetHTMLControlName returns the value supplied by the ImplGetHTMLControlName (see page 2081) method. Unlike GetHTMLControlName, ImplGetHTMLControlName (see page 2081) is a virtual method that descendants can override to supply a name in class-specific ways.

See Also

ImplGetHTMLControlName (see page 2081)

37.1.50.4.7 TWebDataDisplay.GetHTMLForm Method

Used internally to retrieve information about the form in which the display control is defined.

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

TWebDataDisplay (see page 2073) and its descendants use GetHTMLForm to obtain information about the form in which the generated display control appears. This information is used to generate code for calling form methods in response to user events.

GetHTMLForm walks up the hierarchy of Web items (using the GetParentComponent method) until it finds a component that can supply an interface for the HTML form.

See Also

GetParentComponent

37.1.50.4.8 TWebDataDisplay.GetLayoutAttributes Method

Returns the value of the LayoutAttributes (see page 2085) property.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 2076) method) to take into account layout properties of the child component.

GetLayoutAttributes returns the value of the LayoutAttributes (see page 2085) property.

See Also

Content (see page 2076)

LayoutAttributes (see page 2085)

37.1.50.4.9 TWebDataDisplay.GetXmlDisplayName Method

Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.

Pascal

```
function GetXmlDisplayName: string;
```

C++

```
__fastcall UnicodeString GetXmlDisplayName();
```

Description

GetXmlDisplayName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 2073) for descendant classes that are only accessible on Windows.

On Windows, GetXmlDisplayName returns the name of the javascript object that groups the set of display controls which includes this TWebDataDisplay (see page 2073) descendant's generated control. The javascript object is generated by a TDataGrid (see page 1850) or TFieldGroup (see page 1869) component, and provides the display component's link to its XML data packet. Typically, the TDataGrid (see page 1850) or TFieldGroup (see page 1869) component is the parent of the TWebDataDisplay (see page 2073) component, but it may be higher in the parent hierarchy if the application uses layout

groups.

See Also

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

XMLBroker (see page 2187)

37.1.50.4.10 TWebDataDisplay.GetXmlRowSetName Method

Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.

Pascal

```
function GetXmlRowSetName: string;
```

C++

```
__fastcall UnicodeString GetXmlRowSetName();
```

Description

GetXmlRowSetName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 2073) for descendant classes that are only accessible on Windows.

On Windows, GetXmlRowSetName is used when generating HTML that accesses data from the XML data packet. It returns the name of the rowset that represents the data in the Web data display.

As implemented in TWebDataDisplay (see page 2073), GetXmlRowSetName walks up the parent hierarchy until it finds a Web item associated with a rowset, and then returns the name of that rowset.

See Also

GetXmlDisplayName (see page 2079)

37.1.50.4.11 TWebDataDisplay.ImplContent Method

Provides the underlying implementation for the Content (see page 2076) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 2076) method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent (see page 2077) method. ControlContent (see page 2077) is an abstract (pure virtual) method in TWebDataDisplay (see page 2073). TWebDataDisplay (see page 2073) descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay (see page 2073) should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

See Also

Content (see page 2076)

Caption (see page 2083)

ILayoutWebContent

37.1.50.4.12 TWebDataDisplay.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay (see page 2073) descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name

37.1.50.4.13 TWebDataDisplay.IsColumn Method

Indicates whether the component generates the controls that appear in the column of a grid.

Pascal

```
class function IsColumn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a TWebDataDisplay (see page 2073) descendant generates the controls that appear in a single column of an adapter grid (TAdapterGrid) or data grid (TDataGrid (see page 1850)). As implemented in TWebDataDisplay (see page 2073), IsColumn returns false. Descendant classes that generate controls for the columns of a grid override this method to return true.

See Also

IsQueryField (see page 2081)

TDataGrid (see page 1850)

TAdapterGrid

37.1.50.4.14 TWebDataDisplay.IsQueryField Method

Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Pascal

```
class function IsQueryField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

IsQueryField is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 2073) for descendant classes that are only used on Windows.

On Windows, Call IsQueryField to determine whether a TWebDataDisplay (see page 2073) descendant generates the controls that represent a named value in a query form (TQueryForm (see page 1971)). As implemented in TWebDataDisplay (see page 2073), IsQueryField returns false. Descendant classes that generate controls for a TQueryFieldGroup (see page 1965) component override this method to return true.

See Also

IsColumn (see page 2081)

TQueryFieldGroup (see page 1965)

TQueryForm (see page 1971)

37.1.50.4.15 TWebDataDisplay.LabelContent Method

Returns the HTML for the display control's caption.

Pascal

```
function LabelContent: string; virtual;
```

C++

```
virtual __fastcall UnicodeString LabelContent();
```

Description

The ImplContent (see page 2080) method calls LabelContent to provide the HTML for the label of the generated display control. LabelContent calls the FormatCaption (see page 2077) method to produce this HTML and returns the resulting string.

See Also

FormatCaption (see page 2077)

Caption (see page 2083)

ImplContent (see page 2080)

37.1.50.4.16 TWebDataDisplay.SetCaption Method

Sets the value of the Caption (see page 2083) property.

Pascal

```
procedure SetCaption(Value: string); virtual;
```

C++

```
virtual __fastcall SetCaption(UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption (see page 2083) property.

See Also

Caption (see page 2083)

37.1.50.4.17 TWebDataDisplay.SetCaptionAttributes Method

Sets the value of the CaptionAttributes (see page 2084) property.

Pascal

```
procedure SetCaptionAttributes(const Value: TCaptionAttributes);
```

C++

```
__fastcall SetCaptionAttributes(const TCaptionAttributes Value);
```

Description

SetCaptionAttributes is the protected write implementation for the CaptionAttributes (see page 2084) property.

See Also

CaptionAttributes (see page 2084)

37.1.50.5 TWebDataDisplay Properties

The properties of the TWebDataDisplay class are listed here.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

37.1.50.5.1 TWebDataDisplay.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.50.5.2 TWebDataDisplay.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption (see page 2083) property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.50.5.3 TWebDataDisplay.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.50.5.4 TWebDataDisplay.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay (see page 2073) descendants generate different HTML tags to generate the control that displays

information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes (see page 2084) property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.50.5.5 TWebDataDisplay.LayoutAttributes Property

Encodes attributes that describe how the generated control should look.

Pascal

```
property LayoutAttributes: TLayoutAttributes;
```

C++

```
__property TLayoutAttributes LayoutAttributes;
```

Description

LayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 2076) method) to take into account layout properties of the child component.

LayoutAttributes encodes the information in the CaptionPosition (see page 2084) and CaptionAttributes (see page 2084) properties. Some descendant classes add information from the Style (see page 2085) and StyleRule (see page 2086) properties as well.

See Also

GetLayoutAttributes (see page 2079)

CaptionPosition (see page 2084)

Content (see page 2076)

Style (see page 2085)

CaptionAttributes (see page 2084)

StyleRule (see page 2086)

37.1.50.5.6 TWebDataDisplay.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes (see page 2084) property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.50.5.7 TWebDataDisplay.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 2085) property instead.

Note: To apply a style to the control's label, use the CaptionAttributes (see page 2084) property instead.

See Also

Style (see page 2085)

Styles (see page 2272)

Styles

StylesFile (see page 2273)

StylesFile

CaptionAttributes (see page 2084)

37.1.50.5.8 TWebDataDisplay.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

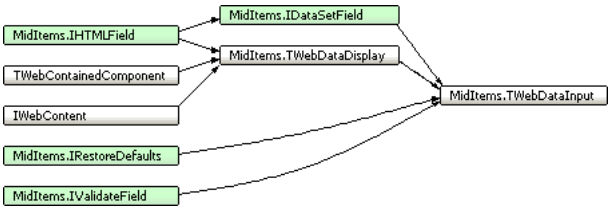
Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

37.1.51 TWebDataInput Class

TWebDataInput is the base class for Web items that create HTML display controls for entering information.

Class Hierarchy



Pascal

```
TWebDataInput = class(TWebDataDisplay, IRestoreDefaults, IDataSetField, IValidateField);
```

C++

```
class TWebDataInput : public TWebDataDisplay, public IRestoreDefaults, public IDataSetField,
public IValidateField;
```

File

MidItems

Description

Use TWebDataInput as a base class for components that generate HTML controls which display information in an InternetExpress application and into which users can enter values. TWebDataInput descendants generate controls that are organized by TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965).

TWebDataInput defines or inherits properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Specifying a field or parameter whose value the control displays.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebDataInput. TWebDataInput relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataInput that generates an HTML control of the desired type.

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

37.1.51.1 TWebDataInput Members

The following tables list the members exposed by TWebDataInput.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2075)	Creates and initializes an instance of TWebDataDisplay (see page 2073).

	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

37.1.51.2 TWebDataInput Methods

The methods of the TWebDataInput class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

37.1.51.2.1 TWebDataInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataInput.

37.1.51.2.2 TWebDataInput.FindAssociatedField Method

Pascal

```
function FindAssociatedField(DataSet: IInetXWebDataSet): TField; virtual;
```

C++

```
virtual __fastcall TField FindAssociatedField(IInetXWebDataSet DataSet);
```

Description

This is FindAssociatedField, a member of class TWebDataInput.

37.1.51.2.3 TWebDataInput.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 2083)

37.1.51.2.4 TWebDataInput.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall UnicodeString GetFieldName();
```

Description

This is GetFieldName, a member of class TWebDataInput.

37.1.51.2.5 TWebDataInput.GetParamName Method

Pascal

```
function GetParamName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetParamName();
```

Description

This is GetParamName, a member of class TWebDataInput.

37.1.51.2.6 TWebDataInput.GetRowSetFieldAttributes Method

Pascal

```
function GetRowSetFieldAttributes(const FieldVarName: string): string;
```

C++

```
__fastcall UnicodeString GetRowSetFieldAttributes(const UnicodeString FieldVarName);
```

Description

This is GetRowSetFieldAttributes, a member of class TWebDataInput.

37.1.51.2.7 TWebDataInput.ImplGetFieldName Method

Pascal

```
function ImplGetFieldName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetFieldName();
```

Description

This is ImplGetFieldName, a member of class TWebDataInput.

37.1.51.2.8 TWebDataInput.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name

37.1.51.2.9 TWebDataInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetRowSetFieldAttributes(const UnicodeString
FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.

37.1.51.2.10 TWebDataInput.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TWebDataInput.

37.1.51.2.11 TWebDataInput.RestoreDefaults Method

Returns the Web item to a default state.

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

The Web page editor calls RestoreDefaults when the user chooses the Restore Defaults command. Web items implement this method to return property values to a default state.

37.1.51.2.12 TWebDataInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); virtual;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebDataInput.

37.1.51.2.13 TWebDataInput.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(Value: string); override;
```

C++

```
virtual __fastcall SetCaption(UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

See Also

Caption (see page 2083)

37.1.51.2.14 TWebDataInput.SetFieldName Method

Pascal

```
procedure SetFieldName(Value: string);
```

C++

```
__fastcall SetFieldName(UnicodeString Value);
```

Description

This is SetFieldName, a member of class TWebDataInput.

37.1.51.2.15 TWebDataInput.SetParamName Method

Pascal

```
procedure SetParamName(Value: string);
```

C++

```
__fastcall SetParamName(UnicodeString Value);
```

Description

This is SetParamName, a member of class TWebDataInput.

37.1.51.2.16 TWebDataInput.ValidateField Method

Pascal

```
function ValidateField(DataSet: IInetXWebDataSet; AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateField(IInetXWebDataSet DataSet, IAddScriptElements AddIntf);
```

Description

This is ValidateField, a member of class TWebDataInput.

37.1.51.3 TWebDataInput Properties

The properties of the TWebDataInput class are listed here.

Protected Properties

	Name	Description
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Properties

	Name	Description
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.

37.1.51.3.1 TWebDataInput.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

ParamName (see page 2094)

Setting Web Item Properties

37.1.51.3.2 TWebDataInput.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField (see page 2081) method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 2094)

IsQueryField (see page 2081)

37.1.52 TWebDisplay Class

Class Hierarchy

Pascal

```
TWebDisplay = class(TObject);
```

C++

```
class TWebDisplay : public TObject;
```

File

MidItems

Description

This is class MidItems.TWebDisplay.

37.1.52.1 TWebDisplay Members

The following tables list the members exposed by TWebDisplay.

Protected Methods

	Name	Description
	Changed (see page 2096)	This is Changed, a member of class TWebDisplay.
V	ChangedDisplayComponent (see page 2096)	This is ChangedDisplayComponent, a member of class TWebDisplay.
V	GetDisplayComponent (see page 2096)	This is GetDisplayComponent, a member of class TWebDisplay.
	SetDisplayComponent (see page 2097)	This is SetDisplayComponent, a member of class TWebDisplay.

Public Events

	Name	Description
	OnChange (see page 2098)	This is OnChange, a member of class TWebDisplay.

Public Methods

	Name	Description
	Create (see page 2095)	This is Create, a member of class TWebDisplay.
V	Notification (see page 2097)	This is Notification, a member of class TWebDisplay.

Public Properties

	Name	Description
	DisplayComponent (see page 2097)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 2097)	This is Parent, a member of class TWebDisplay.

37.1.52.2 TWebDisplay.Create Constructor

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TWebDisplay(TComponent * AParent);
```

Description

This is Create, a member of class TWebDisplay.

37.1.52.3 TWebDisplay Methods

The methods of the TWebDisplay class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2096)	This is Changed, a member of class TWebDisplay.
V	ChangedDisplayComponent (see page 2096)	This is ChangedDisplayComponent, a member of class TWebDisplay.
V	GetDisplayComponent (see page 2096)	This is GetDisplayComponent, a member of class TWebDisplay.
	SetDisplayComponent (see page 2097)	This is SetDisplayComponent, a member of class TWebDisplay.

Public Methods

	Name	Description
V	Notification (see page 2097)	This is Notification, a member of class TWebDisplay.

37.1.52.3.1 TWebDisplay.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TWebDisplay.

37.1.52.3.2 TWebDisplay.ChangedDisplayComponent Method

Pascal

```
procedure ChangedDisplayComponent; virtual;
```

C++

```
virtual __fastcall ChangedDisplayComponent();
```

Description

This is ChangedDisplayComponent, a member of class TWebDisplay.

37.1.52.3.3 TWebDisplay.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TWebDisplay.

37.1.52.3.4 TWebDisplay.Notification Method

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); virtual;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This is Notification, a member of class TWebDisplay.

37.1.52.3.5 TWebDisplay.SetDisplayComponent Method

Pascal

```
procedure SetDisplayComponent(const Value: TComponent);
```

C++

```
__fastcall SetDisplayComponent(const TComponent * Value);
```

Description

This is SetDisplayComponent, a member of class TWebDisplay.

37.1.52.4 TWebDisplay Properties

The properties of the TWebDisplay class are listed here.

Public Properties

	Name	Description
	DisplayComponent (see page 2097)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 2097)	This is Parent, a member of class TWebDisplay.

37.1.52.4.1 TWebDisplay.DisplayComponent Property

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

This is DisplayComponent, a member of class TWebDisplay.

37.1.52.4.2 TWebDisplay.Parent Property

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

This is Parent, a member of class TWebDisplay.

37.1.52.5 TWebDisplay Events

The events of the TWebDisplay class are listed here.

Public Events

	Name	Description
	OnChange (see page 2098)	This is OnChange, a member of class TWebDisplay.

37.1.52.5.1 TWebDisplay.OnChange Event

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

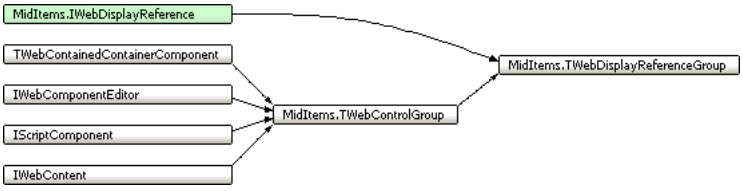
Description

This is OnChange, a member of class TWebDisplay.

37.1.53 TWebDisplayReferenceGroup Class

TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.

Class Hierarchy



Pascal

```
TWebDisplayReferenceGroup = class(TWebControlGroup, IWebDisplayReference);
```

C++

```
class TWebDisplayReferenceGroup : public TWebControlGroup, public IWebDisplayReference;
```

File

MidItems

Description

Use TWebDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of button controls. Each TWebDisplayReferenceGroup object has an associated Web item that generates controls that display data in the final HTML document. The controls arranged by TWebDisplayReferenceGroup manipulate the information the display controls show.

In order to let other Web items use the HTML that the TWebDisplayReferenceGroup object generates, TWebDisplayReferenceGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TWebDisplayReferenceGroup. TWebDisplayReferenceGroup manages the Web items that generate buttons and the association to a display generator, but does not produce any content. Instead, use a descendant of TWebDisplayReferenceGroup such as TDataNavigator (see page 1855) (in InternetExpress applications) or TAdapterCommandGroup (in WebSnap applications).

See Also

TDataNavigator (see page 1855)

IWebContent

TAdapterCommandGroup

37.1.53.1 TWebDisplayReferenceGroup Members

The following tables list the members exposed by TWebDisplayReferenceGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetWebDisplayComponent (see page 2100)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 2069)	Provides the underlying implementation for the AddElements (see page 2066) method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	Notification (see page 2101)	Forwards notification messages to all owned components.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
V	SetWebDisplayComponent (see page 2101)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
R	WebDisplay (see page 2102)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 2102)	

Public Methods

	Name	Description
V	Create (see page 2100)	Creates an instance of TWebDisplayReferenceGroup (see page 2098).
V	Destroy (see page 2100)	Frees an instance of TWebDisplayReferenceGroup (see page 2098).

Public Properties

	Name	Description
	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.

37.1.53.2 TWebDisplayReferenceGroup.Create Constructor

Creates an instance of TWebDisplayReferenceGroup (see page 2098).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebDisplayReferenceGroup(TComponent * AOwner);
```

Description

Call TWebDisplayReferenceGroup (see page 2098) to instantiate TWebDisplayReferenceGroup (see page 2098) at runtime. TWebDisplayReferenceGroup (see page 2098) components added at design time are instantiated automatically.

37.1.53.3 TWebDisplayReferenceGroup.Destroy Destructor

Frees an instance of TWebDisplayReferenceGroup (see page 2098).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDisplayReferenceGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object is not nil before calling Destroy.

See Also

System::TObject::Free

37.1.53.4 TWebDisplayReferenceGroup Methods

The methods of the TWebDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
	GetWebDisplayComponent (see page 2100)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	Notification (see page 2101)	Forwards notification messages to all owned components.
	SetWebDisplayComponent (see page 2101)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

37.1.53.4.1 TWebDisplayReferenceGroup.GetWebDisplayComponent Method

Pascal

```
function GetWebDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetWebDisplayComponent();
```

Description

This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

37.1.53.4.2 TWebDisplayReferenceGroup.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.53.4.3 TWebDisplayReferenceGroup.SetWebDisplayComponent Method

Pascal

```
procedure SetWebDisplayComponent(const Value: TComponent); virtual;
```

C++

```
virtual __fastcall SetWebDisplayComponent(const TComponent * Value);
```

Description

This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

37.1.53.5 TWebDisplayReferenceGroup Properties

The properties of the TWebDisplayReferenceGroup class are listed here.

Protected Properties

	Name	Description
	WebDisplay (see page 2102)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 2102)	

37.1.53.5.1 TWebDisplayReferenceGroup.WebDisplay Property

Pascal

```
property WebDisplay: TWebDisplay;
```

C++

```
__property TWebDisplay WebDisplay;
```

Description

This is WebDisplay, a member of class TWebDisplayReferenceGroup.

37.1.53.5.2 TWebDisplayReferenceGroup.WebDisplayComponent Property

Pascal

```
property WebDisplayComponent: TComponent;
```

C++

```
__property TComponent * WebDisplayComponent;
```

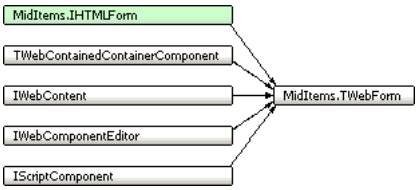
See Also

GetWebDisplayComponent (see page 2228)

37.1.54 TWebForm Class

TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.

Class Hierarchy



Pascal

```
TWebForm = class(TWebContainedContainerComponent, IWebContent, IWebComponentEditor,
IScriptComponent, IHTMLForm);
```

C++

```
class TWebForm : public TWebContainedContainerComponent, public IWebContent, public
IWebComponentEditor, public IScriptComponent, public IHTMLForm;
```

File

MidItems

Description

Use TWebForm as a base class for components that generate the HTML statements defining a form that is contained in an HTML document. The list of Web items that generate content for an InternetExpress page producer can only contain descendants of TWebForm.

In order to allow the InternetExpress page producer to use the HTML generated by the TWebForm descendant, TWebForm implements the IWebContent interface. In order to allow other Web items to generate javascript that refers to form elements, TWebForm implements the IHTMLForm (see page 2211) interface.

Do not create instances of TWebForm. TWebForm relies on an abstract or, in C++ terminology, pure virtual method to generate the HTML form. Instead, create descendants of TWebForm such a TDataForm (see page 1847) or TQueryForm (see page 1971).

See Also

TQueryForm (see page 1971)

TDataForm (see page 1847)

TBasePageItemsProducer (see page 2966)

TInetXPageProducer (see page 2285)

IWebContent

IHTMLForm (see page 2211)

37.1.54.1 TWebForm Members

The following tables list the members exposed by TWebForm.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
V	ImplAddElements (see page 2108)	Provides the underlying implementation for the AddElements (see page 2105) method.
A	ImplCanAddClass (see page 2109)	Provides the underlying implementation for the CanAddClass (see page 2105) method.
A	ImplContent (see page 2109)	Provides the underlying implementation for the Content (see page 2106) method.
V	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
V	Create (see page 2104)	Creates and initializes an instance of TWebForm (see page 2102).
V	Destroy (see page 2104)	Frees an instance of TWebForm (see page 2102).

Public Properties

	Name	Description
	Custom (see page 2110)	Represents a tag option and its value in the generated FORM tag.
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.
	Style (see page 2111)	Adds style attributes to the generated form.
	StyleRule (see page 2111)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

37.1.54.2 TWebForm.Create Constructor

Creates and initializes an instance of TWebForm (see page 2102).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TWebForm(TComponent * AComponent);
```

Description

Call Create to instantiate a TWebForm (see page 2102) descendant at runtime. TWebForm (see page 2102) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.54.3 TWebForm.Destroy Destructor

Frees an instance of TWebForm (see page 2102).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebForm();
```

Description

Destroy removes the form generator from its parent's list of components that generate HTML before freeing the TWebForm (see page 2102) instance.

37.1.54.4 TWebForm Methods

The methods of the TWebForm class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 2105)	Used internally to generate any javascript declarations needed by the form.

	CanAddClass (see page 2105)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.
	Content (see page 2106)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 2106)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 2107)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2107)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 2107)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 2108)	Returns the value of the WebComponents (see page 2112) property.
	GetVisibleFields (see page 2108)	Returns the value of the VisibleFields (see page 2112) property.
V	ImplAddElements (see page 2108)	Provides the underlying implementation for the AddElements (see page 2105) method.
A	ImplCanAddClass (see page 2109)	Provides the underlying implementation for the CanAddClass (see page 2105) method.
A	ImplContent (see page 2109)	Provides the underlying implementation for the Content (see page 2106) method.
V	SetDefaultWebComponents (see page 2110)	Prevents an application from trying to assign a default set of Web items on the form.

37.1.54.4.1 TWebForm.AddElements Method

Used internally to generate any javascript declarations needed by the form.

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

The InternetExpress page producer calls AddElements when it generates the block of javascript declarations in its HTML document. This method allows the generated form to use javascript classes and methods.

AddElements calls on the virtual ImplAddElements (see page 2108) method, which uses the provided interface to return javascript declarations. Each TWebForm (see page 2102) descendant overrides ImplAddElements (see page 2108) to add any declarations it needs.

See Also

ImplAddElements (see page 2108)

TInetXPageProducer (see page 2285)

37.1.54.4.2 TWebForm.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebComponents (see page 2112) property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the TWebForm (see page 2102) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 2109) method to determine whether a class of Web item is valid.

AParent is the TWebForm (see page 2102) descendant to whose WebComponents (see page 2112) property the Web item

will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web form can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 2109)

WebComponents (see page 2112)

37.1.54.4.3 TWebForm.Content Method

Returns the HTML that defines the HTML form.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Content implements the IWebContent method of the same name. This method allows the page producer to extract the HTML defining the form.

Content calls the virtual ImplContent (see page 2109) method to provide the HTML form it returns. Each TWebForm (see page 2102) descendant overrides ImplContent (see page 2109) to generate its particular HTML form. The generated HTML can make use of any javascript declarations supplied by the AddElements (see page 2105) method.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML form it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

Content returns a string of HTML defining the form.

See Also

ImplContent (see page 2109)

IWebContent

AddElements (see page 2105)

37.1.54.4.4 TWebForm.GetDefaultWebComponents Method

Returns nil (Delphi) or NULL (C++).

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents is implemented by all Web items that use sub Web items when generating HTML. (TWebForm (see page 2102) uses the subitems in the WebComponents (see page 2112) property). This method returns a list of Web items that are used by default when an application does not explicitly assign child Web items.

In TWebForm (see page 2102), GetDefaultWebComponents returns nil (Delphi) or NULL (C++) because Web forms do not any set of items that appear by default.

See Also

WebComponents (see page 2112)

GetDefaultWebComponents

37.1.54.4.5 TWebForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormName();
```

Description

TWebForm (see page 2102) uses GetHTMLFormName internally to specify the NAME option of the generated form and to declare a javascript variable that references the form.

GetHTMLFormName returns the value of the Name property.

See Also

GetHTMLFormVarName (see page 2107)

Name

37.1.54.4.6 TWebForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormVarName();
```

Description

TWebForm (see page 2102) uses GetHTMLFormVarName internally to declare a javascript variable that references the form. GetHTMLFormVarName returns the value of the Name property.

See Also

GetHTMLFormName (see page 2107)

Name

37.1.54.4.7 TWebForm.GetLayoutAttributes Method

Returns the object that specifies how the generated form should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 2106) method) to take into account layout properties of the child component.

As implemented by TWebForm (see page 2102), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout at the form level does not make use of layout attributes.

See Also

Content (see page 2106)

37.1.54.4.8 TWebForm.GetSubComponents Method

Returns the value of the WebComponents (see page 2112) property.

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

GetSubComponents returns the TWebForm (see page 2102)'s list of Web items that it uses to generate HTML content. This method is part of the mechanism that fits TWebForm (see page 2102) into a hierarchy of Web items, each of which generates part of a larger HTML document.

See Also

WebComponents (see page 2112)

37.1.54.4.9 TWebForm.GetVisibleFields Method

Returns the value of the VisibleFields (see page 2112) property.

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

GetVisibleFields is the protected read implementation of the VisibleFields (see page 2112) property.

See Also

VisibleFields (see page 2112)

37.1.54.4.10 TWebForm.ImplAddElements Method

Provides the underlying implementation for the AddElements (see page 2105) method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements (see page 2105) method calls ImplAddElements to add any javascript declarations by calling the AddIntf interface. These declarations allow the generated display control to call javascript methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebForm (see page 2102), ImplAddElements does nothing. TWebForm (see page 2102) descendants can override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2105)

37.1.54.4.11 TWebForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 2105) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass) = 0;
```

Description

The CanAddClass (see page 2105) method calls ImpleCanAddClass to determine whether the TWebForm (see page 2102) descendant can add a component of type AClass to its WebComponents (see page 2112) property list. AParent is the TWebForm (see page 2102) instance to which the component will be added.

In TWebForm (see page 2102), ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm (see page 2102) descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 2105)

WebComponents (see page 2112)

37.1.54.4.12 TWebForm.ImplContent Method

Provides the underlying implementation for the Content (see page 2106) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout Layout) = 0;
```

Description

The Content (see page 2106) method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm (see page 2102). TWebForm (see page 2102) descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm (see page 2102) should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

Content (see page 2106)

AddElements (see page 2105)

37.1.54.4.13 TWebForm.SetDefaultWebComponents Method

Prevents an application from trying to assign a default set of Web items on the form.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents is implemented by all Web items that use sub Web items when generating HTML. (TWebForm (see page 2102) uses the subitems in the WebComponents (see page 2112) property). This method assigns a list of Web items that are used by default when an application does not explicitly assign child Web items.

In TWebForm (see page 2102), SetDefaultWebComponents does nothing with the list supplied as the AList parameter. This is because web forms do not have default items.

See Also

WebComponents (see page 2112)

SetDefaultWebComponents

37.1.54.5 TWebForm Properties

The properties of the TWebForm class are listed here.

Protected Properties

	Name	Description
R	VisibleFields (see page 2112)	Lists the Web items whose generated content appears in the HTML form.

Public Properties

	Name	Description
	Custom (see page 2110)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 2111)	Adds style attributes to the generated form.
	StyleRule (see page 2111)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 2112)	Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

37.1.54.5.1 TWebForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm (see page 2102) descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 2111)

37.1.54.5.2 TWebForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm (see page 2102) descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 2110)

StyleRule (see page 2111)

37.1.54.5.3 TWebForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile

property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 2111) property.

See Also

Style (see page 2111)

Styles (see page 2272)

StylesFile (see page 2273)

37.1.54.5.4 TWebForm.VisibleFields Property

Lists the Web items whose generated content appears in the HTML form.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

VisibleFields is used internally when assembling the HTML form from the HTML generated by the form's Web items. For TWebForm (see page 2102), the value of VisibleFields is always the same as WebComponents (see page 2112).

Override GetVisibleFields (see page 2108) in a descendant class to provide a default set of that appear when the WebComponents (see page 2112) property is not set.

See Also

WebComponents (see page 2112)

37.1.54.5.5 TWebForm.WebComponents Property

Maintains a list of components that generate HTML content for the TWebForm (see page 2102) descendant.

Pascal

```
property WebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList WebComponents;
```

Description

WebComponents lists the components that generate content for the Web form. Each of these components supports the IWebContent interface, and some can contain their own list of Web items that help them generate their content.

The type of items that can be added to the WebComponents list are restricted by the protected CanAddClass (see page 2105) method. Descendant classes override this method to indicate what types of items can be added to the list. For example, TQueryForm (see page 1971) limits the list to components that display or manipulate named values (TQueryButtons (see page 1962), TQueryFields) or layout groups that manage the layout of those items (TLayoutGroup (see page 1939)).

At design time, add components to the WebComponents property by bringing up the Web page editor for the containing TInetXPageProducer (see page 2285) component. Select the TWebForm (see page 2102) descendant in the editor, and use the editor to add child controls.

See Also

IWebContent

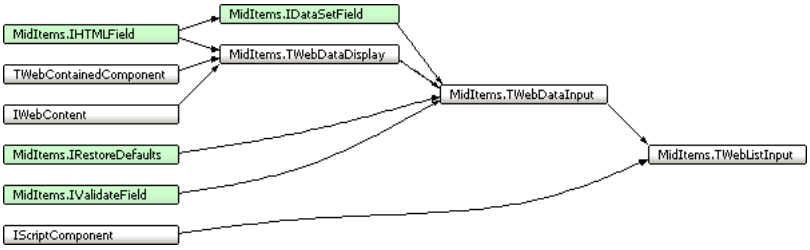
TInetXPageProducer (see page 2285)

CanAddClass (see page 2105)

37.1.55 TWebListInput Class

TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.

Class Hierarchy



Pascal

```
TWebListInput = class(TWebDataInput, IScriptComponent);
```

C++

```
class TWebListInput : public TWebDataInput, public IScriptComponent;
```

File

MidItems

Description

Use TWebListInput as a base class for components that generate HTML controls for displaying a fixed set of possible values from which a user can choose. TWebListInput descendants generate controls that are organized by TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965).

TWebListInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebListInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebListInput. Instead, use a descendant of TWebListInput such as TFieldRadioGroup (see page 1874), TQueryRadioGroup (see page 1976), TFieldSelectOptions (see page 1884), TQuerySelectOptions (see page 1989), or TSelectOptionsColumn (see page 2024).

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TFieldRadioGroup (see page 1874)

TQueryRadioGroup (see page 1976)

TFieldSelectOptions (see page 1884)

TQuerySelectOptions (see page 1989)

TSelectOptionsColumn (see page 2024)

37.1.55.1 TWebListInput Members

The following tables list the members exposed by TWebListInput.

Protected Methods

	Name	Description
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
A	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.

	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2116)	Creates and initializes an instance of TWebListInput (see page 2113).
	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 2119)	Specifies a dataset that supplies the possible values listed in the generated control.
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Items (see page 2120)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2120)	Indicates which field in DataSet (see page 2119) supplies the possible selections for the generated control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 2121)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2121)	Indicates which field in DataSet (see page 2119) supplies the possible values for the generated control.

37.1.55.2 TWebListInput.Create Constructor

Creates and initializes an instance of TWebListInput (see page 2113).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebListInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebListInput (see page 2113) at runtime. TWebListInput (see page 2113) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.55.3 TWebListInput.Destroy Destructor

Frees an instance of TWebListInput (see page 2113).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebListInput();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component is not nil, and only then calls Destroy.

See Also

System::TObject::Free

37.1.55.4 TWebListInput Methods

The methods of the TWebListInput class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
A	FormatInputs (see page 2117)	This is FormatInputs, a member of class TWebListInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.

37.1.55.4.1 TWebListInput.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TWebListInput.

37.1.55.4.2 TWebListInput.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.55.4.3 TWebListInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options) = 0;
```

Description

This is FormatInputs, a member of class TWebListInput.

37.1.55.4.4 TWebListInput.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TWebListInput.

37.1.55.4.5 TWebListInput.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TWebListInput.

37.1.55.4.6 TWebListInput.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.55.4.7 TWebListInput.SetDataSet Method

Pascal

```
procedure SetDataSet(const Value: TDataSet);
```

C++

```
__fastcall SetDataSet(const TDataSet Value);
```

Description

This is SetDataSet, a member of class TWebListInput.

37.1.55.4.8 TWebListInput.SetItems Method

Pascal

```
procedure SetItems(const Value: TStrings);
```

C++

```
__fastcall SetItems(const TStrings Value);
```

Description

This is SetItems, a member of class TWebListInput.

37.1.55.4.9 TWebListInput.SetValues Method

Pascal

```
procedure SetValues(const Value: TStrings);
```

C++

```
__fastcall SetValues(const TStrings Value);
```

Description

This is SetValues, a member of class TWebListInput.

37.1.55.5 TWebListInput Properties

The properties of the TWebListInput class are listed here.

Public Properties

	Name	Description
	DataSet (see page 2119)	Specifies a dataset that supplies the possible values listed in the generated control.
	Items (see page 2120)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2120)	Indicates which field in DataSet (see page 2119) supplies the possible selections for the generated control.
	Values (see page 2121)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2121)	Indicates which field in DataSet (see page 2119) supplies the possible values for the generated control.

37.1.55.5.1 TWebListInput.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField (see page 2120) property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField (see page 2121) property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items (see page 2120) and Values (see page 2121) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 2120)

ValuesField (see page 2121)

Items (see page 2120)

Values (see page 2121)

37.1.55.5.2 TWebListInput.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values (see page 2121) property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values (see page 2121) properties, use the DataSet (see page 2119), ItemsField (see page 2120), and ValuesField (see page 2121) properties.

See Also

ItemsField (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.55.5.3 TWebListInput.ItemsField Property

Indicates which field in DataSet (see page 2119) supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet (see page 2119) property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField (see page 2121) property.

Note: If the list of possible values is not available in a dataset, use the Items (see page 2120) and Values (see page 2121) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.55.5.4 TWebListInput.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items (see page 2120) property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items (see page 2120) and Values properties, use the DataSet (see page 2119), ItemsField (see page 2120), and ValuesField (see page 2121) properties.

See Also

Items (see page 2120)

ItemsField (see page 2120)

DataSet (see page 2119)

ValuesField (see page 2121)

37.1.55.5.5 TWebListInput.ValuesField Property

Indicates which field in DataSet (see page 2119) supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet (see page 2119) property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField (see page 2120) field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items (see page 2120) and Values (see page 2121) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 2120)

Values (see page 2121)

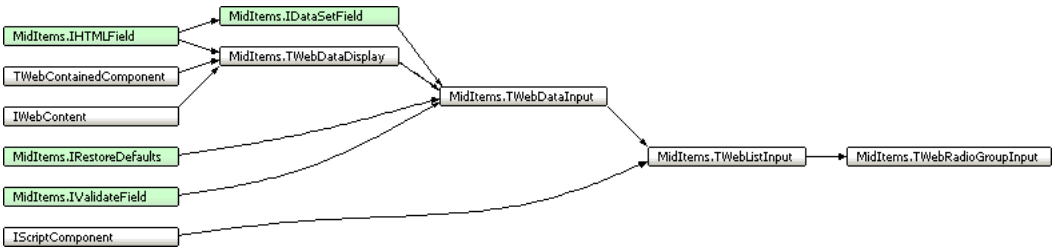
DataSet (see page 2119)

ItemsField (see page 2120)

37.1.56 TWebRadioGroupInput Class

TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.

Class Hierarchy



Pascal

```
TWebRadioGroupInput = class(TWebListInput);
```

C++

```
class TWebRadioGroupInput : public TWebListInput;
```

File

MidItems

Description

Use TWebRadioGroupInput as a base class for components that generate HTML radio groups that represent field or parameter values. TWebRadioGroupInput descendants generate controls that are organized by TFieldGroup (see page 1869) or TQueryFieldGroup (see page 1965).

TWebRadioGroupInput defines or inherits properties and methods for

Specifying a field or parameter whose value the radio group displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the radio group.

Fitting the radio group into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebRadioGroupInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebRadioGroupInput. Instead, use a descendant of TWebRadioGroupInput such as TFieldRadioGroup (see page 1874) or TQueryRadioGroup (see page 1976).

See Also

IWebContent

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TFieldRadioGroup (see page 1874)

TQueryRadioGroup (see page 1976)

37.1.56.1 TWebRadioGroupInput Members

The following tables list the members exposed by TWebRadioGroupInput.

Protected Methods

	Name	Description
V	AddAttributes (see page 2125)	This is AddAttributes, a member of class TWebRadioGroupInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2126)	This is EventContent, a member of class TWebRadioGroupInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	FormatInputs (see page 2126)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
V	GetCheckIndex (see page 2126)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.

	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2126)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2126)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2125)	Creates and initializes an instance of TWebRadioGroupInput (see page 2122).
	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 2119)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 2127)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 2127)	Specifies the width of the radio group, in characters.
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.

	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Items (see page 2120)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2120)	Indicates which field in DataSet (see page 2119) supplies the possible selections for the generated control.
	ReadOnly (see page 2128)	Indicates whether end users can use the generated control to set values.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 2121)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2121)	Indicates which field in DataSet (see page 2119) supplies the possible values for the generated control.

37.1.56.2 TWebRadioGroupInput.Create Constructor

Creates and initializes an instance of TWebRadioGroupInput (see page 2122).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebRadioGroupInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebRadioGroupInput (see page 2122) at runtime. TWebRadioGroupInput (see page 2122) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.56.3 TWebRadioGroupInput Methods

The methods of the TWebRadioGroupInput class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 2125)	This is AddAttributes, a member of class TWebRadioGroupInput.
V	EventContent (see page 2126)	This is EventContent, a member of class TWebRadioGroupInput.
V	FormatInputs (see page 2126)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCheckIndex (see page 2126)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
V	ImplGetRowSetFieldAttributes (see page 2126)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
V	RestoreFieldDefaults (see page 2126)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.

37.1.56.3.1 TWebRadioGroupInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TWebRadioGroupInput.

37.1.56.3.2 TWebRadioGroupInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebRadioGroupInput.

37.1.56.3.3 TWebRadioGroupInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options);
```

Description

This is FormatInputs, a member of class TWebRadioGroupInput.

37.1.56.3.4 TWebRadioGroupInput.GetCheckIndex Method

Pascal

```
function GetCheckIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; virtual;
```

C++

```
virtual __fastcall int GetCheckIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetCheckIndex, a member of class TWebRadioGroupInput.

37.1.56.3.5 TWebRadioGroupInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetRowSetFieldAttributes(const UnicodeString
FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.

37.1.56.3.6 TWebRadioGroupInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.

37.1.56.4 TWebRadioGroupInput Properties

The properties of the TWebRadioGroupInput class are listed here.

Public Properties

	Name	Description
	DisplayColumns (see page 2127)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 2127)	Specifies the width of the radio group, in characters.
	ReadOnly (see page 2128)	Indicates whether end users can use the generated control to set values.

37.1.56.4.1 TWebRadioGroupInput.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 2120)

Items (see page 2120)

DisplayWidth (see page 2127)

37.1.56.4.2 TWebRadioGroupInput.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 2127)

Custom (see page 2084)

37.1.56.4.3 TWebRadioGroupInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

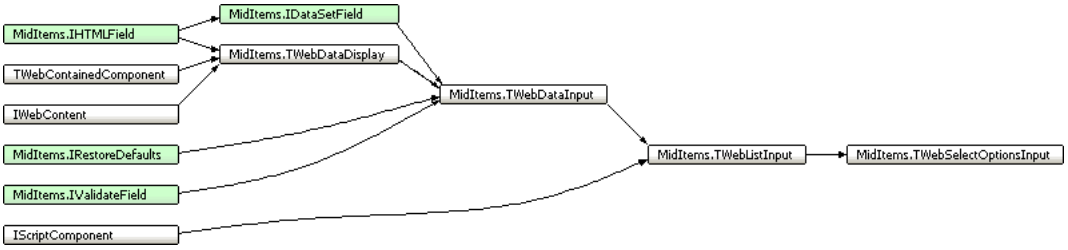
DisplayWidth (see page 2127)

Custom (see page 2084)

37.1.57 TWebSelectOptionsInput Class

TWebSelectOptionsInput is the base class for Web items that create HTML list controls.

Class Hierarchy



Pascal

```
TWebSelectOptionsInput = class(TWebListInput);
```

C++

```
class TWebSelectOptionsInput : public TWebListInput;
```

File

MidItems

Description

Use TWebSelectOptionsInput as a base class for components that generate HTML list controls that represent field or parameter values. TWebSelectOptionsInput descendants generate controls that are organized by TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965).

TWebSelectOptionsInput defines or inherits properties and methods for

Specifying a field or parameter whose value the list box displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the list box.

Fitting the list box into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebSelectOptionsInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebSelectOptionsInput. Instead, use a descendant of TWebSelectOptionsInput such as TFieldSelectOptions (see page 1884), TQuerySelectOptions (see page 1989), or TSelectOptionsColumn (see page 2024).

See Also

IWebContent

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TFieldSelectOptions (see page 1884)

TQuerySelectOptions (see page 1989)

TDataGrid (see page 1850)

TSelectOptionsColumn (see page 2024)

37.1.57.1 TWebSelectOptionsInput Members

The following tables list the members exposed by TWebSelectOptionsInput.

Protected Methods

	Name	Description
V	AddAttributes (see page 2131)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 2117)	This is AddElements, a member of class TWebListInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
A	ControlContent (see page 2077)	Returns the HTML that defines the display control (without its caption).
V	ControlContent (see page 2117)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2132)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	FormatInputs (see page 2132)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
V	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
V	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 2132)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 2118)	This is GetSubComponents, a member of class TWebListInput.

	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 2118)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 2091)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	Notification (see page 2118)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
V	RestoreFieldDefaults (see page 2092)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
V	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetDataSet (see page 2119)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 2119)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 2119)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2131)	Creates and initializes an instance of TWebSelectOptionsInput (see page 2128).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
V	Destroy (see page 2116)	Frees an instance of TWebListInput (see page 2113).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.

	DataSet (see page 2119)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 2132)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Items (see page 2120)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 2120)	Indicates which field in DataSet (see page 2119) supplies the possible selections for the generated control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 2121)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 2121)	Indicates which field in DataSet (see page 2119) supplies the possible values for the generated control.

37.1.57.2 TWebSelectOptionsInput.Create Constructor

Creates and initializes an instance of TWebSelectOptionsInput (see page 2128).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebSelectOptionsInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebSelectOptionsInput (see page 2128) at runtime. TWebSelectOptionsInput (see page 2128) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.57.3 TWebSelectOptionsInput Methods

The methods of the TWebSelectOptionsInput class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 2131)	This is AddAttributes, a member of class TWebSelectOptionsInput.
V	EventContent (see page 2132)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FormatInputs (see page 2132)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetSelectIndex (see page 2132)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.

37.1.57.3.1 TWebSelectOptionsInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TWebSelectOptionsInput.

37.1.57.3.2 TWebSelectOptionsInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebSelectOptionsInput.

37.1.57.3.3 TWebSelectOptionsInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options);
```

Description

This is FormatInputs, a member of class TWebSelectOptionsInput.

37.1.57.3.4 TWebSelectOptionsInput.GetSelectIndex Method

Pascal

```
function GetSelectIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; virtual;
```

C++

```
virtual __fastcall int GetSelectIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetSelectIndex, a member of class TWebSelectOptionsInput.

37.1.57.4 TWebSelectOptionsInput Properties

The properties of the TWebSelectOptionsInput class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 2132)	Specifies the number of rows that appear in the generated list box.

37.1.57.4.1 TWebSelectOptionsInput.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

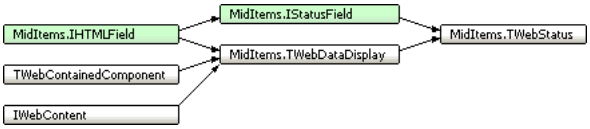
37.1.58 TWebStatus Class

TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.

Class Hierarchy



Pascal

```
TWebStatus = class(TWebDataDisplay, IStatusField);
```

C++

```
class TWebStatus : public TWebDataDisplay, public IStatusField;
```

File

MidItems

Description

Use TWebStatus as a base class for components that generate HTML controls which indicate whether records have been inserted or modified by the user. TWebStatus descendants generate controls that are added to TDataGrid (see page 1850) or TFieldGroup (see page 1869) to provide feedback about modifications to the underlying XML data packet.

TWebStatus defines or inherits properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebStatus inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebStatus. Instead, use a descendant of TWebStatus such as TFieldStatus (see page 1894) or TStatusColumn (see page 2033).

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TFieldStatus (see page 1894)

TStatusColumn (see page 2033)

37.1.58.1 TWebStatus Members

The following tables list the members exposed by TWebStatus.

Protected Methods

	Name	Description
	Content (see page 2076)	Returns the HTML that defines the display control.
V	ControlContent (see page 2135)	Returns the HTML that defines the display control (without its caption).
V	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
V	GetCaption (see page 2136)	Returns the value of the Caption property.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
V	ImplGetHTMLControlName (see page 2136)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
V	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 2135)	Creates and initializes an instance of TWebStatus (see page 2133).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	Identifier (see page 2136)	Returns the name under which record status information is stored in the XML data packet.
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	Caption (see page 2137)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2137)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2138)	Specifies where the label appears relative to the generated display control.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2138)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

37.1.58.2 TWebStatus.Create Constructor

Creates and initializes an instance of TWebStatus (see page 2133).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebStatus(TComponent * AOwner);
```

Description

Call Create to instantiate TWebStatus (see page 2133) at runtime. TWebStatus (see page 2133) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.58.3 TWebStatus Methods

The methods of the TWebStatus class are listed here.

Protected Methods

	Name	Description
V	ControlContent (see page 2135)	Returns the HTML that defines the display control (without its caption).
V	GetCaption (see page 2136)	Returns the value of the Caption property.
V	ImplGetHTMLControlName (see page 2136)	Returns the name that other components can use to refer to the generated display control.

Public Methods

	Name	Description
	Identifier (see page 2136)	Returns the name under which record status information is stored in the XML data packet.

37.1.58.3.1 TWebStatus.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.58.3.2 TWebStatus.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 2083)

37.1.58.3.3 TWebStatus.Identifier Method

Returns the name under which record status information is stored in the XML data packet.

Pascal

```
class function Identifier: string;
```

C++

```
__fastcall UnicodeString Identifier();
```

Description

Call Identifier to determine the name of the pseudo-field in the XML data packet that stores the status information displayed by the generated control.

37.1.58.3.4 TWebStatus.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name

37.1.58.4 TWebStatus Properties

The properties of the TWebStatus class are listed here.

Public Properties

	Name	Description
	Caption (see page 2137)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2137)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 2138)	Specifies where the label appears relative to the generated display control.
	DisplayWidth (see page 2138)	Specifies the width, in characters, of the generated HTML control.

37.1.58.4.1 TWebStatus.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 2084)

CaptionPosition (see page 2084)

37.1.58.4.2 TWebStatus.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 2083)

CaptionPosition (see page 2084)

HeadingAttributes (see page 1817)

37.1.58.4.3 TWebStatus.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 2084)

Caption (see page 2083)

37.1.58.4.4 TWebStatus.DisplayWidth Property

Specifies the width, in characters, of the generated HTML control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

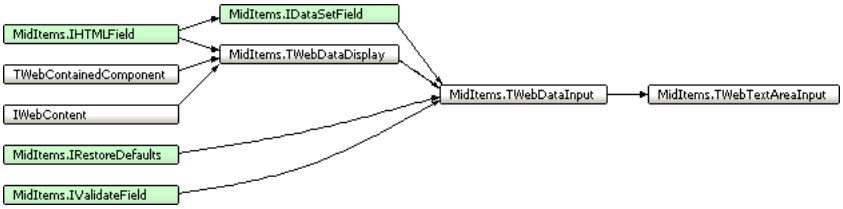
Description

Use DisplayWidth to control the width of the HTML control that displays record status information. By default, DisplayWidth is 1 because the TWebStatus (see page 2133) control values are one character (M for modified or I for inserted).

37.1.59 TWebTextAreaInput Class

TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.

Class Hierarchy



Pascal

```
TWebTextAreaInput = class(TWebDataInput);
```

C++

```
class TWebTextAreaInput : public TWebDataInput;
```

File

MidItems

Description

Use TWebTextAreaInput as a base class for components that generate HTML controls for displaying a field or parameter value in a multi-line text control. TWebTextAreaInput descendants generate controls that are organized by TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965).

TWebTextAreaInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebTextAreaInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebTextAreaInput. Instead, use a descendant of TWebTextAreaInput such as TFieldTextArea (see page 1905), TQueryTextArea (see page 2010), or TTextAreaColumn (see page 2041).

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TFieldTextArea (see page 1905)

TQueryTextArea (see page 2010)

TTextAreaColumn (see page 2041)

37.1.59.1 TWebTextAreaInput Members

The following tables list the members exposed by TWebTextAreaInput.

Protected Methods

	Name	Description
	AddAttributes (see page 2142)	This is AddAttributes, a member of class TWebTextAreaInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2142)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2142)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2143)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2143)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.
	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 2141)	Creates and initializes an instance of TWebTextAreaInput (see page 2138).

	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2084)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 2143)	Specifies the height of the generated control.
	DisplayWidth (see page 2144)	Specifies the horizontal size of the generated control.
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	ReadOnly (see page 2144)	Indicates whether end users can use the generated control to set values.
	Style (see page 2085)	Adds style attributes to the generated display control.
	StyleRule (see page 2086)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 2144)	Specifies how the generated control treats lines that are longer than the display width.

37.1.59.2 TWebTextAreaInput.Create Constructor

Creates and initializes an instance of TWebTextAreaInput (see page 2138).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebTextAreaInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebTextAreaInput (see page 2138) at runtime. TWebTextAreaInput (see page 2138) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.59.3 TWebTextAreaInput Methods

The methods of the TWebTextAreaInput class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 2142)	This is AddAttributes, a member of class TWebTextAreaInput.
	ControlContent (see page 2142)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2142)	This is EventContent, a member of class TWebTextAreaInput.

	ImplGetRowSetFieldAttributes (see page 2143)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	RestoreFieldDefaults (see page 2143)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.

37.1.59.3.1 TWebTextAreaInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TWebTextAreaInput.

37.1.59.3.2 TWebTextAreaInput.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.59.3.3 TWebTextAreaInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebTextAreaInput.

37.1.59.3.4 TWebTextAreaInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetRowSetFieldAttributes(const UnicodeString
FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.

37.1.59.3.5 TWebTextAreaInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebTextAreaInput.

37.1.59.4 TWebTextAreaInput Properties

The properties of the TWebTextAreaInput class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 2143)	Specifies the height of the generated control.
	DisplayWidth (see page 2144)	Specifies the horizontal size of the generated control.
	ReadOnly (see page 2144)	Indicates whether end users can use the generated control to set values.
	Wrap (see page 2144)	Specifies how the generated control treats lines that are longer than the display width.

37.1.59.4.1 TWebTextAreaInput.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 2144)

37.1.59.4.2 TWebTextAreaInput.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 2143)

37.1.59.4.3 TWebTextAreaInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

37.1.59.4.4 TWebTextAreaInput.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth (see page 2144). TWebTextAreaInput (see page 2138) uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.

wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

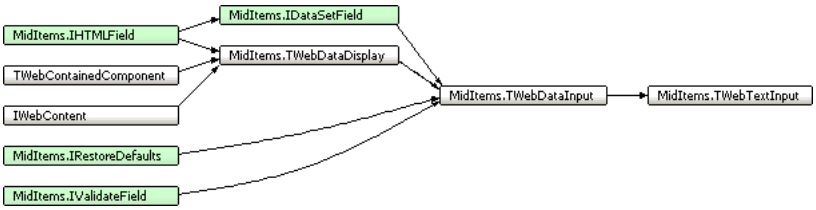
See Also

DisplayWidth (see page 2144)

37.1.60 TWebTextInput Class

TWebTextInput is the base class for Web items that create HTML single-line text controls.

Class Hierarchy



Pascal

```
TWebTextInput = class(TWebDataInput);
```

C++

```
class TWebTextInput : public TWebDataInput;
```

File

MidItems

Description

Use TWebTextInput as a base class for components that generate HTML controls for displaying a field or parameter value as a single-line text string. TWebTextInput descendants generate controls that are organized by TDataGrid (see page 1850), TFieldGroup (see page 1869), or TQueryFieldGroup (see page 1965).

TWebTextInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebTextInput inherits the IWebContent interface from TWebDataDisplay (see page 2073).

Do not create instances of TWebTextInput. Instead, use a descendant of TWebTextInput such as TFieldText (see page 1899), TQueryText (see page 2000), or TTextColumn (see page 2049).

See Also

IWebContent

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

TFieldText (see page 1899)

TQueryText (see page 2000)

TTextColumn (see page 2049)

37.1.60.1 TWebTextInput Members

The following tables list the members exposed by TWebTextInput.

Protected Methods

	Name	Description
	AddAttributes (see page 2148)	This is AddAttributes, a member of class TWebTextInput.
	Content (see page 2076)	Returns the HTML that defines the display control.
	ControlContent (see page 2148)	Returns the HTML that defines the display control (without its caption).
	EventContent (see page 2077)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 2089)	This is EventContent, a member of class TWebDataInput.
	FindAssociatedField (see page 2090)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 2077)	Returns the HTML for the display control's caption.
	GetCaption (see page 2078)	Returns the value of the Caption (see page 2083) property.
	GetCaption (see page 2090)	Returns the value of the Caption property.
	GetFieldName (see page 2090)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 2078)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 2078)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 2079)	Returns the value of the LayoutAttributes (see page 2085) property.
	GetParamName (see page 2090)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 2091)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 2079)	Returns the name of the javascript object that uses TWebDataDisplay (see page 2073) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 2080)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 2080)	Provides the underlying implementation for the Content (see page 2076) method.
	ImplGetFieldName (see page 2091)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 2081)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 2091)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 2149)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 2092)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 2082)	Returns the HTML for the display control's caption.
	RestoreDefaults (see page 2092)	Returns the Web item to a default state.
	RestoreFieldDefaults (see page 2149)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetCaption (see page 2082)	Sets the value of the Caption (see page 2083) property.
	SetCaption (see page 2092)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 2083)	Sets the value of the CaptionAttributes (see page 2084) property.

	SetFieldName (see page 2093)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 2093)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 2093)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 2084)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 2085)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 2094)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 2147)	Creates and initializes an instance of TWebTextInput (see page 2145).
V	Destroy (see page 2075)	Frees an instance of TWebDataDisplay (see page 2073).
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 2081)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 2081)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 2083)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 2084)	Customizes the appearance of the generated control's label.
	Custom (see page 2149)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2150)	Specifies the horizontal size of the generated control.
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 2094)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	ReadOnly (see page 2150)	Indicates whether end users can use the generated control to set values.
	Style (see page 2150)	Adds style attributes to the generated display control.
	StyleRule (see page 2151)	Applies a style in the page producer's style sheet to the generated display control.
	TabIndex (see page 2086)	Determines the position of the generated control in the HTML form's tab order.

37.1.60.2 TWebTextInput.Create Constructor

Creates and initializes an instance of TWebTextInput (see page 2145).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebTextInput(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebTextInput (see page 2145) descendant at runtime. TWebTextInput (see page 2145) descendants added at design time using the Web Page editor are instantiated automatically.

37.1.60.3 TWebTextInput Methods

The methods of the TWebTextInput class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 2148)	This is AddAttributes, a member of class TWebTextInput.
	ControlContent (see page 2148)	Returns the HTML that defines the display control (without its caption).
	ImplGetRowSetFieldAttributes (see page 2149)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	RestoreFieldDefaults (see page 2149)	This is RestoreFieldDefaults, a member of class TWebTextInput.

37.1.60.3.1 TWebTextInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TWebTextInput.

37.1.60.3.2 TWebTextInput.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent (see page 2080)

EventContent (see page 2077)

FormatCaption (see page 2077)

37.1.60.3.3 TWebTextInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetRowSetFieldAttributes(const UnicodeString
FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.

37.1.60.3.4 TWebTextInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebTextInput.

37.1.60.4 TWebTextInput Properties

The properties of the TWebTextInput class are listed here.

Public Properties

	Name	Description
	Custom (see page 2149)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 2150)	Specifies the horizontal size of the generated control.
	ReadOnly (see page 2150)	Indicates whether end users can use the generated control to set values.
	Style (see page 2150)	Adds style attributes to the generated display control.
	StyleRule (see page 2151)	Applies a style in the page producer's style sheet to the generated display control.

37.1.60.4.1 TWebTextInput.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator

key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 2085)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

37.1.60.4.2 TWebTextInput.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

37.1.60.4.3 TWebTextInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

37.1.60.4.4 TWebTextInput.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 2084)

StyleRule (see page 2086)

CaptionAttributes (see page 2084)

Setting Web Item Properties

37.1.60.4.5 TWebTextInput.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

37.1.61 TXMLButton Class

TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.

Class Hierarchy

Pascal

```
TXMLButton = class(TWebButton);
```

C++

```
class TXMLButton : public TWebButton;
```

File

MidItems

Description

Use TXMLButton as a base class for components that generate the HTML statements defining a specialized button control for manipulating an XML data packet. TXMLButton defines properties and methods for

Generating the HTML code to define the button control.

Associating the button with an XML broker that fetches the XML data packet and responds to update messages.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TXMLButton inherits support for the IWebContent interface from TWebButton (see page 2058).

Do not create instances of TXMLButton. TXMLButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TXMLButton, such as TApplyUpdatesButton (see page 1798).

See Also

TApplyUpdatesButton (see page 1798)

IWebContent

37.1.61.1 TXMLButton Members

The following tables list the members exposed by TXMLButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 2154)	Returns the value of the Caption property.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetXMLBroker (see page 2154)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 2154)	This is GetXMLUseParent, a member of class TXMLButton.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2154)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetXMLBroker (see page 2155)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 2155)	This is SetXMLUseParent, a member of class TXMLButton.

Protected Properties

	Name	Description
	DefaultCaption (see page 2156)	This is DefaultCaption, a member of class TXMLButton.
R	XMLData (see page 2156)	This is XMLData, a member of class TXMLButton.

Public Methods

	Name	Description
V	Create (see page 2153)	Creates and initializes an instance of TXMLButton (see page 2151).

	Destroy (see page 2153)	Frees an instance of TXMLButton (see page 2151).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 2156)	Associates the XML button with an XML broker.
	XMLUseParent (see page 2156)	Specifies whether the XML button is associated with its parent's XML broker.

37.1.61.2 TXMLButton.Create Constructor

Creates and initializes an instance of TXMLButton (see page 2151).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLButton(TComponent * AOwner);
```

Description

Call Create to instantiate an XML button at runtime. Web buttons added at design time using the Web Page editor are instantiated automatically.

37.1.61.3 TXMLButton.Destroy Destructor

Frees an instance of TXMLButton (see page 2151).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLButton();
```

Description

Destroy removes the XML button from its parent's list of components that generate HTML before freeing the button instance.

37.1.61.4 TXMLButton Methods

The methods of the TXMLButton class are listed here.

Protected Methods

	Name	Description
	GetCaption (see page 2154)	Returns the value of the Caption property.
	GetXMLBroker (see page 2154)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 2154)	This is GetXMLUseParent, a member of class TXMLButton.
	Notification (see page 2154)	Forwards notification messages to all owned components.
	SetXMLBroker (see page 2155)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 2155)	This is SetXMLUseParent, a member of class TXMLButton.

37.1.61.4.1 TXMLButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 2062)

SetCaption (see page 2061)

37.1.61.4.2 TXMLButton.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLButton.

37.1.61.4.3 TXMLButton.GetXMLUseParent Method

Pascal

```
function GetXMLUseParent: Boolean;
```

C++

```
__fastcall Boolean GetXMLUseParent();
```

Description

This is GetXMLUseParent, a member of class TXMLButton.

37.1.61.4.4 TXMLButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification

to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.61.4.5 TXMLButton.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker);
```

C++

```
__fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLButton.

37.1.61.4.6 TXMLButton.SetXMLUseParent Method

Pascal

```
procedure SetXMLUseParent(const Value: Boolean);
```

C++

```
__fastcall SetXMLUseParent(const Boolean Value);
```

Description

This is SetXMLUseParent, a member of class TXMLButton.

37.1.61.5 TXMLButton Properties

The properties of the TXMLButton class are listed here.

Protected Properties

	Name	Description
	DefaultCaption (see page 2156)	This is DefaultCaption, a member of class TXMLButton.
R	XMLData (see page 2156)	This is XMLData, a member of class TXMLButton.

Public Properties

	Name	Description
	XMLBroker (see page 2156)	Associates the XML button with an XML broker.
	XMLUseParent (see page 2156)	Specifies whether the XML button is associated with its parent's XML broker.

37.1.61.5.1 TXMLButton.DefaultCaption Property

Pascal

```
property DefaultCaption: string;
```

C++

```
__property UnicodeString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TXMLButton.

37.1.61.5.2 TXMLButton.XMLBroker Property

Associates the XML button with an XML broker.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Set XMLBroker to specify the XML broker whose data packets the XML button manipulates.

When XML buttons are used by TDataNavigator (see page 1855), the data navigator already establishes a connection (indirectly) to an XML broker. If the XML button uses this same XML broker, you do not need to set the XMLBroker property. Instead, setting the XMLUseParent (see page 2156) property to true (the default) automatically associates the XML button with the same broker as the one associated with the navigator.

See Also

XMLUseParent (see page 2156)

37.1.61.5.3 TXMLButton.XMLData Property

Pascal

```
property XMLData: TXMLDataParent;
```

C++

```
__property TXMLDataParent XMLData;
```

Description

This is XMLData, a member of class TXMLButton.

37.1.61.5.4 TXMLButton.XMLUseParent Property

Specifies whether the XML button is associated with its parent's XML broker.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the XML button determines the XML broker whose data packets it manipulates. When XMLUseParent is false, the XMLBroker (see page 2156) property must be set to indicate the XML broker. When XMLUseParent is true, the XML broker associated with the XML button's parent determines the associated XML broker.

The XML button's parent is the Web item (typically TDataNavigator (see page 1855)) that uses the XML button to assemble its own HTML content. The parent's associated broker may be defined through an indirect association. For example, the data navigator acts on another component, such as a field group, which has an associated broker.

If the parent does not have an associated XML broker, setting XMLUseParent to true sets the XMLBroker (see page 2156) property to nil (Delphi) or NULL (C++).

See Also

XMLBroker (see page 2156)

37.1.62 TXMLData Class

TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.

Class Hierarchy

Pascal

```
TXMLData = class(TObject);
```

C++

```
class TXMLData : public TObject;
```

File

MidItems

Description

TXMLData represents the link to an XML broker for a Web item that is bound to a dataset in the XML broker's data packet. It is the base class for TXMLDataSet (see page 2164), which allows the Web item to bind to a dataset field nested in the XML broker's top-level dataset.

TXMLData does not support the ability to bind to a nested dataset field. Rather, it introduces the underlying support needed to keep track of the XML broker for components that supply this ability.

See Also

TXMLBroker

IDataSetComponent (see page 2200)

TXMLDataSet (see page 2164)

37.1.62.1 TXMLData Members

The following tables list the members exposed by TXMLData.

Protected Methods

	Name	Description
	Changed (see page 2159)	This is Changed, a member of class TXMLData.
V	ChangedXMLBroker (see page 2159)	This is ChangedXMLBroker, a member of class TXMLData.
V	GetXMLBroker (see page 2159)	This is GetXMLBroker, a member of class TXMLData.
V	SetXMLBroker (see page 2160)	This is SetXMLBroker, a member of class TXMLData.

Public Events

	Name	Description
	OnChange (see page 2161)	Occurs when the XMLBroker (see page 2160) property changes.

Public Methods

	Name	Description
	Create (see page 2158)	Creates a new TXMLData (see page 2157) object.
V	Notification (see page 2159)	Responds to notifications when objects are created or destroyed.

Public Properties

	Name	Description
R	Parent (see page 2160)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 2160)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

37.1.62.2 TXMLData.Create Constructor

Creates a new TXMLData (see page 2157) object.

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLData(TComponent * AParent);
```

Description

Most applications do not need to call the TXMLData (see page 2157) constructor. The Web item that uses the TXMLData (see page 2157) object to represent its link to a dataset instantiates this object.

The AParent parameter specifies the Web item that uses the TXMLData (see page 2157) object to link to an XML broker. This becomes the value of the Parent (see page 2160) property.

See Also

Parent (see page 2160)

37.1.62.3 TXMLData Methods

The methods of the TXMLData class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2159)	This is Changed, a member of class TXMLData.
V	ChangedXMLBroker (see page 2159)	This is ChangedXMLBroker, a member of class TXMLData.
V	GetXMLBroker (see page 2159)	This is GetXMLBroker, a member of class TXMLData.
V	SetXMLBroker (see page 2160)	This is SetXMLBroker, a member of class TXMLData.

Public Methods

	Name	Description
	Notification (see page 2159)	Responds to notifications when objects are created or destroyed.

37.1.62.3.1 TXMLData.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TXMLData.

37.1.62.3.2 TXMLData.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; virtual;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLData.

37.1.62.3.3 TXMLData.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; virtual;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLData.

37.1.62.3.4 TXMLData.Notification Method

Responds to notifications when objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); virtual;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method. It is called automatically when objects are created or destroyed. TXMLData (see page 2157) responds to notifications by setting the XMLBroker (see page 2160) property to nil (Delphi) or NULL (C++) if it is notified that this component is about to be destroyed.

See Also

XMLBroker (see page 2160)

37.1.62.3.5 TXMLData.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker); virtual;
```

C++

```
virtual __fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLData.

37.1.62.4 TXMLData Properties

The properties of the TXMLData class are listed here.

Public Properties

	Name	Description
	Parent (see page 2160)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 2160)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

37.1.62.4.1 TXMLData.Parent Property

Indicates the Web item that uses this object to represent its link to an XML broker.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to determine the Web item that uses this object to bind to a dataset from an XML broker. The value of Parent is set by the constructor.

See Also

XMLBroker (see page 2160)

Create (see page 2158)

37.1.62.4.2 TXMLData.XMLBroker Property

Specifies the XML broker that generates the dataset to which the associated Web item is bound.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

The Web item specified by the Parent (see page 2160) property sets XMLBroker to bind to an XML broker.

When the value of XMLBroker changes, the TXMLData (see page 2157) object generates an OnChange (see page 2161) event.

See Also

Parent (see page 2160)

OnChange (see page 2161)

37.1.62.5 TXMLData Events

The events of the TXMLData class are listed here.

Public Events

	Name	Description
	OnChange (see page 2161)	Occurs when the XMLBroker (see page 2160) property changes.

37.1.62.5.1 TXMLData.OnChange Event

Occurs when the XMLBroker (see page 2160) property changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to respond immediately after the Web item specified by Parent (see page 2160) becomes bound to a different XML broker. This occurs when Parent (see page 2160) changes the XMLBroker (see page 2160) property explicitly in response to a change in its own properties, or when the XML broker object to which it is bound is destroyed.

See Also

XMLBroker (see page 2160)

Parent (see page 2160)

37.1.63 TXMLDataParent Class

Class Hierarchy

Pascal

```
TXMLDataParent = class(TXMLData);
```

C++

```
class TXMLDataParent : public TXMLData;
```

File

MidItems

Description

This is class MidItems.TXMLDataParent.

37.1.63.1 TXMLDataParent Members

The following tables list the members exposed by TXMLDataParent.

Protected Methods

	Name	Description
	Changed (see page 2159)	This is Changed, a member of class TXMLData.
V	ChangedUseParent (see page 2163)	This is ChangedUseParent, a member of class TXMLDataParent.
V	ChangedXMLBroker (see page 2163)	This is ChangedXMLBroker, a member of class TXMLDataParent.
V	GetXMLBroker (see page 2163)	This is GetXMLBroker, a member of class TXMLDataParent.
	ParentXMLBroker (see page 2163)	This is ParentXMLBroker, a member of class TXMLDataParent.
	SetUseParent (see page 2163)	This is SetUseParent, a member of class TXMLDataParent.
V	SetXMLBroker (see page 2160)	This is SetXMLBroker, a member of class TXMLData.

Public Events

	Name	Description
	OnChange (see page 2161)	Occurs when the XMLBroker (see page 2160) property changes.

Public Methods

	Name	Description
	Create (see page 2158)	Creates a new TXMLData (see page 2157) object.
V	Notification (see page 2159)	Responds to notifications when objects are created or destroyed.

Public Properties

	Name	Description
R	Parent (see page 2160)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 2160)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

Published Properties

	Name	Description
	UseParent (see page 2164)	This is UseParent, a member of class TXMLDataParent.

37.1.63.2 TXMLDataParent Methods

The methods of the TXMLDataParent class are listed here.

Protected Methods

	Name	Description
V	ChangedUseParent (see page 2163)	This is ChangedUseParent, a member of class TXMLDataParent.
V	ChangedXMLBroker (see page 2163)	This is ChangedXMLBroker, a member of class TXMLDataParent.
V	GetXMLBroker (see page 2163)	This is GetXMLBroker, a member of class TXMLDataParent.
	ParentXMLBroker (see page 2163)	This is ParentXMLBroker, a member of class TXMLDataParent.
	SetUseParent (see page 2163)	This is SetUseParent, a member of class TXMLDataParent.

37.1.63.2.1 TXMLDataParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDataParent.

37.1.63.2.2 TXMLDataParent.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataParent.

37.1.63.2.3 TXMLDataParent.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; override;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLDataParent.

37.1.63.2.4 TXMLDataParent.ParentXMLBroker Method

Pascal

```
function ParentXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker ParentXMLBroker();
```

Description

This is ParentXMLBroker, a member of class TXMLDataParent.

37.1.63.2.5 TXMLDataParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDataParent.

37.1.63.3 TXMLDataParent Properties

The properties of the TXMLDataParent class are listed here.

Published Properties

	Name	Description
	UseParent (see page 2164)	This is UseParent, a member of class TXMLDataParent.

37.1.63.3.1 TXMLDataParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

Description

This is UseParent, a member of class TXMLDataParent.

37.1.64 TXMLDataSet Class

TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.

Class Hierarchy

Pascal

```
TXMLDataSet = class(TXMLData, INotifyConnectionChange);
```

C++

```
class TXMLDataSet : public TXMLData, public INotifyConnectionChange;
```

File

MidItems

Description

TXMLDataSet represents a Web item's link to an XML dataset. The Web item can be bound to an XML broker's data packet, or to a dataset field nested in an XML broker's data packet.

See Also

TXMLBroker

IDataSetComponent (see page 2200)

TXMLDisplayGroup (see page 2176)

37.1.64.1 TXMLDataSet Members

The following tables list the members exposed by TXMLDataSet.

Protected Methods

	Name	Description
	_AddRef (see page 2167)	This is _AddRef, a member of class TXMLDataSet.
	_Release (see page 2167)	This is _Release, a member of class TXMLDataSet.
	Changed (see page 2159)	This is Changed, a member of class TXMLData.
V	ChangedDataSetField (see page 2167)	This is ChangedDataSetField, a member of class TXMLDataSet.
V	ChangedXMLBroker (see page 2167)	This is ChangedXMLBroker, a member of class TXMLDataSet.
	CompareXMLData (see page 2167)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 2168)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 2168)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 2168)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 2168)	This is GetDataSet, a member of class TXMLDataSet.
V	GetDataSetField (see page 2169)	This is GetDataSetField, a member of class TXMLDataSet.
	GetDataSetPath (see page 2169)	This is GetDataSetPath, a member of class TXMLDataSet.
V	GetXMLBroker (see page 2159)	This is GetXMLBroker, a member of class TXMLData.
V	QueryInterface (see page 2169)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 2169)	This is SetDataSetField, a member of class TXMLDataSet.
V	SetXMLBroker (see page 2169)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 2170)	This is WrapperDataChange, a member of class TXMLDataSet.

Protected Properties

	Name	Description
R	Parent (see page 2171)	Indicates the Web item that uses this object to represent its link to an XML broker.

Public Events

	Name	Description
	OnChange (see page 2161)	Occurs when the XMLBroker (see page 2160) property changes.

Public Methods

	Name	Description
	Create (see page 2165)	Creates a new TXMLDataSet (see page 2164) object.
V	Destroy (see page 2166)	TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 2164) object.
V	Notification (see page 2159)	Responds to notifications when objects are created or destroyed.

Public Properties

	Name	Description
R	DataSet (see page 2170)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 2171)	Identifies a nested dataset in the associated XML broker's data packet.
R	DataSetPath (see page 2171)	Represents the parsed value of the DataSetField (see page 2171) property.
	XMLBroker (see page 2160)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

37.1.64.2 TXMLDataSet.Create Constructor

Creates a new TXMLDataSet (see page 2164) object.

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLDataSet(TComponent * AParent);
```

Description

Most applications do not need to call the TXMLDataSet (see page 2164) constructor. The Web item that uses the TXMLDataSet (see page 2164) object to represent its link to a dataset instantiates this object.

The AParent parameter specifies the Web item that uses the TXMLDataSet (see page 2164) object to link to an XML dataset. This becomes the value of the Parent (see page 2171) property.

See Also

Parent (see page 2160)

37.1.64.3 TXMLDataSet.Destroy Destructor

TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 2164) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDataSet();
```

Description

Typically, applications do not free instances of TXMLDataSet (see page 2164). Instead, this object is freed by the Web item that uses it.

37.1.64.4 TXMLDataSet Methods

The methods of the TXMLDataSet class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 2167)	This is _AddRef, a member of class TXMLDataSet.
	_Release (see page 2167)	This is _Release, a member of class TXMLDataSet.
V	ChangedDataSetField (see page 2167)	This is ChangedDataSetField, a member of class TXMLDataSet.
V	ChangedXMLBroker (see page 2167)	This is ChangedXMLBroker, a member of class TXMLDataSet.
	CompareXMLData (see page 2167)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 2168)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 2168)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 2168)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 2168)	This is GetDataSet, a member of class TXMLDataSet.
V	GetDataSetField (see page 2169)	This is GetDataSetField, a member of class TXMLDataSet.
	GetDataSetPath (see page 2169)	This is GetDataSetPath, a member of class TXMLDataSet.
V	QueryInterface (see page 2169)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 2169)	This is SetDataSetField, a member of class TXMLDataSet.
V	SetXMLBroker (see page 2169)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 2170)	This is WrapperDataChange, a member of class TXMLDataSet.

37.1.64.4.1 TXMLDataSet._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TXMLDataSet.

37.1.64.4.2 TXMLDataSet._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TXMLDataSet.

37.1.64.4.3 TXMLDataSet.ChangedDataSetField Method

Pascal

```
procedure ChangedDataSetField; virtual;
```

C++

```
virtual __fastcall ChangedDataSetField();
```

Description

This is ChangedDataSetField, a member of class TXMLDataSet.

37.1.64.4.4 TXMLDataSet.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataSet.

37.1.64.4.5 TXMLDataSet.CompareXMLData Method

Pascal

```
function CompareXMLData(XMLDataSet: TXMLDataSet): Boolean;
```

C++

```
__fastcall Boolean CompareXMLData(TXMLDataSet XMLDataSet);
```

Description

This is CompareXMLData, a member of class TXMLDataSet.

37.1.64.4.6 TXMLDataSet.ConnectionChange Method

Pascal

```
procedure ConnectionChange(Sender: TComponent; Connecting: Boolean);
```

C++

```
__fastcall ConnectionChange(TComponent * Sender, Boolean Connecting);
```

Description

This is ConnectionChange, a member of class TXMLDataSet.

37.1.64.4.7 TXMLDataSet.CreateDataSet Method

Pascal

```
function CreateDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet CreateDataSet();
```

Description

This is CreateDataSet, a member of class TXMLDataSet.

37.1.64.4.8 TXMLDataSet.FindDataSet Method

Pascal

```
function FindDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet FindDataSet();
```

Description

This is FindDataSet, a member of class TXMLDataSet.

37.1.64.4.9 TXMLDataSet.GetDataSet Method

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TXMLDataSet.

37.1.64.4.10 TXMLDataSet.GetDataSetField Method

Pascal

```
function GetDataSetField: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDataSet.

37.1.64.4.11 TXMLDataSet.GetDataSetPath Method

Pascal

```
function GetDataSetPath: TStrings;
```

C++

```
__fastcall TStrings GetDataSetPath();
```

Description

This is GetDataSetPath, a member of class TXMLDataSet.

37.1.64.4.12 TXMLDataSet.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TXMLDataSet.

37.1.64.4.13 TXMLDataSet.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: string);
```

C++

```
__fastcall SetDataSetField(const UnicodeString Value);
```

Description

This is SetDataSetField, a member of class TXMLDataSet.

37.1.64.4.14 TXMLDataSet.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker); override;
```

C++

```
virtual __fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLDataSet.

37.1.64.4.15 TXMLDataSet.WrapperDataChange Method

Pascal

```
procedure WrapperDataChange(Sender: TObject);
```

C++

```
__fastcall WrapperDataChange(TObject * Sender);
```

Description

This is WrapperDataChange, a member of class TXMLDataSet.

37.1.64.5 TXMLDataSet Properties

The properties of the TXMLDataSet class are listed here.

Protected Properties

	Name	Description
	Parent (see page 2171)	Indicates the Web item that uses this object to represent its link to an XML broker.

Public Properties

	Name	Description
	DataSet (see page 2170)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 2171)	Identifies a nested dataset in the associated XML broker's data packet.
	DataSetPath (see page 2171)	Represents the parsed value of the DataSetField (see page 2171) property.

37.1.64.5.1 TXMLDataSet.DataSet Property

Provides access to an interface for working with the associated dataset.

Pascal

```
property DataSet: IInetXWebDataSet;
```

C++

```
__property IInetXWebDataSet DataSet;
```

Description

Use DataSet to manipulate the associated dataset. DataSet is an interface that provides information about the available fields and parameters of the dataset and lets you respond when this information changes.

An advantage of using the DataSet property is that it handles the task of identifying the correct dataset within the associated XML broker's data packet. This lets you treat nested datasets in the same way that you interact with the XML broker's main dataset.

See Also

XMLBroker (see page 2160)

DataSetField (see page 2171)

37.1.64.5.2 TXMLDataSet.DataSetField Property

Identifies a nested dataset in the associated XML broker's data packet.

Pascal

```
property DataSetField: string;
```

C++

```
__property UnicodeString DataSetField;
```

Description

Use DataSetField, in conjunction with the XMLBroker (see page 2160) property, to identify the XML dataset that the TXMLDataSet (see page 2164) object represents. If the dataset is the dataset represented directly by the XML broker's data packet, DataSetField is an empty string and the XMLBroker (see page 2160) property fully describes the dataset. If the dataset is a nested detail set, DataSetField indicates what detail dataset to use from the data packet associated with XMLBroker (see page 2160).

Specify the name of the dataset field as the value of DataSetField. If the dataset is the detail set of a detail set, you can use periods to qualify dataset field names. Thus, for example, if XMLBroker (see page 2160) represents a customer dataset with a nested Orders dataset field that has its own nested LineItems field, you can specify the LineItems dataset by setting DataSetField to

```
Orders.LineItems
```

See Also

XMLBroker (see page 2160)

DataSet (see page 2170)

DataSetPath (see page 2171)

37.1.64.5.3 TXMLDataSet.DataSetPath Property

Represents the parsed value of the DataSetField (see page 2171) property.

Pascal

```
property DataSetPath: TStrings;
```

C++

```
__property TStrings DataSetPath;
```

Description

DataSetPath is a parsed version of the DataSetField (see page 2171) property, where each dataset field is a separate string in the TStrings object. The order of the strings indicates the level of nesting, where the first string names a dataset field in the XML broker's data packet, the second string names a dataset field in that nested dataset, and so on.

See Also

XMLBroker (see page 2160)

DataSetField (see page 2171)

37.1.64.5.4 TXMLDataSet.Parent Property

Indicates the Web item that uses this object to represent its link to an XML broker.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to determine the Web item that uses this object to bind to a dataset from an XML broker. The value of Parent is set by the constructor.

See Also

XMLBroker (see page 2160)

Create (see page 2158)

37.1.65 TXMLDataSetParent Class

Class Hierarchy

Pascal

```
TXMLDataSetParent = class(TXMLDataSet);
```

C++

```
class TXMLDataSetParent : public TXMLDataSet;
```

File

MidItems

Description

This is class MidItems.TXMLDataSetParent.

37.1.65.1 TXMLDataSetParent Members

The following tables list the members exposed by TXMLDataSetParent.

Protected Methods

	Name	Description
	_AddRef (see page 2167)	This is _AddRef, a member of class TXMLDataSet.
	_Release (see page 2167)	This is _Release, a member of class TXMLDataSet.
	Changed (see page 2159)	This is Changed, a member of class TXMLData.
V	ChangedDataSetField (see page 2174)	This is ChangedDataSetField, a member of class TXMLDataSetParent.
V	ChangedUseParent (see page 2174)	This is ChangedUseParent, a member of class TXMLDataSetParent.
V	ChangedXMLBroker (see page 2174)	This is ChangedXMLBroker, a member of class TXMLDataSetParent.
	CompareXMLData (see page 2167)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 2168)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 2168)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 2168)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 2168)	This is GetDataSet, a member of class TXMLDataSet.

	GetDataSetField (see page 2174)	This is GetDataSetField, a member of class TXMLDataSetParent.
	GetDataSetPath (see page 2169)	This is GetDataSetPath, a member of class TXMLDataSet.
	GetXMLBroker (see page 2174)	This is GetXMLBroker, a member of class TXMLDataSetParent.
	ParentDataSetField (see page 2175)	This is ParentDataSetField, a member of class TXMLDataSetParent.
	ParentXMLBroker (see page 2175)	This is ParentXMLBroker, a member of class TXMLDataSetParent.
	ParentXMLDataSet (see page 2175)	This is ParentXMLDataSet, a member of class TXMLDataSetParent.
	QueryInterface (see page 2169)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 2169)	This is SetDataSetField, a member of class TXMLDataSet.
	SetUseParent (see page 2175)	This is SetUseParent, a member of class TXMLDataSetParent.
	SetXMLBroker (see page 2160)	This is SetXMLBroker, a member of class TXMLData.
	SetXMLBroker (see page 2169)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 2170)	This is WrapperDataChange, a member of class TXMLDataSet.

Protected Properties

	Name	Description
	Parent (see page 2171)	Indicates the Web item that uses this object to represent its link to an XML broker.
	UseParent (see page 2176)	This is UseParent, a member of class TXMLDataSetParent.

Public Events

	Name	Description
	OnChange (see page 2161)	Occurs when the XMLBroker (see page 2160) property changes.

Public Methods

	Name	Description
	Create (see page 2158)	Creates a new TXMLData (see page 2157) object.
	Create (see page 2165)	Creates a new TXMLDataSet (see page 2164) object.
	Destroy (see page 2166)	TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 2164) object.
	Notification (see page 2159)	Responds to notifications when objects are created or destroyed.

Public Properties

	Name	Description
	DataSet (see page 2170)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 2171)	Identifies a nested dataset in the associated XML broker's data packet.
	DataSetPath (see page 2171)	Represents the parsed value of the DataSetField (see page 2171) property.
	Parent (see page 2160)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 2160)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

37.1.65.2 TXMLDataSetParent Methods

The methods of the TXMLDataSetParent class are listed here.

Protected Methods

	Name	Description
	ChangedDataSetField (see page 2174)	This is ChangedDataSetField, a member of class TXMLDataSetParent.
	ChangedUseParent (see page 2174)	This is ChangedUseParent, a member of class TXMLDataSetParent.
	ChangedXMLBroker (see page 2174)	This is ChangedXMLBroker, a member of class TXMLDataSetParent.
	GetDataSetField (see page 2174)	This is GetDataSetField, a member of class TXMLDataSetParent.
	GetXMLBroker (see page 2174)	This is GetXMLBroker, a member of class TXMLDataSetParent.
	ParentDataSetField (see page 2175)	This is ParentDataSetField, a member of class TXMLDataSetParent.
	ParentXMLBroker (see page 2175)	This is ParentXMLBroker, a member of class TXMLDataSetParent.
	ParentXMLDataSet (see page 2175)	This is ParentXMLDataSet, a member of class TXMLDataSetParent.
	SetUseParent (see page 2175)	This is SetUseParent, a member of class TXMLDataSetParent.

37.1.65.2.1 TXMLDataSetParent.ChangedDataSetField Method

Pascal

```
procedure ChangedDataSetField; override;
```

C++

```
virtual __fastcall ChangedDataSetField();
```

Description

This is ChangedDataSetField, a member of class TXMLDataSetParent.

37.1.65.2.2 TXMLDataSetParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDataSetParent.

37.1.65.2.3 TXMLDataSetParent.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataSetParent.

37.1.65.2.4 TXMLDataSetParent.GetDataSetField Method

Pascal

```
function GetDataSetField: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDataSetParent.

37.1.65.2.5 TXMLDataSetParent.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; override;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLDataSetParent.

37.1.65.2.6 TXMLDataSetParent.ParentDataSetField Method

Pascal

```
function ParentDataSetField: string;
```

C++

```
__fastcall UnicodeString ParentDataSetField();
```

Description

This is ParentDataSetField, a member of class TXMLDataSetParent.

37.1.65.2.7 TXMLDataSetParent.ParentXMLBroker Method

Pascal

```
function ParentXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker ParentXMLBroker();
```

Description

This is ParentXMLBroker, a member of class TXMLDataSetParent.

37.1.65.2.8 TXMLDataSetParent.ParentXMLDataSet Method

Pascal

```
function ParentXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet ParentXMLDataSet();
```

Description

This is ParentXMLDataSet, a member of class TXMLDataSetParent.

37.1.65.2.9 TXMLDataSetParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDataSetParent.

37.1.65.3 TXMLDataSetParent Properties

The properties of the TXMLDataSetParent class are listed here.

Protected Properties

	Name	Description
	UseParent (see page 2176)	This is UseParent, a member of class TXMLDataSetParent.

37.1.65.3.1 TXMLDataSetParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

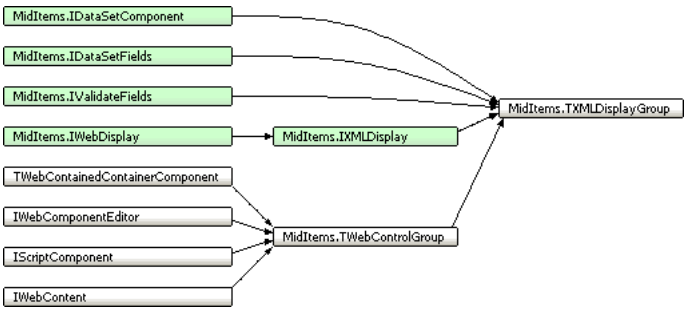
Description

This is UseParent, a member of class TXMLDataSetParent.

37.1.66 TXMLDisplayGroup Class

TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.

Class Hierarchy



Pascal

```
TXMLDisplayGroup = class(TWebControlGroup, IDataSetComponent, IDataSetFields, IXMLDisplay,
IValidateFields);
```

C++

```
class TXMLDisplayGroup : public TWebControlGroup, public IDataSetComponent, public
IDataSetFields, public IXMLDisplay, public IValidateFields;
```

File

MidItems

Description

Use TXMLDisplayGroup as a base class for Web items that generate the HTML to arrange a collection of HTML controls. Each TXMLDisplayGroup object maintains a list of Web items that display information in the final HTML document. The XML display group arranges the controls that these items generate.

If the controls generated for TXMLDisplayGroup by its Web items represent database information, you can bind the XML display group to an XML data packet or dataset field within an XML data packet. The Web items can use that binding to determine the source of the data they display.

In order to let other Web items use the HTML that the TXMLDisplayGroup object generates, TXMLDisplayGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TXMLDisplayGroup. TXMLDisplayGroup manages the Web items that generate display controls, but does not produce any content. Instead, use a descendant of TXMLDisplayGroup that generates the HTML for its set of specialized controls such as TDataGrid (see page 1850), TFieldGroup (see page 1869) or TQueryFieldGroup (see page 1965).

See Also

TDataGrid (see page 1850)

TFieldGroup (see page 1869)

TQueryFieldGroup (see page 1965)

IWebContent

37.1.66.1 TXMLDisplayGroup Members

The following tables list the members exposed by TXMLDisplayGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.
	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 2183)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.

	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 2178)	Creates and initializes an instance of TXMLDisplayGroup (see page 2176).
V	Destroy (see page 2178)	Frees an instance of TXMLDisplayGroup (see page 2176).

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
R	IsMultipleRecordView (see page 2227)	
R	IsMultipleRecordView (see page 2230)	
R	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.66.2 TXMLDisplayGroup.Create Constructor

Creates and initializes an instance of TXMLDisplayGroup (see page 2176).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TXMLDisplayGroup(TComponent * AComponent);
```

Description

Call Create to instantiate TXMLDisplayGroup (see page 2176) at runtime. TXMLDisplayGroup (see page 2176) components added at design time using the Web Page editor are instantiated automatically.

37.1.66.3 TXMLDisplayGroup.Destroy Destructor

Frees an instance of TXMLDisplayGroup (see page 2176).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDisplayGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the object is not nil before calling Destroy.

See Also

System::TObject::Free

37.1.66.4 TXMLDisplayGroup Methods

The methods of the TXMLDisplayGroup class are listed here.

Protected Methods

	Name	Description
	CreateDefaultFields (see page 2179)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 2180)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 2180)	Returns the value of the DataSet property.
	GetDataSetField (see page 2180)	This is GetDataSetField, a member of class TXMLDisplayGroup.
	GetEnableValidateFields (see page 2180)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
	GetFieldsList (see page 2181)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 2181)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
	GetVisibleFields (see page 2181)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 2181)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 2182)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 2182)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 2182)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 2182)	This is HasStatusField, a member of class TXMLDisplayGroup.
	ImplAddElements (see page 2183)	Provides the underlying implementation for the AddElements method.
	ImplGetSubComponents (see page 2183)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 2183)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 2184)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	Notification (see page 2184)	Forwards notification messages to all owned components.
	SetDataSetField (see page 2184)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetEnableValidateFields (see page 2185)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 2185)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 2185)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 2185)	This is ValidateFields, a member of class TXMLDisplayGroup.
	XMLDataChange (see page 2185)	This is XMLDataChange, a member of class TXMLDisplayGroup.

37.1.66.4.1 TXMLDisplayGroup.CreateDefaultFields Method

Pascal

```
procedure CreateDefaultFields; virtual;
```

C++

```
virtual __fastcall CreateDefaultFields();
```

Description

This is CreateDefaultFields, a member of class TXMLDisplayGroup.

37.1.66.4.2 TXMLDisplayGroup.FindField Method

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const UnicodeString AName);
```

Description

This is FindField, a member of class TXMLDisplayGroup.

37.1.66.4.3 TXMLDisplayGroup.GetDataSet Method

Returns the value of the DataSet property.

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

GetDataSet is the read access method for the DataSet property.

See Also

DataSet (see page 2202)

37.1.66.4.4 TXMLDisplayGroup.GetDataSetField Method

Pascal

```
function GetDataSetField: string;
```

C++

```
__fastcall UnicodeString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDisplayGroup.

37.1.66.4.5 TXMLDisplayGroup.GetEnableValidateFields Method

Pascal

```
function GetEnableValidateFields: Boolean;
```

C++

```
__fastcall Boolean GetEnableValidateFields();
```

Description

This is GetEnableValidateFields, a member of class TXMLDisplayGroup.

37.1.66.4.6 TXMLDisplayGroup.GetFieldsList Method

Pascal

```
procedure GetFieldsList(List: TStrings); virtual;
```

C++

```
virtual __fastcall GetFieldsList(TStrings List);
```

Description

This is GetFieldsList, a member of class TXMLDisplayGroup.

37.1.66.4.7 TXMLDisplayGroup.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.

37.1.66.4.8 TXMLDisplayGroup.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class TXMLDisplayGroup.

37.1.66.4.9 TXMLDisplayGroup.GetXMLBroker Method

Returns the value of the XMLBroker property.

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

GetXMLBroker is the read access method for the XMLBroker property.

See Also

XMLBroker (see page 2203)

37.1.66.4.10 TXMLDisplayGroup.GetXMLDataSet Method

Returns the value of the XMLDataSet property.

Pascal

```
function GetXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet GetXMLDataSet();
```

Description

GetXMLDataSet is the read access method for the XMLDataSet property.

See Also

XMLDataSet (see page 2203)

37.1.66.4.11 TXMLDisplayGroup.GetXMLDisplayName Method

Pascal

```
function GetXMLDisplayName: string;
```

C++

```
__fastcall UnicodeString GetXMLDisplayName();
```

Description

This is GetXMLDisplayName, a member of class TXMLDisplayGroup.

37.1.66.4.12 TXMLDisplayGroup.GetXMLRowSetName Method

Pascal

```
function GetXMLRowSetName: string;
```

C++

```
__fastcall UnicodeString GetXMLRowSetName();
```

Description

This is GetXMLRowSetName, a member of class TXMLDisplayGroup.

37.1.66.4.13 TXMLDisplayGroup.HasStatusField Method

Pascal

```
function HasStatusField: Boolean;
```

C++

```
__fastcall Boolean HasStatusField();
```

Description

This is HasStatusField, a member of class TXMLDisplayGroup.

37.1.66.4.14 TXMLDisplayGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.66.4.15 TXMLDisplayGroup.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents method.

Pascal

```
function ImplGetSubComponents: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents method calls ImplGetSubComponents to retrieve the value of WebFieldControls as a TObject. TWebControlGroup descendants override this method if the list is not simply the value of WebFieldControls. For example, some TWebControlGroup descendants supply a default value (DefaultWebComponents) when the WebFieldControls property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 2069)

DefaultWebComponents (see page 2072)

WebFieldControls (see page 2072)

37.1.66.4.16 TXMLDisplayGroup.ImplIsMultipleRecordView Method

Pascal

```
function ImplIsMultipleRecordView: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsMultipleRecordView();
```

Description

This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.

37.1.66.4.17 TXMLDisplayGroup.IsFieldInUse Method

Pascal

```
function IsFieldInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(UnicodeString AName);
```

Description

This is IsFieldInUse, a member of class TXMLDisplayGroup.

37.1.66.4.18 TXMLDisplayGroup.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.66.4.19 TXMLDisplayGroup.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: string);
```

C++

```
__fastcall SetDataSetField(const UnicodeString Value);
```

Description

This is SetDataSetField, a member of class TXMLDisplayGroup.

37.1.66.4.20 TXMLDisplayGroup.SetEnableValidateFields Method

Pascal

```
procedure SetEnableValidateFields(Value: Boolean);
```

C++

```
__fastcall SetEnableValidateFields(Boolean Value);
```

Description

This is SetEnableValidateFields, a member of class TXMLDisplayGroup.

37.1.66.4.21 TXMLDisplayGroup.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker);
```

C++

```
__fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLDisplayGroup.

37.1.66.4.22 TXMLDisplayGroup.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class TXMLDisplayGroup.

37.1.66.4.23 TXMLDisplayGroup.ValidateFields Method

Pascal

```
function ValidateFields(AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateFields(IAddScriptElements AddIntf);
```

Description

This is ValidateFields, a member of class TXMLDisplayGroup.

37.1.66.4.24 TXMLDisplayGroup.XMLDataChange Method

Pascal

```
procedure XMLDataChange(Sender: TObject); virtual;
```

C++

```
virtual __fastcall XMLDataChange(TObject * Sender);
```

Description

This is XMLDataChange, a member of class TXMLDisplayGroup.

37.1.66.5 TXMLDisplayGroup Properties

The properties of the TXMLDisplayGroup class are listed here.

Protected Properties

	Name	Description
	EnableValidateFields (see page 2186)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 2187)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Properties

	Name	Description
R	VisibleFields (see page 2186)	Indicates the controls displayed by the HTML that the XML display group generates.

Published Properties

	Name	Description
	XMLBroker (see page 2187)	Binds the XML display group to an XML broker that represents a dataset.
	XMLDataSetField (see page 2188)	Binds the XML display group to a nested dataset from the XML data packet.

37.1.66.5.1 TXMLDisplayGroup.EnableValidateFields Property

Pascal

```
property EnableValidateFields: Boolean;
```

C++

```
__property Boolean EnableValidateFields;
```

Description

This is EnableValidateFields, a member of class TXMLDisplayGroup.

37.1.66.5.2 TXMLDisplayGroup.VisibleFields Property

Indicates the controls displayed by the HTML that the XML display group generates.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

Use VisibleFields to access the components that generate HTML controls for the XML display group. If a set of Web items is explicitly assigned to the WebFieldControls (see page 2072) property, VisibleFields has the same value as WebFieldControls (see page 2072). Otherwise, VisibleFields represents a set of default Web items that generate display controls for all the fields or parameters of the associated dataset or dataset field.

When no Web items are assigned to WebFieldControls (see page 2072), the default Web items in the VisibleFields list are specific to the TXMLDisplayGroup (see page 2176) descendant.

See Also

WebFieldControls (see page 2072)

XMLBroker (see page 2187)

XMLDataSetField (see page 2188)

37.1.66.5.3 TXMLDisplayGroup.XMLBroker Property

Binds the XML display group to an XML broker that represents a dataset.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Most XML display groups contain controls that represent database information. TDataGrid (see page 1850) and TFieldGroup (see page 1869) represent the fields from a dataset. By default, TQueryFieldGroup (see page 1965) represents the parameter values for a query or stored procedure or field values that filter a table. XMLBroker indicates the XML broker component that fetches XML data packets for the dataset whose values the controls display.

If the controls arranged by TXMLDisplayGroup (see page 2176) represent the data from a dataset nested within the XML broker's data packet, use the XMLDataSetField (see page 2188) to indicate which dataset field to use from the data packet associated with XMLBroker.

See Also

VisibleFields (see page 2186)

XMLDataSetField (see page 2188)

37.1.66.5.4 TXMLDisplayGroup.XMLDataSet Property

Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Pascal

```
property XMLDataSet: TXMLDataSet;
```

C++

```
__property TXMLDataSet XMLDataSet;
```

Description

XMLDataSet describes how to locate the appropriate dataset, given the XML broker that provides its XML data packet. This dataset may be the main dataset of the XML broker, or it may be a nested dataset that is represented by a dataset field within that dataset (or a dataset field nested in a dataset field, and so on).

See Also

DataSet (see page 2202)

XMLBroker (see page 2203)

37.1.66.5.5 TXMLDisplayGroup.XMLDataSetField Property

Binds the XML display group to a nested dataset from the XML data packet.

Pascal

```
property XMLDataSetField: string;
```

C++

```
__property UnicodeString XMLDataSetField;
```

Description

Most XML display groups contain controls that represent database information. TDataGrid (see page 1850) and TFieldGroup (see page 1869) represent the fields from a dataset. By default, TQueryFieldGroup (see page 1965) represents the parameter values for a query or stored procedure or field values that filter a table. If the database information comes from the dataset represented by an XML broker's data packet, XMLDataSetField is an empty string and the XMLBroker (see page 2187) property fully describes the dataset. However, if the database information comes from a nested detail set, XMLDataSetField indicates what detail dataset to use from the data packet associated with XMLBroker (see page 2187).

Specify the name of the dataset field as the value of XMLDataSetField. If the XML display group is bound to the detail set of a detail set, you can use periods to qualify dataset field names. Thus, for example, if XMLBroker (see page 2187) represents a customer dataset with a nested Orders dataset field that has its own nested LineItems field, you can bind the XML display group to the LineItems dataset by setting XMLDataSetField to

```
Orders.LineItems
```

See Also

XMLBroker (see page 2187)

VisibleFields (see page 2186)

Setting Web Item Properties

37.1.67 TXMLDisplayParent Class

Class Hierarchy

Pascal

```
TXMLDisplayParent = class(TWebDisplay);
```

C++

```
class TXMLDisplayParent : public TWebDisplay;
```

File

MidItems

Description

This is class MidItems.TXMLDisplayParent.

37.1.67.1 TXMLDisplayParent Members

The following tables list the members exposed by TXMLDisplayParent.

Protected Methods

	Name	Description
	Changed (see page 2096)	This is Changed, a member of class TWebDisplay.
V	ChangedDisplayComponent (see page 2190)	This is ChangedDisplayComponent, a member of class TXMLDisplayParent.
V	ChangedUseParent (see page 2190)	This is ChangedUseParent, a member of class TXMLDisplayParent.
V	GetDisplayComponent (see page 2190)	This is GetDisplayComponent, a member of class TXMLDisplayParent.
	SetDisplayComponent (see page 2097)	This is SetDisplayComponent, a member of class TWebDisplay.
	SetUseParent (see page 2190)	This is SetUseParent, a member of class TXMLDisplayParent.

Public Events

	Name	Description
	OnChange (see page 2098)	This is OnChange, a member of class TWebDisplay.

Public Methods

	Name	Description
	Create (see page 2189)	This is Create, a member of class TXMLDisplayParent.
V	Notification (see page 2097)	This is Notification, a member of class TWebDisplay.

Public Properties

	Name	Description
	DisplayComponent (see page 2097)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 2097)	This is Parent, a member of class TWebDisplay.

Published Properties

	Name	Description
	UseParent (see page 2191)	This is UseParent, a member of class TXMLDisplayParent.

37.1.67.2 TXMLDisplayParent.Create Constructor

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLDisplayParent(TComponent * AParent);
```

Description

This is Create, a member of class TXMLDisplayParent.

37.1.67.3 TXMLDisplayParent Methods

The methods of the TXMLDisplayParent class are listed here.

Protected Methods

	Name	Description
V	ChangedDisplayComponent (see page 2190)	This is ChangedDisplayComponent, a member of class TXMLDisplayParent.
V	ChangedUseParent (see page 2190)	This is ChangedUseParent, a member of class TXMLDisplayParent.

	GetDisplayComponent (see page 2190)	This is GetDisplayComponent, a member of class TXMLDisplayParent.
	SetUseParent (see page 2190)	This is SetUseParent, a member of class TXMLDisplayParent.

37.1.67.3.1 TXMLDisplayParent.ChangedDisplayComponent Method

Pascal

```
procedure ChangedDisplayComponent; override;
```

C++

```
virtual __fastcall ChangedDisplayComponent();
```

Description

This is ChangedDisplayComponent, a member of class TXMLDisplayParent.

37.1.67.3.2 TXMLDisplayParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDisplayParent.

37.1.67.3.3 TXMLDisplayParent.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TXMLDisplayParent.

37.1.67.3.4 TXMLDisplayParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDisplayParent.

37.1.67.4 TXMLDisplayParent Properties

The properties of the TXMLDisplayParent class are listed here.

Published Properties

	Name	Description
	UseParent (see page 2191)	This is UseParent, a member of class TXMLDisplayParent.

37.1.67.4.1 TXMLDisplayParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

Description

This is UseParent, a member of class TXMLDisplayParent.

37.1.68 TXMLDisplayReferenceButton Class

TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.

Class Hierarchy

Pascal

```
TXMLDisplayReferenceButton = class(TWebButton);
```

C++

```
class TXMLDisplayReferenceButton : public TWebButton;
```

File

MidItems

Description

Use TXMLDisplayReferenceButton as a base class for components that generate the HTML statements defining a specialized button control for working with a data display control in the Web page produced by TInetXPageProducer (see page 2285).

TXMLDisplayReferenceButton defines properties and methods for

Generating the HTML code to define the button.

Associating the button with another Web item that generates a data display control.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TXMLDisplayReferenceButton inherits support for the IWebContent interface from TWebButton (see page 2058).

Do not create instances of TXMLDisplayReferenceButton. TXMLDisplayReferenceButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TXMLDisplayReferenceButton, such as TPostButton (see page 1947), TInsertButton (see page 1935), and so on.

See Also

TFirstButton (see page 1913)

TNextButton (see page 1943)

TPriorButton (see page 1949)

TLastButton (see page 1937)

TNextPageButton (see page 1945)

TPriorPageButton (see page 1951)

TInsertButton (see page 1935)

TDeleteButton (see page 1867)

TUndoButton (see page 2055)

TPostButton (see page 1947)

IWebContent

TDataNavigator (see page 1855)

TResetQueryButton (see page 2022)

TSubmitQueryButton (see page 2038)

37.1.68.1 TXMLDisplayReferenceButton Members

The following tables list the members exposed by TXMLDisplayReferenceButton.

Protected Methods

	Name	Description
	Content (see page 2060)	Returns the HTML that defines the button control.
V	GetCaption (see page 2060)	Returns the value of the Caption (see page 2062) property.
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 2060)	Returns the layout object that specifies how the generated control should look.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
A	ImplContent (see page 2061)	Provides the underlying implementation for the Content (see page 2060) method.
V	Notification (see page 2194)	Forwards notification messages to all owned components.
V	SetCaption (see page 2061)	Sets the value of the Caption (see page 2062) property.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 2193)	Creates and initializes an instance of TXMLDisplayReferenceButton (see page 2191).
V	Destroy (see page 2193)	Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Public Properties

	Name	Description
	Caption (see page 2062)	Specifies the caption that appears on the button.
	Custom (see page 2062)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 2063)	Adds style attributes to the generated button control.
	StyleRule (see page 2063)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

37.1.68.2 TXMLDisplayReferenceButton.Create Constructor

Creates and initializes an instance of TXMLDisplayReferenceButton (see page 2191).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLDisplayReferenceButton(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset button at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

37.1.68.3 TXMLDisplayReferenceButton.Destroy Destructor

Frees an instance of TXMLDisplayReferenceButton (see page 2191).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDisplayReferenceButton();
```

Description

Destroy removes the button from its parent's list of components that generate HTML.

37.1.68.4 TXMLDisplayReferenceButton Methods

The methods of the TXMLDisplayReferenceButton class are listed here.

Protected Methods

	Name	Description
	GetDisplayComponent (see page 2194)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 2194)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetXmlDisplayName (see page 2194)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
	Notification (see page 2194)	Forwards notification messages to all owned components.
	SetDisplayComponent (see page 2195)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 2195)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

37.1.68.4.1 TXMLDisplayReferenceButton.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.

37.1.68.4.2 TXMLDisplayReferenceButton.GetDisplayComponentParent Method

Pascal

```
function GetDisplayComponentParent: Boolean;
```

C++

```
__fastcall Boolean GetDisplayComponentParent();
```

Description

This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

37.1.68.4.3 TXMLDisplayReferenceButton.GetXmlDisplayName Method

Pascal

```
function GetXmlDisplayName: string;
```

C++

```
__fastcall UnicodeString GetXmlDisplayName();
```

Description

This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.

37.1.68.4.4 TXMLDisplayReferenceButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

37.1.68.4.5 TXMLDisplayReferenceButton.SetDisplayComponent Method

Pascal

```
procedure SetDisplayComponent(const Value: TComponent);
```

C++

```
__fastcall SetDisplayComponent(const TComponent * Value);
```

Description

This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.

37.1.68.4.6 TXMLDisplayReferenceButton.SetDisplayComponentParent Method

Pascal

```
procedure SetDisplayComponentParent(const Value: Boolean);
```

C++

```
__fastcall SetDisplayComponentParent(const Boolean Value);
```

Description

This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

37.1.68.5 TXMLDisplayReferenceButton Properties

The properties of the TXMLDisplayReferenceButton class are listed here.

Protected Properties

	Name	Description
	XMLDisplay (see page 2196)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Properties

	Name	Description
	XMLComponent (see page 2195)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 2196)	Specifies whether the button is associated with its parent's display object.

37.1.68.5.1 TXMLDisplayReferenceButton.XMLComponent Property

Associates the button with the component that generates the display control it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates a display control that the button influences.

Note: Typically, descendants of TXMLDisplayReferenceButton (see page 2191) are used by a descendant of TXMLDisplayReferenceGroup (see page 2197), which has its own XMLComponent property. If the button influences this same component, you need not set the XMLComponent property. Instead, setting the XMLUseParent (see page 2196) property to true (the default) sets XMLComponent to the value of the parent's XMLComponent property.

See Also

XMLUseParent (see page 2196)

37.1.68.5.2 TXMLDisplayReferenceButton.XMLDisplay Property

Pascal

```
property XMLDisplay: TXMLDisplayParent;
```

C++

```
__property TXMLDisplayParent XMLDisplay;
```

Description

This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

37.1.68.5.3 TXMLDisplayReferenceButton.XMLUseParent Property

Specifies whether the button is associated with its parent's display object.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the dataset button determines the component that it influences. When XMLUseParent is false, the XMLComponent (see page 2195) property must be set to indicate the display component. When XMLUseParent is true, the button influences the component specified by its parent's XMLComponent (see page 2195) property.

The button's parent is the Web item that uses the button to assemble its own HTML content (typically a TDataNavigator (see page 1855) or TQueryButtons (see page 1962) object). If the parent does not have an associated display component, setting XMLUseParent to true sets the XMLComponent (see page 2195) property to nil (Delphi) or NULL (C++).

See Also

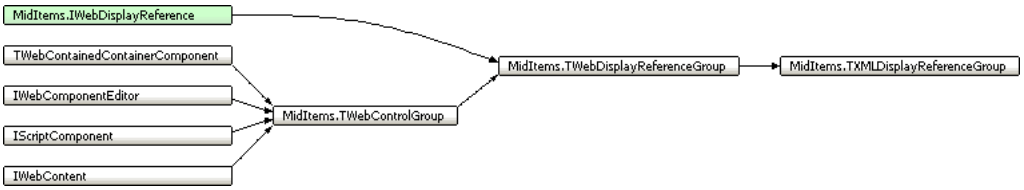
XMLComponent (see page 2195)

XMLComponent (see page 2199)

37.1.69 TXMLDisplayReferenceGroup Class

TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

Class Hierarchy



Pascal

```
TXMLDisplayReferenceGroup = class(TWebDisplayReferenceGroup);
```

C++

```
class TXMLDisplayReferenceGroup : public TWebDisplayReferenceGroup;
```

File

MidItems

Description

Use TXMLDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of button controls. Each TXMLDisplayGroup (see page 2176) object has an associated Web item that generates controls that display data in the final HTML document. The buttons arranged by TXMLDisplayReferenceGroup manipulate the information the display controls show.

In order to let other Web items use the HTML that the TXMLDisplayReferenceGroup object generates, TXMLDisplayReferenceGroup inherits the IWebContent interface from TWebControlGroup (see page 2064).

Do not create instances of TXMLDisplayReferenceGroup. TXMLDisplayReferenceGroup manages the Web items that generate buttons and the association to a display generator, but does not produce any content. Instead, use a descendant of TXMLDisplayReferenceGroup that generates the HTML for its set of specialized buttons such as TDataNavigator (see page 1855) or TQueryButtons (see page 1962).

See Also

TDataNavigator (see page 1855)

IWebContent

37.1.69.1 TXMLDisplayReferenceGroup Members

The following tables list the members exposed by TXMLDisplayReferenceGroup.

Protected Methods

	Name	Description
	AddElements (see page 2066)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 2067)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 2072) property list.

	ChangeFieldControls (see page 2067)	Responds when the group of HTML controls changes.
	Content (see page 2068)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 2068)	Returns the value of the DefaultWebComponents (see page 2072) property.
V	GetLayoutAttributes (see page 2069)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 2069)	Returns the value of the WebFieldControls (see page 2072) property.
	GetWebDisplayComponent (see page 2100)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 2198)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 2070)	Provides the underlying implementation for the CanAddClass (see page 2067) method.
V	ImplContent (see page 2070)	Provides the underlying implementation for the Content (see page 2068) method.
V	ImplGetSubComponents (see page 2071)	Provides the underlying implementation for the GetSubComponents (see page 2069) method.
V	Notification (see page 2101)	Forwards notification messages to all owned components.
V	SetDefaultWebComponents (see page 2071)	Sets the value of the DefaultWebComponents (see page 2072) property.
V	SetWebDisplayComponent (see page 2101)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 2072)	Specifies the default value of the WebFieldControls (see page 2072) property when that property is not explicitly set.
R	WebDisplay (see page 2102)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 2102)	

Public Methods

	Name	Description
V	Create (see page 2065)	Creates and initializes an instance of TWebControlGroup (see page 2064).
V	Create (see page 2100)	Creates an instance of TWebDisplayReferenceGroup (see page 2098).
V	Destroy (see page 2066)	Frees an instance of TWebControlGroup (see page 2064).
V	Destroy (see page 2100)	Frees an instance of TWebDisplayReferenceGroup (see page 2098).
	GetWebDisplayComponent (see page 2228)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 2228)	
R	WebFieldControls (see page 2072)	Lists the components that generate HTML controls for the Web control group.
	XMLComponent (see page 2199)	Associates the group with a component that generates HTML display controls.

37.1.69.2 TXMLDisplayReferenceGroup Methods

The methods of the TXMLDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
V	ImplAddElements (see page 2198)	Provides the underlying implementation for the AddElements method.

37.1.69.2.1 TXMLDisplayReferenceGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 2066)

37.1.69.3 TXMLDisplayReferenceGroup Properties

The properties of the TXMLDisplayReferenceGroup class are listed here.

Public Properties

	Name	Description
	XMLComponent (see page 2199)	Associates the group with a component that generates HTML display controls.

37.1.69.3.1 TXMLDisplayReferenceGroup.XMLComponent Property

Associates the group with a component that generates HTML display controls.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Use XMLComponent to associate the group of buttons with a Web item that generates the display controls those buttons influence. Typical values of XMLComponent are TFieldGroup (see page 1869) or TDataGrid (see page 1850).

If all the buttons arranged by the TXMLDisplayReferenceGroup (see page 2197) object operate on the same set of display controls, it is most efficient to specify the Web item generating these controls as the value of XMLComponent. Then, each button uses this value to determine its associated display controls when its XMLUseParent property is true. Any buttons that do not operate on the display controls generated by XMLComponent can set their own XMLComponent property to another Web item.

See Also

XMLComponent (see page 2195)

XMLUseParent (see page 2196)

TFieldGroup (see page 1869)

TDataGrid (see page 1850)

TQueryFieldGroup (see page 1965)

37.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDataSetComponent (see page 2200)	IDataSetComponent defines the methods that bind a Web item to an XML broker.
	IDataSetField (see page 2204)	This is class MidItems.IDataSetField.
	IDataSetFields (see page 2206)	This is class MidItems.IDataSetFields.
	IFormatColumn (see page 2208)	This is class MidItems.IFormatColumn.
	IHTMLField (see page 2209)	IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.
	IHTMLForm (see page 2211)	IHTMLForm is an interface that must be implemented by Web items that generate forms.
	IInetXWebDataSet (see page 2213)	IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.
	IQueryField (see page 2217)	This is class MidItems.IQueryField.
	IQueryFields (see page 2220)	This is class MidItems.IQueryFields.
	IQueryForm (see page 2221)	This is class MidItems.IQueryForm.
	IRestoreDefaults (see page 2221)	IRestoreDefaults enables the Web Page editor to restore a Web item to a default state.
	IStatusField (see page 2223)	This is class MidItems.IStatusField.
	IValidateField (see page 2223)	This is class MidItems.IValidateField.
	IValidateFields (see page 2224)	This is class MidItems.IValidateFields.
	IWebDisplay (see page 2226)	
	IWebDisplayReference (see page 2227)	
	IXMLDisplay (see page 2229)	This is class MidItems.IXMLDisplay.

37.2.1 IDataSetComponent Interface

IDataSetComponent defines the methods that bind a Web item to an XML broker.

Class Hierarchy

Pascal

```
IDataSetComponent = interface;
```

C++

```
__interface IDataSetComponent;
```

File

MidItems

Description

The TXMLDisplayGroup (see page 2176) class implements IDataSetComponent to provide information about the dataset from which its child controls obtain their data. The child Web items use this information to determine the default data binding.

Most Web items that generate a group of data-aware controls inherit the support for IDataSetComponent from TXMLDisplayGroup (see page 2176).

See Also

TXMLDisplayGroup (see page 2176)

TXMLBroker

37.2.1.1 IDataSetComponent Members

The following tables list the members exposed by IDataSetComponent.

Public Methods

	Name	Description
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
R	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.

37.2.1.2 IDataSetComponent Methods

The methods of the IDataSetComponent class are listed here.

Public Methods

	Name	Description
	GetDataSet (see page 2201)	Returns the value of the DataSet (see page 2202) property.
	GetXMLBroker (see page 2201)	Returns the value of the XMLBroker (see page 2203) property.
	GetXMLDataSet (see page 2202)	Returns the value of the XMLDataSet (see page 2203) property.

37.2.1.2.1 IDataSetComponent.GetDataSet Method

Returns the value of the DataSet (see page 2202) property.

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

GetDataSet is the read access method for the DataSet (see page 2202) property.

See Also

DataSet (see page 2202)

37.2.1.2.2 IDataSetComponent.GetXMLBroker Method

Returns the value of the XMLBroker (see page 2203) property.

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

GetXMLBroker is the read access method for the XMLBroker (see page 2203) property.

See Also

XMLBroker (see page 2203)

37.2.1.2.3 IDataSetComponent.GetXMLDataSet Method

Returns the value of the XMLDataSet (see page 2203) property.

Pascal

```
function GetXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet GetXMLDataSet();
```

Description

GetXMLDataSet is the read access method for the XMLDataSet (see page 2203) property.

See Also

XMLDataSet (see page 2203)

37.2.1.3 IDataSetComponent Properties

The properties of the IDataSetComponent class are listed here.

Public Properties

	Name	Description
R	DataSet (see page 2202)	Provides access to an interface for working with the associated dataset.
R	XMLBroker (see page 2203)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 2203)	Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.

37.2.1.3.1 IDataSetComponent.DataSet Property

Provides access to an interface for working with the associated dataset.

Pascal

```
property DataSet: IInetXWebDataSet;
```

C++

```
__property IInetXWebDataSet DataSet;
```

Description

The child Web items of the item that implements IDataSetComponent (see page 2200) use the DataSet property to obtain information about the dataset to which they are bound and to respond when this information changes. This information includes

details about the available fields and parameters in the dataset to which they can be bound.

See Also

XMLDataSet (see page 2203)

37.2.1.3.2 IDataSetComponent.XMLBroker Property

Indicates the XML broker that fetches the data packets to which the Web item is bound.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Use XMLBroker to access the TXMLBroker object that fetches XML data packets from the application server. The XML broker can be used to obtain information about the source of the dataset, the form that contains the XML data packet, the javascript variables that represent this data packet, and so on.

Note: The dataset represented by the Web item may not correspond directly to the XML broker's dataset. It may be a nested dataset contained by that dataset. The XMLDataSet (see page 2203) property indicates whether the dataset is nested, and if so, describes the field that represents it.

See Also

XMLDataSet (see page 2203)

DataSet (see page 2202)

37.2.1.3.3 IDataSetComponent.XMLDataSet Property

Indicates the TXMLDataSet (see page 2164) object that represents the dataset to which the Web item is bound.

Pascal

```
property XMLDataSet: TXMLDataSet;
```

C++

```
__property TXMLDataSet XMLDataSet;
```

Description

XMLDataSet describes how to locate the appropriate dataset, given the XML broker that provides its XML data packet. This dataset may be the main dataset of the XML broker, or it may be a nested dataset that is represented by a dataset field within that dataset (or a dataset field nested in a dataset field, and so on).

See Also

DataSet (see page 2202)

XMLBroker (see page 2203)

37.2.2 IDataSetField Interface

Class Hierarchy

Pascal

```
IDataSetField = interface(IHTMLField);
```

C++

```
__interface IDataSetField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IDataSetField.

37.2.2.1 IDataSetField Members

The following tables list the members exposed by IDataSetField.

Public Methods

	Name	Description
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.

Public Properties

	Name	Description
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

37.2.2.2 IDataSetField Methods

The methods of the IDataSetField class are listed here.

Public Methods

	Name	Description
	GetFieldName (see page 2204)	This is GetFieldName, a member of class IDataSetField.
	GetRowSetFieldAttributes (see page 2205)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	SetFieldName (see page 2205)	This is SetFieldName, a member of class IDataSetField.

37.2.2.2.1 IDataSetField.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall UnicodeString GetFieldName();
```

Description

This is GetFieldName, a member of class IDataSetField.

37.2.2.2.2 IDataSetField.GetRowSetFieldAttributes Method

Pascal

```
function GetRowSetFieldAttributes(const FieldVarName: string): string;
```

C++

```
__fastcall UnicodeString GetRowSetFieldAttributes(const UnicodeString FieldVarName);
```

Description

This is GetRowSetFieldAttributes, a member of class IDataSetField.

37.2.2.2.3 IDataSetField.SetFieldName Method

Pascal

```
procedure SetFieldName(AFieldName: string);
```

C++

```
__fastcall SetFieldName(UnicodeString AFieldName);
```

Description

This is SetFieldName, a member of class IDataSetField.

37.2.2.3 IDataSetField Properties

The properties of the IDataSetField class are listed here.

Public Properties

	Name	Description
	FieldName (see page 2205)	This is FieldName, a member of class IDataSetField.

37.2.2.3.1 IDataSetField.FieldName Property

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

This is FieldName, a member of class IDataSetField.

37.2.3 IDataSetFields Interface

Class Hierarchy

Pascal

```
IDataSetFields = interface;
```

C++

```
__interface IDataSetFields;
```

File

MidItems

Description

This is class MidItems.IDataSetFields.

37.2.3.1 IDataSetFields Members

The following tables list the members exposed by IDataSetFields.

Public Methods

	Name	Description
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.

Public Properties

	Name	Description
	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.

37.2.3.2 IDataSetFields Methods

The methods of the IDataSetFields class are listed here.

Public Methods

	Name	Description
	GetFieldsList (see page 2207)	This is GetFieldsList, a member of class IDataSetFields.
	GetVisibleFields (see page 2207)	This is GetVisibleFields, a member of class IDataSetFields.
	HasStatusField (see page 2207)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 2207)	This is IsFieldInUse, a member of class IDataSetFields.
	ValidateDataSet (see page 2207)	This is ValidateDataSet, a member of class IDataSetFields.

37.2.3.2.1 IDataSetFields.GetFieldsList Method

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

This is GetFieldsList, a member of class IDataSetFields.

37.2.3.2.2 IDataSetFields.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class IDataSetFields.

37.2.3.2.3 IDataSetFields.HasStatusField Method

Pascal

```
function HasStatusField: Boolean;
```

C++

```
__fastcall Boolean HasStatusField();
```

Description

This is HasStatusField, a member of class IDataSetFields.

37.2.3.2.4 IDataSetFields.IsFieldInUse Method

Pascal

```
function IsFieldInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(UnicodeString AName);
```

Description

This is IsFieldInUse, a member of class IDataSetFields.

37.2.3.2.5 IDataSetFields.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class IDataSetFields.

37.2.3.3 IDataSetFields Properties

The properties of the IDataSetFields class are listed here.

Public Properties

	Name	Description
	VisibleFields (see page 2208)	This is VisibleFields, a member of class IDataSetFields.

37.2.3.3.1 IDataSetFields.VisibleFields Property

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

This is VisibleFields, a member of class IDataSetFields.

37.2.4 IFormatColumn Interface

Class Hierarchy

MidItems.IFormatColumn

Pascal

```
IFormatColumn = interface;
```

C++

```
__interface IFormatColumn;
```

File

MidItems

Description

This is class MidItems.IFormatColumn.

37.2.4.1 IFormatColumn Members

The following tables list the members exposed by IFormatColumn.

Public Methods

	Name	Description
	FormatColumnData (see page 2209)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 2209)	This is FormatColumnHeading, a member of class IFormatColumn.

37.2.4.2 IFormatColumn Methods

The methods of the IFormatColumn class are listed here.

Public Methods

	Name	Description
	FormatColumnData (see page 2209)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 2209)	This is FormatColumnHeading, a member of class IFormatColumn.

37.2.4.2.1 IFormatColumn.FormatColumnData Method

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnData(const UnicodeString Content, TWebContentOptions
Options);
```

Description

This is FormatColumnData, a member of class IFormatColumn.

37.2.4.2.2 IFormatColumn.FormatColumnHeading Method

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnHeading(TWebContentOptions Options);
```

Description

This is FormatColumnHeading, a member of class IFormatColumn.

37.2.5 IHTMLField Interface

IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.

Class Hierarchy

MidItems.IHTMLField

Pascal

```
IHTMLField = interface;
```

C++

```
__interface IHTMLField;
```

File

MidItems

Description

The TWebDataDisplay (see page 2073) class implements IHTMLField to provide information about information about the HTML control it represents. This interface is used when generating javascript that refers to the control.

Most Web items that generate HTML <INPUT> elements inherit the support for IHTMLField from TWebDataDisplay (see page 2073). However, when writing custom Web items that generate <INPUT> tags but that do not descend from TWebDataDisplay (see page 2073), component writers must ensure that the Web item supports the IHTMLField interface.

See Also

TWebDataDisplay (see page 2073)

37.2.5.1 IHTMLField Members

The following tables list the members exposed by IHTMLField.

Public Methods

	Name	Description
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

37.2.5.2 IHTMLField Methods

The methods of the IHTMLField class are listed here.

Public Methods

	Name	Description
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.

37.2.5.2.1 IHTMLField.GetHTMLControlName Method

Returns the name of the generated HTML <INPUT> control.

Pascal

```
function GetHTMLControlName: string;
```

C++

```
__fastcall UnicodeString GetHTMLControlName();
```

Description

GetHTMLFormName is the read access method for the HTMLControlName (see page 2211) property.

See Also

HTMLControlName (see page 2211)

37.2.5.3 IHTMLField Properties

The properties of the IHTMLField class are listed here.

Public Properties

	Name	Description
	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.

37.2.5.3.1 IHTMLField.HTMLControlName Property

Indicates the name of the generated HTML control.

Pascal

```
property HTMLControlName: string;
```

C++

```
__property UnicodeString HTMLControlName;
```

Description

HTMLControlName is the value of the NAME option on the generated <INPUT> tag. This value is used when creating javascript references to the control.

37.2.6 IHTMLForm Interface

IHTMLForm is an interface that must be implemented by Web items that generate forms.

Class Hierarchy

MidItems.IHTMLForm

Pascal

```
IHTMLForm = interface;
```

C++

```
__interface IHTMLForm;
```

File

MidItems

Description

Web items that produce forms (such as TQueryForm (see page 1971) or TDataForm (see page 1847)) must implement the IHTML form interface. This interface allows other Web items to access information about form elements when generating javascript declarations and method calls.

See Also

TQueryForm (see page 1971)

TDataForm (see page 1847)

37.2.6.1 IHTMLForm Members

The following tables list the members exposed by IHTMLForm.

Public Methods

	Name	Description
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.

37.2.6.2 IHTMLForm Methods

The methods of the IHTMLForm class are listed here.

Public Methods

	Name	Description
	GetHTMLFormName (see page 2212)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 2212)	Returns the name of the javascript variable that refers to the generated form.

37.2.6.2.1 IHTMLForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormName();
```

Description

GetHTMLFormName is the read access method for the HTMLFormName (see page 2213) property.

See Also

HTMLFormName (see page 2213)

37.2.6.2.2 IHTMLForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormVarName();
```

Description

GetHTMLFormVarName is the read access method for the HTMLFormVarName (see page 2213) property.

See Also

HTMLFormVarName (see page 2213)

37.2.6.3 IHTMLForm Properties

The properties of the IHTMLForm class are listed here.

Public Properties

	Name	Description
R	HTMLFormName (see page 2213)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 2213)	Indicates the name of the javascript variable that represents the HTML form.

37.2.6.3.1 IHTMLForm.HTMLFormName Property

Indicates the name of the generated HTML form.

Pascal

```
property HTMLFormName: string;
```

C++

```
__property UnicodeString HTMLFormName;
```

Description

HTMLFormName is the value of the NAME option on the generated form. Other Web items can use this property when they need to refer to the form name. For example, this property is used to declare the javascript variable that represents the form.

See Also

HTMLFormVarName (see page 2213)

37.2.6.3.2 IHTMLForm.HTMLFormVarName Property

Indicates the name of the javascript variable that represents the HTML form.

Pascal

```
property HTMLFormVarName: string;
```

C++

```
__property UnicodeString HTMLFormVarName;
```

Description

HTMLFormVarName is the value of the javascript variable for the form. Other Web items can use this property when they need to refer to the form in generated javascript code.

See Also

HTMLFormName (see page 2213)

37.2.7 IInetXWebDataSet Interface

IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.

Class Hierarchy

Pascal

```
IInetXWebDataSet = interface;
```

C++

```
__interface IInetXWebDataSet;
```

File

MidItems

Description

Web items use the IInetXWebDataSet interface (formerly known as IMidasWebDataSet (see page 2240)) to obtain information about a dataset supplied by an XML broker. By using this interface, the Web item does not need to worry about whether the dataset is the top-level dataset in the XML data packet or a nested dataset in that data packet.

IInetXWebDataSet defines methods for obtaining information about the fields and parameters of the associated dataset. It also defines methods for assigning an event handler that receives notifications when this information changes.

Note: VCL Method declarations that use IInetXWebDataSet use the _di_IInetXWebDataSet type instead. This type is a DelphiInterface wrapper around the IInetXWebDataSet interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IInetXWebDataSet >
_di_IInetXWebDataSet;
```

See Also

TXMLDataSet (see page 2164)

TXMLBroker

37.2.7.1 IInetXWebDataSet Members

The following tables list the members exposed by IInetXWebDataSet.

Public Methods

	Name	Description
	AddOnDataChange (see page 2215)	Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.
	FetchParams (see page 2215)	Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.
	FieldCount (see page 2215)	Returns the number of fields in the associated dataset.
	Fields (see page 2216)	Returns the set of fields in the associated dataset.
	ParamCount (see page 2216)	Returns the number of parameters for the associated dataset.
	Params (see page 2216)	Returns the set of parameters in the associated dataset.
	RemoveOnDataChange (see page 2217)	Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

37.2.7.2 IInetXWebDataSet Methods

The methods of the IInetXWebDataSet class are listed here.

Public Methods

	Name	Description
	AddOnDataChange (see page 2215)	Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.

	FetchParams (see page 2215)	Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.
	FieldCount (see page 2215)	Returns the number of fields in the associated dataset.
	Fields (see page 2216)	Returns the set of fields in the associated dataset.
	ParamCount (see page 2216)	Returns the number of parameters for the associated dataset.
	Params (see page 2216)	Returns the set of parameters in the associated dataset.
	RemoveOnDataChange (see page 2217)	Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

37.2.7.2.1 IInetXWebDataSet.AddOnDataChange Method

Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.

Pascal

```
procedure AddOnDataChange(const Value: TNotifyEvent);
```

C++

```
__fastcall AddOnDataChange(const TNotifyEvent Value);
```

Description

Call AddOnDataChange to specify an event handler that is called when the fields or parameters of the dataset change. This allows Web items to update their data bindings to reflect changes in the associated data packet.

Value specifies the event handler that is added to the list.

See Also

RemoveOnDataChange (see page 2217)

37.2.7.2.2 IInetXWebDataSet.FetchParams Method

Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.

Pascal

```
procedure FetchParams;
```

C++

```
__fastcall FetchParams();
```

Description

Call FetchParams to tell the XML broker to fetch parameter values from the application server. This ensures that the Params (see page 2216) method returns the current values of any parameters on the server.

See Also

FetchParams

Params (see page 2216)

37.2.7.2.3 IInetXWebDataSet.FieldCount Method

Returns the number of fields in the associated dataset.

Pascal

```
function FieldCount: Integer;
```

C++

```
__fastcall int FieldCount();
```

Description

Call FieldCount to determine the number of fields returned by the Fields (see page 2216) method. This is the number of fields in the XML data packet belonging to the associated dataset.

See Also

Fields (see page 2216)

37.2.7.2.4 IInetXWebDataSet.Fields Method

Returns the set of fields in the associated dataset.

Pascal

```
function Fields: TFields;
```

C++

```
__fastcall TFields Fields();
```

Description

Call Fields to obtain access to the field objects (TField) that represent the fields in the XML data packet. Each field object can be used to read the value of the field, determine its type, and so on.

See Also

FieldCount (see page 2215)

37.2.7.2.5 IInetXWebDataSet.ParamCount Method

Returns the number of parameters for the associated dataset.

Pascal

```
function ParamCount: Integer;
```

C++

```
__fastcall int ParamCount();
```

Description

Call ParamCount to determine the number of parameters returned by the Params (see page 2216) method. This is the number of parameters in the XML data packet belonging to the associated dataset.

See Also

Params (see page 2216)

37.2.7.2.6 IInetXWebDataSet.Params Method

Returns the set of parameters in the associated dataset.

Pascal

```
function Params: TParams;
```

C++

```
__fastcall TParams Params();
```

Description

Call Params to obtain access to the parameter objects (TParam) that represent the parameters in the XML data packet. Each parameter object can be used to read the value of the parameter, determine its type, and so on.

See Also

ParamCount (see page 2216)

FetchParams (see page 2215)

37.2.7.2.7 IInetXWebDataSet.RemoveOnDataChange Method

Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

Pascal

```
procedure RemoveOnDataChange(const Value: TNotifyEvent);
```

C++

```
__fastcall RemoveOnDataChange(const TNotifyEvent Value);
```

Description

Call RemoveOnDataChange to remove an event handler that was added using the AddOnDataChange (see page 2215) method.

Value specifies the event handler to remove from the list.

See Also

AddOnDataChange (see page 2215)

37.2.8 IQueryField Interface

Class Hierarchy

Pascal

```
IQueryField = interface(IHTMLField);
```

C++

```
__interface IQueryField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IQueryField.

37.2.8.1 IQueryField Members

The following tables list the members exposed by IQueryField.

Public Methods

	Name	Description
	GetHTMLControlName (see page 2210)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetText (see page 2218)	This is GetText, a member of class IQueryField.
	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	SetText (see page 2219)	This is SetText, a member of class IQueryField.

Public Properties

	Name	Description
R	HTMLControlName (see page 2211)	Indicates the name of the generated HTML control.
	ParamName (see page 2219)	This is ParamName, a member of class IQueryField.
	Text (see page 2219)	This is Text, a member of class IQueryField.

37.2.8.2 IQueryField Methods

The methods of the IQueryField class are listed here.

Public Methods

	Name	Description
	GetParamName (see page 2218)	This is GetParamName, a member of class IQueryField.
	GetText (see page 2218)	This is GetText, a member of class IQueryField.
	SetParamName (see page 2218)	This is SetParamName, a member of class IQueryField.
	SetText (see page 2219)	This is SetText, a member of class IQueryField.

37.2.8.2.1 IQueryField.GetParamName Method

Pascal

```
function GetParamName: string;
```

C++

```
__fastcall UnicodeString GetParamName();
```

Description

This is GetParamName, a member of class IQueryField.

37.2.8.2.2 IQueryField.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class IQueryField.

37.2.8.2.3 IQueryField.SetParamName Method

Pascal

```
procedure SetParamName(AParamName: string);
```

C++

```
__fastcall SetParamName(UnicodeString AParamName);
```

Description

This is SetParamName, a member of class IQueryField.

37.2.8.2.4 IQueryField.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class IQueryField.

37.2.8.3 IQueryField Properties

The properties of the IQueryField class are listed here.

Public Properties

	Name	Description
	ParamName (see page 2219)	This is ParamName, a member of class IQueryField.
	Text (see page 2219)	This is Text, a member of class IQueryField.

37.2.8.3.1 IQueryField.ParamName Property

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;
```

Description

This is ParamName, a member of class IQueryField.

37.2.8.3.2 IQueryField.Text Property

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

This is Text, a member of class IQueryField.

37.2.9 IQueryFields Interface

Class Hierarchy

Pascal

```
IQueryFields = interface;
```

C++

```
__interface IQueryFields;
```

File

MidItems

Description

This is class MidItems.IQueryFields.

37.2.9.1 IQueryFields Members

The following tables list the members exposed by IQueryFields.

Public Methods

	Name	Description
	GetParamsList (see page 2220)	This is GetParamsList, a member of class IQueryFields.
	IsParamInUse (see page 2221)	This is IsParamInUse, a member of class IQueryFields.
	ValidateDataSet (see page 2221)	This is ValidateDataSet, a member of class IQueryFields.

37.2.9.2 IQueryFields Methods

The methods of the IQueryFields class are listed here.

Public Methods

	Name	Description
	GetParamsList (see page 2220)	This is GetParamsList, a member of class IQueryFields.
	IsParamInUse (see page 2221)	This is IsParamInUse, a member of class IQueryFields.
	ValidateDataSet (see page 2221)	This is ValidateDataSet, a member of class IQueryFields.

37.2.9.2.1 IQueryFields.GetParamsList Method

Pascal

```
procedure GetParamsList(AList: TStrings);
```

C++

```
__fastcall GetParamsList(TStrings AList);
```

Description

This is GetParamsList, a member of class IQueryFields.

37.2.9.2.2 IQueryFields.IsParamInUse Method

Pascal

```
function IsParamInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsParamInUse(UnicodeString AName);
```

Description

This is IsParamInUse, a member of class IQueryFields.

37.2.9.2.3 IQueryFields.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class IQueryFields.

37.2.10 IQueryForm Interface

Class Hierarchy

Pascal

```
IQueryForm = interface;
```

C++

```
__interface IQueryForm;
```

File

MidItems

Description

This is class MidItems.IQueryForm.

37.2.11 IRestoreDefaults Interface

IRestoreDefaults enables the Web Page editor to restore a Web item to a default state.

Class Hierarchy

Pascal

```
IRestoreDefaults = interface;
```

C++

```
__interface IRestoreDefaults;
```

File

MidItems

Description

Implement IRestoreDefaults to allow the Web Page editor to restore a Web item to its default state. When a Web item implements IRestoreDefaults, the Web Page editor enables the Restore Defaults command when that item is selected.

IRestoreDefaults defines a single method, RestoreDefaults (see page 2222), which is called when a user chooses the Restore Defaults command in the Web Page editor.

See Also

IWebComponentEditor

37.2.11.1 IRestoreDefaults Members

The following tables list the members exposed by IRestoreDefaults.

Public Methods

	Name	Description
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.

37.2.11.2 IRestoreDefaults Methods

The methods of the IRestoreDefaults class are listed here.

Public Methods

	Name	Description
	RestoreDefaults (see page 2222)	Returns the Web item to a default state.

37.2.11.2.1 IRestoreDefaults.RestoreDefaults Method

Returns the Web item to a default state.

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

The Web page editor calls RestoreDefaults when the user chooses the Restore Defaults command. Web items implement this method to return property values to a default state.

37.2.12 IStatusField Interface

Class Hierarchy

Pascal

```
IStatusField = interface(IHTMLField);
```

C++

```
__interface IStatusField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IStatusField.

37.2.13 IValidateField Interface

Class Hierarchy

Pascal

```
IValidateField = interface;
```

C++

```
__interface IValidateField;
```

File

MidItems

Description

This is class MidItems.IValidateField.

37.2.13.1 IValidateField Members

The following tables list the members exposed by IValidateField.

Public Methods

	Name	Description
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

37.2.13.2 IValidateField Methods

The methods of the IValidateField class are listed here.

Public Methods

	Name	Description
	ValidateField (see page 2224)	This is ValidateField, a member of class IValidateField.

37.2.13.2.1 IValidateField.ValidateField Method

Pascal

```
function ValidateField(DataSet: IInetXWebDataSet; AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateField(IInetXWebDataSet DataSet, IAddScriptElements AddIntf);
```

Description

This is ValidateField, a member of class IValidateField.

37.2.14 IValidateFields Interface

Class Hierarchy

MidItems.IValidateFields

Pascal

```
IValidateFields = interface;
```

C++

```
__interface IValidateFields;
```

File

MidItems

Description

This is class MidItems.IValidateFields.

37.2.14.1 IValidateFields Members

The following tables list the members exposed by IValidateFields.

Public Methods

	Name	Description
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.

37.2.14.2 IValidateFields Methods

The methods of the IValidateFields class are listed here.

Public Methods

	Name	Description
	GetEnableValidateFields (see page 2225)	This is GetEnableValidateFields, a member of class IValidateFields.
	SetEnableValidateFields (see page 2225)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateFields (see page 2225)	This is ValidateFields, a member of class IValidateFields.

37.2.14.2.1 IValidateFields.GetEnableValidateFields Method

Pascal

```
function GetEnableValidateFields: Boolean;
```

C++

```
__fastcall Boolean GetEnableValidateFields();
```

Description

This is GetEnableValidateFields, a member of class IValidateFields.

37.2.14.2.2 IValidateFields.SetEnableValidateFields Method

Pascal

```
procedure SetEnableValidateFields(Value: Boolean);
```

C++

```
__fastcall SetEnableValidateFields(Boolean Value);
```

Description

This is SetEnableValidateFields, a member of class IValidateFields.

37.2.14.2.3 IValidateFields.ValidateFields Method

Pascal

```
function ValidateFields(AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateFields(IAddScriptElements AddIntf);
```

Description

This is ValidateFields, a member of class IValidateFields.

37.2.14.3 IValidateFields Properties

The properties of the IValidateFields class are listed here.

Public Properties

	Name	Description
	EnableValidateFields (see page 2226)	This is EnableValidateFields, a member of class IValidateFields.

37.2.14.3.1 IValidateFields.EnableValidateFields Property

Pascal

```
property EnableValidateFields: Boolean;
```

C++

```
__property Boolean EnableValidateFields;
```

Description

This is EnableValidateFields, a member of class IValidateFields.

37.2.15 IWebDisplay Interface

Class Hierarchy

Pascal

```
IWebDisplay = interface;
```

C++

```
__interface IWebDisplay;
```

File

MidItems

See Also

TWebDisplay (see page 2095)

37.2.15.1 IWebDisplay Members

The following tables list the members exposed by IWebDisplay.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 2227)	

37.2.15.2 IWebDisplay Methods

The methods of the IWebDisplay class are listed here.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 2227)	This is GetIsMultipleRecordView, a member of class IWebDisplay.

37.2.15.2.1 IWebDisplay.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class IWebDisplay.

37.2.15.3 IWebDisplay Properties

The properties of the IWebDisplay class are listed here.

Public Properties

	Name	Description
	IsMultipleRecordView (see page 2227)	

37.2.15.3.1 IWebDisplay.IsMultipleRecordView Property

Pascal

```
property IsMultipleRecordView: Boolean;
```

C++

```
__property Boolean IsMultipleRecordView;
```

Description

.

See Also

GetIsMultipleRecordView (see page 2227)

37.2.16 IWebDisplayReference Interface

Class Hierarchy

Pascal

```
IWebDisplayReference = interface;
```

C++

```
__interface IWebDisplayReference;
```

File

MidItems

See Also

TWebDisplay (see page 2095)

37.2.16.1 IWebDisplayReference Members

The following tables list the members exposed by IWebDisplayReference.

Public Methods

	Name	Description
	GetWebDisplayComponent (see page 2228)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 2228)	

37.2.16.2 IWebDisplayReference Methods

The methods of the IWebDisplayReference class are listed here.

Public Methods

	Name	Description
	GetWebDisplayComponent (see page 2228)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

37.2.16.2.1 IWebDisplayReference.GetWebDisplayComponent Method

Pascal

```
function GetWebDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetWebDisplayComponent();
```

Description

This is GetWebDisplayComponent, a member of class IWebDisplayReference.

37.2.16.3 IWebDisplayReference Properties

The properties of the IWebDisplayReference class are listed here.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 2228)	

37.2.16.3.1 IWebDisplayReference.WebDisplayComponent Property

Pascal

```
property WebDisplayComponent: TComponent;
```

C++

```
__property TComponent * WebDisplayComponent;
```

See Also

GetWebDisplayComponent (see page 2228)

37.2.17 IXMLDisplay Interface

Class Hierarchy

Pascal

```
IXMLDisplay = interface(IWebDisplay);
```

C++

```
__interface IXMLDisplay : public IWebDisplay;
```

File

MidItems

Description

This is class MidItems.IXMLDisplay.

37.2.17.1 IXMLDisplay Members

The following tables list the members exposed by IXMLDisplay.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 2230)	
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

37.2.17.2 IXMLDisplay Methods

The methods of the IXMLDisplay class are listed here.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 2229)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetXMLDisplayName (see page 2230)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 2230)	This is GetXMLRowSetName, a member of class IXMLDisplay.

37.2.17.2.1 IXMLDisplay.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class IXMLDisplay.

37.2.17.2.2 IXMLDisplay.GetXMLDisplayName Method

Pascal

```
function GetXMLDisplayName: string;
```

C++

```
__fastcall UnicodeString GetXMLDisplayName();
```

Description

This is GetXMLDisplayName, a member of class IXMLDisplay.

37.2.17.2.3 IXMLDisplay.GetXMLRowSetName Method

Pascal

```
function GetXMLRowSetName: string;
```

C++

```
__fastcall UnicodeString GetXMLRowSetName();
```

Description

This is GetXMLRowSetName, a member of class IXMLDisplay.

37.2.17.3 IXMLDisplay Properties

The properties of the IXMLDisplay class are listed here.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 2230)	
R	XMLDisplayName (see page 2231)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 2231)	This is XMLRowSetName, a member of class IXMLDisplay.

37.2.17.3.1 IXMLDisplay.IsMultipleRecordView Property

Pascal

```
property IsMultipleRecordView: Boolean;
```

C++

```
__property Boolean IsMultipleRecordView;
```

Description

.

See Also

GetIsMultipleRecordView (see page 2227)

37.2.17.3.2 IXMLDisplay.XMLDisplayName Property

Pascal

```
property XMLDisplayName: string;
```

C++

```
__property UnicodeString XMLDisplayName;
```

Description

This is XMLDisplayName, a member of class IXMLDisplay.

37.2.17.3.3 IXMLDisplay.XMLRowSetName Property

Pascal

```
property XMLRowSetName: string;
```

C++

```
__property UnicodeString XMLRowSetName;
```

Description

This is XMLRowSetName, a member of class IXMLDisplay.

37.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddBoolAttrib (see page 2232)	This is function MidItems.AddBoolAttrib.
	AddCustomAttrib (see page 2232)	This is function MidItems.AddCustomAttrib.
	AddIntAttrib (see page 2233)	This is function MidItems.AddIntAttrib.
	AddQuotedAttrib (see page 2233)	This is function MidItems.AddQuotedAttrib.
	AddStringAttrib (see page 2233)	This is function MidItems.AddStringAttrib.
	CanAddClassHelper (see page 2234)	This is function MidItems.CanAddClassHelper.
	CreateDefaultButtonClasses (see page 2234)	This is function MidItems.CreateDefaultButtonClasses.
	DeclareSubmitForm (see page 2234)	This is function MidItems.DeclareSubmitForm.
	FindDispatcher (see page 2235)	This is function MidItems.FindDispatcher.
	FindProducer (see page 2235)	This is function MidItems.FindProducer.
	FormatColumnData (see page 2235)	This is function MidItems.FormatColumnData.
	FormatColumnHeading (see page 2236)	This is function MidItems.FormatColumnHeading.
	GetItemValuesFromDataSet (see page 2236)	This is function MidItems.GetItemValuesFromDataSet.

37.3.1 MidItems.AddBoolAttrib Function

Pascal

```
procedure AddBoolAttrib(var Attribs: string; const Attrib: string; Value: Boolean);
```

C++

```
AddBoolAttrib(UnicodeString Attribs, const UnicodeString Attrib, Boolean Value);
```

File

MidItems

Description

This is function MidItems.AddBoolAttrib.

37.3.2 MidItems.AddCustomAttrib Function

Pascal

```
procedure AddCustomAttrib(var Attribs: string; Value: string);
```

C++

```
AddCustomAttrib(UnicodeString Attribs, UnicodeString Value);
```

File

MidItems

Description

This is function MidItems.AddCustomAttrib.

37.3.3 MidItems.AddIntAttrib Function

Pascal

```
procedure AddIntAttrib(var Attribs: string; const Attrib: string; Value: Integer);
```

C++

```
AddIntAttrib(UnicodeString Attribs, const UnicodeString Attrib, int Value);
```

File

MidItems

Description

This is function MidItems.AddIntAttrib.

37.3.4 MidItems.AddQuotedAttrib Function

Pascal

```
procedure AddQuotedAttrib(var Attribs: string; const Attrib: string; const Value: string);
```

C++

```
AddQuotedAttrib(UnicodeString Attribs, const UnicodeString Attrib, const UnicodeString Value);
```

File

MidItems

Description

This is function MidItems.AddQuotedAttrib.

37.3.5 MidItems.AddStringAttrib Function

Pascal

```
procedure AddStringAttrib(var Attribs: string; const Attrib: string; const Value: string);
```

C++

```
AddStringAttrib(UnicodeString Attribs, const UnicodeString Attrib, const UnicodeString Value);
```

File

MidItems

Description

This is function MidItems.AddStringAttrib.

37.3.6 MidItems.CanAddClassHelper Function

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass AClass);
```

File

MidItems

Description

This is function MidItems.CanAddClassHelper.

37.3.7 MidItems.CreateDefaultButtonClasses Function

Pascal

```
procedure CreateDefaultButtonClasses(const Classes: array of TWebButtonClass; Container:
TWebComponentList);
```

C++

```
CreateDefaultButtonClasses(const array of TWebButtonClass Classes, TWebComponentList
Container);
```

File

MidItems

Description

This is function MidItems.CreateDefaultButtonClasses.

37.3.8 MidItems.DeclareSubmitForm Function

Pascal

```
procedure DeclareSubmitForm(Component: TComponent; XMLBroker: TXMLBroker; AddIntf:
IAddScriptElements);
```

C++

```
DeclareSubmitForm(TComponent * Component, TXMLBroker XMLBroker, IAddScriptElements AddIntf);
```

File

MidItems

Description

This is function MidItems.DeclareSubmitForm.

37.3.9 MidItems.FindDispatcher Function

Pascal

```
function FindDispatcher(Component: TComponent): IWebDispatcherAccess;
```

C++

```
IWebDispatcherAccess FindDispatcher(TComponent * Component);
```

File

MidItems

Description

This is function MidItems.FindDispatcher.

37.3.10 MidItems.FindProducer Function

Pascal

```
function FindProducer(Component: TComponent): TCustomContentProducer;
```

C++

```
TCustomContentProducer FindProducer(TComponent * Component);
```

File

MidItems

Description

This is function MidItems.FindProducer.

37.3.11 MidItems.FormatColumnData Function

Pascal

```
function FormatColumnData(Field: TWebDataDisplay; Content: string): string;
```

C++

```
UnicodeString FormatColumnData(TWebDataDisplay Field, UnicodeString Content);
```

File

MidItems

Description

This is function MidItems.FormatColumnData.

37.3.12 MidItems.FormatColumnHeading Function

Pascal

```
function FormatColumnHeading(Field: TWebDataDisplay): string;
```

C++

```
UnicodeString FormatColumnHeading(TWebDataDisplay Field);
```

File

MidItems

Description

This is function MidItems.FormatColumnHeading.

37.3.13 MidItems.GetItemValuesFromDataSet Function

Pascal

```
function GetItemValuesFromDataSet(DataSet: TDataSet; const ItemsField: string; const
ValuesField: string; var ItemsStrings: TStrings; var ValuesStrings: TStrings): Boolean;
```

C++

```
Boolean GetItemValuesFromDataSet(TDataSet DataSet, const UnicodeString ItemsField, const
UnicodeString ValuesField, TStrings ItemsStrings, TStrings ValuesStrings);
```

File

MidItems

Description

This is function MidItems.GetItemValuesFromDataSet.

37.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCaptionPosition (see page 2237)	TCaptionPosition indicates the relative position of a label to the HTML control it labels.
	TFormMethod (see page 2238)	TFormMethod represents the method attribute on the <form> tag of an HTML form.
	TLayoutState (see page 2238)	This is record MidItems.TLayoutState.
	TTextAreaWrap (see page 2239)	TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

37.4.1 MidItems.TCaptionPosition Enumeration

TCaptionPosition indicates the relative position of a label to the HTML control it labels.

Pascal

```
TCaptionPosition = (
  capLeft,
  capRight,
  capAbove,
  capBelow
);
```

C++

```
enum TCaptionPosition {
  capLeft,
  capRight,
  capAbove,
  capBelow
};
```

File

MidItems

Description

TCaptionPosition can have one of the following values.

Value	Meaning
capLeft	The caption appears to the left of the HTML control.
capRight	The caption appears to the right of the HTML control.
capAbove	The caption appears above the HTML control.
capBelow	The caption appears below the HTML control.

37.4.2 MidItems.TFormMethod Enumeration

TFormMethod represents the method attribute on the <form> tag of an HTML form.

Pascal

```
TFormMethod = (
  fmPost,
  fmGet
);
```

C++

```
enum TFormMethod {
  fmPost,
  fmGet
};
```

File

MidItems

Description

HTML forms include a <form> tag that distinguishes them from other types of HTML pages. This<form> tag includes a method attribute, which determines the method header of the HTTP request message that the form sends to its server. The method type corresponds to the MethodType property of the HTTP request message.

Components that generate HTML forms use TFormMethod to specify the method attribute of the <form> tag they generate, and hence the method header of the messages that they send to the server.

The following table describes the possible values:

Value	Corresponding MethodType	Meaning
fmPost	mtPost	The value of the method attribute is 'post'. The form submits messages that post displayed values to the server application. Named value pairs are passed as content fields of the HTTP message.
fmGet	mtGet	The value of the method attribute is 'get'. The form submits messages that request values it can display. Named value pairs are supplied as query fields in the URL.

See Also

TWebRequest

37.4.3 MidItems.TLayoutState Enumeration

Pascal

```
TLayoutState = (
  lsUnknown,
  lsFields,
  lsButtons
);
```

C++

```
enum TLayoutState {
```

```
    lsUnknown,
    lsFields,
    lsButtons
  };
```

File

MidItems

Description

This is record MidItems.TLayoutState.

37.4.4 MidItems.TTextAreaWrap Enumeration

TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

Pascal

```
  TTextAreaWrap = (
    wrOff,
    wrPhysical,
    wrVirtual
  );
```

C++

```
  enum TTextAreaWrap {
    wrOff,
    wrPhysical,
    wrVirtual
  };
```

File

MidItems

Description

TTextAreaWrap can have one of the following values.

Value	Meaning
wrOff	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

37.5 Types

The following table lists types in this documentation.

Types

Name	Description
IMidasWebDataSet (see page 2240)	This is type MidItems.IMidasWebDataSet.
TWebButtonClass (see page 2240)	This is type MidItems.TWebButtonClass.
TWebDataDisplayClass (see page 2241)	This is type MidItems.TWebDataDisplayClass.
TWebDataInputClass (see page 2241)	This is type MidItems.TWebDataInputClass.
TWebStatusClass (see page 2241)	This is type MidItems.TWebStatusClass.

37.5.1 MidItems.IMidasWebDataSet Type

Pascal

```
IMidasWebDataSet = IInetXWebDataSet;
```

C++

```
IInetXWebDataSet IMidasWebDataSet;
```

File

MidItems

Description

This is type MidItems.IMidasWebDataSet.

37.5.2 MidItems.TWebButtonClass Type

Pascal

```
TWebButtonClass = class of TWebButton;
```

C++

```
TWebButton TWebButtonClass;
```

File

MidItems

Description

This is type MidItems.TWebButtonClass.

37.5.3 MidItems.TWebDataDisplayClass Type

Pascal

```
TWebDataDisplayClass = class of TWebDataDisplay;
```

C++

```
TWebDataDisplay TWebDataDisplayClass;
```

File

MidItems

Description

This is type MidItems.TWebDataDisplayClass.

37.5.4 MidItems.TWebDataInputClass Type

Pascal

```
TWebDataInputClass = class of TWebDataInput;
```

C++

```
TWebDataInput TWebDataInputClass;
```

File

MidItems

Description

This is type MidItems.TWebDataInputClass.

37.5.5 MidItems.TWebStatusClass Type

Pascal

```
TWebStatusClass = class of TWebStatus;
```

C++

```
TWebStatus TWebStatusClass;
```

File

MidItems

Description

This is type MidItems.TWebStatusClass.

37.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
FormMethodNames (see page 2242)	This is constant MidItems.FormMethodNames.
HTMLAlignValues (see page 2243)	This is constant MidItems.HTMLAlignValues.
HTMLVAlignValues (see page 2243)	This is constant MidItems.HTMLVAlignValues.
sActionAttr (see page 2243)	This is constant MidItems.sActionAttr.
sAlignAttr (see page 2244)	This is constant MidItems.sAlignAttr.
sBgColorAttr (see page 2244)	This is constant MidItems.sBgColorAttr.
sBorderAttr (see page 2244)	This is constant MidItems.sBorderAttr.
sCellPaddingAttr (see page 2245)	This is constant MidItems.sCellPaddingAttr.
sCellSpacingAttr (see page 2245)	This is constant MidItems.sCellSpacingAttr.
sCheckedAttr (see page 2245)	This is constant MidItems.sCheckedAttr.
sClassAttr (see page 2246)	This is constant MidItems.sClassAttr.
sColsAttr (see page 2246)	This is constant MidItems.sColsAttr.
sColSpanAttr (see page 2246)	This is constant MidItems.sColSpanAttr.
sEncTypeAttr (see page 2247)	This is constant MidItems.sEncTypeAttr.
sImageHeightAttr (see page 2247)	This is constant MidItems.sImageHeightAttr.
sImageWidthAttr (see page 2247)	This is constant MidItems.sImageWidthAttr.
sMaxLengthAttr (see page 2248)	This is constant MidItems.sMaxLengthAttr.
sMethodAttr (see page 2248)	This is constant MidItems.sMethodAttr.
sMultipleAttr (see page 2248)	This is constant MidItems.sMultipleAttr.
sNameAttr (see page 2249)	This is constant MidItems.sNameAttr.
sOnClickAttr (see page 2249)	This is constant MidItems.sOnClickAttr.
sReadOnlyAttr (see page 2249)	This is constant MidItems.sReadOnlyAttr.
sRowsAttr (see page 2250)	This is constant MidItems.sRowsAttr.
sSelectedAttr (see page 2250)	This is constant MidItems.sSelectedAttr.
sSizeAttr (see page 2250)	This is constant MidItems.sSizeAttr.
sStyleAttr (see page 2251)	This is constant MidItems.sStyleAttr.
sTabIndexAttr (see page 2251)	This is constant MidItems.sTabIndexAttr.
sTypeAttr (see page 2251)	This is constant MidItems.sTypeAttr.
sVAlignAttr (see page 2252)	This is constant MidItems.sVAlignAttr.
sValueAttr (see page 2252)	This is constant MidItems.sValueAttr.
sWidthAttr (see page 2252)	This is constant MidItems.sWidthAttr.
sWrapAttr (see page 2253)	This is constant MidItems.sWrapAttr.
TextAreaWrap (see page 2253)	This is constant MidItems.TextAreaWrap.

37.6.1 MidItems.FormMethodNames Constant

Pascal

```
FormMethodNames: array[TFormMethod] of string = ('POST', 'GET');
```

C++

```
array[TFormMethod] of string FormMethodNames = ('POST', 'GET');
```

File

MidItems

Description

This is constant MidItems.FormMethodNames.

37.6.2 MidItems.HTMLAlignValues Constant

Pascal

```
HTMLAlignValues: array[THTMLAlign] of string = ('', 'left', 'right', 'center');
```

C++

```
array[THTMLAlign] of string HTMLAlignValues = ('', 'left', 'right', 'center');
```

File

MidItems

Description

This is constant MidItems.HTMLAlignValues.

37.6.3 MidItems.HTMLVAlignValues Constant

Pascal

```
HTMLVAlignValues: array[THTMLVAlign] of string = ('', 'top', 'middle', 'bottom', 'baseline');
```

C++

```
array[THTMLVAlign] of string HTMLVAlignValues = ('', 'top', 'middle', 'bottom', 'baseline');
```

File

MidItems

Description

This is constant MidItems.HTMLVAlignValues.

37.6.4 MidItems.sActionAttr Constant

Pascal

```
sActionAttr = 'action';
```

C++

```
sActionAttr = 'action';
```

File

MidItems

Description

This is constant MidItems.sActionAttr.

37.6.5 MidItems.sAlignAttr Constant

Pascal

```
sAlignAttr = 'align';
```

C++

```
sAlignAttr = 'align';
```

File

MidItems

Description

This is constant MidItems.sAlignAttr.

37.6.6 MidItems.sBgColorAttr Constant

Pascal

```
sBgColorAttr = 'bgcolor';
```

C++

```
sBgColorAttr = 'bgcolor';
```

File

MidItems

Description

This is constant MidItems.sBgColorAttr.

37.6.7 MidItems.sBorderAttr Constant

Pascal

```
sBorderAttr = 'border';
```

C++

```
sBorderAttr = 'border';
```

File

MidItems

Description

This is constant MidItems.sBorderAttr.

37.6.8 MidItems.sCellPaddingAttr Constant

Pascal

```
sCellPaddingAttr = 'cellpadding';
```

C++

```
sCellPaddingAttr = 'cellpadding';
```

File

MidItems

Description

This is constant MidItems.sCellPaddingAttr.

37.6.9 MidItems.sCellSpacingAttr Constant

Pascal

```
sCellSpacingAttr = 'cellspacing';
```

C++

```
sCellSpacingAttr = 'cellspacing';
```

File

MidItems

Description

This is constant MidItems.sCellSpacingAttr.

37.6.10 MidItems.sCheckedAttr Constant

Pascal

```
sCheckedAttr = 'checked';
```

C++

```
sCheckedAttr = 'checked';
```

File

MidItems

Description

This is constant MidItems.sCheckedAttr.

37.6.11 MidItems.sClassAttr Constant

Pascal

```
sClassAttr = 'class';
```

C++

```
sClassAttr = 'class';
```

File

MidItems

Description

This is constant MidItems.sClassAttr.

37.6.12 MidItems.sColsAttr Constant

Pascal

```
sColsAttr = 'cols';
```

C++

```
sColsAttr = 'cols';
```

File

MidItems

Description

This is constant MidItems.sColsAttr.

37.6.13 MidItems.sColSpanAttr Constant

Pascal

```
sColSpanAttr = 'colspan';
```

C++

```
sColSpanAttr = 'colspan';
```

File

MidItems

Description

This is constant MidItems.sColSpanAttr.

37.6.14 MidItems.sEncTypeAttr Constant

Pascal

```
sEncTypeAttr = 'enctype';
```

C++

```
sEncTypeAttr = 'enctype';
```

File

MidItems

Description

This is constant MidItems.sEncTypeAttr.

37.6.15 MidItems.sImageHeightAttr Constant

Pascal

```
sImageHeightAttr = 'imageheight';
```

C++

```
sImageHeightAttr = 'imageheight';
```

File

MidItems

Description

This is constant MidItems.sImageHeightAttr.

37.6.16 MidItems.sImageWidthAttr Constant

Pascal

```
sImageWidthAttr = 'imagewidth';
```

C++

```
sImageWidthAttr = 'imagewidth';
```

File

MidItems

Description

This is constant MidItems.sImageWidthAttr.

37.6.17 MidItems.sMaxLengthAttr Constant

Pascal

```
sMaxLengthAttr = 'maxlength';
```

C++

```
sMaxLengthAttr = 'maxlength';
```

File

MidItems

Description

This is constant MidItems.sMaxLengthAttr.

37.6.18 MidItems.sMethodAttr Constant

Pascal

```
sMethodAttr = 'method';
```

C++

```
sMethodAttr = 'method';
```

File

MidItems

Description

This is constant MidItems.sMethodAttr.

37.6.19 MidItems.sMultipleAttr Constant

Pascal

```
sMultipleAttr = 'multiple';
```

C++

```
sMultipleAttr = 'multiple';
```

File

MidItems

Description

This is constant MidItems.sMultipleAttr.

37.6.20 MidItems.sNameAttr Constant

Pascal

```
sNameAttr = 'name';
```

C++

```
sNameAttr = 'name';
```

File

MidItems

Description

This is constant MidItems.sNameAttr.

37.6.21 MidItems.sOnClickAttr Constant

Pascal

```
sOnClickAttr = 'onclick';
```

C++

```
sOnClickAttr = 'onclick';
```

File

MidItems

Description

This is constant MidItems.sOnClickAttr.

37.6.22 MidItems.sReadOnlyAttr Constant

Pascal

```
sReadOnlyAttr = 'readonly';
```

C++

```
sReadOnlyAttr = 'readonly';
```

File

MidItems

Description

This is constant MidItems.sReadOnlyAttr.

37.6.23 MidItems.sRowsAttr Constant

Pascal

```
sRowsAttr = 'rows';
```

C++

```
sRowsAttr = 'rows';
```

File

MidItems

Description

This is constant MidItems.sRowsAttr.

37.6.24 MidItems.sSelectedAttr Constant

Pascal

```
sSelectedAttr = 'selected';
```

C++

```
sSelectedAttr = 'selected';
```

File

MidItems

Description

This is constant MidItems.sSelectedAttr.

37.6.25 MidItems.sSizeAttr Constant

Pascal

```
sSizeAttr = 'size';
```

C++

```
sSizeAttr = 'size';
```

File

MidItems

Description

This is constant MidItems.sSizeAttr.

37.6.26 MidItems.sStyleAttr Constant

Pascal

```
sStyleAttr = 'style';
```

C++

```
sStyleAttr = 'style';
```

File

MidItems

Description

This is constant MidItems.sStyleAttr.

37.6.27 MidItems.sTabIndexAttr Constant

Pascal

```
sTabIndexAttr = 'tabindex';
```

C++

```
sTabIndexAttr = 'tabindex';
```

File

MidItems

Description

This is constant MidItems.sTabIndexAttr.

37.6.28 MidItems.sTypeAttr Constant

Pascal

```
sTypeAttr = 'type';
```

C++

```
sTypeAttr = 'type';
```

File

MidItems

Description

This is constant MidItems.sTypeAttr.

37.6.29 MidItems.sVAlignAttr Constant

Pascal

```
sVAlignAttr = 'valign';
```

C++

```
sVAlignAttr = 'valign';
```

File

MidItems

Description

This is constant MidItems.sVAlignAttr.

37.6.30 MidItems.sValueAttr Constant

Pascal

```
sValueAttr = 'value';
```

C++

```
sValueAttr = 'value';
```

File

MidItems

Description

This is constant MidItems.sValueAttr.

37.6.31 MidItems.sWidthAttr Constant

Pascal

```
sWidthAttr = 'width';
```

C++

```
sWidthAttr = 'width';
```

File

MidItems

Description

This is constant MidItems.sWidthAttr.

37.6.32 MidItems.sWrapAttr Constant

Pascal

```
sWrapAttr = 'wrap';
```

C++

```
sWrapAttr = 'wrap';
```

File

MidItems

Description

This is constant MidItems.sWrapAttr.

37.6.33 MidItems.TextAreaWrap Constant

Pascal

```
TextAreaWrap: array[TTextAreaWrap] of string = ('OFF', 'PHYSICAL', 'VIRTUAL');
```

C++

```
array[TTextAreaWrap] of string TextAreaWrap = ('OFF', 'PHYSICAL', 'VIRTUAL');
```

File

MidItems

Description

This is constant MidItems.TextAreaWrap.

38 MidProd Namespace

This is namespace MidProd.

Topics

Name	Description
Classes (see page 2257)	The following table lists classes in this documentation.
Functions (see page 2296)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2297)	The following table lists structs, records, enums in this documentation.
Types (see page 2298)	The following table lists types in this documentation.
Constants (see page 2301)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBaseInetXPageProducer (see page 2257)	TBaseInetXPageProducer is an base class for InternetExpress page producer classes.
	TCustomInetXPageProducer (see page 2275)	TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.
	TInetXPageElements (see page 2283)	This is class MidProd.TInetXPageElements.
	TInetXPageProducer (see page 2285)	TInetXPageProducer assembles an HTML document that represents live database information from an application server.
	TMidasPageProducer (see page 2295)	TMidasPageProducer assembles an HTML document that represents live database information from an application server.

Constants

Name	Description
sXMLBroker (see page 2301)	This is constant MidProd.sXMLBroker.
sXMLReadyVar (see page 2301)	This is constant MidProd.sXMLReadyVar.

Functions

	Name	Description
	AddStdIncludes (see page 2296)	This is function MidProd.AddStdIncludes.
	PathInfoToRelativePath (see page 2296)	This is function MidProd.PathInfoToRelativePath.

Structs, Records, Enums

	Name	Description
	TStdInclude (see page 2297)	This is record MidProd.TStdInclude.

Types

Name	Description
TBaseMidasPageProducer (see page 2298)	This is type MidProd.TBaseMidasPageProducer.
TCustomMidasPageProducer (see page 2298)	This is type MidProd.TCustomMidasPageProducer.
TMidasPageElements (see page 2299)	This is type MidProd.TMidasPageElements.
TStdIncludes (see page 2299)	This is type MidProd.TStdIncludes.
TXMLDataEvent (see page 2299)	TXMLDataEvent is the type of event handlers that occur when an InternetExpress page producer adds an XML data packet to its HTML document.

38.1 Classes

The following table lists classes in this documentation.

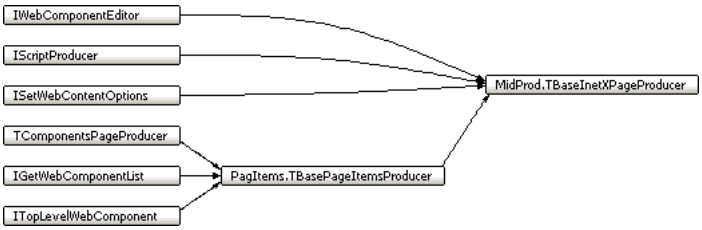
Classes

	Name	Description
	TBaseInetXPageProducer (see page 2257)	TBaseInetXPageProducer is an base class for InternetExpress page producer classes.
	TCustomInetXPageProducer (see page 2275)	TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.
	TInetXPageElements (see page 2283)	This is class MidProd.TInetXPageElements.
	TInetXPageProducer (see page 2285)	TInetXPageProducer assembles an HTML document that represents live database information from an application server.
	TMidasPageProducer (see page 2295)	TMidasPageProducer assembles an HTML document that represents live database information from an application server.

38.1.1 TBaseInetXPageProducer Class

TBaseInetXPageProducer is an base class for InternetExpress page producer classes.

Class Hierarchy



Pascal

```
TBaseInetXPageProducer = class(TBasePageItemsProducer, IWebComponentEditor, IScriptProducer,
ISetWebContentOptions);
```

C++

```
class TBaseInetXPageProducer : public TBasePageItemsProducer, public IWebComponentEditor,
public IScriptProducer, public ISetWebContentOptions;
```

File

MidProd

Description

Do not create instances of TBaseInetXPageProducer. Instead, use one of its descendant classes, such as TInetXPageProducer (see page 2285).

TBaseInetXPageProducer introduces the logic for working with an XML broker to obtain database information and for translating the special HTML-transparent tags that are used in InternetExpress applications. Unlike its immediate descendant (TCustomInetXPageProducer (see page 2275)) however, TBaseInetXPageProducer does not initialize the HTMLDoc property to the default template for an InternetExpress application, although it dynamically generates the InternetExpress-specific tags.

You can use TBaseInetXPageProducer as a base class when writing a page producer that does not use the default template, but

which translates InternetExpress tags into HTML and javascript.

TInetXPageProducer (see page 2285)

TXMLBroker

38.1.1.1 TBaseInetXPageProducer Members

The following tables list the members exposed by TBaseInetXPageProducer.

Protected Methods

	Name	Description
	AddIncludes (see page 2261)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 2261)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	CanAddClass (see page 2261)	Indicates whether a specified class can be used as a child Web item.
	CreatePageElements (see page 2262)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 2262)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 2263)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 2263)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 2263)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 2263)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 2263)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 2264)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
	DeclareXMLDocuments (see page 2264)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 2264)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DoAfterGetContent (see page 2264)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 2265)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 2265)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 2265)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 2265)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	GeneratePageElements (see page 2266)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetContentOptions (see page 2267)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetDefaultTemplate (see page 2267)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetScriptManager (see page 2268)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetUseXMLIslands (see page 2268)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 2268)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 2269)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	ImplCanAddClass (see page 2269)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.
	SetWebContentOptions (see page 2270)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

Protected Properties

	Name	Description
	PageElements (see page 2271)	This is PageElements, a member of class TBaseInetXPageProducer.
	ScriptManager (see page 2272)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Events

	Name	Description
	OnAfterGetContent (see page 2273)	Occurs after the page producer generates its HTML document.

	OnAfterGetXMLData (see page 2274)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 2274)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 2275)	Occurs before the page producer fetches an XML data packet from an XML broker.

Public Methods

	Name	Description
V	ContentFromStream (see page 2262)	Returns the content produced in response to input read from a stream.
V	Create (see page 2259)	Creates an instance of a TBaseInetXPageProducer (see page 2257).
V	Destroy (see page 2259)	Destroys the instance of the TBasePageItemsProducer.
V	FindXMLBroker (see page 2265)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
V	FindXMLBrokerName (see page 2266)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
V	GetRequiredTags (see page 2267)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
V	GetXMLData (see page 2268)	Obtains an XML data packet from a specified XML broker.
	SetIncludePathURL (see page 2269)	Assigns a value to the IncludePathURL (see page 2271) property.
	SetStyles (see page 2269)	Assigns a value to the Styles (see page 2272) property.
	SetStylesFile (see page 2270)	Assigns a value to the StylesFile (see page 2273) property.

Public Properties

	Name	Description
	EnableXMLIslands (see page 2271)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	IncludePathURL (see page 2271)	Indicates the URL where the javascript libraries are installed.
	Styles (see page 2272)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 2273)	Specifies a file containing the individual styles for the page producer's style sheet.
R	WebPageItems (see page 2969)	Maintains a list of components that generate HTML content for the producer.

38.1.1.2 TBaseInetXPageProducer.Create Constructor

Creates an instance of a TBaseInetXPageProducer (see page 2257).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TBaseInetXPageProducer(TComponent * AComponent);
```

Description

Call Create to instantiate a TBaseInetXPageProducer (see page 2257) component at runtime if it was not created at design time.

AOwner is the component, typically the Web module, that becomes the value of this page producer's Owner property. The Owner is responsible for freeing the TBaseInetXPageProducer (see page 2257) instance.

See Also

Owner

38.1.1.3 TBaseInetXPageProducer.Destroy Destructor

Destroys the instance of the TBasePageItemsProducer.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseInetXPageProducer();
```

Description

Do not call Destroy directly. Instead call Free, which checks that the TBasePageItemsProducer reference is not nil before calling Destroy.

Create (see page 2967)

System::TObject::Free

38.1.1.4 TBaseInetXPageProducer Methods

The methods of the TBaseInetXPageProducer class are listed here.

Protected Methods

	Name	Description
	AddIncludes (see page 2261)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 2261)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	CanAddClass (see page 2261)	Indicates whether a specified class can be used as a child Web item.
	CreatePageElements (see page 2262)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 2262)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 2263)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 2263)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 2263)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 2263)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 2263)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 2264)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
	DeclareXMLDocuments (see page 2264)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 2264)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DoAfterGetContent (see page 2264)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 2265)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 2265)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 2265)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 2265)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	GeneratePageElements (see page 2266)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetContentOptions (see page 2267)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultTemplate (see page 2267)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetScriptManager (see page 2268)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetUseXMLIslands (see page 2268)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 2268)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 2269)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	ImplCanAddClass (see page 2269)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	SetWebContentOptions (see page 2270)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

Public Methods

	Name	Description
	ContentFromStream (see page 2262)	Returns the content produced in response to input read from a stream.

	FindXMLBroker (see page 2265)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 2266)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	GetRequiredTags (see page 2267)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetXMLData (see page 2268)	Obtains an XML data packet from a specified XML broker.
	SetIncludePathURL (see page 2269)	Assigns a value to the IncludePathURL (see page 2271) property.
	SetStyles (see page 2269)	Assigns a value to the Styles (see page 2272) property.
	SetStylesFile (see page 2270)	Assigns a value to the StylesFile (see page 2273) property.

38.1.1.4.1 TBaseInetXPageProducer.AddIncludes Method

Pascal

```
procedure AddIncludes; virtual;
```

C++

```
virtual __fastcall AddIncludes();
```

Description

This is AddIncludes, a member of class TBaseInetXPageProducer.

38.1.1.4.2 TBaseInetXPageProducer.AddScriptComponents Method

Pascal

```
procedure AddScriptComponents; virtual;
```

C++

```
virtual __fastcall AddScriptComponents();
```

Description

This is AddScriptComponents, a member of class TBaseInetXPageProducer.

38.1.1.4.3 TBaseInetXPageProducer.CanAddClass Method

Indicates whether a specified class can be used as a child Web item.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the Web item that implements this interface.

AParent is the Web item that will act as a parent to the added Web item.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web item can use content generated by a component of type AClass, false otherwise.

38.1.1.4.4 TBaseInetXPageProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(InStream: TStream): string; override;
```

C++

```
virtual __fastcall UnicodeString ContentFromStream(TStream InStream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter. ContentFromStream

1. Generates an OnBeforeGetContent (see page 2274) event.
2. Translates the HTML template that is the value of Stream, using information produced by the items listed in the WebPageItems property.
3. Generates an OnAfterGetContent (see page 2273) event.
4. Returns the HTML produced in step 2.

See Also

Content

OnBeforeGetContent (see page 2274)

WebPageItems (see page 2969)

OnAfterGetContent (see page 2273)

38.1.1.4.5 TBaseInetXPageProducer.CreatePageElements Method

Pascal

```
function CreatePageElements: TInetxPageElements; virtual;
```

C++

```
virtual __fastcall TInetxPageElements CreatePageElements();
```

Description

This is CreatePageElements, a member of class TBaseInetXPageProducer.

38.1.1.4.6 TBaseInetXPageProducer.CreateScriptManager Method

Pascal

```
function CreateScriptManager(Options: TWebContentOptions): TObject; virtual;
```

C++

```
virtual __fastcall TObject * CreateScriptManager(TWebContentOptions Options);
```

Description

This is CreateScriptManager, a member of class TBaseInetXPageProducer.

38.1.1.4.7 TBaseInetXPageProducer.DeclareFunctions Method

Pascal

```
function DeclareFunctions: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareFunctions();
```

Description

This is DeclareFunctions, a member of class TBaseInetXPageProducer.

38.1.1.4.8 TBaseInetXPageProducer.DeclareIncludes Method

Pascal

```
function DeclareIncludes: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareIncludes();
```

Description

This is DeclareIncludes, a member of class TBaseInetXPageProducer.

38.1.1.4.9 TBaseInetXPageProducer.DeclareRowSets Method

Pascal

```
function DeclareRowSets: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareRowSets();
```

Description

This is DeclareRowSets, a member of class TBaseInetXPageProducer.

38.1.1.4.10 TBaseInetXPageProducer.DeclareScript Method

Pascal

```
function DeclareScript(XMLIslands: Boolean): string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareScript(Boolean XMLIslands);
```

Description

This is DeclareScript, a member of class TBaseInetXPageProducer.

38.1.1.4.11 TBaseInetXPageProducer.DeclareStyles Method

Pascal

```
function DeclareStyles: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareStyles();
```

Description

This is DeclareStyles, a member of class TBaseInetXPageProducer.

38.1.1.4.12 TBaseInetXPageProducer.DeclareWarnings Method

Pascal

```
function DeclareWarnings(Warnings: TStrings): string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareWarnings(TStrings Warnings);
```

Description

This is DeclareWarnings, a member of class TBaseInetXPageProducer.

38.1.1.4.13 TBaseInetXPageProducer.DeclareXMLDocuments Method

Pascal

```
function DeclareXMLDocuments: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareXMLDocuments();
```

Description

This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.

38.1.1.4.14 TBaseInetXPageProducer.DeclareXMLIslands Method

Pascal

```
function DeclareXMLIslands: string; virtual;
```

C++

```
virtual __fastcall UnicodeString DeclareXMLIslands();
```

Description

This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.

38.1.1.4.15 TBaseInetXPageProducer.DoAfterGetContent Method

Pascal

```
procedure DoAfterGetContent;
```

C++

```
__fastcall DoAfterGetContent();
```

Description

This is DoAfterGetContent, a member of class TBaseInetXPageProducer.

38.1.1.4.16 TBaseInetXPageProducer.DoAfterGetXMLData Method

Pascal

```
procedure DoAfterGetXMLData(XMLBroker: TXMLBroker; var OwnerData: OleVariant);
```

C++

```
__fastcall DoAfterGetXMLData(TXMLBroker XMLBroker, OleVariant OwnerData);
```

Description

This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.

38.1.1.4.17 TBaseInetXPageProducer.DoBeforeGetContent Method

Pascal

```
procedure DoBeforeGetContent;
```

C++

```
__fastcall DoBeforeGetContent();
```

Description

This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.

38.1.1.4.18 TBaseInetXPageProducer.DoBeforeGetXMLData Method

Pascal

```
procedure DoBeforeGetXMLData(XMLBroker: TXMLBroker; var OwnerData: OleVariant);
```

C++

```
__fastcall DoBeforeGetXMLData(TXMLBroker XMLBroker, OleVariant OwnerData);
```

Description

This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.

38.1.1.4.19 TBaseInetXPageProducer.DoTagEvent Method

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); override;
```

C++

```
virtual __fastcall DoTagEvent(TTag Tag, const UnicodeString TagString, TStrings TagParams,
UnicodeString ReplaceText);
```

Description

This is DoTagEvent, a member of class TBaseInetXPageProducer.

38.1.1.4.20 TBaseInetXPageProducer.FindXMLBroker Method

Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.

Pascal

```
function FindXMLBroker(TagParams: TStrings): TXMLBroker; virtual;
```

C++

```
virtual __fastcall TXMLBroker FindXMLBroker(TStrings TagParams);
```

Description

The page producer translates HTML-transparent tags of the form

<#DATAPACKET XMLBroker=BrokerName>

into the XML returned by the XML broker. To do so, it calls FindXMLBroker to locate the XML broker specified by the XMLBroker parameter.

TagParams is a set of Name=Value pairs. This comes from the parameter portion of the DATAPACKET tag.

FindXMLBroker returns the XML broker with the name specified by the XMLBroker parameter. If TagParams does not contain a string of the form XMLBroker=BrokerName, FindXMLBroker returns nil (Delphi) or NULL (C++).

See Also

FindXMLBrokerName (see page 2266)

GetXMLData (see page 2268)

38.1.1.4.21 TBaseInetXPageProducer.FindXMLBrokerName Method

Returns the name of an XML broker given the parameters in a DATAPACKET tag..

Pascal

```
function FindXMLBrokerName(TagParams: TStrings): string; virtual;
```

C++

```
virtual __fastcall UnicodeString FindXMLBrokerName(TStrings TagParams);
```

Description

The page producer translates HTML-transparent tags of the form

<#DATAPACKET XMLBroker=BrokerName>

into the XML returned by the XML broker. To do so, it calls FindXMLBrokerName to parse the parameters for the value of the XMLBroker parameter.

TagParams is a set of Name=Value pairs. This comes from the parameter portion of the DATAPACKET tag.

FindXMLBrokerName returns the value string from the XMLBroker parameter. If TagParams does not contain a string of the form XMLBroker=BrokerName, FindXMLBrokerName returns an empty string.

See Also

FindXMLBroker (see page 2265)

GetXMLData (see page 2268)

38.1.1.4.22 TBaseInetXPageProducer.GeneratePageElements Method

Pascal

```
procedure GeneratePageElements; virtual;
```

C++

```
virtual __fastcall GeneratePageElements();
```

Description

This is GeneratePageElements, a member of class TBaseInetXPageProducer.

38.1.1.4.23 TBaseInetXPageProducer.GetContentOptions Method

Pascal

```
function GetContentOptions(var Owned: Boolean): TWebContentOptions; override;
```

C++

```
virtual __fastcall TWebContentOptions GetContentOptions(Boolean Owned);
```

Description

This is GetContentOptions, a member of class TBaseInetXPageProducer.

38.1.1.4.24 TBaseInetXPageProducer.GetDefaultTemplate Method

Pascal

```
function GetDefaultTemplate: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultTemplate();
```

Description

This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.

38.1.1.4.25 TBaseInetXPageProducer.GetRequiredTags Method

Returns the default set of HTML-transparent tags for an InternetExpress page producer.

Pascal

```
class function GetRequiredTags: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetRequiredTags();
```

Description

GetRequiredTags dynamically generates the InternetExpress-specific tags that form the basis of an InternetExpress page producer's default template.

GetRequiredTags returns the string

```
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
```

See Also

HTMLDoc (see page 2281)

Content (see page 2279)

38.1.1.4.26 TBaseInetXPageProducer.GetScriptManager Method

Pascal

```
function GetScriptManager: IScriptManager;
```

C++

```
__fastcall IScriptManager GetScriptManager();
```

Description

This is GetScriptManager, a member of class TBaseInetXPageProducer.

38.1.1.4.27 TBaseInetXPageProducer.GetUseXMLIslands Method

Pascal

```
function GetUseXMLIslands: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetUseXMLIslands();
```

Description

This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.

38.1.1.4.28 TBaseInetXPageProducer.GetXMLData Method

Obtains an XML data packet from a specified XML broker.

Pascal

```
function GetXMLData(XMLBroker: TXMLBroker; XMLOptions: TXMLOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetXMLData(TXMLBroker XMLBroker, TXMLOptions XMLOptions);
```

Description

GetXMLData first generates an OnBeforeGetXMLData (see page 2275) event. It then calls the RequestRecords method of the XML broker specified by XMLBroker, passing in the formatting options specified by XMLOptions. Finally, it generates an OnAfterGetXMLData (see page 2274) event.

GetXMLData returns the XML data packet that XMLBroker supplies.

See Also

OnAfterGetXMLData (see page 2274)

OnBeforeGetXMLData (see page 2275)

Content

RequestRecords

38.1.1.4.29 TBaseInetXPageProducer.GetXMLDelta Method

Pascal

```
function GetXMLDelta(XMLBroker: TXMLBroker): string;
```

C++

```
__fastcall UnicodeString GetXMLDelta(TXMLBroker XMLBroker);
```

Description

This is GetXMLDelta, a member of class TBaseInetXPageProducer.

38.1.1.4.30 TBaseInetXPageProducer.GetXMLErrors Method

Pascal

```
function GetXMLErrors(XMLBroker: TXMLBroker): string;
```

C++

```
__fastcall UnicodeString GetXMLErrors(TXMLBroker XMLBroker);
```

Description

This is GetXMLErrors, a member of class TBaseInetXPageProducer.

38.1.1.4.31 TBaseInetXPageProducer.ImplCanAddClass Method

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is ImplCanAddClass, a member of class TBaseInetXPageProducer.

38.1.1.4.32 TBaseInetXPageProducer.SetIncludePathURL Method

Assigns a value to the IncludePathURL (see page 2271) property.

Pascal

```
procedure SetIncludePathURL(const Value: string);
```

C++

```
__fastcall SetIncludePathURL(const UnicodeString Value);
```

Description

SetIncludePathURL is the write implementation of the IncludePathURL (see page 2271) property.

See Also

IncludePathURL (see page 2271)

38.1.1.4.33 TBaseInetXPageProducer.SetStyles Method

Assigns a value to the Styles (see page 2272) property.

Pascal

```
procedure SetStyles(Value: TStrings);
```

C++

```
__fastcall SetStyles(TStrings Value);
```

Description

SetStyles is the write implementation of the Styles (see page 2272) property.

See Also

Styles (see page 2272)

38.1.1.4.34 TBaseInetXPageProducer.SetStylesFile Method

Assigns a value to the StylesFile (see page 2273) property.

Pascal

```
procedure SetStylesFile(const Value: TFileName);
```

C++

```
__fastcall SetStylesFile(const TFileName Value);
```

Description

SetStylesFile is the write implementation of the StylesFile (see page 2273) property.

See Also

StylesFile (see page 2273)

38.1.1.4.35 TBaseInetXPageProducer.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

38.1.1.5 TBaseInetXPageProducer Properties

The properties of the TBaseInetXPageProducer class are listed here.

Protected Properties

	Name	Description
	PageElements (see page 2271)	This is PageElements, a member of class TBaseInetXPageProducer.
	ScriptManager (see page 2272)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Properties

	Name	Description
	EnableXMLIslands (see page 2271)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	IncludePathURL (see page 2271)	Indicates the URL where the javascript libraries are installed.
	Styles (see page 2272)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 2273)	Specifies a file containing the individual styles for the page producer's style sheet.

38.1.1.5.1 TBaseInetXPageProducer.EnableXMLIslands Property

Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.

Pascal

```
property EnableXMLIslands: Boolean;
```

C++

```
__property Boolean EnableXMLIslands;
```

Description

Set EnableXMLIslands to indicate whether the XML in the generated HTML document should be declared using XML islands. XML islands are only used if the document is created in response to a request message whose headers indicate that the browser supports XML islands.

Set EnableXMLIslands to false to prevent the page producer from declaring XML islands even if the requesting browser supports them.

See Also

GetXMLData (see page 2268)

Content

38.1.1.5.2 TBaseInetXPageProducer.IncludePathURL Property

Indicates the URL where the javascript libraries are installed.

Pascal

```
property IncludePathURL: string;
```

C++

```
__property UnicodeString IncludePathURL;
```

Description

Set IncludePathURL to indicate where the javascript libraries are installed. The page producer uses this value to create HTML statements that include the libraries in the generated HTML document. These statements have the form

```
<SCRIPT language=Javascript type="text/javascript" SRC="IncludePathURL/xmldb.js"> </SCRIPT>
```

The javascript libraries define classes and methods that allow the HTML document to interpret XML data packets if the Web browser is not XML-enabled, and that enable controls in the document to navigate the data, post changes, and apply updates.

SetIncludePathURL (see page 2269)

Content

Creating Web Pages with an InternetExpress Page Producer

38.1.1.5.3 TBaseInetXPageProducer.PageElements Property

Pascal

```
property PageElements: TInetxPageElements;
```

C++

```
__property TInetxPageElements PageElements;
```

Description

This is PageElements, a member of class TBaseInetXPageProducer.

38.1.1.5.4 TBaseInetXPageProducer.ScriptManager Property

Pascal

```
property ScriptManager: IScriptManager;
```

C++

```
__property IScriptManager ScriptManager;
```

Description

This is ScriptManager, a member of class TBaseInetXPageProducer.

38.1.1.5.5 TBaseInetXPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseInetXPageProducer (see page 2257). Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a file. To define the styles in a file, use the StylesFile (see page 2273) property instead. If StylesFile (see page 2273) is defined, it takes precedence over the Styles property.

SetStyles (see page 2269)

StylesFile (see page 2273)

Content

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

38.1.1.5.6 TBaseInetXPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these style definitions to declare a style sheet in the HTML document it generates.

Styles (see page 2272) for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles (see page 2272) property instead.

38.1.1.6 TBaseInetXPageProducer Events

The events of the TBaseInetXPageProducer class are listed here.

Public Events

	Name	Description
	OnAfterGetContent (see page 2273)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 2274)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 2274)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 2275)	Occurs before the page producer fetches an XML data packet from an XML broker.

38.1.1.6.1 TBaseInetXPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its HTML document.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the page producer generates an HTML document. This event occurs immediately before the Content method returns the generated document. Typically it is used in applications where the page producer automatically responds to messages as the Provider (see page 3073) property of an action item or the Response producer property of an XML broker.

See Also

OnBeforeGetContent (see page 2274)

Content

Producer

38.1.1.6.2 TBaseInetXPageProducer.OnAfterGetXMLData Event

Occurs after the page producer translates fetches an XML data packet from an XML broker.

Pascal

```
property OnAfterGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnAfterGetXMLData;
```

Description

Write an OnAfterGetXMLData event handler to take specific action immediately after the page producer obtains an XML data packet from an XML broker. Typically, the OnAfterGetXMLData event handler responds to any values returned by the provider on the application server as the OwnerData parameter.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnAfterGetXMLData occurs after the page producer has returned an XML data packet but before it is assigned as part of the emerging content.

See Also

OnBeforeGetXMLData (see page 2275)

GetXMLData (see page 2268)

OnHTMLTag

Content

38.1.1.6.3 TBaseInetXPageProducer.OnBeforeGetContent Event

Occurs when the Content method is called.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the page producer generates an HTML document. This event occurs when the Content method is called before the page producer starts assembling its HTML

document. Typically it is used in applications where the page producer automatically responds to messages as the Provider (see page 3073) property of an action item or the Response producer property of an XML broker.

See Also

OnAfterGetContent (see page 2273)

Content

Producer

38.1.1.6.4 TBaseInetXPageProducer.OnBeforeGetXMLData Event

Occurs before the page producer fetches an XML data packet from an XML broker.

Pascal

```
property OnBeforeGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnBeforeGetXMLData;
```

Description

Write an OnBeforeGetXMLData event handler to take specific action immediately before the page producer requests an XML data packet from an XML broker. Typically, the OnBeforeGetXMLData event handler encodes any values for the provider on the application server as the OwnerData parameter or initializes properties on the XML broker that affect the data packet.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnBeforeGetXMLData occurs immediately before the page producer requests an XML data packet. Any value assigned to the OwnerData parameter is passed to the XML broker's OnRequestRecords event handler, and from there to the provider's OnBeforeGetRecords event handler.

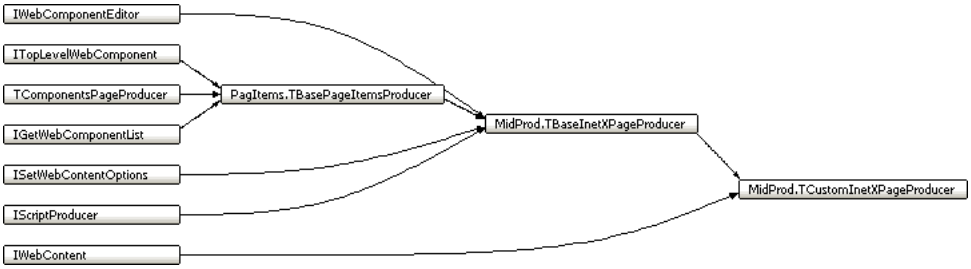
38.1.2 TCustomInetXPageProducer Class

TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.

Class Hierarchy



Pascal

```
TCustomInetXPageProducer = class(TBaseInetXPageProducer, IWebContent);
```

C++

```
class TCustomInetXPageProducer : public TBaseInetXPageProducer, public IWebContent;
```

File

MidProd

Description

Use TCustomInetXPageProducer as a base class for components that create Web pages in an InternetExpress Web application. These pages display database information from an application server and include data packets encoded in XML and javascript that lets Web browsers navigate that data, post changes, and apply updates back to the application server.

The InetX page producer creates its HTML document from a template. The InetX page producer has a default template that coordinates several top-level declarations for the HTML document with content produced by other components. The other components that generate HTML content for the InetX page producer can be added at design time using the Web Page editor.

Do not instantiate TCustomInetXPageProducer. To create a producer that generates HTML pages with javascript database functions and XML data packets, use a descendant class such as TInetXPageProducer (see page 2285).

TXMLBroker

38.1.2.1 TCustomInetXPageProducer Members

The following tables list the members exposed by TCustomInetXPageProducer.

Protected Methods

	Name	Description
	AddIncludes (see page 2261)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 2261)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	CanAddClass (see page 2261)	Indicates whether a specified class can be used as a child Web item.
	CreatePageElements (see page 2262)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 2262)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 2263)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 2263)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 2263)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 2263)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 2263)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 2264)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.

	DeclareXMLDocuments (see page 2264)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 2264)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DoAfterGetContent (see page 2264)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 2265)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 2265)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 2265)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 2265)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	GeneratePageElements (see page 2266)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetContentOptions (see page 2267)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetDefaultTemplate (see page 2267)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetScriptManager (see page 2268)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetTemplateFileName (see page 2280)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
	GetTemplateStream (see page 2280)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	GetUseXMLIslands (see page 2268)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 2268)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 2269)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	ImplCanAddClass (see page 2269)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.
	SetWebContentOptions (see page 2270)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.
	WebContent (see page 2281)	This is WebContent, a member of class TCustomInetXPageProducer.

Protected Properties

	Name	Description
	PageElements (see page 2271)	This is PageElements, a member of class TBaseInetXPageProducer.
	ScriptManager (see page 2272)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Events

	Name	Description
	OnAfterGetContent (see page 2273)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 2274)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 2274)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 2275)	Occurs before the page producer fetches an XML data packet from an XML broker.

Public Methods

	Name	Description
	Content (see page 2279)	Returns the HTML document assembled by the InternetExpress page producer.
	ContentFromStream (see page 2262)	Returns the content produced in response to input read from a stream.
	Create (see page 2278)	Creates and initializes an instance of TCustomInetXPageProducer (see page 2275).
	Destroy (see page 2278)	Frees an instance of TCustomInetXPageProducer (see page 2275).
	FindXMLBroker (see page 2265)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 2266)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	GetRequiredTags (see page 2267)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetXMLData (see page 2268)	Obtains an XML data packet from a specified XML broker.
	SetIncludePathURL (see page 2269)	Assigns a value to the IncludePathURL (see page 2271) property.
	SetStyles (see page 2269)	Assigns a value to the Styles (see page 2272) property.
	SetStylesFile (see page 2270)	Assigns a value to the StylesFile (see page 2273) property.

Public Properties

	Name	Description
	EnableXMLIslands (see page 2271)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	HTMLDoc (see page 2281)	Specifies the HTML template used to generate the value returned by the Content (see page 2279) method.
	HTMLFile (see page 2282)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 2279) method.
	IncludePathURL (see page 2271)	Indicates the URL where the javascript libraries are installed.
	Styles (see page 2272)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 2273)	Specifies a file containing the individual styles for the page producer's style sheet.
R	WebPageItems (see page 2969)	Maintains a list of components that generate HTML content for the producer.

38.1.2.2 TCustomInetXPageProducer.Create Constructor

Creates and initializes an instance of TCustomInetXPageProducer (see page 2275).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomInetXPageProducer(TComponent * AOwner);
```

Description

Call Create to instantiate an InternetExpress page producer at runtime. InternetExpress page producers placed in a Web module at design time are instantiated automatically.

AOwner is a component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for freeing the TCustomInetXPageProducer (see page 2275) instance.

See Also

Owner

38.1.2.3 TCustomInetXPageProducer.Destroy Destructor

Frees an instance of TCustomInetXPageProducer (see page 2275).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomInetXPageProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

System::TObject::Free

38.1.2.4 TCustomInetXPageProducer Methods

The methods of the TCustomInetXPageProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateFileName (see page 2280)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
	GetTemplateStream (see page 2280)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	WebContent (see page 2281)	This is WebContent, a member of class TCustomInetXPageProducer.

Public Methods

	Name	Description
	Content (see page 2279)	Returns the HTML document assembled by the InternetExpress page producer.

38.1.2.4.1 TCustomInetXPageProducer.Content Method

Returns the HTML document assembled by the InternetExpress page producer.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall UnicodeString Content();
```

Description

Call Content to get the HTML document produced by TCustomInetXPageProducer (see page 2275). This document contains a mixture of HTML, XML, and javascript. It allows Web browsers to view and edit data from an application server.

The InternetExpress page producer creates its content by replacing HTML-transparent tags in the template specified by HTMLDoc (see page 2281) or HTMLFile (see page 2282).

By default, this template has the form

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
</HTML>
```

Although the template can be changed to include any combination of these tags with tags of the following forms

```
<#COMPONENT Name=WebItemName>
<#DATAPACKET XMLBroker=BrokerName>
```

which are also translated automatically. The template can replace the default HTML-transparent tags with the tag

```
<#BODYELEMENTS>
```

Finally, the template can include any tags translated by the OnHTMLTag event handler.

The Content method translates the tags listed above as follows:

<#INCLUDES> generates the statements that include the javascript libraries at the location specified by IncludePathURL (see page 2271).

<#STYLES> generates the statements that defines a style sheet from the definitions listed in the Styles (see page 2272) or StylesFile (see page 2273) property.

<#WARNINGS> generates nothing at runtime. At design time, it adds warning messages for problems detected while generating the HTML document. You can see these messages in the Web page editor.

<#FORMS> generates the HTML produced by the components listed in the WebPageItems property. The HTML from each component is listed in the order it appears in WebPageItems.

<#SCRIPT> generates a block of javascript declarations that are used by the components listed in WebPageItems.

<#BODYELEMENTS> generates the same HTML as results from the 5 tags in the default template. It is useful when generating a template in an HTML editor when you want to use the default layout but add additional elements (such as style sheets) using the editor.

<#COMPONENT> is replaced with the content produced by the specified component. Typically, this is a component listed in the WebPageItems property, but it can be any component that supports the IWebContent interface and has the same Owner as the INETX page producer.

<#DATAPACKET> is replaced with the XML data packet obtained from the specified XML broker.

The string returned by Content can be used as the Content property of the response to an HTTP request message.

Customizing the InternetExpress Page Producer Template

38.1.2.4.2 TCustomInetXPageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TCustomInetXPageProducer.

38.1.2.4.3 TCustomInetXPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomInetXPageProducer.

38.1.2.4.4 TCustomInetXPageProducer.WebContent Method

Pascal

```
function WebContent(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall UnicodeString WebContent(TWebContentOptions Options, TLayout Layout);
```

Description

This is WebContent, a member of class TCustomInetXPageProducer.

38.1.2.5 TCustomInetXPageProducer Properties

The properties of the TCustomInetXPageProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 2281)	Specifies the HTML template used to generate the value returned by the Content (see page 2279) method.
	HTMLFile (see page 2282)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 2279) method.

38.1.2.5.1 TCustomInetXPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content (see page 2279) method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white

space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomInetXPageProducer (see page 2275) automatically handles the conversion of the HTML-transparent tags in the default template, as well as the tags described in the help for the Content (see page 2279) method. If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile (see page 2282) property.

Content (see page 2279)

HTMLFile (see page 2282)

OnHTMLTag

Creating Web Pages with an InternetExpress Page Producer

Customizing the InternetExpress Page Producer Template

38.1.2.5.2 TCustomInetXPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 2279) method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 2281) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

MidProd

Description

This is class MidProd.TInetXPageElements.

38.1.3.1 TInetXPageElements Members

The following tables list the members exposed by TInetXPageElements.

Public Fields

	Name	Description
	FormsContent (see page 2284)	This is FormsContent, a member of class TInetXPageElements.
	IncludesContent (see page 2284)	This is IncludesContent, a member of class TInetXPageElements.
	ScriptContent (see page 2284)	This is ScriptContent, a member of class TInetXPageElements.
	StylesContent (see page 2284)	This is StylesContent, a member of class TInetXPageElements.
	WarningsContent (see page 2284)	This is WarningsContent, a member of class TInetXPageElements.

Public Methods

	Name	Description
	BodyContent (see page 2285)	This is BodyContent, a member of class TInetXPageElements.

38.1.3.2 TInetXPageElements Fields

The fields of the TInetXPageElements class are listed here.

Public Fields

	Name	Description
	FormsContent (see page 2284)	This is FormsContent, a member of class TInetXPageElements.
	IncludesContent (see page 2284)	This is IncludesContent, a member of class TInetXPageElements.
	ScriptContent (see page 2284)	This is ScriptContent, a member of class TInetXPageElements.
	StylesContent (see page 2284)	This is StylesContent, a member of class TInetXPageElements.
	WarningsContent (see page 2284)	This is WarningsContent, a member of class TInetXPageElements.

38.1.3.2.1 TInetXPageElements.FormsContent Field

Pascal

```
FormsContent: string;
```

C++

```
UnicodeString FormsContent;
```

Description

This is FormsContent, a member of class TInetXPageElements.

38.1.3.2.2 TInetXPageElements.IncludesContent Field

Pascal

```
IncludesContent: string;
```

C++

```
UnicodeString IncludesContent;
```

Description

This is IncludesContent, a member of class TInetXPageElements.

38.1.3.2.3 TInetXPageElements.ScriptContent Field

Pascal

```
ScriptContent: string;
```

C++

```
UnicodeString ScriptContent;
```

Description

This is ScriptContent, a member of class TInetXPageElements.

38.1.3.2.4 TInetXPageElements.StylesContent Field

Pascal

```
StylesContent: string;
```

C++

```
UnicodeString StylesContent;
```

Description

This is StylesContent, a member of class TInetXPageElements.

38.1.3.2.5 TInetXPageElements.WarningsContent Field

Pascal

```
WarningsContent: string;
```

C++

```
UnicodeString WarningsContent;
```

Description

This is WarningsContent, a member of class TInetXPageElements.

38.1.3.3 TInetXPageElements Methods

The methods of the TInetXPageElements class are listed here.

Public Methods

	Name	Description
	BodyContent (see page 2285)	This is BodyContent, a member of class TInetXPageElements.

38.1.3.3.1 TInetXPageElements.BodyContent Method

Pascal

```
function BodyContent: string; virtual;
```

C++

```
virtual __fastcall UnicodeString BodyContent();
```

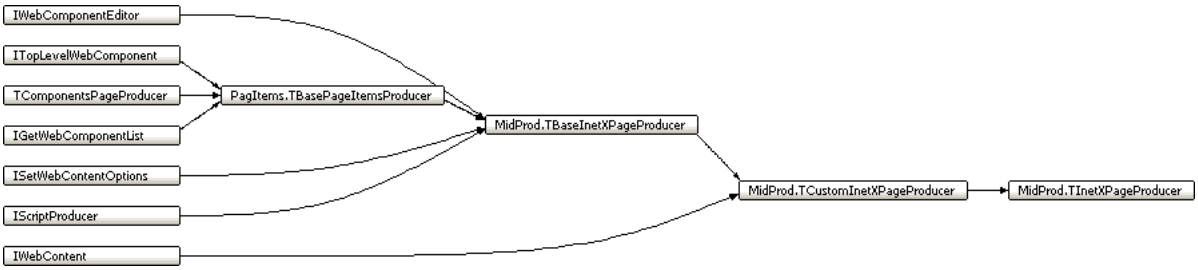
Description

This is BodyContent, a member of class TInetXPageElements.

38.1.4 TInetXPageProducer Class

TInetXPageProducer assembles an HTML document that represents live database information from an application server.

Class Hierarchy



Pascal

```
TInetXPageProducer = class(TCustomInetXPageProducer);
```

C++

```
class TInetXPageProducer : public TCustomInetXPageProducer;
```

File

MidProd

Description

Use TInetXPageProducer to create Web pages for an InternetExpress application. These pages display database information from an application server and include data packets encoded in XML and javascript that lets Web browsers navigate that data,

post changes, and apply updates back to the application server.

The InetX page producer is assigned as the Producer property of a Web action item or called from an OnAction event handler.

The InetX page producer creates its HTML document from a template. Unlike other page producers, the InetX page producer has a default template that coordinates several top-level declarations for the HTML document with content produced by other components. The other components that generate HTML content for the InetX page producer can be added at design time using the Web Page editor.

38.1.4.1 TInetXPageProducer Members

The following tables list the members exposed by TInetXPageProducer.

Protected Methods

	Name	Description
	AddIncludes (see page 2261)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 2261)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	CanAddClass (see page 2261)	Indicates whether a specified class can be used as a child Web item.
	CreatePageElements (see page 2262)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 2262)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 2263)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 2263)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 2263)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 2263)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 2263)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 2264)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
	DeclareXMLDocuments (see page 2264)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 2264)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DoAfterGetContent (see page 2264)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 2265)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 2265)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 2265)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 2265)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	GeneratePageElements (see page 2266)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetChildren (see page 2968)	Enumerates all child components.
	GetComponentList (see page 2968)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetContentOptions (see page 2267)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 2969)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetDefaultTemplate (see page 2267)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetScriptManager (see page 2268)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetTemplateFileName (see page 2280)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
	GetTemplateStream (see page 2280)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	GetUseXMLIslands (see page 2268)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 2268)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 2269)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	ImplCanAddClass (see page 2269)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	SetChildOrder (see page 2969)	Sets the visual ordering of a child control.
	SetWebContentOptions (see page 2270)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

	WebContent (see page 2281)	This is WebContent, a member of class TCustomInetXPageProducer.

Protected Properties

	Name	Description
R	PageElements (see page 2271)	This is PageElements, a member of class TBaseInetXPageProducer.
R	ScriptManager (see page 2272)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Methods

	Name	Description
V	Content (see page 2279)	Returns the HTML document assembled by the InternetExpress page producer.
V	ContentFromStream (see page 2262)	Returns the content produced in response to input read from a stream.
V	Create (see page 2259)	Creates an instance of a TBaseInetXPageProducer (see page 2257).
V	Create (see page 2278)	Creates and initializes an instance of TCustomInetXPageProducer (see page 2275).
V	Create (see page 2967)	Creates an instance of a TBasePageItemsProducer (see page 2966).
V	Destroy (see page 2259)	Destroys the instance of the TBasePageItemsProducer.
V	Destroy (see page 2278)	Frees an instance of TCustomInetXPageProducer (see page 2275).
V	Destroy (see page 2967)	Destroys the instance of the TBasePageItemsProducer (see page 2966).
V	FindXMLBroker (see page 2265)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
V	FindXMLBrokerName (see page 2266)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
V	GetRequiredTags (see page 2267)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
V	GetXMLData (see page 2268)	Obtains an XML data packet from a specified XML broker.
	SetIncludePathURL (see page 2269)	Assigns a value to the IncludePathURL (see page 2271) property.
	SetStyles (see page 2269)	Assigns a value to the Styles (see page 2272) property.
	SetStylesFile (see page 2270)	Assigns a value to the StylesFile (see page 2273) property.

Published Events

	Name	Description
	OnAfterGetContent (see page 2293)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 2293)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 2294)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 2294)	Occurs before the page producer fetches an XML data packet from an XML broker.

Published Properties

	Name	Description
	EnableXMLIslands (see page 2288)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	HTMLDoc (see page 2288)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 2289)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	IncludePathURL (see page 2290)	Indicates the URL where the javascript libraries are installed.
	ScriptEngine (see page 2290)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	Styles (see page 2291)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 2291)	Specifies a file containing the individual styles for the page producer's style sheet.
	WebPageItems (see page 2292)	Maintains a list of components that generate HTML content for the producer.

38.1.4.2 TInetXPageProducer Properties

The properties of the TInetXPageProducer class are listed here.

Published Properties

	Name	Description
	EnableXMLIslands (see page 2288)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	HTMLDoc (see page 2288)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 2289)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	IncludePathURL (see page 2290)	Indicates the URL where the javascript libraries are installed.
	ScriptEngine (see page 2290)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	Styles (see page 2291)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 2291)	Specifies a file containing the individual styles for the page producer's style sheet.
	WebPageItems (see page 2292)	Maintains a list of components that generate HTML content for the producer.

38.1.4.2.1 TInetXPageProducer.EnableXMLIslands Property

Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.

Pascal

```
property EnableXMLIslands: Boolean;
```

C++

```
__property Boolean EnableXMLIslands;
```

Description

Set EnableXMLIslands to indicate whether the XML in the generated HTML document should be declared using XML islands. XML islands are only used if the document is created in response to a request message whose headers indicate that the browser supports XML islands.

Set EnableXMLIslands to false to prevent the page producer from declaring XML islands even if the requesting browser supports them.

GetXMLData (see page 2268)

Content

38.1.4.2.2 TInetXPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
```

```
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomInetXPageProducer automatically handles the conversion of the HTML-transparent tags in the default template, as well as the tags described in the help for the Content method. If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile property.

HTMLFile (see page 2282)

OnHTMLTag

Creating Web Pages with an InternetExpress Page Producer

Customizing the InternetExpress Page Producer Template

38.1.4.2.3 TInetXPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

HTMLDoc (see page 2281)

Customizing the InternetExpress Page Producer Template

38.1.4.2.4 TInetXPageProducer.IncludePathURL Property

Indicates the URL where the javascript libraries are installed.

Pascal

```
property IncludePathURL: string;
```

C++

```
__property UnicodeString IncludePathURL;
```

Description

Set IncludePathURL to indicate where the javascript libraries are installed. The page producer uses this value to create HTML statements that include the libraries in the generated HTML document. These statements have the form

```
<SCRIPT language=Javascript type="text/javascript" SRC="IncludePathURL/xmldb.js"> </SCRIPT>
```

The javascript libraries define classes and methods that allow the HTML document to interpret XML data packets if the Web browser is not XML-enabled, and that enable controls in the document to navigate the data, post changes, and apply updates.

See Also

SetIncludePathURL (see page 2269)

Content

Creating Web Pages with an InternetExpress Page Producer

38.1.4.2.5 TInetXPageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine;
```

C++

```
__property ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag

38.1.4.2.6 TInetXPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseInetXPageProducer. Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a file. To define the styles in a file, use the StylesFile property instead. If StylesFile is defined, it takes precedence over the Styles property.

StylesFile (see page 2273)

Content

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

38.1.4.2.7 TInetXPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these

style definitions to declare a style sheet in the HTML document it generates.

Styles for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles property instead.

SetStylesFile (see page 2270)

Styles (see page 2272)

Content

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

38.1.4.2.8 TInetXPageProducer.WebPageItems Property

Maintains a list of components that generate HTML content for the producer.

Pascal

```
property WebPageItems: TWebComponentList;
```

C++

```
__property TWebComponentList WebPageItems;
```

Description

WebPageItems lists the components that generate content for the page items producer. Each of these components supports the IWebContent interface, and can contain its own list of Web items that help it generate its content.

The type of items that can be added to the WebPageItems list are restricted by a protected method that is abstract or, in C++ terminology, pure virtual in TBasePageItemsProducer. Descendant classes implement this protected method to indicate what types of items can be added to the list.

At design time, use the Web page editor to add components to the WebPageItems property.

Note: Typically, WebPageItems lists all the components that generate content for the page items producer, in the order that the generated content appears in the final HTML document. However, the page items producer can transform COMPONENT tags in its template using components that are not in this list, as long as they have the same owner as the page items producer..

Creating Web Pages with an InternetExpress Page Producer

38.1.4.3 TInetXPageProducer Events

The events of the TInetXPageProducer class are listed here.

Published Events

	Name	Description
	OnAfterGetContent (see page 2293)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 2293)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 2294)	Occurs when the Content method is called.

	OnBeforeGetXMLData (see page 2294)	Occurs before the page producer fetches an XML data packet from an XML broker.

38.1.4.3.1 TInetXPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its HTML document.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the page producer generates an HTML document. This event occurs immediately before the Content method returns the generated document. Typically it is used in applications where the page producer automatically responds to messages as the Provider property of an action item or the Response producer property of an XML broker.

See Also

OnBeforeGetContent (see page 2274)

Content

Producer

38.1.4.3.2 TInetXPageProducer.OnAfterGetXMLData Event

Occurs after the page producer translates fetches an XML data packet from an XML broker.

Pascal

```
property OnAfterGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnAfterGetXMLData;
```

Description

Write an OnAfterGetXMLData event handler to take specific action immediately after the page producer obtains an XML data packet from an XML broker. Typically, the OnAfterGetXMLData event handler responds to any values returned by the provider on the application server as the OwnerData parameter.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnAfterGetXMLData occurs after the page producer has returned an XML data packet but before it is assigned as part of the emerging content.

See Also

OnBeforeGetXMLData (see page 2275)

GetXMLData (see page 2268)

OnHTMLTag

Content

38.1.4.3.3 TInetXPageProducer.OnBeforeGetContent Event

Occurs when the Content method is called.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the page producer generates an HTML document. This event occurs when the Content method is called before the page producer starts assembling its HTML document. Typically it is used in applications where the page producer automatically responds to messages as the Provider property of an action item or the Response producer property of an XML broker.

See Also

OnAfterGetContent (see page 2273)

Content

Producer

38.1.4.3.4 TInetXPageProducer.OnBeforeGetXMLData Event

Occurs before the page producer fetches an XML data packet from an XML broker.

Pascal

```
property OnBeforeGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnBeforeGetXMLData;
```

Description

Write an OnBeforeGetXMLData event handler to take specific action immediately before the page producer requests an XML data packet from an XML broker. Typically, the OnBeforeGetXMLData event handler encodes any values for the provider on the application server as the OwnerData parameter or initializes properties on the XML broker that affect the data packet.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnBeforeGetXMLData occurs immediately before the page producer requests an XML data packet. Any value assigned to the OwnerData parameter is passed to the XML broker's OnRequestRecords event handler, and from there to the provider's OnBeforeGetRecords event handler.

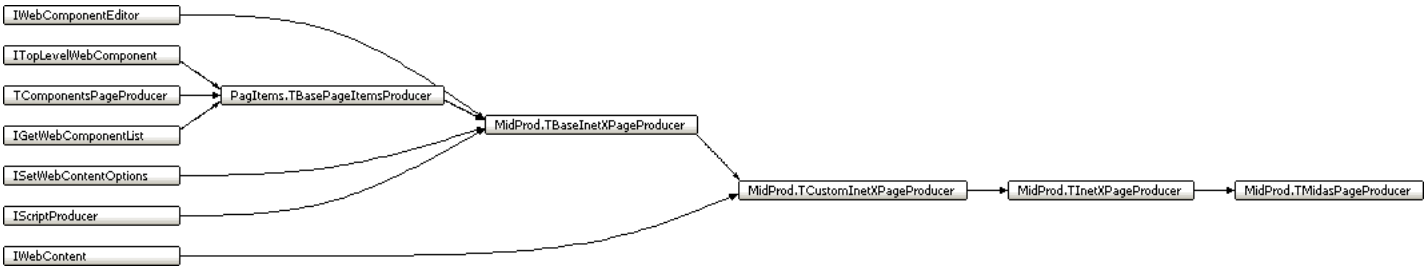
MaxRecords

Params

38.1.5 TMidasPageProducer Class

TMidasPageProducer assembles an HTML document that represents live database information from an application server.

Class Hierarchy



Pascal

```
TMidasPageProducer = class(TInetXPageProducer);
```

C++

```
class TMidasPageProducer : public TInetXPageProducer;
```

File

MidProd

Description

Do not use TMidasPageProducer. It is included only for backward compatibility. To add a page producer that assembles Web pages in an InternetExpress application, use TInetXPageProducer (see page 2285) instead.

38.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddStdIncludes (see page 2296)	This is function MidProd.AddStdIncludes.
	PathInfoToRelativePath (see page 2296)	This is function MidProd.PathInfoToRelativePath.

38.2.1 MidProd.AddStdIncludes Function

Pascal

```
procedure AddStdIncludes(StdIncludes: TStdIncludes; AddIntf: IAddScriptElements);
```

C++

```
AddStdIncludes(TStdIncludes StdIncludes, IAddScriptElements AddIntf);
```

File

MidProd

Description

This is function MidProd.AddStdIncludes.

38.2.2 MidProd.PathInfoToRelativePath Function

Pascal

```
function PathInfoToRelativePath(const PathInfo: string): string;
```

C++

```
UnicodeString PathInfoToRelativePath(const UnicodeString PathInfo);
```

File

MidProd

Description

This is function MidProd.PathInfoToRelativePath.

38.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TStdInclude (see page 2297)	This is record MidProd.TStdInclude.

38.3.1 MidProd.TStdInclude Enumeration

Pascal

```
TStdInclude = (
  jsDom,
  jsDB,
  jsDisp,
  jsBind,
  jsErrDisp,
  jsShow
);
```

C++

```
enum TStdInclude {
  jsDom,
  jsDB,
  jsDisp,
  jsBind,
  jsErrDisp,
  jsShow
};
```

File

MidProd

Description

This is record MidProd.TStdInclude.

38.4 Types

The following table lists types in this documentation.

Types

Name	Description
TBaseMidasPageProducer (see page 2298)	This is type MidProd.TBaseMidasPageProducer.
TCustomMidasPageProducer (see page 2298)	This is type MidProd.TCustomMidasPageProducer.
TMidasPageElements (see page 2299)	This is type MidProd.TMidasPageElements.
TStdIncludes (see page 2299)	This is type MidProd.TStdIncludes.
TXMLDataEvent (see page 2299)	TXMLDataEvent is the type of event handlers that occur when an InternetExpress page producer adds an XML data packet to its HTML document.

38.4.1 MidProd.TBaseMidasPageProducer Type

Pascal

```
TBaseMidasPageProducer = TBaseInetXPageProducer;
```

C++

```
TBaseInetXPageProducer TBaseMidasPageProducer;
```

File

MidProd

Description

This is type MidProd.TBaseMidasPageProducer.

38.4.2 MidProd.TCustomMidasPageProducer Type

Pascal

```
TCustomMidasPageProducer = TCustomInetXPageProducer;
```

C++

```
TCustomInetXPageProducer TCustomMidasPageProducer;
```

File

MidProd

Description

This is type MidProd.TCustomMidasPageProducer.

38.4.3 MidProd.TMidasPageElements Type

Pascal

```
TMidasPageElements = TInetXPageElements;
```

C++

```
TInetXPageElements TMidasPageElements;
```

File

MidProd

Description

This is type MidProd.TMidasPageElements.

38.4.4 MidProd.TStdIncludes Type

Pascal

```
TStdIncludes = set of TStdInclude;
```

C++

```
TStdInclude TStdIncludes;
```

File

MidProd

Description

This is type MidProd.TStdIncludes.

38.4.5 MidProd.TXMLDataEvent Type

TXMLDataEvent is the type of event handlers that occur when an InternetExpress page producer adds an XML data packet to its HTML document.

Pascal

```
TXMLDataEvent = procedure (Sender: TObject; Request: TWebRequest; XMLBroker: TXMLBroker; var
OwnerData: OleVariant) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; XMLBroker: TXMLBroker; var OwnerData: OleVariant) (
TXMLDataEvent)();
```

File

MidProd

Description

TXMLDataEvent is the type for event handlers that occur before and after an InternetExpress page producer translates a

DATAPACKET tag into a string of XML.

Sender is the InternetExpress page producer that is creating an HTML document containing the XML data packet.

Request is the request message in response to which the InternetExpress page producer is creating the HTML document.

XMLBroker is the XMLBroker that fetches the XML data packet from the application server and returns it to the InternetExpress page producer.

OwnerData is application-specific information that allows the InternetExpress page producer to communicate with the XMLBroker and with the provider on the application server. Typically, this parameter is used to communicate persistent state information when the application server is stateless. If the event handler is used for an OnBeforeGetXMLData event, the event handler creates and returns a value in OwnerData which is passed to the XMLBroker's OnRequestRecords event handler, and from there passed to the provider on the application server. If the event handler is used for an OnAfterGetXMLData event, OwnerData is set to the value returned by the provider on the application server on entry into the event handler and is ignored on exit.

38.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sXMLBroker (see page 2301)	This is constant MidProd.sXMLBroker.
sXMLReadyVar (see page 2301)	This is constant MidProd.sXMLReadyVar.

38.5.1 MidProd.sXMLBroker Constant

Pascal

```
sXMLBroker = 'XMLBROKER';
```

C++

```
sXMLBroker = 'XMLBROKER';
```

File

MidProd

Description

This is constant MidProd.sXMLBroker.

38.5.2 MidProd.sXMLReadyVar Constant

Pascal

```
sXMLReadyVar = 'xml_ready';
```

C++

```
sXMLReadyVar = 'xml_ready';
```

File

MidProd

Description

This is constant MidProd.sXMLReadyVar.

39 MPlayer Namespace

This is namespace MPlayer.

Topics

Name	Description
Classes (see page 2305)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 2376)	The following table lists structs, records, enums in this documentation.
Types (see page 2384)	The following table lists types in this documentation.

Classes

	Name	Description
	EMCIDeviceError (see page 2305)	EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.
	TMediaPlayer (see page 2305)	TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

Structs, Records, Enums

	Name	Description
	TMPBtnType (see page 2376)	TMPBtnType defines the possible buttons in a TMediaPlayer (see page 2305) component and TButtonSet (see page 2385) represents a set of those buttons.
	TMPButton (see page 2377)	This is record MPlayer.TMPButton.
	TMPDevCaps (see page 2378)	TMPDevCaps defines the capabilities of a TMediaPlayer (see page 2305) component and TMPDevCapsSet (see page 2385) represents a set of those capabilities.
	TMPDeviceTypes (see page 2378)	TMPDeviceTypes identifies a multimedia device.
	TMPGlyph (see page 2380)	This is record MPlayer.TMPGlyph.
	TMPModes (see page 2380)	TMPModes identifies the state of a TMediaPlayer (see page 2305) component.
	TMPNotifyValues (see page 2381)	TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 2305) component.
	TMPTimeFormats (see page 2382)	TMPTimeFormats indicates the format a media player uses to indicate position.

Types

Name	Description
EMPNotify (see page 2384)	EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 2305) component.
EMPPostNotify (see page 2384)	EMPPostNotify is the type of a media player's OnPostClick event handler.
TButtonSet (see page 2385)	TButtonSet is a set of TMPBtnType (see page 2376) values.

TMediaDevice (see page 2385)	This is type MPlayer.TMediaDevice.
TMPDevCapsSet (see page 2385)	This is type MPlayer.TMPDevCapsSet.

39.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMCIDeviceError (see page 2305)	EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.
	TMediaPlayer (see page 2305)	TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

39.1.1 EMCIDeviceError Class

EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.

Class Hierarchy

Pascal

```
EMCIDeviceError = class(Exception);
```

C++

```
class EMCIDeviceError : public Exception;
```

File

MPlayer

Description

EMCIDeviceError is raised if an error occurs when accessing a multimedia device. The most common cause for the exception is trying to access a multimedia device before it has been opened with the Open method of TMediaPlayer (see page 2305).

See Also

TMediaPlayer (see page 2305)

39.1.2 TMediaPlayer Class

TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

Class Hierarchy

Pascal

```
TMediaPlayer = class(TCustomControl);
```

C++

```
class TMediaPlayer : public TCustomControl;
```

File

MPlayer

Description

The TMediaPlayer component includes a set of buttons (Play (see page 2323), Stop (see page 2330), Eject (see page 2315), and so on) that control a multimedia device such as a CD-ROM drive, MIDI sequencer, or VCR. A multimedia device may be hardware or software.

The media player component contains of multiple buttons. These buttons can be clicked with the mouse, but are not separate objects or button components.

ButtonValueAction

Button	Value	Action
Play (see page 2323)	btPlay	Plays the media player
Pause (see page 2322)	btPause	Pauses playing or recording. If already paused when clicked, resumes playing or recording.
Stop (see page 2330)	btStop	Stops playing or recording
Next (see page 2318)	btNext	Skips to the next track, or to the end if the medium doesn't use tracks
Prev	btPrev	Skips to the previous track, or to the beginning if the medium doesn't use tracks
Step (see page 2330)	btStep	Moves forward a number of frames
Back (see page 2313)	btBack	Moves backward a number of frames
Record	btRecord	Starts recording
Eject (see page 2315)	btEject	Ejects the medium

The multimedia device is played, paused, stopped, and so on when the user clicks the corresponding button on the TMediaPlayer component. The device can also be controlled by the control methods that correspond to the buttons (Play (see page 2323), Pause (see page 2322), Stop (see page 2330), Next (see page 2318), Previous (see page 2327), Step (see page 2330), Back (see page 2313), StartRecording (see page 2329), and Eject (see page 2315)).

The type of multimedia device (such as dtWaveAudio or dtVideodisc) is specified by the DeviceType (see page 2339) property. If the device stores its media in a file, the name of the media file is specified by the FileName (see page 2347) property. If DeviceType (see page 2339) is dtAutoSelect, the media player attempts to determine the type of device from the extension of the file specified by FileName (see page 2347).

To have the media player attempt to open the device specified by DeviceType (see page 2339) automatically when the media player component is created at runtime, set the AutoOpen (see page 2336) property to true.

C++ Examples:

```
//
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
```

```
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
        }
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */
    MediaPlayer1->Stop();
    MediaPlayer1->Close();

    MediaPlayer1->EnabledButtons = TButtonSet();

    /* Enable open button again */
    btOpen->Enabled = true;
}

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Disable all buttons */
    MediaPlayer1->AutoEnable = false;
    MediaPlayer1->EnabledButtons = TButtonSet();
}

void __fastcall TForm2::MediaPlayer1PostClick(TObject *Sender,
          TMPBtnType Button)
{
    if (Button == TMPBtnType::btStop)
        btStop->Click();
}
```

Delphi Examples:

```
{
```

```
  This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
  for Open and Stop are present on the form.
  Note: AutoEnable must be set to false to be able to control
  the buttons manually.
  }

  procedure TForm2.btOpenClick(Sender: TObject);
  var
    OpenMediaDialog : TOpenDialog;
  begin
    OpenMediaDialog := TOpenDialog.Create(Self);
    OpenMediaDialog.Filter := 'All Video Files (*.avi)|*.avi';
    // There are avi files in
    // C:\Documents and Settings\All Users\Documents\RAD
  Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if OpenMediaDialog.Execute() then
    begin
      { Assign a file to the media player }
      MediaPlayer1.FileName := OpenMediaDialog.FileName;

      { Check if the file exists and is not a directory }
      if (FileExists(OpenMediaDialog.FileName)) and
         (not DirectoryExists(OpenMediaDialog.FileName)) then
      begin
        { Open the files }
        MediaPlayer1.Wait := true;
        MediaPlayer1.Open;
        MediaPlayer1.Play;

        { Override automatic button controlling }
        MediaPlayer1.EnabledButtons :=
          [TMPBtnType.btPause, TMPBtnType.btStop, TMPBtnType.btPlay];

        { Enable  the stop button }
        btStop.Enabled := true;
        btOpen.Enabled := false;
      end;
    end;

    OpenMediaDialog.Free;
  end;

  procedure TForm2.btStopClick(Sender: TObject);
  begin
    { Stop and close the media }
    MediaPlayer1.Stop;
    MediaPlayer1.Close;

    MediaPlayer1.EnabledButtons := [];

    { Enable open button again }
    btOpen.Enabled := true;
  end;

  procedure TForm2.FormCreate(Sender: TObject);
  begin
    { Disable all buttons }
    MediaPlayer1.AutoEnable := false;
    MediaPlayer1.EnabledButtons := [];
  end;

  procedure TForm2.MediaPlayer1PostClick(Sender: TObject;
    Button: TMPBtnType);
  begin
    if Button = TMPBtnType.btStop then
       btStop.Click;
```

```
end;
```

39.1.2.1 TMediaPlayer Members

The following tables list the members exposed by TMediaPlayer.

Protected Methods

	Name	Description
	AutoButtonSet (see page 2312)	Enables or Disables the media player's buttons.
	Click (see page 2313)	Generates an OnClick (see page 2366) event.
	DoNotify (see page 2315)	Generates an OnNotify (see page 2375) event.
V	KeyDown (see page 2317)	Provides responses when the user types arrow keys or the space bar.
V	Loaded (see page 2317)	Initializes the media player after it is loaded from a stream.
	MMNotify (see page 2318)	Responds to a notification that the MCI device has completed an operation.
V	Notification (see page 2319)	Responds when components are about to be inserted or removed.
V	Paint (see page 2322)	Renders the image of the media player.
	PostClick (see page 2326)	Determines the action that takes place when an OnPostClick (see page 2375) event occurs.
V	Updated (see page 2331)	Signals that the media player has finished updating.

Public Methods

	Name	Description
	Back (see page 2313)	Steps backward a number of frames (determined by the value of the Frames (see page 2349) property) in the currently loaded medium.
	Close (see page 2314)	Closes the open multimedia device.
V	Create (see page 2311)	Creates a media player object.
V	Destroy (see page 2311)	Destroys an instance of the media player.
	Eject (see page 2315)	Releases the loaded medium from the open multimedia device.
	Next (see page 2318)	Moves to the beginning of the next track of the currently loaded medium.
	Open (see page 2319)	Opens a multimedia device.
	Pause (see page 2322)	Toggles the open multimedia device on or off.
	PauseOnly (see page 2323)	Pauses the open multimedia device.
	Play (see page 2323)	Plays the media loaded in the open multimedia device.
	Previous (see page 2327)	Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.
	Resume (see page 2327)	Resumes playing or recording the currently paused multimedia device.
	Rewind (see page 2328)	Sets the current position to the beginning of the the medium, which is stored in the Start (see page 2360) property.
	Save (see page 2328)	Saves the currently loaded medium to the file specified in the FileName (see page 2347) property.
	StartRecording (see page 2329)	Begins recording from the current Position (see page 2357) or from the position specified in StartPos (see page 2360).
	Step (see page 2330)	Moves forward a number of frames (determined by the Frames (see page 2349) property) in the currently loaded medium.
	Stop (see page 2330)	Halts playing or recording.

Public Properties

	Name	Description
R	Capabilities (see page 2337)	Determines the capabilities of the open multimedia device.
R	DeviceID (see page 2338)	Specifies the device ID for the currently open multimedia device.
	DisplayRect (see page 2340)	Specifies a rectangular area in the control specified by the Display (see page 2339) property that is used to display output from a multimedia device.

	EndPos (see page 2345)	Specifies the position within the currently loaded medium at which to stop playing or recording.
R	Error (see page 2346)	Specifies the MCI error code returned by the media control method.
R	ErrorMessage (see page 2346)	Describes the error code stored in the Error (see page 2346) property.
	Frames (see page 2349)	Specifies the number of frames moved forward or backward.
R	Length (see page 2350)	Specifies the length of the medium in the open multimedia device.
R	Mode (see page 2350)	Indicates the state of the currently open multimedia device.
	Notify (see page 2350)	Determines whether an OnNotify (see page 2375) event is generated.
R	NotifyValue (see page 2351)	Indicates the result of the last media control method that requested a notification.
	Position (see page 2357)	Specifies the current position within the currently loaded medium.
R	Start (see page 2360)	Specifies the starting position within the currently loaded medium.
	StartPos (see page 2360)	Specifies the position within the currently loaded medium from which to begin playing or recording.
	TimeFormat (see page 2362)	Determines the format used to specify position information.
R	TrackLength (see page 2362)	Reports the length of the track.
R	TrackPosition (see page 2362)	Reports the starting position of the track.
R	Tracks (see page 2363)	Specifies the number of playable tracks on the open multimedia device.
	Wait (see page 2365)	Determines whether a media control method returns control to the application only after it has been completed.

Published Events

	Name	Description
	OnClick (see page 2366)	Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.
	OnContextPopup (see page 2367)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnEnter (see page 2368)	Occurs when a control receives the input focus.
	OnExit (see page 2370)	Occurs when the input focus shifts away from one control to another.
	OnMouseEnter (see page 2374)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2374)	Occurs when the user moves the mouse outside of a control.
	OnNotify (see page 2375)	Occurs upon the completion of a media control method.
	OnPostClick (see page 2375)	Occurs after the OnClick (see page 2366) event handler is called.

Published Properties

	Name	Description
	Anchors (see page 2332)	Specifies how the control is anchored to its parent.
	AutoEnable (see page 2333)	Determines whether the media player automatically enables and disables individual buttons in the component.
	AutoOpen (see page 2336)	Determines if the media player is opened automatically when the application is run.
	AutoRewind (see page 2337)	Determines if the media player control rewinds before playing or recording.
	ColoredButtons (see page 2337)	Determines which buttons on the media player control have color.
	Constraints (see page 2338)	Specifies the size constraints for the control.
	DeviceType (see page 2339)	Specifies a multimedia device type to open the media player.
	Display (see page 2339)	Specifies the display window for a multimedia device that uses a window for output.
	DoubleBuffered (see page 2340)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 2342)	Controls whether the control responds to mouse, keyboard, and timer events.
	EnabledButtons (see page 2343)	Determines which buttons on the media player are usable.
	FileName (see page 2347)	Specifies the opened or saved media file.
	ParentDoubleBuffered (see page 2352)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentShowHint (see page 2352)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2352)	Identifies the pop-up menu associated with the control.
	Shareable (see page 2358)	Determines whether more than one application can share a multimedia device.

	ShowHint (see page 2358)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2361)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2361)	Determines if the user can tab to a control.
	Visible (see page 2363)	Determines whether the component appears onscreen.
	VisibleButtons (see page 2365)	Indicates which of the buttons on the media player are visible.

39.1.2.2 TMediaPlayer.Create Constructor

Creates a media player object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMediaPlayer(TComponent * AOwner);
```

Description

Call Create to instantiate a media player at runtime. For media players created at design time, Create is called automatically.

Create allocates memory for a media player and calls the inherited Create. Then it loads the bitmaps for the media player's buttons and initializes its properties, setting AutoEnable (see page 2333), AutoRewind (see page 2337), Colored, Enabled (see page 2342), and Visible (see page 2363) to true, AutoOpen (see page 2336) to false, and DeviceType (see page 2339) to dtAutoSelect.

See Also

Create

ParentWindow

39.1.2.3 TMediaPlayer.Destroy Destructor

Destroys an instance of the media player.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMediaPlayer();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free checks that the TMediaPlayer (see page 2305) reference is not nil before it calls Destroy.

Destroy first verifies that no device is open, then destroys the bitmaps used for the media player's buttons and calls the inherited Destroy.

See Also

Destroy

System::TObject::Free

39.1.2.4 TMediaPlayer Methods

The methods of the TMediaPlayer class are listed here.

Protected Methods

	Name	Description
	AutoButtonSet (see page 2312)	Enables or Disables the media player's buttons.
	Click (see page 2313)	Generates an OnClick (see page 2366) event.
	DoNotify (see page 2315)	Generates an OnNotify (see page 2375) event.
	KeyDown (see page 2317)	Provides responses when the user types arrow keys or the space bar.
	Loaded (see page 2317)	Initializes the media player after it is loaded from a stream.
	MMNotify (see page 2318)	Responds to a notification that the MCI device has completed an operation.
	Notification (see page 2319)	Responds when components are about to be inserted or removed.
	Paint (see page 2322)	Renders the image of the media player.
	PostClick (see page 2326)	Determines the action that takes place when an OnPostClick (see page 2375) event occurs.
	Updated (see page 2331)	Signals that the media player has finished updating.

Public Methods

	Name	Description
	Back (see page 2313)	Steps backward a number of frames (determined by the value of the Frames (see page 2349) property) in the currently loaded medium.
	Close (see page 2314)	Closes the open multimedia device.
	Eject (see page 2315)	Releases the loaded medium from the open multimedia device.
	Next (see page 2318)	Moves to the beginning of the next track of the currently loaded medium.
	Open (see page 2319)	Opens a multimedia device.
	Pause (see page 2322)	Toggles the open multimedia device on or off.
	PauseOnly (see page 2323)	Pauses the open multimedia device.
	Play (see page 2323)	Plays the media loaded in the open multimedia device.
	Previous (see page 2327)	Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.
	Resume (see page 2327)	Resumes playing or recording the currently paused multimedia device.
	Rewind (see page 2328)	Sets the current position to the beginning of the the medium, which is stored in the Start (see page 2360) property.
	Save (see page 2328)	Saves the currently loaded medium to the file specified in the FileName (see page 2347) property.
	StartRecording (see page 2329)	Begins recording from the current Position (see page 2357) or from the position specified in StartPos (see page 2360).
	Step (see page 2330)	Moves forward a number of frames (determined by the Frames (see page 2349) property) in the currently loaded medium.
	Stop (see page 2330)	Halts playing or recording.

39.1.2.4.1 TMediaPlayer.AutoButtonSet Method

Enables or Disables the media player's buttons.

Pascal

```
procedure AutoButtonSet(Btn: TMPBtnType); dynamic;
```

C++

```
__fastcall AutoButtonSet(TMPBtnType Btn);
```

Description

AutoButtonSet implements the automatic enabling and disabling of the media player's buttons when the AutoEnable (see page 2333) property is true. The Btn parameter indicates which of the media player's buttons the user pressed.

See Also

AutoEnable (see page 2333)

EnabledButtons (see page 2343)

39.1.2.4.2 TMediaPlayer.Back Method

Steps backward a number of frames (determined by the value of the Frames (see page 2349) property) in the currently loaded medium.

Pascal

```
procedure Back;
```

C++

```
__fastcall Back();
```

Description

Back is called when the Back button on the media player control is clicked at runtime.

Upon completion, Back stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Back method has been completed. The Notify (see page 2350) property determines whether Back generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

Adding Audio and/or Video Clips to an Application

39.1.2.4.3 TMediaPlayer.Click Method

Generates an OnClick (see page 2366) event.

Pascal

```
procedure Click(Button: TMPBtnType; var DoDefault: Boolean); dynamic; reintroduce;
```

C++

```
__fastcall Click(TMPBtnType Button, Boolean DoDefault);
```

Description

Click for media-player components is the implementation method for the OnClick (see page 2366) event. By default, Click does nothing other than call any event handler attached to the media player's OnClick (see page 2366) event. Click can be overridden in descendant classes to customize responses to clicks.

See Also

OnClick (see page 2366)

39.1.2.4.4 TMediaPlayer.Close Method

Closes the open multimedia device.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Upon completion, Close stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Close method is completed. The Notify (see page 2350) property determines whether Close generates an OnNotify (see page 2375) event.

Close is called automatically when the application is terminated.

C++ Examples:

```
/*
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
*/

Word TimeOver;

void __fastcall TForm1::FormClick(TObject *Sender)
{
  MediaPlayer1->DeviceType = dtCDAudio;
  MediaPlayer1->Open();
  MediaPlayer1->Play();
  Timer1->Enabled = true;
  TimeOver = 0;
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  if (TimeOver == 10)
  {
    MediaPlayer1->Eject();
    MediaPlayer1->Close();
    // disable the timer, as we are done
    Timer1->Enabled = false;
  }
  else
    TimeOver++;
}
```

Delphi Examples:

```
{
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
}
var
```

```
    TimerOver: Word;

  procedure TForm1.FormClick(Sender: TObject);
  begin
    MediaPlayer1.DeviceType := dtCDAudio;
    MediaPlayer1.Open;
    MediaPlayer1.Play;
  end;

  procedure TForm1.Timer1Timer(Sender: TObject);
  begin
    if TimeOver = 10 then
    begin
      MediaPlayer1.Eject;
      MediaPlayer1.Close;
      { disable the timer, as we are done }
      Timer1.Enabled := False;
    end
    else
      if (MediaPlayer1.Mode = mpOpen) then
       Inc(TimeOver);
  end;
```

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

39.1.2.4.5 TMediaPlayer.DoNotify Method

Generates an OnNotify (see page 2375) event.

Pascal

```
procedure DoNotify; dynamic;
```

C++

```
__fastcall DoNotify();
```

Description

DoNotify is the implementation method for a media-player component's OnNotify (see page 2375) event. The media player's MMNotify (see page 2318) method calls DoNotify after correcting the enabling and disabling of buttons and setting internal flags from the values passed in the notification message parameters.

By default, DoNotify does nothing except call any event handler attached to the media player's OnNotify (see page 2375) event. DoNotify can be overridden to provide other responses in addition to the inherited event-handler call.

See Also

MMNotify (see page 2318)

OnNotify (see page 2375)

39.1.2.4.6 TMediaPlayer.Eject Method

Releases the loaded medium from the open multimedia device.

Pascal

```
procedure Eject;
```

C++

```
__fastcall Eject();
```

Description

Eject is called when the Eject button on the media player control is clicked at runtime. It ejects the loaded medium from the open multimedia device.

Upon completion, Eject stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Eject method has been completed. The Notify (see page 2350) property determines whether Eject generates an OnNotify (see page 2375) event.

C++ Examples:

```
/*
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
*/

Word TimeOver;

void __fastcall TForm1::FormClick(TObject *Sender)
{
  MediaPlayer1->DeviceType = dtCDAudio;
  MediaPlayer1->Open();
  MediaPlayer1->Play();
  Timer1->Enabled = true;
  TimeOver = 0;
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  if (TimeOver == 10)
  {
    MediaPlayer1->Eject();
    MediaPlayer1->Close();
    // disable the timer, as we are done
    Timer1->Enabled = false;
  }
  else
    TimeOver++;
}
```

Delphi Examples:

```
{
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
}
var
  TimerOver: Word;

procedure TForm1.FormClick(Sender: TObject);
begin
```

```
    MediaPlayer1.DeviceType := dtCDAudio;
    MediaPlayer1.Open;
    MediaPlayer1.Play;
  end;

  procedure TForm1.Timer1Timer(Sender: TObject);
  begin
    if TimeOver = 10 then
    begin
      MediaPlayer1.Eject;
      MediaPlayer1.Close;
      { disable the timer, as we are done }
      Timer1.Enabled := False;
    end
    else
      if (MediaPlayer1.Mode = mpOpen) then
       Inc(TimeOver);
  end;
```

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

Adding Audio and/or Video Clips to an Application

39.1.2.4.7 TMediaPlayer.KeyDown Method

Provides responses when the user types arrow keys or the space bar.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

KeyDown overrides the inherited method to implement the media player's response to certain keystrokes. It changes the current button when the user types the left or right arrow keys. When the user presses the space bar, KeyDown simulates a click on the current button.

See Also

EnabledButtons (see page 2343)

KeyDown

39.1.2.4.8 TMediaPlayer.Loaded Method

Initializes the media player after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded provides an opportunity for a component to initialize itself after all its parts have loaded from a stream. TMediaPlayer (see page 2305) overrides the inherited method to implement the AutoOpen (see page 2336) property.

See Also

Create (see page 2311)

AutoOpen (see page 2336)

39.1.2.4.9 TMediaPlayer.MMNotify Method

Responds to a notification that the MCI device has completed an operation.

Pascal

```
procedure MMNotify(var Message: TMessage); message MM_MCINOTIFY;
```

C++

```
__fastcall MMNotify(TMessage Message);
```

Description

MMNotify responds to a notification message from Windows that a multimedia command completed by updating button states if the AutoEnable (see page 2333) property is true, setting internal flags to reflect the outcome of the command, then calling the DoNotify (see page 2315) method to trigger the OnNotify (see page 2375) event and any other special responses.

See Also

AutoEnable (see page 2333)

DoNotify (see page 2315)

OnNotify (see page 2375)

39.1.2.4.10 TMediaPlayer.Next Method

Moves to the beginning of the next track of the currently loaded medium.

Pascal

```
procedure Next;
```

C++

```
__fastcall Next();
```

Description

If the current position is at the last track when Next is called, Next makes the current position the beginning of the last track. If the multimedia device doesn't use tracks, Next goes to the end of the medium. Next is called when the Next button on the media player control is clicked at runtime.

Upon completion, Next stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Next method has completed. The Notify (see page 2350) property determines whether Next generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

Adding Audio and/or Video Clips to an Application

39.1.2.4.11 TMediaPlayer.Notification Method

Responds when components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

By default, components pass along the notification to their owned components, if any. Notification calls the inherited Notification and then, if the Display (see page 2339) window is deleted at runtime, it sets the video display back to original window.

See Also

Notification

Display (see page 2339)

39.1.2.4.12 TMediaPlayer.Open Method

Opens a multimedia device.

Pascal

```
procedure Open;
```

C++

```
__fastcall Open();
```

Description

Use Open to open a multimedia device. The multimedia device type must be specified in the DeviceType (see page 2339) property before a device can be opened.

Upon completion, Open stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Open method is completed. The Notify (see page 2350) property determines whether Open generates an OnNotify (see page 2375) event.

C++ Examples:

```
//
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
```

```
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
        }
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */
    MediaPlayer1->Stop();
    MediaPlayer1->Close();

    MediaPlayer1->EnabledButtons = TButtonSet();

    /* Enable open button again */
    btOpen->Enabled = true;
}

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Disable all buttons */
    MediaPlayer1->AutoEnable = false;
    MediaPlayer1->EnabledButtons = TButtonSet();
}

void __fastcall TForm2::MediaPlayer1PostClick(TObject *Sender,
          TMPBtnType Button)
{
    if (Button == TMPBtnType::btStop)
        btStop->Click();
```

```
}
```

Delphi Examples:

```
{
This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
for Open and Stop are present on the form.
Note: AutoEnable must be set to false to be able to control
the buttons manually.
}

procedure TForm2.btOpenClick(Sender: TObject);
var
  OpenMediaDialog : TOpenDialog;
begin
  OpenMediaDialog := TOpenDialog.Create(Self);
  OpenMediaDialog.Filter := 'All Video Files (*.avi)|*.avi';
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
  if OpenMediaDialog.Execute() then
  begin
    { Assign a file to the media player }
    MediaPlayer1.FileName := OpenMediaDialog.FileName;

    { Check if the file exists and is not a directory }
    if (FileExists(OpenMediaDialog.FileName)) and
       (not DirectoryExists(OpenMediaDialog.FileName)) then
    begin
      { Open the files }
      MediaPlayer1.Wait := true;
      MediaPlayer1.Open;
      MediaPlayer1.Play;

      { Override automatic button controlling }
      MediaPlayer1.EnabledButtons :=
        [TMPBtnType.btPause, TMPBtnType.btStop, TMPBtnType.btPlay];

      { Enable  the stop button }
      btStop.Enabled := true;
      btOpen.Enabled := false;
    end;
  end;

  OpenMediaDialog.Free;
end;

procedure TForm2.btStopClick(Sender: TObject);
begin
  { Stop and close the media }
  MediaPlayer1.Stop;
  MediaPlayer1.Close;

  MediaPlayer1.EnabledButtons := [];

  { Enable open button again }
  btOpen.Enabled := true;
end;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Disable all buttons }
  MediaPlayer1.AutoEnable := false;
  MediaPlayer1.EnabledButtons := [];
end;

procedure TForm2.MediaPlayer1PostClick(Sender: TObject;
```

```
  Button: TMPBtnType);
begin
  if Button = TMPBtnType.btStop then
     btStop.Click;
end;
```

39.1.2.4.13 TMediaPlayer.Paint Method

Renders the image of the media player.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

When the media player component receives a WM_PAINT (see page 1750) message, like other custom controls, it responds by initializing the control's canvas and calling Paint. Paint draws the frame and all visible buttons.

When creating a descendant media player class, Paint can be overridden to draw the image of the corresponding media player object.

See Also

VisibleButtons (see page 2365)

39.1.2.4.14 TMediaPlayer.Pause Method

Toggles the open multimedia device on or off.

Pascal

```
procedure Pause;
```

C++

```
__fastcall Pause();
```

Description

If the device is already paused when Pause is called, the device resumes playing or recording by calling the Resume (see page 2327) method. Pause is called when the Pause button on the media player control is clicked at runtime.

Upon completion, Pause stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Pause method has completed. The Notify (see page 2350) property determines whether Pause generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Resume (see page 2327)

Wait (see page 2365)

Adding Audio and/or Video Clips to an Application

39.1.2.4.15 TMediaPlayer.PauseOnly Method

Pauses the open multimedia device.

Pascal

```
procedure PauseOnly;
```

C++

```
__fastcall PauseOnly();
```

Description

If the device is already paused when PauseOnly is called, the device will remain paused.

Upon completion, PauseOnly stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the PauseOnly method has completed. The Notify (see page 2350) property determines whether PauseOnly generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

39.1.2.4.16 TMediaPlayer.Play Method

Plays the media loaded in the open multimedia device.

Pascal

```
procedure Play;
```

C++

```
__fastcall Play();
```

Description

Play is called when the Play button on the media player control is clicked at runtime.

Upon completion, Play stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Play method has completed. The Notify (see page 2350) property determines whether Play generates an OnNotify (see page 2375) event.

If the StartPos (see page 2360) property is set, playing starts at the position specified in StartPos (see page 2360). Otherwise, playing starts at the current position, specified in the Position (see page 2357) property. Similarly, if the EndPos (see page 2345) property is set, playing stops at the position specified in EndPos (see page 2345). Otherwise, playing stops at the end of the medium.

Whether the medium (specified in the Position (see page 2357) property) is rewound before playing starts depends on the AutoRewind (see page 2337) property.

C++ Examples:

```
//
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
        }
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */
```

```
    MediaPlayer1->Stop();
    MediaPlayer1->Close();

    MediaPlayer1->EnabledButtons = TButtonSet();

    /* Enable open button again */
    btOpen->Enabled = true;
}

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Disable all buttons */
    MediaPlayer1->AutoEnable = false;
    MediaPlayer1->EnabledButtons = TButtonSet();
}

void __fastcall TForm2::MediaPlayer1PostClick(TObject *Sender,
          TMPBtnType Button)
{
    if (Button == TMPBtnType::btStop)
        btStop->Click();
}
```

Delphi Examples:

```
{
This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
for Open and Stop are present on the form.
Note: AutoEnable must be set to false to be able to control
the buttons manually.
}

procedure TForm2.btOpenClick(Sender: TObject);
var
  OpenMediaDialog : TOpenDialog;
begin
  OpenMediaDialog := TOpenDialog.Create(Self);
  OpenMediaDialog.Filter := 'All Video Files (*.avi)|*.avi';
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
  if OpenMediaDialog.Execute() then
  begin
    { Assign a file to the media player }
    MediaPlayer1.FileName := OpenMediaDialog.FileName;

    { Check if the file exists and is not a directory }
    if (FileExists(OpenMediaDialog.FileName)) and
       (not DirectoryExists(OpenMediaDialog.FileName)) then
    begin
      { Open the files }
      MediaPlayer1.Wait := true;
      MediaPlayer1.Open;
      MediaPlayer1.Play;

      { Override automatic button controlling }
      MediaPlayer1.EnabledButtons :=
        [TMPBtnType.btPause, TMPBtnType.btStop, TMPBtnType.btPlay];

      { Enable  the stop button }
      btStop.Enabled := true;
      btOpen.Enabled := false;
    end;
  end;

  OpenMediaDialog.Free;
end;
```

```
procedure TForm2.btStopClick(Sender: TObject);
begin
  { Stop and close the media }
  MediaPlayer1.Stop;
  MediaPlayer1.Close;

  MediaPlayer1.EnabledButtons := [];

  { Enable open button again }
  btOpen.Enabled := true;
end;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Disable all buttons }
  MediaPlayer1.AutoEnable := false;
  MediaPlayer1.EnabledButtons := [];
end;

procedure TForm2.MediaPlayer1PostClick(Sender: TObject;
  Button: TMPBtnType);
begin
  if Button = TMPBtnType.btStop then
     btStop.Click;
end;
```

39.1.2.4.17 TMediaPlayer.PostClick Method

Determines the action that takes place when an OnPostClick (see page 2375) event occurs.

Pascal

```
procedure PostClick(Button: TMPBtnType); dynamic;
```

C++

```
__fastcall PostClick(TMPBtnType Button);
```

Description

PostClick is the implementation method for the OnPostClick (see page 2375) event. By default, PostClick does nothing other than call any event handler attached to the media player's OnPostClick (see page 2375) event. PostClick can be overridden in

descendant types to customize responses to clicks.

See Also

OnPostClick (see page 2375)

39.1.2.4.18 TMediaPlayer.Previous Method

Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.

Pascal

```
procedure Previous;
```

C++

```
__fastcall Previous();
```

Description

If the position is at the first track or somewhere other than the beginning of a track when Previous was called, Previous sets the current position to the beginning of the current track. If the device doesn't use tracks, Previous sets the current position to the beginning of the medium, which is specified in the Start (see page 2360) property. Previous is called when the Previous button on the media player control is clicked at runtime.

Upon completion, Previous stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Previous method has completed. The Notify (see page 2350) property determines whether Previous generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Adding Audio and/or Video Clips to an Application

39.1.2.4.19 TMediaPlayer.Resume Method

Resumes playing or recording the currently paused multimedia device.

Pascal

```
procedure Resume;
```

C++

```
__fastcall Resume();
```

Description

Resume is called when the Pause (see page 2322) button on the media player control is clicked at runtime, when the device is paused.

Upon completion, Resume stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Resume method has completed. The Notify (see page 2350) property determines whether Resume generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Wait (see page 2365)

39.1.2.4.20 TMediaPlayer.Rewind Method

Sets the current position to the beginning of the the medium, which is stored in the Start (see page 2360) property.

Pascal

```
procedure Rewind;
```

C++

```
__fastcall Rewind();
```

Description

Upon completion, Rewind stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Rewind method has completed. The Notify (see page 2350) property determines whether Rewind generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

Notify (see page 2350)

OnNotify (see page 2375)

Start (see page 2360)

39.1.2.4.21 TMediaPlayer.Save Method

Saves the currently loaded medium to the file specified in the FileName (see page 2347) property.

Pascal

```
procedure Save;
```

C++

```
__fastcall Save();
```

Description

Save is ignored for devices that don't use media stored in files (videodiscs, for example).

Upon completion, Save stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Save method has completed. The Notify (see page 2350) property determines whether Save generates an OnNotify (see page 2375) event.

See Also

Error (see page 2346)

ErrorMessage (see page 2346)

39.1.2.4.22 TMediaPlayer.StartRecording Method

Begins recording from the current Position (see page 2357) or from the position specified in StartPos (see page 2360).

Pascal

```
procedure StartRecording;
```

C++

```
__fastcall StartRecording();
```

Description

StartRecording is called when the Record button on the media player control is clicked at runtime.

Upon completion, StartRecording stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the StartRecording method has completed. The Notify (see page 2350) property determines whether StartRecording generates an OnNotify (see page 2375) event.

By default, the Notify (see page 2350) property becomes true, and the Wait (see page 2365) property becomes false upon completion of the StartRecording method. However, if these properties have been set to specific values prior to calling StartRecording, they remain unchanged.

Wait (see page 2365)

39.1.2.4.23 TMediaPlayer.Step Method

Moves forward a number of frames (determined by the Frames (see page 2349) property) in the currently loaded medium.

Pascal

```
procedure Step;
```

C++

```
__fastcall Step();
```

Description

Step is called when the Step button on the media player control is clicked at runtime.

Upon completion, Step stores a numerical error code in the Error (see page 2346) property and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Step method has completed. The Notify (see page 2350) property determines whether Step generates an OnNotify (see page 2375) event.

39.1.2.4.24 TMediaPlayer.Stop Method

Halts playing or recording.

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

Stop is called when the Stop button on the media player control is clicked at runtime.

Upon completion, Stop stores a numerical error code in the Error (see page 2346) property, and the corresponding error message in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before the Stop method has completed. The Notify (see page 2350) property determines whether Stop generates an OnNotify (see page 2375) event.

39.1.2.4.25 TMediaPlayer.Updated Method

Signals that the media player has finished updating.

Pascal

```
procedure Updated; override;
```

C++

```
virtual __fastcall Updated();
```

Description

Updated calls the inherited Updated before it modifies the layout of the media player buttons and forces a repaint.

Updated

39.1.2.5 TMediaPlayer Properties

The properties of the TMediaPlayer class are listed here.

Public Properties

	Name	Description
R	Capabilities (see page 2337)	Determines the capabilities of the open multimedia device.
R	DeviceID (see page 2338)	Specifies the device ID for the currently open multimedia device.
	DisplayRect (see page 2340)	Specifies a rectangular area in the control specified by the Display (see page 2339) property that is used to display output from a multimedia device.
	EndPos (see page 2345)	Specifies the position within the currently loaded medium at which to stop playing or recording.
R	Error (see page 2346)	Specifies the MCI error code returned by the media control method.
R	ErrorMessage (see page 2346)	Describes the error code stored in the Error (see page 2346) property.
	Frames (see page 2349)	Specifies the number of frames moved forward or backward.
R	Length (see page 2350)	Specifies the length of the medium in the open multimedia device.
R	Mode (see page 2350)	Indicates the state of the currently open multimedia device.
	Notify (see page 2350)	Determines whether an OnNotify (see page 2375) event is generated.
R	NotifyValue (see page 2351)	Indicates the result of the last media control method that requested a notification.
	Position (see page 2357)	Specifies the current position within the currently loaded medium.
R	Start (see page 2360)	Specifies the starting position within the currently loaded medium.
	StartPos (see page 2360)	Specifies the position within the currently loaded medium from which to begin playing or recording.
	TimeFormat (see page 2362)	Determines the format used to specify position information.
R	TrackLength (see page 2362)	Reports the length of the track.
R	TrackPosition (see page 2362)	Reports the starting position of the track.
R	Tracks (see page 2363)	Specifies the number of playable tracks on the open multimedia device.
	Wait (see page 2365)	Determines whether a media control method returns control to the application only after it has been completed.

Published Properties

	Name	Description
	Anchors (see page 2332)	Specifies how the control is anchored to its parent.
	AutoEnable (see page 2333)	Determines whether the media player automatically enables and disables individual buttons in the component.
	AutoOpen (see page 2336)	Determines if the media player is opened automatically when the application is run.
	AutoRewind (see page 2337)	Determines if the media player control rewinds before playing or recording.
	ColoredButtons (see page 2337)	Determines which buttons on the media player control have color.
	Constraints (see page 2338)	Specifies the size constraints for the control.
	DeviceType (see page 2339)	Specifies a multimedia device type to open the media player.
	Display (see page 2339)	Specifies the display window for a multimedia device that uses a window for output.
	DoubleBuffered (see page 2340)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 2342)	Controls whether the control responds to mouse, keyboard, and timer events.
	EnabledButtons (see page 2343)	Determines which buttons on the media player are usable.
	FileName (see page 2347)	Specifies the opened or saved media file.
	ParentDoubleBuffered (see page 2352)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentShowHint (see page 2352)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2352)	Identifies the pop-up menu associated with the control.
	Shareable (see page 2358)	Determines whether more than one application can share a multimedia device.
	ShowHint (see page 2358)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2361)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2361)	Determines if the user can tab to a control.
	Visible (see page 2363)	Determines whether the component appears onscreen.
	VisibleButtons (see page 2365)	Indicates which of the buttons on the media player are visible.

39.1.2.5.1 TMediaPlayer.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

39.1.2.5.2 TMediaPlayer.AutoEnable Property

Determines whether the media player automatically enables and disables individual buttons in the component.

Pascal

```
property AutoEnable: Boolean;
```

C++

```
__property Boolean AutoEnable;
```

Description

Use AutoEnable to automatically enable or disable the control buttons on the media player. If AutoEnable is true, the media player automatically enables or disables its control buttons. The media player determines which buttons to enable or disable by the current mode specified in the Mode (see page 2350) property, and the current multimedia device type specified in the DeviceType (see page 2339) property.

AutoEnable overrides the EnabledButtons (see page 2343) property. The buttons enabled or disabled automatically by the media player supersede any buttons enabled or disabled with EnabledButtons (see page 2343).

If AutoEnable is false, the media player does not enable or disable buttons. The buttons must enabled or disabled with the EnabledButtons (see page 2343) property.

The following table shows whether buttons are automatically enabled or disabled for each device mode:

Button	Play (see page 2323)	Record	Pause (see page 2322)	Stop (see page 2330)	Not Open (see page 2319)
Back (see page 2313)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Eject (see page 2315)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Next (see page 2318)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Pause (see page 2322)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled	Disabled
Play (see page 2323)	Disabled	Disabled	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Prev	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Record	Disabled	Disabled	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Step (see page 2330)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled
Stop (see page 2330)	Enabled (see page 2342)	Enabled (see page 2342)	Disabled	Disabled	Disabled

C++ Examples:

```
//
```

```
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
        }
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */
    MediaPlayer1->Stop();
    MediaPlayer1->Close();

    MediaPlayer1->EnabledButtons = TButtonSet();

    /* Enable open button again */
    btOpen->Enabled = true;
}

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Disable all buttons */
    MediaPlayer1->AutoEnable = false;
    MediaPlayer1->EnabledButtons = TButtonSet();
}

void __fastcall TForm2::MediaPlayer1PostClick(TObject *Sender,
          TMPBtnType Button)
```

```
{
    if (Button == TMPBtnType::btStop)
        btStop->Click();
}
```

Delphi Examples:

```
{
This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
for Open and Stop are present on the form.
Note: AutoEnable must be set to false to be able to control
the buttons manually.
}

procedure TForm2.btOpenClick(Sender: TObject);
var
  OpenMediaDialog : TOpenDialog;
begin
  OpenMediaDialog := TOpenDialog.Create(Self);
  OpenMediaDialog.Filter := 'All Video Files (*.avi)|*.avi';
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
  if OpenMediaDialog.Execute() then
  begin
    { Assign a file to the media player }
    MediaPlayer1.FileName := OpenMediaDialog.FileName;

    { Check if the file exists and is not a directory }
    if (FileExists(OpenMediaDialog.FileName)) and
       (not DirectoryExists(OpenMediaDialog.FileName)) then
    begin
      { Open the files }
      MediaPlayer1.Wait := true;
      MediaPlayer1.Open;
      MediaPlayer1.Play;

      { Override automatic button controlling }
      MediaPlayer1.EnabledButtons :=
        [TMPBtnType.btPause, TMPBtnType.btStop, TMPBtnType.btPlay];

      { Enable  the stop button }
      btStop.Enabled := true;
      btOpen.Enabled := false;
    end;
  end;

  OpenMediaDialog.Free;
end;

procedure TForm2.btStopClick(Sender: TObject);
begin
  { Stop and close the media }
  MediaPlayer1.Stop;
  MediaPlayer1.Close;

  MediaPlayer1.EnabledButtons := [];

  { Enable open button again }
  btOpen.Enabled := true;
end;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Disable all buttons }
  MediaPlayer1.AutoEnable := false;
  MediaPlayer1.EnabledButtons := [];
```

```
end;

procedure TForm2.MediaPlayer1PostClick(Sender: TObject;
  Button: TMPBtnType);
begin
  if Button = TMPBtnType.btStop then
     btStop.Click;
end;
```

Adding Audio and/or Video Clips to an Application

39.1.2.5.3 TMediaPlayer.AutoOpen Property

Determines if the media player is opened automatically when the application is run.

Pascal

```
property AutoOpen: Boolean;
```

C++

```
__property Boolean AutoOpen;
```

Description

Use AutoOpen to have the media player automatically open at runtime.

If AutoOpen is true, the media player attempts to open the multimedia device specified by the DeviceType (see page 2339) property (or FileName (see page 2347) if DeviceType (see page 2339) is dtAutoSelect) when the form containing the media player component is created at runtime.

If AutoOpen is false, the device must be opened with a call to the Open (see page 2319) method.

If an error occurs when opening the device, an exception of type EMCIDeviceError (see page 2305) exception is raised that contains the error message. Upon completion, a numerical error code is stored in the Error (see page 2346) property, and the corresponding error message is stored in the ErrorMessage (see page 2346) property.

The Wait (see page 2365) property determines whether control is returned to the application before opening the multimedia device. The Notify (see page 2350) property determines whether opening the device generates an OnNotify (see page 2375) event.

OnNotify (see page 2375)

Wait (see page 2365)

Adding Audio and/or Video Clips to an Application

39.1.2.5.4 TMediaPlayer.AutoRewind Property

Determines if the media player control rewinds before playing or recording.

Pascal

```
property AutoRewind: Boolean;
```

C++

```
__property Boolean AutoRewind;
```

Description

If AutoRewind is true and the current position is at the end of the medium, Play (see page 2323) or StartRecording (see page 2329) moves the current position to the beginning of the medium before playing or recording. If AutoRewind is false, the user must click the Prev button or write code to call Previous (see page 2327) to move to the beginning.

If values have been assigned to StartPos (see page 2360) or EndPos (see page 2345) or if the multimedia device uses tracks, AutoRewind has no effect on playing or recording. When calling Play (see page 2323) or StartRecording (see page 2329), the current position remains at the end of the medium.

See Also

Previous (see page 2327)

39.1.2.5.5 TMediaPlayer.Capabilities Property

Determines the capabilities of the open multimedia device.

Pascal

```
property Capabilities: TMPDevCapsSet;
```

C++

```
__property TMPDevCapsSet Capabilities;
```

Description

The various capabilities specified in Capabilities are determined when the device is opened with the Open (see page 2319) method.

Note: Currently, there is no way to check whether a device can step forward or backward. Capabilities includes mpCanStep only if the device type (specified in the DeviceType (see page 2339) property) is Animation, AVI Video, Digital Video, Overlay, or VCR.

See Also

DeviceType (see page 2339)

Open (see page 2319)

39.1.2.5.6 TMediaPlayer.ColoredButtons Property

Determines which buttons on the media player control have color.

Pascal

```
property ColoredButtons: TButtonSet;
```

C++

```
__property TButtonSet ColoredButtons;
```

Description

ColoredButtons controls which buttons on the media player are colored.

If a button is not colored with ColoredButtons, it appears in black-and-white when visible. All media player control buttons are colored by default.

See Also

EnabledButtons (see page 2343)

VisibleButtons (see page 2365)

39.1.2.5.7 TMediaPlayer.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

OnCanResize

39.1.2.5.8 TMediaPlayer.DeviceID Property

Specifies the device ID for the currently open multimedia device.

Pascal

```
property DeviceID: Word;
```

C++

```
__property Word DeviceID;
```

Description

The value of DeviceID is determined when a device is opened with the Open (see page 2319) method. If no device is open, DeviceID is 0.

See Also

Open (see page 2319)

39.1.2.5.9 TMediaPlayer.DeviceType Property

Specifies a multimedia device type to open the media player.

Pascal

```
property DeviceType: TMPDeviceTypes;
```

C++

```
__property TMPDeviceTypes DeviceType;
```

Description

DeviceType specifies a multimedia device type to open with the Open (see page 2319) method. The default is dtAutoSelect.

If DeviceType is dtAutoSelect, the device type is determined by the file extension specified in the FileName (see page 2347) property. If no device type is associated with the extension, the correct device type must be explicitly specified by setting DeviceType to a value other than dtAutoSelect.

A multimedia device is typically associated with an appropriate file name extension when the device is installed. Associations are specified in the registry or SYSTEM.INI file. See the documentation for the specific device for instructions about how to associate file name extensions with the device.

FileName (see page 2347)

Open (see page 2319)

Adding Audio and/or Video Clips to an Application

39.1.2.5.10 TMediaPlayer.Display Property

Specifies the display window for a multimedia device that uses a window for output.

Pascal

```
property Display: TWinControl;
```

C++

```
__property TWinControl * Display;
```

Description

To use Display, assign the name of a windowed control such as a form or panel to Display to display output in that control.

The default value of Display is nil (Delphi) or NULL (C++), meaning that the device creates its own window to display output.

Also, by freeing the control assigned to Display after the device has been opened, video output will be in its own default window.

Examples of multimedia devices that use a window to display output are Animation, AVI Video, Digital Video, Overlay, and VCR.

See Also

DisplayRect (see page 2340)

Adding Audio and/or Video Clips to an Application

39.1.2.5.11 TMediaPlayer.DisplayRect Property

Specifies a rectangular area in the control specified by the Display (see page 2339) property that is used to display output from a multimedia device.

Pascal

```
property DisplayRect: TRect;
```

C++

```
__property TRect DisplayRect;
```

Description

To display output in a specific rectangle area on a form assign a TRect record to DisplayRect. The Rect function can be used to create a TRect record.

Media that use a rectangle to display output usually perform best if the default DisplayRect size is used. To set DisplayRect to the default size, position the rectangle in the upper left corner and use 0, 0 for the lower right corner.

DisplayRect is ignored if Display (see page 2339) is nil (Delphi) or NULL (C++).

Examples of multimedia devices that use a window to display output are Animation, AVI Video, Digital Video, Overlay, and VCR.

Note: DisplayRect can be set only after the media device is opened.

Display (see page 2339)

Open (see page 2319)

39.1.2.5.12 TMediaPlayer.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:
```

```
procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

39.1.2.5.13 TMediaPlayer.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to False. Some disabled controls appear dimmed (for example: buttons, check boxes, labels), while others (container controls) simply lose their functionality without changing their appearance. If Enabled is set to False, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to True.

Note: This property applies to all TControl descendants.

DisableControls

EnableControls

Enabling Mouse

39.1.2.5.14 TMediaPlayer.EnabledButtons Property

Determines which buttons on the media player are usable.

Pascal

```
property EnabledButtons: TButtonSet;
```

C++

```
__property TButtonSet EnabledButtons;
```

Description

EnabledButtons controls which buttons on the media player are enabled and usable.

An enabled button is colored and usable. A disabled button is dimmed and not usable. If a button is not enabled with EnabledButtons, it is disabled. By default, all buttons are enabled.

If the AutoEnable (see page 2333) property is true, AutoEnable (see page 2333) supersedes EnabledButtons. The buttons automatically enabled or disabled by the media player override any buttons enabled or disabled with the EnabledButtons property.

C++ Examples:

```
//
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
        }
```

```
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */

39.1.2.5.15 TMediaPlayer.EndPos Property

Specifies the position within the currently loaded medium at which to stop playing or recording.

Pascal

```
property EndPos: Longint;
```

C++

```
__property Longint EndPos;
```

Description

EndPos is specified using the current time format, which is specified in the TimeFormat (see page 2362) property.

The EndPos property affects only the next Play (see page 2323) or StartRecording (see page 2329) method called after setting EndPos. Reset EndPos to affect any subsequent calls to Play (see page 2323) or StartRecording (see page 2329).

See Also

Play (see page 2323)

StartRecording (see page 2329)

TimeFormat (see page 2362)

39.1.2.5.16 TMediaPlayer.Error Property

Specifies the MCI error code returned by the media control method.

Pascal

```
property Error: Longint;
```

C++

```
__property Longint Error;
```

Description

Error specifies the MCI error code returned by the most recent media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), StartRecording (see page 2329), Resume (see page 2327), Rewind (see page 2328), Step (see page 2330), or Stop (see page 2330)). The ErrorMessage (see page 2346) property describes the Error.

The error code returned by media control methods are the same error code returned by the mciSendCommand function. The message describing the error code is stored in the ErrorMessage (see page 2346) property.

The value of Error is zero if the most recent media control method didn't cause an error. If a method results in an error, a value other than zero is stored in Error. If the error occurs during the opening of the device, an EMCIDeviceError (see page 2305) exception occurs.

39.1.2.5.17 TMediaPlayer.ErrorMessage Property

Describes the error code stored in the Error (see page 2346) property.

Pascal

```
property ErrorMessage: string;
```

C++

```
__property UnicodeString ErrorMessage;
```

Description

ErrorMessage specifies the error message that describes the error code returned from the most recent media control method (Back (see page 2313), Close (see page 2314), Eject (see page 2315), Next (see page 2318), Open (see page 2319), Pause (see page 2322), PauseOnly (see page 2323), Play (see page 2323), Previous (see page 2327), StartRecording (see page 2329), Resume (see page 2327), Rewind (see page 2328), Step (see page 2330), or Stop (see page 2330)).

The error code described by the message is stored in the Error (see page 2346) property.

39.1.2.5.18 TMediaPlayer.FileName Property

Specifies the opened or saved media file.

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

FileName specifies the media file to be opened by the Open (see page 2319) method, or the file to save by the Save (see page 2328) method.

At design time, use a file open dialog box to specify the FileName property by clicking the ellipsis button (...) in the Object Inspector.

C++ Examples:

```
//
//This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
//for Open and Stop are present on the form.
//Note: AutoEnable must be set to false to be able to control
//the buttons manually.
//
void __fastcall TForm2::btOpenClick(TObject *Sender)
{
    TOpenDialog* OpenMediaDialog;

    OpenMediaDialog = new TOpenDialog(this);
    OpenMediaDialog->Filter = "All Video Files (*.avi)|*.avi";
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
    if (OpenMediaDialog->Execute())
    {
        /* Assign a file to the media player */
        MediaPlayer1->FileName = OpenMediaDialog->FileName;

        /* Check if the file exists and is not a directory */
        if ((FileExists(OpenMediaDialog->FileName)) &&
           (!DirectoryExists(OpenMediaDialog->FileName)))
        {
            /* Open the files */
            MediaPlayer1->Wait = true;
            MediaPlayer1->Open();
            MediaPlayer1->Play();

            /* Override automatic button controlling */
            MediaPlayer1->EnabledButtons =
                TButtonSet() <<
                TMPBtnType::btPause <<
                TMPBtnType::btStop <<
                TMPBtnType::btPlay;

            /* Enable  the stop button */
            btStop->Enabled = true;
            btOpen->Enabled = false;
```

```
        }
    }

    delete OpenMediaDialog;
}

void __fastcall TForm2::btStopClick(TObject *Sender)
{
    /* Stop and close the media */
    MediaPlayer1->Stop();
    MediaPlayer1->Close();

    MediaPlayer1->EnabledButtons = TButtonSet();

    /* Enable open button again */
    btOpen->Enabled = true;
}

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Disable all buttons */
    MediaPlayer1->AutoEnable = false;
    MediaPlayer1->EnabledButtons = TButtonSet();
}

void __fastcall TForm2::MediaPlayer1PostClick(TObject *Sender,
          TMPBtnType Button)
{
    if (Button == TMPBtnType::btStop)
        btStop->Click();
}
```

Delphi Examples:

```
{
This example demonstrates the use of TMediaPlayer component. Assuming 2 buttons
for Open and Stop are present on the form.
Note: AutoEnable must be set to false to be able to control
the buttons manually.
}

procedure TForm2.btOpenClick(Sender: TObject);
var
  OpenMediaDialog : TOpenDialog;
begin
  OpenMediaDialog := TOpenDialog.Create(Self);
  OpenMediaDialog.Filter := 'All Video Files (*.avi)|*.avi';
  // There are avi files in
  // C:\Documents and Settings\All Users\Documents\RAD
Studio\6.0\Demos\DelphiWin32\VCLWin32\CoolStuff
  if OpenMediaDialog.Execute() then
  begin
    { Assign a file to the media player }
    MediaPlayer1.FileName := OpenMediaDialog.FileName;

    { Check if the file exists and is not a directory }
    if (FileExists(OpenMediaDialog.FileName)) and
       (not DirectoryExists(OpenMediaDialog.FileName)) then
    begin
      { Open the files }
      MediaPlayer1.Wait := true;
      MediaPlayer1.Open;
      MediaPlayer1.Play;

      { Override automatic button controlling }
      MediaPlayer1.EnabledButtons :=
        [TMPBtnType.btPause, TMPBtnType.btStop, TMPBtnType.btPlay];
```

```
        { Enable  the stop button }
        btStop.Enabled := true;
        btOpen.Enabled := false;
      end;
    end;

    OpenMediaDialog.Free;
  end;

  procedure TForm2.btStopClick(Sender: TObject);
  begin
    { Stop and close the media }
    MediaPlayer1.Stop;
    MediaPlayer1.Close;

    MediaPlayer1.EnabledButtons := [];

    { Enable open button again }
    btOpen.Enabled := true;
  end;

  procedure TForm2.FormCreate(Sender: TObject);
  begin
    { Disable all buttons }
    MediaPlayer1.AutoEnable := false;
    MediaPlayer1.EnabledButtons := [];
  end;

  procedure TForm2.MediaPlayer1PostClick(Sender: TObject;
    Button: TMPBtnType);
  begin
    if Button = TMPBtnType.btStop then
       btStop.Click;
  end;
```

39.1.2.5.19 TMediaPlayer.Frames Property

Specifies the number of frames moved forward or backward.

Pascal

```
property Frames: Longint;
```

C++

```
__property Longint Frames;
```

Description

Frames specifies the number of frames the Step (see page 2330) method steps forward or the Back (see page 2313) method steps backward. Frames defaults to ten percent of the length of the currently loaded medium, which is specified by the Length (see page 2350) property.
