For example, TScrollingWinControl (see page 2554) calls ChangeBiDiPosition from its DoFlipChildren method to determine whether the scroll bar should be repositioned along with the child controls.

See Also

BiDiMode

DoFlipChildren (see page 2560)

7.1.2.2.3 TControlScrollBar.IsScrollBarVisible Method

Returns true if the scroll bar is visible.

Pascal

```
function IsScrollBarVisible: Boolean;
```

C++

```
__fastcall Boolean IsScrollBarVisible();
```

Description

Call IsScrollBarVisible to determine whether the scroll bar is visible. IsScrollBarVisible returns true if the Visible (see page 2022) property is true and the associated scrolling windowed control contains child controls that lie within Margin (see page 2015) pixels from the edge.

See Also

Visible (see page 2022)

Margin (see page 2015)

7.1.2.3 TControlScrollBar Properties

The properties of the TControlScrollBar class are listed here.

Public Properties

	Name	Description
R	Kind (see page 2015)	Indicates whether the scroll bar is horizontal or vertical.
R	ScrollPos (see page 2020)	Indicates the position of the thumb tab.

Published Properties

	Name	Description
	ButtonSize (see page 2012)	Specifies the sizes of the buttons in the scroll bar.
	Color (see page 2013)	Specifies the scroll bar's color.
	Increment (see page 2013)	Determines how far the display moves when the user clicks one of the small end arrows on the scroll bar.
	Margin (see page 2015)	Determines when a scroll bar is generated.
	ParentColor (see page 2016)	Specifies whether the scroll bar should.
	Position (see page 2017)	Specifies the position of the thumb tab on the scroll bar.
	Range (see page 2018)	Determines how far the scrolling region of the associated control can move.
	Size (see page 2021)	Specifies the scroll bar's size.
	Smooth (see page 2021)	Specifies whether the amount the associated control scrolls is dynamically computed.
	Style (see page 2022)	Specifies the scroll bar's style.
	ThumbSize (see page 2022)	This is ThumbSize, a member of class TControlScrollBar.
	Tracking (see page 2022)	Determines whether the form or scroll box moves before the thumb tab is released.
	Visible (see page 2022)	Determines whether the scroll bar appears.

7.1.2.3.1 TControlScrollBar.ButtonSize Property

Specifies the sizes of the buttons in the scroll bar.

Pascal

```
property ButtonSize: Integer;
```

C++

```
__property int ButtonSize;
```

Description

Use ButtonSize to specify the sizes of the buttons in the scroll bar. If the scroll bar is horizontal, ButtonSize is the width of the arrow buttons in pixels. If the scroll bar is vertical, ButtonSize is the height of the arrow buttons in pixels.

See Also

Size (see page 2021)

Kind (see page 2015)

thumbsize (see page 2022)

7.1.2.3.2 TControlScrollBar.Color Property

Specifies the scroll bar's color.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to specify the scroll bar's color. When you explicitly assign a value to Color, the ParentColor (see page 2016) property is automatically set to false.

If the scroll bar's ParentColor (see page 2016) property is true, then the Color property reflects the Windows button highlight color (clBtnHighlight (see page 2900)), and changing this color in the Windows control panel automatically updates the value of Color.

See Also

ParentColor (see page 2016)

7.1.2.3.3 TControlScrollBar.Increment Property

Determines how far the display moves when the user clicks one of the small end arrows on the scroll bar.

Pascal

```
property Increment: TScrollBarInc;
```

C++

```
__property TScrollBarInc Increment;
```

Description

Use Increment to control how the scroll bar affects the scrollable region of the control. If Increment is set to 1, each click scrolls by one position; if Increment is set to 2, each click scrolls by two positions; and so forth.

Note: Do not use the Increment property when Smooth (see page 2021) is set to true. When Smooth (see page 2021) is true, every time the range or visibility of the scroll bar changes, the value of Increment is dynamically recomputed.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

Smooth (see page 2021)

7.1.2.3.4 TControlScrollBar.Kind Property

Indicates whether the scroll bar is horizontal or vertical.

Pascal

```
property Kind: TScrollBarKind;
```

C++

```
__property TScrollBarKind Kind;
```

Description

Kind indicates whether the scroll bar has a vertical or horizontal orientation. This value is initialized in the constructor, when the scroll bar is created by a scrolling windowed control for its VertScrollBar or HorzScrollBar property.

See Also

VertScrollBar (see page 2563)

HorzScrollBar (see page 2562)

Create

7.1.2.3.5 TControlScrollBar.Margin Property

Determines when a scroll bar is generated.

Pascal

```
property Margin: Word;
```

C++

```
__property Word Margin;
```

Description

The Margin property determines the minimum number of pixels that must separate each control from the edge of the control that uses the scroll bar. At runtime, whenever a child control is less than Margin pixels from the edge and Visible (see page 2022) is set to true, a scroll bar appears.

C++ Examples:

```
/*
This example uses a button and a label on a form and needs
the AutoScroll property set on the form. Place the label
near the left side of the form, and place the button
somewhere near the middle of the form. When the user runs
the application, a horizontal scroll bar does not appear,
because no control on the form is close enough to the right
edge.  Each time the user clicks the button, the button moves
25 pixels to the right, and the calculated Range value is
reported in the caption of the label. Repeatedly clicking the
button eventually moves the button close enough to the edge
of the form (within the Margin amount) so that a horizontal
scroll bar appears.  Note that the Range property is
continuously updated as the button moves to the right.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  Button1->Left = Button1->Left + 25;
  Label1->Caption = IntToStr(HorzScrollBar->Range);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  HorzScrollBar->Margin = 25;
  HorzScrollBar->Increment = 10;
}
```

Delphi Examples:

```
{
This example uses a button and a label on a form and needs
the AutoScroll property set on the form. Place the label
near the left side of the form, and place the button
somewhere near the middle of the form. When the user runs
the application, a horizontal scroll bar does not appear,
because no control on the form is close enough to the right
edge.  Each time the user clicks the button, the button moves
25 pixels to the right, and the calculated Range value is
reported in the caption of the label. Repeatedly clicking the
button eventually moves the button close enough to the edge
of the form (within the Margin amount) so that a horizontal
scroll bar appears.  Note that the Range property is
continuously updated as the button moves to the right.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with HorzScrollBar do
  begin
    Margin:= 25;
    Increment := 10;
    Visible := True;
  end;
end;
procedure TForm1.Button1Click(Sender: TObject);
begin
  Button1.Left := Button1.Left + 25;
  Label1.Caption := IntToStr(HorzScrollBar.Range);
end;
```

See Also

Visible (see page 2022)

IsScrollBarVisible (see page 2011)

7.1.2.3.6 TControlScrollBar.ParentColor Property

Specifies whether the scroll bar should.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

Use ParentColor to indicate that the scroll bar should always reflect the Windows button highlight color. Using ParentColor differs from setting the Color (see page 2013) property to clBtnHighlight (see page 2900) in that when ParentColor is true, changing the button highlight color in the Windows control panel automatically updates the value of Color (see page 2013).

When the value of the Color (see page 2013) property is changed, its ParentColor property is automatically set to false.

See Also

Color (see page 2013)

TColor (see page 2878)

7.1.2.3.7 TControlScrollBar.Position Property

Specifies the position of the thumb tab on the scroll bar.

Pascal

```
property Position: Integer;
```

C++

```
__property int Position;
```

Description

Use Position to programmatically scroll the client area of the associated control. The value of Position changes (from 0 to Range (see page 2018)) at runtime as the user scrolls the scroll bar.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
```

```
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

Range (see page 2018)

ScrollPos (see page 2020)

7.1.2.3.8 TControlScrollBar.Range Property

Determines how far the scrolling region of the associated control can move.

Pascal

```
property Range: Integer;
```

C++

```
__property int Range;
```

Description

Range represents the virtual size (in pixels) of the associated control's client area. For example, if the Range of a form's horizontal scroll bar is set to 500, and the width of the form is 200, the scroll bar's Position (see page 2017) can vary from 0 to 300.

If the Range of a horizontal scroll bar is less than the width of the form or scroll box, no horizontal scroll bar appears. If the Range of a vertical scroll bar is less than the height of the form or scroll box, no vertical scroll bar appears.

The value of Range is set automatically, but can be overridden in the Object Inspector or in program code.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
This example uses a button and a label on a form and needs
the AutoScroll property set on the form. Place the label
near the left side of the form, and place the button
somewhere near the middle of the form. When the user runs
the application, a horizontal scroll bar does not appear,
because no control on the form is close enough to the right
edge.  Each time the user clicks the button, the button moves
25 pixels to the right, and the calculated Range value is
reported in the caption of the label. Repeatedly clicking the
button eventually moves the button close enough to the edge
of the form (within the Margin amount) so that a horizontal
scroll bar appears.  Note that the Range property is
continuously updated as the button moves to the right.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Button1->Left = Button1->Left + 25;
  Label1->Caption = IntToStr(HorzScrollBar->Range);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  HorzScrollBar->Margin = 25;
  HorzScrollBar->Increment = 10;
}
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
```

```
      { This means that the form's logical size is twice as big }
      { as the physical window. }
      { Note that Range must always be larger than the ClientWidth }
      Range := 600;
      Position := Range - ClientWidth; { start form out fully scrolled }
      Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
      Visible := True;  { Show the scrollbar }
    end;
  end;
  {
  This example uses a button and a label on a form and needs
  the AutoScroll property set on the form. Place the label
  near the left side of the form, and place the button
  somewhere near the middle of the form. When the user runs
  the application, a horizontal scroll bar does not appear,
  because no control on the form is close enough to the right
  edge.  Each time the user clicks the button, the button moves
  25 pixels to the right, and the calculated Range value is
  reported in the caption of the label. Repeatedly clicking the
  button eventually moves the button close enough to the edge
  of the form (within the Margin amount) so that a horizontal
  scroll bar appears.  Note that the Range property is
  continuously updated as the button moves to the right.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    with HorzScrollBar do
    begin
      Margin:= 25;
      Increment := 10;
      Visible := True;
    end;
  end;
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Button1.Left := Button1.Left + 25;
    Label1.Caption := IntToStr(HorzScrollBar.Range);
  end;
  {
  The following example demonstrates form scrolling with the
  PgUp and PgDn keys.
  }
  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
  Shift: TShiftState);
  const
    PageDelta = 10;
  begin
    With VertScrollbar do
      if Key = VK_NEXT then
        Position := Position + PageDelta
      else if Key = VK_PRIOR then
        Position := Position - PageDelta;
  end;
```

See Also

Position (see page 2017)

Width

Height

7.1.2.3.9 TControlScrollBar.ScrollPos Property

Indicates the position of the thumb tab.

Pascal

```
property ScrollPos: Integer;
```

C++

```
__property int ScrollPos;
```

Description

The read-only ScrollPos property returns the current value of Position (see page 2017) when the scroll bar is visible. If the scroll bar is not visible, ScrollPos returns 0.

See Also

Position (see page 2017)

Visible (see page 2022)

7.1.2.3.10 TControlScrollBar.Size Property

Specifies the scroll bar's size.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Use Size to specify the width of the scroll bar in pixels.

Note: The length of the scroll bar is determined by the width (for horizontal scroll bars) or height (for vertical scroll bars) of the associated scrolling windowed control.

See Also

ButtonSize (see page 2012)

thumbsize (see page 2022)

7.1.2.3.11 TControlScrollBar.Smooth Property

Specifies whether the amount the associated control scrolls is dynamically computed.

Pascal

```
property Smooth: Boolean;
```

C++

```
__property Boolean Smooth;
```

Description

Set Smooth to true to specify that the scroll bar should dynamically adjust its scrolling increment based on the size of the associated control's client area.

When Smooth is true, clicking the end arrows of the scroll bar scrolls the associated control by approximately one tenth of its client area, and clicking the scroll bar beside the thumb tab scrolls the control by the length of the client area minus the amount scrolled by the end arrows. When Smooth is false, the Increment (see page 2013) property controls the amount of scrolling when the user clicks the end arrows, and clicking beside the thumb tab scrolls the control by the entire length of the client area.

See Also

Increment (see page 2013)

Position (see page 2017)

7.1.2.3.12 TControlScrollBar.Style Property

Specifies the scroll bar's style.

Pascal

```
property Style: TScrollBarStyle;
```

C++

```
__property TScrollBarStyle Style;
```

Description

Use Style to specify the scroll bar's style. The style determines whether the scroll bar appears three-dimensional, flat, or uses hot tracking.

7.1.2.3.13 TControlScrollBar.ThumbSize Property

Pascal

```
property ThumbSize: Integer;
```

C++

```
__property int ThumbSize;
```

Description

This is ThumbSize, a member of class TControlScrollBar.

7.1.2.3.14 TControlScrollBar.Tracking Property

Determines whether the form or scroll box moves before the thumb tab is released.

Pascal

```
property Tracking: Boolean;
```

C++

```
__property Boolean Tracking;
```

Description

Use Tracking to control whether the scroll bar and associated control repaint while the thumb tab is dragged with the mouse. If Tracking is true, the image moves as the user drags the thumb tab. If Tracking is false, the image remains static until the thumb tab is released.

Repainting while the thumb tab is dragged can provide useful feedback to the user about how far the control has scrolled, but slows performance.

7.1.2.3.15 TControlScrollBar.Visible Property

Determines whether the scroll bar appears.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

If Visible is set to true, a scroll bar appears whenever a visual component is less than Margin (see page 2015) pixels from the edge of the form or scroll box. If Visible is set to false, the scroll bar is never visible. This is useful, for example, for programmatically controlling the scroll position of a form without allowing the user to control the scroll position.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
```

```
      Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
      Visible := True;  { Show the scrollbar }
    end;
  end;
  {
  The following example demonstrates form scrolling with the
  PgUp and PgDn keys.
  }
  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
  Shift: TShiftState);
  const
    PageDelta = 10;
  begin
    With VertScrollbar do
      if Key = VK_NEXT then
        Position := Position + PageDelta
      else if Key = VK_PRIOR then
        Position := Position - PageDelta;
  end;
```

Margin (see page 2015)

7.1.3 TCustomActiveForm Class

TCustomActiveForm is the base class for Active (see page 2145) Forms (see page 1921).

Class Hierarchy

Pascal

```
TCustomActiveForm = class(TCustomForm);
```

C++

```
class TCustomActiveForm : public TCustomForm;
```

File

Forms

Description

TCustomActiveForm is used in code that is generated automatically by the ActiveForm wizard. For more information, see Generating an ActiveX control based on a VCL form.

7.1.3.1 TCustomActiveForm Members

The following tables list the members exposed by TCustomActiveForm.

Protected Events

	Name	Description
	OnCanResize (see page 2202)	Occurs when an attempt is made to resize the control.
	OnClose (see page 2205)	Occurs when the form closes.
	OnCloseQuery (see page 2206)	Occurs when close is attempted.
	OnHelp (see page 2217)	Occurs when the form receives a request for help.

	OnHide (see page 2217)	Occurs when the form is hidden (that is, when its Visible (see page 2192) property is set to false).
	OnResize (see page 2235)	Occurs immediately after the control is resized.
	OnShortCut (see page 2235)	Occurs when the user presses a key (before the OnKeyDown (see page 2219) event).
	OnShow (see page 2236)	Occurs when the form is shown (that is, when its Visible (see page 2192) property is set to true).

Protected Fields

	Name	Description
	FFormState (see page 2110)	This is FFormState, a member of class TCustomForm.

Protected Methods

	Name	Description
	Activate (see page 2111)	Activation event dispatcher.
	ActiveChanged (see page 2112)	Active (see page 2145) state event dispatcher.
V	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
V	AlignControls (see page 2113)	Aligns all child controls of the form that fall within a specified rectangle.
V	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
V	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
V	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
V	BeginAutoDrag (see page 2113)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
V	ChangeScale (see page 2114)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
V	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CloseModal (see page 2115)	This is CloseModal, a member of class TCustomForm.
V	CreateParams (see page 2029)	Updates the active form's creation parameters according to the value of the AxBorderStyle (see page 2033) property.
V	CreateWindowHandle (see page 2116)	Creates a form window given a set of window-creation parameters.
V	CreateWnd (see page 2117)	Creates the form window.
V	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	Deactivate (see page 2117)	Generates an OnDeactivate (see page 2209) event.
V	DefineProperties (see page 2118)	Designates methods for storing a form's unpublished data on a stream such as a form file.
V	DestroyHandle (see page 2119)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 2119)	Destroys the window created in the CreateWindowHandle (see page 2116) method.
	DoClose (see page 2120)	Form closing event dispatcher.
V	DoCreate (see page 2120)	Form creation event dispatcher.
V	DoDestroy (see page 2121)	Form destruction event dispatcher.
V	DoDock (see page 2121)	Docking event dispatcher.
V	DoFlipChildren (see page 2560)	Flips the control's children.
	DoHide (see page 2122)	Form hide event dispatcher.
	DoShow (see page 2122)	Form show event dispatcher.
	get_ActiveMDIChild (see page 2123)	This is get_ActiveMDIChild, a member of class TCustomForm.
	get_MDIChildCount (see page 2123)	This is get_MDIChildCount, a member of class TCustomForm.
	get_MDIChildren (see page 2123)	This is get_MDIChildren, a member of class TCustomForm.
	GetBorderIconStyles (see page 2123)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 2124)	This is GetBorderStyles, a member of class TCustomForm.
V	GetClientRect (see page 2124)	Returns the value of the ClientRect property.
V	GetFloating (see page 2125)	Returns the value of the Floating property.
	GetOwnerWindow (see page 2127)	This is GetOwnerWindow, a member of class TCustomForm.
	HandleCreateException (see page 2127)	Handles exceptions that are raised by the OnCreate (see page 2207) event handler.
	InitializeNewForm (see page 2128)	This is InitializeNewForm, a member of class TCustomForm.
V	Loaded (see page 2129)	Performs fix-ups when the form is first loaded into memory.

	Notification (see page 2130)	Responds to notifications that objects are about to be inserted or removed.
	Paint (see page 2131)	Generates an OnPaint (see page 2233) event.
	PaintWindow (see page 2131)	Renders the image of the form.
	PaletteChanged (see page 2132)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	QueryInterface (see page 2132)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2133)	Reads the form's published properties, stored data, and owned components from a reader object.
	RequestAlign (see page 2134)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	Resizing (see page 2134)	Makes any required adjustments when the form changes size.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.
	SetChildOrder (see page 2135)	Changes the order in which Child appears when GetChildren (see page 2124) is called.
	SetParent (see page 2136)	Sets the Parent property.
	SetParentBiDiMode (see page 2136)	Sets the ParentBiDiMode property.
	UpdateActions (see page 2140)	Updates all actions associated with the form.
	UpdateWindowState (see page 2141)	Updates the WindowState (see page 2195) property to reflect the current state of the form.
	ValidateRename (see page 2141)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 2141)	Responds just before the form changes the value of its Visible (see page 2192) property.
	WndProc (see page 2142)	Provides specific message responses for the form.

Protected Properties

	Name	Description
	ActiveMDIChild (see page 2146)	Specifies the MDI child that has focus.
	AlphaBlend (see page 2147)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2147)	Specifies the degree of translucency on a translucent form.
	BorderIcons (see page 2148)	Specifies which icons appear on the title bar of the form.
	ClientHandle (see page 2154)	Provides access to the handle of the form's internal MDI client window.
	ClientHeight (see page 2154)	Specifies the height (in pixels) of the form's client area.
	ClientWidth (see page 2155)	Specifies the width (in pixels) of the form's client area.
	Ctl3D (see page 2158)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2158)	Specifies the monitor on which the form appears.
	FormStyle (see page 2162)	Determines the form's style.
	Icon (see page 2167)	Specifies the icon that appears when the form is minimized.
	MDIChildCount (see page 2172)	Specifies the number of open MDI child forms.
	MDIChildren (see page 2173)	Provides indexed access to all MDI child forms.
	ObjectMenuItem (see page 2177)	Represents an OLE object menu item that reacts to selections of OLE objects.
	ParentFont (see page 2179)	Determines where a control looks for its font information.
	PopupChildren (see page 2179)	This is PopupChildren, a member of class TCustomForm.
	Position (see page 2185)	Represents the size and placement of the form.
	TileMode (see page 2188)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 2190)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2191)	Indicates the color on the form that appears transparent when TransparentColor (see page 2190) is true.
	WindowMenu (see page 2194)	Specifies the Window menu for an MDI parent form.

Public Methods

	Name	Description
	AfterConstruction (see page 2112)	Construction event dispatcher.
	BeforeDestruction (see page 2113)	Destruction event dispatcher.
	Close (see page 2114)	Closes the form.
	CloseQuery (see page 2115)	Close (see page 2114) attempt event dispatcher.

	Create (see page 2029)	Creates a new TCustomActiveForm (see page 2024) object.
	CreateNew (see page 2108)	Creates and initializes a new form.
	DefaultHandler (see page 2118)	Provides message handling for all messages that the form does not fully process.
	DefocusControl (see page 2118)	Removes focus from a control on the form.
	Destroy (see page 2109)	Removes the form from memory.
	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	Dock (see page 2120)	Handles automatic docking of the form into other windows.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	FocusControl (see page 2122)	Sets focus to a control on the form.
	GetChildren (see page 2124)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetFormImage (see page 2125)	Returns a bitmap of the form.
	Hide (see page 2127)	Hides the form.
	IsShortCut (see page 2128)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 2129)	Ensures that the form is fully visible on a specified monitor.
	MouseWheelHandler (see page 2130)	Directs mouse wheel messages to the appropriate control.
	Print (see page 2132)	Prints the form.
	RecreateAsPopup (see page 2133)	This is RecreateAsPopup, a member of class TCustomForm.
	Release (see page 2133)	Destroys the form and frees its associated memory.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 2134)	Cancels modes on the form.
	set_PopupParent (see page 2135)	This is set_PopupParent, a member of class TCustomForm.
	SetFocus (see page 2135)	Sets focus to the form.
	SetFocusedControl (see page 2136)	Sets focus to a control on the form.
	Show (see page 2137)	Shows the form.
	ShowModal (see page 2139)	Shows a form as a modal dialog.
	WantChildKey (see page 2030)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
	Action (see page 2144)	Designates the action associated with the control.
R	Active (see page 2145)	Specifies whether the form has focus.
	ActiveOleControl (see page 2146)	Specifies the OLE control on the form that reacts to changes in focus.
	BorderStyle (see page 2149)	Specifies the appearance and behavior of the form border.
R	Canvas (see page 2150)	Provides access to the drawing area of the form.
	Designer (see page 2159)	Specifies the designer interface for the form.
	DropTarget (see page 2159)	Specifies whether the form is the target of a drag-and-drop operation.
R	FormState (see page 2161)	Indicates transitional state information about the form.
	GlassFrame (see page 2164)	This is GlassFrame, a member of class TCustomForm.
	HelpFile (see page 2165)	Specifies the name of the file the form uses to display Help.
	Menu (see page 2174)	Specifies the form's main menu.
	ModalResult (see page 2176)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 2177)	Provides access to the monitor on which the form appears.
	OleFormObject (see page 2178)	Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.
	PopupMode (see page 2185)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 2185)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 2187)	Specifies whether form snaps to edge of screen.
	SnapBuffer (see page 2188)	Specifies distance for screen snap.
	Visible (see page 2054)	Indicates whether the form is visible.
	WindowState (see page 2195)	Represents how the form appears on the screen.

Published Events

	Name	Description
	OnActivate (see page 2058)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnClick (see page 2064)	Occurs when the user clicks the control.
	OnContextPopup (see page 2066)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 2066)	Occurs when the form is created.
	OnDblClick (see page 2068)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2068)	Occurs when the form loses focus.
	OnDestroy (see page 2069)	Occurs when the form is destroyed.
	OnDragDrop (see page 2070)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2073)	Occurs when the user drags an object over a control.
	OnKeyDown (see page 2076)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2080)	Occurs when a key is pressed.
	OnKeyUp (see page 2081)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2083)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2084)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2086)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2086)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2086)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2089)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 2091)	Occurs when the form is redrawn.

Published Properties

	Name	Description
	ActiveControl (see page 2031)	Specifies the control that has focus on the form.
	Anchors (see page 2032)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2033)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2033)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AxBorderStyle (see page 2033)	Sets the active form's border style.
	BorderWidth (see page 2034)	Specifies the width of the control's border.
	Caption (see page 2034)	Specifies a text string that identifies the control to the user.
	Color (see page 2037)	Specifies the background color of the control.
	Constraints (see page 2038)	Specifies the size constraints for the control.
	Font (see page 2038)	Controls the attributes of text written on or in the control.
	Height (see page 2039)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 2040)	Represents the horizontal scroll bar for the scrolling windowed control.
	KeyPreview (see page 2041)	Specifies whether the form should receive keyboard events before the active control.
	Left (see page 2171)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	OldCreateOrder (see page 2045)	Specifies when OnCreate and OnDestroy events occur.
	Padding (see page 2045)	Specifies the padding of a control.
	PixelsPerInch (see page 2046)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 2046)	Identifies the pop-up menu associated with the control.
	PrintScale (see page 2051)	Represents the proportions of a printed form.

	Scaled (see page 2052)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ShowHint (see page 2052)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Top (see page 2189)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	VertScrollBar (see page 2054)	Represents the vertical scroll bar for the scrolling windowed control.
	Width (see page 2055)	Specifies the horizontal size of the control or form in pixels.

7.1.3.2 TCustomActiveForm.Create Constructor

Creates a new TCustomActiveForm (see page 2024) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActiveForm(TComponent * AOwner);
```

Description

Create is the TCustomActiveForm (see page 2024) constructor.

AOwner specifies a component, typically the global application object, that becomes the value of the Owner property. The owner is responsible for initiating streaming of the active form and for freeing it.

See Also

Owner

ParentWindow

7.1.3.3 TCustomActiveForm Methods

The methods of the TCustomActiveForm class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 2029)	Updates the active form's creation parameters according to the value of the AxBorderStyle (see page 2033) property.

Public Methods

	Name	Description
	WantChildKey (see page 2030)	Indicates whether the form processes keyboard input for a control it owns.

7.1.3.3.1 TCustomActiveForm.CreateParams Method

Updates the active form's creation parameters according to the value of the AxBorderStyle (see page 2033) property.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams performs the following tasks:

Calls the inherited CreateParams method.

Removes the WS_CAPTION flag from the Style property of Params.

Adds flags to the Style and ExStyle properties of Params according to the value of the AxBorderStyle (see page 2033) property, as shown in the following table:

AxBorderStyleStyleExStyle

AxBorderStyle (see page 2033)	Style	ExStyle
afbNone	Nothing	Nothing
afbSingle	WS_BORDER	Nothing
afbSunken	Nothing	WS_EX_CLIENTEDGE
afbRaised	WS_DLGFRAME	WS_EX_WINDOWEDGE

Note: The creation parameters are not updated when the form is in design mode.

See Also

CreateParams2

7.1.3.3.2 TCustomActiveForm.WantChildKey Method

Indicates whether the form processes keyboard input for a control it owns.

Pascal

```
function WantChildKey(Child: TControl; var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean WantChildKey(TControl * Child, TMessage Message);
```

Description

Do not call WantChildKey. It is used internally to ensure that keyboard events sent to child objects are handled correctly.

See Also

WantChildKey (see page 2142)

7.1.3.4 TCustomActiveForm Properties

The properties of the TCustomActiveForm class are listed here.

Public Properties

	Name	Description
	Visible (see page 2054)	Indicates whether the form is visible.

Published Properties

	Name	Description
	ActiveControl (see page 2031)	Specifies the control that has focus on the form.
	Anchors (see page 2032)	Specifies how the control is anchored to its parent.

	AutoScroll (see page 2033)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2033)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AxBorderStyle (see page 2033)	Sets the active form's border style.
	BorderWidth (see page 2034)	Specifies the width of the control's border.
	Caption (see page 2034)	Specifies a text string that identifies the control to the user.
	Color (see page 2037)	Specifies the background color of the control.
	Constraints (see page 2038)	Specifies the size constraints for the control.
	Font (see page 2038)	Controls the attributes of text written on or in the control.
	Height (see page 2039)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 2040)	Represents the horizontal scroll bar for the scrolling windowed control.
	KeyPreview (see page 2041)	Specifies whether the form should receive keyboard events before the active control.
	OldCreateOrder (see page 2045)	Specifies when OnCreate and OnDestroy events occur.
	Padding (see page 2045)	Specifies the padding of a control.
	PixelsPerInch (see page 2046)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 2046)	Identifies the pop-up menu associated with the control.
	PrintScale (see page 2051)	Represents the proportions of a printed form.
	Scaled (see page 2052)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ShowHint (see page 2052)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	VertScrollBar (see page 2054)	Represents the vertical scroll bar for the scrolling windowed control.
	Width (see page 2055)	Specifies the horizontal size of the control or form in pixels.

7.1.3.4.1 TCustomActiveForm.ActiveControl Property

Specifies the control that has focus on the form.

Pascal

```
property ActiveControl: TWinControl;
```

C++

```
__property TWinControl * ActiveControl;
```

Description

Use ActiveControl to get or set the control that has focus on the form. Only one control can have focus at a given time in an application.

If the form does not have focus, ActiveControl is the control on the form that will receive focus when the form receives focus.

Note: When focus shifts to another control, ActiveControl is updated before the OnExit event occurs.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
```

```
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

See Also

ActiveOleControl (see page 2146)

OnExit

OnEnter

Active (see page 2145)

7.1.3.4.2 TCustomActiveForm.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

7.1.3.4.3 TCustomActiveForm.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.3.4.4 TCustomActiveForm.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints

CanAutoSize

7.1.3.4.5 TCustomActiveForm.AxBorderStyle Property

Sets the active form's border style.

Pascal

```
property AxBorderStyle: TActiveFormBorderStyle;
```

C++

```
__property TActiveFormBorderStyle AxBorderStyle;
```

Description

AxBorderStyle takes one of the following values:

ValuesMeaning

Values	Meaning	
afbNone	No border appears around the active form.	
afbSingle	A single line border appears around the active form.	
afbSunken	The active form gets a sunken border.	
afbRaised	The active form gets a raised border and no caption.	

See Also

BorderStyle (see page 2149)

7.1.3.4.6 TCustomActiveForm.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth;
```

C++

```
__property BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter

7.1.3.4.7 TCustomActiveForm.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
```

```
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
```

```
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

7.1.3.4.8 TCustomActiveForm.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

7.1.3.4.9 TCustomActiveForm.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

7.1.3.4.10 TCustomActiveForm.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

7.1.3.4.11 TCustomActiveForm.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
```

```
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;

7.1.3.4.12 TCustomActiveForm.HorzScrollBar Property

Represents the horizontal scroll bar for the scrolling windowed control.

Pascal

```
property HorzScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar HorzScrollBar;
```

Description

Use HorzScrollBar to hide, show, or manipulate the horizontal scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
```

7.1.3.4.13 TCustomActiveForm.KeyPreview Property

Specifies whether the form should receive keyboard events before the active control.

Pascal

```
property KeyPreview: Boolean;
```

C++

```
__property Boolean KeyPreview;
```

Description

If KeyPreview is true, keyboard events occur on the form before they occur on the active control. (The active control is specified by the ActiveControl property.)

If KeyPreview is false, keyboard events occur only on the active control.

Navigation keys (Tab, BackTab, the arrow keys, and so on) are unaffected by KeyPreview because they do not generate keyboard events. Similarly, when a button has focus or when its Default property is true, the Enter key is unaffected by KeyPreview because it does not generate a keyboard events.

KeyPreview is false by default.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
   KeyPreview = True;

}
```

```
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);

7.1.3.4.14 TCustomActiveForm.OldCreateOrder Property

Specifies when OnCreate and OnDestroy events occur.

Pascal

```
property OldCreateOrder: Boolean;
```

C++

```
__property Boolean OldCreateOrder;
```

Description

When OldCreateOrder is false (the default) the OnCreate event occurs after all constructors are finished and the OnDestroy event occurs before any destructors are called.

This differs from earlier versions of the library (distributed with Delphi version 3 and previous and C++Builder 1), where the OnCreate event occurred when the TCustomForm constructor executed and the OnDestroy event occurred when the TCustomForm destructor executed. Applications that require the OnCreate event and OnDestroy events to occur from the constructor and destructor of the form can set OldCreateOrder to true.

See Also

OnCreate (see page 2207)

OnDestroy (see page 2209)

BeforeDestruction (see page 2113)

AfterConstruction (see page 2112)

7.1.3.4.15 TCustomActiveForm.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding;
```

C++

```
__property Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding

7.1.3.4.16 TCustomActiveForm.PixelsPerInch Property

Represents the proportion of the font on the system on which the form was designed.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Use PixelsPerInch at runtime to change how the form is scaled to the current screen resolution. If PixelsPerInch is changed from its default value, the form will not have the same proportion on every screen resolution.

At design time, PixelsPerInch is set automatically when the form is saved. Changes to PixelsPerInch made in the Object Inspector only affect the form at runtime.

The form's Scaled property must be true for PixelsPerInch to have an effect.

See Also

Scaled (see page 2187)

7.1.3.4.17 TCustomActiveForm.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
```

```
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
```

```
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}
```

```
type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
    procedure AddButtonClick(Sender: TObject);
    procedure EditButtonClick(Sender: TObject);
    procedure DestroyButtonClick(Sender: TObject);
    procedure FormCreate(Sender: TObject);
  private
    { Private declarations }
  public
    procedure PopupMenuItemsClick(Sender: TObject);

  end;

var
  Form1: TForm1;

7.1.3.4.18 TCustomActiveForm.PrintScale Property

Represents the proportions of a printed form.

Pascal

```
property PrintScale: TPrintScale;
```

C++

```
__property TPrintScale PrintScale;
```

Description

Use PrintScale to get or set the proportions of the printed form. PrintScale can have one of the following TPrintScale values:

Value	Meaning
poNone	No special scaling occurs; therefore, the printed form and how the form appears onscreen may appear squished or stretched.
poProportional	The form is printed so that the printed image is approximately the same visible size as on the screen (WYSIWYG). The form image is scaled so that the printed image is approximately the same visible size as on the screen.
poPrintToFit	The form is printed using the same screen proportions, but in a size that just fits the printed page.

See Also

Print (see page 2132)

7.1.3.4.19 TCustomActiveForm.Scaled Property

Specifies whether the form is sized according to the value of the PixelsPerInch property.

Pascal

```
property Scaled: Boolean;
```

C++

```
__property Boolean Scaled;
```

Description

Scaled determines whether the form adjusts itself to differences between the font used at design time and the current system font used by a system at runtime. If Scaled is true, the form resizes itself and all its child controls to maintain the relationship between the size of controls and the height of text displayed in the default font. If Scaled is false, no such resizing occurs.

By setting Scaled to true, the form can adjust to fonts that are not scalable (that is, fonts that only supply discrete point sizes) or to differences such as forms designed using small fonts at design time that are run on systems that use large fonts.

The degree of resizing is determined by the PixelsPerInch property, which measures the proportion of the font on the system used when designing the form.

See Also

PixelsPerInch (see page 2179)

Considerations When Dynamically Resizing Forms and Controls

7.1.3.4.20 TCustomActiveForm.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

7.1.3.4.21 TCustomActiveForm.VertScrollBar Property

Represents the vertical scroll bar for the scrolling windowed control.

Pascal

```
property VertScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar VertScrollBar;
```

Description

Use VertScrollBar to hide, show, or manipulate the vertical scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

AutoScroll (see page 2561)

HorzScrollBar (see page 2562)

TControlScrollBar (see page 2009)

7.1.3.4.22 TCustomActiveForm.Visible Property

Indicates whether the form is visible.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use Visible to determine whether the form is visible.

If Visible is true, the form is visible unless it is completely obscured by other forms. If Visible is false, the form is not visible.

The Show and ShowModal methods set Visible to true and bring the form to the front of all open windows.

C++ Examples:

```
/*
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must include Unit2.h in this
module.
*/
#include "Unit2.h"

void __fastcall TForm1::ShowPaletteButtonClick(TObject *Sender)
{
  if (!Form2->Visible)
  {
    Form2->Visible = true;
    Form2->BringToFront();
  }
}
```

Delphi Examples:

```
{
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must add Unit2 in the uses clause
of your unit.
}
procedure TForm1.ShowPaletteButtonClick(Sender: TObject);
begin
if Form2.Visible = False then Form2.Visible := True;
Form2.BringToFront;
end;
```

BringToFront

Show (see page 2137)

ShowModal (see page 2139)

7.1.3.4.23 TCustomActiveForm.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width;
```

C++

```
__property Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
```

```
    Dirs := TDirectoryListBox.Create(Form1);
    { line it up on the left of the form }
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
```

7.1.3.5 TCustomActiveForm Events

The events of the TCustomActiveForm class are listed here.

Published Events

	Name	Description
	OnActivate (see page 2058)	Occurs when the form becomes active.
	OnClick (see page 2064)	Occurs when the user clicks the control.
	OnContextPopup (see page 2066)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 2066)	Occurs when the form is created.
	OnDblClick (see page 2068)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2068)	Occurs when the form loses focus.
	OnDestroy (see page 2069)	Occurs when the form is destroyed.
	OnDragDrop (see page 2070)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2073)	Occurs when the user drags an object over a control.
	OnKeyDown (see page 2076)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2080)	Occurs when a key is pressed.
	OnKeyUp (see page 2081)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2083)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2084)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2086)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2086)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2086)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2089)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 2091)	Occurs when the form is redrawn.

7.1.3.5.1 TCustomActiveForm.OnActivate Event

Occurs when the form becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Use OnActivate to perform special processing when the form receives focus. A form becomes active when focus is transferred to it (when the user clicks on the form, for example).

Note: The OnActivate event of the application (TApplication), not the form, occurs when Windows switches control from another application.

C++ Examples:

```
/*
This example fills a list box with the names of TDataSources
that are present and then fills a DBGrid a second form with
the data from the selected data source.  The DBGrid is not
filled in until Form2 is activated.  Here is the code for Form1
that fills the list box.
*/

7.1.3.5.2 TCustomActiveForm.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
```

```
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

7.1.3.5.3 TCustomActiveForm.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

7.1.3.5.4 TCustomActiveForm.OnCreate Event

Occurs when the form is created.

Pascal

```
property OnCreate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCreate;
```

Description

Use OnCreate to perform special processing when the form is created and is invoked by TCustomForm's constructor. Either implement this event or override the constructor of the form; do not do both. Any objects created in the OnCreate event should

be freed by the OnDestroy event.

When a form is being created and its Visible property is true, the following events occur in the order listed:

1. OnCreate2. OnShow3. OnActivate4. OnPaint

Note: Use of the OnCreate event is discouraged in C++ code because it can interact badly with the form's constructor (see OldCreateOrder). It is recommended that you override the form constructor instead.

C++ Examples:

```
/*
This example requires a new TPageControl, as is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
const
  TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *page = new TTabSheet(PageControl1);  // These tabsheets are cleaned up by their
owner (PageControl1).
    page->PageControl = PageControl1;
    page->Caption = AnsiString("Page") + IntToStr(i);
    page->Brush->Color = colorPalette[i];
  }
}

void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  PageControl1->SelectNextPage(Button == btNext);
}
```

Delphi Examples:

```
{
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
const
  colorPalette: Array[0..11] of TColor =
    (clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple);
begin
```

```
    for i := 0 to 9 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet #' + IntToStr(i);
        Brush.Color := colorPalette[i];
      end;
  end;

  procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
  begin
    PageControl1.SelectNextPage(Button = btNext);
  end;
```

7.1.3.5.5 TCustomActiveForm.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

7.1.3.5.6 TCustomActiveForm.OnDeactivate Event

Occurs when the form loses focus.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Use OnDeactivate to perform special processing when the form transitions from being the active form to another form in the same application becoming the active form. If activation goes to another application, this event is not triggered. To determine if another application has become active, Use the TApplication object's OnDeactivate event.

See Also

OnActivate (see page 2196)

OnDeactivate (see page 1992)

7.1.3.5.7 TCustomActiveForm.OnDestroy Event

Occurs when the form is destroyed.

Pascal

```
property OnDestroy: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDestroy;
```

Description

Use OnDestroy to perform special processing when the form is destroyed. Either implement this event or override the destructor of the class, but not both. This event should destroy any objects created in the OnCreate event.

C++ Examples:

```
/*
This example uses the OnActiveControlChange event to detect
when focus changes on the form. When focus changes, the hint
for the active control is displayed on the status bar. To use
this example, you must add a status bar to the form and set
its SimplePanel property to true.  Add a new public procedure,
ActiveControlChanged, to the TForm1 class declaration.
*/
void _fastcall TForm1::ActiveControlChanged(System::TObject *Sender)
{
  TWinControl *Active = NULL;
  for (int I = 0; I < Form1->ControlCount; I++)
  {
    TWinControl *Temp = dynamic_cast<TWinControl *>(Form1->Controls[I]);
    if (Temp && Temp->Focused())
      Active = Temp;
  }
  if ((Active != NULL) && (Active->Hint != ""))
    StatusBar2->SimpleText = GetLongHint(Active->Hint) + " focus";
}

void __fastcall TForm1::MouseOverChanged(TObject *Sender)
{
  TWinControl *Active = dynamic_cast<TWinControl *>(Sender);
  if (Active != NULL)
    StatusBar1->SimpleText = GetLongHint(Active->Hint) + " mouse over";
}

/*
Assign this method as the OnActiveControlChange event
handler by setting it from the form's OnCreate event handler:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveControlChange = ActiveControlChanged;
}

/*
Make sure you clean up the screen object when the form is
freed by adding this OnDestroy event handler to the form:
*/
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  Screen->OnActiveControlChange = 0;
}
```

Delphi Examples:

```
{
The following code explicitly allocates memory for a pointer
in the OnCreate event of Form1, then releases the memory in
the OnDestroy event. Assume that MyPtr is a Pointer type
field of TForm1.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  New(MyPtr);
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  Dispose(MyPtr);
end;
```

7.1.3.5.8 TCustomActiveForm.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}
```

```
void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

7.1.3.5.9 TCustomActiveForm.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
```

```
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{

7.1.3.5.10 TCustomActiveForm.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {

OnKeyPress

OnKeyUp

7.1.3.5.11 TCustomActiveForm.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyPress

7.1.3.5.13 TCustomActiveForm.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

7.1.3.5.14 TCustomActiveForm.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

MouseCapture

7.1.3.5.15 TCustomActiveForm.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

7.1.3.5.16 TCustomActiveForm.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

7.1.3.5.17 TCustomActiveForm.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
```

```
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }

OnMouseUp

MouseCapture

7.1.3.5.18 TCustomActiveForm.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

OnMouseMove

Responding to a Mouse-up Action

7.1.3.5.19 TCustomActiveForm.OnPaint Event

Occurs when the form is redrawn.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Use OnPaint to perform special processing when the form is redrawn. Any special painting on the form should be done in this event. OnPaint occurs before any controls on the form are painted.

To determine which portions of the form's canvas need to be repainted, use the ClipRect property of the canvas.

If you use the form's Canvas property outside the OnPaint event, it will be erased and drawn-over by the next OnPaint event.

C++ Examples:

```
/*
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
*/

#include <memory>       //for STL auto_ptr class

Graphics::TBitmap *TheGraphic;

void __fastcall TForm1::FormPaint(TObject *Sender)// OnPaint event handler
{
  Form1->Canvas->Draw(0, 0, TheGraphic); // Draw the graphic on the Canvas
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  static std::auto_ptr<Graphics::TBitmap> _TheGraphicCleaner(TheGraphic = new
Graphics::TBitmap());  // Create the bitmap object
  TheGraphic->LoadFromFile("..\\bigf.bmp"); // Load the bitmap from a file
}
```

Delphi Examples:

```
{
```

```
  The following code loads a background bitmap onto the Canvas
  of the main form in the OnPaint event handler.
  }
  procedure TForm1.FormPaint(Sender: TObject); { OnPaint event handler}
  begin
    Form1.Canvas.Draw(0, 0, TheGraphic); { Draw the graphic on the Canvas }
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    TheGraphic := TBitmap.Create; { Create the bitmap object }
    TheGraphic.LoadFromFile('bigf.bmp'); { Load the bitmap from a file}
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  begin
    (TheGraphic as TObject).Free;
  end;
```

7.1.4 TCustomDockForm Class

TCustomDockForm is the default floating dock site class for TControl objects.

Class Hierarchy

Pascal

```
TCustomDockForm = class(TCustomForm);
```

C++

```
class TCustomDockForm : public TCustomForm;
```

File

Forms

Description

When a control is created, TCustomDockForm is the type assigned to its FloatingDockSiteClass property. You can use TCustomDockForm as the basis for your own floating dock site class, and then assign the new class to the a control's FloatingDockSiteClass property.

7.1.4.1 TCustomDockForm Members

The following tables list the members exposed by TCustomDockForm.

Protected Events

	Name	Description
	OnActivate (see page 2196)	Occurs when the form becomes active.
	OnCanResize (see page 2202)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2203)	Occurs when the user clicks the control.
	OnClose (see page 2205)	Occurs when the form closes.
	OnCloseQuery (see page 2206)	Occurs when close is attempted.
	OnCreate (see page 2207)	Occurs when the form is created.
	OnDblClick (see page 2209)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2209)	Occurs when the form loses focus.
	OnDestroy (see page 2209)	Occurs when the form is destroyed.
	OnDragDrop (see page 2211)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2214)	Occurs when the user drags an object over a control.
	OnHelp (see page 2217)	Occurs when the form receives a request for help.
	OnHide (see page 2217)	Occurs when the form is hidden (that is, when its Visible (see page 2192) property is set to false).
	OnKeyDown (see page 2219)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2223)	Occurs when a key is pressed.
	OnKeyUp (see page 2224)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2226)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2227)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 2229)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2231)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 2233)	Occurs when the form is redrawn.
	OnResize (see page 2235)	Occurs immediately after the control is resized.
	OnShortCut (see page 2235)	Occurs when the user presses a key (before the OnKeyDown (see page 2219) event).
	OnShow (see page 2236)	Occurs when the form is shown (that is, when its Visible (see page 2192) property is set to true).

Protected Fields

	Name	Description
	FFormState (see page 2110)	This is FFormState, a member of class TCustomForm.

Protected Methods

	Name	Description
	Activate (see page 2111)	Activation event dispatcher.
	ActiveChanged (see page 2112)	Active (see page 2145) state event dispatcher.
V	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
V	AlignControls (see page 2113)	Aligns all child controls of the form that fall within a specified rectangle.
V	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
V	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
V	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
V	BeginAutoDrag (see page 2113)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
V	ChangeScale (see page 2114)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
V	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CloseModal (see page 2115)	This is CloseModal, a member of class TCustomForm.
V	CreateParams (see page 2116)	Initializes the window-creation parameter record when the form window is created.
V	CreateParams (see page 2559)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.

	CreateWindowHandle (see page 2116)	Creates a form window given a set of window-creation parameters.
	CreateWnd (see page 2117)	Creates the form window.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	Deactivate (see page 2117)	Generates an OnDeactivate (see page 2209) event.
	DefineProperties (see page 2118)	Designates methods for storing a form's unpublished data on a stream such as a form file.
	DestroyHandle (see page 2119)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 2119)	Destroys the window created in the CreateWindowHandle (see page 2116) method.
	DoAddDockClient (see page 2097)	Performs actions when a control is docked to the windowed control.
	DoClose (see page 2120)	Form closing event dispatcher.
	DoCreate (see page 2120)	Form creation event dispatcher.
	DoDestroy (see page 2121)	Form destruction event dispatcher.
	DoDock (see page 2121)	Docking event dispatcher.
	DoFlipChildren (see page 2560)	Flips the control's children.
	DoHide (see page 2122)	Form hide event dispatcher.
	DoRemoveDockClient (see page 2098)	Performs actions when a control is undocked from the dock form.
	DoShow (see page 2122)	Form show event dispatcher.
	get_ActiveMDIChild (see page 2123)	This is get_ActiveMDIChild, a member of class TCustomForm.
	get_MDIChildCount (see page 2123)	This is get_MDIChildCount, a member of class TCustomForm.
	get_MDIChildren (see page 2123)	This is get_MDIChildren, a member of class TCustomForm.
	GetBorderIconStyles (see page 2123)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 2124)	This is GetBorderStyles, a member of class TCustomForm.
	GetClientRect (see page 2124)	Returns the value of the ClientRect property.
	GetFloating (see page 2125)	Returns the value of the Floating property.
	GetOwnerWindow (see page 2127)	This is GetOwnerWindow, a member of class TCustomForm.
	GetSiteInfo (see page 2098)	Returns docking information for the dock form.
	HandleCreateException (see page 2127)	Handles exceptions that are raised by the OnCreate (see page 2207) event handler.
	InitializeNewForm (see page 2128)	This is InitializeNewForm, a member of class TCustomForm.
	Loaded (see page 2099)	Specifies actions to perform when the dock form is loaded.
	Notification (see page 2130)	Responds to notifications that objects are about to be inserted or removed.
	Paint (see page 2131)	Generates an OnPaint (see page 2233) event.
	PaintWindow (see page 2131)	Renders the image of the form.
	PaletteChanged (see page 2132)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	QueryInterface (see page 2132)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2133)	Reads the form's published properties, stored data, and owned components from a reader object.
	RequestAlign (see page 2134)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	Resizing (see page 2134)	Makes any required adjustments when the form changes size.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.
	SetChildOrder (see page 2135)	Changes the order in which Child appears when GetChildren (see page 2124) is called.
	SetParent (see page 2136)	Sets the Parent property.
	SetParentBiDiMode (see page 2136)	Sets the ParentBiDiMode property.
	UpdateActions (see page 2140)	Updates all actions associated with the form.
	UpdateWindowState (see page 2141)	Updates the WindowState (see page 2195) property to reflect the current state of the form.
	ValidateRename (see page 2141)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 2141)	Responds just before the form changes the value of its Visible (see page 2192) property.
	WndProc (see page 2142)	Provides specific message responses for the form.

Protected Properties

	Name	Description
R	ActiveMDIChild (see page 2146)	Specifies the MDI child that has focus.
	AlphaBlend (see page 2147)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2147)	Specifies the degree of translucency on a translucent form.
	BorderIcons (see page 2148)	Specifies which icons appear on the title bar of the form.
R	ClientHandle (see page 2154)	Provides access to the handle of the form's internal MDI client window.
W	ClientHeight (see page 2154)	Specifies the height (in pixels) of the form's client area.
W	ClientWidth (see page 2155)	Specifies the width (in pixels) of the form's client area.
	Ctl3D (see page 2158)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2158)	Specifies the monitor on which the form appears.
	Height (see page 2164)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 2166)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 2167)	Specifies the icon that appears when the form is minimized.
R	MDIChildCount (see page 2172)	Specifies the number of open MDI child forms.
R	MDIChildren (see page 2173)	Provides indexed access to all MDI child forms.
	ObjectMenuItem (see page 2177)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 2178)	Specifies when OnCreate (see page 2207) and OnDestroy (see page 2209) events occur.
	ParentFont (see page 2179)	Determines where a control looks for its font information.
R	PopupChildren (see page 2179)	This is PopupChildren, a member of class TCustomForm.
	PopupMenu (see page 2180)	Identifies the pop-up menu associated with the control.
	Position (see page 2185)	Represents the size and placement of the form.
	PrintScale (see page 2186)	Represents the proportions of a printed form.
	Scaled (see page 2187)	Specifies whether the form is sized according to the value of the PixelsPerInch (see page 2179) property.
	TileMode (see page 2188)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 2190)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2191)	Indicates the color on the form that appears transparent when TransparentColor (see page 2190) is true.
	VertScrollBar (see page 2191)	Represents the vertical scroll bar for the scrolling windowed control.
W	Visible (see page 2192)	Indicates whether the form is visible.
	Width (see page 2193)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 2194)	Specifies the Window menu for an MDI parent form.

Public Methods

	Name	Description
V	AfterConstruction (see page 2112)	Construction event dispatcher.
V	BeforeDestruction (see page 2113)	Destruction event dispatcher.
	Close (see page 2114)	Closes the form.
V	CloseQuery (see page 2115)	Close (see page 2114) attempt event dispatcher.
V	Create (see page 2097)	Creates an instance of TCustomDockForm (see page 2092).
V	CreateNew (see page 2108)	Creates and initializes a new form.
V	DefaultHandler (see page 2118)	Provides message handling for all messages that the form does not fully process.
	DefocusControl (see page 2118)	Removes focus from a control on the form.
V	Destroy (see page 2109)	Removes the form from memory.
V	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
V	Dock (see page 2120)	Handles automatic docking of the form into other windows.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	FocusControl (see page 2122)	Sets focus to a control on the form.
V	GetChildren (see page 2124)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetFormImage (see page 2125)	Returns a bitmap of the form.

	Hide (see page 2127)	Hides the form.
	IsShortCut (see page 2128)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 2129)	Ensures that the form is fully visible on a specified monitor.
V	MouseWheelHandler (see page 2130)	Directs mouse wheel messages to the appropriate control.
	Print (see page 2132)	Prints the form.
	RecreateAsPopup (see page 2133)	This is RecreateAsPopup, a member of class TCustomForm.
	Release (see page 2133)	Destroys the form and frees its associated memory.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 2134)	Cancels modes on the form.
	set_PopupParent (see page 2135)	This is set_PopupParent, a member of class TCustomForm.
V	SetFocus (see page 2135)	Sets focus to the form.
V	SetFocusedControl (see page 2136)	Sets focus to a control on the form.
	Show (see page 2137)	Shows the form.
V	ShowModal (see page 2139)	Shows a form as a modal dialog.
V	WantChildKey (see page 2142)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
	Action (see page 2144)	Designates the action associated with the control.
R	Active (see page 2145)	Specifies whether the form has focus.
	ActiveControl (see page 2145)	Specifies the control that has focus on the form.
	ActiveOleControl (see page 2146)	Specifies the OLE control on the form that reacts to changes in focus.
	AutoScroll (see page 2099)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	BorderStyle (see page 2100)	Specifies the appearance and behavior of the form border.
R	Canvas (see page 2150)	Provides access to the drawing area of the form.
	Caption (see page 2151)	Specifies a text string that identifies the control to the user.
	Color (see page 2157)	Specifies the background color of the control.
	Designer (see page 2159)	Specifies the designer interface for the form.
	DropTarget (see page 2159)	Specifies whether the form is the target of a drag-and-drop operation.
	Font (see page 2160)	Controls the attributes of text written on or in the control.
R	FormState (see page 2161)	Indicates transitional state information about the form.
	FormStyle (see page 2100)	Determines the form's style.
	GlassFrame (see page 2164)	This is GlassFrame, a member of class TCustomForm.
	HelpFile (see page 2165)	Specifies the name of the file the form uses to display Help.
	KeyPreview (see page 2167)	Specifies whether the form should receive keyboard events before the active control.
	Menu (see page 2174)	Specifies the form's main menu.
	ModalResult (see page 2176)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 2177)	Provides access to the monitor on which the form appears.
	OleFormObject (see page 2178)	Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.
	PopupMode (see page 2185)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 2185)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 2187)	Specifies whether form snaps to edge of screen.
	SnapBuffer (see page 2188)	Specifies distance for screen snap.
	WindowState (see page 2195)	Represents how the form appears on the screen.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.

Published Properties

	Name	Description
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	Left (see page 2171)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	PixelsPerInch (see page 2103)	Represents the proportion of the font on the system on which the form was designed.
	Top (see page 2189)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.

7.1.4.2 TCustomDockForm.Create Constructor

Creates an instance of TCustomDockForm (see page 2092).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDockForm(TComponent * AOwner);
```

Description

Typically, applications do not create instances of TCustomDockForm (see page 2092). Instead, this class is instantiated automatically as needed by controls that specify it as the value of their FloatingDockSiteClass property.

AOwner is the dock form's owner.

FloatingDockSiteClass

Floating

7.1.4.3 TCustomDockForm Methods

The methods of the TCustomDockForm class are listed here.

Protected Methods

	Name	Description
	DoAddDockClient (see page 2097)	Performs actions when a control is docked to the windowed control.
	DoRemoveDockClient (see page 2098)	Performs actions when a control is undocked from the dock form.
	GetSiteInfo (see page 2098)	Returns docking information for the dock form.
	Loaded (see page 2099)	Specifies actions to perform when the dock form is loaded.

7.1.4.3.1 TCustomDockForm.DoAddDockClient Method

Performs actions when a control is docked to the windowed control.

Pascal

```
procedure DoAddDockClient(Client: TControl; const ARect: TRect); override;
```

C++

```
virtual __fastcall DoAddDockClient(TControl * Client, const TRect ARect);
```

Description

DoAddDockClient is called automatically when a client control is docked to the windowed control. As implemented in TWinControl, DoAddDockClient sets the client's Parent property to the control.

Client is the control that has been docked.

ARect describes the boundaries of the region where Client has been docked.

Override DoAddDockClient to perform actions when a control is docked to the windowed control.

Note: DoAddDockClient is called in response to a message sent by the DockDrop method, before the OnDockDrop event.

See Also

Parent

DockClients

ManualDock

DoRemoveDockClient

DockDrop

OnDockDrop

7.1.4.3.2 TCustomDockForm.DoRemoveDockClient Method

Performs actions when a control is undocked from the dock form.

Pascal

```
procedure DoRemoveDockClient(Client: TControl); override;
```

C++

```
virtual __fastcall DoRemoveDockClient(TControl * Client);
```

Description

Client is the control being undocked.

DoRemoveDockClient calls the inherited DoRemoveDockClient method. Then, if the dock form contains no more clients, DoRemoveDockClient calls the Release (see page 2133) method.

See Also

Release (see page 2133)

doadddockclient (see page 2097)

7.1.4.3.3 TCustomDockForm.GetSiteInfo Method

Returns docking information for the dock form.

Pascal

```
procedure GetSiteInfo(Client: TControl; var InfluenceRect: TRect; MousePos: TPoint; var
CanDock: Boolean); override;
```

C++

```
virtual __fastcall GetSiteInfo(TControl * Client, TRect InfluenceRect, TPoint MousePos,
Boolean CanDock);
```

Description

GetSiteInfo overrides the inherited method, setting CanDock to true if the dock form contains one or more clients.

See Also

DockClientCount

7.1.4.3.4 TCustomDockForm.Loaded Method

Specifies actions to perform when the dock form is loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded calls the inherited method. Then Loaded sets the dock form's active control, if possible.

7.1.4.4 TCustomDockForm Properties

The properties of the TCustomDockForm class are listed here.

Public Properties

	Name	Description
	AutoScroll (see page 2099)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	BorderStyle (see page 2100)	Specifies the appearance and behavior of the form border.
	FormStyle (see page 2100)	Determines the form's style.

Published Properties

	Name	Description
	PixelsPerInch (see page 2103)	Represents the proportion of the font on the system on which the form was designed.

7.1.4.4.1 TCustomDockForm.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.4.4.2 TCustomDockForm.BorderStyle Property

Specifies the appearance and behavior of the form border.

Pascal

```
property BorderStyle: TFormBorderStyle;
```

C++

```
__property TFormBorderStyle BorderStyle;
```

Description

Use BorderStyle to get or set the appearance and behavior of the form border. BorderStyle can be any of the following TForm BorderStyle values:

Value	Meaning
bsDialog	Not resizable; no minimize/maximize menu
bsSingle	Not resizable; minimize/maximize menu
bsNone	Not resizable; no visible border line
bsSizeable	Standard resizable border
bsToolWindow	like bsSingle but with a smaller caption
bsSizeToolWin	like bsSizeable with a smaller caption

Note: Changing the border style of an MDI child form to bsDialog or bsNone has no effect.

See Also

BorderIcons (see page 2148)

7.1.4.4.3 TCustomDockForm.FormStyle Property

Determines the form's style.

Pascal

```
property FormStyle: TFormStyle;
```

C++

```
__property TFormStyle FormStyle;
```

Description

Use FormStyle to get or set the form's style. FormStyle is one of the following values:

Value	Meaning
fsNormal	The form is neither an MDI parent window nor an MDI child window.
fsMDIChild	The form is an MDI child window.

fsMDIForm	The form is an MDI parent window.
fsStayOnTop	This form remains on top of the desktop and of other forms in the project, except any others that also have FormStyle set to fsStayOnTop. If one fsStayOnTop form launches another, neither form will consistently remain on top.

If the form is the main form of an MDI application, its FormStyle property must be set to fsMDIForm.

Note: It is not advisable to change FormStyle at runtime.

Warning: TGraphicControl descendants placed in the client area of a form with FormStyle set to fsMDIForm will not paint.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example ensures that the main form of the application
is an MDI parent:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  if(FormStyle != fsMDIForm)
          FormStyle = fsMDIForm;
  if(FormStyle == fsMDIForm)
          Edit1->Text = "MDI form";
  else
    //This line never executes
    Edit1->Text = "Not an MDI form";
}
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
{
This example ensures that the main form of the application
is an MDI parent:
}
type
  TForm1 = class(TForm)
    Edit1: TEdit;
  private
    { Private declarations }
  public
    { Public declarations }
    constructor Create(AOwner : TComponent); override;
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

constructor TForm1.Create(AOwner : TComponent);

begin
  inherited Create(AOwner);
  if FormStyle <> fsMDIForm then
          FormStyle := fsMDIForm;
  if FormStyle = fsMDIForm then
          Edit1.Text := 'MDI form'
  else
    //This line never executes
    Edit1.Text := 'Not an MDI form';
end;
{
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
}
procedure TForm1.TileFormsClick(Sender: TObject);
begin
  TileMode := tbVertical;
  Tile;
end;
```

Windows Overview

7.1.4.4.4 TCustomDockForm.PixelsPerInch Property

Represents the proportion of the font on the system on which the form was designed.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Use PixelsPerInch at runtime to change how the form is scaled to the current screen resolution. If PixelsPerInch is changed from its default value, the form will not have the same proportion on every screen resolution.

At design time, PixelsPerInch is set automatically when the form is saved. Changes to PixelsPerInch made in the Object Inspector only affect the form at runtime.

The form's Scaled property must be true for PixelsPerInch to have an effect.

See Also

Scaled (see page 2187)

7.1.5 TCustomForm Class

TCustomForm is the base class from which to derive a window such as a form or dialog.

Class Hierarchy

Pascal

```
TCustomForm = class(TScrollingWinControl);
```

C++

```
class TCustomForm : public TScrollingWinControl;
```

File

Forms

Description

Derive from TCustomForm to create a custom window. The TCustomForm descendant can contain other objects, such as TButton, TCheckBox, and TComboBox objects.

See Also

TPropertyPage

TActiveForm

TForm (see page 2241)

7.1.5.1 TCustomForm Members

The following tables list the members exposed by TCustomForm.

Protected Events

	Name	Description
	OnActivate (see page 2196)	Occurs when the form becomes active.
	OnCanResize (see page 2202)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2203)	Occurs when the user clicks the control.
	OnClose (see page 2205)	Occurs when the form closes.
	OnCloseQuery (see page 2206)	Occurs when close is attempted.
	OnCreate (see page 2207)	Occurs when the form is created.
	OnDblClick (see page 2209)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2209)	Occurs when the form loses focus.
	OnDestroy (see page 2209)	Occurs when the form is destroyed.
	OnDragDrop (see page 2211)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2214)	Occurs when the user drags an object over a control.
	OnHelp (see page 2217)	Occurs when the form receives a request for help.
	OnHide (see page 2217)	Occurs when the form is hidden (that is, when its Visible (see page 2192) property is set to false).
	OnKeyDown (see page 2219)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2223)	Occurs when a key is pressed.
	OnKeyUp (see page 2224)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2226)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2227)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 2229)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2231)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 2233)	Occurs when the form is redrawn.
	OnResize (see page 2235)	Occurs immediately after the control is resized.
	OnShortCut (see page 2235)	Occurs when the user presses a key (before the OnKeyDown (see page 2219) event).
	OnShow (see page 2236)	Occurs when the form is shown (that is, when its Visible (see page 2192) property is set to true).

Protected Fields

	Name	Description
	FFormState (see page 2110)	This is FFormState, a member of class TCustomForm.

Protected Methods

	Name	Description
	Activate (see page 2111)	Activation event dispatcher.
	ActiveChanged (see page 2112)	Active (see page 2145) state event dispatcher.
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2113)	Aligns all child controls of the form that fall within a specified rectangle.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	BeginAutoDrag (see page 2113)	Responds when the user starts dragging the form if DragMode is dmAutomatic.

	ChangeScale (see page 2114)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
	CloseModal (see page 2115)	This is CloseModal, a member of class TCustomForm.
	CreateParams (see page 2116)	Initializes the window-creation parameter record when the form window is created.
	CreateWindowHandle (see page 2116)	Creates a form window given a set of window-creation parameters.
	CreateWnd (see page 2117)	Creates the form window.
	Deactivate (see page 2117)	Generates an OnDeactivate (see page 2209) event.
	DefineProperties (see page 2118)	Designates methods for storing a form's unpublished data on a stream such as a form file.
	DestroyHandle (see page 2119)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 2119)	Destroys the window created in the CreateWindowHandle (see page 2116) method.
	DoClose (see page 2120)	Form closing event dispatcher.
	DoCreate (see page 2120)	Form creation event dispatcher.
	DoDestroy (see page 2121)	Form destruction event dispatcher.
	DoDock (see page 2121)	Docking event dispatcher.
	DoFlipChildren (see page 2560)	Flips the control's children.
	DoHide (see page 2122)	Form hide event dispatcher.
	DoShow (see page 2122)	Form show event dispatcher.
	get_ActiveMDIChild (see page 2123)	This is get_ActiveMDIChild, a member of class TCustomForm.
	get_MDIChildCount (see page 2123)	This is get_MDIChildCount, a member of class TCustomForm.
	get_MDIChildren (see page 2123)	This is get_MDIChildren, a member of class TCustomForm.
	GetBorderIconStyles (see page 2123)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 2124)	This is GetBorderStyles, a member of class TCustomForm.
	GetClientRect (see page 2124)	Returns the value of the ClientRect property.
	GetFloating (see page 2125)	Returns the value of the Floating property.
	GetOwnerWindow (see page 2127)	This is GetOwnerWindow, a member of class TCustomForm.
	HandleCreateException (see page 2127)	Handles exceptions that are raised by the OnCreate (see page 2207) event handler.
	InitializeNewForm (see page 2128)	This is InitializeNewForm, a member of class TCustomForm.
	Loaded (see page 2129)	Performs fix-ups when the form is first loaded into memory.
	Notification (see page 2130)	Responds to notifications that objects are about to be inserted or removed.
	Paint (see page 2131)	Generates an OnPaint (see page 2233) event.
	PaintWindow (see page 2131)	Renders the image of the form.
	PaletteChanged (see page 2132)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	QueryInterface (see page 2132)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2133)	Reads the form's published properties, stored data, and owned components from a reader object.
	RequestAlign (see page 2134)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	Resizing (see page 2134)	Makes any required adjustments when the form changes size.
	SetChildOrder (see page 2135)	Changes the order in which Child appears when GetChildren (see page 2124) is called.
	SetParent (see page 2136)	Sets the Parent property.
	SetParentBiDiMode (see page 2136)	Sets the ParentBiDiMode property.
	UpdateActions (see page 2140)	Updates all actions associated with the form.
	UpdateWindowState (see page 2141)	Updates the WindowState (see page 2195) property to reflect the current state of the form.
	ValidateRename (see page 2141)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 2141)	Responds just before the form changes the value of its Visible (see page 2192) property.
	WndProc (see page 2142)	Provides specific message responses for the form.

Protected Properties

	Name	Description
R	ActiveMDIChild (see page 2146)	Specifies the MDI child that has focus.
	AlphaBlend (see page 2147)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2147)	Specifies the degree of translucency on a translucent form.
	AutoScroll (see page 2148)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	BorderIcons (see page 2148)	Specifies which icons appear on the title bar of the form.
R	ClientHandle (see page 2154)	Provides access to the handle of the form's internal MDI client window.
W	ClientHeight (see page 2154)	Specifies the height (in pixels) of the form's client area.
W	ClientWidth (see page 2155)	Specifies the width (in pixels) of the form's client area.
	Ctl3D (see page 2158)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2158)	Specifies the monitor on which the form appears.
	FormStyle (see page 2162)	Determines the form's style.
	Height (see page 2164)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 2166)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 2167)	Specifies the icon that appears when the form is minimized.
R	MDIChildCount (see page 2172)	Specifies the number of open MDI child forms.
R	MDIChildren (see page 2173)	Provides indexed access to all MDI child forms.
	ObjectMenuItem (see page 2177)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 2178)	Specifies when OnCreate (see page 2207) and OnDestroy (see page 2209) events occur.
	ParentFont (see page 2179)	Determines where a control looks for its font information.
	PixelsPerInch (see page 2179)	Represents the proportion of the font on the system on which the form was designed.
R	PopupChildren (see page 2179)	This is PopupChildren, a member of class TCustomForm.
	PopupMenu (see page 2180)	Identifies the pop-up menu associated with the control.
	Position (see page 2185)	Represents the size and placement of the form.
	PrintScale (see page 2186)	Represents the proportions of a printed form.
	Scaled (see page 2187)	Specifies whether the form is sized according to the value of the PixelsPerInch (see page 2179) property.
	TileMode (see page 2188)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 2190)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2191)	Indicates the color on the form that appears transparent when TransparentColor (see page 2190) is true.
	VertScrollBar (see page 2191)	Represents the vertical scroll bar for the scrolling windowed control.
W	Visible (see page 2192)	Indicates whether the form is visible.
	Width (see page 2193)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 2194)	Specifies the Window menu for an MDI parent form.

Public Methods

	Name	Description
V	AfterConstruction (see page 2112)	Construction event dispatcher.
V	BeforeDestruction (see page 2113)	Destruction event dispatcher.
	Close (see page 2114)	Closes the form.
V	CloseQuery (see page 2115)	Close (see page 2114) attempt event dispatcher.
V	Create (see page 2108)	Creates and initializes a new TForm (see page 2241) object.
V	CreateNew (see page 2108)	Creates and initializes a new form.
V	DefaultHandler (see page 2118)	Provides message handling for all messages that the form does not fully process.
	DefocusControl (see page 2118)	Removes focus from a control on the form.
V	Destroy (see page 2109)	Removes the form from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
V	Dock (see page 2120)	Handles automatic docking of the form into other windows.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	FocusControl (see page 2122)	Sets focus to a control on the form.

	GetChildren (see page 2124)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetFormImage (see page 2125)	Returns a bitmap of the form.
	Hide (see page 2127)	Hides the form.
	IsShortCut (see page 2128)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 2129)	Ensures that the form is fully visible on a specified monitor.
	MouseWheelHandler (see page 2130)	Directs mouse wheel messages to the appropriate control.
	Print (see page 2132)	Prints the form.
	RecreateAsPopup (see page 2133)	This is RecreateAsPopup, a member of class TCustomForm.
	Release (see page 2133)	Destroys the form and frees its associated memory.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 2134)	Cancels modes on the form.
	set_PopupParent (see page 2135)	This is set_PopupParent, a member of class TCustomForm.
	SetFocus (see page 2135)	Sets focus to the form.
	SetFocusedControl (see page 2136)	Sets focus to a control on the form.
	Show (see page 2137)	Shows the form.
	ShowModal (see page 2139)	Shows a form as a modal dialog.
	WantChildKey (see page 2142)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
	Action (see page 2144)	Designates the action associated with the control.
R	Active (see page 2145)	Specifies whether the form has focus.
	ActiveControl (see page 2145)	Specifies the control that has focus on the form.
	ActiveOleControl (see page 2146)	Specifies the OLE control on the form that reacts to changes in focus.
	BorderStyle (see page 2149)	Specifies the appearance and behavior of the form border.
R	Canvas (see page 2150)	Provides access to the drawing area of the form.
	Caption (see page 2151)	Specifies a text string that identifies the control to the user.
	Color (see page 2157)	Specifies the background color of the control.
	Designer (see page 2159)	Specifies the designer interface for the form.
	DropTarget (see page 2159)	Specifies whether the form is the target of a drag-and-drop operation.
	Font (see page 2160)	Controls the attributes of text written on or in the control.
R	FormState (see page 2161)	Indicates transitional state information about the form.
	GlassFrame (see page 2164)	This is GlassFrame, a member of class TCustomForm.
	HelpFile (see page 2165)	Specifies the name of the file the form uses to display Help.
	KeyPreview (see page 2167)	Specifies whether the form should receive keyboard events before the active control.
	Menu (see page 2174)	Specifies the form's main menu.
	ModalResult (see page 2176)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 2177)	Provides access to the monitor on which the form appears.
	OleFormObject (see page 2178)	Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.
	PopupMode (see page 2185)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 2185)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 2187)	Specifies whether form snaps to edge of screen.
	SnapBuffer (see page 2188)	Specifies distance for screen snap.
	WindowState (see page 2195)	Represents how the form appears on the screen.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.

Published Properties

	Name	Description
	Left (see page 2171)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Top (see page 2189)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

7.1.5.2 TCustomForm.Create Constructor

Creates and initializes a new TForm (see page 2241) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomForm(TComponent * AOwner);
```

Description

Use Create to instantiate a TForm (see page 2241) object or descendant of TForm (see page 2241) at runtime. AOwner is the owner of the TCustomForm (see page 2103) object.

For descendants of TCustomForm (see page 2103) that are not TForm (see page 2241) objects, use CreateNew (see page 2108) instead. Calling Create for a TCustomForm (see page 2103) descendant that is not a TForm (see page 2241) will raise an exception.

See Also

CreateNew (see page 2108)

TForm (see page 2241)

Owner

7.1.5.3 TCustomForm.CreateNew Constructor

Creates and initializes a new form.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); virtual;
```

C++

```
virtual __fastcall TCustomForm(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 2108) to create a form without using the associated .DFM file to initialize it. Always use CreateNew if the TCustomForm (see page 2103) descendant is not a TForm (see page 2241) object or a descendant of TForm (see page 2241).

CreateNew bypasses the streaming in of the previously-associated .DFM file. If the form contains visual components, therefore, you must stream in an external .DFM to bind the visual components with their classes. If the newly created form has an external .DFM file, then you can follow the call to CreateNew with a call to InitInheritedComponent. If you need to create the .dfm file for the new form instance, bracket the call to CreateNew with calls to WriteComponentResFile and ReadComponentResFile. The following code sequence

1. streams out an external .DFM file;2. creates a new form disassociated from any .DFM resource file;3. streams in the external .DFM file and binds it to this new form.

```
WriteComponentResFile('Temp.dfm', Form1);
...
```

Form2 := TForm.CreateNew(Application (see page 2612));

```
ReadComponentResFile('Temp.dfm', Form2);
```

Warning: Using CreateNew instead of Create (see page 2108) can cause unpredictable results because most forms are written assuming their controls will be created from the .DFM file.

CreateNew is called by the Create (see page 2108) method.

The first argument, AOwner, is the owner of the form (usually the application or another form is the owner). The second argument, Dummy, defaults to 0 and is not used by this constructor. The system passes 0 by default if this constructor is passed only the first argument, AOwner.

See Also

Create (see page 2108)

Owner

ReadComponentResFile

WriteComponentResFile

7.1.5.4 TCustomForm.Destroy Destructor

Removes the form from memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomForm();
```

Description

Do not call Destroy. Instead, call Release (see page 2133), which indirectly produces a call to the Free method, which in turn calls Destroy.

See Also

OnDestroy (see page 2209)

Release (see page 2133)

System::TObject::Free

7.1.5.5 TCustomForm Fields

The fields of the TCustomForm class are listed here.

Protected Fields

	Name	Description
	FFormState (see page 2110)	This is FFormState, a member of class TCustomForm.

7.1.5.5.1 TCustomForm.FFormState Field

Pascal

```
FFormState: TFormState;
```

C++

```
TFormState FFormState;
```

Description

This is FFormState, a member of class TCustomForm.

7.1.5.6 TCustomForm Methods

The methods of the TCustomForm class are listed here.

Protected Methods

	Name	Description
	Activate (see page 2111)	Activation event dispatcher.
	ActiveChanged (see page 2112)	Active (see page 2145) state event dispatcher.
V	AlignControls (see page 2113)	Aligns all child controls of the form that fall within a specified rectangle.
V	BeginAutoDrag (see page 2113)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
V	ChangeScale (see page 2114)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
	CloseModal (see page 2115)	This is CloseModal, a member of class TCustomForm.
V	CreateParams (see page 2116)	Initializes the window-creation parameter record when the form window is created.
V	CreateWindowHandle (see page 2116)	Creates a form window given a set of window-creation parameters.
V	CreateWnd (see page 2117)	Creates the form window.
	Deactivate (see page 2117)	Generates an OnDeactivate (see page 2209) event.
V	DefineProperties (see page 2118)	Designates methods for storing a form's unpublished data on a stream such as a form file.
V	DestroyHandle (see page 2119)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 2119)	Destroys the window created in the CreateWindowHandle (see page 2116) method.
	DoClose (see page 2120)	Form closing event dispatcher.
V	DoCreate (see page 2120)	Form creation event dispatcher.
V	DoDestroy (see page 2121)	Form destruction event dispatcher.
V	DoDock (see page 2121)	Docking event dispatcher.
	DoHide (see page 2122)	Form hide event dispatcher.
	DoShow (see page 2122)	Form show event dispatcher.
	get_ActiveMDIChild (see page 2123)	This is get_ActiveMDIChild, a member of class TCustomForm.
	get_MDIChildCount (see page 2123)	This is get_MDIChildCount, a member of class TCustomForm.
	get_MDIChildren (see page 2123)	This is get_MDIChildren, a member of class TCustomForm.
	GetBorderIconStyles (see page 2123)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 2124)	This is GetBorderStyles, a member of class TCustomForm.
V	GetClientRect (see page 2124)	Returns the value of the ClientRect property.
V	GetFloating (see page 2125)	Returns the value of the Floating property.
	GetOwnerWindow (see page 2127)	This is GetOwnerWindow, a member of class TCustomForm.
	HandleCreateException (see page 2127)	Handles exceptions that are raised by the OnCreate (see page 2207) event handler.
	InitializeNewForm (see page 2128)	This is InitializeNewForm, a member of class TCustomForm.
V	Loaded (see page 2129)	Performs fix-ups when the form is first loaded into memory.
V	Notification (see page 2130)	Responds to notifications that objects are about to be inserted or removed.
	Paint (see page 2131)	Generates an OnPaint (see page 2233) event.

	PaintWindow (see page 2131)	Renders the image of the form.
	PaletteChanged (see page 2132)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	QueryInterface (see page 2132)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2133)	Reads the form's published properties, stored data, and owned components from a reader object.
	RequestAlign (see page 2134)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	Resizing (see page 2134)	Makes any required adjustments when the form changes size.
	SetChildOrder (see page 2135)	Changes the order in which Child appears when GetChildren (see page 2124) is called.
	SetParent (see page 2136)	Sets the Parent property.
	SetParentBiDiMode (see page 2136)	Sets the ParentBiDiMode property.
	UpdateActions (see page 2140)	Updates all actions associated with the form.
	UpdateWindowState (see page 2141)	Updates the WindowState (see page 2195) property to reflect the current state of the form.
	ValidateRename (see page 2141)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 2141)	Responds just before the form changes the value of its Visible (see page 2192) property.
	WndProc (see page 2142)	Provides specific message responses for the form.

Public Methods

	Name	Description
	AfterConstruction (see page 2112)	Construction event dispatcher.
	BeforeDestruction (see page 2113)	Destruction event dispatcher.
	Close (see page 2114)	Closes the form.
	CloseQuery (see page 2115)	Close (see page 2114) attempt event dispatcher.
	DefaultHandler (see page 2118)	Provides message handling for all messages that the form does not fully process.
	DefocusControl (see page 2118)	Removes focus from a control on the form.
	Dock (see page 2120)	Handles automatic docking of the form into other windows.
	FocusControl (see page 2122)	Sets focus to a control on the form.
	GetChildren (see page 2124)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetFormImage (see page 2125)	Returns a bitmap of the form.
	Hide (see page 2127)	Hides the form.
	IsShortCut (see page 2128)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 2129)	Ensures that the form is fully visible on a specified monitor.
	MouseWheelHandler (see page 2130)	Directs mouse wheel messages to the appropriate control.
	Print (see page 2132)	Prints the form.
	RecreateAsPopup (see page 2133)	This is RecreateAsPopup, a member of class TCustomForm.
	Release (see page 2133)	Destroys the form and frees its associated memory.
	SendCancelMode (see page 2134)	Cancels modes on the form.
	set_PopupParent (see page 2135)	This is set_PopupParent, a member of class TCustomForm.
	SetFocus (see page 2135)	Sets focus to the form.
	SetFocusedControl (see page 2136)	Sets focus to a control on the form.
	Show (see page 2137)	Shows the form.
	ShowModal (see page 2139)	Shows a form as a modal dialog.
	WantChildKey (see page 2142)	Indicates whether the form processes keyboard input for a control it owns.

7.1.5.6.1 TCustomForm.Activate Method

Activation event dispatcher.

Pascal

```
procedure Activate; dynamic;
```

C++

```
__fastcall Activate();
```

Description

Activation is the event dispatcher for form activations.

The form component calls Activate in response to the CM_ACTIVATE message, sent when a form gets the focus either because of a change in active windows within an application or because of the application becoming active. As defined in TCustomForm (see page 2103), Activate simply calls the OnActivate (see page 2196) event handler.

See Also

Deactivate (see page 2117)

OnActivate (see page 2196)

7.1.5.6.2 TCustomForm.ActiveChanged Method

Active (see page 2145) state event dispatcher.

Pascal

```
procedure ActiveChanged; dynamic;
```

C++

```
__fastcall ActiveChanged();
```

Description

ActiveChanged is the event dispatcher for changes in the form's active status. As implemented in TCustomForm (see page 2103), ActiveChanged does nothing. Override this method in a descendant class to implement event handling or other response to a change in the active form.

See Also

ActiveControl (see page 2145)

7.1.5.6.3 TCustomForm.AfterConstruction Method

Construction event dispatcher.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is the dispatcher for the event that occurs immediately after the form object's construction. As implemented in TCustomForm (see page 2103), AfterConstruction calls the OnCreate (see page 2207) event handler, provided the OldCreateOrder (see page 2178) property is false.

See Also

BeforeDestruction (see page 2113)

OnCreate (see page 2207)

OldCreateOrder (see page 2178)

7.1.5.6.4 TCustomForm.AlignControls Method

Aligns all child controls of the form that fall within a specified rectangle.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of the form. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly aligned controls.

See Also

Align

7.1.5.6.5 TCustomForm.BeforeDestruction Method

Destruction event dispatcher.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is the dispatcher for the event that occurs immediately before the form object's destruction. As implemented in TCustomForm (see page 2103), BeforeDestruction calls the OnDestroy (see page 2209) event handler, provided the OldCreateOrder (see page 2178) property is false.

See Also

AfterConstruction (see page 2112)

OnDestroy (see page 2209)

7.1.5.6.6 TCustomForm.BeginAutoDrag Method

Responds when the user starts dragging the form if DragMode is dmAutomatic.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag suppresses the default behavior of the BeginAutoDrag method. This is because forms do not change the mouse cursor when dragged.

See Also

DragMode

Floating

7.1.5.6.7 TCustomForm.ChangeScale Method

Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.

Pascal

```
procedure ChangeScale(M: Integer; D: Integer); override;
```

C++

```
virtual __fastcall ChangeScale(int M, int D);
```

Description

TCustomForm (see page 2103) overrides ChangeScale to rescale any scroll bars and child controls.

See Also

ChangeScale

7.1.5.6.8 TCustomForm.Close Method

Closes the form.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to close a form.

Attempts to close a form can be aborted by the CloseQuery (see page 2115) event dispatcher or the OnCloseQuery (see page 2206) event handler.

Note: When the main form of the application closes, the application terminates.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
*/
void __fastcall TForm1::CloseChildrenClick(TObject *Sender)
{
  for(int i = MDIChildCount - 1; i >= 0; i--)
    MDIChildren[i]->Close();
}
```

```
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}

void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
  }
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
}
procedure TForm1.CloseChildrenClick(Sender: TObject);
var
  I: Integer;
begin
  with Form1 do
    for I := MDIChildCount-1 downto 0 do
      MDIChildren[I].Close;
end;

procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;

procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

See Also

CloseQuery (see page 2115)

OnCloseQuery (see page 2206)

7.1.5.6.9 TCustomForm.CloseModal Method

Pascal

```
procedure CloseModal;
```

C++

```
__fastcall CloseModal();
```

Description

This is CloseModal, a member of class TCustomForm.

7.1.5.6.10 TCustomForm.CloseQuery Method

Close (see page 2114) attempt event dispatcher.

Pascal

```
function CloseQuery: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CloseQuery();
```

Description

CloseQuery is called automatically when an attempt is made to close the form. CloseQuery can allow the form to close by returning true, or prevent the form from closing by returning false.

As implemented in TCustomForm (see page 2103), CloseQuery polls any MDI children by calling their CloseQuery methods. If no child form aborts the close, CloseQuery then calls the OnCloseQuery (see page 2206) event handler, if it exists, to determine if the close should be allowed. If no such event handler exists, CloseQuery returns true.

See Also

Close (see page 2114)

OnCloseQuery (see page 2206)

7.1.5.6.11 TCustomForm.CreateParams Method

Initializes the window-creation parameter record when the form window is created.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 2117) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle (see page 2116). TCustomForm (see page 2103) overrides CreateParams to customize the way the form creates its Windows representation after calling the inherited method. You should never need to override this method in the context of a form class.

The fields of the Params parameter become the parameters to a call to the CreateWindowEx OS function.

See Also

CreateWindowHandle (see page 2116)

CreateWnd (see page 2117)

7.1.5.6.12 TCustomForm.CreateWindowHandle Method

Creates a form window given a set of window-creation parameters.

Pascal

```
procedure CreateWindowHandle(const Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateWindowHandle(const TCreateParams Params);
```

Description

The CreateWnd (see page 2117) method calls CreateWindowHandle to create the form window once it has been specified in the window-creation parameters. CreateWindowHandle creates the window by calling the CreateWindowEx API function, passing parameters from the record passed in the Params parameter. CreateWindowHandle removes the CS_HREDRAW and

CS_VREDRAW class styles from the window class.

Params holds information needed when telling Windows to create a window handle.

See Also

CreateParams (see page 2116)

CreateWnd (see page 2117)

7.1.5.6.13 TCustomForm.CreateWnd Method

Creates the form window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called when the form is created, and whenever a change to the form requires the window to be recreated. CreateWnd calls (indirectly) the CreateParams (see page 2116) method to obtain the window creation parameters, and then calls CreateWindowHandle (see page 2116) to direct Windows to create the underlying window for the form. It then initializes the newly-created window to reflect the property settings of the form.

See Also

CreateParams (see page 2116)

CreateWindowHandle (see page 2116)

Handle

7.1.5.6.14 TCustomForm.Deactivate Method

Generates an OnDeactivate (see page 2209) event.

Pascal

```
procedure Deactivate; dynamic;
```

C++

```
__fastcall Deactivate();
```

Description

The form component calls Deactivate in response to the CM_DEACTIVATE message, sent when a form gets the focus either because of a change in active windows within an application or because of the application becoming active.

The default Deactivate method calls any event handler attached by the user to the OnDeactivate (see page 2209) event. Override this method to block the OnDeactivate (see page 2209) event or provide additional responses to the loss of activation.

See Also

Activate (see page 2111)

OnActivate (see page 2196)

7.1.5.6.15 TCustomForm.DefaultHandler Method

Provides message handling for all messages that the form does not fully process.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

Override DefaultHandler to change the default message handling for the form. This is seldom necessary because messages can be handled by creating message methods.

DefaultHandler passes any otherwise-unhandled messages to the form's window procedure by calling the CallWindowProc OS function.

Note: In Delphi code, calling inherited in a message-handling method results in a call to the ancestor's DefaultHandler method unless that ancestor specifies a handler for the message.

See Also

System::TObject::Dispatch

7.1.5.6.16 TCustomForm.DefineProperties Method

Designates methods for storing a form's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties calls the inherited method and calls the filer object's DefineProperty method for the PixelsPerInch (see page 2179),and TextHeight properties. TForm (see page 2241) descendants can also specify methods that read and write data other than properties by overriding the DefineProperties method.

See Also

DefineProperty

DefineBinaryProperty

7.1.5.6.17 TCustomForm.DefocusControl Method

Removes focus from a control on the form.

Pascal

```
procedure DefocusControl(Control: TWinControl; Removing: Boolean);
```

C++

```
__fastcall DefocusControl(TWinControl * Control, Boolean Removing);
```

Description

Use DefocusControl to remove focus from a control on the form. This method is used internally by the VCL.

Control is the control from which to remove focus. If Control is the form's active control, DefocusControl sets the form's ActiveControl (see page 2145) property to nil (Delphi) or NULL (C++).

Removing specifies whether to set focus to the control's parent.

See Also

SetFocusedControl (see page 2136)

ActiveControl (see page 2145)

SetFocus (see page 2135)

FocusedControl

7.1.5.6.18 TCustomForm.DestroyHandle Method

Destroys the control's window without destroying the control.

Pascal

```
procedure DestroyHandle; override;
```

C++

```
virtual __fastcall DestroyHandle();
```

Description

Call DestroyHandle to dispose of the window, but leave the control intact. The control can later recreate the window if needed. DestroyHandle is the converse operation to CreateHandle. Applications should call the high-level CreateHandle and DestroyHandle methods, rather than the lower-level methods of CreateWnd and DestroyWnd, whenever possible.

If the control has TWinControl objects as child controls, DestroyHandle calls each of their DestroyHandle methods before calling DestroyWnd to destroy its own handle.

See Also

CreateHandle

DestroyWnd

7.1.5.6.19 TCustomForm.DestroyWindowHandle Method

Destroys the window created in the CreateWindowHandle (see page 2116) method.

Pascal

```
procedure DestroyWindowHandle; override;
```

C++

```
virtual __fastcall DestroyWindowHandle();
```

Description

DestroyWindowHandle is called automatically to destroy the window associated with a form before destroying the form.

See Also

CreateWindowHandle (see page 2116)

DestroyWnd

Destroy (see page 2109)

7.1.5.6.20 TCustomForm.Dock Method

Handles automatic docking of the form into other windows.

Pascal

```
procedure Dock(NewDockSite: TWinControl; ARect: TRect); override;
```

C++

```
virtual __fastcall Dock(TWinControl * NewDockSite, TRect ARect);
```

Description

Do not call Dock in application code. It is called automatically when the form is released on a docking site that will accept it. To dock a form programmatically, use the ManualDock method instead.

See Also

DragMode

ManualDock

7.1.5.6.21 TCustomForm.DoClose Method

Form closing event dispatcher.

Pascal

```
procedure DoClose(var Action: TCloseAction); dynamic;
```

C++

```
__fastcall DoClose(TCloseAction Action);
```

Description

DoClose is called automatically when the form is about to close. DoClose can alter closing behavior by changing the Action (see page 2144) parameter. For more information, refer to the OnClose (see page 2205) event handler.

As implemented in TCustomForm (see page 2103), DoClose simply calls the OnClose (see page 2205) event handler.

See Also

OnClose (see page 2205)

7.1.5.6.22 TCustomForm.DoCreate Method

Form creation event dispatcher.

Pascal

```
procedure DoCreate; virtual;
```

C++

```
virtual __fastcall DoCreate();
```

Description

DoCreate is called automatically after form construction is complete. The precise way DoCreate is called can be modified by setting the OldCreateOrder (see page 2178) property.

As implemented in TCustomForm (see page 2103), DoCreate simply calls the OnCreate (see page 2207) event handler.

See Also

OnCreate (see page 2207)

FormState (see page 2161)

Visible

OldCreateOrder (see page 2178)

7.1.5.6.23 TCustomForm.DoDestroy Method

Form destruction event dispatcher.

Pascal

```
procedure DoDestroy; virtual;
```

C++

```
virtual __fastcall DoDestroy();
```

Description

DoDestroy is called automatically when the TCustomForm (see page 2103) object is about to be deallocated. The precise way DoDestroy is called can be modified by setting the OldCreateOrder (see page 2178) property.

As implemented in TCustomForm (see page 2103), DoDestroy simply calls the OnDestroy (see page 2209) event handler.

See Also

OnDestroy (see page 2209)

OldCreateOrder (see page 2178)

7.1.5.6.24 TCustomForm.DoDock Method

Docking event dispatcher.

Pascal

```
procedure DoDock(NewDockSite: TWinControl; var ARect: TRect); override;
```

C++

```
virtual __fastcall DoDock(TWinControl * NewDockSite, TRect ARect);
```

Description

DoDock supplements the inherited DoDock method by updating form borders.

See Also

DoDock

Floating

Dock (see page 2120)

ManualDock

ManualFloat

7.1.5.6.25 TCustomForm.DoHide Method

Form hide event dispatcher.

Pascal

```
procedure DoHide; dynamic;
```

C++

```
__fastcall DoHide();
```

Description

DoHide is called automatically when the form is hidden.

As implemented in TCustomForm (see page 2103), DoHide calls the OnHide (see page 2217) event handler.

See Also

OnHide (see page 2217)

DoShow (see page 2122)

Hide (see page 2127)

7.1.5.6.26 TCustomForm.DoShow Method

Form show event dispatcher.

Pascal

```
procedure DoShow; dynamic;
```

C++

```
__fastcall DoShow();
```

Description

DoShow is called automatically when the application is about to show the form. As implemented in TCustomForm (see page 2103), DoShow simply calls the OnShow (see page 2236) event handler.

See Also

DoHide (see page 2122)

OnShow (see page 2236)

7.1.5.6.27 TCustomForm.FocusControl Method

Sets focus to a control on the form.

Pascal

```
procedure FocusControl(Control: TWinControl);
```

C++

```
__fastcall FocusControl(TWinControl * Control);
```

Description

Use FocusControl to set focus to a control on the form.

Control is a TWinControl object encapsulating the control on which to set focus. FocusControl sets the ActiveControl (see page 2145) property.

See Also

TWinControl

ActiveControl (see page 2145)

7.1.5.6.28 TCustomForm.get_ActiveMDIChild Method

Pascal

```
function get_ActiveMDIChild: TForm;
```

C++

```
__fastcall TForm * get_ActiveMDIChild();
```

Description

This is get_ActiveMDIChild, a member of class TCustomForm.

7.1.5.6.29 TCustomForm.get_MDIChildCount Method

Pascal

```
function get_MDIChildCount: Integer;
```

C++

```
__fastcall int get_MDIChildCount();
```

Description

This is get_MDIChildCount, a member of class TCustomForm.

7.1.5.6.30 TCustomForm.get_MDIChildren Method

Pascal

```
function get_MDIChildren(I: Integer): TForm;
```

C++

```
__fastcall TForm * get_MDIChildren(int I);
```

Description

This is get_MDIChildren, a member of class TCustomForm.

7.1.5.6.31 TCustomForm.GetBorderIconStyles Method

Pascal

```
procedure GetBorderIconStyles(var Style: Cardinal; var ExStyle: Cardinal); dynamic;
```

C++

```
__fastcall GetBorderIconStyles(unsigned Style, unsigned ExStyle);
```

Description

This is GetBorderIconStyles, a member of class TCustomForm.

7.1.5.6.32 TCustomForm.GetBorderStyles Method

Pascal

```
procedure GetBorderStyles(var Style: Cardinal; var ExStyle: Cardinal; var ClassStyle:
Cardinal); dynamic;
```

C++

```
__fastcall GetBorderStyles(unsigned Style, unsigned ExStyle, unsigned ClassStyle);
```

Description

This is GetBorderStyles, a member of class TCustomForm.

7.1.5.6.33 TCustomForm.GetChildren Method

Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

The component streaming system calls GetChildren to request that the form execute a callback for every child component in the form. The callback must execute in creation order (the order the child components appear in the form file). A child component is defined as any component that returns this form from its GetParentComponent method.

Proc is the callback to execute for every child component.

Root specifies the top-level component (such as a form or data module) that is currently being loaded or saved.

In TCustomForm (see page 2103), GetChildren first calls the inherited method, which executes Proc for every control that lists the form as its Parent. Then, if the Root parameter identifies this form, GetChildren executes Proc for every child component that does not have a Parent.

See Also

GetParentComponent

7.1.5.6.34 TCustomForm.GetClientRect Method

Returns the value of the ClientRect property.

Pascal

```
function GetClientRect: TRect; override;
```

C++

```
virtual __fastcall TRect GetClientRect();
```

Description

GetClientRect is the protected access function for the ClientRect property. It returns the dimensions of the form window, indented by any scroll bars and menus.

Override this method to change the way the client area of the form is defined.

C++ Examples:

```
/*
The following lines of code draw the top quarter of an arc
bounded by the current window:
*/
void __fastcall TForm1::FormPaint(TObject *Sender)
{
  TRect R = GetClientRect();  // Gets the rectangular
                              // coordinates of
                              // the current window.
  Canvas->Arc(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
}
```

Delphi Examples:

```
{
The following lines of code draw the top quarter of an arc
bounded by the current window:
}
procedure TForm1.FormPaint(Sender: TObject);
var
  R: TRect;
begin
  R := GetClientRect;   { Gets the boundaries of the current window }
  Canvas.Arc(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
end;
```

See Also

GetClientOrigin

ClientRect

7.1.5.6.35 TCustomForm.GetFloating Method

Returns the value of the Floating property.

Pascal

```
function GetFloating: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetFloating();
```

Description

GetFloating is the protected access function for the Floating property. Override this method in descendants that implement floating windows in some class-specific way.

See Also

Floating

7.1.5.6.36 TCustomForm.GetFormImage Method

Returns a bitmap of the form.

Pascal

```
function GetFormImage: TBitmap;
```

C++

```
__fastcall TBitmap GetFormImage();
```

Description

Use the GetFormImage method to obtain a bitmap of the form.

C++ Examples:

```
/*
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
*/

#include <Clipbrd.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Graphics::TBitmap *FormImage = GetFormImage();
  try
  {
    Clipboard()->Assign(FormImage);
    Image1->Picture->Assign(Clipboard());
  }
  __finally
  {
    delete FormImage;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Shape1->Shape = stEllipse;
  Shape1->Brush->Color = clLime;
  Image1->Stretch = true;
}
```

Delphi Examples:

```
{
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  FormImage: TBitmap;
begin
  FormImage := GetFormImage;
  try
    Clipboard.Assign(FormImage);
    Image1.Picture.Assign(Clipboard);
  finally
    FormImage.Free;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Shape1.Shape := stEllipse;
```

```
  Shape1.Brush.Color := clLime;
  Image1.Stretch := True;
end;
```

See Also

Print (see page 2132)

7.1.5.6.37 TCustomForm.GetOwnerWindow Method

Pascal

```
function GetOwnerWindow: HWND; dynamic;
```

C++

```
__fastcall HWND GetOwnerWindow();
```

Description

This is GetOwnerWindow, a member of class TCustomForm.

7.1.5.6.38 TCustomForm.HandleCreateException Method

Handles exceptions that are raised by the OnCreate (see page 2207) event handler.

Pascal

```
function HandleCreateException: Boolean; dynamic;
```

C++

```
__fastcall Boolean HandleCreateException();
```

Description

The form calls HandleCreateException internally if the OnCreate (see page 2207) event handler raises an exception. HandleCreateException forwards the exception on to the application object, which generates an OnException event. If there is no OnException event handler, the application displays an exception message box.

HandleCreateException returns true if it handles the exception, false otherwise.

See Also

OnCreate (see page 2207)

OnException (see page 1993)

ShowException (see page 1961)

7.1.5.6.39 TCustomForm.Hide Method

Hides the form.

Pascal

```
procedure Hide;
```

C++

```
__fastcall Hide();
```

Description

Hide sets the Visible (see page 2192) property to false.

C++ Examples:

```
/*
This code uses a button, a timer and a maskedit on a
form. When the user clicks the button, the form
disappears for the period of time specified in the
Interval property of the timer control, then the form
reappears:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Timer1->Interval = StrToInt(MaskEdit1->Text);
  Timer1->Enabled = true;
  Hide();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Visible = true;
  Timer1->Enabled = false;
}
```

Delphi Examples:

```
{
This code uses a button, a timer and a maskedit on a
form. When the user clicks the button, the form
disappears for the period of time specified in the
Interval property of the timer control, then the form
reappears:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Timer1.Interval := StrtoInt(MaskEdit1.Text);
  Timer1.Enabled := True;
  Hide;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Visible := True;
  Timer1.Enabled := False;
end;
```

See Also

Visible (see page 2192)

7.1.5.6.40 TCustomForm.InitializeNewForm Method

Pascal

```
procedure InitializeNewForm; dynamic;
```

C++

```
__fastcall InitializeNewForm();
```

Description

This is InitializeNewForm, a member of class TCustomForm.

7.1.5.6.41 TCustomForm.IsShortCut Method

Processes shortcut keys when the form has focus.

Pascal

```
function IsShortCut(var Message: TWMKey): Boolean; dynamic;
```

C++

```
__fastcall Boolean IsShortCut(TWMKey Message);
```

Description

IsShortCut is called automatically when the user presses a key while the form has focus. It allows the form to dispatch shortcut keys and bypass the standard keystroke processing (OnKeyDown (see page 2219), OnKeyPress (see page 2223), and OnKeyUp (see page 2224) events).

The Message parameter encapsulates the Windows message describing the keypress. If a shortcut for the key exists, IsShortCut executes the appropriate command and returns true. Otherwise IsShortCut returns false.

IsShortCut generates an OnShortCut (see page 2235) event to allow the developer to insert shortcuts for the form. If the keystroke is not handled in an OnShortCut (see page 2235) event handler, IsShortCut checks for any shortcuts associated with the form's menus and actions.

See Also

OnShortCut (see page 2235)

OnKeyDown

OnKeyPress

OnKeyUp

7.1.5.6.42 TCustomForm.Loaded Method

Performs fix-ups when the form is first loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded overrides the inherited method to give focus to the ActiveControl (see page 2145) if it is assigned. Before assigning focus, Loaded calls the inherited method to perform any lower-level initialization.

See Also

ActiveControl (see page 2145)

Loaded

7.1.5.6.43 TCustomForm.MakeFullyVisible Method

Ensures that the form is fully visible on a specified monitor.

Pascal

```
procedure MakeFullyVisible(AMonitor: TMonitor = nil);
```

C++

```
__fastcall MakeFullyVisible(TMonitor AMonitor = nil);
```

Description

Call MakeFullyVisible to ensure that the form does not appear split over more than one monitor in a multi-monitor application.

AMonitor is the monitor on which the form should appear. If AMonitor is nil (Delphi) or NULL (C++), MakeFullyVisible uses the Monitor (see page 2177) property.

MakeFullyVisible checks whether the form fits entirely on the specified monitor. If not, it repositions the form so that it fits, if possible.

See Also

DefaultMonitor (see page 2158)

Monitor (see page 2177)

7.1.5.6.44 TCustomForm.MouseWheelHandler Method

Directs mouse wheel messages to the appropriate control.

Pascal

```
procedure MouseWheelHandler(var Message: TMessage); override;
```

C++

```
virtual __fastcall MouseWheelHandler(TMessage Message);
```

Description

MouseWheelHandler is called automatically when the form or any windowed control contained in the form receives a message from a mouse wheel. The Message parameter encapsulates the message.

As implemented in TCustomForm (see page 2103), MouseWheelHandler performs no special processing, but simply redirects the message to the active control by calling its Perform method. By default, the Perform method generates the appropriate mouse wheel events.

See Also

ActiveControl (see page 2145)

Perform

OnMouseWheel

OnMouseWheelUp

OnMouseWheelDown

7.1.5.6.45 TCustomForm.Notification Method

Responds to notifications that objects are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, forms pass along the notification to their owned components, if any. In addition, Notification makes internal

adjustments if the main menu is added or deleted.

A form can, if needed, override Notification to make other adjustments when components are inserted or removed. In particular, if a form has object fields or properties that contains references to other components, it might check the notifications of component removals and invalidate those references as needed.

See Also

InsertComponent

7.1.5.6.46 TCustomForm.Paint Method

Generates an OnPaint (see page 2233) event.

Pascal

```
procedure Paint; dynamic;
```

C++

```
__fastcall Paint();
```

Description

The form component calls Paint in response to the WM_PAINT (see page 5198) message (sent when the window needs to be painted) before rendering all controls on the form.

The default Paint method calls any event handler attached by the user to the OnPaint (see page 2233) event. Override Paint to block the OnPaint (see page 2233) event or to draw additional features before or after the OnPaint (see page 2233) event.

See Also

OnPaint (see page 2233)

7.1.5.6.47 TCustomForm.PaintWindow Method

Renders the image of the form.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Applications can't call this protected method. It is called when the form needs to be painted.

PaintWindow locks the canvas to prevent threading issues, assigns the DC parameter as the Handle of the form's canvas, and then calls the Paint (see page 2131) method to render the image of the form.

See Also

Paint (see page 2131)

Canvas (see page 2150)

Handle (see page 2722)

Lock (see page 2694)

7.1.5.6.48 TCustomForm.PaletteChanged Method

Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.

Pascal

```
function PaletteChanged(Foreground: Boolean): Boolean; override;
```

C++

```
virtual __fastcall Boolean PaletteChanged(Boolean Foreground);
```

Description

PaletteChanged is called automatically when the system palette changes. The Foreground parameter indicates whether the palette realization should treat this control's palette as being in the foreground or the background. The return value from PaletteChanged indicates whether the form actually realized its palette, returning true only if the form has an associated palette.

Most applications should not need to alter the default behavior of PaletteChanged.

See Also

PaletteChanged

7.1.5.6.49 TCustomForm.Print Method

Prints the form.

Pascal

```
procedure Print;
```

C++

```
__fastcall Print();
```

Description

Call Print to print the form. Print uses the GetFormImage (see page 2125) method to obtain a bitmap of the form and draws that to the printer's HDC.

See Also

GetFormImage (see page 2125)

7.1.5.6.50 TCustomForm.QueryInterface Method

Returns a reference to a specified interface if that interface is supported by the form.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

For forms that support interfaces, QueryInterface calls the QueryInterface method of the interface supported by the form. QueryInterface returns a reference to the interface specified by the IID parameter, as the Obj parameter. If the form does not support the interface, the Obj parameter is nil (Delphi) or NULL (C++).

QueryInterface returns S_OK if the Obj parameter is successfully assigned.

See Also

_AddRef

_Release

Invoke

7.1.5.6.51 TCustomForm.ReadState Method

Reads the form's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the VCL streaming system that loads and saves VCL components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

TReader

7.1.5.6.52 TCustomForm.RecreateAsPopup Method

Pascal

```
procedure RecreateAsPopup(AWindowHandle: HWND);
```

C++

```
__fastcall RecreateAsPopup(HWND AWindowHandle);
```

Description

This is RecreateAsPopup, a member of class TCustomForm.

7.1.5.6.53 TCustomForm.Release Method

Destroys the form and frees its associated memory.

Pascal

```
procedure Release;
```

C++

```
__fastcall Release();
```

Description

Use Release to destroy the form and free its associated memory.

Release does not destroy the form until all event handlers of the form and event handlers of components on the form have finished executing. Release also guarantees that all messages in the form's event queue are processed before the form is released. Any event handlers for the form or its children should use Release instead of Free (Delphi) or delete (C++). Failing to

do so can cause a memory access error.

Note: Release returns immediately to the caller. It does not wait for the form to be freed before returning.

See Also

System::TObject::Free

Destroy (see page 2109)

7.1.5.6.54 TCustomForm.RequestAlign Method

Instructs the form's parent (if any) to reposition the form, enforcing its Align property.

Pascal

```
procedure RequestAlign; override;
```

C++

```
virtual __fastcall RequestAlign();
```

Description

RequestAlign is called internally when changes are made to the size or position of the form, so that it remains properly aligned within a dock site or properly positioned on the screen.

See Also

Align

Floating

7.1.5.6.55 TCustomForm.Resizing Method

Makes any required adjustments when the form changes size.

Pascal

```
procedure Resizing(State: TWindowState); override;
```

C++

```
virtual __fastcall Resizing(TWindowState State);
```

Description

This protected method is called automatically when the form is resized, including when it is maximized, minimized, or restored to normal size. Resizing adjusts the size and position of any child controls that are aligned to the form.

The State parameter indicates the state of the form after the resize.

7.1.5.6.56 TCustomForm.SendCancelMode Method

Cancels modes on the form.

Pascal

```
procedure SendCancelMode(Sender: TControl);
```

C++

```
__fastcall SendCancelMode(TControl * Sender);
```

Description

Use SendCancelMode to release the mouse capture and cancel scroll bar input and menu processing on the form.

See Also

ActiveControl (see page 2145)

7.1.5.6.57 TCustomForm.set_PopupParent Method

Pascal

```
procedure set_PopupParent(Value: TCustomForm);
```

C++

```
__fastcall set_PopupParent(TCustomForm Value);
```

Description

This is set_PopupParent, a member of class TCustomForm.

7.1.5.6.58 TCustomForm.SetChildOrder Method

Changes the order in which Child appears when GetChildren (see page 2124) is called.

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

Use SetChildOrder to change the order in which child components are loaded and saved. The Child moves as if it were an item in a list object: items previously below the child's old position move up, and those below the new position move down.

See Also

GetChildren (see page 2124)

7.1.5.6.59 TCustomForm.SetFocus Method

Sets focus to the form.

Pascal

```
procedure SetFocus; override;
```

C++

```
virtual __fastcall SetFocus();
```

Description

Use SetFocus to give the form input focus. SetFocus calls the SetFocus method of the active control, if one exists. To determine whether the form has focus, use the Active (see page 2145) property.

See Also

Active (see page 2145)

SetFocusedControl (see page 2136)

SetFocus

7.1.5.6.60 TCustomForm.SetFocusedControl Method

Sets focus to a control on the form.

Pascal

```
function SetFocusedControl(Control: TWinControl): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SetFocusedControl(TWinControl * Control);
```

Description

Use SetFocusedControl to give a control on the form input focus. SetFocusedControl returns false if the Control specified by the Control parameter was already in the process of receiving focus, true otherwise.

Note: A return value of true does not indicate the control has successfully received input focus. If the Control can't have focus (for example, if it is not visible), SetFocusedControl will still return true, indicating that an attempt was made.

See Also

Active (see page 2145)

SetFocus (see page 2135)

DefocusControl (see page 2118)

7.1.5.6.61 TCustomForm.SetParent Method

Sets the Parent property.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. It overrides the inherited method to regenerate the form's window when the Parent property is changed to nil (Delphi) or NULL (C++).

See Also

Parent

7.1.5.6.62 TCustomForm.SetParentBiDiMode Method

Sets the ParentBiDiMode property.

Pascal

```
procedure SetParentBiDiMode(Value: Boolean); override;
```

C++

```
virtual __fastcall SetParentBiDiMode(Boolean Value);
```

Description

SetParentBiDiMode is the protected implementation of the ParentBiDiMode property. It overrides the inherited method to obtain

the BiDiMode property of the application if the form does not have a parent.

See Also

ParentBiDiMode

7.1.5.6.63 TCustomForm.Show Method

Shows the form.

Pascal

```
procedure Show;
```

C++

```
__fastcall Show();
```

Description

Use Show to set the form's Visible (see page 2192) property to true and to bring the form to the front of other forms on the screen.

C++ Examples:

```
/*
This example shows progress of loading forms as an
application starts up. The code example is placed in the
project source (*_proj.cpp) file. To see project source, right
click on the executable file in the Project Manager and
select the View Source menu item.
You will need to set up your project with the following steps
before using the code example:
o          Add four additional forms to a default project.
o          Place a TProgressBar on Form5
o          Take the Project|Options|Forms menu option and place
               Form5 on the available forms list.
o          Change the code of your project (*_proj.cpp) file to
               look like the example.
*/
#include <vcl\vcl.h>
#include "Unit5.h"
#pragma hdrstop
//---------------------------------------------------------------------------
USEFORM("TAppCreateForm.cpp", Form1);
USERES("Project1.res");
USEFORM("Unit2.cpp", Form2);
USEFORM("Unit3.cpp", Form3);
USEFORM("Unit4.cpp", Form4);
USEFORM("Unit5.cpp", Form5);
//---------------------------------------------------------------------------
WINAPI WinMain(HINSTANCE, HINSTANCE, LPSTR, int)
{
  try
  {
    Application->Initialize();
    SetApplicationMainFormOnTaskBar(Application, true);
    Application->CreateForm(__classid(TForm5), &Form5);
    Form5->ProgressBar1->Max = 100;
    Form5->Show();   // show a splash screen contain ProgressBar control
    Form5->Update(); // force display of Form5
    Application->CreateForm(__classid(TForm1), &Form1);
    Form5->ProgressBar1->StepBy(25);
    Form5->Label1->Caption =  "Form1 loaded successfully.";
    Form5->Update(); // force display of Form5
    Sleep(3000);
```

```
    Application->CreateForm(__classid(TForm2), &Form2);
    Form5->ProgressBar1->StepBy(25);
    Form5->Label1->Caption =  "Form2 loaded successfully.";
    Form5->Update(); // force display of Form5
    Sleep(3000);
    Application->CreateForm(__classid(TForm3), &Form3);
    Form5->ProgressBar1->StepBy(25);
    Form5->Label1->Caption =  "Form3 loaded successfully.";
    Form5->Update(); // force display of Form5
    Sleep(3000);
    Application->CreateForm(__classid(TForm4), &Form4);
    Form5->ProgressBar1->StepBy(25);
    Form5->Label1->Caption =  "Form4 loaded successfully.";
    Form5->Update(); // force display of Form5
    Sleep(3000);
//  delete Form5;
    Application->Run();
  }
  catch (Exception &exception)
  {
    Application->ShowException(&exception);
  }
  return 0;
}
```

Delphi Examples:

```
{
This example shows progress of loading forms as an
application starts up. The code example is placed in the
project source (*.dpr) file.  To see project source, right
click on the executable file in the Project Manager and
select the View Source menu item.  You will need to set up
your project with the following steps before using the codeexample:    Add four additional
forms to a default project.
    Place a TProgressBar on Form5
    Take the Project|Options|Forms menu option and place
          Form5 on the available forms list.
    Change the code of your project (*.dpr) file to look
          like the example.
}
begin
  Application.Initialize;
  with TForm5.Create(nil) do
  try
    Application.MainFormOnTaskbar := True;
    ProgressBar1.Max := 100;
    Show;  // show a splash screen contain ProgressBar control
    Update; // force display of Form5
    Application.CreateForm(TForm1, Form1);
    ProgressBar1.StepBy(25);
    Label1.Caption :=  'Form1 loaded successfully.';
    Update; // force display of Form5
    Sleep(3000);
    Application.CreateForm(TForm2, Form2);
    ProgressBar1.StepBy(25);
    Label1.Caption :=  'Form2 loaded successfully.';
    Update; // force display of Form5
    Sleep(3000);
    Application.CreateForm(TForm3, Form3);
    ProgressBar1.StepBy(25);
    Label1.Caption :=  'Form3 loaded successfully.';
    Update; // force display of Form5
    Sleep(3000);
    Application.CreateForm(TForm4, Form4);
    ProgressBar1.StepBy(25);
    Label1.Caption :=  'Form4 loaded successfully.';
```

```
    Update; // force display of Form5
    Sleep(3000);
  finally
    Free;
  end;
  Application.Run;
```

BringToFront

Visible (see page 2192)

7.1.5.6.64 TCustomForm.ShowModal Method

Shows a form as a modal dialog.

Pascal

```
function ShowModal: Integer; virtual;
```

C++

```
virtual __fastcall int ShowModal();
```

Description

Use ShowModal to show a form as a modal form. A modal form is one where the application can't continue to run until the form is closed. Thus, ShowModal does not return until the form closes. When the form closes, it returns the value of the ModalResult (see page 2176) property.

To close a modal form, set its ModalResult (see page 2176) property to a nonzero value.

Note: If the form contains buttons with a ModalResult (see page 2176) property set to a value other than mrNone, the form automatically closes when the user clicks one of those buttons and returns the ModalResult (see page 2176) value as the return value of ShowModal.

You can check the return value against common return values using the global IsAbortResult, IsAnAllResult, IsNegativeResult, or IsPositiveResult functions.

C++ Examples:

```
/*
This code brings up the modal dialog from Unit2 when a
button is clicked.  It causes a Beep if the OK button is
clicked. Implement the modal form in Unit2 and then put
Unit2 in the uses clause for this module.
*/
#include "Unit2.h"
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (MyDialogBox1->ShowModal() == mrOk)
    MessageBeep(0);
}
/*
The following methods are used for buttons in a form that is
used as a modal dialog box. The methods cause the dialog box
to terminate when the user clicks either the OK or Cancel
button, returning mrOk or mrCancel from ShowModal,
respectively. You could also set the ModalResult value to
mrOk for the OK button and mrCancel for the Cancel button to
accomplish the same thing. When the user clicks either
button, the dialog box closes.
*/
void __fastcall TMyDialogBox1::OKButtonClick(TObject *Sender)
{
```

```
  ModalResult = mrOk;
}

void __fastcall TMyDialogBox1::CancelButtonClick(TObject *Sender)
{
  ModalResult = mrCancel;
}
```

Delphi Examples:

```
{
This code brings up the modal dialog from Unit2 when a
button is clicked.  It causes a Beep if the OK button is
clicked. Implement the modal form in Unit2 and then put
Unit2 in the uses clause for this module.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if MyDialogBox1.ShowModal = mrOK then
    Beep;
end;
{
The following methods are used for buttons in a form that is
used as a modal dialog box. The methods cause the dialog box
to terminate when the user clicks either the OK or Cancel
button, returning mrOk or mrCancel from ShowModal,
respectively. You could also set the ModalResult value to
mrOk for the OK button and mrCancel for the Cancel button to
accomplish the same thing. When the user clicks either
button, the dialog box closes.
}
procedure TMyDialogBox1.CancelButtonClick(Sender: TObject);
begin
  ModalResult := mrCancel;
end;

procedure TMyDialogBox1.OKButtonClick(Sender: TObject);
begin
  ModalResult := mrOK;
end;
```

IsAnALlResult

IsNegativeResult

IsPositiveResult

StripAllFromResult

IsAbortResult

7.1.5.6.65 TCustomForm.UpdateActions Method

Updates all actions associated with the form.

Pascal

```
procedure UpdateActions; virtual;
```

C++

```
virtual __fastcall UpdateActions();
```

Description

UpdateActions is called automatically when the application is idle to allow all components in the form an opportunity to update any actions for which the component is a target. This allows actions to be checked, grayed, and so on to reflect the current state of their targets.

UpdateActions updates all actions associated with the form, its menus, and the components contained in the form.

See Also

UpdateAction

InitiateAction

7.1.5.6.66 TCustomForm.UpdateWindowState Method

Updates the WindowState (see page 2195) property to reflect the current state of the form.

Pascal

```
procedure UpdateWindowState;
```

C++

```
__fastcall UpdateWindowState();
```

Description

UpdateWindowState ensures that the WindowState (see page 2195) property reflects the current state of the form.

See Also

WindowState (see page 2195)

7.1.5.6.67 TCustomForm.ValidateRename Method

Determines if a form can rename one of its owned components.

Pascal

```
procedure ValidateRename(AComponent: TComponent; const CurName: string; const NewName:
string); override;
```

C++

```
virtual __fastcall ValidateRename(TComponent * AComponent, const UnicodeString CurName, const
UnicodeString NewName);
```

Description

The ValidateRename method checks to see if a form can rename one of its owned components, passed in AComponent, from its current name (CurName) to the string passed in NewName. If AComponent is nil (Delphi) or NULL (C++) or NewName is already the name of a component in the form's list, ValidateRename raises an EComponentError exception.

See Also

FindComponent

7.1.5.6.68 TCustomForm.VisibleChanging Method

Responds just before the form changes the value of its Visible (see page 2192) property.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

This protected method raises an exception if, for some reason, the form should not change its visible state.

See Also

Visible (see page 2192)

7.1.5.6.69 TCustomForm.WantChildKey Method

Indicates whether the form processes keyboard input for a control it owns.

Pascal

```
function WantChildKey(Child: TControl; var Message: TMessage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean WantChildKey(TControl * Child, TMessage Message);
```

Description

WantChildKey is called by any control that the form owns when the control receives keyboard input. If WantChildKey returns true, the control performs no further processing in response to the keyboard input, instead deferring to its parent form to respond to the keystroke. In its default implementation, WantChildKey always returns false; it is overridden in TActiveForm to implement certain ActiveX functionality.

7.1.5.6.70 TCustomForm.WndProc Method

Provides specific message responses for the form.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method that receives messages for a form. After calling the inherited method, WndProc performs some window activation, focus, and position message handling necessary to keep in sync with Windows. Override WndProc to change how the form responds to Windows messages.

See Also

WndProc

7.1.5.7 TCustomForm Properties

The properties of the TCustomForm class are listed here.

Protected Properties

	Name	Description
R	ActiveMDIChild (see page 2146)	Specifies the MDI child that has focus.
	AlphaBlend (see page 2147)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2147)	Specifies the degree of translucency on a translucent form.
	AutoScroll (see page 2148)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	BorderIcons (see page 2148)	Specifies which icons appear on the title bar of the form.
R	ClientHandle (see page 2154)	Provides access to the handle of the form's internal MDI client window.
W	ClientHeight (see page 2154)	Specifies the height (in pixels) of the form's client area.
W	ClientWidth (see page 2155)	Specifies the width (in pixels) of the form's client area.
	Ctl3D (see page 2158)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2158)	Specifies the monitor on which the form appears.
	FormStyle (see page 2162)	Determines the form's style.
	Height (see page 2164)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 2166)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 2167)	Specifies the icon that appears when the form is minimized.
R	MDIChildCount (see page 2172)	Specifies the number of open MDI child forms.
R	MDIChildren (see page 2173)	Provides indexed access to all MDI child forms.
	ObjectMenuItem (see page 2177)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 2178)	Specifies when OnCreate (see page 2207) and OnDestroy (see page 2209) events occur.
	ParentFont (see page 2179)	Determines where a control looks for its font information.
	PixelsPerInch (see page 2179)	Represents the proportion of the font on the system on which the form was designed.
R	PopupChildren (see page 2179)	This is PopupChildren, a member of class TCustomForm.
	PopupMenu (see page 2180)	Identifies the pop-up menu associated with the control.
	Position (see page 2185)	Represents the size and placement of the form.
	PrintScale (see page 2186)	Represents the proportions of a printed form.
	Scaled (see page 2187)	Specifies whether the form is sized according to the value of the PixelsPerInch (see page 2179) property.
	TileMode (see page 2188)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 2190)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2191)	Indicates the color on the form that appears transparent when TransparentColor (see page 2190) is true.
	VertScrollBar (see page 2191)	Represents the vertical scroll bar for the scrolling windowed control.
W	Visible (see page 2192)	Indicates whether the form is visible.
	Width (see page 2193)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 2194)	Specifies the Window menu for an MDI parent form.

Public Properties

	Name	Description
	Action (see page 2144)	Designates the action associated with the control.
R	Active (see page 2145)	Specifies whether the form has focus.
	ActiveControl (see page 2145)	Specifies the control that has focus on the form.
	ActiveOleControl (see page 2146)	Specifies the OLE control on the form that reacts to changes in focus.
	BorderStyle (see page 2149)	Specifies the appearance and behavior of the form border.
R	Canvas (see page 2150)	Provides access to the drawing area of the form.
	Caption (see page 2151)	Specifies a text string that identifies the control to the user.
	Color (see page 2157)	Specifies the background color of the control.
	Designer (see page 2159)	Specifies the designer interface for the form.
	DropTarget (see page 2159)	Specifies whether the form is the target of a drag-and-drop operation.
	Font (see page 2160)	Controls the attributes of text written on or in the control.
R	FormState (see page 2161)	Indicates transitional state information about the form.
	GlassFrame (see page 2164)	This is GlassFrame, a member of class TCustomForm.

	HelpFile (see page 2165)	Specifies the name of the file the form uses to display Help.
	KeyPreview (see page 2167)	Specifies whether the form should receive keyboard events before the active control.
	Menu (see page 2174)	Specifies the form's main menu.
	ModalResult (see page 2176)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 2177)	Provides access to the monitor on which the form appears.
	OleFormObject (see page 2178)	Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.
	PopupMode (see page 2185)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 2185)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 2187)	Specifies whether form snaps to edge of screen.
	SnapBuffer (see page 2188)	Specifies distance for screen snap.
	WindowState (see page 2195)	Represents how the form appears on the screen.

Published Properties

	Name	Description
	Left (see page 2171)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Top (see page 2189)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

7.1.5.7.1 TCustomForm.Action Property

Designates the action associated with the control.

Pascal

```
property Action;
```

C++

```
__property Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

Delphi Examples:

```
{
This example shows that OnClick is the default event of a form.
When the form is created, the OnExecute event of its Action property
is initialized to some user-defined procedure, which randomly changes
the color of the form.
}
procedure TForm1.ChangeColor(Sender: TObject);
begin
  { randomly change the color of the form }
  Color := Random($FFFF);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { allocate memory for the Action property }
  Action := TBasicAction.Create(Self);

  { set the OnExecute event handler }
```

```
    Action.OnExecute := ChangeColor;

    { initialize the random number generator }
    Randomize;
  end;
```

7.1.5.7.2 TCustomForm.Active Property

Specifies whether the form has focus.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine whether the form has focus. The Active Form receives all keyboard input. If it has a title bar, it is drawn using the active colors specified in the Control panel.

If Active is true , the form has focus; if Active is false, the form does not have focus.

See Also

SetFocus (see page 2135)

OnActivate (see page 2196)

OnDeactivate (see page 2209)

ActiveControl (see page 2145)

7.1.5.7.3 TCustomForm.ActiveControl Property

Specifies the control that has focus on the form.

Pascal

```
property ActiveControl: TWinControl;
```

C++

```
__property TWinControl * ActiveControl;
```

Description

Use ActiveControl to get or set the control that has focus on the form. Only one control can have focus at a given time in an application.

If the form does not have focus, ActiveControl is the control on the form that will receive focus when the form receives focus.

Note: When focus shifts to another control, ActiveControl is updated before the OnExit event occurs.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
```

```
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

See Also

ActiveOleControl (see page 2146)

OnExit

OnEnter

Active (see page 2145)

7.1.5.7.4 TCustomForm.ActiveMDIChild Property

Specifies the MDI child that has focus.

Pascal

```
property ActiveMDIChild: TForm;
```

C++

```
__property TForm * ActiveMDIChild;
```

Description

Use ActiveMDIChild to get the MDI child that has focus.

If the form is not an MDI parent (that is, if the FormStyle (see page 2162) property of the form is not fsMDIForm), ActiveMDIChild returns nil (Delphi) or NULL (C++).

See Also

FormStyle (see page 2162)

MDIChildCount (see page 2172)

7.1.5.7.5 TCustomForm.ActiveOleControl Property

Specifies the OLE control on the form that reacts to changes in focus.

Pascal

```
property ActiveOleControl: TWinControl;
```

C++

```
__property TWinControl * ActiveOleControl;
```

Description

Use ActiveOLEControl to get or set an OLE control on the form that reacts to changes in focus.

If ActiveOLEControl is not nil (Delphi) or NULL (C++), the user interface for the specified OLE control is deactivated when it is not focused. Also, when the form receives or loses focus, the document window for the specified OLE control is activated or deactivated respectively.

See Also

ActiveControl (see page 2145)

TWinControl

7.1.5.7.6 TCustomForm.AlphaBlend Property

Specifies whether the form is translucent.

Pascal

```
property AlphaBlend: Boolean;
```

C++

```
__property Boolean AlphaBlend;
```

Description

Set AlphaBlend to specify that the form represents a layered window that allows a translucent color. The AlphaBlendValue (see page 2147) property specifies the degree of translucency.

Note: AlphaBlend does not work on all systems. The application must be running under Windows 2000 or better, and the machine must be a P90 or better.

See Also

AlphaBlendValue (see page 2147)

TransparentColor (see page 2190)

7.1.5.7.7 TCustomForm.AlphaBlendValue Property

Specifies the degree of translucency on a translucent form.

Pascal

```
property AlphaBlendValue: Byte;
```

C++

```
__property Byte AlphaBlendValue;
```

Description

Set AlphaBlendValue to a value between 0 and 255 to indicate the degree of translucency when the AlphaBlend (see page 2147) property is true. A value of 0 indicates a completely transparent window. A value of 255 indicates complete opacity.

Note: AlphaBlendValue only has an effect when the AlphaBlend (see page 2147) property is true.

See Also

AlphaBlend (see page 2147)

TransparentColor (see page 2190)

TransparentColorValue (see page 2191)

7.1.5.7.8 TCustomForm.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.5.7.9 TCustomForm.BorderIcons Property

Specifies which icons appear on the title bar of the form.

Pascal

```
property BorderIcons: TBorderIcons;
```

C++

```
__property TBorderIcons BorderIcons;
```

Description

Use BorderIcons to get or set the icons that appear on the title bar of the form. BorderIcons can include any of the following TBorderIcons (see page 2596) values:

Value	Meaning
biSystemMenu	The form has a Control menu (also known as a System menu).
biMinimize	The form has a Minimize button
biMaximize	The form has a Maximize button
biHelp	If BorderStyle (see page 2149) is bsDialog or biMinimize and biMaximize are excluded, a question mark appears in the form's title bar and when clicked, the cursor changes to crHelp; otherwise,no question mark appears.

Note: Certain combinations of the BorderIcons and BorderStyle (see page 2149) properties are mutually exclusive. For example, BorderIcons biMax, biMin with BorderStyle (see page 2149) of bsDialog are mutually exclusive.

C++ Examples:

```
/*
The following code removes a form's Maximize button when the
user clicks a button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TBorderIcons tempBI = BorderIcons;
  tempBI >> biMaximize;
  BorderIcons = tempBI;
}
```

Delphi Examples:

```
{
The following code removes a form's Maximize button when the
user clicks a button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
BorderIcons := BorderIcons - [biMaximize];
end;
```

See Also

BorderStyle (see page 2149)

7.1.5.7.10 TCustomForm.BorderStyle Property

Specifies the appearance and behavior of the form border.

Pascal

```
property BorderStyle: TFormBorderStyle;
```

C++

```
__property TFormBorderStyle BorderStyle;
```

Description

Use BorderStyle to get or set the appearance and behavior of the form border. BorderStyle can be any of the following TForm (see page 2241) BorderStyle values:

Value	Meaning
bsDialog	Not resizable; no minimize/maximize menu
bsSingle	Not resizable; minimize/maximize menu
bsNone	Not resizable; no visible border line
bsSizeable	Standard resizable border
bsToolWindow	like bsSingle but with a smaller caption
bsSizeToolWin	like bsSizeable with a smaller caption

Note: Changing the border style of an MDI child form to bsDialog or bsNone has no effect.

See Also

BorderIcons (see page 2148)

7.1.5.7.11 TCustomForm.Canvas Property

Provides access to the drawing area of the form.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use TCanvas (see page 2673) to draw on the client area of the form. Canvas is often used in the OnPaint (see page 2233) event handler.

C++ Examples:

```
/*
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> BrushBmp(new Graphics::TBitmap);
  BrushBmp->LoadFromFile("../bm1.BMP");
  Form1->Canvas->Brush->Bitmap = BrushBmp.get();
  Form1->Canvas->FillRect(Rect(0,0,100,100));
  Form1->Canvas->Brush->Bitmap = NULL;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TForm1 *myForm;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TForm1")
  {
    myForm = dynamic_cast<TForm1 *>(ListBox1->Items->Objects[Index]);
    // make sure we are using the TControls canvas and not the from's!
    myForm->Canvas->MoveTo(myForm->ClientRect.Left, myForm->ClientRect.Top);
    myForm->Canvas->LineTo(myForm->ClientRect.Right, myForm->ClientRect.Bottom);
    myForm = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TForm1) then
```

```
    begin
      myForm:= (ListBox1.Items.Objects[Index] as TForm1);
      with myForm.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myForm.Canvas.MoveTo(Left, Top);
        myForm.Canvas.LineTo(Right, Bottom);
      end;
    myForm:= nil;
    end;
  {
  The following code loads a bitmap from a file and assigns it
  to the Brush of the Canvas of Form1:
  }
  var
    Bitmap: TBitmap;

  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Bitmap := TBitmap.Create;
    try
      Bitmap.LoadFromFile('bm1.BMP');
      Form1.Canvas.Brush.Bitmap := Bitmap;
      Form1.Canvas.FillRect(Rect(0,0,100,100));
    finally
      Form1.Canvas.Brush.Bitmap := nil;
      Bitmap.Free;
    end;
  end;
```

See Also

TCanvas (see page 2673)

OnPaint (see page 2233)

7.1.5.7.12 TCustomForm.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
```

```
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
```

```
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

7.1.5.7.13 TCustomForm.ClientHandle Property

Provides access to the handle of the form's internal MDI client window.

Pascal

```
property ClientHandle: HWND;
```

C++

```
__property HWND ClientHandle;
```

Description

Use ClientHandle to get the handle for the form's internal MDI client window.

ClientHandle is meaningful only if the form is an MDI parent (that is, if the form's FormStyle (see page 2162) property is set to fsMDIForm).

Note: Use the Handle property instead to get the handle to the form window itself.

See Also

FormStyle (see page 2162)

Handle

7.1.5.7.14 TCustomForm.ClientHeight Property

Specifies the height (in pixels) of the form's client area.

Pascal

```
property ClientHeight;
```

C++

```
__property ClientHeight;
```

Description

Use ClientHeight to determine the height (in pixels) of the form's client area. The client area is the usable area inside the form's border, excluding the title bar, scroll bars, and so on.

Set ClientHeight to change the height of the form's window based on the desired client area. To change the height of the form's window based on the total size of the window (including the border, menu, status bar and so on), use the Height (see page 2164) property instead.

C++ Examples:

```
/*
This example reduces the height of the form's client area by
half when the user clicks the button on the form:
Note that only the client area is halved, not the entire form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form1->ClientHeight = Form1->ClientHeight/2;
}
```

Delphi Examples:

```
{
```

```
This example reduces the height of the form's client area by
half when the user clicks the button on the form:
Note that only the client area is halved, not the entire form.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ClientHeight := ClientHeight div 2;
end;
```

See Also

ClientRect

ClientWidth (see page 2155)

Height

7.1.5.7.15 TCustomForm.ClientWidth Property

Specifies the width (in pixels) of the form's client area.

Pascal

```
property ClientWidth;
```

C++

```
__property ClientWidth;
```

Description

Use ClientWidth to determine the width (in pixels) of the form's client area. The client area is the usable area inside the form's border. Set ClientWidth to change the width of the form's window based on the desired client area. To change the width of the form's window based on the total size of the window (including the border, status bar and so on), use the Width (see page 2193) property instead.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
```

```
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
```

```
    Dirs := TDirectoryListBox.Create(Form1);
    { line it up on the left of the form }
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane - a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
```

Width

7.1.5.7.16 TCustomForm.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
```

```
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

7.1.5.7.17 TCustomForm.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

7.1.5.7.18 TCustomForm.DefaultMonitor Property

Specifies the monitor on which the form appears.

Pascal

```
property DefaultMonitor: TDefaultMonitor;
```

C++

```
__property TDefaultMonitor DefaultMonitor;
```

Description

Use DefaultMonitor to associate a form with a particular monitor in a multi-monitor application. The following table lists the possible values:

Value	Meaning
dmDesktop	No attempt is made to position the form on a specific monitor.
dmPrimary	The form is positioned on the first monitor listed in the global screen object's Monitors property.
dmMainForm	The form appears on the same monitor as the application's main form.
dmActiveForm	The form appears on the same monitor as the currently active form.

Note: DefaultMonitor has no effect if the application does not have a main form.

7.1.5.7.19 TCustomForm.Designer Property

Specifies the designer interface for the form.

Pascal

```
property Designer: IDesignerHook;
```

C++

```
__property IDesignerHook Designer;
```

Description

The Designer property is used internally at design time. Never assign a value to this property. This is done automatically by the form designer. Only use this property when designing classes for use in the form designer, such as property editors and component editors.

TComponentEditor

7.1.5.7.20 TCustomForm.DropTarget Property

Specifies whether the form is the target of a drag-and-drop operation.

Pascal

```
property DropTarget: Boolean;
```

C++

```
__property Boolean DropTarget;
```

Description

Use DropTarget to determine whether the form is currently the target of a drag-and-drop operation.

7.1.5.7.21 TCustomForm.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
```

```
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

7.1.5.7.22 TCustomForm.FormState Property

Indicates transitional state information about the form.

Pascal

```
property FormState: TFormState;
```

C++

```
__property TFormState FormState;
```

Description

Read FormState to determine the state of the form. FormState indicates when the form is in various transitional states or when certain Windows operations have occurred. The following table lists the values that can be included in a form's state:

Value	Meaning
fsCreating	The form's constructor is currently executing.
fsVisible	The form's window is visible. This state is used to update the Visible (see page 2192) property.
fsShowing	The form's WindowState (see page 2195) property is changing. This state is used to prevent WindowState (see page 2195) changes from interfering with a transition that is in progress.
fsModal	The form was created as a modal window.
fsCreatedMDIChild	The form is an MDI parent window. This state is only set once the MDI client window has been created.
fsActivated	The form has received a CM_ACTIVATE message (because it received focus or the application became active) but has not yet called the Activate (see page 2111) method to generate an OnActivate (see page 2196) event.

See Also

Visible (see page 2192)

Create (see page 2108)

ShowModal (see page 2139)

FormStyle (see page 2162)

Activate (see page 2111)

7.1.5.7.23 TCustomForm.FormStyle Property

Determines the form's style.

Pascal

```
property FormStyle: TFormStyle;
```

C++

```
__property TFormStyle FormStyle;
```

Description

Use FormStyle to get or set the form's style. FormStyle is one of the following values:

Value	Meaning
fsNormal	The form is neither an MDI parent window nor an MDI child window.
fsMDIChild	The form is an MDI child window.
fsMDIForm	The form is an MDI parent window.
fsStayOnTop	This form remains on top of the desktop and of other forms in the project, except any others that also have FormStyle set to fsStayOnTop. If one fsStayOnTop form launches another, neither form will consistently remain on top.

If the form is the main form of an MDI application, its FormStyle property must be set to fsMDIForm.

Note: It is not advisable to change FormStyle at runtime.

Warning: TGraphicControl descendants placed in the client area of a form with FormStyle set to fsMDIForm will not paint.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example ensures that the main form of the application
is an MDI parent:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  if(FormStyle != fsMDIForm)
          FormStyle = fsMDIForm;
  if(FormStyle == fsMDIForm)
          Edit1->Text = "MDI form";
  else
```

```
    //This line never executes
    Edit1->Text = "Not an MDI form";
}
}
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
{
This example ensures that the main form of the application
is an MDI parent:
}
type
  TForm1 = class(TForm)
    Edit1: TEdit;
  private
    { Private declarations }
  public
    { Public declarations }
    constructor Create(AOwner : TComponent); override;
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

constructor TForm1.Create(AOwner : TComponent);

begin
  inherited Create(AOwner);
  if FormStyle <> fsMDIForm then
          FormStyle := fsMDIForm;
  if FormStyle = fsMDIForm then
          Edit1.Text := 'MDI form'
  else
```

```
    //This line never executes
    Edit1.Text := 'Not an MDI form';
end;
{
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
}
procedure TForm1.TileFormsClick(Sender: TObject);
begin
  TileMode := tbVertical;
  Tile;
end;
```

Windows Overview

7.1.5.7.24 TCustomForm.GlassFrame Property

Pascal

```
property GlassFrame: TGlassFrame;
```

C++

```
__property TGlassFrame GlassFrame;
```

Description

This is GlassFrame, a member of class TCustomForm.

7.1.5.7.25 TCustomForm.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
```

```
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

7.1.5.7.26 TCustomForm.HelpFile Property

Specifies the name of the file the form uses to display Help.

Pascal

```
property HelpFile: string;
```

C++

```
__property UnicodeString HelpFile;
```

Description

Use HelpFile for forms that have a help file to use with the Help system. Help topics are selected from the specified file.

HelpContext

OnHelp (see page 2217)

HelpFile (see page 1974)

HelpKeyword

7.1.5.7.27 TCustomForm.HorzScrollBar Property

Represents the horizontal scroll bar for the scrolling windowed control.

Pascal

```
property HorzScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar HorzScrollBar;
```

Description

Use HorzScrollBar to hide, show, or manipulate the horizontal scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
```

```
      Range := 600;
      Position := Range - ClientWidth; { start form out fully scrolled }
      Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
      Visible := True;  { Show the scrollbar }
    end;
  end;
```

TControlScrollBar (see page 2009)

7.1.5.7.28 TCustomForm.Icon Property

Specifies the icon that appears when the form is minimized.

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

Set the Icon property to provide an icon for the form. If Icon is not set, the system provides a default icon when the form is minimized.

C++ Examples:

```
/*
This code assigns an icon to a form when the form is created:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Icon->LoadFromFile("..\\MDIChild1.ICO");
}
```

Delphi Examples:

```
{
This code assigns an icon to a form when the form is created:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Icon.LoadFromFile('MDIChild1.ICO');
end;
```

See Also

WindowState (see page 2195)

7.1.5.7.29 TCustomForm.KeyPreview Property

Specifies whether the form should receive keyboard events before the active control.

Pascal

```
property KeyPreview: Boolean;
```

C++

```
__property Boolean KeyPreview;
```

Description

If KeyPreview is true, keyboard events occur on the form before they occur on the active control. (The active control is specified by the ActiveControl (see page 2145) property.)

If KeyPreview is false, keyboard events occur only on the active control.

Navigation keys (Tab, BackTab, the arrow keys, and so on) are unaffected by KeyPreview because they do not generate keyboard events. Similarly, when a button has focus or when its Default property is true, the Enter key is unaffected by KeyPreview because it does not generate a keyboard events.

KeyPreview is false by default.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
   KeyPreview = True;

}
```

```
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())
  {
    Memo1->Lines->LoadFromFile(OpenDialog1->FileName);

    Printer()->BeginDoc();
    int X = 200;
    int Y = 200;
    for (int I = 0; I <= 10; I++)
      if (!Printer()->Aborted)
      {
        Printer()->Canvas->TextOut(X, Y, Memo1->Lines->Strings[I]);
        Y = Y + 80;
        if (Y > (Printer()->PageHeight - 300))
        {
          Y = 200;
          Printer()->NewPage();
          Sleep(1000);  // to give you time to abort!
        }
      }
    if (!Printer()->Aborted) Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}

OnKeyUp

OnKeyPress

7.1.5.7.30 TCustomForm.Left Property

Specifies the horizontal coordinate of the left edge of a component relative to its parent.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

Use the Left property to determine where the left side of the control begins or to reposition the left side of the control.

If the control is contained in another control, the Left and Top properties are relative to the parent control. If the control is contained directly by the form, the property values are relative to the form. For forms, the value of the Left property is relative to the screen in pixels.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
```

```
    if ActiveControl <> nil then
      ActiveControl.Left := ActiveControl.Left + 1;
  end;
```

7.1.5.7.31 TCustomForm.MDIChildCount Property

Specifies the number of open MDI child forms.

Pascal

```
property MDIChildCount: Integer;
```

C++

```
__property int MDIChildCount;
```

Description

Use MDIChildCount to get the number of open MDI child forms.

MDIChildCount is meaningful only if the form is an MDI parent (that is, if the form's FormStyle (see page 2162) property is set to fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
*/
void __fastcall TForm1::CloseChildrenClick(TObject *Sender)
{
  for(int i = MDIChildCount - 1; i >= 0; i--)
    MDIChildren[i]->Close();
}

void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}

void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
  }
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
}
```

```
procedure TForm1.CloseChildrenClick(Sender: TObject);
var
  I: Integer;
begin
  with Form1 do
    for I := MDIChildCount-1 downto 0 do
      MDIChildren[I].Close;
end;

procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;

procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

See Also

MDIChildren (see page 2173)

7.1.5.7.32 TCustomForm.MDIChildren Property

Provides indexed access to all MDI child forms.

Pascal

```
property MDIChildren [I: Integer]: TForm;
```

C++

```
__property TForm * MDIChildren[int I];
```

Description

Use MDIChildren to access a child form.

I is the index of the child form to access. The order of MDI children changes as different MDI forms are activated. Initially, forms are listed in creation order, with new forms being added to the end of the array. Whenever an MDI child is activated, however, it moves to the front of the list. Thus, use I to index over all forms in the array, but not to refer to a specific form.

MDIChildren is meaningful only if the form is an MDI frame (that is, if the form's FormStyle (see page 2162) property is set to fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
*/
void __fastcall TForm1::CloseChildrenClick(TObject *Sender)
{
  for(int i = MDIChildCount - 1; i >= 0; i--)
    MDIChildren[i]->Close();
}

void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
```

```
  Form1->ArrangeIcons();
}

void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
  }
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
}
procedure TForm1.CloseChildrenClick(Sender: TObject);
var
  I: Integer;
begin
  with Form1 do
    for I := MDIChildCount-1 downto 0 do
      MDIChildren[I].Close;
end;

procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;

procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

See Also

MDIChildCount (see page 2172)

FormStyle (see page 2162)

7.1.5.7.33 TCustomForm.Menu Property

Specifies the form's main menu.

Pascal

```
property Menu: TMainMenu;
```

C++

```
__property TMainMenu Menu;
```

Description

Use Menu to get or set the form's main menu. At design time, Menu is set to the first TMainMenu (see page 4828) component added to the form.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
```

```
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
/*
To create a toolbar that corresponds to an existing menu:

1   Drop a ToolBar on the form and add a ToolButton for each
  top-level menu item you wish to create.
2   Set the MenuItem property of each ToolButton to correspond
  to the top level menu items.
3   Set the Grouped property of each ToolButton to true.
4   Clear the Menu property of the Form (if it is assigned)
5   Set the Visible property on the ToolBar and ToolButtons to
  true.
6   Set the ShowCaptions property on the ToolBar to true.
7   Set the MenuItem | Visible property of each ToolButton to
  true.
*/
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
{
To create a toolbar that corresponds to an existing menu:

1   Drop a ToolBar on the form and add a ToolButton for each top-level menu item you wish to
create.
2   Set the MenuItem property of each ToolButton to correspond to the top level menu items.
3   Set the Grouped property of each ToolButton to true.
4   Clear the Menu property of the Form (if it is assigned)
5   Set the Visible property on the ToolBar and ToolButtons to true.
6   Set the ShowCaptions property on the ToolBar to true.
7   Set the MenuItem | Visible property of each ToolButton to true.
}
```

TMainMenu (see page 4828)

7.1.5.7.34 TCustomForm.ModalResult Property

Represents the return value of a form that is used as a modal dialog.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

Use ModalResult to close the form when it is displayed modally.

By default, ModalResult is mrNone. Set ModalResult to any nonzero value to close the form. The value assigned to ModalResult becomes the return value of the ShowModal (see page 2139) function call used to display the form.

Note: This property is modified automatically by some components such as the TButton object.

C++ Examples:

```
/*
This code brings up the modal dialog from Unit2 when a
button is clicked.  It causes a Beep if the OK button is
clicked. Implement the modal form in Unit2 and then put
Unit2 in the uses clause for this module.
*/
#include "Unit2.h"
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (MyDialogBox1->ShowModal() == mrOk)
    MessageBeep(0);
}
/*
The following methods are used for buttons in a form that is
used as a modal dialog box. The methods cause the dialog box
to terminate when the user clicks either the OK or Cancel
button, returning mrOk or mrCancel from ShowModal,
respectively. You could also set the ModalResult value to
mrOk for the OK button and mrCancel for the Cancel button to
accomplish the same thing. When the user clicks either
button, the dialog box closes.
*/
void __fastcall TMyDialogBox1::OKButtonClick(TObject *Sender)
{
  ModalResult = mrOk;
}

void __fastcall TMyDialogBox1::CancelButtonClick(TObject *Sender)
{
  ModalResult = mrCancel;
}
```

Delphi Examples:

```
{
This code brings up the modal dialog from Unit2 when a
button is clicked.  It causes a Beep if the OK button is
clicked. Implement the modal form in Unit2 and then put
Unit2 in the uses clause for this module.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
```

```
    if MyDialogBox1.ShowModal = mrOK then
      Beep;
  end;
  {
  The following methods are used for buttons in a form that is
  used as a modal dialog box. The methods cause the dialog box
  to terminate when the user clicks either the OK or Cancel
  button, returning mrOk or mrCancel from ShowModal,
  respectively. You could also set the ModalResult value to
  mrOk for the OK button and mrCancel for the Cancel button to
  accomplish the same thing. When the user clicks either
  button, the dialog box closes.
  }
  procedure TMyDialogBox1.CancelButtonClick(Sender: TObject);
  begin
    ModalResult := mrCancel;
  end;

  procedure TMyDialogBox1.OKButtonClick(Sender: TObject);
  begin
    ModalResult := mrOK;
  end;
```

ShowModal (see page 2139)

ModalResult

7.1.5.7.35 TCustomForm.Monitor Property

Provides access to the monitor on which the form appears.

Pascal

```
property Monitor: TMonitor;
```

C++

```
__property TMonitor Monitor;
```

Description

Use Monitor to access information about the monitor on which the form appears if the application runs on a multi-monitor system. The monitor is determined by the DefaultMonitor (see page 2158) property.

See Also

Monitors (see page 2474)

BoundsRect

DefaultMonitor (see page 2158)

MakeFullyVisible (see page 2129)

7.1.5.7.36 TCustomForm.ObjectMenuItem Property

Represents an OLE object menu item that reacts to selections of OLE objects.

Pascal

```
property ObjectMenuItem: TMenuItem;
```

C++

```
__property TMenuItem ObjectMenuItem;
```

Description

Use ObjectMenuItem to get or set a menu item that becomes enabled or disabled when an OLE object on the form is selected or unselected respectively.

The OLE object menu item can be used for standard OLE commands, such as Activate (see page 2111) or Convert. (The implementations of these commands are provided by the OLE server.)

See Also

OleFormObject (see page 2178)

7.1.5.7.37 TCustomForm.OldCreateOrder Property

Specifies when OnCreate (see page 2207) and OnDestroy (see page 2209) events occur.

Pascal

```
property OldCreateOrder: Boolean;
```

C++

```
__property Boolean OldCreateOrder;
```

Description

When OldCreateOrder is false (the default) the OnCreate (see page 2207) event occurs after all constructors are finished and the OnDestroy (see page 2209) event occurs before any destructors are called.

This differs from earlier versions of the library (distributed with Delphi version 3 and previous and C++Builder 1), where the OnCreate (see page 2207) event occurred when the TCustomForm (see page 2103) constructor executed and the OnDestroy (see page 2209) event occurred when the TCustomForm (see page 2103) destructor executed. Applications that require the OnCreate (see page 2207) event and OnDestroy (see page 2209) events to occur from the constructor and destructor of the form can set OldCreateOrder to true.

See Also

OnCreate (see page 2207)

OnDestroy (see page 2209)

BeforeDestruction (see page 2113)

AfterConstruction (see page 2112)

7.1.5.7.38 TCustomForm.OleFormObject Property

Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.

Pascal

```
property OleFormObject: IOleForm;
```

C++

```
__property IOleForm OleFormObject;
```

Description

OleFormObject is used to communicate resize and destroy notifications when a form is used as a frame for an in-place OLE object.

See Also

ObjectMenuItem (see page 2177)

7.1.5.7.39 TCustomForm.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

Font

Parent

ParentColor

ParentShowHint

7.1.5.7.40 TCustomForm.PixelsPerInch Property

Represents the proportion of the font on the system on which the form was designed.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Use PixelsPerInch at runtime to change how the form is scaled to the current screen resolution. If PixelsPerInch is changed from its default value, the form will not have the same proportion on every screen resolution.

At design time, PixelsPerInch is set automatically when the form is saved. Changes to PixelsPerInch made in the Object Inspector only affect the form at runtime.

The form's Scaled (see page 2187) property must be true for PixelsPerInch to have an effect.

See Also

Scaled (see page 2187)

7.1.5.7.41 TCustomForm.PopupChildren Property

Pascal

```
property PopupChildren: TList;
```

C++

```
__property TList PopupChildren;
```

Description

This is PopupChildren, a member of class TCustomForm.

7.1.5.7.42 TCustomForm.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
```

```
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
```

```
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
```

```
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

OnContextPopup

7.1.5.7.43 TCustomForm.PopupMode Property

Pascal

```
property PopupMode: TPopupMode;
```

C++

```
__property TPopupMode PopupMode;
```

Description

This is PopupMode, a member of class TCustomForm.

7.1.5.7.44 TCustomForm.PopupParent Property

Sets an order for stacked forms that users cannot change.

Pascal

```
property PopupParent: TCustomForm;
```

C++

```
__property TCustomForm PopupParent;
```

Description

If the PopupMode (see page 2185) property is set to pmExplicit and PopupParent is nil, then the Application.MainForm is implicitly used as the PopupParent. If no Application.MainForm is assigned, then Application.Handle is used as the PopupParent.

If the PopupMode (see page 2185) property is set to pmAuto, Screen.ActiveForm is used as the PopupParent property.

7.1.5.7.45 TCustomForm.Position Property

Represents the size and placement of the form.

Pascal

```
property Position: TPosition;
```

C++

```
__property TPosition Position;
```

Description

Use Position to get or set the size and placement of the form. Position can have one of the following TPosition (see page 2590) values:

Value	Meaning
poDesigned	The form appears positioned on the screen and with the same height and width as it had at design time.

poDefault	The form appears in a position on the screen and with a height and width determined by the operating system. Each time you run the application, the form moves slightly down and to the right. The right side of the form is always near the far right side of the screen, and the bottom of the form is always near the bottom of the screen, regardless of the screen's resolution. The operating system only supports this for overlapped windows. For a pop-up or child window (that has a BorderStyle (see page 2149) of bsDialog or bsNone, for example), the window is positioned in the upper left corner of the screen.
poDefaultPosOnly	The form displays with the size you created it at design time, but the operating system chooses its position on the screen. Each time you run the application, the form moves slightly down and to the right. When the form can no longer move down and to the right and keep the same size while remaining entirely visible on the screen, the form displays at the top-left corner of the screen. The operating system only supports this for overlapped windows. For a pop-up or child window (that has a BorderStyle (see page 2149) of bsDialog or bsNone, for example), the window is positioned in the upper left corner of the screen.
poDefaultSizeOnly	The form appears in the position you left it at design time, but the operating system chooses its size. The right side of the form is always near the far right side of the screen, and the bottom of the form is always near the bottom of the screen, regardless of the screen's resolution.
poScreenCenter	The form remains the size you left it at design time, but is positioned in the center of the screen. In multi-monitor applications, the form may be moved from this center position so that it falls entirely on one monitor, as specified by the DefaultMonitor (see page 2158) property.
poDesktopCenter	The form remains the size you left it at design time, but is positioned in the center of the screen. No adjustments are made for multi-monitor applications.
poMainFormCenter	The form remains the size you left it at design time, but is positioned in the center of the application's main form. No adjustments are made for multi-monitor applications. This position should only be used with secondary forms. If set for a main form, it acts like poScreenCenter.
poOwnerFormCenter	The form remains the size you left it at design time, but is positioned in the center of the form specified by the Owner property. If the Owner property does not specify a form, this position acts like poMainFormCenter.

OnResize

SetInitialBounds

7.1.5.7.46 TCustomForm.PrintScale Property

Represents the proportions of a printed form.

Pascal

```
property PrintScale: TPrintScale;
```

C++

```
__property TPrintScale PrintScale;
```

Description

Use PrintScale to get or set the proportions of the printed form. PrintScale can have one of the following TPrintScale (see page 2591) values:

Value	Meaning
poNone	No special scaling occurs; therefore, the printed form and how the form appears onscreen may appear squished or stretched.

poProportional	The form is printed so that the printed image is approximately the same visible size as on the screen (WYSIWYG). The form image is scaled so that the printed image is approximately the same visible size as on the screen.
poPrintToFit	The form is printed using the same screen proportions, but in a size that just fits the printed page.

See Also

Print (see page 2132)

7.1.5.7.47 TCustomForm.Scaled Property

Specifies whether the form is sized according to the value of the PixelsPerInch (see page 2179) property.

Pascal

```
property Scaled: Boolean;
```

C++

```
__property Boolean Scaled;
```

Description

Scaled determines whether the form adjusts itself to differences between the font used at design time and the current system font used by a system at runtime. If Scaled is true, the form resizes itself and all its child controls to maintain the relationship between the size of controls and the height of text displayed in the default font. If Scaled is false, no such resizing occurs.

By setting Scaled to true, the form can adjust to fonts that are not scalable (that is, fonts that only supply discrete point sizes) or to differences such as forms designed using small fonts at design time that are run on systems that use large fonts.

The degree of resizing is determined by the PixelsPerInch (see page 2179) property, which measures the proportion of the font on the system used when designing the form.

See Also

PixelsPerInch (see page 2179)

Considerations When Dynamically Resizing Forms and Controls

7.1.5.7.48 TCustomForm.ScreenSnap Property

Specifies whether form snaps to edge of screen.

Pascal

```
property ScreenSnap: Boolean;
```

C++

```
__property Boolean ScreenSnap;
```

Description

ScreenSnap determines whether the edges of the form snap to the edge of the screen when the user moves the form. To control the snap distance, set the SnapBuffer (see page 2188) property.

See Also

SnapBuffer (see page 2188)

7.1.5.7.49 TCustomForm.SnapBuffer Property

Specifies distance for screen snap.

Pascal

```
property SnapBuffer: Integer;
```

C++

```
__property int SnapBuffer;
```

Description

If ScreenSnap (see page 2187) is true, SnapBuffer determines the maximum number of pixels that be between the form edge and the screen edge before the form snaps to the screen edge.

See Also

ScreenSnap (see page 2187)

7.1.5.7.50 TCustomForm.TileMode Property

Represents how MDI child forms are arranged when the Tile method is called.

Pascal

```
property TileMode: TTileMode;
```

C++

```
__property TTileMode TileMode;
```

Description

TileMode can have one of the following TTileMode (see page 2593) values:

Value	Meaning
tbHorizontal	Each form stretches across the width of the parent form
tbVertical	Each form stretches along the height of the parent form

TileMode is meaningful only if the form is an MDI child (that is, if the form's FormStyle (see page 2162) property is set to fsMDIChild).

C++ Examples:

```
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
}
procedure TForm1.TileFormsClick(Sender: TObject);
begin
  TileMode := tbVertical;
  Tile;
end;
```

See Also

FormStyle (see page 2162)

Tile (see page 2249)

7.1.5.7.51 TCustomForm.Top Property

Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

Use Top to locate the top of the control or reposition the control to a different Y coordinate. The Top property, like the Left property, is the position of the control relative to its container. Thus, if a control is contained in a TPanel, the Left and Top properties are relative to the panel. If the control is contained directly by the form, it is relative to the form. For forms, the value of the Top property is relative to the screen in pixels.

C++ Examples:

```
/*
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control or is clicked, the controls within
the group box are moved in the appropriate direction.
*/
void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  int I;
  TControl *ChildControl;

  for (I = 0; I < GroupBox1->ControlCount; I++)
  {
    ChildControl = GroupBox1->Controls[I];
    if (Button == btNext)
      ChildControl->Top = ChildControl->Top + 15;
    else
      ChildControl->Top = ChildControl->Top - 15;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  const TColor colorarray[5] = {clYellow, clGreen, clBlue, clLime, clFuchsia};
  GroupBox1->Brush->Color = clRed;
  for (int i = 0; i < GroupBox1->ControlCount; i++)
    dynamic_cast<TWinControl *>(GroupBox1->Controls[i])->Brush->Color = colorarray[i];
}
```

Delphi Examples:

```
{
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control is clicked, the controls within
the group box are moved in the appropriate direction.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
const
  colorarray : Array[0..4] of TColor = (clYellow, clGreen, clBlue, clLime, clFuchsia);
begin
   GroupBox1.Brush.Color := clRed;
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    TWinControl(GroupBox1.Controls[I]).Brush.Color := colorarray[I];
  end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
var
  I: Integer;
  ChildControl: TControl;
begin
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    ChildControl := GroupBox1.Controls[I];
    if Button = btNext then
      ChildControl.Top := ChildControl.Top + 15
    else
      ChildControl.Top := ChildControl.Top - 15;
  end;
end;
```

See Also

Left

7.1.5.7.52 TCustomForm.TransparentColor Property

Specifies whether a color on the form appears transparent.

Pascal

```
property TransparentColor: Boolean;
```

C++

```
__property Boolean TransparentColor;
```

Description

Use TransparentColor to indicate that one of the colors on the form should be treated as transparent, allowing windows behind the form to completely show through. The TransparentColorValue (see page 2191) property indicates the color that appears completely transparent.

Note: To make the entire form transparent, or to make it translucent rather than transparent, use the AlphaBlend (see page 2147) and AlphaBlendValue (see page 2147) properties.

Note: TransparentColor does not work on all systems. The application must be running under Windows 2000 or better, with adequate hardware.

See Also

TransparentColorValue (see page 2191)

AlphaBlend (see page 2147)

AlphaBlendValue (see page 2147)

7.1.5.7.53 TCustomForm.TransparentColorValue Property

Indicates the color on the form that appears transparent when TransparentColor (see page 2190) is true.

Pascal

```
property TransparentColorValue: TColor;
```

C++

```
__property TColor TransparentColorValue;
```

Description

Use TransparentColorValue to indicate the color that appears transparent when the TransparentColor (see page 2190) property is true.

Note: If the application uses a 16-bit color palette, TransparentColorValue must be a basic color.

See Also

TransparentColor (see page 2190)

7.1.5.7.54 TCustomForm.VertScrollBar Property

Represents the vertical scroll bar for the scrolling windowed control.

Pascal

```
property VertScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar VertScrollBar;
```

Description

Use VertScrollBar to hide, show, or manipulate the vertical scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
```

```
}
```

Delphi Examples:

```
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

AutoScroll (see page 2561)

HorzScrollBar (see page 2562)

TControlScrollBar (see page 2009)

7.1.5.7.55 TCustomForm.Visible Property

Indicates whether the form is visible.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use Visible to determine whether the form is visible.

If Visible is true, the form is visible unless it is completely obscured by other forms. If Visible is false, the form is not visible.

The Show (see page 2137) and ShowModal (see page 2139) methods set Visible to true and bring the form to the front of all open windows.

C++ Examples:

```
/*
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must include Unit2.h in this
module.
*/
#include "Unit2.h"

void __fastcall TForm1::ShowPaletteButtonClick(TObject *Sender)
{
  if (!Form2->Visible)
  {
    Form2->Visible = true;
    Form2->BringToFront();
  }
}
```

Delphi Examples:

```
{
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must add Unit2 in the uses clause
of your unit.
}
procedure TForm1.ShowPaletteButtonClick(Sender: TObject);
begin
if Form2.Visible = False then Form2.Visible := True;
Form2.BringToFront;
end;
```

BringToFront

Show (see page 2137)

ShowModal (see page 2139)

7.1.5.7.56 TCustomForm.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width;
```

C++

```
__property Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
```

```
    pdlb->Width = Form1->ClientWidth/3;

    // Now use the splitter to divide the directory pane from the file pane.
    ps->Parent = Form1;
    ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
    ps->Align = pdlb->Align; // Give same alignment as directory list.

    // Each pane must be at least one quarter of the form's width.
    ps->MinSize = Form1->ClientWidth/4;

    // Finally, create the last pane - a file list box.
    pflb->Parent = Form1;
    pflb->Align = alClient;
    pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
```

7.1.5.7.57 TCustomForm.WindowMenu Property

Specifies the Window menu for an MDI parent form.

Pascal

```
property WindowMenu: TMenuItem;
```

C++

```
__property TMenuItem WindowMenu;
```

Description

Use WindowMenu to get or set the Window menu for an MDI parent form. The Window menu is a standard menu in MDI applications. It contains commands that let the user manage the windows in the application. Menu (see page 2174) items usually include Cascade, Arrange Icons, Tile, and so on.

The Window menu also lists (at the bottom) the child windows that are currently open in the application. When the user selects one of these windows from the menu, the window becomes the active window in the application.

Although this menu is commonly called the Window menu, it can have any name that corresponds to an existing menu item on the menu bar. The names of open child forms are merged onto the menu automatically at run-time.

WindowMenu is meaningful only if the form is an MDI parent (that is, if the form's FormStyle (see page 2162) property is set to fsMDIForm).

See Also

FormStyle (see page 2162)

7.1.5.7.58 TCustomForm.WindowState Property

Represents how the form appears on the screen.

Pascal

```
property WindowState: TWindowState;
```

C++

```
__property TWindowState WindowState;
```

Description

Set WindowState to minimize, maximize, or restore the form window. Read WindowState to determine whether the form is minimized, maximized, or in a normal state.

See Also

Icon (see page 2167)

BorderStyle (see page 2149)

7.1.5.8 TCustomForm Events

The events of the TCustomForm class are listed here.

Protected Events

	Name	Description
	OnActivate (see page 2196)	Occurs when the form becomes active.
	OnCanResize (see page 2202)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2203)	Occurs when the user clicks the control.
	OnClose (see page 2205)	Occurs when the form closes.
	OnCloseQuery (see page 2206)	Occurs when close is attempted.
	OnCreate (see page 2207)	Occurs when the form is created.

	OnDblClick (see page 2209)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2209)	Occurs when the form loses focus.
	OnDestroy (see page 2209)	Occurs when the form is destroyed.
	OnDragDrop (see page 2211)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2214)	Occurs when the user drags an object over a control.
	OnHelp (see page 2217)	Occurs when the form receives a request for help.
	OnHide (see page 2217)	Occurs when the form is hidden (that is, when its Visible (see page 2192) property is set to false).
	OnKeyDown (see page 2219)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2223)	Occurs when a key is pressed.
	OnKeyUp (see page 2224)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2226)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2227)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 2229)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2231)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 2233)	Occurs when the form is redrawn.
	OnResize (see page 2235)	Occurs immediately after the control is resized.
	OnShortCut (see page 2235)	Occurs when the user presses a key (before the OnKeyDown (see page 2219) event).
	OnShow (see page 2236)	Occurs when the form is shown (that is, when its Visible (see page 2192) property is set to true).

7.1.5.8.1 TCustomForm.OnActivate Event

Occurs when the form becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Use OnActivate to perform special processing when the form receives focus. A form becomes active when focus is transferred to it (when the user clicks on the form, for example).

Note: The OnActivate event of the application (TApplication (see page 1924)), not the form, occurs when Windows switches control from another application.

C++ Examples:

```
/*
This example fills a list box with the names of TDataSources
that are present and then fills a DBGrid a second form with
the data from the selected data source.  The DBGrid is not
filled in until Form2 is activated.  Here is the code for Form1
that fills the list box.
*/

TForm1 *Form1;
TTable *Customers, *Blobs;
Boolean Form1Done = False;

void CreateCustSource()
```

```
{

OnActivate (see page 1992)

7.1.5.8.2 TCustomForm.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize;
```

C++

```
__property OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

OnResize

7.1.5.8.3 TCustomForm.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

7.1.5.8.4 TCustomForm.OnClose Event

Occurs when the form closes.

Pascal

```
property OnClose: TCloseEvent;
```

C++

```
__property TCloseEvent OnClose;
```

Description

Use OnClose to perform special processing when the form closes. The OnClose event specifies which event handler to call when a form is about to close. The handler specified by OnClose might, for example, test to make sure all fields in a data-entry form have valid contents before allowing the form to close.

A form is closed by the Close (see page 2114) method or when the user chooses Close (see page 2114) from the form's system menu.

The TCloseEvent (see page 2597) type points to a method that handles the closing of a form. The value of the Action (see page 2144) parameter determines if the form actually closes. These are the possible values of Action (see page 2144):

Value	Meaning
caNone	The form is not allowed to close, so nothing happens.
caHide	The form is not closed, but just hidden. Your application can still access a hidden form.
caFree	The form is closed and all allocated memory for the form is freed.
caMinimize	The form is minimized, rather than closed. This is the default action for MDI child forms.

If a form is an MDI child form, and its BorderIcons (see page 2148) property is biMinimize, then the default Action (see page 2144) is caMinimize. If a MDI child form does not have these settings, the default Action (see page 2144) is caNone, meaning that nothing happens when the user attempts to close the form.

If a form is an SDI child form, Action (see page 2144) defaults to caHide.

To close the form and free it in an OnClose event, set Action (see page 2144) to caFree.

Note: When the application shuts down, the main form receives an OnClose event, but any child forms do not receive the OnClose event.

C++ Examples:

```
/*
This example displays a message dialog box when the user
attempts to close the form. If the user clicks the Yes
button, the form closes; otherwise, the form only minimizes.
TCustomForm.Close does not allow an action of caMinimize
for a form closing itself.  Close Form2 from Form1 (from
a button?) and implement the OnClose in Form2.  Place
"Application.CreateForm(TForm2, Form2);" in the project dpr
file to open Form2 and set the Form2 Visible property to
True.
*/
void __fastcall TForm2::FormClose(TObject *Sender, TCloseAction &Action)
{
  if (MessageDlg("Close application ?", mtConfirmation, TMsgDlgButtons() << mbYes << mbNo,0)
== mrYes)
    Action = caFree;
```

```
  else
    Action = caMinimize;
}
```

Delphi Examples:

```
{
This example displays a message dialog box when the user
attempts to close the form. If the user clicks the Yes
button, the form closes; otherwise, the form only minimizes.
TCustomForm.Close does not allow an action of caMinimize
for a form closing itself.  Close Form2 from Form1 (from
a button?) and implement the OnClose in Form2.  Place
"Application.CreateForm(TForm2, Form2);" in the project dpr
file to open Form2 and set the Form2 Visible property to
True.
}
procedure TForm2.FormClose(Sender: TObject; var Action: TCloseAction);
begin
  if MessageDlg('Close application ?', mtConfirmation,
    [mbYes, mbNo], 0) = mrYes then
    Action := caFree
  else
    Action := caMinimize;
end;
```

OnCreate (see page 2207)

OnCloseQuery (see page 2206)

OnDestroy (see page 2209)

7.1.5.8.5 TCustomForm.OnCloseQuery Event

Occurs when close is attempted.

Pascal

```
property OnCloseQuery: TCloseQueryEvent;
```

C++

```
__property TCloseQueryEvent OnCloseQuery;
```

Description

Use OnCloseQuery to specify the conditions under which the form can close. An OnCloseQuery event handler returns a Boolean CanClose value that determines whether a form is allowed to close. Its default value is true.

You can use an OnCloseQuery event handler to ask users if they are sure they really want the form closed immediately. For example, you can use the handler to display a message box that prompts the user to save a file before closing the form.

The TCloseQueryEvent (see page 2598) type points to the method that determines whether a form can be closed. The value of the CanClose parameter determines if the form can close or not.

C++ Examples:

```
/*
When the user attempts to close the form in this example, a
message dialog appears that asks the user if it is OK to
close the form. If the user chooses the OK button, the form
closes. If the user chooses Cancel, the form doesn't close.
Populate the OnCloseQuery event handler of the form.
*/
void __fastcall TForm1::FormCloseQuery(TObject *Sender, bool &CanClose)
```

```
{
  if (MessageDlg("Close the form?", mtConfirmation, TMsgDlgButtons() << mbOK << mbCancel,0) ==
mrCancel)
    CanClose = false;
}
```

Delphi Examples:

```
{
When the user attempts to close the form in this example, a
message dialog appears that asks the user if it is OK to
close the form. If the user chooses the OK button, the form
closes. If the user chooses Cancel, the form doesn't close.
Populate the OnCloseQuery event handler of the form.
}
procedure TForm1.FormCloseQuery(Sender: TObject; var CanClose: Boolean);
begin
  if MessageDlg('Close the form?', mtConfirmation,
    [mbOk, mbCancel], 0) = mrCancel then
     CanClose := False;
end;
```

OnClose (see page 2205)

7.1.5.8.6 TCustomForm.OnCreate Event

Occurs when the form is created.

Pascal

```
property OnCreate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCreate;
```

Description

Use OnCreate to perform special processing when the form is created and is invoked by TCustomForm (see page 2103)'s constructor. Either implement this event or override the constructor of the form; do not do both. Any objects created in the OnCreate event should be freed by the OnDestroy (see page 2209) event.

When a form is being created and its Visible (see page 2192) property is true, the following events occur in the order listed:

1. OnCreate2. OnShow3. OnActivate4. OnPaint (see page 2233)

Note: Use of the OnCreate event is discouraged in C++ code because it can interact badly with the form's constructor (see OldCreateOrder (see page 2178)). It is recommended that you override the form constructor instead.

C++ Examples:

```
/*
This example requires a new TPageControl, as is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
*/
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
const
  TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *page = new TTabSheet(PageControl1);  // These tabsheets are cleaned up by their
owner (PageControl1).
    page->PageControl = PageControl1;
    page->Caption = AnsiString("Page") + IntToStr(i);
    page->Brush->Color = colorPalette[i];
  }
}

void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  PageControl1->SelectNextPage(Button == btNext);
}
```

Delphi Examples:

```
{
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
const
  colorPalette: Array[0..11] of TColor =
    (clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple);
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet #' + IntToStr(i);
      Brush.Color := colorPalette[i];
    end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
begin
  PageControl1.SelectNextPage(Button = btNext);
end;
```

7.1.5.8.7 TCustomForm.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

7.1.5.8.8 TCustomForm.OnDeactivate Event

Occurs when the form loses focus.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Use OnDeactivate to perform special processing when the form transitions from being the active form to another form in the same application becoming the active form. If activation goes to another application, this event is not triggered. To determine if another application has become active, Use the TApplication (see page 1924) object's OnDeactivate event.

See Also

OnActivate (see page 2196)

OnDeactivate (see page 1992)

7.1.5.8.9 TCustomForm.OnDestroy Event

Occurs when the form is destroyed.

Pascal

```
property OnDestroy: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDestroy;
```

Description

Use OnDestroy to perform special processing when the form is destroyed. Either implement this event or override the destructor of the class, but not both. This event should destroy any objects created in the OnCreate (see page 2207) event.

C++ Examples:

```
/*
```

```
/*
This example uses the OnActiveControlChange event to detect
when focus changes on the form. When focus changes, the hint
for the active control is displayed on the status bar. To use
this example, you must add a status bar to the form and set
its SimplePanel property to true.  Add a new public procedure,
ActiveControlChanged, to the TForm1 class declaration.
*/
void _fastcall TForm1::ActiveControlChanged(System::TObject *Sender)
{
  TWinControl *Active = NULL;
  for (int I = 0; I < Form1->ControlCount; I++)
  {
    TWinControl *Temp = dynamic_cast<TWinControl *>(Form1->Controls[I]);
    if (Temp && Temp->Focused())
      Active = Temp;
  }
  if ((Active != NULL) && (Active->Hint != ""))
    StatusBar2->SimpleText = GetLongHint(Active->Hint) + " focus";
}

void __fastcall TForm1::MouseOverChanged(TObject *Sender)
{
  TWinControl *Active = dynamic_cast<TWinControl *>(Sender);
  if (Active != NULL)
    StatusBar1->SimpleText = GetLongHint(Active->Hint) + " mouse over";
}

/*
Assign this method as the OnActiveControlChange event
handler by setting it from the form's OnCreate event handler:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveControlChange = ActiveControlChanged;
}

/*
Make sure you clean up the screen object when the form is
freed by adding this OnDestroy event handler to the form:
*/
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  Screen->OnActiveControlChange = 0;
}
```

Delphi Examples:

```
{
The following code explicitly allocates memory for a pointer
in the OnCreate event of Form1, then releases the memory in
the OnDestroy event. Assume that MyPtr is a Pointer type
field of TForm1.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  New(MyPtr);
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  Dispose(MyPtr);
end;
```

7.1.5.8.10 TCustomForm.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
```

```
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}

7.1.5.8.11 TCustomForm.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
```

```
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}

7.1.5.8.12 TCustomForm.OnHelp Event

Occurs when the form receives a request for help.

Pascal

```
property OnHelp: THelpEvent;
```

C++

```
__property THelpEvent OnHelp;
```

Description

Write an OnHelp event handler to perform special processing when the user requests help. The HelpContext and the HelpJump methods automatically trigger the OnHelp event.

Set the CallHelp parameter to true if the application should still invoke the help system after the event. Set CallHelp to false to prevent the default response by the help system. The form calls the help system only if OnHelp's CallHelp parameter returns true or if no OnHelp event handler is assigned.

To find the possible values of the Command and Data parameters, search for WinHelp in the Win32 Developer's Reference Help (Win32.HLP) file, which explains the WinHelp API (application programming interface). The possible values for the Data parameter depend upon the value of the Command parameter.

The event handler returns true if it succeeds, false if it fails.

7.1.5.8.13 TCustomForm.OnHide Event

Occurs when the form is hidden (that is, when its Visible (see page 2192) property is set to false).

Pascal

```
property OnHide: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHide;
```

Description

Use OnHide to perform special processing when the form is hidden (that is, when the form's Visible (see page 2192) property is set to false).

C++ Examples:

```
/*
This example uses two forms, each with a label and a button.
When the user clicks a button, the other form appears and
the current form disappears. Also, a message appears in the
label of the form that is showing, indicating that the other
form is hidden. Set the OnHide event handle for each form to

7.1.5.8.14 TCustomForm.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse

buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/

OnKeyPress

OnKeyUp

7.1.5.8.15 TCustomForm.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/
```

```
void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;

7.1.5.8.16 TCustomForm.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.

OnKeyDown

OnKeyPress

7.1.5.8.17 TCustomForm.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

OnClick

OnMouseMove

OnMouseUp

MouseCapture

7.1.5.8.18 TCustomForm.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
```

```
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
```

```
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

MouseCapture

7.1.5.8.19 TCustomForm.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

OnMouseDown

OnMouseUp

MouseCapture

7.1.5.8.20 TCustomForm.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
```

```
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

7.1.5.8.21 TCustomForm.OnPaint Event

Occurs when the form is redrawn.

Pascal

```
  property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Use OnPaint to perform special processing when the form is redrawn. Any special painting on the form should be done in this event. OnPaint occurs before any controls on the form are painted.

To determine which portions of the form's canvas need to be repainted, use the ClipRect property of the canvas.

If you use the form's Canvas (see page 2150) property outside the OnPaint event, it will be erased and drawn-over by the next OnPaint event.

C++ Examples:

```
/*
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
*/

#include <memory>       //for STL auto_ptr class

Graphics::TBitmap *TheGraphic;

void __fastcall TForm1::FormPaint(TObject *Sender)// OnPaint event handler
{
  Form1->Canvas->Draw(0, 0, TheGraphic); // Draw the graphic on the Canvas
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  static std::auto_ptr<Graphics::TBitmap> _TheGraphicCleaner(TheGraphic = new
Graphics::TBitmap());  // Create the bitmap object
  TheGraphic->LoadFromFile("..\\bigf.bmp"); // Load the bitmap from a file
}
```

Delphi Examples:

```
{
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
}
procedure TForm1.FormPaint(Sender: TObject); { OnPaint event handler}
begin
  Form1.Canvas.Draw(0, 0, TheGraphic); { Draw the graphic on the Canvas }
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  TheGraphic := TBitmap.Create; { Create the bitmap object }
  TheGraphic.LoadFromFile('bigf.bmp'); { Load the bitmap from a file}
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  (TheGraphic as TObject).Free;
end;
```

7.1.5.8.22 TCustomForm.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize;
```

C++

```
__property OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

C++ Examples:

```
/*
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
*/
void __fastcall TForm1::FormResize(TObject *Sender)
{
  Button1->Left = Form1->ClientWidth - Button1->Width;
}
```

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

7.1.5.8.23 TCustomForm.OnShortCut Event

Occurs when the user presses a key (before the OnKeyDown (see page 2219) event).

Pascal

```
property OnShortCut: TShortCutEvent;
```

C++

```
__property TShortCutEvent OnShortCut;
```

Description

Use OnShortCut to dispatch shortcut keystrokes before the form handles them. When the user presses a key, the form can dispatch it as a shortcut key instead of allowing the standard keystroke processing (OnKeyDown (see page 2219), OnKeyPress (see page 2223), and OnKeyUp (see page 2224)). Built-in shortcut processing is provided for menu shortcuts and actions associated with the form. OnShortCut allows the form to implement additional shortcuts.

If the OnShortCut implements a response to the keystroke, set the Handled parameter of the event handler to true. This prevents the keystroke from being passed on to menus or actions associated with the form. It also prevents the standard keystroke processing in the same way that a menu or action shortcut does.

IsShortCut (see page 4845)

7.1.5.8.24 TCustomForm.OnShow Event

Occurs when the form is shown (that is, when its Visible (see page 2192) property is set to true).

Pascal

```
property OnShow: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnShow;
```

Description

Use OnShow to perform special processing when the form is shown (that is, when the form's Visible (see page 2192) property is set to true).

C++ Examples:

```
/*
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form's OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  Caption = AnsiString("Now working on tab: " + PageControl1->ActivePage->Caption);
}

void __fastcall TForm1::FormShow(TObject *Sender)
{
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This project requires a Page Control.  You will need to
```

```
  populate the Page Control by right clicking and selecting
  New Page from the context menu. As the tabs are selected by
  the user, the Page Control OnChange event fires, which
  causes the form caption to display the captions of each of
  the TTabSheets attached to the Page Control.
  Note the use of the Form's OnShow event handler to set the
  caption when the form first appears.  This occurs before
  any changes trigger the OnChange event of the Page Control.
  }
  procedure TForm1.PageControl1Change(Sender: TObject);
  begin
    Caption := ' Now working on tab:  ' + PageControl1.ActivePage.Caption;
  end;

  procedure TForm1.FormShow(Sender: TObject);
  begin
    PageControl1Change(Sender);
  end;
```

7.1.6 TCustomFrame Class

TCustomFrame is the base class from which TFrame (see page 2366) descends.

Class Hierarchy

Pascal

```
TCustomFrame = class(TScrollingWinControl);
```

C++

```
class TCustomFrame : public TScrollingWinControl;
```

File

Forms

Description

TCustomFrame is the base class for frames. A frame, like a form, is a container for controls and components. It uses the same ownership mechanism as forms for automatic instantiation and destruction of the components on it, and the same parent-child relationships for synchronization of component properties. Unlike forms, however, frames can be nested within forms or other frames, and can be saved on the Component palette for easy reuse. After a frame is created and saved, it continues to function as a unit and to inherit changes from the components (including other frames) it contains. Moreover, an embedded frame continues to inherit changes made to the frame from which it is derived.

Do not create instances of TCustomFrame. Instead, to create and work with frames, define a TCustomFrame descendant by choosing File|New|Frame, and adding the controls and components that you want your frame to encapsulate.

TForm (see page 2241)

TScrollingWinControl (see page 2554)

TFrame (see page 2366)

7.1.6.1 TCustomFrame Members

The following tables list the members exposed by TCustomFrame.

Protected Methods

	Name	Description
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CreateParams (see page 2239)	Initializes frame creation parameters for efficient redrawing.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	DoFlipChildren (see page 2560)	Flips the control's children.
	PaintWindow (see page 2240)	Renders the image of a windowed control.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.
	SetParent (see page 2240)	Sets the Parent property.

Protected Properties

	Name	Description
	AutoScroll (see page 2561)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Public Methods

	Name	Description
	Create (see page 2238)	Creates and initializes a TCustomFrame (see page 2237) object.
	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	GetChildren (see page 2239)	Calls a specified method for each child of the frame.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.

Published Properties

	Name	Description
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.

7.1.6.2 TCustomFrame.Create Constructor

Creates and initializes a TCustomFrame (see page 2237) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFrame(TComponent * AOwner);
```

Description

Use Create to create and initialize a frame.

AOwner is the component that owns the frame.

See Also

TFrame (see page 2366)

Owner

ParentWindow

7.1.6.3 TCustomFrame Methods

The methods of the TCustomFrame class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 2239)	Initializes frame creation parameters for efficient redrawing.
	PaintWindow (see page 2240)	Renders the image of a windowed control.
	SetParent (see page 2240)	Sets the Parent property.

Public Methods

	Name	Description
	GetChildren (see page 2239)	Calls a specified method for each child of the frame.

7.1.6.3.1 TCustomFrame.CreateParams Method

Initializes frame creation parameters for efficient redrawing.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 2559) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle.

See Also

CreateParams (see page 2559)

CreateWnd (see page 2559)

CreateWindowHandle

7.1.6.3.2 TCustomFrame.GetChildren Method

Calls a specified method for each child of the frame.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the component streaming system that loads and saves forms and data modules. Applications seldom need to call this routine.

Proc is a callback to execute for every component in the frame.

Root indicates the top-level component that is the entry point for the entire streaming process. This can be a form, data module, or frame.

GetChildren executes the method specified by Proc for every component contained by the frame. It provides extra support for components that do not have parents if the Root parameter identifies this frame.

See Also

GetChildren

7.1.6.3.3 TCustomFrame.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler

PaintTo

7.1.6.3.4 TCustomFrame.SetParent Method

Sets the Parent property.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. TCustomFrame (see page 2237) overrides the method inherited from TControl to

Update the parent form so that it is aware of any action lists in the frame.

Regenerate the frame's window so that it fits properly into its new parent.

Parent

7.1.7 TForm Class

TForm represents a standard application window (form).

Class Hierarchy

Pascal

```
TForm = class(TCustomForm);
```

C++

```
class TForm : public TCustomForm;
```

File

Forms

Description

When you create forms in the Form designer at design time, they are implemented as descendants of TForm. Forms (see page 1921) can represent the application's main window, or dialog boxes, or MDI children. A form can contain other objects, such as TButton, TCheckBox, and TComboBox objects.

Examples of forms include TLoginDialog and TPasswordDialog objects.

7.1.7.1 TForm Members

The following tables list the members exposed by TForm.

Protected Fields

	Name	Description
	FFormState (see page 2110)	This is FFormState, a member of class TCustomForm.

Protected Methods

	Name	Description
	Activate (see page 2111)	Activation event dispatcher.
	ActiveChanged (see page 2112)	Active (see page 2145) state event dispatcher.
V	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
V	AlignControls (see page 2113)	Aligns all child controls of the form that fall within a specified rectangle.
V	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
V	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
V	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
V	BeginAutoDrag (see page 2113)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
V	ChangeScale (see page 2114)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
V	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CloseModal (see page 2115)	This is CloseModal, a member of class TCustomForm.
V	CreateParams (see page 2116)	Initializes the window-creation parameter record when the form window is created.
V	CreateParams (see page 2559)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
V	CreateWindowHandle (see page 2116)	Creates a form window given a set of window-creation parameters.
V	CreateWnd (see page 2117)	Creates the form window.
V	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	Deactivate (see page 2117)	Generates an OnDeactivate (see page 2209) event.
V	DefineProperties (see page 2118)	Designates methods for storing a form's unpublished data on a stream such as a form file.
V	DestroyHandle (see page 2119)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 2119)	Destroys the window created in the CreateWindowHandle (see page 2116) method.
	DoClose (see page 2120)	Form closing event dispatcher.
V	DoCreate (see page 2120)	Form creation event dispatcher.
V	DoDestroy (see page 2121)	Form destruction event dispatcher.
V	DoDock (see page 2121)	Docking event dispatcher.
V	DoFlipChildren (see page 2560)	Flips the control's children.
	DoHide (see page 2122)	Form hide event dispatcher.
	DoShow (see page 2122)	Form show event dispatcher.
	get_ActiveMDIChild (see page 2123)	This is get_ActiveMDIChild, a member of class TCustomForm.
	get_MDIChildCount (see page 2123)	This is get_MDIChildCount, a member of class TCustomForm.

	get_MDIChildren (see page 2123)	This is get_MDIChildren, a member of class TCustomForm.
	GetBorderIconStyles (see page 2123)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 2124)	This is GetBorderStyles, a member of class TCustomForm.
V	GetClientRect (see page 2124)	Returns the value of the ClientRect property.
V	GetFloating (see page 2125)	Returns the value of the Floating property.
	GetOwnerWindow (see page 2127)	This is GetOwnerWindow, a member of class TCustomForm.
	HandleCreateException (see page 2127)	Handles exceptions that are raised by the OnCreate (see page 2207) event handler.
	InitializeNewForm (see page 2128)	This is InitializeNewForm, a member of class TCustomForm.
V	Loaded (see page 2129)	Performs fix-ups when the form is first loaded into memory.
V	Notification (see page 2130)	Responds to notifications that objects are about to be inserted or removed.
	Paint (see page 2131)	Generates an OnPaint (see page 2233) event.
V	PaintWindow (see page 2131)	Renders the image of the form.
V	PaletteChanged (see page 2132)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
V	QueryInterface (see page 2132)	Returns a reference to a specified interface if that interface is supported by the form.
V	ReadState (see page 2133)	Reads the form's published properties, stored data, and owned components from a reader object.
V	RequestAlign (see page 2134)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
V	Resizing (see page 2134)	Makes any required adjustments when the form changes size.
V	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.
V	SetChildOrder (see page 2135)	Changes the order in which Child appears when GetChildren (see page 2124) is called.
V	SetParent (see page 2136)	Sets the Parent property.
V	SetParentBiDiMode (see page 2136)	Sets the ParentBiDiMode property.
V	UpdateActions (see page 2140)	Updates all actions associated with the form.
	UpdateWindowState (see page 2141)	Updates the WindowState (see page 2195) property to reflect the current state of the form.
V	ValidateRename (see page 2141)	Determines if a form can rename one of its owned components.
V	VisibleChanging (see page 2141)	Responds just before the form changes the value of its Visible (see page 2192) property.
V	WndProc (see page 2142)	Provides specific message responses for the form.

Protected Properties

	Name	Description
R	PopupChildren (see page 2179)	This is PopupChildren, a member of class TCustomForm.

Public Methods

	Name	Description
V	AfterConstruction (see page 2112)	Construction event dispatcher.
	ArrangeIcons (see page 2247)	Arranges the icons of minimized MDI child forms.
V	BeforeDestruction (see page 2113)	Destruction event dispatcher.
	Cascade (see page 2248)	Arranges MDI child forms so they overlap.
	Close (see page 2114)	Closes the form.
V	CloseQuery (see page 2115)	Close (see page 2114) attempt event dispatcher.
V	Create (see page 2108)	Creates and initializes a new TForm (see page 2241) object.
V	Create (see page 2555)	Creates and initializes a new TScrollingWinControl (see page 2554) object.
V	CreateNew (see page 2108)	Creates and initializes a new form.
V	DefaultHandler (see page 2118)	Provides message handling for all messages that the form does not fully process.
	DefocusControl (see page 2118)	Removes focus from a control on the form.
V	Destroy (see page 2109)	Removes the form from memory.
V	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
V	Dock (see page 2120)	Handles automatic docking of the form into other windows.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.

	FocusControl (see page 2122)	Sets focus to a control on the form.
V	GetChildren (see page 2124)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetFormImage (see page 2125)	Returns a bitmap of the form.
	Hide (see page 2127)	Hides the form.
	IsShortCut (see page 2128)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 2129)	Ensures that the form is fully visible on a specified monitor.
V	MouseWheelHandler (see page 2130)	Directs mouse wheel messages to the appropriate control.
	Next (see page 2249)	Activates the next child form in the form sequence.
	Previous (see page 2249)	Activates the previous MDI child form in the form sequence.
	Print (see page 2132)	Prints the form.
	RecreateAsPopup (see page 2133)	This is RecreateAsPopup, a member of class TCustomForm.
	Release (see page 2133)	Destroys the form and frees its associated memory.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 2134)	Cancels modes on the form.
	set_PopupParent (see page 2135)	This is set_PopupParent, a member of class TCustomForm.
V	SetFocus (see page 2135)	Sets focus to the form.
V	SetFocusedControl (see page 2136)	Sets focus to a control on the form.
	Show (see page 2137)	Shows the form.
V	ShowModal (see page 2139)	Shows a form as a modal dialog.
	Tile (see page 2249)	Arranges MDI child forms so that they are all the same size.
V	WantChildKey (see page 2142)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
R	Active (see page 2145)	Specifies whether the form has focus.
	ActiveMDIChild (see page 2254)	Specifies the MDI child that has focus.
	ActiveOleControl (see page 2146)	Specifies the OLE control on the form that reacts to changes in focus.
R	Canvas (see page 2150)	Provides access to the drawing area of the form.
	ClientHandle (see page 2264)	Provides access to the handle of the form's internal MDI client window.
	Designer (see page 2159)	Specifies the designer interface for the form.
	DockManager (see page 2270)	Specifies the control's docking manager interface.
	DropTarget (see page 2159)	Specifies whether the form is the target of a drag-and-drop operation.
R	FormState (see page 2161)	Indicates transitional state information about the form.
	MDIChildCount (see page 2288)	Specifies the number of open MDI child forms.
	MDIChildren (see page 2289)	Provides indexed access to all MDI child forms.
	ModalResult (see page 2176)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 2177)	Provides access to the monitor on which the form appears.
	OleFormObject (see page 2178)	Specifies the IOleForm (see page 2572) interface for an in-place OLE object contained in the form.
	TileMode (see page 2304)	Represents how MDI child forms are arranged when the Tile method is called.

Published Events

	Name	Description
	OnActivate (see page 2312)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 2318)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2318)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 2319)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2319)	Occurs when the user clicks the control.
	OnClose (see page 2321)	Occurs when the form closes.
	OnCloseQuery (see page 2323)	Occurs when close is attempted.
	OnConstrainedResize (see page 2324)	Adjust resize constraints.
	OnContextPopup (see page 2324)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 2325)	Occurs when the form is created.

	OnDblClick (see page 2327)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2327)	Occurs when the form loses focus.
	OnDestroy (see page 2327)	Occurs when the form is destroyed.
	OnDockDrop (see page 2329)	Occurs when another control is docked to the control.
	OnDockOver (see page 2331)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2333)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2336)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2339)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 2339)	Returns the control's docking information.
	OnHelp (see page 2341)	Occurs when the form receives a request for help.
	OnHide (see page 2342)	Occurs when the form is hidden (that is, when its Visible property is set to false).
	OnKeyDown (see page 2344)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2347)	Occurs when a key is pressed.
	OnKeyUp (see page 2348)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2350)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2351)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2353)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2354)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2354)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2356)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2359)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2359)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2359)	Occurs when the mouse wheel is rotated upward.
	OnPaint (see page 2360)	Occurs when the form is redrawn.
	OnResize (see page 2361)	Occurs immediately after the control is resized.
	OnShortCut (see page 2362)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShow (see page 2362)	Occurs when the form is shown (that is, when its Visible property is set to true).
	OnStartDock (see page 2363)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnUnDock (see page 2364)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Action (see page 2252)	Designates the action associated with the control.
	ActiveControl (see page 2253)	Specifies the control that has focus on the form.
	Align (see page 2254)	Determines how the control aligns within its container (parent control).
	AlphaBlend (see page 2257)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2258)	Specifies the degree of translucency on a translucent form.
	Anchors (see page 2258)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2259)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2259)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BiDiMode (see page 2260)	Specifies the bi-directional mode for the control.
	BorderIcons (see page 2260)	Specifies which icons appear on the title bar of the form.
	BorderStyle (see page 2261)	Specifies the appearance and behavior of the form border.
	BorderWidth (see page 2262)	Specifies the width of the control's border.
	Caption (see page 2262)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 2265)	Specifies the height (in pixels) of the form's client area.
	ClientWidth (see page 2266)	Specifies the width (in pixels) of the form's client area.
	Color (see page 2268)	Specifies the background color of the control.

	Constraints (see page 2269)	Specifies the size constraints for the control.
	Ctl3D (see page 2269)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2270)	Specifies the monitor on which the form appears.
	DockSite (see page 2272)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2273)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragKind (see page 2275)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2275)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2277)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2277)	Controls the attributes of text written on or in the control.
	FormStyle (see page 2279)	Determines the form's style.
	GlassFrame (see page 2281)	This is GlassFrame, a member of class TForm.
	Height (see page 2281)	Specifies the vertical size of the control in pixels.
	HelpFile (see page 2282)	Specifies the name of the file the form uses to display Help.
	HorzScrollBar (see page 2283)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 2284)	Specifies the icon that appears when the form is minimized.
	KeyPreview (see page 2284)	Specifies whether the form should receive keyboard events before the active control.
	Left (see page 2171)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Menu (see page 2290)	Specifies the form's main menu.
	ObjectMenuItem (see page 2292)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 2292)	Specifies when OnCreate and OnDestroy events occur.
	Padding (see page 2292)	Specifies the padding of a control.
	ParentBiDiMode (see page 2293)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 2293)	Determines where a control looks for its font information.
	PixelsPerInch (see page 2294)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 2294)	Identifies the pop-up menu associated with the control.
	PopupMode (see page 2299)	Controls how the top-level form behaves with respect to Window's WS_POPUP style.
	PopupParent (see page 2300)	Sets an order for stacked forms that users cannot change.
	Position (see page 2300)	Represents the size and placement of the form.
	PrintScale (see page 2301)	Represents the proportions of a printed form.
	Scaled (see page 2302)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ScreenSnap (see page 2302)	Specifies whether form snaps to edge of screen.
	ShowHint (see page 2302)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SnapBuffer (see page 2304)	Specifies distance for screen snap.
	Top (see page 2189)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	TransparentColor (see page 2305)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2306)	Indicates the color on the form that appears transparent when TransparentColor is true.
	UseDockManager (see page 2306)	Specifies whether the docking manager is used in drag-and-dock operations.
	VertScrollBar (see page 2306)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 2307)	Indicates whether the form is visible.
	Width (see page 2308)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 2310)	Specifies the Window menu for an MDI parent form.
	WindowState (see page 2310)	Represents how the form appears on the screen.

7.1.7.2 TForm Methods

The methods of the TForm class are listed here.

Public Methods

	Name	Description
	ArrangeIcons (see page 2247)	Arranges the icons of minimized MDI child forms.
	Cascade (see page 2248)	Arranges MDI child forms so they overlap.
	Next (see page 2249)	Activates the next child form in the form sequence.
	Previous (see page 2249)	Activates the previous MDI child form in the form sequence.
	Tile (see page 2249)	Arranges MDI child forms so that they are all the same size.

7.1.7.2.1 TForm.ArrangeIcons Method

Arranges the icons of minimized MDI child forms.

Pascal

```
procedure ArrangeIcons;
```

C++

```
__fastcall ArrangeIcons();
```

Description

Use ArrangeIcons to arrange the icons of minimized MDI child forms so they are evenly spaced and don't overlap.

ArrangeIcons works only if the form is an MDI parent form (that is, if the form's FormStyle (see page 2279) property is fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
```

See Also

Cascade (see page 2248)

Tile (see page 2249)

FormStyle (see page 2162)

7.1.7.2.2 TForm.Cascade Method

Arranges MDI child forms so they overlap.

Pascal

```
procedure Cascade;
```

C++

```
__fastcall Cascade();
```

Description

Use Cascade to arrange MDI child forms so they overlap.

Cascade works only if the form is an MDI parent form (that is, if the form's FormStyle (see page 2279) property is fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to fsMDIForm. The others have their
FormStyle properties set to fsMDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyCascade. This is code for the
MyCascadeClick handler.  When the user chooses the
Cascade command, restored forms are arranged
so that they overlap.  DO NOT name the menu items "Cascade"
as that will override the TForm method.
*/
void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to fsMDIForm. The others have their
FormStyle properties set to fsMDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyCascade. This is code for the
MyCascadeClick handler.  When the user chooses the
Cascade command, restored forms are arranged
so that they overlap.  DO NOT name the menu items "Cascade"
as that will override the TForm method.
}
procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

See Also

Tile (see page 2249)

ArrangeIcons (see page 2247)

FormStyle (see page 2162)

7.1.7.2.3 TForm.Next Method

Activates the next child form in the form sequence.

Pascal

```
procedure Next;
```

C++

```
__fastcall Next();
```

Description

Use Next to change the active child form of an MDI parent. For example, if you have three child forms within a parent form and Form2 is the active form, the Next method makes Form3 the active form. Calling Next again makes Form4 active. The next time your application calls Next, the sequence starts over again and Form2 becomes the active form once again.

The Next method applies only to forms that are MDI parent forms (have a FormStyle (see page 2279) property value of fsMDIForm).

See Also

Previous (see page 2249)

FormStyle (see page 2162)

7.1.7.2.4 TForm.Previous Method

Activates the previous MDI child form in the form sequence.

Pascal

```
procedure Previous;
```

C++

```
__fastcall Previous();
```

Description

Use Previous to change the active child form of an MDI parent. For example, if you have three child forms within a parent form and Form4 is the active form, the Previous method makes Form3 the active form. Calling Previous again makes Form2 active. The next time your application calls Previous, the sequence starts over again and Form4 becomes the active form once again.

The Previous method applies only to forms that are MDI parent forms (have a FormStyle (see page 2279) property value of fsMDIForm).

See Also

Next (see page 2249)

7.1.7.2.5 TForm.Tile Method

Arranges MDI child forms so that they are all the same size.

Pascal

```
procedure Tile;
```

C++

```
__fastcall Tile();
```

Description

Use Tile to arrange MDI child forms so that they are all the same size. Tiled forms completely fill up the client area of the parent form. How the forms arrange themselves depends upon the values of their TileMode (see page 2304) properties.

Tile works only if the form is an MDI parent form (that is, if the form's FormStyle (see page 2279) property is fsMDIForm).

C++ Examples:

```
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
}
procedure TForm1.TileFormsClick(Sender: TObject);
begin
  TileMode := tbVertical;
  Tile;
end;
```

TileMode (see page 2188)

7.1.7.3 TForm Properties

The properties of the TForm class are listed here.

Public Properties

	Name	Description
	ActiveMDIChild (see page 2254)	Specifies the MDI child that has focus.
	ClientHandle (see page 2264)	Provides access to the handle of the form's internal MDI client window.
	DockManager (see page 2270)	Specifies the control's docking manager interface.
	MDIChildCount (see page 2288)	Specifies the number of open MDI child forms.
	MDIChildren (see page 2289)	Provides indexed access to all MDI child forms.
	TileMode (see page 2304)	Represents how MDI child forms are arranged when the Tile method is called.

Published Properties

	Name	Description
	Action (see page 2252)	Designates the action associated with the control.
	ActiveControl (see page 2253)	Specifies the control that has focus on the form.
	Align (see page 2254)	Determines how the control aligns within its container (parent control).
	AlphaBlend (see page 2257)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 2258)	Specifies the degree of translucency on a translucent form.
	Anchors (see page 2258)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2259)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2259)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BiDiMode (see page 2260)	Specifies the bi-directional mode for the control.
	BorderIcons (see page 2260)	Specifies which icons appear on the title bar of the form.
	BorderStyle (see page 2261)	Specifies the appearance and behavior of the form border.
	BorderWidth (see page 2262)	Specifies the width of the control's border.
	Caption (see page 2262)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 2265)	Specifies the height (in pixels) of the form's client area.
	ClientWidth (see page 2266)	Specifies the width (in pixels) of the form's client area.
	Color (see page 2268)	Specifies the background color of the control.
	Constraints (see page 2269)	Specifies the size constraints for the control.
	Ctl3D (see page 2269)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 2270)	Specifies the monitor on which the form appears.
	DockSite (see page 2272)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2273)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragKind (see page 2275)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2275)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2277)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2277)	Controls the attributes of text written on or in the control.
	FormStyle (see page 2279)	Determines the form's style.
	GlassFrame (see page 2281)	This is GlassFrame, a member of class TForm.
	Height (see page 2281)	Specifies the vertical size of the control in pixels.
	HelpFile (see page 2282)	Specifies the name of the file the form uses to display Help.
	HorzScrollBar (see page 2283)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 2284)	Specifies the icon that appears when the form is minimized.
	KeyPreview (see page 2284)	Specifies whether the form should receive keyboard events before the active control.
	Menu (see page 2290)	Specifies the form's main menu.
	ObjectMenuItem (see page 2292)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 2292)	Specifies when OnCreate and OnDestroy events occur.
	Padding (see page 2292)	Specifies the padding of a control.
	ParentBiDiMode (see page 2293)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 2293)	Determines where a control looks for its font information.
	PixelsPerInch (see page 2294)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 2294)	Identifies the pop-up menu associated with the control.
	PopupMode (see page 2299)	Controls how the top-level form behaves with respect to Window's WS_POPUP style.
	PopupParent (see page 2300)	Sets an order for stacked forms that users cannot change.
	Position (see page 2300)	Represents the size and placement of the form.
	PrintScale (see page 2301)	Represents the proportions of a printed form.
	Scaled (see page 2302)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ScreenSnap (see page 2302)	Specifies whether form snaps to edge of screen.

	ShowHint (see page 2302)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SnapBuffer (see page 2304)	Specifies distance for screen snap.
	TransparentColor (see page 2305)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 2306)	Indicates the color on the form that appears transparent when TransparentColor is true.
	UseDockManager (see page 2306)	Specifies whether the docking manager is used in drag-and-dock operations.
	VertScrollBar (see page 2306)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 2307)	Indicates whether the form is visible.
	Width (see page 2308)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 2310)	Specifies the Window menu for an MDI parent form.
	WindowState (see page 2310)	Represents how the form appears on the screen.

7.1.7.3.1 TForm.Action Property

Designates the action associated with the control.

Pascal

```
property Action;
```

C++

```
__property Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

Delphi Examples:

```
{
This example shows that OnClick is the default event of a form.
When the form is created, the OnExecute event of its Action property
is initialized to some user-defined procedure, which randomly changes
the color of the form.
}
procedure TForm1.ChangeColor(Sender: TObject);
begin
  { randomly change the color of the form }
  Color := Random($FFFF);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { allocate memory for the Action property }
  Action := TBasicAction.Create(Self);

  { set the OnExecute event handler }
  Action.OnExecute := ChangeColor;

  { initialize the random number generator }
  Randomize;
end;
```

7.1.7.3.2 TForm.ActiveControl Property

Specifies the control that has focus on the form.

Pascal

```
property ActiveControl: TWinControl;
```

C++

```
__property TWinControl * ActiveControl;
```

Description

Use ActiveControl to get or set the control that has focus on the form. Only one control can have focus at a given time in an application.

If the form does not have focus, ActiveControl is the control on the form that will receive focus when the form receives focus.

Note: When focus shifts to another control, ActiveControl is updated before the OnExit event occurs.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

See Also

ActiveOleControl (see page 2146)

OnExit

OnEnter

Active (see page 2145)

7.1.7.3.3 TForm.ActiveMDIChild Property

Specifies the MDI child that has focus.

Pascal

```
property ActiveMDIChild: TForm;
```

C++

```
__property TForm * ActiveMDIChild;
```

Description

Use ActiveMDIChild to get the MDI child that has focus.

If the form is not an MDI parent (that is, if the FormStyle property of the form is not fsMDIForm), ActiveMDIChild returns nil (Delphi) or NULL (C++).

See Also

FormStyle (see page 2162)

MDIChildCount (see page 2172)

7.1.7.3.4 TForm.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
```

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var

Anchors

7.1.7.3.5 TForm.AlphaBlend Property

Specifies whether the form is translucent.

Pascal

```
property AlphaBlend: Boolean;
```

C++

```
__property Boolean AlphaBlend;
```

Description

Set AlphaBlend to specify that the form represents a layered window that allows a translucent color. The AlphaBlendValue property specifies the degree of translucency.

Note: AlphaBlend does not work on all systems. The application must be running under Windows 2000 or better, and the machine must be a P90 or better.

See Also

AlphaBlendValue (see page 2147)

TransparentColor (see page 2190)

7.1.7.3.6 TForm.AlphaBlendValue Property

Specifies the degree of translucency on a translucent form.

Pascal

```
property AlphaBlendValue: Byte;
```

C++

```
__property Byte AlphaBlendValue;
```

Description

Set AlphaBlendValue to a value between 0 and 255 to indicate the degree of translucency when the AlphaBlend property is true. A value of 0 indicates a completely transparent window. A value of 255 indicates complete opacity.

Note: AlphaBlendValue only has an effect when the AlphaBlend property is true.

See Also

AlphaBlend (see page 2147)

TransparentColor (see page 2190)

TransparentColorValue (see page 2191)

7.1.7.3.7 TForm.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at

design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

7.1.7.3.8 TForm.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.7.3.9 TForm.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints

CanAutoSize

7.1.7.3.10 TForm.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

7.1.7.3.11 TForm.BorderIcons Property

Specifies which icons appear on the title bar of the form.

Pascal

```
property BorderIcons: TBorderIcons;
```

C++

```
__property TBorderIcons BorderIcons;
```

Description

Use BorderIcons to get or set the icons that appear on the title bar of the form. BorderIcons can include any of the following TBorderIcons values:

Value	Meaning
biSystemMenu	The form has a Control menu (also known as a System menu).
biMinimize	The form has a Minimize button
biMaximize	The form has a Maximize button
biHelp	If BorderStyle is bsDialog or biMinimize and biMaximize are excluded, a question mark appears in the form's title bar and when clicked, the cursor changes to crHelp; otherwise,no question mark appears.

Note: Certain combinations of the BorderIcons and BorderStyle properties are mutually exclusive. For example, BorderIcons biMax, biMin with BorderStyle of bsDialog are mutually exclusive.

C++ Examples:

```
/*
The following code removes a form's Maximize button when the
user clicks a button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TBorderIcons tempBI = BorderIcons;
  tempBI >> biMaximize;
  BorderIcons = tempBI;
}
```

Delphi Examples:

```
{
The following code removes a form's Maximize button when the
user clicks a button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
BorderIcons := BorderIcons - [biMaximize];
end;
```

See Also

BorderStyle (see page 2149)

7.1.7.3.12 TForm.BorderStyle Property

Specifies the appearance and behavior of the form border.

Pascal

```
property BorderStyle: TFormBorderStyle;
```

C++

```
__property TFormBorderStyle BorderStyle;
```

Description

Use BorderStyle to get or set the appearance and behavior of the form border. BorderStyle can be any of the following TForm BorderStyle values:

Value	Meaning
bsDialog	Not resizable; no minimize/maximize menu
bsSingle	Not resizable; minimize/maximize menu
bsNone	Not resizable; no visible border line
bsSizeable	Standard resizable border
bsToolWindow	like bsSingle but with a smaller caption
bsSizeToolWin	like bsSizeable with a smaller caption

Note: Changing the border style of an MDI child form to bsDialog or bsNone has no effect.

See Also

BorderIcons (see page 2148)

7.1.7.3.13 TForm.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth;
```

C++

```
__property BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter

7.1.7.3.14 TForm.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
```

```
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
```

```
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

7.1.7.3.15 TForm.ClientHandle Property

Provides access to the handle of the form's internal MDI client window.

Pascal

```
property ClientHandle: HWND;
```

C++

```
__property HWND ClientHandle;
```

Description

Use ClientHandle to get the handle for the form's internal MDI client window.

ClientHandle is meaningful only if the form is an MDI parent (that is, if the form's FormStyle property is set to fsMDIForm).

Note: Use the Handle property instead to get the handle to the form window itself.

See Also

FormStyle (see page 2162)

Handle

7.1.7.3.16 TForm.ClientHeight Property

Specifies the height (in pixels) of the form's client area.

Pascal

```
property ClientHeight;
```

C++

```
__property ClientHeight;
```

Description

Use ClientHeight to determine the height (in pixels) of the form's client area. The client area is the usable area inside the form's border, excluding the title bar, scroll bars, and so on.

Set ClientHeight to change the height of the form's window based on the desired client area. To change the height of the form's window based on the total size of the window (including the border, menu, status bar and so on), use the Height property instead.

C++ Examples:

```
/*
This example reduces the height of the form's client area by
half when the user clicks the button on the form:
Note that only the client area is halved, not the entire form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form1->ClientHeight = Form1->ClientHeight/2;
}
```

Delphi Examples:

```
{
This example reduces the height of the form's client area by
half when the user clicks the button on the form:
Note that only the client area is halved, not the entire form.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ClientHeight := ClientHeight div 2;
end;
```

See Also

ClientRect

ClientWidth (see page 2155)

Height

7.1.7.3.17 TForm.ClientWidth Property

Specifies the width (in pixels) of the form's client area.

Pascal

```
property ClientWidth;
```

C++

```
__property ClientWidth;
```

Description

Use ClientWidth to determine the width (in pixels) of the form's client area. The client area is the usable area inside the form's border. Set ClientWidth to change the width of the form's window based on the desired client area. To change the width of the form's window based on the total size of the window (including the border, status bar and so on), use the Width property instead.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
```

```
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
```

```
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
```

Width

7.1.7.3.18 TForm.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

7.1.7.3.19 TForm.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

OnCanResize

7.1.7.3.20 TForm.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

BorderWidth

7.1.7.3.21 TForm.DefaultMonitor Property

Specifies the monitor on which the form appears.

Pascal

```
property DefaultMonitor: TDefaultMonitor;
```

C++

```
__property TDefaultMonitor DefaultMonitor;
```

Description

Use DefaultMonitor to associate a form with a particular monitor in a multi-monitor application. The following table lists the possible values:

Value	Meaning
dmDesktop	No attempt is made to position the form on a specific monitor.
dmPrimary	The form is positioned on the first monitor listed in the global screen object's Monitors property.
dmMainForm	The form appears on the same monitor as the application's main form.
dmActiveForm	The form appears on the same monitor as the currently active form.

Note: DefaultMonitor has no effect if the application does not have a main form.

7.1.7.3.22 TForm.DockManager Property

Specifies the control's docking manager interface.

Pascal

```
property DockManager;
```

C++

```
__property DockManager;
```

Description

Use DockManager to specify the control's docking manager. The docking manager handles the layout of docking zones (where controls are docked) and any painting associated with docking zones.

If you set DockSite and UseDockManager to true, but do not assign a value to DockManager, the windowed control generates a

default docking manager, using the global DefaultDockTreeClass variable.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
```

```
    Source: TDragDockObject; X, Y: Integer);
  begin
    //OnDockDrop gets called AFTER the client has actually docked,
    //so we check for DockClientCount = 1 before making the dock panel visible.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, True, nil);
    (Sender as TPanel).DockManager.ResetBounds(True);
    //Make DockManager repaints it's clients.
  end;

  procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
    Source: TDragDockObject; X, Y: Integer; State: TDragState;
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

See Also

DockSite

UseDockManager

DefaultDockTreeClass

7.1.7.3.23 TForm.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite;
```

C++

```
__property DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

7.1.7.3.24 TForm.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
```

```
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);

7.1.7.3.27 TForm.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

7.1.7.3.28 TForm.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);

7.1.7.3.29 TForm.FormStyle Property

Determines the form's style.

Pascal

```
property FormStyle: TFormStyle;
```

C++

```
__property TFormStyle FormStyle;
```

Description

Use FormStyle to get or set the form's style. FormStyle is one of the following values:

Value	Meaning
fsNormal	The form is neither an MDI parent window nor an MDI child window.
fsMDIChild	The form is an MDI child window.
fsMDIForm	The form is an MDI parent window.
fsStayOnTop	This form remains on top of the desktop and of other forms in the project, except any others that also have FormStyle set to fsStayOnTop. If one fsStayOnTop form launches another, neither form will consistently remain on top.

If the form is the main form of an MDI application, its FormStyle property must be set to fsMDIForm.

Note: It is not advisable to change FormStyle at runtime.

Warning: TGraphicControl descendants placed in the client area of a form with FormStyle set to fsMDIForm will not paint.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example ensures that the main form of the application
is an MDI parent:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  if(FormStyle != fsMDIForm)
          FormStyle = fsMDIForm;
  if(FormStyle == fsMDIForm)
          Edit1->Text = "MDI form";
  else
```

```
    //This line never executes
    Edit1->Text = "Not an MDI form";
}
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
{
This example ensures that the main form of the application
is an MDI parent:
}

Windows Overview

7.1.7.3.30 TForm.GlassFrame Property

Pascal

```
property GlassFrame: TGlassFrame;
```

C++

```
__property TGlassFrame GlassFrame;
```

Description

This is GlassFrame, a member of class TForm.

7.1.7.3.31 TForm.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
```

```
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;

7.1.7.3.32 TForm.HelpFile Property

Specifies the name of the file the form uses to display Help.

Pascal

```
property HelpFile: string;
```

C++

```
__property UnicodeString HelpFile;
```

Description

Use HelpFile for forms that have a help file to use with the Help system. Help topics are selected from the specified file.

OnHelp (see page 2217)

HelpFile (see page 1974)

HelpKeyword

7.1.7.3.33 TForm.HorzScrollBar Property

Represents the horizontal scroll bar for the scrolling windowed control.

Pascal

```
property HorzScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar HorzScrollBar;
```

Description

Use HorzScrollBar to hide, show, or manipulate the horizontal scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
```

```
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
```

7.1.7.3.34 TForm.Icon Property

Specifies the icon that appears when the form is minimized.

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

Set the Icon property to provide an icon for the form. If Icon is not set, the system provides a default icon when the form is minimized.

C++ Examples:

```
/*
This code assigns an icon to a form when the form is created:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Icon->LoadFromFile("..\\MDIChild1.ICO");
}
```

Delphi Examples:

```
{
This code assigns an icon to a form when the form is created:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Icon.LoadFromFile('MDIChild1.ICO');
end;
```

WindowState (see page 2195)

7.1.7.3.35 TForm.KeyPreview Property

Specifies whether the form should receive keyboard events before the active control.

Pascal

```
property KeyPreview: Boolean;
```

C++

```
__property Boolean KeyPreview;
```

Description

If KeyPreview is true, keyboard events occur on the form before they occur on the active control. (The active control is specified by the ActiveControl property.)

If KeyPreview is false, keyboard events occur only on the active control.

Navigation keys (Tab, BackTab, the arrow keys, and so on) are unaffected by KeyPreview because they do not generate keyboard events. Similarly, when a button has focus or when its Default property is true, the Enter key is unaffected by KeyPreview because it does not generate a keyboard events.

KeyPreview is false by default.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{

7.1.7.3.36 TForm.MDIChildCount Property

Specifies the number of open MDI child forms.

Pascal

```
property MDIChildCount: Integer;
```

C++

```
__property int MDIChildCount;
```

Description

Use MDIChildCount to get the number of open MDI child forms.

MDIChildCount is meaningful only if the form is an MDI parent (that is, if the form's FormStyle property is set to fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
*/
void __fastcall TForm1::CloseChildrenClick(TObject *Sender)
{
  for(int i = MDIChildCount - 1; i >= 0; i--)
    MDIChildren[i]->Close();
}

void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}

void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
  }
```

Delphi Examples:

```
{
```

```
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
}
procedure TForm1.CloseChildrenClick(Sender: TObject);
var
  I: Integer;
begin
  with Form1 do
    for I := MDIChildCount-1 downto 0 do
      MDIChildren[I].Close;
end;

procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;

procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

See Also

MDIChildren (see page 2173)

7.1.7.3.37 TForm.MDIChildren Property

Provides indexed access to all MDI child forms.

Pascal

```
property MDIChildren [I: Integer]: TForm;
```

C++

```
__property TForm * MDIChildren[int I];
```

Description

Use MDIChildren to access a child form.

I is the index of the child form to access. The order of MDI children changes as different MDI forms are activated. Initially, forms are listed in creation order, with new forms being added to the end of the array. Whenever an MDI child is activated, however, it moves to the front of the list. Thus, use I to index over all forms in the array, but not to refer to a specific form.

MDIChildren is meaningful only if the form is an MDI frame (that is, if the form's FormStyle property is set to fsMDIForm).

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
*/
void __fastcall TForm1::CloseChildrenClick(TObject *Sender)
```

```
{
  for(int i = MDIChildCount - 1; i >= 0; i--)
    MDIChildren[i]->Close();
}

void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}

void __fastcall TForm1::MyCascadeClick(TObject *Sender)
{
  Form1->Cascade();
  }
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items CloseChildren. This is code for the
CloseChildrenClick handler.  When the user chooses the
CloseChildren command, all the MDI children of Form1 are
closed.
}
procedure TForm1.CloseChildrenClick(Sender: TObject);
var
  I: Integer;
begin
  with Form1 do
    for I := MDIChildCount-1 downto 0 do
      MDIChildren[I].Close;
end;

procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;

procedure TForm1.MyCascadeClick(Sender: TObject);
begin
  Form1.Cascade;
end;
```

MDIChildCount (see page 2172)

FormStyle (see page 2162)

7.1.7.3.38 TForm.Menu Property

Specifies the form's main menu.

Pascal

```
property Menu: TMainMenu;
```

C++

```
__property TMainMenu Menu;
```

Description

Use Menu to get or set the form's main menu. At design time, Menu is set to the first TMainMenu component added to the form.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
/*
To create a toolbar that corresponds to an existing menu:

1   Drop a ToolBar on the form and add a ToolButton for each
  top-level menu item you wish to create.
2   Set the MenuItem property of each ToolButton to correspond
  to the top level menu items.
3   Set the Grouped property of each ToolButton to true.
4   Clear the Menu property of the Form (if it is assigned)
5   Set the Visible property on the ToolBar and ToolButtons to
  true.
6   Set the ShowCaptions property on the ToolBar to true.
7   Set the MenuItem | Visible property of each ToolButton to
  true.
*/
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
{
To create a toolbar that corresponds to an existing menu:

1   Drop a ToolBar on the form and add a ToolButton for each top-level menu item you wish to
create.
2   Set the MenuItem property of each ToolButton to correspond to the top level menu items.
3   Set the Grouped property of each ToolButton to true.
4   Clear the Menu property of the Form (if it is assigned)
5   Set the Visible property on the ToolBar and ToolButtons to true.
6   Set the ShowCaptions property on the ToolBar to true.
7   Set the MenuItem | Visible property of each ToolButton to true.
}
```

TMainMenu (see page 4828)

7.1.7.3.39 TForm.ObjectMenuItem Property

Represents an OLE object menu item that reacts to selections of OLE objects.

Pascal

```
property ObjectMenuItem: TMenuItem;
```

C++

```
__property TMenuItem ObjectMenuItem;
```

Description

Use ObjectMenuItem to get or set a menu item that becomes enabled or disabled when an OLE object on the form is selected or unselected respectively.

The OLE object menu item can be used for standard OLE commands, such as Activate or Convert. (The implementations of these commands are provided by the OLE server.)

See Also

OleFormObject (see page 2178)

7.1.7.3.40 TForm.OldCreateOrder Property

Specifies when OnCreate and OnDestroy events occur.

Pascal

```
property OldCreateOrder: Boolean;
```

C++

```
__property Boolean OldCreateOrder;
```

Description

When OldCreateOrder is false (the default) the OnCreate event occurs after all constructors are finished and the OnDestroy event occurs before any destructors are called.

This differs from earlier versions of the library (distributed with Delphi version 3 and previous and C++Builder 1), where the OnCreate event occurred when the TCustomForm constructor executed and the OnDestroy event occurred when the TCustomForm destructor executed. Applications that require the OnCreate event and OnDestroy events to occur from the constructor and destructor of the form can set OldCreateOrder to true.

See Also

OnCreate (see page 2207)

OnDestroy (see page 2209)

BeforeDestruction (see page 2113)

AfterConstruction (see page 2112)

7.1.7.3.41 TForm.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding;
```

C++

```
__property Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding

7.1.7.3.42 TForm.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent

BiDiMode

7.1.7.3.43 TForm.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentShowHint

7.1.7.3.44 TForm.PixelsPerInch Property

Represents the proportion of the font on the system on which the form was designed.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Use PixelsPerInch at runtime to change how the form is scaled to the current screen resolution. If PixelsPerInch is changed from its default value, the form will not have the same proportion on every screen resolution.

At design time, PixelsPerInch is set automatically when the form is saved. Changes to PixelsPerInch made in the Object Inspector only affect the form at runtime.

The form's Scaled property must be true for PixelsPerInch to have an effect.

See Also

Scaled (see page 2187)

7.1.7.3.45 TForm.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
```

```
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
```

```
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
```

```
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{

OnContextPopup

7.1.7.3.46 TForm.PopupMode Property

Controls how the top-level form behaves with respect to Window's WS_POPUP style.

Pascal

```
property PopupMode: TPopupMode;
```

C++

```
__property TPopupMode PopupMode;
```

Description

The PopupMode property controls how the top-level form behaves with respect to Window's WS_POPUP style. A window that has the WS_POPUP style is always above its "owner" in Z-order. You can use the PopupMode property in conjunction with the PopupParent (see page 2300) property to avoid the appearance of a hung application caused by a modal dialog showing up behind another form on the screen.

Note: Using the PopupMode property is similar to specifying fsStayOnTop for the FormStyle (see page 2279) property, but allows better control over the layering.

The PopupMode property is automatically set to pmAuto when the ShowModal (see page 2139) method is called. However, this causes the window handle to be recreated, which is not usually desirable. To avoid the re-creation of window handles, you can explicitly set the PopupMode property to pmAuto prior to calling the ShowModal (see page 2139) method (such as at design time).

Set the PopupMode property to pmExplicit for non-modal design windows such as tool palettes and other floating tool windows. This causes the windows to always remain on top of the main form. In the case of a snapped together design (in which the window is docked to the main form), the design window remains on top of the designer.

Note: For undocked windows, the design window remains above the main form, allowing other top-level forms to obscure the design window.

Set thePopupMode property to pmNone if you want the popup window to have the pre-Delphi 8 behavior (except for the ShowModal (see page 2139) item mentioned above).

You can force the Z-Ordering of your forms and create a "stacked" appearance that the user cannot change by setting the PopupParent (see page 2300) property to an explicit TCustomForm (see page 2103). If the PopupMode property is pmExplicit and PopupParent (see page 2300) is nil, then the Application.MainForm is implicitly used as the PopupParent (see page 2300). If no Application.MainForm is assigned, then Application.Handle is used as the PopupParent (see page 2300). If the PopupMode property is set to pmAuto, Screen.ActiveForm is used as the PopupParent (see page 2300).

7.1.7.3.47 TForm.PopupParent Property

Sets an order for stacked forms that users cannot change.

Pascal

```
property PopupParent: TCustomForm;
```

C++

```
__property TCustomForm PopupParent;
```

Description

If the PopupMode property is set to pmExplicit and PopupParent is nil, then the Application.MainForm is implicitly used as the PopupParent. If no Application.MainForm is assigned, then Application.Handle is used as the PopupParent.

If the PopupMode property is set to pmAuto, Screen.ActiveForm is used as the PopupParent property.

7.1.7.3.48 TForm.Position Property

Represents the size and placement of the form.

Pascal

```
property Position: TPosition;
```

C++

```
__property TPosition Position;
```

Description

Use Position to get or set the size and placement of the form. Position can have one of the following TPosition values:

Value	Meaning
poDesigned	The form appears positioned on the screen and with the same height and width as it had at design time.
poDefault	The form appears in a position on the screen and with a height and width determined by the operating system. Each time you run the application, the form moves slightly down and to the right. The right side of the form is always near the far right side of the screen, and the bottom of the form is always near the bottom of the screen, regardless of the screen's resolution. The operating system only supports this for overlapped windows. For a pop-up or child window (that has a BorderStyle of bsDialog or bsNone, for example), the window is positioned in the upper left corner of the screen.

poDefaultPosOnly	The form displays with the size you created it at design time, but the operating system chooses its position on the screen. Each time you run the application, the form moves slightly down and to the right. When the form can no longer move down and to the right and keep the same size while remaining entirely visible on the screen, the form displays at the top-left corner of the screen. The operating system only supports this for overlapped windows. For a pop-up or child window (that has a BorderStyle of bsDialog or bsNone, for example), the window is positioned in the upper left corner of the screen.
poDefaultSizeOnly	The form appears in the position you left it at design time, but the operating system chooses its size. The right side of the form is always near the far right side of the screen, and the bottom of the form is always near the bottom of the screen, regardless of the screen's resolution.
poScreenCenter	The form remains the size you left it at design time, but is positioned in the center of the screen. In multi-monitor applications, the form may be moved from this center position so that it falls entirely on one monitor, as specified by the DefaultMonitor property.
poDesktopCenter	The form remains the size you left it at design time, but is positioned in the center of the screen. No adjustments are made for multi-monitor applications.
poMainFormCenter	The form remains the size you left it at design time, but is positioned in the center of the application's main form. No adjustments are made for multi-monitor applications. This position should only be used with secondary forms. If set for a main form, it acts like poScreenCenter.
poOwnerFormCenter	The form remains the size you left it at design time, but is positioned in the center of the form specified by the Owner property. If the Owner property does not specify a form, this position acts like poMainFormCenter.

OnResize

SetInitialBounds

7.1.7.3.49 TForm.PrintScale Property

Represents the proportions of a printed form.

Pascal

```
property PrintScale: TPrintScale;
```

C++

```
__property TPrintScale PrintScale;
```

Description

Use PrintScale to get or set the proportions of the printed form. PrintScale can have one of the following TPrintScale values:

Value	Meaning
poNone	No special scaling occurs; therefore, the printed form and how the form appears onscreen may appear squished or stretched.
poProportional	The form is printed so that the printed image is approximately the same visible size as on the screen (WYSIWYG). The form image is scaled so that the printed image is approximately the same visible size as on the screen.
poPrintToFit	The form is printed using the same screen proportions, but in a size that just fits the printed page.

See Also

Print (see page 2132)

7.1.7.3.50 TForm.Scaled Property

Specifies whether the form is sized according to the value of the PixelsPerInch property.

Pascal

```
property Scaled: Boolean;
```

C++

```
__property Boolean Scaled;
```

Description

Scaled determines whether the form adjusts itself to differences between the font used at design time and the current system font used by a system at runtime. If Scaled is true, the form resizes itself and all its child controls to maintain the relationship between the size of controls and the height of text displayed in the default font. If Scaled is false, no such resizing occurs.

By setting Scaled to true, the form can adjust to fonts that are not scalable (that is, fonts that only supply discrete point sizes) or to differences such as forms designed using small fonts at design time that are run on systems that use large fonts.

The degree of resizing is determined by the PixelsPerInch property, which measures the proportion of the font on the system used when designing the form.

See Also

PixelsPerInch (see page 2179)

Considerations When Dynamically Resizing Forms and Controls

7.1.7.3.51 TForm.ScreenSnap Property

Specifies whether form snaps to edge of screen.

Pascal

```
property ScreenSnap: Boolean;
```

C++

```
__property Boolean ScreenSnap;
```

Description

ScreenSnap determines whether the edges of the form snap to the edge of the screen when the user moves the form. To control the snap distance, set the SnapBuffer property.

See Also

SnapBuffer (see page 2188)

7.1.7.3.52 TForm.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

7.1.7.3.53 TForm.SnapBuffer Property

Specifies distance for screen snap.

Pascal

```
property SnapBuffer: Integer;
```

C++

```
__property int SnapBuffer;
```

Description

If ScreenSnap is true, SnapBuffer determines the maximum number of pixels that be between the form edge and the screen edge before the form snaps to the screen edge.

See Also

ScreenSnap (see page 2187)

7.1.7.3.54 TForm.TileMode Property

Represents how MDI child forms are arranged when the Tile method is called.

Pascal

```
property TileMode: TTileMode;
```

C++

```
__property TTileMode TileMode;
```

Description

TileMode can have one of the following TTileMode values:

Value	Meaning
tbHorizontal	Each form stretches across the width of the parent form
tbVertical	Each form stretches along the height of the parent form

TileMode is meaningful only if the form is an MDI child (that is, if the form's FormStyle property is set to fsMDIChild).

C++ Examples:

```
/*
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
*/
void __fastcall TForm1::TileFormsClick(TObject *Sender)
{
  TileMode = tbVertical;
  Tile();
}
```

Delphi Examples:

```
{
This example uses three forms. The first form has its
FormStyle property set to MDIForm. The other two have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items TileForms. This is code for the
TileFormsClick handler.  When the user chooses the TileForms
command, the child forms tile vertically within the MDI frame
form.
}
procedure TForm1.TileFormsClick(Sender: TObject);
begin
  TileMode := tbVertical;
  Tile;
end;
```

See Also

FormStyle (see page 2162)

Tile (see page 2249)

7.1.7.3.55 TForm.TransparentColor Property

Specifies whether a color on the form appears transparent.

Pascal

```
property TransparentColor: Boolean;
```

C++

```
__property Boolean TransparentColor;
```

Description

Use TransparentColor to indicate that one of the colors on the form should be treated as transparent, allowing windows behind the form to completely show through. The TransparentColorValue property indicates the color that appears completely transparent.

Note: To make the entire form transparent, or to make it translucent rather than transparent, use the AlphaBlend and AlphaBlendValue properties.

Note: TransparentColor does not work on all systems. The application must be running under Windows 2000 or better, with adequate hardware.

See Also

TransparentColorValue (see page 2191)

AlphaBlend (see page 2147)

AlphaBlendValue (see page 2147)

7.1.7.3.56 TForm.TransparentColorValue Property

Indicates the color on the form that appears transparent when TransparentColor is true.

Pascal

```
property TransparentColorValue: TColor;
```

C++

```
__property TColor TransparentColorValue;
```

Description

Use TransparentColorValue to indicate the color that appears transparent when the TransparentColor property is true.

Note: If the application uses a 16-bit color palette, TransparentColorValue must be a basic color.

See Also

TransparentColor (see page 2190)

7.1.7.3.57 TForm.UseDockManager Property

Specifies whether the docking manager is used in drag-and-dock operations.

Pascal

```
property UseDockManager;
```

C++

```
__property UseDockManager;
```

Description

Use UseDockManager to get or set whether a docking manager is used in drag-and-dock operations.

The docking manager handles the positioning of docked controls and any painting of docking zones around those controls. If you do not use a docking manager, docked controls are aligned to the windowed control based on the closest edge to where they are released. When you do not use a docking manager, there is no region for a user to grab to automatically undock a docked control.

See Also

DockManager

7.1.7.3.58 TForm.VertScrollBar Property

Represents the vertical scroll bar for the scrolling windowed control.

Pascal

```
property VertScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar VertScrollBar;
```

Description

Use VertScrollBar to hide, show, or manipulate the vertical scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

AutoScroll (see page 2561)

HorzScrollBar (see page 2562)

TControlScrollBar (see page 2009)

7.1.7.3.59 TForm.Visible Property

Indicates whether the form is visible.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use Visible to determine whether the form is visible.

If Visible is true, the form is visible unless it is completely obscured by other forms. If Visible is false, the form is not visible.

The Show and ShowModal methods set Visible to true and bring the form to the front of all open windows.

C++ Examples:

```
/*
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must include Unit2.h in this
module.
*/
#include "Unit2.h"

void __fastcall TForm1::ShowPaletteButtonClick(TObject *Sender)
{
  if (!Form2->Visible)
  {
    Form2->Visible = true;
    Form2->BringToFront();
  }
}
```

Delphi Examples:

```
{
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must add Unit2 in the uses clause
of your unit.
}
procedure TForm1.ShowPaletteButtonClick(Sender: TObject);
begin
if Form2.Visible = False then Form2.Visible := True;
Form2.BringToFront;
end;
```

See Also

BringToFront

Show (see page 2137)

ShowModal (see page 2139)

7.1.7.3.60 TForm.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width;
```

C++

```
__property Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

C++ Examples:

```
/*
```

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
```

```
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
```

7.1.7.3.61 TForm.WindowMenu Property

Specifies the Window menu for an MDI parent form.

Pascal

```
property WindowMenu: TMenuItem;
```

C++

```
__property TMenuItem WindowMenu;
```

Description

Use WindowMenu to get or set the Window menu for an MDI parent form. The Window menu is a standard menu in MDI applications. It contains commands that let the user manage the windows in the application. Menu items usually include Cascade, Arrange Icons, Tile, and so on.

The Window menu also lists (at the bottom) the child windows that are currently open in the application. When the user selects one of these windows from the menu, the window becomes the active window in the application.

Although this menu is commonly called the Window menu, it can have any name that corresponds to an existing menu item on the menu bar. The names of open child forms are merged onto the menu automatically at run-time.

WindowMenu is meaningful only if the form is an MDI parent (that is, if the form's FormStyle property is set to fsMDIForm).

See Also

FormStyle (see page 2162)

7.1.7.3.62 TForm.WindowState Property

Represents how the form appears on the screen.

Pascal

```
property WindowState: TWindowState;
```

C++

```
__property TWindowState WindowState;
```

Description

Set WindowState to minimize, maximize, or restore the form window. Read WindowState to determine whether the form is minimized, maximized, or in a normal state.

Icon (see page 2167)

BorderStyle (see page 2149)

7.1.7.4 TForm Events

The events of the TForm class are listed here.

Published Events

	Name	Description
	OnActivate (see page 2312)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 2318)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2318)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 2319)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2319)	Occurs when the user clicks the control.
	OnClose (see page 2321)	Occurs when the form closes.
	OnCloseQuery (see page 2323)	Occurs when close is attempted.
	OnConstrainedResize (see page 2324)	Adjust resize constraints.
	OnContextPopup (see page 2324)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 2325)	Occurs when the form is created.
	OnDblClick (see page 2327)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 2327)	Occurs when the form loses focus.
	OnDestroy (see page 2327)	Occurs when the form is destroyed.
	OnDockDrop (see page 2329)	Occurs when another control is docked to the control.
	OnDockOver (see page 2331)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2333)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2336)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2339)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 2339)	Returns the control's docking information.
	OnHelp (see page 2341)	Occurs when the form receives a request for help.
	OnHide (see page 2342)	Occurs when the form is hidden (that is, when its Visible property is set to false).
	OnKeyDown (see page 2344)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2347)	Occurs when a key is pressed.
	OnKeyUp (see page 2348)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2350)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2351)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2353)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2354)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2354)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2356)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2359)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2359)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2359)	Occurs when the mouse wheel is rotated upward.
	OnPaint (see page 2360)	Occurs when the form is redrawn.
	OnResize (see page 2361)	Occurs immediately after the control is resized.
	OnShortCut (see page 2362)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShow (see page 2362)	Occurs when the form is shown (that is, when its Visible property is set to true).

	OnStartDock (see page 2363)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnUnDock (see page 2364)	Occurs when the application tries to undock a control that is docked to the windowed control.

7.1.7.4.1 TForm.OnActivate Event

Occurs when the form becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Use OnActivate to perform special processing when the form receives focus. A form becomes active when focus is transferred to it (when the user clicks on the form, for example).

Note: The OnActivate event of the application (TApplication), not the form, occurs when Windows switches control from another application.

C++ Examples:

```
/*
This example fills a list box with the names of TDataSources
that are present and then fills a DBGrid a second form with
the data from the selected data source.  The DBGrid is not
filled in until Form2 is activated.  Here is the code for Form1
that fills the list box.
*/

TForm1 *Form1;
TTable *Customers, *Blobs;
Boolean Form1Done = False;

void CreateCustSource()
{
  Customers = new TTable(Form1); // The owner will clean this up.
  Customers->Active = false; // The Table component must not be active
  Customers->DatabaseName = "DBDEMOS";
  Customers->TableType = ttParadox;
  Customers->TableName = "CustInfo";
  Customers->Active = False;
  if (Customers->Exists) // Don't overwrite an existing table
  {
    Customers->Close();
    Customers->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Customers->FieldDefs->Clear();
  TFieldDef *pNewDef = Customers->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;

7.1.7.4.2 TForm.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore;
```

C++

```
__property OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

TAlignInsertBeforeEvent

7.1.7.4.3 TForm.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition;
```

C++

```
__property OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

7.1.7.4.4 TForm.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize;
```

C++

```
__property OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

OnResize

7.1.7.4.5 TForm.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
```

```
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin

7.1.7.4.6 TForm.OnClose Event

Occurs when the form closes.

Pascal

```
property OnClose: TCloseEvent;
```

C++

```
__property TCloseEvent OnClose;
```

Description

Use OnClose to perform special processing when the form closes. The OnClose event specifies which event handler to call when a form is about to close. The handler specified by OnClose might, for example, test to make sure all fields in a data-entry form have valid contents before allowing the form to close.

A form is closed by the Close method or when the user chooses Close from the form's system menu.

The TCloseEvent type points to a method that handles the closing of a form. The value of the Action parameter determines if the form actually closes. These are the possible values of Action:

Value	Meaning
caNone	The form is not allowed to close, so nothing happens.
caHide	The form is not closed, but just hidden. Your application can still access a hidden form.
caFree	The form is closed and all allocated memory for the form is freed.
caMinimize	The form is minimized, rather than closed. This is the default action for MDI child forms.

If a form is an MDI child form, and its BorderIcons property is biMinimize, then the default Action is caMinimize. If a MDI child form does not have these settings, the default Action is caNone, meaning that nothing happens when the user attempts to close the form.

If a form is an SDI child form, Action defaults to caHide.

To close the form and free it in an OnClose event, set Action to caFree.

Note: When the application shuts down, the main form receives an OnClose event, but any child forms do not receive the OnClose event.

C++ Examples:

```
/*
This example displays a message dialog box when the user
attempts to close the form. If the user clicks the Yes
button, the form closes; otherwise, the form only minimizes.
TCustomForm.Close does not allow an action of caMinimize
for a form closing itself.  Close Form2 from Form1 (from
a button?) and implement the OnClose in Form2.  Place
"Application.CreateForm(TForm2, Form2);" in the project dpr
file to open Form2 and set the Form2 Visible property to
True.
*/
void __fastcall TForm2::FormClose(TObject *Sender, TCloseAction &Action)
{
  if (MessageDlg("Close application ?", mtConfirmation, TMsgDlgButtons() << mbYes << mbNo,0)
== mrYes)
    Action = caFree;
  else
    Action = caMinimize;
}
```

Delphi Examples:

```
{
This example displays a message dialog box when the user
attempts to close the form. If the user clicks the Yes
button, the form closes; otherwise, the form only minimizes.
TCustomForm.Close does not allow an action of caMinimize
for a form closing itself.  Close Form2 from Form1 (from
a button?) and implement the OnClose in Form2.  Place
"Application.CreateForm(TForm2, Form2);" in the project dpr
```

```
file to open Form2 and set the Form2 Visible property to
True.
}
procedure TForm2.FormClose(Sender: TObject; var Action: TCloseAction);
begin
  if MessageDlg('Close application ?', mtConfirmation,
    [mbYes, mbNo], 0) = mrYes then
    Action := caFree
  else
    Action := caMinimize;
end;
```

7.1.7.4.7 TForm.OnCloseQuery Event

Occurs when close is attempted.

Pascal

```
property OnCloseQuery: TCloseQueryEvent;
```

C++

```
__property TCloseQueryEvent OnCloseQuery;
```

Description

Use OnCloseQuery to specify the conditions under which the form can close. An OnCloseQuery event handler returns a Boolean CanClose value that determines whether a form is allowed to close. Its default value is true.

You can use an OnCloseQuery event handler to ask users if they are sure they really want the form closed immediately. For example, you can use the handler to display a message box that prompts the user to save a file before closing the form.

The TCloseQueryEvent type points to the method that determines whether a form can be closed. The value of the CanClose parameter determines if the form can close or not.

C++ Examples:

```
/*
When the user attempts to close the form in this example, a
message dialog appears that asks the user if it is OK to
close the form. If the user chooses the OK button, the form
closes. If the user chooses Cancel, the form doesn't close.
Populate the OnCloseQuery event handler of the form.
*/
void __fastcall TForm1::FormCloseQuery(TObject *Sender, bool &CanClose)
{
  if (MessageDlg("Close the form?", mtConfirmation, TMsgDlgButtons() << mbOK << mbCancel,0) ==
mrCancel)
    CanClose = false;
}
```

Delphi Examples:

```
{
When the user attempts to close the form in this example, a
message dialog appears that asks the user if it is OK to
close the form. If the user chooses the OK button, the form
closes. If the user chooses Cancel, the form doesn't close.
Populate the OnCloseQuery event handler of the form.
```

```
}
procedure TForm1.FormCloseQuery(Sender: TObject; var CanClose: Boolean);
begin
  if MessageDlg('Close the form?', mtConfirmation,
    [mbOk, mbCancel], 0) = mrCancel then
     CanClose := False;
end;
```

OnClose (see page 2205)

7.1.7.4.8 TForm.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize;
```

C++

```
__property OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

CanAutoSize

7.1.7.4.9 TForm.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The

OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 4935)

PopupMenu

AutoPopup (see page 4942)

7.1.7.4.10 TForm.OnCreate Event

Occurs when the form is created.

Pascal

```
property OnCreate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCreate;
```

Description

Use OnCreate to perform special processing when the form is created and is invoked by TCustomForm's constructor. Either implement this event or override the constructor of the form; do not do both. Any objects created in the OnCreate event should be freed by the OnDestroy event.

When a form is being created and its Visible property is true, the following events occur in the order listed:

1. OnCreate2. OnShow3. OnActivate4. OnPaint

Note: Use of the OnCreate event is discouraged in C++ code because it can interact badly with the form's constructor (see OldCreateOrder). It is recommended that you override the form constructor instead.

C++ Examples:

```
/*
This example requires a new TPageControl, as is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
```

```
is selected.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
const
  TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *page = new TTabSheet(PageControl1);  // These tabsheets are cleaned up by their
owner (PageControl1).
    page->PageControl = PageControl1;
    page->Caption = AnsiString("Page") + IntToStr(i);
    page->Brush->Color = colorPalette[i];
  }
}

void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  PageControl1->SelectNextPage(Button == btNext);
}
```

Delphi Examples:

```
{
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
const
  colorPalette: Array[0..11] of TColor =
    (clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple);
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet #' + IntToStr(i);
      Brush.Color := colorPalette[i];
    end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
begin
  PageControl1.SelectNextPage(Button = btNext);
end;
```

7.1.7.4.11 TForm.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

7.1.7.4.12 TForm.OnDeactivate Event

Occurs when the form loses focus.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Use OnDeactivate to perform special processing when the form transitions from being the active form to another form in the same application becoming the active form. If activation goes to another application, this event is not triggered. To determine if another application has become active, Use the TApplication object's OnDeactivate event.

See Also

OnActivate (see page 2196)

OnDeactivate (see page 1992)

7.1.7.4.13 TForm.OnDestroy Event

Occurs when the form is destroyed.

Pascal

```
property OnDestroy: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDestroy;
```

Description

Use OnDestroy to perform special processing when the form is destroyed. Either implement this event or override the destructor of the class, but not both. This event should destroy any objects created in the OnCreate event.

C++ Examples:

```
/*
This example uses the OnActiveControlChange event to detect
when focus changes on the form. When focus changes, the hint
for the active control is displayed on the status bar. To use
this example, you must add a status bar to the form and set
its SimplePanel property to true.  Add a new public procedure,
ActiveControlChanged, to the TForm1 class declaration.
*/
void _fastcall TForm1::ActiveControlChanged(System::TObject *Sender)
{
  TWinControl *Active = NULL;
  for (int I = 0; I < Form1->ControlCount; I++)
  {
    TWinControl *Temp = dynamic_cast<TWinControl *>(Form1->Controls[I]);
    if (Temp && Temp->Focused())
      Active = Temp;
  }
  if ((Active != NULL) && (Active->Hint != ""))
    StatusBar2->SimpleText = GetLongHint(Active->Hint) + " focus";
}

void __fastcall TForm1::MouseOverChanged(TObject *Sender)
{
  TWinControl *Active = dynamic_cast<TWinControl *>(Sender);
  if (Active != NULL)
    StatusBar1->SimpleText = GetLongHint(Active->Hint) + " mouse over";
}

/*
Assign this method as the OnActiveControlChange event
handler by setting it from the form's OnCreate event handler:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveControlChange = ActiveControlChanged;
}

/*
Make sure you clean up the screen object when the form is
freed by adding this OnDestroy event handler to the form:
*/
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  Screen->OnActiveControlChange = 0;
}
```

Delphi Examples:

```
{
The following code explicitly allocates memory for a pointer
in the OnCreate event of Form1, then releases the memory in
the OnDestroy event. Assume that MyPtr is a Pointer type
field of TForm1.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  New(MyPtr);
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  Dispose(MyPtr);
end;
```

7.1.7.4.14 TForm.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop;
```

C++

```
__property OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

DockSite

OnDockOver

7.1.7.4.15 TForm.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver;
```

C++

```
__property OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
```

```
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,

OnDockDrop

OnGetSiteInfo

TDragDockObject

7.1.7.4.16 TForm.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/
```

```
// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,

OnStartDrag

TDragObject

7.1.7.4.17 TForm.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.

OnDockDrop

OnStartDock

7.1.7.4.19 TForm.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo;
```

C++

```
__property OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
```

```
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, True, nil);
    (Sender as TPanel).DockManager.ResetBounds(True);
    //Make DockManager repaints it's clients.
  end;

  procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
    Source: TDragDockObject; X, Y: Integer; State: TDragState;
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

7.1.7.4.20 TForm.OnHelp Event

Occurs when the form receives a request for help.

Pascal

```
property OnHelp: THelpEvent;
```

C++

```
__property THelpEvent OnHelp;
```

Description

Write an OnHelp event handler to perform special processing when the user requests help. The HelpContext and the HelpJump methods automatically trigger the OnHelp event.

Set the CallHelp parameter to true if the application should still invoke the help system after the event. Set CallHelp to false to prevent the default response by the help system. The form calls the help system only if OnHelp's CallHelp parameter returns true or if no OnHelp event handler is assigned.

To find the possible values of the Command and Data parameters, search for WinHelp in the Win32 Developer's Reference Help (Win32.HLP) file, which explains the WinHelp API (application programming interface). The possible values for the Data parameter depend upon the value of the Command parameter.

The event handler returns true if it succeeds, false if it fails.

7.1.7.4.21 TForm.OnHide Event

Occurs when the form is hidden (that is, when its Visible property is set to false).

Pascal

```
property OnHide: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHide;
```

Description

Use OnHide to perform special processing when the form is hidden (that is, when the form's Visible property is set to false).

C++ Examples:

```
/*
This example uses two forms, each with a label and a button.
When the user clicks a button, the other form appears and
the current form disappears. Also, a message appears in the
label of the form that is showing, indicating that the other
form is hidden. Set the OnHide event handle for each form to

7.1.7.4.22 TForm.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
```

```
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
/*
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
*/
#include <Printers.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
   KeyPreview = True;

}

void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key, TShiftState Shift)

{
  if (Key == VK_ESCAPE && Printer()->Printing)
  {
    Printer()->Abort();
    MessageDlg("Printing aborted", mtInformation,
               TMsgDlgButtons() << mbOK,0);
  }
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMemo *Memo1 = new TMemo(Form1); // The parent (Form1) will clean up this object.
  Memo1->Parent = Form1;
  Memo1->Visible = True;
  Memo1->Width = 700;
  if (OpenDialog1->Execute())

OnKeyPress

OnKeyUp

7.1.7.4.23 TForm.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

7.1.7.4.24 TForm.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.

OnKeyDown

OnKeyPress

7.1.7.4.25 TForm.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
```

```
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

7.1.7.4.26 TForm.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
```

```
  The following example requires a form with a four-paneled
  status bar.  (Set the Width of the status panels to 150
  before running this example).  When the user presses a mouse
  button, moves the mouse, and releases the mouse button, a
  rectangle is drawn on the form. When the mouse button is
  released, the rectangle appears on the form's canvas. Its
  top-left and bottom-right corners are defined by the
  location of the mouse pointer when the user pressed and
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  */
  int StartX, StartY; // Declare at the top of the form's unit
  // Use this code as the OnMouseDown event handler of the form:
  void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
  int X, int Y)
  {
    StartX = X;
    StartY = Y;
  }

  // Use this code as the OnMouseUp event handler of the form:
  void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
  int X, int Y)
  {
    Form1->Canvas->Rectangle(StartX, StartY, X, Y);
    StatusBar1->Panels->Items[0]->Text = "";
    StatusBar1->Panels->Items[1]->Text = "";
    StatusBar1->Panels->Items[2]->Text = "";
    StatusBar1->Panels->Items[3]->Text = "";
  }

  // Use this code as the OnMouseMove event handler of the form:
  void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
  {
    if (Shift.Contains(ssLeft)) // make sure button is down
    {
      if (Y > StartY)
      {
        StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
        StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
      }
      else
      {
        StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
        StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
      }

7.1.7.4.27 TForm.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

7.1.7.4.28 TForm.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

7.1.7.4.29 TForm.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
```

```
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

OnMouseDown

OnMouseUp

MouseCapture

7.1.7.4.30 TForm.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

Responding to a Mouse-up Action

7.1.7.4.31 TForm.OnMouseWheel Event

Occurs when the mouse wheel is rotated.

Pascal

```
property OnMouseWheel;
```

C++

```
__property OnMouseWheel;
```

Description

Write code in the OnMouseWheel event handler to respond to mouse wheel messages. If there is no OnMouseWheel event handler, or if the mouse wheel message is not handled in the OnMouseWheel event handler, then an OnMouseWheelUp or OnMouseWheelDown event occurs, depending on the direction the mouse wheel was rotated.

See Also

OnMouseWheelDown

OnMouseWheelUp

7.1.7.4.32 TForm.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown;
```

C++

```
__property OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel

OnMouseWheelUp

7.1.7.4.33 TForm.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp;
```

C++

```
__property OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheelDown

OnMouseWheel

7.1.7.4.34 TForm.OnPaint Event

Occurs when the form is redrawn.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Use OnPaint to perform special processing when the form is redrawn. Any special painting on the form should be done in this event. OnPaint occurs before any controls on the form are painted.

To determine which portions of the form's canvas need to be repainted, use the ClipRect property of the canvas.

If you use the form's Canvas property outside the OnPaint event, it will be erased and drawn-over by the next OnPaint event.

C++ Examples:

```
/*
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
*/

#include <memory>       //for STL auto_ptr class

Graphics::TBitmap *TheGraphic;

void __fastcall TForm1::FormPaint(TObject *Sender)// OnPaint event handler
{
  Form1->Canvas->Draw(0, 0, TheGraphic); // Draw the graphic on the Canvas
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  static std::auto_ptr<Graphics::TBitmap> _TheGraphicCleaner(TheGraphic = new
Graphics::TBitmap());  // Create the bitmap object
  TheGraphic->LoadFromFile("..\\bigf.bmp"); // Load the bitmap from a file
}
```

Delphi Examples:

```
{
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
}
procedure TForm1.FormPaint(Sender: TObject); { OnPaint event handler}
begin
  Form1.Canvas.Draw(0, 0, TheGraphic); { Draw the graphic on the Canvas }
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  TheGraphic := TBitmap.Create; { Create the bitmap object }
  TheGraphic.LoadFromFile('bigf.bmp'); { Load the bitmap from a file}
end;
```

```
procedure TForm1.FormDestroy(Sender: TObject);
begin
  (TheGraphic as TObject).Free;
end;
```

7.1.7.4.35 TForm.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize;
```

C++

```
__property OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

C++ Examples:

```
/*
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
*/
void __fastcall TForm1::FormResize(TObject *Sender)
{
  Button1->Left = Form1->ClientWidth - Button1->Width;
}
```

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize

7.1.7.4.36 TForm.OnShortCut Event

Occurs when the user presses a key (before the OnKeyDown event).

Pascal

```
property OnShortCut: TShortCutEvent;
```

C++

```
__property TShortCutEvent OnShortCut;
```

Description

Use OnShortCut to dispatch shortcut keystrokes before the form handles them. When the user presses a key, the form can dispatch it as a shortcut key instead of allowing the standard keystroke processing (OnKeyDown, OnKeyPress, and OnKeyUp). Built-in shortcut processing is provided for menu shortcuts and actions associated with the form. OnShortCut allows the form to implement additional shortcuts.

If the OnShortCut implements a response to the keystroke, set the Handled parameter of the event handler to true. This prevents the keystroke from being passed on to menus or actions associated with the form. It also prevents the standard keystroke processing in the same way that a menu or action shortcut does.

IsShortCut

IsShortCut (see page 4845)

7.1.7.4.37 TForm.OnShow Event

Occurs when the form is shown (that is, when its Visible property is set to true).

Pascal

```
property OnShow: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnShow;
```

Description

Use OnShow to perform special processing when the form is shown (that is, when the form's Visible property is set to true).

C++ Examples:

```
/*
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form's OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  Caption = AnsiString("Now working on tab: " + PageControl1->ActivePage->Caption);
```

```
}

void __fastcall TForm1::FormShow(TObject *Sender)
{
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form's OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
}
procedure TForm1.PageControl1Change(Sender: TObject);
begin
  Caption := ' Now working on tab:  ' + PageControl1.ActivePage.Caption;
end;

procedure TForm1.FormShow(Sender: TObject);
begin
  PageControl1Change(Sender);
end;
```

OnHide (see page 2217)

7.1.7.4.38 TForm.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

7.1.7.4.39 TForm.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock;
```

C++

```
__property OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/

7.1.8 TFrame Class

TFrame is a container for components; it can be nested within forms or other frames.

Class Hierarchy

Pascal

```
TFrame = class(TCustomFrame);
```

C++

```
class TFrame : public TCustomFrame;
```

File

Forms

Description

When you create frames, they are implemented as descendants of TFrame.

A frame, like a form, is a container for other components. It uses the same ownership mechanism as forms for automatic instantiation and destruction of the components on it, and the same parent-child relationships for synchronization of component properties. But frames can be nested within forms or other frames, and they can be saved on the Component palette for easy reuse. After a frame is created and saved, it continues to function as a unit and to inherit changes from the components (including other frames) it contains. Moreover, an embedded frame continues to inherit changes made to the frame from which it is derived.

There is a nonstandard A-footnote (Frames_Object) in the main topic for TFrame. Please do not remove it, since it is necessary for making the Component palette Help work.

TForm (see page 2241)

7.1.8.1 TFrame Members

The following tables list the members exposed by TFrame.

Protected Methods

	Name	Description
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CreateParams (see page 2239)	Initializes frame creation parameters for efficient redrawing.
	CreateParams (see page 2559)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	DoFlipChildren (see page 2560)	Flips the control's children.
	PaintWindow (see page 2240)	Renders the image of a windowed control.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.
	SetParent (see page 2240)	Sets the Parent property.

Public Methods

	Name	Description
	Create (see page 2238)	Creates and initializes a TCustomFrame (see page 2237) object.
	Create (see page 2555)	Creates and initializes a new TScrollingWinControl (see page 2554) object.
	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	GetChildren (see page 2239)	Calls a specified method for each child of the frame.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2397)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2397)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 2398)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2398)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 2400)	Adjust resize constraints.
	OnContextPopup (see page 2401)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2401)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 2402)	Occurs when another control is docked to the control.
	OnDockOver (see page 2404)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2406)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2409)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2412)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2412)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2413)	Occurs when a control receives the input focus.
	OnExit (see page 2416)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 2419)	Returns the control's docking information.
	OnMouseActivate (see page 2421)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2422)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2424)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2424)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2424)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2427)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2429)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2429)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2430)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 2430)	Occurs immediately after the control is resized.
	OnStartDock (see page 2431)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2431)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 2432)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 2370)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2373)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2374)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2374)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BiDiMode (see page 2375)	Specifies the bi-directional mode for the control.
	Color (see page 2375)	Specifies the background color of the control.
	Constraints (see page 2376)	Specifies the size constraints for the control.
	Ctl3D (see page 2376)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 2377)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2378)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

	DragCursor (see page 2380)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2380)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2380)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2382)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2382)	Controls the attributes of text written on or in the control.
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	Padding (see page 2384)	Specifies the padding of a control.
	ParentBackground (see page 2384)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 2384)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 2385)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2385)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 2385)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2386)	Determines where a control looks for its font information.
	ParentShowHint (see page 2386)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2387)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2392)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2393)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2394)	Determines if the user can tab to a control.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 2394)	Determines whether the component appears onscreen.

7.1.8.2 TFrame Properties

The properties of the TFrame class are listed here.

Published Properties

	Name	Description
	Align (see page 2370)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2373)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2374)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2374)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BiDiMode (see page 2375)	Specifies the bi-directional mode for the control.
	Color (see page 2375)	Specifies the background color of the control.
	Constraints (see page 2376)	Specifies the size constraints for the control.
	Ctl3D (see page 2376)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 2377)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2378)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 2380)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2380)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2380)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2382)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2382)	Controls the attributes of text written on or in the control.
	Padding (see page 2384)	Specifies the padding of a control.
	ParentBackground (see page 2384)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 2384)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 2385)	Determines where a control looks for its color information.

	ParentCtl3D (see page 2385)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 2385)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2386)	Determines where a control looks for its font information.
	ParentShowHint (see page 2386)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2387)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2392)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2393)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2394)	Determines if the user can tab to a control.
	Visible (see page 2394)	Determines whether the component appears onscreen.

7.1.8.2.1 TFrame.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
```

```
        pts[i]->Brush->Color = colorPalette[i];
    }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

Parent

Anchors

7.1.8.2.2 TFrame.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at

design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

7.1.8.2.3 TFrame.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.8.2.4 TFrame.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints

CanAutoSize

7.1.8.2.5 TFrame.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

7.1.8.2.6 TFrame.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
```

```
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor

7.1.8.2.7 TFrame.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

7.1.8.2.8 TFrame.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

7.1.8.2.9 TFrame.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite;
```

C++

```
__property DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

7.1.8.2.10 TFrame.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
```

```
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
```

```
  end;
end;
```

7.1.8.2.11 TFrame.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

7.1.8.2.12 TFrame.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

7.1.8.2.13 TFrame.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
```

```
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;

Arranging the Order of Persistent Columns

7.1.8.2.14 TFrame.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

7.1.8.2.15 TFrame.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;

Displaying and Editing Text in a Memo Control

7.1.8.2.16 TFrame.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding;
```

C++

```
__property Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding

7.1.8.2.17 TFrame.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground;
```

C++

```
__property ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

7.1.8.2.18 TFrame.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

BiDiMode

7.1.8.2.19 TFrame.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

7.1.8.2.20 TFrame.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

7.1.8.2.21 TFrame.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

7.1.8.2.22 TFrame.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentColor

ParentShowHint

7.1.8.2.23 TFrame.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

7.1.8.2.24 TFrame.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
```

```
}

{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
```

```
  TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
  The names will be automatically set to "Cut1", "Copy1", and
  "Paste1".  Then double click on the OnClick events and they will
  be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
  Note: only the selected portion of the string in the edit box will
  be copied, cut or replaced.
  }
  procedure TForm1.Copy1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
     Edit1.CopyToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CopyToClipboard
    else
      Beep;
  end;

  procedure TForm1.Cut1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);

      case Tag of
        0:  ShowMessage('first item clicked');
        1:  ShowMessage('second item clicked');
        2:  ShowMessage('third item clicked');
        3:  ShowMessage('fourth item clicked');
      end;
    end;
  end;

  {
  To edit or destroy an item, grab its pointer via the Items
  property.
  }
  procedure TForm1.EditButtonClick(Sender: TObject);
  var
    ItemToEdit: TMenuItem;
  begin
    ItemToEdit := PopupMenu.Items[1];
    ItemToEdit.Caption := 'Changed Caption';
  end;

  procedure TForm1.DestroyButtonClick(Sender: TObject);
  var
    ItemToDelete: TMenuItem;
  begin
    ItemToDelete := PopupMenu.Items[2];
    ItemToDelete.Free;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    index: Integer;
    NewItem: TMenuItem;
  begin
    for index := 0 to 3 do
    begin
        // The owner (PopupMenu1) will cleanup this menu item.
      NewItem := TMenuItem.Create(PopupMenu1); // create the new item
      PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
      NewItem.Caption := 'Menu Item ' + IntToStr(index);
      NewItem.Tag := index;
```

```
    NewItem.OnClick :=
      PopupMenuItemsClick; // assign it an event handler
  end;
end;
```

OnContextPopup

7.1.8.2.25 TFrame.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
```

```
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

7.1.8.2.26 TFrame.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is

sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

7.1.8.2.27 TFrame.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

7.1.8.2.28 TFrame.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
```

```
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;

7.1.8.3 TFrame Events

The events of the TFrame class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2397)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2397)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 2398)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2398)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 2400)	Adjust resize constraints.
	OnContextPopup (see page 2401)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2401)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 2402)	Occurs when another control is docked to the control.
	OnDockOver (see page 2404)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2406)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2409)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2412)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2412)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2413)	Occurs when a control receives the input focus.
	OnExit (see page 2416)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 2419)	Returns the control's docking information.
	OnMouseActivate (see page 2421)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2422)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2424)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2424)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2424)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2427)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2429)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2429)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2430)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 2430)	Occurs immediately after the control is resized.
	OnStartDock (see page 2431)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2431)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 2432)	Occurs when the application tries to undock a control that is docked to the windowed control.

7.1.8.3.1 TFrame.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore;
```

C++

```
__property OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

Align

TAlignInsertBeforeEvent

7.1.8.3.2 TFrame.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition;
```

C++

```
__property OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

7.1.8.3.3 TFrame.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize;
```

C++

```
__property OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

OnConstrainedResize

SetBounds

OnResize

7.1.8.3.4 TFrame.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.

- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

7.1.8.3.5 TFrame.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize;
```

C++

```
__property OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

7.1.8.3.6 TFrame.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

7.1.8.3.7 TFrame.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick

Responding to User Actions at Runtime

7.1.8.3.8 TFrame.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop;
```

C++

```
__property OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
```

```
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite

OnDockOver

7.1.8.3.9 TFrame.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver;
```

C++

```
__property OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.

TDragDockObject

7.1.8.3.10 TFrame.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/
```

```
// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/

TDragObject

7.1.8.3.11 TFrame.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.

OnDragDrop

OnDragOver

OnStartDrag

DragKind

7.1.8.3.14 TFrame.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter

event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)

7.1.8.3.15 TFrame.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
```

```
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';

7.1.8.3.16 TFrame.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo;
```

C++

```
__property OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
```

```
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;

OnDockOver

TDragDockObject

7.1.8.3.17 TFrame.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

7.1.8.3.18 TFrame.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
```

```
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }

MouseCapture

7.1.8.3.19 TFrame.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

7.1.8.3.20 TFrame.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

7.1.8.3.21 TFrame.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,

Responding to a Mouse-up Action

7.1.8.3.23 TFrame.OnMouseWheel Event

Occurs when the mouse wheel is rotated.

Pascal

```
property OnMouseWheel;
```

C++

```
__property OnMouseWheel;
```

Description

Write code in the OnMouseWheel event handler to respond to mouse wheel messages. If there is no OnMouseWheel event handler, or if the mouse wheel message is not handled in the OnMouseWheel event handler, then an OnMouseWheelUp or OnMouseWheelDown event occurs, depending on the direction the mouse wheel was rotated.

See Also

OnMouseWheelDown

OnMouseWheelUp

7.1.8.3.24 TFrame.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown;
```

C++

```
__property OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel

OnMouseWheelUp

7.1.8.3.25 TFrame.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp;
```

C++

```
__property OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

OnMouseWheelDown

OnMouseWheel

7.1.8.3.26 TFrame.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize;
```

C++

```
__property OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

C++ Examples:

```
/*
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
*/
void __fastcall TForm1::FormResize(TObject *Sender)
{
  Button1->Left = Form1->ClientWidth - Button1->Width;
}
```

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize

7.1.8.3.27 TFrame.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnEndDock

TDragDockObjectEx

DragKind

OnDragOver

OnDockDrop

7.1.8.3.28 TFrame.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it

contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

OnDragDrop

7.1.8.3.29 TFrame.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock;
```

C++

```
__property OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
```

```
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

7.1.9 TGlassFrame Class

TGlassFrame controls Windows Vista Aero glass effects.

Class Hierarchy

Pascal

```
TGlassFrame = class(TPersistent);
```

C++

```
class TGlassFrame : public TPersistent;
```

File

Forms

Description

TGlassFrame uses the DwmExtendFrameIntoClientArea API to extend glass effects into the client area. Use the Top (see page 2439), Left (see page 2438), Bottom (see page 2438), and Right (see page 2439) properties to specify the amount to extend the glass effect into the client area, or use SheetOfGlass (see page 2439) to render the entire client area as a glass surface. This is only available on Windows Vista with Aero.

TForm (see page 2241)

TCustomForm (see page 2103)

7.1.9.1 TGlassFrame Members

The following tables list the members exposed by TGlassFrame.

Protected Methods

	Name	Description
	Change (see page 2437)	This is Change, a member of class TGlassFrame.

Public Events

	Name	Description
	OnChange (see page 2439)	Occurs when the dimensions for glass effects change, or when they are enabled/disabled.

Public Methods

	Name	Description
	Assign (see page 2436)	Copies the contents of another, similar object.
	Create (see page 2436)	This is Create, a member of class TGlassFrame.
	FrameExtended (see page 2437)	Returns True if glass effects are extended into the client area.
	IntersectsControl (see page 2438)	Returns True if a control intersects the glass area.

Published Properties

	Name	Description
	Bottom (see page 2438)	Specifies the amount (in pixels) glass effects are extended into the client area.
	Enabled (see page 2438)	This property controls whether glass effects are extended into the client area or not.
	Left (see page 2438)	Specifies the amount (in pixels) glass effects are extended into the client area.
	Right (see page 2439)	Specifies the amount (in pixels) glass effects are extended into the client area.
	SheetOfGlass (see page 2439)	Extends glass effects into the entire client area.
	Top (see page 2439)	Specifies the amount (in pixels) glass effects are extended into the client area.

7.1.9.2 TGlassFrame.Create Constructor

Pascal

```
constructor Create(Client: TCustomForm);
```

C++

```
__fastcall TGlassFrame(TCustomForm Client);
```

Description

This is Create, a member of class TGlassFrame.

7.1.9.3 TGlassFrame Methods

The methods of the TGlassFrame class are listed here.

Protected Methods

	Name	Description
	Change (see page 2437)	This is Change, a member of class TGlassFrame.

Public Methods

	Name	Description
	Assign (see page 2436)	Copies the contents of another, similar object.
	FrameExtended (see page 2437)	Returns True if glass effects are extended into the client area.
	IntersectsControl (see page 2438)	Returns True if a control intersects the glass area.

7.1.9.3.1 TGlassFrame.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError

7.1.9.3.2 TGlassFrame.Change Method

Pascal

```
procedure Change; virtual;
```

C++

```
virtual __fastcall Change();
```

Description

This is Change, a member of class TGlassFrame.

7.1.9.3.3 TGlassFrame.FrameExtended Method

Returns True if glass effects are extended into the client area.

Pascal

```
function FrameExtended: Boolean;
```

C++

```
__fastcall Boolean FrameExtended();
```

Description

Use FrameExtended to determine if glass effects are supported and enabled. The return value is True if Desktop Window Manager (DWM) composition is enabled, Enabled (see page 2438) is True and either SheetOfGlass (see page 2439) is True or any of the properties Top (see page 2439), Left (see page 2438), Bottom (see page 2438) or Right (see page 2439) have a value other than zero.

7.1.9.3.4 TGlassFrame.IntersectsControl Method

Returns True if a control intersects the glass area.

Pascal

```
function IntersectsControl(Control: TControl): Boolean;
```

C++

```
__fastcall Boolean IntersectsControl(TControl * Control);
```

7.1.9.4 TGlassFrame Properties

The properties of the TGlassFrame class are listed here.

Published Properties

	Name	Description
	Bottom (see page 2438)	Specifies the amount (in pixels) glass effects are extended into the client area.
	Enabled (see page 2438)	This property controls whether glass effects are extended into the client area or not.
	Left (see page 2438)	Specifies the amount (in pixels) glass effects are extended into the client area.
	Right (see page 2439)	Specifies the amount (in pixels) glass effects are extended into the client area.
	SheetOfGlass (see page 2439)	Extends glass effects into the entire client area.
	Top (see page 2439)	Specifies the amount (in pixels) glass effects are extended into the client area.

7.1.9.4.1 TGlassFrame.Bottom Property

Specifies the amount (in pixels) glass effects are extended into the client area.

Pascal

```
property Bottom: Integer;
```

C++

```
__property int Bottom;
```

7.1.9.4.2 TGlassFrame.Enabled Property

This property controls whether glass effects are extended into the client area or not.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

7.1.9.4.3 TGlassFrame.Left Property

Specifies the amount (in pixels) glass effects are extended into the client area.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

7.1.9.4.4 TGlassFrame.Right Property

Specifies the amount (in pixels) glass effects are extended into the client area.

Pascal

```
property Right: Integer;
```

C++

```
__property int Right;
```

7.1.9.4.5 TGlassFrame.SheetOfGlass Property

Extends glass effects into the entire client area.

Pascal

```
property SheetOfGlass: Boolean;
```

C++

```
__property Boolean SheetOfGlass;
```

7.1.9.4.6 TGlassFrame.Top Property

Specifies the amount (in pixels) glass effects are extended into the client area.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

7.1.9.5 TGlassFrame Events

The events of the TGlassFrame class are listed here.

Public Events

	Name	Description
	OnChange (see page 2439)	Occurs when the dimensions for glass effects change, or when they are enabled/disabled.

7.1.9.5.1 TGlassFrame.OnChange Event

Occurs when the dimensions for glass effects change, or when they are enabled/disabled.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

7.1.10 TMonitor Class

TMonitor represents a monitor on which an application runs.

Class Hierarchy

Pascal

```
TMonitor = class(TObject);
```

C++

```
class TMonitor : public TObject;
```

File

Forms

Description

TMonitor represents a monitor that displays the user interface of an application. It introduces properties to describe the dimensions of a single monitor. In addition, the Primary (see page 2443) property distinguishes the primary property from other monitors on the system.

When writing multi-monitor applications, use TMonitor to help lay out forms and dialogs so that they are not split over several monitors.

Applications do not create instances of TMonitor. Instead, monitor components for all available monitors are listed by the Monitors property of the global Screen (see page 2615) variable. The global Screen (see page 2615) variable also provides global information about the monitors on which the application runs, such as screen resolution, available fonts, and so on.

See Also

TApplication (see page 1924)

TScreen (see page 2445)

TCustomForm (see page 2103)

Screen (see page 2615)

TCustomForm (see page 2103)

7.1.10.1 TMonitor Members

The following tables list the members exposed by TMonitor.

Public Properties

	Name	Description
R	BoundsRect (see page 2441)	Indicates the dimensions of the monitor in pixels.
R	Handle (see page 2441)	Indicates the Windows handle for the monitor.
R	Height (see page 2442)	Indicates the vertical size of the monitor in pixels.
R	Left (see page 2442)	Indicates the logical position of the left edge of the monitor.
R	MonitorNum (see page 2443)	Specifies the index of the monitor in the global screen object's Monitors list.
R	Primary (see page 2443)	Indicates whether this is the primary monitor.
R	Top (see page 2443)	Indicates the logical position of the top edge of the monitor.
R	Width (see page 2444)	Indicates the horizontal size of the monitor in pixels.
R	WorkareaRect (see page 2444)	Gives the application useable area of the monitor.

7.1.10.2 TMonitor Properties

The properties of the TMonitor class are listed here.

Public Properties

	Name	Description
	BoundsRect (see page 2441)	Indicates the dimensions of the monitor in pixels.
	Handle (see page 2441)	Indicates the Windows handle for the monitor.
	Height (see page 2442)	Indicates the vertical size of the monitor in pixels.
	Left (see page 2442)	Indicates the logical position of the left edge of the monitor.
	MonitorNum (see page 2443)	Specifies the index of the monitor in the global screen object's Monitors list.
	Primary (see page 2443)	Indicates whether this is the primary monitor.
	Top (see page 2443)	Indicates the logical position of the top edge of the monitor.
	Width (see page 2444)	Indicates the horizontal size of the monitor in pixels.
	WorkareaRect (see page 2444)	Gives the application useable area of the monitor.

7.1.10.2.1 TMonitor.BoundsRect Property

Indicates the dimensions of the monitor in pixels.

Pascal

```
property BoundsRect: TRect;
```

C++

```
__property TRect BoundsRect;
```

Description

Read BoundsRect to learn the dimensions of the monitor. BoundsRect gives the dimensions of the monitor in pixels, where (0,0) represents the top-left corner of the primary monitor.

The top of BoundsRect is given by the Top (see page 2443) property, the left edge by the Left (see page 2442) property, and the height and width by the Height (see page 2442) and Width (see page 2444) properties respectively.

Note: The BoundsRect property does not take into account any task bars or tool bars docked on the monitor. To determine the area on the monitor that is free of such docked windows, use the WorkAreaRect property.

See Also

Width (see page 2444)

Top (see page 2443)

Left (see page 2442)

Height (see page 2442)

WorkAreaRect (see page 2444)

DesktopRect (see page 2464)

Primary (see page 2443)

7.1.10.2.2 TMonitor.Handle Property

Indicates the Windows handle for the monitor.

Pascal

```
property Handle: HMONITOR;
```

C++

```
__property HMONITOR Handle;
```

Description

Read Monitor to obtain a Windows handle for the monitor represented by this TMonitor (see page 2439) component. Use this handle for Windows API calls such as GetMonitorInfo.

See Also

MonitorNum (see page 2443)

7.1.10.2.3 TMonitor.Height Property

Indicates the vertical size of the monitor in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Read Height to learn the size of the monitor in pixels. Use this value along with the Top (see page 2443) property to calculate how to position objects vertically in multi-monitor applications.

Note: The Height property does not take into account any task bars or tool bars docked on the monitor. To determine the area on the monitor that is free of such docked windows, use the WorkAreaRect property.

See Also

Height (see page 2470)

DesktopHeight (see page 2463)

Width (see page 2444)

BoundsRect (see page 2441)

WorkAreaRect (see page 2444)

7.1.10.2.4 TMonitor.Left Property

Indicates the logical position of the left edge of the monitor.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

In multi-monitor applications, the available screen space can span multiple monitors from left to right. Read Left to determine where, in the entire available screen space, this monitor appears. The value of Left is in pixels relative to the left edge of the primary monitor.

See Also

Width (see page 2444)

Top (see page 2443)

BoundsRect (see page 2441)

WorkAreaRect (see page 2444)

Primary (see page 2443)

DesktopLeft (see page 2463)

7.1.10.2.5 TMonitor.MonitorNum Property

Specifies the index of the monitor in the global screen object's Monitors list.

Pascal

```
property MonitorNum: Integer;
```

C++

```
__property int MonitorNum;
```

Description

The global screen variable maintains a list of all monitors in a multi-monitor application. MonitorNum is the index of this monitor in the list object that is the screen's Monitors property.

Use MonitorNum to identify a specific monitor when working with multiple monitors.

See Also

Monitors (see page 2474)

Screen (see page 2615)

7.1.10.2.6 TMonitor.Primary Property

Indicates whether this is the primary monitor.

Pascal

```
property Primary: Boolean;
```

C++

```
__property Boolean Primary;
```

Description

Read Primary to determine whether a monitor is the primary monitor in a multi-monitor application. When Primary is true, the monitor is the primary monitor. The coordinates of other monitors are given in terms of the primary monitor.

See Also

Monitors (see page 2474)

BoundsRect (see page 2441)

DesktopRect (see page 2464)

7.1.10.2.7 TMonitor.Top Property

Indicates the logical position of the top edge of the monitor.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

In multi-monitor applications, the available screen space can span multiple monitors from top to bottom. Read Top to determine where, in the entire available screen space, this monitor appears. The value of Top is in pixels relative to the top edge of the primary monitor.

See Also

Height (see page 2442)

Left (see page 2442)

BoundsRect (see page 2441)

WorkAreaRect (see page 2444)

Primary (see page 2443)

DesktopTop (see page 2465)

7.1.10.2.8 TMonitor.Width Property

Indicates the horizontal size of the monitor in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Read Width to learn the size of the monitor in pixels. Use this value along with the Left (see page 2442) property to calculate vertical positions for objects in multi-monitor applications.

Note: The Width property does not take into account any task bars or tool bars docked on the monitor. To determine the area on the monitor that is free of such docked windows, use the WorkAreaRect property.

See Also

Height (see page 2442)

Left (see page 2442)

Width (see page 2475)

DesktopWidth (see page 2465)

BoundsRect (see page 2441)

WorkAreaRect (see page 2444)

7.1.10.2.9 TMonitor.WorkareaRect Property

Gives the application useable area of the monitor.

Pascal

```
property WorkareaRect: TRect;
```

C++

```
__property TRect WorkareaRect;
```

Description

WorkareaRect returns a TRect value furnished with the coordinates and dimensions of the work area of the Monitor. On Windows, for example, the application tabs at the screen mean that the Workarea is smaller than the monitor size.

Note: The TRect Right and Bottom values are one pixel beyond Workarea boundary. They are given these values to allow for easy calculation of Workarea width and height as (Right-Left (see page 2442)) and (Bottom-Top (see page 2443)) respectively.

See Also

TRect

7.1.11 TScreen Class

TScreen represents the state of the screen in which an application runs.

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TScreen = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TScreen : public TComponent;
```

File

Forms

Description

TScreen introduces properties that keep track of

What forms and data modules have been instantiated by the application.

The active form, and the active control within that form.

The size and resolution of the screen.

The cursors and fonts available for the application to use.

The monitors on which the application's forms can appear, including their dimensions.

There is a global variable, Screen (see page 2615), of type TScreen, which is already instantiated for use by GUI applications. Use Screen (see page 2615) to obtain information about the current state of the screen in an application.

See Also

TApplication (see page 1924)

TDataModule

TForm (see page 2241)

TFont (see page 2730)

Handling the Screen

Controlling Application Behavior

7.1.11.1 TScreen Members

The following tables list the members exposed by TScreen.

Public Events

	Name	Description
	OnActiveControlChange (see page 2479)	Occurs immediately after input focus changes to a new windowed control.
	OnActiveFormChange (see page 2481)	Occurs immediately after a new form becomes active in a multi-form application.

Public Methods

	Name	Description
V	Create (see page 2447)	Creates an instance of TScreen (see page 2445).
V	Destroy (see page 2448)	Destroys an instance of TScreen (see page 2445).
	DisableAlign (see page 2448)	Prevents forms from being aligned in the screen.
	EnableAlign (see page 2449)	Allows forms to be aligned in the screen.
	MonitorFromPoint (see page 2449)	Returns the monitor where a specified point is located.
	MonitorFromRect (see page 2449)	Returns the monitor where a specified rectangle is located.
	MonitorFromWindow (see page 2450)	Returns the monitor where a specified window is located.
	Realign (see page 2450)	Realigns the screen's forms according to their Align properties.
	ResetFonts (see page 2451)	Reinitializes the fonts listed in the Fonts (see page 2466) property.

Public Properties

	Name	Description
R	ActiveControl (see page 2452)	Indicates which control currently has input focus on the screen.
R	ActiveCustomForm (see page 2452)	Indicates the descendant of TCustomForm (see page 2103) that currently has focus.
R	ActiveForm (see page 2453)	Indicates which form currently has focus.
	Cursor (see page 2455)	Controls the mouse cursor image on a global level.
R	CursorCount (see page 2458)	This is CursorCount, a member of class TScreen.
	Cursors (see page 2458)	Lists the cursors available to the application.
R	CustomFormCount (see page 2460)	Indicates the number of forms or property pages displayed on the screen.
R	CustomForms (see page 2460)	Lists all the forms and property pages that are currently displayed in the application.
R	DataModuleCount (see page 2461)	Indicates the number of data modules that are currently instantiated in the application.
R	DataModules (see page 2462)	Lists all the data modules that are currently instantiated in the application.
R	DefaultIme (see page 2462)	Indicates which input method editor (IME) is active when the TScreen (see page 2445) object is created.
R	DefaultKbLayout (see page 2463)	Indicates the Windows handle to the keyboard layout that was active when the application started running.
R	DesktopHeight (see page 2463)	Specifies the height of the entire virtual desktop.

R	DesktopLeft (see page 2463)	Specifies the x-coordinate of the desktop's left edge relative to the upper-left corner of the primary monitor.
R	DesktopRect (see page 2464)	Specifies the boundaries of the virtual desktop relative to the upper-left corner of the primary monitor.
R	DesktopTop (see page 2465)	Specifies the y-coordinate of the entire desktop's top edge relative to the upper-left corner of the primary monitor.
R	DesktopWidth (see page 2465)	Specifies the width of the entire virtual desktop.
	FocusedForm (see page 2466)	Provides a reference to the form that has focus.
R	Fonts (see page 2466)	Lists the face names for all fonts supported by the screen.
R	FormCount (see page 2467)	Indicates the number of forms displayed on the screen.
R	Forms (see page 2468)	Lists all the forms currently displayed in the application.
R	Height (see page 2470)	Indicates the vertical size of the screen in pixels.
	HintFont (see page 2471)	Specifies the font used to display help hints.
	IconFont (see page 2472)	Specifies the font used to display the labels on the icons in file selection dialogs.
R	Imes (see page 2472)	Lists all input method editors (IMEs) installed on the system.
	MenuFont (see page 2473)	Specifies the font used for menu commands.
	MessageFont (see page 2473)	This is MessageFont, a member of class TScreen.
R	MonitorCount (see page 2473)	Specifies the number of monitors used to comprise the desktop.
R	Monitors (see page 2474)	Provides access to an individual monitor used to comprise the desktop.
R	PixelsPerInch (see page 2474)	Indicates the number of screen pixels that make up a logical inch in the vertical direction.
R	PrimaryMonitor (see page 2474)	Provides a reference to the primary monitor.
R	SaveFocusedList (see page 2475)	This is SaveFocusedList, a member of class TScreen.
R	Width (see page 2475)	Indicates the horizontal size of the screen in pixels.
R	WorkAreaHeight (see page 2476)	Specifies the height of the work area on the primary monitor.
R	WorkAreaLeft (see page 2477)	Specifies the left edge of the work area on the primary monitor.
R	WorkAreaRect (see page 2477)	Specifies the boundaries of the usable work area on the primary monitor.
R	WorkAreaTop (see page 2478)	Specifies the top edge of the work area on the primary monitor.
R	WorkAreaWidth (see page 2478)	Specifies the width of the work area on the primary monitor.

7.1.11.2 TScreen.Create Constructor

Creates an instance of TScreen (see page 2445).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TScreen(TComponent * AOwner);
```

Description

Do not create separate instances of TScreen (see page 2445). There is a global variable, Screen (see page 2615), of type TScreen (see page 2445), which is already instantiated for use by GUI applications. The properties of Screen (see page 2615) are global to the entire application.

AOwner specifies the Owner of the screen, which is responsible for freeing it. For the global TScreen (see page 2445) object, this is the application.

See Also

Screen (see page 2615)

Owner

TApplication (see page 1924)

7.1.11.3 TScreen.Destroy Destructor

Destroys an instance of TScreen (see page 2445).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScreen();
```

Description

Do not destroy the global object Screen (see page 2615) that is automatically instantiated in GUI applications.

See Also

Screen (see page 2615)

System::TObject::Free

7.1.11.4 TScreen Methods

The methods of the TScreen class are listed here.

Public Methods

	Name	Description
	DisableAlign (see page 2448)	Prevents forms from being aligned in the screen.
	EnableAlign (see page 2449)	Allows forms to be aligned in the screen.
	MonitorFromPoint (see page 2449)	Returns the monitor where a specified point is located.
	MonitorFromRect (see page 2449)	Returns the monitor where a specified rectangle is located.
	MonitorFromWindow (see page 2450)	Returns the monitor where a specified window is located.
	Realign (see page 2450)	Realigns the screen's forms according to their Align properties.
	ResetFonts (see page 2451)	Reinitializes the fonts listed in the Fonts (see page 2466) property.

7.1.11.4.1 TScreen.DisableAlign Method

Prevents forms from being aligned in the screen.

Pascal

```
procedure DisableAlign;
```

C++

```
__fastcall DisableAlign();
```

Description

Call DisableAlign to prevent forms from being aligned in the screen. After calling DisableAlign, the Align properties of the screen's forms are ignored until the call is matched by a call to EnableAlign (see page 2449).

See Also

EnableAlign (see page 2449)

Realign (see page 2450)

Constraints

7.1.11.4.2 TScreen.EnableAlign Method

Allows forms to be aligned in the screen.

Pascal

```
procedure EnableAlign;
```

C++

```
__fastcall EnableAlign();
```

Description

Call EnableAlign to allow forms to be aligned in the screen. After calling DisableAlign (see page 2448), the Align properties of the screen's forms are ignored until that call is matched by a call to EnableAlign.

See Also

DisableAlign (see page 2448)

Realign (see page 2450)

Constraints

7.1.11.4.3 TScreen.MonitorFromPoint Method

Returns the monitor where a specified point is located.

Pascal

```
function MonitorFromPoint(const Point: TPoint; MonitorDefault: TMonitorDefaultTo = mdNearest):
TMonitor;
```

C++

```
__fastcall TMonitor MonitorFromPoint(const TPoint Point, TMonitorDefaultTo MonitorDefault =
mdNearest);
```

Description

Call MonitorFromPoint determine the monitor where a specified point is located.

Point is the coordinates of the point to locate. It is in pixels relative to the upper-left corner of the primary monitor.

MonitorDefault indicates how to select a monitor when the point does not fall clearly on a single monitor.

See Also

Monitors (see page 2474)

DesktopRect (see page 2464)

BoundsRect (see page 2441)

7.1.11.4.4 TScreen.MonitorFromRect Method

Returns the monitor where a specified rectangle is located.

Pascal

```
function MonitorFromRect(const Rect: TRect; MonitorDefault: TMonitorDefaultTo = mdNearest):
TMonitor;
```

C++

```
__fastcall TMonitor MonitorFromRect(const TRect Rect, TMonitorDefaultTo MonitorDefault =
mdNearest);
```

Description

Call MonitorFromRect determine the monitor where a specified boundary rectangle falls.

Rect is the coordinates of the rectangle to locate. It is in pixels relative to the upper-left corner of the primary monitor.

MonitorDefault indicates how to select a monitor when the rectangle does not fall entirely on a single monitor.

See Also

Monitors (see page 2474)

DesktopRect (see page 2464)

BoundsRect (see page 2441)

7.1.11.4.5 TScreen.MonitorFromWindow Method

Returns the monitor where a specified window is located.

Pascal

```
function MonitorFromWindow(const Handle: THandle; MonitorDefault: TMonitorDefaultTo =
mdNearest): TMonitor;
```

C++

```
__fastcall TMonitor MonitorFromWindow(const THandle Handle, TMonitorDefaultTo MonitorDefault =
mdNearest);
```

Description

Call MonitorFromWindow determine the monitor that displays a specified window.

Handle is the window handle for the window to be located.

MonitorDefault indicates how to select a monitor when the window does not fall entirely on a single monitor.

See Also

Monitors (see page 2474)

DesktopRect (see page 2464)

BoundsRect (see page 2441)

7.1.11.4.6 TScreen.Realign Method

Realigns the screen's forms according to their Align properties.

Pascal

```
procedure Realign;
```

C++

```
__fastcall Realign();
```

Description

Call Realign to realign the screen's forms according to their Align properties.

See Also

EnableAlign (see page 2449)

DisableAlign (see page 2448)

Constraints

7.1.11.4.7 TScreen.ResetFonts Method

Reinitializes the fonts listed in the Fonts (see page 2466) property.

Pascal

```
procedure ResetFonts;
```

C++

```
__fastcall ResetFonts();
```

Description

Call ResetFonts to ensure that the fonts listed in the Fonts (see page 2466) property are up to date. ResetFonts reinitializes the Fonts (see page 2466) property so that its value is reread from the operating system the next time it is needed.

TScreen (see page 2445) calls ResetFonts internally in response to messages from Windows that the available fonts have changed.

See Also

Fonts (see page 2466)

7.1.11.5 TScreen Properties

The properties of the TScreen class are listed here.

Public Properties

	Name	Description
R	ActiveControl (see page 2452)	Indicates which control currently has input focus on the screen.
R	ActiveCustomForm (see page 2452)	Indicates the descendant of TCustomForm (see page 2103) that currently has focus.
R	ActiveForm (see page 2453)	Indicates which form currently has focus.
	Cursor (see page 2455)	Controls the mouse cursor image on a global level.
R	CursorCount (see page 2458)	This is CursorCount, a member of class TScreen.
	Cursors (see page 2458)	Lists the cursors available to the application.
R	CustomFormCount (see page 2460)	Indicates the number of forms or property pages displayed on the screen.
R	CustomForms (see page 2460)	Lists all the forms and property pages that are currently displayed in the application.
R	DataModuleCount (see page 2461)	Indicates the number of data modules that are currently instantiated in the application.
R	DataModules (see page 2462)	Lists all the data modules that are currently instantiated in the application.
R	DefaultIme (see page 2462)	Indicates which input method editor (IME) is active when the TScreen (see page 2445) object is created.
R	DefaultKbLayout (see page 2463)	Indicates the Windows handle to the keyboard layout that was active when the application started running.
R	DesktopHeight (see page 2463)	Specifies the height of the entire virtual desktop.
R	DesktopLeft (see page 2463)	Specifies the x-coordinate of the desktop's left edge relative to the upper-left corner of the primary monitor.
R	DesktopRect (see page 2464)	Specifies the boundaries of the virtual desktop relative to the upper-left corner of the primary monitor.

R	DesktopTop (see page 2465)	Specifies the y-coordinate of the entire desktop's top edge relative to the upper-left corner of the primary monitor.
R	DesktopWidth (see page 2465)	Specifies the width of the entire virtual desktop.
	FocusedForm (see page 2466)	Provides a reference to the form that has focus.
R	Fonts (see page 2466)	Lists the face names for all fonts supported by the screen.
R	FormCount (see page 2467)	Indicates the number of forms displayed on the screen.
R	Forms (see page 2468)	Lists all the forms currently displayed in the application.
R	Height (see page 2470)	Indicates the vertical size of the screen in pixels.
	HintFont (see page 2471)	Specifies the font used to display help hints.
	IconFont (see page 2472)	Specifies the font used to display the labels on the icons in file selection dialogs.
R	Imes (see page 2472)	Lists all input method editors (IMEs) installed on the system.
	MenuFont (see page 2473)	Specifies the font used for menu commands.
	MessageFont (see page 2473)	This is MessageFont, a member of class TScreen.
R	MonitorCount (see page 2473)	Specifies the number of monitors used to comprise the desktop.
R	Monitors (see page 2474)	Provides access to an individual monitor used to comprise the desktop.
R	PixelsPerInch (see page 2474)	Indicates the number of screen pixels that make up a logical inch in the vertical direction.
R	PrimaryMonitor (see page 2474)	Provides a reference to the primary monitor.
R	SaveFocusedList (see page 2475)	This is SaveFocusedList, a member of class TScreen.
R	Width (see page 2475)	Indicates the horizontal size of the screen in pixels.
R	WorkAreaHeight (see page 2476)	Specifies the height of the work area on the primary monitor.
R	WorkAreaLeft (see page 2477)	Specifies the left edge of the work area on the primary monitor.
R	WorkAreaRect (see page 2477)	Specifies the boundaries of the usable work area on the primary monitor.
R	WorkAreaTop (see page 2478)	Specifies the top edge of the work area on the primary monitor.
R	WorkAreaWidth (see page 2478)	Specifies the width of the work area on the primary monitor.

7.1.11.5.1 TScreen.ActiveControl Property

Indicates which control currently has input focus on the screen.

Pascal

```
property ActiveControl: TWinControl;
```

C++

```
__property TWinControl * ActiveControl;
```

Description

Read ActiveControl to learn which windowed control object in the active form currently receives the input from the keyboard.

ActiveControl is a read-only property. To change the ActiveControl, use the SetFocusedControl method of the form that contains the control that should receive focus.

After focus shifts from one control to another, the screen receives an OnActiveControlChange (see page 2479) event.

See Also

OnActiveControlChange (see page 2479)

ActiveControl (see page 2145)

SetFocusedControl (see page 2136)

7.1.11.5.2 TScreen.ActiveCustomForm Property

Indicates the descendant of TCustomForm (see page 2103) that currently has focus.

Pascal

```
property ActiveCustomForm: TCustomForm;
```

C++

```
__property TCustomForm ActiveCustomForm;
```

Description

Read ActiveCustomForm to learn which form or property page has input focus. If the active custom form is a TForm (see page 2241) object, ActiveCustomForm is the same as ActiveForm (see page 2453).

See Also

ActiveForm (see page 2453)

OnActiveFormChange (see page 2481)

TForm (see page 2241)

TPropertyPage

7.1.11.5.3 TScreen.ActiveForm Property

Indicates which form currently has focus.

Pascal

```
property ActiveForm: TForm;
```

C++

```
__property TForm * ActiveForm;
```

Description

Read ActiveForm to learn which form in the application has input focus. If the application is not currently active, ActiveForm is the form that will have focus when the application becomes active again.

ActiveForm is a read-only property. To change the ActiveForm, use the SetFocus method of the form that should receive focus. ActiveForm also changes if the SetFocusedControl method of an inactive form is called to set focus to a control on that inactive form.

After focus shifts from one form to another, the screen receives an OnActiveFormChange (see page 2481) event.

Note: If the application window with focus is not a TForm (see page 2241) descendant (for example, if it is a property page), it will not appear as ActiveForm. To handle such cases, use the ActiveCustomForm (see page 2452) property instead.

C++ Examples:

```
/*
This example uses two forms with a button on the first
form. When the user clicks the button, the second form
appears. As the user switches between forms, the form that
is active is colored aqua.
Note:   You must include the unit header for form 2 to the
unit file for form 1, and add the public ColorForm method
to the definition of the TForm1 class.
*/
#include "Unit2.h"

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
```

```
}

void __fastcall TForm1::ColorForm(TObject *Sender)
{
  Color = clWhite;
  Form2->Color = clWhite;
  Screen->ActiveForm->Color = clAqua;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveFormChange = ColorForm;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  // This stops ColorForm from being called during termination.
  Screen->OnActiveFormChange = NULL;
}
```

Delphi Examples:

```
{
This example uses a two forms with a button on the first
form. When the user clicks the button, the second form
appears. As the user switches between forms, the form that
is active is colored aqua.
Note:   You must include the unit header for form 2 to the
unit file for form 1, and add the public ColorForm method
to the header for form 1's unit.
}
type
  TForm1 = class(TForm)
    Button1: TButton;
    procedure Button1Click(Sender: TObject);
    procedure FormCreate(Sender: TObject);
    procedure FormDestroy(Sender: TObject);
  private
    { Private declarations }
  public
    procedure ColorForm(Sender: TObject);
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

uses Unit2;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Form2.Show;
end;

procedure TForm1.ColorForm(Sender: TObject);
begin
  Color := clWhite;
  Form2.Color := clWhite;
  Screen.ActiveForm.Color := clAqua;
end;
procedure TForm1.FormCreate(Sender: TObject);
begin
  Screen.OnActiveFormChange := ColorForm;
end;
```

```
procedure TForm1.FormDestroy(Sender: TObject);
begin
  // This stops ColorForm from being called during termination.

ActiveMDIChild (see page 2146)

SetFocus (see page 2135)

SetFocusedControl (see page 2136)

How Actions Find Their Targets

7.1.11.5.4 TScreen.Cursor Property

Controls the mouse cursor image on a global level.

Pascal

```
property Cursor: TCursor;
```

C++

```
__property TCursor Cursor;
```

Description

Set Cursor to override the cursor image associated with individual control objects. When Cursor is crDefault, the individual objects determine the cursor image. Assigning any other value sets the mouse cursor image for all windows belonging to the application. The global mouse cursor image remains in effect until the screen's Cursor property is changed back to crDefault.

Cursor can be set to any of the cursor values available in the Cursors (see page 2458) property. This can be one of the built-in cursor values, or a custom cursor that has been added to the Cursors (see page 2458) property.

Note: Changes to the value of the Cursor property may not show up immediately. Call the ProcessMessages method of the global Application (see page 2612) object to allow the application to respond to a notification that the value has changed.

C++ Examples:

```
/*
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
*/

#include <memory>       //for STL auto_ptr class

const crMyCursor = 5;

  void __fastcall TForm1::Button2Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bmpMask(new Graphics::TBitmap);
  std::auto_ptr<Graphics::TBitmap> bmpColor(new Graphics::TBitmap);
  std::auto_ptr<TIconInfo> iconInfo(new TIconInfo);
```

```
  bmpMask->LoadFromFile("../SquareMask.bmp");
  bmpColor->LoadFromFile("../Square.bmp");

  iconInfo->fIcon = false;
  iconInfo->xHotspot = 15;
  iconInfo->yHotspot = 15;
  iconInfo->hbmMask = bmpMask->Handle;
  iconInfo->hbmColor = bmpColor->Handle;

  Screen->Cursors[crMyCursor] = CreateIconIndirect(iconInfo.get());

  Screen->Cursor = crMyCursor;
}
/*
Assignments to the Screen object's cursor property are
typically guarded by a try...finally statement to ensure
that normal cursor behavior is restored. Note that the
original cursor is saved and restored.  This allows cursor
changes to be nested without accidentally restoring the
cursor to a hard-coded value prematurely.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
TCursor Save_Cursor = Screen->Cursor;
Screen->Cursor = crHourGlass;    // Show hourglass cursor
try
{
  // Do some lengthy operation
  int I = 0;
  int J = 0;
  int X, Y;
  const magicnumber = 150000000;
  while (I < magicnumber)
  {
    Randomize;
    while (J < magicnumber)
    {
      Y = Random(J);
      J++;
    }
    X = Random(I);
    I++;
  }
}
__finally
{
  Screen->Cursor = Save_Cursor; // always restore the cursor
}
}
```

Delphi Examples:

```
{
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
}
var
  bmpMask : TBitmap;
  bmpColor : TBitmap;
  iconInfo : TIconInfo;
const
  crMyCursor = 5;

procedure TForm1.Button2Click(Sender: TObject);
begin
```

```
    bmpMask := TBitmap.Create;
    bmpColor := TBitmap.Create;

    bmpMask.LoadFromFile('SquareMask.bmp');
    bmpColor.LoadFromFile('Square.bmp');

    with iconInfo do
    begin
      fIcon := false;
      xHotspot := 15;
      yHotspot := 15;
      hbmMask := bmpMask.Handle;
      hbmColor := bmpColor.Handle;
    end;

    Screen.Cursors[crMyCursor] := CreateIconIndirect(iconInfo);

    Screen.Cursor := crMyCursor;

    bmpMask.Free;
    bmpColor.Free;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  begin
    DestroyIcon(Screen.Cursors[crMyCursor]);
  end;
  {
  Assignments to the Screen object's cursor property are
  typically guarded by a try...finally statement to ensure
  that normal cursor behavior is restored. Note that the
  original cursor is saved and restored.  This allows cursor
  changes to be nested without accidentally restoring the
  cursor to a hard-coded value prematurely.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    Save_Cursor : TCursor;
    I, J: Integer;
    X, Y: Word;
  const
    magicnumber = 3000000;
  begin
    Save_Cursor := Screen.Cursor;
    Screen.Cursor := crHourGlass;    { Show hourglass cursor }
    try
      { Do some lengthy operation }
    I := 0;
    J := 0;
    while I < magicnumber do
    begin
      Randomize;
      while J < magicnumber do
      begin
        Y := Random(J);
        Inc(J);
      end;
      X := Random(I);
      Inc(I);
    end;
    finally
      Screen.Cursor := Save_Cursor;  { Always restore to normal }
    end;
  end;
```

Cursors (see page 2458)

Cursor

ProcessMessages (see page 1954)

7.1.11.5.5 TScreen.CursorCount Property

Pascal

```
property CursorCount: Integer;
```

C++

```
__property int CursorCount;
```

Description

This is CursorCount, a member of class TScreen.

7.1.11.5.6 TScreen.Cursors Property

Lists the cursors available to the application.

Pascal

```
property Cursors [Index: Integer]: HCURSOR;
```

C++

```
__property HCURSOR Cursors[int Index];
```

Description

Use Cursor (see page 2455) to access a particular cursor for use by the application or by a control within the application. TScreen (see page 2445) includes several built-in cursors that are indexed by symbolic cursor constants. The image associated with the built-in cursors constants can be changed by setting the Cursors property.

Custom cursors can be added to the Cursors property for use by the application or any of its controls. To add a custom cursor to an application:

1Create (see page 2447) the cursor resource using a resource editor.

2Declare a cursor constant with a value that does not conflict with an existing cursor constant.

3Use the Windows API function LoadCursor to obtain a handle to the new cursor.

4Set the Cursors property, indexed by the newly declared cursor constant, to the handle obtained from LoadCursor.

Note: Don't call the Windows API function DestroyCursor when finished with a custom cursor; it is handled automatically.

C++ Examples:

```
/*
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
*/

#include <memory>       //for STL auto_ptr class
```

```
const crMyCursor = 5;

  void __fastcall TForm1::Button2Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bmpMask(new Graphics::TBitmap);
  std::auto_ptr<Graphics::TBitmap> bmpColor(new Graphics::TBitmap);
  std::auto_ptr<TIconInfo> iconInfo(new TIconInfo);

  bmpMask->LoadFromFile("../SquareMask.bmp");
  bmpColor->LoadFromFile("../Square.bmp");

  iconInfo->fIcon = false;
  iconInfo->xHotspot = 15;
  iconInfo->yHotspot = 15;
  iconInfo->hbmMask = bmpMask->Handle;
  iconInfo->hbmColor = bmpColor->Handle;

  Screen->Cursors[crMyCursor] = CreateIconIndirect(iconInfo.get());

  Screen->Cursor = crMyCursor;
}
```

Delphi Examples:

```
{
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
}
var
  bmpMask : TBitmap;
  bmpColor : TBitmap;
  iconInfo : TIconInfo;
const
  crMyCursor = 5;

procedure TForm1.Button2Click(Sender: TObject);
begin
  bmpMask := TBitmap.Create;
  bmpColor := TBitmap.Create;

  bmpMask.LoadFromFile('SquareMask.bmp');
  bmpColor.LoadFromFile('Square.bmp');

  with iconInfo do
  begin
    fIcon := false;
    xHotspot := 15;
    yHotspot := 15;
    hbmMask := bmpMask.Handle;
    hbmColor := bmpColor.Handle;
  end;

  Screen.Cursors[crMyCursor] := CreateIconIndirect(iconInfo);

  Screen.Cursor := crMyCursor;

  bmpMask.Free;
  bmpColor.Free;
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  DestroyIcon(Screen.Cursors[crMyCursor]);
end;
```

Cursor

7.1.11.5.7 TScreen.CustomFormCount Property

Indicates the number of forms or property pages displayed on the screen.

Pascal

```
property CustomFormCount: Integer;
```

C++

```
__property int CustomFormCount;
```

Description

Read CustomFormCount to learn the number of forms or property pages currently displayed on the screen. These forms can be accessed by the CustomForms (see page 2460) property. CustomFormCount can be used with CustomForms (see page 2460) to iterate over all the forms and property pages in an application.

C++ Examples:

```
/*
The following code adds the name of all forms and dialogs on
the screen to ListBox1 when Button1 is clicked.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < Screen->CustomFormCount; i++)
    ListBox1->Items->Add(Screen->CustomForms[i]->Name);
}
```

Delphi Examples:

```
{
The following code adds the name of all forms and dialogs on
the screen to ListBox1 when Button1 is clicked.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Screen.CustomFormCount-1 do
    ListBox1.Items.Add(Screen.CustomForms[I].Name);
end;
```

See Also

CustomForms (see page 2460)

FormCount (see page 2467)

7.1.11.5.8 TScreen.CustomForms Property

Lists all the forms and property pages that are currently displayed in the application.

Pascal

```
property CustomForms [Index: Integer]: TCustomForm;
```

C++

```
__property TCustomForm CustomForms[int Index];
```

Description

Use CustomForms to access a form or property page by index. The value of Index is a number between zero (the first custom form) and CustomFormCount (see page 2460) - 1. CustomForms can be used with CustomFormCount (see page 2460) when an application needs to iterate over all its forms and property pages.

Unlike the Forms (see page 2468) property, CustomForms lists TCustomForm (see page 2103) descendants that do not derive from TForm (see page 2241) (such as property pages).

Warning: The order in which CustomForms lists its forms is affected by the Z order of the forms. Do not change the Z order of forms when using CustomForms to iterate over the forms in an application.

C++ Examples:

```
/*
The following code adds the name of all forms and dialogs on
the screen to ListBox1 when Button1 is clicked.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < Screen->CustomFormCount; i++)
    ListBox1->Items->Add(Screen->CustomForms[i]->Name);
}
```

Delphi Examples:

```
{
The following code adds the name of all forms and dialogs on
the screen to ListBox1 when Button1 is clicked.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Screen.CustomFormCount-1 do
    ListBox1.Items.Add(Screen.CustomForms[I].Name);
end;
```

CustomFormCount (see page 2460)

Forms (see page 2468)

7.1.11.5.9 TScreen.DataModuleCount Property

Indicates the number of data modules that are currently instantiated in the application.

Pascal

```
property DataModuleCount: Integer;
```

C++

```
__property int DataModuleCount;
```

Description

Read DataModuleCount to learn the number of data modules in the DataModules (see page 2462) property. DataModuleCount can be used with DataModules (see page 2462) when an application needs to iterate over all its data

modules.

See Also

DataModules (see page 2462)

TDataModule

7.1.11.5.10 TScreen.DataModules Property

Lists all the data modules that are currently instantiated in the application.

Pascal

```
property DataModules [Index: Integer]: TDataModule;
```

C++

```
__property TDataModule DataModules[int Index];
```

Description

Use DataModules to access an instantiated data module by index. The value of Index is a number between zero (the first data module) and DataModuleCount (see page 2461) - 1. DataModules can be used with DataModuleCount (see page 2461) when an application needs to iterate over all its data modules.

See Also

DataModuleCount (see page 2461)

7.1.11.5.11 TScreen.DefaultIme Property

Indicates which input method editor (IME) is active when the TScreen (see page 2445) object is created.

Pascal

```
property DefaultIme: string;
```

C++

```
__property UnicodeString DefaultIme;
```

Description

In applications that support Asian language characters, read DefaultIme to determine the IME that is active when the application starts.

An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application. There can be multiple IMEs installed on a single system. They vary in user interface, conversion dictionaries, and input method.

Individual controls can override the default IME. When a control specifies a different IME should be used to enter information into the control, the IME that processes keyboard input changes when the control has focus. When the control loses focus, DefaultIme is restored as the system IME.

See Also

DefaultKbLayout (see page 2463)

Imes (see page 2472)

ImeName

ResetIme

7.1.11.5.12 TScreen.DefaultKbLayout Property

Indicates the Windows handle to the keyboard layout that was active when the application started running.

Pascal

```
property DefaultKbLayout: HKL;
```

C++

```
__property HKL DefaultKbLayout;
```

Description

Use DefaultKbLayout for making Windows API calls that require a handle to a keyboard layout. For example, if an application changes the keyboard layout to match the settings for another country, the value of DefaultKbLayout can be used as a parameter to the Windows ActivateKeyboardLayout function in order to restore the original layout.

For asian keyboards, the keyboard layout identifies the input method editor (IME) as well as the default language. Use DefaultKbLayout in Windows API calls that work with the IME. DefaultKbLayout is the keyboard layout handle associated with the IME named by the DefaultIme (see page 2462) property.

See Also

DefaultIme (see page 2462)

Imes (see page 2472)

7.1.11.5.13 TScreen.DesktopHeight Property

Specifies the height of the entire virtual desktop.

Pascal

```
property DesktopHeight: Integer;
```

C++

```
__property int DesktopHeight;
```

Description

Use DesktopHeight to determine the height of the entire desktop. The desktop is defined as the entire virtual desktop, which includes all monitors in the system.

On a single-monitor system, DesktopHeight corresponds to Height (see page 2470).

See Also

DesktopLeft (see page 2463)

DesktopRect (see page 2464)

DesktopTop (see page 2465)

DesktopWidth (see page 2465)

WorkAreaHeight (see page 2476)

Height (see page 2470)

7.1.11.5.14 TScreen.DesktopLeft Property

Specifies the x-coordinate of the desktop's left edge relative to the upper-left corner of the primary monitor.

Pascal

```
property DesktopLeft: Integer;
```

C++

```
__property int DesktopLeft;
```

Description

Use DesktopLeft to determine the x-coordinate of the entire desktop's left edge relative to the upper-left corner of the primary monitor. The primary monitor is the monitor with its Primary property set to true. The desktop is defined as the entire virtual desktop, which includes all monitors in the system.

On a single-monitor system, DesktopLeft is 0.

See Also

DesktopHeight (see page 2463)

DesktopRect (see page 2464)

DesktopTop (see page 2465)

DesktopWidth (see page 2465)

WorkAreaLeft (see page 2477)

Primary (see page 2443)

Monitors (see page 2474)

7.1.11.5.15 TScreen.DesktopRect Property

Specifies the boundaries of the virtual desktop relative to the upper-left corner of the primary monitor.

Pascal

```
property DesktopRect: TRect;
```

C++

```
__property TRect DesktopRect;
```

Description

Use DesktopRect to determine the coordinates of the entire virtual desktop, which includes all monitors in the system. DesktopRect is expressed in coordinates where (0,0) is the upper-left corner of the primary monitor. The primary monitor is the monitor with its Primary property set to true.

See Also

DesktopHeight (see page 2463)

DesktopLeft (see page 2463)

DesktopTop (see page 2465)

DesktopWidth (see page 2465)

WorkAreaRect (see page 2477)

Primary (see page 2443)

Monitors (see page 2474)

7.1.11.5.16 TScreen.DesktopTop Property

Specifies the y-coordinate of the entire desktop's top edge relative to the upper-left corner of the primary monitor.

Pascal

```
property DesktopTop: Integer;
```

C++

```
__property int DesktopTop;
```

Description

Use DesktopTop to determine the y-coordinate of the desktop's top edge relative to the upper-left corner of the primary monitor. The primary monitor is the monitor with its Primary property set to true. The desktop is defined as the entire virtual desktop, which includes all monitors in the system.

On a single-monitor system, DesktopTop is 0.

See Also

DesktopHeight (see page 2463)

DesktopRect (see page 2464)

DesktopLeft (see page 2463)

DesktopWidth (see page 2465)

WorkAreaTop (see page 2478)

Primary (see page 2443)

Monitors (see page 2474)

7.1.11.5.17 TScreen.DesktopWidth Property

Specifies the width of the entire virtual desktop.

Pascal

```
property DesktopWidth: Integer;
```

C++

```
__property int DesktopWidth;
```

Description

Use DesktopWidth to determine the width of the desktop. The desktop is defined as the entire virtual desktop, which includes all monitors in the system.

On a single-monitor system, DesktopWidth corresponds to Width (see page 2475).

See Also

DesktopHeight (see page 2463)

DesktopRect (see page 2464)

DesktopLeft (see page 2463)

DesktopTop (see page 2465)

WorkAreaWidth (see page 2478)

Width (see page 2475)

7.1.11.5.18 TScreen.FocusedForm Property

Provides a reference to the form that has focus.

Pascal

```
property FocusedForm: TCustomForm;
```

C++

```
__property TCustomForm FocusedForm;
```

Description

FocusedForm returns a reference to the form that currently has focus.

See Also

TCustomForm (see page 2103)

7.1.11.5.19 TScreen.Fonts Property

Lists the face names for all fonts supported by the screen.

Pascal

```
property Fonts: TStrings;
```

C++

```
__property TStrings Fonts;
```

Description

Read Fonts to learn what screen fonts are currently installed. Applications can use Fonts to ensure that they do not request a font that is not installed on the user's system. When an application uses a TFont (see page 2730) object to request a font that is not installed, the system substitutes another font, which may not be a font appropriate to the application's needs.

Note: Fonts is a list of screen fonts. It does not give any indication of the printer fonts available to the application.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

TFont (see page 2730)

ResetFonts (see page 2451)

7.1.11.5.20 TScreen.FormCount Property

Indicates the number of forms displayed on the screen.

Pascal

```
property FormCount: Integer;
```

C++

```
__property int FormCount;
```

Description

Read FormCount to learn the number of forms currently displayed on the screen. These forms can be accessed by the Forms (see page 2468) property. FormCount can be used with Forms (see page 2468) to iterate over all the forms in an application.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
```

```
      NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
      NewItem->Caption = Screen->Forms[I]->Name + "Item";
      NewItem->Name = Screen->Forms[I]->Name;
      MainMenu1->Items->Items[1]->Add(NewItem);
    }
  }
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
```

See Also

Forms (see page 2468)

TForm (see page 2241)

7.1.11.5.21 TScreen.Forms Property

Lists all the forms currently displayed in the application.

Pascal

```
property Forms [Index: Integer]: TForm;
```

C++

```
__property TForm * Forms[int Index];
```

Description

Use Forms to access a form by index. The value of Index is a number between zero (the first form) and FormCount (see page 2467) - 1. Forms can be used with FormCount (see page 2467) when an application needs to iterate over all its forms, including all dialogs.

Forms only lists the TForm (see page 2241) descendants in the application. This does not include, for example, property pages. To get a list that includes TCustomForm (see page 2103) descendants that do not descend from TForm (see page 2241), use CustomForms (see page 2460) instead.

Warning: The order in which Forms lists its forms is affected by the Z order of the forms. Do not change the Z order of forms when using Forms to iterate over the forms in an application.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
```

```
    for  I := 0 to Screen.FormCount-1 do
    begin
      NewItem := TMenuItem.Create(MainMenu1.Items[1]);
      NewItem.Caption := Screen.Forms[I].Name + 'Item';
      NewItem.Name := Screen.Forms[I].Name;
      MainMenu1.Items[1].Add(NewItem);
     end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I : Integer;
  begin
    // Count down, not up!
    for  I := MainMenu1.Items[1].Count - 1 downto 0 do
    begin
      MainMenu1.Items[1].Items[I].Free;
    end;
  end;
```

See Also

FormCount (see page 2467)

CustomForms (see page 2460)

7.1.11.5.22 TScreen.Height Property

Indicates the vertical size of the screen in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Read Height to learn the size of the user's screen in pixels. The size or position of objects placed on the screen, can then be set to ensure that the objects fit on screen and don't look crowded.

C++ Examples:

```
/*
The following code determines the height of all forms on the
screen and resizes any that are taller than the screen height.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < Screen->FormCount; i++)
  {
    if (Screen->Forms[i]->Top < 0)
    {
      Screen->Forms[i]->Height += Screen->Forms[i]->Top;
      Screen->Forms[i]->Top = 0;
    }
    if (Screen->Forms[i]->Left < 0)
    {
      Screen->Forms[i]->Width += Screen->Forms[i]->Left;
      Screen->Forms[i]->Left = 0;
    }
    if (Screen->Forms[i]->Left + Screen->Forms[i]->Width > Screen->Width)
      Screen->Forms[i]->Width = Screen->Width - Screen->Forms[i]->Left;
    if (Screen->Forms[i]->Top + Screen->Forms[i]->Height > Screen->Height)
      Screen->Forms[i]->Height = Screen->Height - Screen->Forms[i]->Top;
```

```
  }
}
```

Delphi Examples:

```
{
The following code determines the height of all forms on the
screen and resizes any that are taller than the screen height.
}
procedure TForm1.Button1Click(Sender: TObject);
var I: Integer;
begin
with Screen do
  for I := 0 to FormCount-1 do
    begin
    if Forms[I].Top < 0 then
    begin
      Forms[I].Height := Forms[I].Height + Forms[I].Top;
      Forms[I].Top := 0;
    end;
    if Forms[I].Left < 0 then
    begin
      Forms[I].Width := Forms[I].Width + Forms[I].Left;
      Forms[I].Left := 0;
    end;
    if Forms[I].Left + Forms[I].Width > Width then
      Forms[I].Width := Width - Forms[I].Left;
    if Forms[I].Top + Forms[I].Height > Height then
      Forms[I].Height := Height - Forms[I].Top;
    end;
end;
```

Considerations When Dynamically Resizing Forms and Controls

7.1.11.5.23 TScreen.HintFont Property

Specifies the font used to display help hints.

Pascal

```
property HintFont: TFont;
```

C++

```
__property TFont HintFont;
```

Description

HintFont stores the Windows status font setting. This font is used by default for the help hints that appear when the user pauses the mouse over a control or menu item.

See Also

Fonts (see page 2466)

IconFont (see page 2472)

MenuFont (see page 2473)

Font

Hint

Hint (see page 1976)

7.1.11.5.24 TScreen.IconFont Property

Specifies the font used to display the labels on the icons in file selection dialogs.

Pascal

```
property IconFont: TFont;
```

C++

```
__property TFont IconFont;
```

Description

IconFont stores the Windows icon font setting. This font is used to label the icons on the desktop, and icons in the file selection dialogs.

See Also

Fonts (see page 2466)

HintFont (see page 2471)

MenuFont (see page 2473)

7.1.11.5.25 TScreen.Imes Property

Lists all input method editors (IMEs) installed on the system.

Pascal

```
property Imes: TStrings;
```

C++

```
__property TStrings Imes;
```

Description

Read Imes to obtain a list of all IMEs that are listed in the Windows registry. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application. IMEs vary in user interface, conversion dictionaries, and input method.

Individual controls can require a specific IME to process the keyboard input when they have focus. To specify an IME, the control sets its ImeName property to one of the strings in Imes.

Each IME name in Imes has an associated keyboard layout handle. A keyboard layout handle is a Windows handle that identifies the primary language and IME used to process keyboard input. Use the keyboard layout handle in Windows API calls for programming the IME. To get the keyboard layout handle for a particular IME, a control can use code such as the following:

```
HKeyboard := Screen.Imes.Objects(Screen.Imes.IndexOf(ImeName));
HKeyboard = Screen->Imes->Objects(Screen->Imes->IndexOf(ImeName));
```

See Also

DefaultIme (see page 2462)

DefaultKbLayout (see page 2463)

TStrings

ImeName

7.1.11.5.26 TScreen.MenuFont Property

Specifies the font used for menu commands.

Pascal

```
property MenuFont: TFont;
```

C++

```
__property TFont MenuFont;
```

Description

MenuFont stores the Windows menu font setting. This font is used for menu items in main menus or popup menus that do not draw their own menu items in an OnDrawItem event handler.

See Also

Fonts (see page 2466)

IconFont (see page 2472)

HintFont (see page 2471)

OnDrawItem (see page 4928)

7.1.11.5.27 TScreen.MessageFont Property

Pascal

```
property MessageFont: TFont;
```

C++

```
__property TFont MessageFont;
```

Description

This is MessageFont, a member of class TScreen.

7.1.11.5.28 TScreen.MonitorCount Property

Specifies the number of monitors used to comprise the desktop.

Pascal

```
property MonitorCount: Integer;
```

C++

```
__property int MonitorCount;
```

Description

Use MonitorCount to determine the number of monitors used to comprise the desktop.

See Also

Monitors (see page 2474)

DesktopRect (see page 2464)

7.1.11.5.29 TScreen.Monitors Property

Provides access to an individual monitor used to comprise the desktop.

Pascal

```
property Monitors [Index: Integer]: TMonitor;
```

C++

```
__property TMonitor Monitors[int Index];
```

Description

Use Monitors to access an individual monitor used to comprise the desktop.

The Monitor with its Primary property set to true is the primary monitor.

See Also

MonitorCount (see page 2473)

DesktopRect (see page 2464)

Primary (see page 2443)

7.1.11.5.30 TScreen.PixelsPerInch Property

Indicates the number of screen pixels that make up a logical inch in the vertical direction.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Read PixelsPerInch to convert between measurements in pixels and measurements in logical inches. PixelsPerInch is only accurate for vertical measurements. Most screens have a different scaling factor for horizontal measurements. The value in PixelsPerInch is set from system when the application loads.

See Also

Height (see page 2470)

PixelsPerInch (see page 2179)

7.1.11.5.31 TScreen.PrimaryMonitor Property

Provides a reference to the primary monitor.

Pascal

```
property PrimaryMonitor: TMonitor;
```

C++

```
__property TMonitor PrimaryMonitor;
```

Description

The coordinates of Monitors (see page 2474) in a multi-monitor configuration are related to the primary monitor. PrimaryMonitor returns a reference to the primary monitor. Use the Primary property to determine whether a specific monitor is

the primary one.

See Also

TMonitor (see page 2439)

7.1.11.5.32 TScreen.SaveFocusedList Property

Pascal

```
property SaveFocusedList: TList;
```

C++

```
__property TList SaveFocusedList;
```

Description

This is SaveFocusedList, a member of class TScreen.

7.1.11.5.33 TScreen.Width Property

Indicates the horizontal size of the screen in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Read Width to learn the size of the user's screen in pixels. The size or position of objects placed on the screen, can then be set to ensure that the objects fit on screen and don't look crowded.

C++ Examples:

```
/*
The following code determines the height of all forms on the
screen and resizes any that are taller than the screen height.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < Screen->FormCount; i++)
  {
    if (Screen->Forms[i]->Top < 0)
    {
      Screen->Forms[i]->Height += Screen->Forms[i]->Top;
      Screen->Forms[i]->Top = 0;
    }
    if (Screen->Forms[i]->Left < 0)
    {
      Screen->Forms[i]->Width += Screen->Forms[i]->Left;
      Screen->Forms[i]->Left = 0;
    }
    if (Screen->Forms[i]->Left + Screen->Forms[i]->Width > Screen->Width)
      Screen->Forms[i]->Width = Screen->Width - Screen->Forms[i]->Left;
    if (Screen->Forms[i]->Top + Screen->Forms[i]->Height > Screen->Height)
      Screen->Forms[i]->Height = Screen->Height - Screen->Forms[i]->Top;
  }
}
```

Delphi Examples:

```
{
```

```
  The following code determines the height of all forms on the
  screen and resizes any that are taller than the screen height.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var I: Integer;
  begin
  with Screen do
    for I := 0 to FormCount-1 do
      begin
      if Forms[I].Top < 0 then
      begin
        Forms[I].Height := Forms[I].Height + Forms[I].Top;
        Forms[I].Top := 0;
      end;
      if Forms[I].Left < 0 then
      begin
        Forms[I].Width := Forms[I].Width + Forms[I].Left;
        Forms[I].Left := 0;
      end;
      if Forms[I].Left + Forms[I].Width > Width then
        Forms[I].Width := Width - Forms[I].Left;
      if Forms[I].Top + Forms[I].Height > Height then
        Forms[I].Height := Height - Forms[I].Top;
      end;
  end;
```

WorkAreaWidth (see page 2478)

Considerations When Dynamically Resizing Forms and Controls

7.1.11.5.34 TScreen.WorkAreaHeight Property

Specifies the height of the work area on the primary monitor.

Pascal

```
property WorkAreaHeight: Integer;
```

C++

```
__property int WorkAreaHeight;
```

Description

Use WorkAreaHeight to determine the height of the usable space on the primary monitor. WorkAreaHeight differs from the Height (see page 2470) property in that it adjusts the work area to subtract any space occupied by the task bar and any tool bars that sit on the desktop.

The primary monitor is the monitor whose Primary property is true.

See Also

WorkAreaLeft (see page 2477)

WorkAreaRect (see page 2477)

WorkAreaTop (see page 2478)

WorkAreaWidth (see page 2478)

DesktopHeight (see page 2463)

Height (see page 2470)

Monitors (see page 2474)

Primary (see page 2443)

7.1.11.5.35 TScreen.WorkAreaLeft Property

Specifies the left edge of the work area on the primary monitor.

Pascal

```
property WorkAreaLeft: Integer;
```

C++

```
__property int WorkAreaLeft;
```

Description

Use WorkAreaLeft to determine the left edge of the usable space on the primary monitor. This value indicates the number of pixels between the left edge of the primary monitor, and the space left after accounting for the task bar and any tool bars that sit on the desktop.

The primary monitor is the monitor whose Primary property is true.

See Also

WorkAreaHeight (see page 2476)

WorkAreaRect (see page 2477)

WorkAreaTop (see page 2478)

WorkAreaWidth (see page 2478)

DesktopLeft (see page 2463)

Primary (see page 2443)

Monitors (see page 2474)

7.1.11.5.36 TScreen.WorkAreaRect Property

Specifies the boundaries of the usable work area on the primary monitor.

Pascal

```
property WorkAreaRect: TRect;
```

C++

```
__property TRect WorkAreaRect;
```

Description

Use WorkAreaRect to determine the coordinates of the usable space on the primary monitor. The usable work space is the surface of the primary monitor with the space occupied by the task bar and any tool bars subtracted off.

The primary monitor is the monitor with its Primary property set to true.

See Also

WorkAreaHeight (see page 2476)

WorkAreaLeft (see page 2477)

WorkAreaTop (see page 2478)

WorkAreaWidth (see page 2478)

Primary (see page 2443)

Monitors (see page 2474)

WorkAreaRect (see page 2444)

7.1.11.5.37 TScreen.WorkAreaTop Property

Specifies the top edge of the work area on the primary monitor.

Pascal

```
property WorkAreaTop: Integer;
```

C++

```
__property int WorkAreaTop;
```

Description

Use WorkAreaTop to determine the top edge of the usable space on the primary monitor. This value indicates the number of pixels between the top edge of the primary monitor, and the space left after accounting for the task bar and any tool bars that sit on the desktop.

The primary monitor is the monitor whose Primary property is true.

See Also

WorkAreaHeight (see page 2476)

WorkAreaRect (see page 2477)

WorkAreaLeft (see page 2477)

WorkAreaWidth (see page 2478)

DesktopTop (see page 2465)

Primary (see page 2443)

Monitors (see page 2474)

7.1.11.5.38 TScreen.WorkAreaWidth Property

Specifies the width of the work area on the primary monitor.

Pascal

```
property WorkAreaWidth: Integer;
```

C++

```
__property int WorkAreaWidth;
```

Description

Use WorkAreaWidth to determine the width of the usable space on the primary monitor. WorkAreaWidth differs from the Width (see page 2475) property in that it adjusts the work area to subtract any space occupied by the task bar and any tool bars that

sit on the desktop.

The primary monitor is the monitor whose Primary property is true.

See Also

7.1.11.6 TScreen Events

The events of the TScreen class are listed here.

Public Events

	Name	Description
	OnActiveControlChange (see page 2479)	Occurs immediately after input focus changes to a new windowed control.
	OnActiveFormChange (see page 2481)	Occurs immediately after a new form becomes active in a multi-form application.

7.1.11.6.1 TScreen.OnActiveControlChange Event

Occurs immediately after input focus changes to a new windowed control.

Pascal

```
property OnActiveControlChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActiveControlChange;
```

Description

Write an OnActiveControlChange event handler to take specific action when input focus changes to a new control. The change in focus may be within the active form, or across forms to a new form that then becomes the active form.

When focus moves from one control to another, the following events occur.

1If the new focused control is in a different form, focus moves to the new form.

2Focus moves to the new active control.

3If the active form changed, an OnActiveFormChange (see page 2481) event occurs.

4An OnActiveControlChange event occurs.

C++ Examples:

```
/*
This example uses the OnActiveControlChange event to detect
when focus changes on the form. When focus changes, the hint
for the active control is displayed on the status bar. To use
this example, you must add a status bar to the form and set
its SimplePanel property to true.  Add a new public procedure,
ActiveControlChanged, to the TForm1 class declaration.
*/
```

```
void _fastcall TForm1::ActiveControlChanged(System::TObject *Sender)
{
  TWinControl *Active = NULL;
  for (int I = 0; I < Form1->ControlCount; I++)
  {
    TWinControl *Temp = dynamic_cast<TWinControl *>(Form1->Controls[I]);
    if (Temp && Temp->Focused())
      Active = Temp;
  }
  if ((Active != NULL) && (Active->Hint != ""))
    StatusBar2->SimpleText = GetLongHint(Active->Hint) + " focus";
}

void __fastcall TForm1::MouseOverChanged(TObject *Sender)
{
  TWinControl *Active = dynamic_cast<TWinControl *>(Sender);
  if (Active != NULL)
    StatusBar1->SimpleText = GetLongHint(Active->Hint) + " mouse over";
}

/*
Assign this method as the OnActiveControlChange event
handler by setting it from the form's OnCreate event handler:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveControlChange = ActiveControlChanged;
}

/*
Make sure you clean up the screen object when the form is
freed by adding this OnDestroy event handler to the form:
*/
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  Screen->OnActiveControlChange = 0;
}
```

Delphi Examples:

```
{
This example uses the OnActiveControlChange event to detect
when focus changes on the form. When focus changes, the hint
for the active control is displayed on the status bar. To use
this example, you must add a status bar to the form and set
its SimplePanel property to true.  Add a new public procedure,
ActiveControlChanged, to the TForm1 class declaration.
}

type
  TForm1 = class(TForm)
    StatusBar1, StatusBar2: TStatusBar;
    Button1: TButton;
    RadioButton1: TRadioButton;
    procedure FormCreate(Sender: TObject);
    procedure FormDestroy(Sender: TObject);
    procedure MouseOverChanged(Sender: TObject);
  private
    { Private declarations }
  public
    procedure ActiveControlChanged(Sender: TObject);
  end;

var
  Active : TWinControl;
  I: Integer;
  Form1: TForm1;
```

```
implementation

{$R *.dfm}

procedure TForm1.ActiveControlChanged(Sender: TObject);
var
  Active : TWinControl;
  I: Integer;
begin
  Active := nil;
  for I:= 0 to ControlCount -1 do
  begin
    if (Controls[I] is TWinControl) then
      if (Controls[I] as TWinControl).Focused then
        Active := TWinControl(Controls[I]);
  end;
  if ((Active <> nil) and (Active.Hint <> '')) then
  begin
    StatusBar2.SimpleText := GetLongHint(Active.Hint) + ' focus';
  end
end;

procedure TForm1.MouseOverChanged(Sender: TObject);
var
  Active : TWinControl;
  I: Integer;
begin
  if (Sender is TWinControl) then
  begin
    Active := TWinControl(Sender);
    StatusBar1.SimpleText := GetLongHint(Active.Hint) + ' mouse over';
  end;
end;

{
Assign this method as the OnActiveControlChange event
handler by setting it from the form's OnCreate event handler:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Screen.OnActiveControlChange := ActiveControlChanged;
end;

{
Make sure you clean up the screen object when the form is
freed by adding this OnDestroy event handler to the form:
}
procedure TForm1.FormDestroy(Sender: TObject);
begin
  Screen.OnActiveControlChange := nil;
end;
```

See Also

ActiveControl (see page 2452)

OnActiveFormChange (see page 2481)

SetFocusedControl (see page 2136)

7.1.11.6.2 TScreen.OnActiveFormChange Event

Occurs immediately after a new form becomes active in a multi-form application.

Pascal

```
property OnActiveFormChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActiveFormChange;
```

Description

Write an OnActiveFormChange event handler to take specific action when a new form becomes active. OnActiveFormChange occurs when the active form for the application changes, not when a form becomes active because the application becomes active.

C++ Examples:

```
/*
This example uses two forms with a button on the first
form. When the user clicks the button, the second form
appears. As the user switches between forms, the form that
is active is colored aqua.
Note:   You must include the unit header for form 2 to the
unit file for form 1, and add the public ColorForm method
to the definition of the TForm1 class.
*/
#include "Unit2.h"

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::ColorForm(TObject *Sender)
{
  Color = clWhite;
  Form2->Color = clWhite;
  Screen->ActiveForm->Color = clAqua;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Screen->OnActiveFormChange = ColorForm;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  // This stops ColorForm from being called during termination.
  Screen->OnActiveFormChange = NULL;
}
```

Delphi Examples:

```
{
This example uses a two forms with a button on the first
form. When the user clicks the button, the second form
appears. As the user switches between forms, the form that
is active is colored aqua.
Note:   You must include the unit header for form 2 to the
unit file for form 1, and add the public ColorForm method
to the header for form 1's unit.
}
type
  TForm1 = class(TForm)
    Button1: TButton;
    procedure Button1Click(Sender: TObject);
    procedure FormCreate(Sender: TObject);
    procedure FormDestroy(Sender: TObject);
```

```
    private
      { Private declarations }
    public
      procedure ColorForm(Sender: TObject);
    end;

  var
    Form1: TForm1;

  implementation

  {$R *.dfm}

  uses Unit2;

  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Form2.Show;
  end;

  procedure TForm1.ColorForm(Sender: TObject);
  begin
    Color := clWhite;
    Form2.Color := clWhite;
    Screen.ActiveForm.Color := clAqua;
  end;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    Screen.OnActiveFormChange := ColorForm;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  begin

7.1.12 TScrollBox Class

TScrollBox represents a scrolling area (a scroll box) in a window.

Class Hierarchy

Pascal

```
  TScrollBox = class(TScrollingWinControl);
```

C++

```
  class TScrollBox : public TScrollingWinControl;
```

File

Forms

Description

Use TScrollBox to create a scroll box in a window.

One use of a scroll box is to prevent areas of a window, such as a toolbar or status bar built with TPanel components, from scrolling. To prevent a toolbar and status bar from scrolling, hide the window's scroll bars, and then position a scroll box in the client area of the window between the toolbar and status bar. The scroll bars associated with the scroll box will appear to belong to the window, but will scroll only the area inside the scroll box.

Another use of scroll boxes is to create multiple scrolling areas (views) in a window. Views are common in commercial word-processor, spreadsheet, and project management applications.

A scroll box can contain objects, such as TButton and TCheckBox objects.

TForm (see page 2241)

TFrame (see page 2366)

Grouping Controls

Scroll Boxes

7.1.12.1 TScrollBox Members

The following tables list the members exposed by TScrollBox.

Protected Methods

	Name	Description
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CreateParams (see page 2487)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	DoFlipChildren (see page 2560)	Flips the control's children.
	PaintWindow (see page 2487)	Renders the image of a windowed control.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.

Public Methods

	Name	Description
	Create (see page 2486)	Creates and initializes a new TScrollBox (see page 2483) object.
	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 2517)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2518)	Occurs when the user clicks the control.

	OnConstrainedResize (see page 2520)	Adjust resize constraints.
	OnContextPopup (see page 2520)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2521)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 2521)	Occurs when another control is docked to the control.
	OnDockOver (see page 2523)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2525)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2528)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2531)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2532)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2533)	Occurs when a control receives the input focus.
	OnExit (see page 2535)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 2538)	Returns the control's docking information.
	OnMouseActivate (see page 2540)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2541)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2543)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2544)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2544)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2546)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2548)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2549)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2549)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 2549)	Occurs immediately after the control is resized.
	OnStartDock (see page 2550)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2551)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 2551)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 2488)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2492)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2492)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 2493)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 2493)	Specifies which edges of the control are beveled.
	BevelInner (see page 2493)	Specifies the cut of the inner bevel.
	BevelKind (see page 2494)	Specifies the control's bevel style.
	BevelOuter (see page 2494)	Specifies the cut of the outer bevel.
	BevelWidth (see page 2495)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 2495)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 2496)	Specifies whether the scroll box has a border.
	Color (see page 2496)	Specifies the background color of the control.
	Constraints (see page 2497)	Specifies the size constraints for the control.
	Ctl3D (see page 2497)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 2498)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2499)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

	DragCursor (see page 2501)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2501)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2501)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2503)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2503)	Controls the attributes of text written on or in the control.
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	Padding (see page 2504)	Specifies the padding of a control.
	ParentBackground (see page 2505)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 2505)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 2505)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2506)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 2506)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2506)	Determines where a control looks for its font information.
	ParentShowHint (see page 2507)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2507)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2512)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2514)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2515)	Determines if the user can tab to a control.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 2515)	Determines whether the component appears onscreen.

7.1.12.2 TScrollBox.Create Constructor

Creates and initializes a new TScrollBox (see page 2483) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TScrollBox(TComponent * AOwner);
```

Description

Use Create to create and initialize a new TScrollBox (see page 2483) object.

AOwner is a component, typically the form, that is responsible for freeing the scroll box.

See Also

Owner

7.1.12.3 TScrollBox Methods

The methods of the TScrollBox class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 2487)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	PaintWindow (see page 2487)	Renders the image of a windowed control.

7.1.12.3.1 TScrollBox.CreateParams Method

Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. CreateParams calls the inherited method and uses that Window class style, removing the CS_HREDRAW and CS_VREDRAW styles from it.

By removing these styles the scrolling windowed control will only redraw the invalidated regions, not the entire window.

See Also

CreateWnd (see page 2559)

CreateWindowHandle

7.1.12.3.2 TScrollBox.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler

PaintTo

DoubleBuffered

7.1.12.4 TScrollBox Properties

The properties of the TScrollBox class are listed here.

Published Properties

	Name	Description
	Align (see page 2488)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2492)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 2492)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

	AutoSize (see page 2493)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 2493)	Specifies which edges of the control are beveled.
	BevelInner (see page 2493)	Specifies the cut of the inner bevel.
	BevelKind (see page 2494)	Specifies the control's bevel style.
	BevelOuter (see page 2494)	Specifies the cut of the outer bevel.
	BevelWidth (see page 2495)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 2495)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 2496)	Specifies whether the scroll box has a border.
	Color (see page 2496)	Specifies the background color of the control.
	Constraints (see page 2497)	Specifies the size constraints for the control.
	Ctl3D (see page 2497)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 2498)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 2499)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 2501)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2501)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2501)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2503)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2503)	Controls the attributes of text written on or in the control.
	Padding (see page 2504)	Specifies the padding of a control.
	ParentBackground (see page 2505)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 2505)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 2505)	Determines where a control looks for its color information.
	ParentCtl3D (see page 2506)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 2506)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 2506)	Determines where a control looks for its font information.
	ParentShowHint (see page 2507)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2507)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2512)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2514)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2515)	Determines if the user can tab to a control.
	Visible (see page 2515)	Determines whether the component appears onscreen.

7.1.12.4.1 TScrollBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
```

```
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
```

```
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var

Parent

Anchors

7.1.12.4.2 TScrollBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

7.1.12.4.3 TScrollBox.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.12.4.4 TScrollBox.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints

CanAutoSize

7.1.12.4.5 TScrollBox.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges;
```

C++

```
__property BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner

BevelOuter

BevelKind

7.1.12.4.6 TScrollBox.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner;
```

C++

```
__property BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges

BevelOuter

BevelKind

BevelWidth

BorderWidth

7.1.12.4.7 TScrollBox.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind;
```

C++

```
__property BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges

BevelOuter

BevelInner

BevelWidth

7.1.12.4.8 TScrollBox.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter;
```

C++

```
__property BevelOuter;
```

Description

Use BevelOuter to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges

BevelInner

BevelKind

BevelWidth

7.1.12.4.9 TScrollBox.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth;
```

C++

```
__property BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges

BevelInner

BevelKind

BevelOuter

7.1.12.4.10 TScrollBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment

UseRightToLeftReading

UseRightToLeftScrollBar

Including Bi-directional Functionality in Applications

7.1.12.4.11 TScrollBox.BorderStyle Property

Specifies whether the scroll box has a border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to get or set whether the scroll box has a border.

7.1.12.4.12 TScrollBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
```

```
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor

7.1.12.4.13 TScrollBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

AutoSize

Align

Anchors

OnConstrainedResize

OnCanResize

7.1.12.4.14 TScrollBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

7.1.12.4.15 TScrollBox.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite;
```

C++

```
__property DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
```

```
    // Only 2 dock clients means the host must be destroyed and
    // the remaining window undocked to its old position and size.
    // Recall that OnUnDock gets called before the undocking
    // actually occurs.
    if Client is TDockableForm then
      TDockableForm(Client).DockSite := True;
    if (DockClientCount = 2) and (NewTarget <> Self) then
      PostMessage(Self.Handle, WM_CLOSE, 0, 0);
    UpdateCaption(Client);
  end;
```

7.1.12.4.16 TScrollBox.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
```

```
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

7.1.12.4.17 TScrollBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

7.1.12.4.18 TScrollBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

7.1.12.4.19 TScrollBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;

  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

7.1.12.4.20 TScrollBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

7.1.12.4.21 TScrollBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

7.1.12.4.22 TScrollBox.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding;
```

C++

```
__property Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding

7.1.12.4.23 TScrollBox.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground;
```

C++

```
__property ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

7.1.12.4.24 TScrollBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

Parent

BiDiMode

7.1.12.4.25 TScrollBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

7.1.12.4.26 TScrollBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

7.1.12.4.27 TScrollBox.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

7.1.12.4.28 TScrollBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

Parent

ParentColor

ParentShowHint

7.1.12.4.29 TScrollBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

7.1.12.4.30 TScrollBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;
```

```
procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

7.1.12.4.31 TScrollBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }

Displaying Fly-over Help

7.1.12.4.32 TScrollBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

7.1.12.4.33 TScrollBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

7.1.12.4.34 TScrollBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
```

```
    {
      TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
      pPage->PageControl = PageControl1;
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this); // The owner will clean this up.
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);

7.1.12.5 TScrollBox Events

The events of the TScrollBox class are listed here.

Published Events

	Name	Description
	OnCanResize (see page 2517)	Occurs when an attempt is made to resize the control.
	OnClick (see page 2518)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 2520)	Adjust resize constraints.
	OnContextPopup (see page 2520)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 2521)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 2521)	Occurs when another control is docked to the control.
	OnDockOver (see page 2523)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 2525)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2528)	Occurs when the user drags an object over a control.
	OnEndDock (see page 2531)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2532)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2533)	Occurs when a control receives the input focus.
	OnExit (see page 2535)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 2538)	Returns the control's docking information.
	OnMouseActivate (see page 2540)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2541)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2543)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2544)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2544)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2546)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2548)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2549)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2549)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 2549)	Occurs immediately after the control is resized.
	OnStartDock (see page 2550)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2551)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 2551)	Occurs when the application tries to undock a control that is docked to the windowed control.

7.1.12.5.1 TScrollBox.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize;
```

C++

```
__property OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

SetBounds

OnResize

7.1.12.5.2 TScrollBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

7.1.12.5.3 TScrollBox.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize;
```

C++

```
__property OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

OnResize

CanAutoSize

7.1.12.5.4 TScrollBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by

a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

7.1.12.5.5 TScrollBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick

Responding to User Actions at Runtime

7.1.12.5.6 TScrollBox.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop;
```

C++

```
__property OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
```

```
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
```

```
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

DockSite

OnDockOver

7.1.12.5.7 TScrollBox.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver;
```

C++

```
__property OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
```

```
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,

TDragDockObject

7.1.12.5.8 TScrollBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
```

```
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:

7.1.12.5.9 TScrollBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.

DragKind

7.1.12.5.12 TScrollBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
```

```
}

Using a Single Navigator for Multiple Datasets

7.1.12.5.13 TScrollBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK

button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
```

```
    initialize the mask of each maskedit box
    according to IP address coding conventions
    }
    MaskEdit1.EditMask := '!099.099.099.099;1; ';
    MaskEdit2.EditMask := '!099.099.099.099;1; ';
    MaskEdit3.EditMask := '!099.099.099.099;1; ';

    MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
    net1, net2, host1, host2,
    netmask1, netmask2, hostmask1, hostmask2,
    sub_net1, sub_net2, sub_host1, sub_host2: Integer;

    IP, mask: String;

    IP := MaskEdit1.Text;
    net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
    net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
    host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
    host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
```

```
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

7.1.12.5.14 TScrollBox.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo;
```

C++

```
__property OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
```

```
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
```

```
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

TDragDockObject

7.1.12.5.15 TScrollBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

7.1.12.5.16 TScrollBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
```

```
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

7.1.12.5.17 TScrollBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

7.1.12.5.18 TScrollBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

7.1.12.5.19 TScrollBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

Responding to a Mouse-up Action

7.1.12.5.21 TScrollBox.OnMouseWheel Event

Occurs when the mouse wheel is rotated.

Pascal

```
property OnMouseWheel;
```

C++

```
__property OnMouseWheel;
```

Description

Write code in the OnMouseWheel event handler to respond to mouse wheel messages. If there is no OnMouseWheel event handler, or if the mouse wheel message is not handled in the OnMouseWheel event handler, then an OnMouseWheelUp or

OnMouseWheelDown event occurs, depending on the direction the mouse wheel was rotated.

See Also

OnMouseWheelDown

OnMouseWheelUp

7.1.12.5.22 TScrollBox.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown;
```

C++

```
__property OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel

OnMouseWheelUp

7.1.12.5.23 TScrollBox.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp;
```

C++

```
__property OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheelDown

OnMouseWheel

7.1.12.5.24 TScrollBox.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize;
```

C++

```
__property OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

C++ Examples:

```
/*
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
*/
void __fastcall TForm1::FormResize(TObject *Sender)
{
  Button1->Left = Form1->ClientWidth - Button1->Width;
}
```

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize

7.1.12.5.25 TScrollBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDragOver

OnDockDrop

7.1.12.5.26 TScrollBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

OnDragDrop

7.1.12.5.27 TScrollBox.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock;
```

C++

```
__property OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
```

```
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage(L"GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
```

```
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

7.1.13 TScrollingWinControl Class

TScrollingWinControl is the base class for controls that support scrolling.

Class Hierarchy

Pascal

```
TScrollingWinControl = class(TWinControl);
```

C++

```
class TScrollingWinControl : public TWinControl;
```

File

Forms

Description

Use TScrollingWinControl as a base class when defining a custom windowed control that supports scrolling.

Typically, a scrolling windowed control has horizontal and vertical scroll bars and scrolls a child control into view when the child control receives focus.

Examples of scrolling windowed controls include TForm (see page 2241) and TScrollBox (see page 2483) objects.

The scrolling window's BiDiMode determines whether the left or right side of the window's contents are displayed by default. The BiDiMode does not affect the window's coordinate system. The scroll bars must be adjusted programmatically according to the system locale.

See Also

TForm (see page 2241)

TScrollBox (see page 2483)

7.1.13.1 TScrollingWinControl Members

The following tables list the members exposed by TScrollingWinControl.

Protected Methods

	Name	Description
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CreateParams (see page 2559)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.
	DoFlipChildren (see page 2560)	Flips the control's children.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.

Protected Properties

	Name	Description
	AutoScroll (see page 2561)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Public Methods

	Name	Description
	Create (see page 2555)	Creates and initializes a new TScrollingWinControl (see page 2554) object.
	Destroy (see page 2556)	Removes the TScrollingWinControl (see page 2554) object from memory.
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.

Published Properties

	Name	Description
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.

7.1.13.2 TScrollingWinControl.Create Constructor

Creates and initializes a new TScrollingWinControl (see page 2554) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TScrollingWinControl(TComponent * AOwner);
```

Description

Use Create to create and initialize a new TScrollingWinControl (see page 2554) object.

AOwner is a TComponent object that owns the scrolling windowed control.

See Also

AutoScroll (see page 2561)

HorzScrollBar (see page 2562)

Create

VertScrollBar (see page 2563)

7.1.13.3 TScrollingWinControl.Destroy Destructor

Removes the TScrollingWinControl (see page 2554) object from memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScrollingWinControl();
```

Description

Do not call Destroy.TScrollingWinControl (see page 2554) Instead, call Free, which calls DestroyWinControl if the TScrollingWinControl (see page 2554) object is not nil.

See Also

Destroy

System::TObject::Free

7.1.13.4 TScrollingWinControl Methods

The methods of the TScrollingWinControl class are listed here.

Protected Methods

	Name	Description
	AdjustClientRect (see page 2557)	Adjusts the ClientRect property to exclude the scroll bars.
	AlignControls (see page 2557)	Aligns the controls in the scrolling windowed control.
	AutoScrollEnabled (see page 2558)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 2558)	Scrolls a control into the visible area of the scrolling windowed control.
	ChangeScale (see page 2558)	Resizes the scrolling windowed control by a specific ratio.
	CreateParams (see page 2559)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateWnd (see page 2559)	Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.

	DoFlipChildren (see page 2560)	Flips the control's children.
	Resizing (see page 2561)	This is Resizing, a member of class TScrollingWinControl.

Public Methods

	Name	Description
	DisableAutoRange (see page 2559)	Disables automatic scrolling.
	EnableAutoRange (see page 2560)	Reenables automatic scrolling.
	ScrollInView (see page 2561)	Scrolls a control into the visible area of the scrolling windowed control.

7.1.13.4.1 TScrollingWinControl.AdjustClientRect Method

Adjusts the ClientRect property to exclude the scroll bars.

Pascal

```
procedure AdjustClientRect(var Rect: TRect); override;
```

C++

```
virtual __fastcall AdjustClientRect(TRect Rect);
```

Description

AdjustClientRect is called internally when the control needs accurate information on where to place child controls within the client area. It indents Rect to exclude the area taken by the scroll bars, then calls the inherited AdjustClientRect method.

See Also

ClientRect

7.1.13.4.2 TScrollingWinControl.AlignControls Method

Aligns the controls in the scrolling windowed control.

Pascal

```
procedure AlignControls(AControl: TControl; var ARect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect ARect);
```

Description

Use AlignControls to align the controls in the scrolling control according to the values of their Align properties.

AControl specifies the control that takes precedence in alignment when other controls have the same Align value. AControl can be nil (Delphi) or NULL (C++).

ARect indicates the area in the scrolling control that contains the controls to align. ARect is automatically set to the entire area of the scrolling control.

If AutoScroll (see page 2561) is true and the scrolling control is not being resized, the ranges of the scroll bars on the scrolling control are automatically recalculated.

After recalculating the ranges of the scroll bars and setting the value of ARect, AlignControls calls the inherited AlignControls method, passing the AControl and ARect objects.

See Also

Align

AutoScroll (see page 2561)

AlignControls

7.1.13.4.3 TScrollingWinControl.AutoScrollEnabled Method

Indicates whether automatic scrolling is enabled.

Pascal

```
function AutoScrollEnabled: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AutoScrollEnabled();
```

Description

Call AutoScrollEnabled to determine whether automatic scrolling is enabled.

AutoScrollEnabled returns true if the control is not a dock site using the dock manager and the AutoSize property is false.

See Also

AutoScroll

AutoSize

UseDockManager

7.1.13.4.4 TScrollingWinControl.AutoScrollInView Method

Scrolls a control into the visible area of the scrolling windowed control.

Pascal

```
procedure AutoScrollInView(AControl: TControl); virtual;
```

C++

```
virtual __fastcall AutoScrollInView(TControl * AControl);
```

Description

Use AutoScrollInView to scroll the control specified by the AControl parameter into the visible area of the scrolling windowed control.

Unlike ScrollInView (see page 2561), AutoScrollInView does not perform scrolling when the scrolling windowed control or the specified control are being loaded from a stream.

AutoScrollInView calls ScrollInView (see page 2561) to perform any needed scrolling.

See Also

ScrollInView (see page 2561)

7.1.13.4.5 TScrollingWinControl.ChangeScale Method

Resizes the scrolling windowed control by a specific ratio.

Pascal

```
procedure ChangeScale(M: Integer; D: Integer); override;
```

C++

```
virtual __fastcall ChangeScale(int M, int D);
```

Description

Use ChangeScale to resize the scrolling windowed control by a specific ratio.

M is the multiplier of the ratio; D is the divisor of the ratio. For example, to resize the scrolling windowed control to four-fifths of its current size, set M to four and D to five.

See Also

ChangeScale

7.1.13.4.6 TScrollingWinControl.CreateParams Method

Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 2559) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. CreateParams calls the inherited method and uses that Window class style, removing the CS_HREDRAW and CS_VREDRAW styles from it.

By removing these styles the scrolling windowed control will only redraw the invalidated regions, not the entire window.

See Also

CreateWnd (see page 2559)

CreateWindowHandle

7.1.13.4.7 TScrollingWinControl.CreateWnd Method

Creates a Windows control corresponding to the TScrollingWinControl (see page 2554) object.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the window must be destroyed and recreated to reflect property changes.

See Also

CreateWnd

DestroyWnd

7.1.13.4.8 TScrollingWinControl.DisableAutoRange Method

Disables automatic scrolling.

Pascal

```
procedure DisableAutoRange;
```

C++

```
__fastcall DisableAutoRange();
```

Description

Use DisableAutoRange to temporarily disable scrolling when rearranging controls in a scrolling windowed control. Use the EnableAutoRange (see page 2560) method to turn scrolling on again when finished rearranging the controls.

See Also

EnableAutoRange (see page 2560)

AutoScroll (see page 2561)

7.1.13.4.9 TScrollingWinControl.DoFlipChildren Method

Flips the control's children.

Pascal

```
procedure DoFlipChildren; override;
```

C++

```
virtual __fastcall DoFlipChildren();
```

Description

The FlipChildren method calls DoFlipChildren to reverse the positions of child controls. DoFlipChildren moves the control's children to opposite positions on the control; that is, children on the left side of the control are moved to the right side of the control and vice versa. In addition, DoFlipChildren moves the vertical scroll bars to the other side of the control.

Note: DoFlipChildren is a protected helper method for the public FlipChildren method. Unlike FlipChildren, DoFlipChildren does not adjust the alignment of controls that are aligned to one of the edges of the windowed control.

See Also

FlipChildren

BiDiMode

7.1.13.4.10 TScrollingWinControl.EnableAutoRange Method

Reenables automatic scrolling.

Pascal

```
procedure EnableAutoRange;
```

C++

```
__fastcall EnableAutoRange();
```

Description

Use EnableAutoRange to reenable scrolling after turning it off. This method can be used with the DisableAutoRange (see page 2559) method to turn scrolling on and off.

See Also

DisableAutoRange (see page 2559)

AutoScroll (see page 2561)

7.1.13.4.11 TScrollingWinControl.Resizing Method

Pascal

```
procedure Resizing(State: TWindowState); virtual;
```

C++

```
virtual __fastcall Resizing(TWindowState State);
```

Description

This is Resizing, a member of class TScrollingWinControl.

7.1.13.4.12 TScrollingWinControl.ScrollInView Method

Scrolls a control into the visible area of the scrolling windowed control.

Pascal

```
procedure ScrollInView(AControl: TControl);
```

C++

```
__fastcall ScrollInView(TControl * AControl);
```

Description

Use ScrollInView to ensure that a specified control is in the visible area of the scrolling windowed control. AControl specifies the TControl object to scroll into view.

Note: If the ComponentState property for AControl or the scrolling windowed control might be csLoading, use AutoScrollInView (see page 2558) instead.

See Also

AutoScrollInView (see page 2558)

ComponentState

7.1.13.5 TScrollingWinControl Properties

The properties of the TScrollingWinControl class are listed here.

Protected Properties

	Name	Description
	AutoScroll (see page 2561)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Published Properties

	Name	Description
	HorzScrollBar (see page 2562)	Represents the horizontal scroll bar for the scrolling windowed control.
	VertScrollBar (see page 2563)	Represents the vertical scroll bar for the scrolling windowed control.

7.1.13.5.1 TScrollingWinControl.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar (see page 2562) and VertScrollBar (see page 2563) properties to make scroll bars appear.

See Also

AutoScrollInView (see page 2558)

HorzScrollBar (see page 2562)

VertScrollBar (see page 2563)

7.1.13.5.2 TScrollingWinControl.HorzScrollBar Property

Represents the horizontal scroll bar for the scrolling windowed control.

Pascal

```
property HorzScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar HorzScrollBar;
```

Description

Use HorzScrollBar to hide, show, or manipulate the horizontal scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
```

```
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
```

See Also

AutoScroll (see page 2561)

VertScrollBar (see page 2563)

TControlScrollBar (see page 2009)

7.1.13.5.3 TScrollingWinControl.VertScrollBar Property

Represents the vertical scroll bar for the scrolling windowed control.

Pascal

```
property VertScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar VertScrollBar;
```

Description

Use VertScrollBar to hide, show, or manipulate the vertical scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
```

```
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

AutoScroll (see page 2561)

HorzScrollBar (see page 2562)

TControlScrollBar (see page 2009)

7.1.13.6 TScrollingWinControl Events

The events of the TScrollingWinControl class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 2564)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 2564)	Occurs when an object with custom alignment is aligned.

7.1.13.6.1 TScrollingWinControl.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore;
```

C++

```
__property OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore

Align

TAlignInsertBeforeEvent

7.1.13.6.2 TScrollingWinControl.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition;
```

C++

```
__property OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

TAlignPositionEvent

7.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDesignerHook (see page 2566)	IDesignerHook is an interface that allows component writers to interact with the form designer in the IDE.
	IOleForm (see page 2572)	IOleForm is designed to communicate with OLE containers. To embed a VCL form in an OLE container, CodeGear recommends using ActiveForms and TOleControl instead of IOleForm.

7.2.1 IDesignerHook Interface

IDesignerHook is an interface that allows component writers to interact with the form designer in the IDE.

Class Hierarchy

Pascal

```
IDesignerHook = interface(IDesignerNotify);
```

C++

```
__interface IDesignerHook : public IDesignerNotify;
```

File

Forms

Description

IDesignerHook provides access to the form currently under construction in the form designer, and influences the behavior of the designer by specifying whether the object under construction is a form (as opposed to a composite component), drawing the grid that assists in layout, and so on.

Component writers can access the current IDesignerHook interface using the Designer property of a form.

Note: C++ method declarations that use IDesignerHook use the _di_IDesignerHook type instead. This is a DelphiInterface wrapper around the IDesignerHook interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDesignerHook > _di_IDesignerHook;
```

IFormDesigner

7.2.1.1 IDesignerHook Members

The following tables list the members exposed by IDesignerHook.

Public Methods

	Name	Description
	GetCustomForm (see page 2567)	Specifies the value returned when the Form (see page 2571) property is read.
	GetIsControl (see page 2568)	Specifies the value returned when the IsControl (see page 2571) property is read.
	GetRoot (see page 2568)	Returns the current entity being edited by the form designer.
	IsDesignMsg (see page 2568)	Determines when the designer should handle a Windows message.
	PaintGrid (see page 2569)	Paints the alignment grid on the form's canvas.
	PaintMenu (see page 2569)	This is PaintMenu, a member of class IDesignerHook.
	SetCustomForm (see page 2569)	Specifies what happens when the Form (see page 2571) property is set.
	SetIsControl (see page 2570)	Specifies what happens when the IsControl (see page 2571) property is set.
	UniqueName (see page 2570)	Generates a unique name from a specified base string.
	ValidateRename (see page 2570)	Restricts the names that can be given to components on the form that is being designed.

Public Properties

	Name	Description
	Form (see page 2571)	Provides a reference to the form currently being designed.
	IsControl (see page 2571)	Specifies whether the form is in its form state or its control state.

7.2.1.2 IDesignerHook Methods

The methods of the IDesignerHook class are listed here.

Public Methods

	Name	Description
	GetCustomForm (see page 2567)	Specifies the value returned when the Form (see page 2571) property is read.
	GetIsControl (see page 2568)	Specifies the value returned when the IsControl (see page 2571) property is read.
	GetRoot (see page 2568)	Returns the current entity being edited by the form designer.
	IsDesignMsg (see page 2568)	Determines when the designer should handle a Windows message.
	PaintGrid (see page 2569)	Paints the alignment grid on the form's canvas.
	PaintMenu (see page 2569)	This is PaintMenu, a member of class IDesignerHook.
	SetCustomForm (see page 2569)	Specifies what happens when the Form (see page 2571) property is set.
	SetIsControl (see page 2570)	Specifies what happens when the IsControl (see page 2571) property is set.
	UniqueName (see page 2570)	Generates a unique name from a specified base string.
	ValidateRename (see page 2570)	Restricts the names that can be given to components on the form that is being designed.

7.2.1.2.1 IDesignerHook.GetCustomForm Method

Specifies the value returned when the Form (see page 2571) property is read.

Pascal

```
function GetCustomForm: TCustomForm;
```

C++

```
__fastcall TCustomForm GetCustomForm();
```

Description

Implement GetCustomForm to specify the value returned when the Form (see page 2571) property is read.

See Also

Form (see page 2571)

SetCustomForm (see page 2569)

7.2.1.2.2 IDesignerHook.GetIsControl Method

Specifies the value returned when the IsControl (see page 2571) property is read.

Pascal

```
function GetIsControl: Boolean;
```

C++

```
__fastcall Boolean GetIsControl();
```

Description

Implement GetIsControl to specify the value returned when the IsControl (see page 2571) property is read.

See Also

IsControl (see page 2571)

SetIsControl (see page 2570)

7.2.1.2.3 IDesignerHook.GetRoot Method

Returns the current entity being edited by the form designer.

Pascal

```
function GetRoot: TComponent;
```

C++

```
__fastcall TComponent * GetRoot();
```

Description

Call GetRoot to obtain the object the form designer is working on. If this object is a descendant of TCustomForm (see page 2103), GetRoot returns the value of the Form (see page 2571) property.

Use GetRoot rather than the Form (see page 2571) property, to ensure that code works even when editing a data module, remote data module, active form, or other entity that is not a descendant of TCustomForm (see page 2103).

See Also

Form (see page 2571)

ContainerWindow

7.2.1.2.4 IDesignerHook.IsDesignMsg Method

Determines when the designer should handle a Windows message.

Pascal

```
function IsDesignMsg(Sender: TControl; var Message: TMessage): Boolean;
```

C++

```
__fastcall Boolean IsDesignMsg(TControl * Sender, TMessage Message);
```

Description

IsDesignMsg is called for each message sent to a component in the designer. This method returns true if the message is a design message, meaning one the designer should handle for the component.

See Also

WindowProc

WndProc

7.2.1.2.5 IDesignerHook.PaintGrid Method

Paints the alignment grid on the form's canvas.

Pascal

```
procedure PaintGrid;
```

C++

```
__fastcall PaintGrid();
```

Description

Forms (see page 1921) that are associated with a designer call the PaintGrid method in response to Windows paint messages. If there is no designer associated with the form, the form's Paint method is called instead.

See Also

Paint (see page 2131)

7.2.1.2.6 IDesignerHook.PaintMenu Method

Pascal

```
procedure PaintMenu;
```

C++

```
__fastcall PaintMenu();
```

Description

This is PaintMenu, a member of class IDesignerHook.

7.2.1.2.7 IDesignerHook.SetCustomForm Method

Specifies what happens when the Form (see page 2571) property is set.

Pascal

```
procedure SetCustomForm(Value: TCustomForm);
```

C++

```
__fastcall SetCustomForm(TCustomForm Value);
```

Description

Implement SetCustomForm to specify what happens when the Form (see page 2571) property is set.

See Also

Form (see page 2571)

GetCustomForm (see page 2567)

7.2.1.2.8 IDesignerHook.SetIsControl Method

Specifies what happens when the IsControl (see page 2571) property is set.

Pascal

```
procedure SetIsControl(Value: Boolean);
```

C++

```
__fastcall SetIsControl(Boolean Value);
```

Description

Implement SetIsControl specify what happens when the IsControl (see page 2571) property is set.

See Also

IsControl (see page 2571)

GetIsControl (see page 2568)

7.2.1.2.9 IDesignerHook.UniqueName Method

Generates a unique name from a specified base string.

Pascal

```
function UniqueName(const BaseName: string): string;
```

C++

```
__fastcall UnicodeString UniqueName(const UnicodeString BaseName);
```

Description

Call UniqueName to automatically generate a unique name for a component. Specify the base string for the name by the BaseName parameter. UniqueName appends a number to BaseName to ensure that there are no name-space conflicts.

See Also

GetComponentName

7.2.1.2.10 IDesignerHook.ValidateRename Method

Restricts the names that can be given to components on the form that is being designed.

Pascal

```
procedure ValidateRename(AComponent: TComponent; const CurName: string; const NewName: string);
```

C++

```
__fastcall ValidateRename(TComponent * AComponent, const UnicodeString CurName, const
UnicodeString NewName);
```

Description

Call ValidateRename to determine if the component specified by AComponent, which currently has the name specified by CurName, can be renamed to the string specified by NewName. This method is usually called by the form's ValidateRename

method to provide tighter restrictions on renaming, such as prohibiting reserved words.

See Also

ValidateRename (see page 2141)

7.2.1.3 IDesignerHook Properties

The properties of the IDesignerHook class are listed here.

Public Properties

	Name	Description
	Form (see page 2571)	Provides a reference to the form currently being designed.
	IsControl (see page 2571)	Specifies whether the form is in its form state or its control state.

7.2.1.3.1 IDesignerHook.Form Property

Provides a reference to the form currently being designed.

Pascal

```
property Form: TCustomForm;
```

C++

```
__property TCustomForm Form;
```

Description

Use Form to access the form, if any, that is being designed. When the user specifies changes in the form designer, the changes can be made to the form specified by the Form property.

Note: Not every designer has a form. For example, when the designer is used for a data module, remote data module, or active form, the Form property should not be used. Instead, use the object that the GetRoot (see page 2568) method returns.

See Also

Designer (see page 2159)

IsControl (see page 2571)

GetRoot (see page 2568)

7.2.1.3.2 IDesignerHook.IsControl Property

Specifies whether the form is in its form state or its control state.

Pascal

```
property IsControl: Boolean;
```

C++

```
__property Boolean IsControl;
```

Description

If the designer is used to create a control, rather than a form, set IsControl to true when the user finishes designing the control.

See Also

IsControl

Form (see page 2571)

7.2.2 IOleForm Interface

IOleForm is designed to communicate with OLE containers. To embed a VCL form in an OLE container, CodeGear recommends using ActiveForms and TOleControl instead of IOleForm.

Class Hierarchy

Pascal

```
IOleForm = interface;
```

C++

```
__interface IOleForm;
```

File

Forms

See Also

TOleControl (see page 6074)

7.2.2.1 IOleForm Members

The following tables list the members exposed by IOleForm.

Public Methods

	Name	Description
	OnDestroy (see page 2572)	This is OnDestroy, a member of class IOleForm.
	OnResize (see page 2573)	This is OnResize, a member of class IOleForm.

7.2.2.2 IOleForm Methods

The methods of the IOleForm class are listed here.

Public Methods

	Name	Description
	OnDestroy (see page 2572)	This is OnDestroy, a member of class IOleForm.
	OnResize (see page 2573)	This is OnResize, a member of class IOleForm.

7.2.2.2.1 IOleForm.OnDestroy Method

Pascal

```
procedure OnDestroy;
```

C++

```
__fastcall OnDestroy();
```

Description

This is OnDestroy, a member of class IOleForm.

7.2.2.2.2 IOleForm.OnResize Method

Pascal

```
procedure OnResize;
```

C++

```
__fastcall OnResize();
```

Description

This is OnResize, a member of class IOleForm.

7.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DisableTaskWindows (see page 2574)	This is function Forms.DisableTaskWindows.
	DoneCtl3D (see page 2574)	This is function Forms.DoneCtl3D.
	EnableTaskWindows (see page 2575)	This is function Forms.EnableTaskWindows.
	ForegroundTask (see page 2575)	Indicates whether the current thread is running in the foreground.
	GetParentForm (see page 2576)	Returns the form or property page that contains a specified control.
	InitCtl3D (see page 2576)	This is function Forms.InitCtl3D.
	IsAccel (see page 2576)	Indicates whether a particular character is an accelerator character (or hot key) within a given menu caption or other text string.
	KeyboardStateToShiftState (see page 2577)	Convert array of virtual keys to TShiftState.
	KeyboardStateToShiftState (see page 2577)	Convert array of virtual keys to TShiftState.
	KeyDataToShiftState (see page 2578)	Convert keyboard message data to TShiftState.
	KeysToShiftState (see page 2578)	Convert mouse event parameter to TShiftState.
	RestoreFocusState (see page 2579)	This is function Forms.RestoreFocusState.
	SaveFocusState (see page 2579)	This is function Forms.SaveFocusState.
	SetAutoSubClass (see page 2579)	This is function Forms.SetAutoSubClass.
	Subclass3DDlg (see page 2580)	This is function Forms.Subclass3DDlg.
	Subclass3DWnd (see page 2580)	This is function Forms.Subclass3DWnd.
	ValidParentForm (see page 2580)	Returns the form or property page that contains a specified control.

7.3.1 Forms.DisableTaskWindows Function

Pascal

```
function DisableTaskWindows(ActiveWindow: HWnd): TTaskWindowList;
```

C++

```
TTaskWindowList DisableTaskWindows(HWnd ActiveWindow);
```

File

Forms

Description

This is function Forms.DisableTaskWindows.

7.3.2 Forms.DoneCtl3D Function

Pascal

```
procedure DoneCtl3D; deprecated;
```

C++

```
DoneCtl3D();
```

File

Forms

Description

This is function Forms.DoneCtl3D.

7.3.3 Forms.EnableTaskWindows Function

Pascal

```
procedure EnableTaskWindows(WindowList: TTaskWindowList);
```

C++

```
EnableTaskWindows(TTaskWindowList WindowList);
```

File

Forms

Description

This is function Forms.EnableTaskWindows.

7.3.4 Forms.ForegroundTask Function

Indicates whether the current thread is running in the foreground.

Pascal

```
function ForegroundTask: Boolean;
```

C++

```
Boolean ForegroundTask();
```

File

Forms

Description

Call ForegroundTask to determine whether the current thread is executing in the Foreground. This is useful if you want to provide feedback to users only if they are currently interacting with a window on the same thread, but do not want to interrupt other processes.

ForegroundTask checks whether the window that currently has focus belongs to the thread that executes the function. It returns true if the focused window belongs to the current thread, false otherwise.

7.3.5 Forms.GetParentForm Function

Returns the form or property page that contains a specified control.

Pascal

```
function GetParentForm(Control: TControl; TopForm: Boolean = True): TCustomForm;
```

C++

```
TCustomForm GetParentForm(TControl * Control, Boolean TopForm = True);
```

File

Forms

Description

Call GetParentForm to obtain the descendant of TCustomForm (see page 2103) that contains the control specified by the **Control** parameter. If the **TopForm** parameter if true, this function goes all the way up the parent chain for **Control** until it finds a Form with no parent. If **TopForm** if false, this function goes up the parent chain until it finds a Form that is a TCustomForm (see page 2103).

If the control is not contained in a form (for example, an ActiveX control embedded in another type of window), GetParentForm returns **nil** (Delphi) or **NULL** (C++).

See Also

TControl

TCustomForm (see page 2103)

ValidParentForm (see page 2580)

7.3.6 Forms.InitCtl3D Function

Pascal

```
procedure InitCtl3D; deprecated;
```

C++

```
InitCtl3D();
```

File

Forms

Description

This is function Forms.InitCtl3D.

7.3.7 Forms.IsAccel Function

Indicates whether a particular character is an accelerator character (or hot key) within a given menu caption or other text string.

Pascal

```
function IsAccel(VK: Word; const Str: string): Boolean;
```

C++

```
Boolean IsAccel(Word VK, const UnicodeString Str);
```

File

Forms

Description

Call IsAccel to determine whether the character represented by the VK (virtual key) parameter appears as an accelerator in the string specified by the Str parameter. IsAccel only looks for accelerators that are identified by a preceding ampersand (&). Such accelerators appear underlined in the string when displayed as a control's caption.

Use IsAccel when processing key events to determine whether a key matches an accelerator character in a control's caption.

Note: IsAccel does not recognize hot key combinations in menu items that are identified by the HotKey property.

See Also

TCustomLabel

TCustomStaticText

TMenuItem

7.3.8 Forms.KeyboardStateToShiftState Function

Convert array of virtual keys to TShiftState.

Pascal

```
function KeyboardStateToShiftState(const KeyboardState: TKeyboardState): TShiftState; overload;
function KeyboardStateToShiftState: TShiftState; overload;
```

C++

```
TShiftState KeyboardStateToShiftState(const TKeyboardState KeyboardState);
TShiftState KeyboardStateToShiftState();
```

File

Forms

Description

Convert the given array of virtual keys **KeyboardState** to a TShiftState type. This array can be provided by the Windows function GetKeyboardState.

See Also

KeyDataToShiftState (see page 2578)

KeysToShiftState (see page 2578)

TShiftState

7.3.9 Forms.KeyDataToShiftState Function

Convert keyboard message data to TShiftState.

Pascal

```
function KeyDataToShiftState(KeyData: Longint): TShiftState;
```

C++

```
TShiftState KeyDataToShiftState(Longint KeyData);
```

File

Forms

Description

Convert the current keyboard state and given **KeyData** to a TShiftState type.

See Also

KeyboardStateToShiftState (see page 2577)

KeysToShiftState (see page 2578)

TShiftState

7.3.10 Forms.KeysToShiftState Function

Convert mouse event parameter to TShiftState.

Pascal

```
function KeysToShiftState(Keys: Word): TShiftState;
```

C++

```
TShiftState KeysToShiftState(Word Keys);
```

File

Forms

Description

Convert the parameter **Keys** to a TShiftState type. **Keys** contains flags that indicate the status of the mouse buttons and the CTRL and SHIFT keys at the time of the mouse event

See Also

KeyDataToShiftState (see page 2578)

KeyboardStateToShiftState (see page 2577)

TShiftState

7.3.11 Forms.RestoreFocusState Function

Pascal

```
procedure RestoreFocusState(FocusState: TFocusState);
```

C++

```
RestoreFocusState(TFocusState FocusState);
```

File

Forms

Description

This is function Forms.RestoreFocusState.

7.3.12 Forms.SaveFocusState Function

Pascal

```
function SaveFocusState: TFocusState;
```

C++

```
TFocusState SaveFocusState();
```

File

Forms

Description

This is function Forms.SaveFocusState.

7.3.13 Forms.SetAutoSubClass Function

Pascal

```
procedure SetAutoSubClass(Enable: Boolean); deprecated;
```

C++

```
SetAutoSubClass(Boolean Enable);
```

File

Forms

Description

This is function Forms.SetAutoSubClass.

7.3.14 Forms.Subclass3DDlg Function

Pascal

```
procedure Subclass3DDlg(Wnd: HWnd; Flags: Word); deprecated;
```

C++

```
Subclass3DDlg(HWnd Wnd, Word Flags);
```

File

Forms

Description

This is function Forms.Subclass3DDlg.

7.3.15 Forms.Subclass3DWnd Function

Pascal

```
function Subclass3DWnd(Wnd: HWnd): Boolean; deprecated;
```

C++

```
Boolean Subclass3DWnd(HWnd Wnd);
```

File

Forms

Description

This is function Forms.Subclass3DWnd.

7.3.16 Forms.ValidParentForm Function

Returns the form or property page that contains a specified control.

Pascal

```
function ValidParentForm(Control: TControl; TopForm: Boolean = True): TCustomForm;
```

C++

```
TCustomForm ValidParentForm(TControl * Control, Boolean TopForm = True);
```

File

Forms

Description

Call ValidParentForm to obtain the descendant of TCustomForm (see page 2103) that contains the control specified by the **Control** parameter. If the **TopForm** parameter if true, this function goes all the way up the parent chain for **Control** until it finds a Form with no parent. If **TopForm** if false, this function goes up the parent chain until it finds a Form that is a TCustomForm (see page 2103).

If the control is not contained in a form (for example, an ActiveX control embedded in another type of window), ValidParentForm raises an EInvalidOperation exception.

See Also

GetParentForm (see page 2576)

TControl

TCustomForm (see page 2103)

7.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TActiveFormBorderStyle (see page 2582)	Specifies the style of an active form's border.
	TBorderIcon (see page 2583)	TBorderIcons (see page 2596) and TBorderIcons (see page 2596) specify the buttons that appear on the title bar of a form window.
	TCloseAction (see page 2584)	TCloseAction describes how a form should respond when it is closed.
	TDefaultMonitor (see page 2585)	Specifies the monitor on which the form appears.
	TFormBorderStyle (see page 2586)	TFormBorderStyle is the type of the BorderStyle property for windows-only forms and TBorderStyle (see page 2597) is the type of the BorderStyle property for other controls in windows-only applications.
	TFormStyle (see page 2587)	TFormStyle describes form style.
	TMonitorDefaultTo (see page 2587)	TMonitorDefautlTo specifies which monitor to select when there is no match to the specified criteria.
	TPopupMode (see page 2588)	TPopupMode enumerates the possible values of a Form's PopupMode property.
	TPosition (see page 2590)	TPosition describes the positioning of a form.
	TPrintScale (see page 2591)	Represents the proportions of a printed form.
	TScrollBarKind (see page 2591)	TScrollBarKind indicates the orientation of a scrollbar.
	TScrollBarStyle (see page 2592)	TScrollBarStyle specifies a scroll bar style.
	TShowAction (see page 2592)	This is record Forms.TShowAction.
	TTileMode (see page 2593)	Represents how MDI child forms are arranged when the Tile method is called.
	TTimerMode (see page 2593)	This is record Forms.TTimerMode.
	TWindowState (see page 2594)	TWindowState indicates whether a form is maximized, minimized, or normally sized.

Records

	Name	Description
	TCMHintShowPause (see page 2584)	This is record Forms.TCMHintShowPause.
	TCursorRec (see page 2585)	This is record Forms.TCursorRec.
	TPopupForm (see page 2588)	This is record Forms.TPopupForm.
	TPopupWnd (see page 2589)	This is record Forms.TPopupWnd.

7.4.1 Forms.TActiveFormBorderStyle Enumeration

Specifies the style of an active form's border.

Pascal

```
TActiveFormBorderStyle = (
  afbNone,
  afbSingle,
  afbSunken,
  afbRaised
);
```

C++

```
enum TActiveFormBorderStyle {
  afbNone,
  afbSingle,
```

```
  afbSunken,
  afbRaised
};
```

File

Forms

Description

TActiveFormBorderStyle is an enumeration of possible active form border styles, and may have on of the following are possible values :

Value	Meaning
afbNone	The form has no border.
afbSingle	The form has a regular single-line border.
afbSunken	The form has a 3D look—that is, a border with a sunken edge.
afbRaised	The form has a border with a raised edge.

See Also

TCustomActiveForm (see page 2024)

7.4.2 Forms.TBorderIcon Enumeration

TBorderIcons (see page 2596) and TBorderIcons (see page 2596) specify the buttons that appear on the title bar of a form window.

Pascal

```
TBorderIcon = (
  biSystemMenu,
  biMinimize,
  biMaximize,
  biHelp
);
```

C++

```
enum TBorderIcon {
  biSystemMenu,
  biMinimize,
  biMaximize,
  biHelp
};
```

File

Forms

Description

TBorderIcons (see page 2596) can include any of the following TBorderIcon values:

Value	Meaning
biSystemMenu	The form has a Control menu (also known as a System menu).
biMinimize	The form has a Minimize button
biMinimize	The form has a Maximize button

biHelp	If BorderStyle is bsDialog or biMinimize and biMaximize are excluded, a question mark appears in the form's title bar and when clicked, the cursor changes to crHelp; otherwise, no question mark appears.

7.4.3 Forms.TCloseAction Enumeration

TCloseAction describes how a form should respond when it is closed.

Pascal

```
TCloseAction = (
  caNone,
  caHide,
  caFree,
  caMinimize
);
```

C++

```
enum TCloseAction {
  caNone,
  caHide,
  caFree,
  caMinimize
};
```

File

Forms

Description

TCloseAction consists of the following values:

Value	Meaning
caNone	The form is not allowed to close, so nothing happens.
caHide	The form is not closed, but just hidden. Your application can still access a hidden form.
caFree	The form is closed and all allocated memory for the form is freed.
caMinimize	The form is minimized, rather than closed.

7.4.4 Forms.TCMHintShowPause Record

Pascal

```
TCMHintShowPause = record
  Msg: Cardinal;
  WasActive: Integer;
  Pause: PInteger;
  Result: Integer;
end;
```

C++

```
struct TCMHintShowPause {
  unsigned Msg;
  int WasActive;
```

```
    PInteger Pause;
    int Result;
  };
```

File

Forms

Description

This is record Forms.TCMHintShowPause.

7.4.5 Forms.TCursorRec Record

Pascal

```
  TCursorRec = record
    Next: PCursorRec;
    Index: Integer;
    Handle: HCURSOR;
  end;
```

C++

```
  struct TCursorRec {
    PCursorRec Next;
    int Index;
    HCURSOR Handle;
  };
```

File

Forms

Description

This is record Forms.TCursorRec.

7.4.6 Forms.TDefaultMonitor Enumeration

Specifies the monitor on which the form appears.

Pascal

```
  TDefaultMonitor = (
    dmDesktop,
    dmPrimary,
    dmMainForm,
    dmActiveForm
  );
```

C++

```
  enum TDefaultMonitor {
    dmDesktop,
    dmPrimary,
    dmMainForm,
    dmActiveForm
  };
```

File

Forms

Description

Use TDefaultMonitor to associate a form with a particular monitor in a multi-monitor application. The following table lists the possible values:

Value	Meaning
dmDesktop	No attempt is made to position the form on a specific monitor.
dmPrimary	The form is positioned on the first monitor listed in the global screen object's Monitors property.
dmMainForm	The form appears on the same monitor as the application's main form.
dmActiveForm	The form appears on the same monitor as the currently active form.

7.4.7 Forms.TFormBorderStyle Enumeration

TFormBorderStyle is the type of the BorderStyle property for windows-only forms and TBorderStyle (see page 2597) is the type of the BorderStyle property for other controls in windows-only applications.

Pascal

```
TFormBorderStyle = (
  bsNone,
  bsSingle,
  bsSizeable,
  bsDialog,
  bsToolWindow,
  bsSizeToolWin
);
```

C++

```
enum TFormBorderStyle {
  bsNone,
  bsSingle,
  bsSizeable,
  bsDialog,
  bsToolWindow,
  bsSizeToolWin
};
```

File

Forms

Description

These are the possible values of the TFormBorderStyle type:

Value	Meaning
bsNone	No visible border. (not resizable)
bsSingle	Single-line border. (not resizable)
bsDialog	Standard dialog box border. (not resizable)
bsSizeable	Standard resizable border.
bsToolWindow	Like bsSingle but with a smaller caption.

bsSizeToolWin	Like bsSizeable but with a smaller caption.

Only the bsNone and bsSingle values are possible values of TBorderStyle (see page 2597).

7.4.8 Forms.TFormStyle Enumeration

TFormStyle describes form style.

Pascal

```
TFormStyle = (
  fsNormal,
  fsMDIChild,
  fsMDIForm,
  fsStayOnTop
);
```

C++

```
enum TFormStyle {
  fsNormal,
  fsMDIChild,
  fsMDIForm,
  fsStayOnTop
};
```

File

Forms

Description

TFormStyle consists of the following values.

Value	Meaning
fsNormal	The form is neither an MDI parent window nor an MDI child window.
fsMDIChild	The form is an MDI child window.
fsMDIForm	The form is an MDI parent window.
fsStayOnTop	This form remains on top of the desktop and of other forms in the project, except any others that also have FormStyle set to fsStayOnTop. If one fsStayOnTop form launches another, neither form will consistently remain on top.

See Also

TCustomForm (see page 2103)

7.4.9 Forms.TMonitorDefaultTo Enumeration

TMonitorDefautlTo specifies which monitor to select when there is no match to the specified criteria.

Pascal

```
TMonitorDefaultTo = (
  mdNearest,
  mdNull,
```

```
    mdPrimary
  );
```

C++

```
  enum TMonitorDefaultTo {
    mdNearest,
    mdNull,
    mdPrimary
  };
```

File

Forms

Description

TMonitorDefaultTo indicates which monitor should be used when the selection criteria do not match any of the monitors in the system. It can have any of the following values:

Value	Meaning
mdNearest	Choose the monitor that comes closest to matching the criteria (the monitor closest to a point, on which most of a rectangle lies, etc).
mdNull	Do not select any monitor if the criteria can't be met. Use nil (Delphi) or NULL (C++) to indicate that no monitor could be found.
mdPrimary	Choose the primary monitor if no monitor matches the criteria.

7.4.10 Forms.TPopupForm Record

Pascal

```
  TPopupForm = record
    FormID: Integer;
    Form: TCustomForm;
    WasPopup: Boolean;
  end;
```

C++

```
  struct TPopupForm {
    int FormID;
    TCustomForm Form;
    Boolean WasPopup;
  };
```

File

Forms

Description

This is record Forms.TPopupForm.

7.4.11 Forms.TPopupMode Enumeration

TPopupMode enumerates the possible values of a Form's PopupMode property.

Pascal

```
TPopupMode = (
  pmNone,
  pmAuto,
  pmExplicit
);
```

C++

```
enum TPopupMode {
  pmNone,
  pmAuto,
  pmExplicit
};
```

File

Forms

Description

The PopupMode property controls how the top-level form behaves with respect to Window's WS_POPUP style. The TPopupMode can have one of these values :

Value	Meaning
pmNone	Set the PopupMode property to pmNone if you want the popup window to have the pre-Delphi 8 behavior.
pmAuto	Popup handling is automatic.
pmExplicit	Set the PopupMode property to pmExplicit for non-modal design windows such as tool palettes and other floating tool windows. This causes the windows to always remain on top of the main form.

See Also

PopupMode (see page 2299)

7.4.12 Forms.TPopupWnd Record

Pascal

```
TPopupWnd = record
  ID: Integer;
  ControlWnd: HWND;
end;
```

C++

```
struct TPopupWnd {
  int ID;
  HWND ControlWnd;
};
```

File

Forms

Description

This is record Forms.TPopupWnd.

7.4.13 Forms.TPosition Enumeration

TPosition describes the positioning of a form.

Pascal

```
TPosition = (
  poDesigned,
  poDefault,
  poDefaultPosOnly,
  poDefaultSizeOnly,
  poScreenCenter,
  poDesktopCenter,
  poMainFormCenter,
  poOwnerFormCenter
);
```

C++

```
enum TPosition {
  poDesigned,
  poDefault,
  poDefaultPosOnly,
  poDefaultSizeOnly,
  poScreenCenter,
  poDesktopCenter,
  poMainFormCenter,
  poOwnerFormCenter
};
```

File

Forms

Description

TPosition consists of the following values:

Value	Meaning
poDesigned	The form appears positioned on the screen and with the same height and width as it had at design time.
poDefault	The form appears in a position on the screen and with a height and width determined by the operating system.
poDefaultPosOnly	The form displays with the size you created it at design time, but the operating system chooses its position on the screen.
poDefaultSizeOnly	The form appears in the position you left it at design time, but the operating system chooses its size.
poScreenCenter	The form remains the size you left it at design time, but is positioned in the center of the screen. Note that in multi-monitor applications, this may result in a form that does not fall entirely on one monitor, because CLX does not include multi-monitor support.
poDesktopCenter	The form remains the size you left it at design time, but is positioned in the center of the screen.
poMainFormCenter	The form remains the size you left it at design time, but is positioned in the center of the application's main form. This position should only be used with secondary forms. If set for a main form, it acts like poScreenCenter.
poOwnerFormCenter	The form remains the size you left it at design time, but is positioned in the center of the form specified by the Owner property. If the Owner property does not specify a form, this position acts like poMainFormCenter.

See Also

TCustomForm (see page 2103)

7.4.14 Forms.TPrintScale Enumeration

Represents the proportions of a printed form.

Pascal

```
TPrintScale = (
  poNone,
  poProportional,
  poPrintToFit
);
```

C++

```
enum TPrintScale {
  poNone,
  poProportional,
  poPrintToFit
};
```

File

Forms

Description

Use TPrintScale to get or set the proportions of the printed form. TPrintScale can have one of the following values:

Value	Meaning
poNone	No special scaling occurs; therefore, the printed form and how the form appears onscreen may appear squished or stretched.
poProportional	The form is printed so that the printed image is approximately the same visible size as on the screen (WYSIWYG). The form image is scaled so that the printed image is approximately the same visible size as on the screen.
poPrintToFit	The form is printed using the same screen proportions, but in a size that just fits the printed page.

7.4.15 Forms.TScrollBarKind Enumeration

TScrollBarKind indicates the orientation of a scrollbar.

Pascal

```
TScrollBarKind = (
  sbHorizontal,
  sbVertical
);
```

C++

```
enum TScrollBarKind {
  sbHorizontal,
  sbVertical
};
```

File

Forms

Description

TScrollBarKind indicates whether a scrollbar is horizontal or vertical. It includes the following values:

Value	Meaning
sbHorizontal	Horizontal scrollbar.
sbVertical	Vertical scrollbar.

7.4.16 Forms.TScrollBarStyle Enumeration

TScrollBarStyle specifies a scroll bar style.

Pascal

```
TScrollBarStyle = (
  ssRegular,
  ssFlat,
  ssHotTrack
);
```

C++

```
enum TScrollBarStyle {
  ssRegular,
  ssFlat,
  ssHotTrack
};
```

File

Forms

Description

TScrollBarStyle can have one of the following values:

Value	Meaning
ssRegular	The scroll bar is normal.
ssFlat	The scroll bar is flat.
ssHotTrack	The scroll bar uses hot tracking.

7.4.17 Forms.TShowAction Enumeration

Pascal

```
TShowAction = (
  saIgnore,
  saRestore,
  saMinimize,
  saMaximize
);
```

C++

```
enum TShowAction {
  saIgnore,
  saRestore,
  saMinimize,
  saMaximize
};
```

File

Forms

Description

This is record Forms.TShowAction.

7.4.18 Forms.TTileMode Enumeration

Represents how MDI child forms are arranged when the Tile method is called.

Pascal

```
TTileMode = (
  tbHorizontal,
  tbVertical
);
```

C++

```
enum TTileMode {
  tbHorizontal,
  tbVertical
};
```

File

Forms

Description

TTileMode can have one of the following values:

Value	Meaning
tbHorizontal	Each form stretches across the width of the parent form.
tbVertical	Each form stretches along the height of the parent form.

Note: TTileMode is meaningful only if the form is an MDI child (that is, if the form's FormStyle property is set to fsMDIChild).

7.4.19 Forms.TTimerMode Enumeration

Pascal

```
TTimerMode = (
  tmShow,
  tmHide
);
```

C++

```
enum TTimerMode {
  tmShow,
  tmHide
};
```

File

Forms

Description

This is record Forms.TTimerMode.

7.4.20 Forms.TWindowState Enumeration

TWindowState indicates whether a form is maximized, minimized, or normally sized.

Pascal

```
TWindowState = (
  wsNormal,
  wsMinimized,
  wsMaximized
);
```

C++

```
enum TWindowState {
  wsNormal,
  wsMinimized,
  wsMaximized
};
```

File

Forms

Description

TWindowState describes the state of a form window. The following table lists the possible values:

Value	Meaning
wsNormal	The form is in its normal state (that is, neither minimized nor maximized).
wsMinimized	The form is minimized.
wsMaximized	The form is maximized.

See Also

TCustomForm (see page 2103)

7.5 Types

The following table lists types in this documentation.

Types

Name	Description
PCursorRec (see page 2595)	This is type Forms.PCursorRec.
PHintInfo (see page 2596)	PHintInfo declares a pointer to a Help Window appearance record.
TBorderIcons (see page 2596)	TBorderIcons specifies the buttons that appear on the title bar of a form window.
TBorderStyle (see page 2597)	TBorderStyle is the type of the BorderStyle property for framed controls.
TCloseEvent (see page 2597)	TCloseEvent is the type of a form's OnClose event handle.
TCloseQueryEvent (see page 2598)	TCloseQueryEvent is used for event handlers that are called when a window is about to close.
TCursorRecType (see page 2598)	This is type Forms.TCursorRecType.
TCustomFormClass (see page 2599)	TCustomFormClass defines the metaclass for TCustomForm (see page 2103).
TCustomFrameClass (see page 2599)	TCustomFrameClass defines the metaclass for TCustomFrame (see page 2237).
TExceptionEvent (see page 2599)	TExceptionEvent is the type of event handlers that respond when the application traps an unhandled exception.
TFocusState (see page 2600)	This is type Forms.TFocusState.
TFormClass (see page 2600)	TFormClass defines the metaclass for TForm (see page 2241).
TFormState (see page 2601)	TFormState describes the possible state of a form.
TGetHandleEvent (see page 2601)	This is type Forms.TGetHandleEvent.
THelpEvent (see page 2602)	THelpEvent is the type of an OnHelp event handler.
THintInfo (see page 2602)	THintInfo is used to define the appearance and behavior of the Help window.
TIdleEvent (see page 2604)	TIdleEvent is the type of event handler that perform actions when the application is idle.
TMessageEvent (see page 2605)	TMessageEvent is the type of an OnMessage event handler.
TPopupFormArray (see page 2605)	This is type Forms.TPopupFormArray.
TPopupWndArray (see page 2605)	This is type Forms.TPopupWndArray.
TScrollBarInc (see page 2606)	TScrollBarInc represents a number of logical units on a TControlScrollBar (see page 2009).
TSetLayeredWindowAttributes (see page 2606)	This is type Forms.TSetLayeredWindowAttributes.
TSettingChangeEvent (see page 2607)	TSettingChangeEvent is the type of an OnSettingChange event handler.
TShortCutEvent (see page 2609)	TShortCutEvent is the type of an OnShortCut event handler.
TShowHintEvent (see page 2610)	TShowHintEvent is the type of the OnShowHint event handler.
TTaskWindowList (see page 2610)	This is type Forms.TTaskWindowList.
TWindowHook (see page 2611)	TWindowHook is the type for a dialog procedure.

7.5.1 Forms.PCursorRec Type

Pascal

```
PCursorRec = ^TCursorRec;
```

C++

```
^TCursorRec PCursorRec;
```

File

Forms

Description

This is type Forms.PCursorRec.

7.5.2 Forms.PHintInfo Type

PHintInfo declares a pointer to a Help Window appearance record.

Pascal

```
PHintInfo = Controls.PHintInfo deprecated 'Use Controls.PHintInfo';
```

C++

```
Controls.PHintInfo deprecated 'Use Controls.PHintInfo' PHintInfo;
```

File

Forms

Description

The PHintInfo type declares a pointer to a THintInfo (see page 2602) variable. The THintInfo (see page 2602) type is used to define the appearance and behavior of the Help window in a TShowHintEvent (see page 2610) type OnShowHint event handler.

See Also

OnShowHint (see page 2008)

TShowHintEvent (see page 2610)

THintInfo (see page 2602)

7.5.3 Forms.TBorderIcons Type

TBorderIcons specifies the buttons that appear on the title bar of a form window.

Pascal

```
TBorderIcons = set of TBorderIcon;
```

C++

```
TBorderIcon TBorderIcons;
```

File

Forms

Description

TBorderIcons type declares a pointer to a TBorderIcon (see page 2583) variable. TBorderIcons can include any of the following TBorderIcon (see page 2583) values:

Value	Meaning
biSystemMenu	The form has a Control menu (also known as a System menu).
biMinimize	The form has a Minimize button

biMinimize	The form has a Maximize button
biHelp	If BorderStyle is bsDialog or biMinimize and biMaximize are excluded, a question mark appears in the form's title bar and when clicked, the cursor changes to crHelp; otherwise, no question mark appears.

See Also

TBorderIcon (see page 2583)

7.5.4 Forms.TBorderStyle Type

TBorderStyle is the type of the BorderStyle property for framed controls.

Pascal

```
TBorderStyle = bsNone..bsSingle;
```

C++

```
bsNone..bsSingle TBorderStyle;
```

File

Forms

Description

These are the possible values of the TBorderStyle type:

Value	Meaning
bsNone	No visible border.
bsSingle	Single-line border.

7.5.5 Forms.TCloseEvent Type

TCloseEvent is the type of a form's OnClose event handle.

Pascal

```
TCloseEvent = procedure (Sender: TObject; var Action: TCloseAction) of object;
```

C++

```
(Sender: TObject; var Action: TCloseAction) ( TCloseEvent)();
```

File

Forms

Description

The TCloseEvent type points to a method that handles the closing of a form. The **Sender** parameter is the form that the user tried to close. The **Action** parameter returns the action you want the form to take when it closes.

Setting **Action** controls how the form responds to the attempt to close it as shown below :

Value	Meaning
caNone	The form is not allowed to close, so nothing happens.
caHide	The form is not closed, but just hidden. Your application can still access a hidden form.
caFree	The form is closed and all allocated memory for the form is freed.
caMinimize	The form is minimized, rather than closed. This is the default action for MDI child forms.

See Also

OnClose (see page 2321)

7.5.6 Forms.TCloseQueryEvent Type

TCloseQueryEvent is used for event handlers that are called when a window is about to close.

Pascal

```
TCloseQueryEvent = procedure (Sender: TObject; var CanClose: Boolean) of object;
```

C++

```
(Sender: TObject; var CanClose: Boolean) ( TCloseQueryEvent)();
```

File

Forms

Description

The TCloseQueryEvent type is the type for event handlers that allow an application to block the closing of a window (form or dialog).

Sender is the object whose event handler is called. This is the form that is about to close or the dialog whose window is about to close.

CanClose is set by the event handler to indicate whether the form or dialog can close (true) or whether the user should be blocked from closing it (false).

See Also

OnClose (see page 2321)

TCloseQueryEvent

7.5.7 Forms.TCursorRecType Type

Pascal

```
TCursorRecType = PCursorRec;
```

C++

```
PCursorRec TCursorRecType;
```

File

Forms

Description

This is type Forms.TCursorRecType.

7.5.8 Forms.TCustomFormClass Type

TCustomFormClass defines the metaclass for TCustomForm (see page 2103).

Pascal

```
TCustomFormClass = class of TCustomForm;
```

C++

```
TCustomForm TCustomFormClass;
```

File

Forms

Description

TCustomFormClass is the metaclass for TCustomForm (see page 2103). Its value is the class reference for TCustomForm (see page 2103) or for one of its descendants.

See Also

TCustomForm (see page 2103)

7.5.9 Forms.TCustomFrameClass Type

TCustomFrameClass defines the metaclass for TCustomFrame (see page 2237).

Pascal

```
TCustomFrameClass = class of TCustomFrame;
```

C++

```
TCustomFrame TCustomFrameClass;
```

File

Forms

Description

TCustomFrameClass is the metaclass for TCustomFrame (see page 2237). Its value is the class reference for TCustomFrame (see page 2237) or for one of its descendants.

See Also

TCustomFrame (see page 2237)

7.5.10 Forms.TExceptionEvent Type

TExceptionEvent is the type of event handlers that respond when the application traps an unhandled exception.

Pascal

```
TExceptionEvent = procedure (Sender: TObject; E: Exception) of object;
```

C++

```
(Sender: TObject; E: Exception) ( TExceptionEvent)();
```

File

Forms

Description

The TExceptionEvent type is the type of the OnException event handler.

Sender is the object that receives the event notification. Typically, this is the application object.

E is the exception object that represents the exception.

See Also

OnException (see page 1993)

7.5.11 Forms.TFocusState Type

Pascal

```
TFocusState = type Pointer;
```

C++

```
type Pointer TFocusState;
```

File

Forms

Description

This is type Forms.TFocusState.

7.5.12 Forms.TFormClass Type

TFormClass defines the metaclass for TForm (see page 2241).

Pascal

```
TFormClass = class of TForm;
```

C++

```
TForm * TFormClass;
```

File

Forms

Description

TFormClass is the metaclass for TForm (see page 2241). Its value is the class reference for TForm (see page 2241) or for one of its descendants.

See Also

TForm (see page 2241)

7.5.13 Forms.TFormState Type

TFormState describes the possible state of a form.

Pascal

```
TFormState = set of (fsCreating, fsVisible, fsShowing, fsModal, fsCreatedMDIChild,
fsActivated);
```

C++

```
(fsCreating, fsVisible, fsShowing, fsModal, fsCreatedMDIChild, fsActivated) TFormState;
```

File

Forms

Description

The following table lists the values that can be included in a form's state:

Value	Meaning
fsCreating	The form's constructor is currently executing.
fsVisible	The form's window is visible. This state is used to update the Visible property.
fsShowing	The form's WindowState property is changing. This state is used to prevent WindowState changes from interfering with a transition that is in progress.
fsModal	The form was created as a modal window.
fsActivated	The form has received focus or the application became active but has not yet called the Activate method to generate an OnActivate event.

7.5.14 Forms.TGetHandleEvent Type

Pascal

```
TGetHandleEvent = procedure (var Handle: HWND) of object;
```

C++

```
(var Handle: HWND) ( TGetHandleEvent)();
```

File

Forms

Description

This is type Forms.TGetHandleEvent.

7.5.15 Forms.THelpEvent Type

THelpEvent is the type of an OnHelp event handler.

Pascal

```
THelpEvent = function (Command: Word; Data: Longint; var CallHelp: Boolean): Boolean of object;
```

C++

```
(Command: Word; Data: Longint; var CallHelp: Boolean): Boolean ( THelpEvent)();
```

File

Forms

Description

THelpEvent includes the following parameters:

Command indicates the type of help command that was issued. It's meaning depends on the current help system. For example, when using WinHelp, Command is the command used by the WinHelp API. For details on possible commands, see the documentation provided by the developer of the application's help system. For example, if the application uses WinHelp, the possible commands are listed in the WinHelp section of the Win32 Developer's Reference.

Data provides additional data to describe the desired action by the help system. Its value depends on the value of the Command property. Typically, Data specifies a keyword or context ID. For details, see the documentation provided by the application's help system.

CallHelp is set by the event handler. If CallHelp is true when the event handler exits, the application should forward the help command to the help system. If the event handler handles the command, it sets CallHelp to false so that the application does not forward the help command to the help system.

7.5.16 Forms.THintInfo Type

THintInfo is used to define the appearance and behavior of the Help window.

Pascal

```
THintInfo = Controls.THintInfo deprecated 'Use Controls.THintInfo';
```

C++

```
Controls.THintInfo deprecated 'Use Controls.THintInfo' THintInfo;
```

File

Forms

Description

The THintInfo type is used to define the appearance and behavior of the Help window in a TShowHintEvent (see page 2610) type OnShowHint event handler. The following table describes the meaning of its fields:

Field	Meaning
HintControl	The name of the control for which hint processing is occurring.

HintWindowClass (see page 2615)	The class of the hint-window control. The default is THintWindow, but you can specify any class derived from THintWindow. Use this field if you want to substitute a custom hint window for THintWindow.
HintPos	The default position in screen coordinates of the top-left corner of the hint window. Change where the window appears by changing this value.
HintMaxWidth	The maximum width of the hint window before word wrapping begins. By default, the value is the width of the screen (the Width property of the global Screen (see page 2615) variable).
HintColor	The background color of the Hint window.
CursorRect	The rectangle the user's mouse pointer must be in for the hint window to appear. The default value for CursorRect is the client rectangle of the control. Change this value so that a single control can be divided into several hint regions. When the user moves the mouse pointer outside the rectangle, the hint window disappears.
CursorPos	The location of the mouse pointer within the control.
ReshowTimeout	How long the hint system should wait before asking about the hint status again. By default, this field is zero, indicating that the hint status will not change. Setting it to a non-zero value will cause the hint to act, after the requested milliseconds have elapsed, as if the user moved the mouse outside the hint rectangle and back in. This can be used to either put off hint processing for a period of time, or to allow the hint to be updated periodically.
HideTimeout	The number of milliseconds to show the hint. By default, it is set to the value of the Application (see page 2612) variable's HintHidePause property.
HintStr	The string to be displayed in the hint window. This allows an OnHint event handler to modify the contents of a hint before it is displayed. By default, it contains the value returned by the GetShortHint function when passed the value of the Application (see page 2612) variable's Hint property.
HintData	Additional data to be passed to the hint-window control. Use this field in conjunction with HintWindowClass (see page 2615).

C++ Examples:

```
/*
This example uses three speed buttons on a panel. The code
changes the color, width, and position of the text in the
Help Hint for the third speed button. Set the ShowHint
property of each speed button to true and give a value to
the Hint property of each.  You must declare the DoShow
method in the type declaration of the form. Once it is
declared, write the code for the DoShow method in the
implementation part of the unit. Finally, in the OnCreate
event handler for the form, assign the method to the
OnShowHint event of the application.
*/
void __fastcall TForm1::DoShowHint(UnicodeString &HintStr, bool &CanShow, THintInfo &HintInfo)
{
  if (HintInfo.HintControl == SpeedButton3)
  {
    HintInfo.HintColor = clAqua;// Changes only for this hint
    HintInfo.HintMaxWidth = 120; // Hint text word wraps if width is greater than 120
    HintInfo.HintPos.x += SpeedButton3->Width; // Move hint to right edge
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Application->ShowHint = true;
  Application->OnShowHint = DoShowHint;
}
```

Delphi Examples:

```
{
This example uses three speed buttons on a panel. The code
changes the color, width, and position of the text in the
Help Hint for the third speed button. Set the ShowHint
property of each speed button to true and give a value to
the Hint property of each.  You must declare the DoShow
method in the type declaration of the form. Once it is
declared, write the code for the DoShow method in the
implementation part of the unit. Finally, in the OnCreate
event handler for the form, assign the method to the
OnShowHint event of the application.
}

procedure TForm1.DoShowHint(var HintStr: String; var CanShow: Boolean; var HintInfo:
THintInfo);
begin
  if HintInfo.HintControl = SpeedButton3 then
  begin
    with HintInfo do
    begin
      HintColor := clAqua;{ Changes only for this hint }
      HintMaxWidth := 120;{Hint text word wraps if width is greater than 120 }
      Inc(HintPos.X, SpeedButton3.Width); { Move hint to right edge }
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Application.ShowHint := True;
  Application.OnShowHint := DoShowHint;
end;

7.5.17 Forms.TIdleEvent Type

TIdleEvent is the type of event handler that perform actions when the application is idle.

Pascal

```
TIdleEvent = procedure (Sender: TObject; var Done: Boolean) of object;
```

C++

```
(Sender: TObject; var Done: Boolean) ( TIdleEvent)();
```

File

Forms

Description

The TIdleEvent type is the type of the OnIdle event.

Sender is the object that receives the event notification. Typically, this is the application object.

Done indicates whether the event handler has finished its background processing.

If the event handler exits when **Done** is true, all action components are then given a chance to update themselves and, on Windows, the application yields control to Windows until a new message appears in the application's message queue. When

Done is false, any action components in the application are not allowed to update themselves when the event handler exits and, on Windows, the application does not explicitly yield control to the operating system.

See Also

OnIdle (see page 1998)

7.5.18 Forms.TMessageEvent Type

TMessageEvent is the type of an OnMessage event handler.

Pascal

```
TMessageEvent = procedure (var Msg: TMsg; var Handled: Boolean) of object;
```

C++

```
(var Msg: TMsg; var Handled: Boolean) ( TMessageEvent)();
```

File

Forms

Description

TMessageEvent includes the following parameters:

Msg identifies the Windows message that triggered the event.

Handled indicates whether the event handler responded to the message. If the event handler sets Handled to true, the application assumes that the message has been completely handled and halts any subsequent processing of the message.

7.5.19 Forms.TPopupFormArray Type

Pascal

```
TPopupFormArray = array of TPopupForm;
```

C++

```
array of TPopupForm TPopupFormArray;
```

File

Forms

Description

This is type Forms.TPopupFormArray.

7.5.20 Forms.TPopupWndArray Type

Pascal

```
TPopupWndArray = array of TPopupWnd;
```

C++

```
array of TPopupWnd TPopupWndArray;
```

File

Forms

Description

This is type Forms.TPopupWndArray.

7.5.21 Forms.TScrollBarInc Type

TScrollBarInc represents a number of logical units on a TControlScrollBar (see page 2009).

Pascal

```
TScrollBarInc = 1..32767;
```

C++

```
1..32767 TScrollBarInc;
```

File

Forms

Description

TScrollBarInc has a value between 1 and 32767 (inclusive). It indicates the number of positions to scroll.

See Also

TControlScrollBar

7.5.22 Forms.TSetLayeredWindowAttributes Type

Pascal

```
[SuppressUnmanagedCodeSecurity]
TSetLayeredWindowAttributes = function (Hwnd: THandle; crKey: COLORREF; bAlpha: Byte; dwFlags:
DWORD): Boolean;
```

C++

```
[SuppressUnmanagedCodeSecurity]
(Hwnd: THandle; crKey: COLORREF; bAlpha: Byte; dwFlags: DWORD): Boolean (
TSetLayeredWindowAttributes)();
```

File

Forms

Description

This is type Forms.TSetLayeredWindowAttributes.

7.5.23 Forms.TSettingChangeEvent Type

TSettingChangeEvent is the type of an OnSettingChange event handler.

Pascal

```
TSettingChangeEvent = procedure (Sender: TObject; Flag: Integer; const Section: string; var
Result: Longint) of object;
```

C++

```
(Sender: TObject; Flag: Integer; const Section: string; var Result: Longint) (
TSettingChangeEvent)();
```

File

Forms

Description

TSettingChangeEvent has the following parameters:

Sender is the application object.

Section indicates the area that contains the system parameter that changed. Typically, this is a registry key or the name of a section in Win.ini. If the notification indicates a policy change, Section is the string 'Policy'. If the notification indicates a change in locale settings, Section is the string 'intl'.

Result is the value returned to Windows. It should be 0 if the event handler responded to the setting change, nonzero otherwise.

Flag indicates what setting changed. The following table lists the possible values:

Value	Meaning
0	A user policy was applied or a user locale setting changed.
1	A computer policy was applied.
SPI_SETDESKWALLPAPER	The bitmap for the desktop wallpaper changed.
SPI_SETCURSORS	The system cursors changed.
SPI_SETDESKPATTERN	The desktop pattern was reloaded from Win.ini.
SPI_SETFONTSMOOTING	The font smoothing feature was enabled or disabled.
SPI_SETWORKAREA	The size of the work area (the portion of the screen not obscured by the system taskbar or desktop toolbars) changed.
SPI_ICONHORIZONTALSPACING	The width, in pixels, of an icon cell changed. This affects the arrangement of icons in large icon view.
SPI_ICONVERTICALSPACING	The height, in pixels, of an icon cell changed. This affects the arrangement of icons in large icon view.
SPI_SETICONMETRICS	The metrics associated with system icons changed.
SPI_SETICONS	The system icons were reloaded.
SPI_SETICONTITLELOGFONT	The font for icon titles changed.
SPI_SETICONTITLEWRAP	Icon title-wrapping was turned on or off.
SPI_SETBEEP	The warning beeper was turned on or off.
SPI_SETDEFAULTINPUTLANG	The default input language for the system shell changed
SPI_SETDOUBLECLICKTIME	The double-click time for the mouse changed.

SPI_SETDOUBLECLICKHEIGHT	The height of the double-click rectangle changed.
SPI_SETDOUBLECLICKWIDTH	The width of the double-click rectangle changed.
SPI_SETKEYBOARDCUES	The setting for whether Menu access key letters appear always or only when the menu is activated from the keyboard changed.
SPI_SETKEYBOARDDELAY	The keyboard repeat-delay setting changed.
SPI_SETKEYBOARDPREF	The keyboard preference changed. This indicates whether the user wants applications to display hidden keyboard interfaces.
SPI_SETKEYBOARDSPEED	The keyboard repeat-speed setting changed.
SPI_SETLANGTOGGLE	The hotkey for switching input languages changed.
SPI_SETMOUSE	The mouse threshold values or acceleration changed.
SPI_SETMOUSEBUTTONSWRAP	The meaning of left and right mouse buttons changed.
SPI_SETMOUSEHOVERHEIGHT	The height of the rectangle in which the mouse must stay for mouse hover messages changed.
SPI_SETMOUSEHOVERTIME	The time the mouse must stay in the hover rectangle to generate mouse hover messages changed.
SPI_SETMOUSEHOVERWIDTH	The width of the rectangle in which the mouse must stay for mouse hover messages changed.
SPI_SETMOUSESPEED	The mouse speed changed.
SPI_SETMOUSETRAILS	Mouse trails were turned on or off.
SPI_SETSNAPTODEFBUTTON	The automatic snapping of the mouse to the default button was turned on or off.
SPI_SETWHEELSCROLLLINES	The number of lines to scroll when the mouse wheel rotates changed.
SPI_SETMENUDROPALIGNMENT	Popup menus changed between left- and right-alignment.
SPI_SETMENUFADE	Menu fade animation was turned on or off (Windows 2K)
SPI_SETMENUSHOWDELAY	The delay before displaying a shortcut menu when the mouse is over a submenu item changed.
SPI_SETLOWPOWERACTIVE	The low-power phase of screen saving was activated or deactivated.
SPI_SETLOWPOWERTIMEOUT	The time period before the low-power phase of screen saving is activated changed.
SPI_SETPOWEROFFACTIVE	The power-off phase of screen saving came on or off.
SPI_SETPOWEROFFTIMEOUT	The delay before activating the power-off phase of screen saving changed.
SPI_SETSCREENSAVEACTIVE	The screen saver was activated or deactivated.
SPI_SETSCREENSAVETIMEOUT	The delay before the screen saver appears changed.
SPI_SETCOMBOBOXANIMATION	The slide-open effect for combo boxes was turned on or off.
SPI_SETCURSORSHADOW	The cursor shadow was turned on or off (Windows 2K).
SPI_SETGRADIENTCAPTIONS	The gradient effect on window title bars was turned on or off.
SPI_SETHOTTRACKING	Hot-tracking was enabled or disabled.
SPI_SETLISTBOXSMOOTHSCROLLING	Smooth scrolling of list boxes was enabled or disabled.
SPI_SETMENUANIMATION	Menu animation was enabled or disabled.
SPI_SETMENUUNDERLINES	Same as SPI_SETKEYBOARDCUES.
SPI_SETSELECTIONFADE	The menu selection fade feature was enabled or disabled. (Windows 2K)
SPI_SETTOOLTIPANIMATION	ToolTip animation was enabled or disabled. (Windows 2K)
SPI_SETTOOLTIPFADE	ToolTip animation changed between a fade and a slide effect. (Windows 2K)

SPI_SETUIEFFECTS	UI effects were enabled or disabled. (Windows 2K)
SPI_SETACTIVEWINDOWTRACKING	Active window tracking (where the active window follows the mouse) was enabled or disabled.
SPI_SETACTIVEWNDTRKZORDER	Active window tracking changed whether the active window was brought to the top.
SPI_SETANIMATION	Parameters to the animation effects for user actions changed.
SPI_SETBORDER	The width of a window's sizing border changed.
SPI_SETCARETWIDTH	The width of the caret in edit controls changed (Windows 2K)
SPI_SETDRAGFULLWINDOWS	Dragging of full windows was turned on or off.
SPI_SETDRAGHEIGHT	The height of the rectangle used to detect drag operations changed.
SPI_SETDRAGWIDTH	The width of the rectangle used to detect drag operations changed.
SPI_SETFOREGROUNDFLASHCOUNT	The number of times a taskbar button flashes when rejecting a foreground switch request changed.
SPI_SETFOREGROUNDLOCKTIMEOUT	The time after user input during which applications can't force themselves into the foreground changed.
SPI_SETMINIMIZEDMETRICS	The metrics for minimized windows changed.
SPI_SETNONCLIENTMETRICS	The metrics for the nonclient area of nonminimized windows changed.
SPI_SETSHOWIMEUI	The ability of the IME window to be visible on a per-user basis changed.
SPI_SETPENWINDOWS	Pen windows was loaded or unloaded. (Windows 9x)
SPI_SETACCESSTIMEOUT	The time-out period for accessibility features changed.
SPI_SETFILTERKEYS	The parameters to the FilterKeys accessibility feature changed.
SPI_SETHIGHCONTRAST	The parameters to the HighContrast accessibility feature changed.
SPI_SETMOUSECLICKLOCK	The mouse ClickLock state was turned on or off. (Windows Me)
SPI_SETMOUSECLICKLOCKTIME	The time delay for locking the primary mouse button changed. (Windows Me)
SPI_SETMOUSEKEYS	The parameters for the MouseKeys accessibility feature changed.
SPI_SETMOUSESONAR	The mouse Sonar feature was turned on or off. (Windows Me)
SPI_SETMOUSEVANISH	The mouse Vanish feature was turned on or off. (Windows Me)
SPI_SETSCREENREADER	A screen reviewer utility (such as a speech synthesizer or Braille display utility) started or stopped running.
SPI_SETSERIALKEYS	The parameters to the SerialKeys accessibility feature changed. (Windows 9x)
SPI_SETSHOWSOUNDS	The Show Sounds accessibility feature toggled.
SPI_SETSOUNDSENTRY	The parameters to the SoundSentry accessibility feature changed.
SPI_SETSTICKYKEYS	The parameters to the StickyKeys feature changed.
SPI_SETTOGGLEKEYS	The parameters to the ToggleKeys feature changed.

7.5.24 Forms.TShortCutEvent Type

TShortCutEvent is the type of an OnShortCut event handler.

Pascal

```
TShortCutEvent = procedure (var Msg: TWMKey; var Handled: Boolean) of object;
```

C++

```
(var Msg: TWMKey; var Handled: Boolean) ( TShortCutEvent)();
```

File

Forms

Description

The TShortCutEvent type represents event handlers that respond to keystrokes before they enter the standard keystroke processing. These event handlers allow an application to bypass the standard keystroke processing for special shortcut keys.

The Msg parameter represents the Windows keystroke message. The virtual key code is given by the CharCode field, and the KeyData field contains a set of flags that indicate the repeat count, scan code, extended-key flag, context code, previous key-state flag and transition-state flag. See the Windows documentation for details on these fields.

The Handled parameter indicates whether the event handler processed the key. If Handled is set to true, then the application stops processing the keystroke. Otherwise (if Handled remains false) the application proceeds with normal keystroke processing.

7.5.25 Forms.TShowHintEvent Type

TShowHintEvent is the type of the OnShowHint event handler.

Pascal

```
TShowHintEvent = procedure (var HintStr: string; var CanShow: Boolean; var HintInfo:
THintInfo) of object;
```

C++

```
(var HintStr: string; var CanShow: Boolean; var HintInfo: THintInfo) ( TShowHintEvent)();
```

File

Forms

Description

TShowHintEvent has the following parameters:

HintStr sets the text of the Help Hint. You can change this string in the event handler to change the hint text that appears to the user.

CanShow indicates whether the Help Hint should display. If the event handler sets CanShow to true, the Help Hint displays. If it sets CanShow to false, the Help Hint does not appear.

HintInfo contains information about the appearance and behavior of the Help window. Change its fields to customize the way the Help Hint is displayed.

7.5.26 Forms.TTaskWindowList Type

Pascal

```
TTaskWindowList = Pointer;
```

C++

```
void * TTaskWindowList;
```

File

Forms

Description

This is type Forms.TTaskWindowList.

7.5.27 Forms.TWindowHook Type

TWindowHook is the type for a dialog procedure.

Pascal

```
TWindowHook = function (var Message: TMessage): Boolean of object;
```

C++

```
(var Message: TMessage): Boolean ( TWindowHook)();
```

File

Forms

Description

TWindowHook is the type for the window procedure of a non-VCL dialog box. Like most window procedures, TWindowHook takes a TMessage (see page 4997) value as an argument.

Except in response to the WM_INITDIALOG (see page 5174) message, the window hook should return true if it processes the message, and false if it does not. When the Msg field of the Message parameter is WM_INITDIALOG (see page 5174), the window hook should return false if it explicitly sets the focus to one of the controls in the dialog box. Otherwise, it should return true, in which case the system sets the focus to the first control in the dialog box that can be given the focus.

TApplication (see page 1924)

7.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Application (see page 2612)	Represents application-level information.
Ctl3DBtnWndProc (see page 2614)	This is variable Forms.Ctl3DBtnWndProc.
Ctl3DCtlColorEx (see page 2614)	This is variable Forms.Ctl3DCtlColorEx.
Ctl3DDlgFramePaint (see page 2614)	This is variable Forms.Ctl3DDlgFramePaint.
HintWindowClass (see page 2615)	Specifies the class for the window used to display help hints.
Screen (see page 2615)	Represents a screen device.
SetLayeredWindowAttributes (see page 2617)	This is variable Forms.SetLayeredWindowAttributes.

7.6.1 Forms.Application Variable

Represents application-level information.

Pascal

```
Application: TApplication;
```

C++

```
TApplication Application;
```

File

Forms

Description

By default, when a new project is created, the IDE constructs an application object and assigns it to the Application variable in the Forms (see page 1921) unit. Application has several properties that can be used to get information about an application while it runs.

C++ Examples:

```
/*
This example copies a specified old file to a new file.  Add
a TSaveDialog to the form.  Also add two TEdits, two TLabels
and a TButton with the OnClick event named Save1Click. Change
the Old Path and New Path to move files outside the Debug
directory, Old File and New File will not take a relative path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Save1Click(TObject *Sender)
{
  AnsiString temp1 = Edit4->Text;
  AnsiString temp2 = ExtractFileName(Edit1->Text);
  AnsiString NewFileName = temp1 + temp2;
  AnsiString OldFileName =
    Edit3->Text + ExtractFileName(Edit2->Text);
  AnsiString Msg = Format("Copy %s to %s", ARRAYOFCONST((OldFileName, NewFileName)));
```

```
  if (MessageDlg(Msg, mtCustom, TMsgDlgButtons() << mbOK << mbCancel, 0) == mrOk)
  {
    std::auto_ptr<TFileStream> OldFile(new TFileStream(OldFileName, fmOpenRead |
fmShareDenyWrite));
    std::auto_ptr<TFileStream> NewFile(new TFileStream(NewFileName, fmCreate |
fmShareDenyRead));
    NewFile->CopyFrom(OldFile.get(), OldFile->Size);
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit3->Text = ExtractFilePath(Application->ExeName);
  Edit4->Text = Edit3->Text;
}
/*
This code displays the name of your project in an edit box:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->Text = Application->Title;
}
```

Delphi Examples:

```
{
This example copies a specified old file to a new file.  Add
a TSaveDialog to the form.  Also add two TEdits, two TLabels
and a TButton with the OnClick event named Save1Click. Change
the Old Path and New Path to move files outside the Debug
directory, Old File and New File will not take a relative path.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Edit3.Text := ExtractFilePath(Application.ExeName);
  Edit4.Text := Edit3.Text;
end;

procedure TForm1.Save1Click(Sender: TObject);
var
  NewFileName, OldFileName: string;
  temp1, temp2: string;
  Msg: string;
  NewFile: TFileStream;
  OldFile: TFileStream;
begin
  temp1 := Edit4.Text;
  temp2 := ExtractFileName(Edit1.Text);
  NewFileName := temp1 + temp2;
  OldFileName :=
    Edit3.Text + ExtractFileName(Edit2.Text);
  Msg := Format('Copy %s to %s?', [OldFileName, NewFileName]);
  if MessageDlg(Msg, mtCustom, mbOKCancel, 0) = mrOK then
  begin
    OldFile := TFileStream.Create(
      OldFileName, fmOpenRead or fmShareDenyWrite);
    try
      NewFile := TFileStream.Create(
        NewFileName, fmCreate or fmShareDenyRead);
      try
        NewFile.CopyFrom(OldFile, OldFile.Size);
      finally
        FreeAndNil(NewFile);
      end;
    finally
      FreeAndNil(OldFile);
    end;
```

```
  end;
end;
{
This code displays the name of your project in an edit box:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.Text := Application.Title;
end;
```

See Also

TApplication (see page 1924)

7.6.2 Forms.Ctl3DBtnWndProc Variable

Pascal

```
Ctl3DBtnWndProc: Pointer = nil;
```

C++

```
void * Ctl3DBtnWndProc = nil;
```

File

Forms

Description

This is variable Forms.Ctl3DBtnWndProc.

7.6.3 Forms.Ctl3DCtlColorEx Variable

Pascal

```
Ctl3DCtlColorEx: function(Window: HWnd; Msg, wParam, lParam: Longint): Longint stdcall = nil;
```

C++

```
function(Window: HWnd; Msg, wParam, lParam: Longint): Longint stdcall Ctl3DCtlColorEx = nil;
```

File

Forms

Description

This is variable Forms.Ctl3DCtlColorEx.

7.6.4 Forms.Ctl3DDlgFramePaint Variable

Pascal

```
Ctl3DDlgFramePaint: function(Window: HWnd; Msg, wParam, lParam: Longint): Longint stdcall =
nil;
```

C++

```
function(Window: HWnd; Msg, wParam, lParam: Longint): Longint stdcall Ctl3DDlgFramePaint = nil;
```

File

Forms

Description

This is variable Forms.Ctl3DDlgFramePaint.

7.6.5 Forms.HintWindowClass Variable

Specifies the class for the window used to display help hints.

Pascal

```
HintWindowClass: THintWindowClass = THintWindow;
```

C++

```
THintWindowClass HintWindowClass = THintWindow;
```

File

Forms

Description

When the application displays a Help Hint, it creates an instance of HintWindowClass to represent the window used for displaying the hint. Applications can customize this window by creating a descendant of THintWindow and assigning it to the HintWindowClass variable at application startup.

See Also

THintWindow

TApplication (see page 1924)

7.6.6 Forms.Screen Variable

Represents a screen device.

Pascal

```
Screen: TScreen;
```

C++

```
TScreen Screen;
```

File

Forms

Description

The Screen variable is a TScreen (see page 2445) component that represents the screen of the system on which the application runs. By default, applications create a screen component based on information about the current screen device and assign it to Screen.

C++ Examples:

```
/*
The following code determines the height of all forms on the
screen and resizes any that are taller than the screen height.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < Screen->FormCount; i++)
  {
    if (Screen->Forms[i]->Top < 0)
    {
      Screen->Forms[i]->Height += Screen->Forms[i]->Top;
      Screen->Forms[i]->Top = 0;
    }
    if (Screen->Forms[i]->Left < 0)
    {
      Screen->Forms[i]->Width += Screen->Forms[i]->Left;
      Screen->Forms[i]->Left = 0;
    }
    if (Screen->Forms[i]->Left + Screen->Forms[i]->Width > Screen->Width)
      Screen->Forms[i]->Width = Screen->Width - Screen->Forms[i]->Left;
    if (Screen->Forms[i]->Top + Screen->Forms[i]->Height > Screen->Height)
      Screen->Forms[i]->Height = Screen->Height - Screen->Forms[i]->Top;
  }
}
```

Delphi Examples:

```
{
The following code determines the height of all forms on the
screen and resizes any that are taller than the screen height.
}
procedure TForm1.Button1Click(Sender: TObject);
var I: Integer;
begin
with Screen do
  for I := 0 to FormCount-1 do
    begin
    if Forms[I].Top < 0 then
    begin
      Forms[I].Height := Forms[I].Height + Forms[I].Top;
      Forms[I].Top := 0;
    end;
    if Forms[I].Left < 0 then
    begin
      Forms[I].Width := Forms[I].Width + Forms[I].Left;
      Forms[I].Left := 0;
    end;
    if Forms[I].Left + Forms[I].Width > Width then
      Forms[I].Width := Width - Forms[I].Left;
    if Forms[I].Top + Forms[I].Height > Height then
      Forms[I].Height := Height - Forms[I].Top;
    end;
end;
```

See Also

Application (see page 2612)

7.6.7 Forms.SetLayeredWindowAttributes Variable

Pascal

```
SetLayeredWindowAttributes: TSetLayeredWindowAttributes = nil;
```

C++

```
TSetLayeredWindowAttributes SetLayeredWindowAttributes = nil;
```

File

Forms

Description

This is variable Forms.SetLayeredWindowAttributes.

8 Graphics Namespace

This is namespace Graphics.

Topics

Name	Description
Classes (see page 2627)	The following table lists classes in this documentation.
Interfaces (see page 2834)	The following table lists interfaces in this documentation.
Functions (see page 2836)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2860)	The following table lists structs, records, enums in this documentation.
Types (see page 2875)	The following table lists types in this documentation.
Variables (see page 2890)	The following table lists variables in this documentation.
Constants (see page 2892)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInvalidGraphic (see page 2627)	EInvalidGraphic is the exception class for unrecognized graphic files.
	EInvalidGraphicOperation (see page 2628)	EInvalidGraphicOperation is the exception class for illegal operations on graphics.
	TBitmap (see page 2628)	TBitmap is an encapsulation of a Windows bitmap (HBITMAP), including its palette (HPALETTE).
	TBitmapImage (see page 2662)	TBitmapImage is the internal representation of the bitmap image for a TBitmap (see page 2628) object.
	TBrush (see page 2664)	TBrush represents the color and pattern used to fill solid shapes.
	TBrushRecall (see page 2671)	TBrushRecall saves and restores a TBrush (see page 2664) object.
	TCanvas (see page 2673)	TCanvas provides an abstract drawing space for objects that must render their own images.
	TFont (see page 2730)	TFont encapsulates a system font.
	TFontRecall (see page 2747)	TFontRecall saves and restores the properties of a TFont (see page 2730) object.
	TGraphic (see page 2748)	TGraphic is the abstract base class type for objects such as icons, bitmaps, and metafiles that can store and display visual images.
	TGraphicsObject (see page 2764)	TGraphicsObject is the abstract base class for objects which encapsulate a system graphics object: TBrush (see page 2664), TFont (see page 2730), and TPen (see page 2801).
	TIcon (see page 2768)	TIcon is an encapsulation of a Windows icon.
	TIconImage (see page 2778)	TIconImage is the internal representation of the bitmap image for a TIcon (see page 2768) object.
	TMetafile (see page 2780)	TMetafile is an encapsulation of the Win32 Enhanced (see page 2793) metafile.

	TMetafileCanvas (see page 2794)	TMetafileCanvas allows applications to create metafile images from scratch.
	TMetafileImage (see page 2799)	TMetafileImage is the internal representation of the metafile image for a TMetafile (see page 2780) object.
	TPen (see page 2801)	TPen is used to draw lines or outline shapes on a canvas.
	TPenRecall (see page 2811)	TPenRecall saves and restores the properties of a TPen (see page 2801) object.
	TPicture (see page 2812)	TPicture contains a bitmap, icon, metafile graphic, or user-defined graphic.
	TSharedImage (see page 2830)	TSharedImage is the base class for classes that contain images used for graphics objects.

Constants

Name	Description
cl3DDkShadow (see page 2896)	Represents the dark shadow of 3D components.
cl3DLight (see page 2896)	Represents the light part of 3D components.
clActiveBorder (see page 2897)	Represents the default border color of an active window.
clActiveCaption (see page 2897)	Represents the default color of the title bar of an active window.
clAppWorkSpace (see page 2898)	Represents the default Application WorkSpace color.
clAqua (see page 2898)	Represents the color Aqua.
clBackground (see page 2899)	Represents the default Windows background color.
clBlack (see page 2899)	Represents the color black.
clBlue (see page 2899)	Represents the color blue.
clBtnFace (see page 2900)	Represents the color of the face of a button.
clBtnHighlight (see page 2900)	Represents the color of the highlighting on a button.
clBtnShadow (see page 2901)	Represents the color of the shadow cast by of a button.
clBtnText (see page 2901)	Represents the default color of the text on a button.
clCaptionText (see page 2902)	Represents the default color of the text on the title bar of an active window.
clCream (see page 2902)	Represents the color cream.
clDefault (see page 2903)	Specifies the default color of a component.
clDkGray (see page 2903)	Represents the color dark gray.
clFuchsia (see page 2903)	Represents the color fuchsia.
clGradientActiveCaption (see page 2904)	Right side color in the color gradient of an active window's title bar.
clGradientInactiveCaption (see page 2904)	Right side color in the color gradient of an inactive window's title bar.
clGray (see page 2905)	Represents the color gray.
clGrayText (see page 2905)	Represents the color of text that is grayed out.
clGreen (see page 2906)	Represents the color green.
clHighlight (see page 2906)	Represents the color of the background of a block of selected text.
clHighlightText (see page 2907)	Represents the color of selected text.
clHotLight (see page 2907)	This is constant Graphics.clHotLight.
clInactiveBorder (see page 2908)	Represents the default border color of an inactive window.
clInactiveCaption (see page 2908)	Represents the default color of the title bar of an inactive window.
clInactiveCaptionText (see page 2908)	Represents the default color of the title text in an inactive window.
clInfoBk (see page 2909)	Represents the color of the background of a tool tip.
clInfoText (see page 2909)	Represents the color of tool tip text.
clLime (see page 2910)	Represents the color lime.
clLtGray (see page 2910)	Represents the color light gray.
clMaroon (see page 2911)	Represents the color maroon.
clMedGray (see page 2911)	Represents the color medium gray.
clMenu (see page 2912)	Represents the color of the background of an unselected menu sub item.
clMenuBar (see page 2912)	Represents the color of the background of an unselected main menu item.
clMenuHighlight (see page 2912)	Represents the color of the background of a selected menu item.
clMenuText (see page 2913)	Represents the default menu text color.
clMoneyGreen (see page 2913)	Represents the color money green.
clNavy (see page 2914)	Represents the color navy.
clNone (see page 2914)	Represents no selected color.
clOlive (see page 2915)	Represents the color olive.

clPurple (see page 2915)	Represents the color purple.
clRed (see page 2916)	Represents the color red.
clScrollBar (see page 2916)	This is constant Graphics.clScrollBar.
clSilver (see page 2916)	Represents the color silver.
clSkyBlue (see page 2917)	Represents the color sky blue.
clSystemColor (see page 2917)	Is a mask used to identify the set of system colors.
clTeal (see page 2918)	Represents the color teal.
clWebAliceBlue (see page 2918)	This is constant Graphics.clWebAliceBlue.
clWebAntiqueWhite (see page 2919)	This is constant Graphics.clWebAntiqueWhite.
clWebAqua (see page 2919)	This is constant Graphics.clWebAqua.
clWebAquamarine (see page 2919)	This is constant Graphics.clWebAquamarine.
clWebAzure (see page 2920)	This is constant Graphics.clWebAzure.
clWebBeige (see page 2920)	This is constant Graphics.clWebBeige.
clWebBisque (see page 2920)	This is constant Graphics.clWebBisque.
clWebBlack (see page 2921)	This is constant Graphics.clWebBlack.
clWebBlanchedAlmond (see page 2921)	This is constant Graphics.clWebBlanchedAlmond.
clWebBlue (see page 2921)	This is constant Graphics.clWebBlue.
clWebBlueViolet (see page 2922)	This is constant Graphics.clWebBlueViolet.
clWebBrown (see page 2922)	This is constant Graphics.clWebBrown.
clWebBurlywood (see page 2922)	This is constant Graphics.clWebBurlywood.
clWebCadetBlue (see page 2923)	This is constant Graphics.clWebCadetBlue.
clWebChartreuse (see page 2923)	This is constant Graphics.clWebChartreuse.
clWebChocolate (see page 2923)	This is constant Graphics.clWebChocolate.
clWebCoral (see page 2924)	This is constant Graphics.clWebCoral.
clWebCornFlowerBlue (see page 2924)	This is constant Graphics.clWebCornFlowerBlue.
clWebCornSilk (see page 2924)	This is constant Graphics.clWebCornSilk.
clWebCrimson (see page 2925)	This is constant Graphics.clWebCrimson.
clWebCyan (see page 2925)	This is constant Graphics.clWebCyan.
clWebDarkBlue (see page 2925)	This is constant Graphics.clWebDarkBlue.
clWebDarkCyan (see page 2926)	This is constant Graphics.clWebDarkCyan.
clWebDarkGoldenRod (see page 2926)	This is constant Graphics.clWebDarkGoldenRod.
clWebDarkGray (see page 2926)	This is constant Graphics.clWebDarkGray.
clWebDarkgreen (see page 2927)	This is constant Graphics.clWebDarkgreen.
clWebDarkKhaki (see page 2927)	This is constant Graphics.clWebDarkKhaki.
clWebDarkMagenta (see page 2927)	This is constant Graphics.clWebDarkMagenta.
clWebDarkOliveGreen (see page 2928)	This is constant Graphics.clWebDarkOliveGreen.
clWebDarkOrange (see page 2928)	This is constant Graphics.clWebDarkOrange.
clWebDarkOrchid (see page 2928)	This is constant Graphics.clWebDarkOrchid.
clWebDarkRed (see page 2929)	This is constant Graphics.clWebDarkRed.
clWebDarkSalmon (see page 2929)	This is constant Graphics.clWebDarkSalmon.
clWebDarkSeaGreen (see page 2929)	This is constant Graphics.clWebDarkSeaGreen.
clWebDarkSlateBlue (see page 2930)	This is constant Graphics.clWebDarkSlateBlue.
clWebDarkSlategray (see page 2930)	This is constant Graphics.clWebDarkSlategray.
clWebDarkTurquoise (see page 2930)	This is constant Graphics.clWebDarkTurquoise.
clWebDarkViolet (see page 2931)	This is constant Graphics.clWebDarkViolet.
clWebDeepPink (see page 2931)	This is constant Graphics.clWebDeepPink.
clWebDeepskyBlue (see page 2931)	This is constant Graphics.clWebDeepskyBlue.
clWebDimGray (see page 2932)	This is constant Graphics.clWebDimGray.
clWebDodgerBlue (see page 2932)	This is constant Graphics.clWebDodgerBlue.
clWebFirebrick (see page 2932)	This is constant Graphics.clWebFirebrick.
clWebFloralWhite (see page 2933)	This is constant Graphics.clWebFloralWhite.
clWebForestGreen (see page 2933)	This is constant Graphics.clWebForestGreen.
clWebFuchsia (see page 2933)	This is constant Graphics.clWebFuchsia.
clWebGainsboro (see page 2934)	This is constant Graphics.clWebGainsboro.

clWebGhostWhite (see page 2934)	This is constant Graphics.clWebGhostWhite.
clWebGold (see page 2934)	This is constant Graphics.clWebGold.
clWebGoldenRod (see page 2935)	This is constant Graphics.clWebGoldenRod.
clWebGray (see page 2935)	This is constant Graphics.clWebGray.
clWebGreen (see page 2935)	This is constant Graphics.clWebGreen.
clWebGreenYellow (see page 2936)	This is constant Graphics.clWebGreenYellow.
clWebHoneydew (see page 2936)	This is constant Graphics.clWebHoneydew.
clWebHotPink (see page 2936)	This is constant Graphics.clWebHotPink.
clWebIndianRed (see page 2937)	This is constant Graphics.clWebIndianRed.
clWebIndigo (see page 2937)	This is constant Graphics.clWebIndigo.
clWebIvory (see page 2937)	This is constant Graphics.clWebIvory.
clWebKhaki (see page 2938)	This is constant Graphics.clWebKhaki.
clWebLavender (see page 2938)	This is constant Graphics.clWebLavender.
clWebLavenderBlush (see page 2938)	This is constant Graphics.clWebLavenderBlush.
clWebLawnGreen (see page 2939)	This is constant Graphics.clWebLawnGreen.
clWebLemonChiffon (see page 2939)	This is constant Graphics.clWebLemonChiffon.
clWebLightBlue (see page 2939)	This is constant Graphics.clWebLightBlue.
clWebLightCoral (see page 2940)	This is constant Graphics.clWebLightCoral.
clWebLightCyan (see page 2940)	This is constant Graphics.clWebLightCyan.
clWebLightGoldenrodYellow (see page 2940)	This is constant Graphics.clWebLightGoldenrodYellow.
clWebLightGreen (see page 2941)	This is constant Graphics.clWebLightGreen.
clWebLightgrey (see page 2941)	This is constant Graphics.clWebLightgrey.
clWebLightPink (see page 2941)	This is constant Graphics.clWebLightPink.
clWebLightSalmon (see page 2942)	This is constant Graphics.clWebLightSalmon.
clWebLightSeaGreen (see page 2942)	This is constant Graphics.clWebLightSeaGreen.
clWebLightSkyBlue (see page 2942)	This is constant Graphics.clWebLightSkyBlue.
clWebLightSlateGray (see page 2943)	This is constant Graphics.clWebLightSlateGray.
clWebLightSteelBlue (see page 2943)	This is constant Graphics.clWebLightSteelBlue.
clWebLightYellow (see page 2943)	This is constant Graphics.clWebLightYellow.
clWebLime (see page 2944)	This is constant Graphics.clWebLime.
clWebLimeGreen (see page 2944)	This is constant Graphics.clWebLimeGreen.
clWebLinen (see page 2944)	This is constant Graphics.clWebLinen.
clWebMagenta (see page 2945)	This is constant Graphics.clWebMagenta.
clWebMaroon (see page 2945)	This is constant Graphics.clWebMaroon.
clWebMediumAquamarine (see page 2945)	This is constant Graphics.clWebMediumAquamarine.
clWebMediumBlue (see page 2946)	This is constant Graphics.clWebMediumBlue.
clWebMediumOrchid (see page 2946)	This is constant Graphics.clWebMediumOrchid.
clWebMediumPurple (see page 2946)	This is constant Graphics.clWebMediumPurple.
clWebMediumSeaGreen (see page 2947)	This is constant Graphics.clWebMediumSeaGreen.
clWebMediumSlateBlue (see page 2947)	This is constant Graphics.clWebMediumSlateBlue.
clWebMediumSpringGreen (see page 2947)	This is constant Graphics.clWebMediumSpringGreen.
clWebMediumTurquoise (see page 2948)	This is constant Graphics.clWebMediumTurquoise.
clWebMediumVioletRed (see page 2948)	This is constant Graphics.clWebMediumVioletRed.
clWebMidnightBlue (see page 2948)	This is constant Graphics.clWebMidnightBlue.
clWebMintcream (see page 2949)	This is constant Graphics.clWebMintcream.
clWebMistyRose (see page 2949)	This is constant Graphics.clWebMistyRose.
clWebMoccasin (see page 2949)	This is constant Graphics.clWebMoccasin.
clWebNavajoWhite (see page 2950)	This is constant Graphics.clWebNavajoWhite.
clWebNavy (see page 2950)	This is constant Graphics.clWebNavy.
clWebOldLace (see page 2950)	This is constant Graphics.clWebOldLace.
clWebOlive (see page 2951)	This is constant Graphics.clWebOlive.
clWebOliveDrab (see page 2951)	This is constant Graphics.clWebOliveDrab.
clWebOrange (see page 2951)	This is constant Graphics.clWebOrange.
clWebOrangeRed (see page 2952)	This is constant Graphics.clWebOrangeRed.

clWebOrchid (see page 2952)	This is constant Graphics.clWebOrchid.
clWebPaleGoldenrod (see page 2952)	This is constant Graphics.clWebPaleGoldenrod.
clWebPaleGreen (see page 2953)	This is constant Graphics.clWebPaleGreen.
clWebPaleTurquoise (see page 2953)	This is constant Graphics.clWebPaleTurquoise.
clWebPaleVioletRed (see page 2953)	This is constant Graphics.clWebPaleVioletRed.
clWebPapayaWhip (see page 2954)	This is constant Graphics.clWebPapayaWhip.
clWebPeachPuff (see page 2954)	This is constant Graphics.clWebPeachPuff.
clWebPeru (see page 2954)	This is constant Graphics.clWebPeru.
clWebPink (see page 2955)	This is constant Graphics.clWebPink.
clWebPlum (see page 2955)	This is constant Graphics.clWebPlum.
clWebPowderBlue (see page 2955)	This is constant Graphics.clWebPowderBlue.
clWebPurple (see page 2956)	This is constant Graphics.clWebPurple.
clWebRed (see page 2956)	This is constant Graphics.clWebRed.
clWebRosyBrown (see page 2956)	This is constant Graphics.clWebRosyBrown.
clWebRoyalBlue (see page 2957)	This is constant Graphics.clWebRoyalBlue.
clWebSaddleBrown (see page 2957)	This is constant Graphics.clWebSaddleBrown.
clWebSalmon (see page 2957)	This is constant Graphics.clWebSalmon.
clWebSandyBrown (see page 2958)	This is constant Graphics.clWebSandyBrown.
clWebSeaGreen (see page 2958)	This is constant Graphics.clWebSeaGreen.
clWebSeashell (see page 2958)	This is constant Graphics.clWebSeashell.
clWebSienna (see page 2959)	This is constant Graphics.clWebSienna.
clWebSilver (see page 2959)	This is constant Graphics.clWebSilver.
clWebSkyBlue (see page 2959)	This is constant Graphics.clWebSkyBlue.
clWebSlateBlue (see page 2960)	This is constant Graphics.clWebSlateBlue.
clWebSlateGray (see page 2960)	This is constant Graphics.clWebSlateGray.
clWebSnow (see page 2960)	This is constant Graphics.clWebSnow.
clWebSpringGreen (see page 2961)	This is constant Graphics.clWebSpringGreen.
clWebSteelBlue (see page 2961)	This is constant Graphics.clWebSteelBlue.
clWebTan (see page 2961)	This is constant Graphics.clWebTan.
clWebTeal (see page 2962)	This is constant Graphics.clWebTeal.
clWebThistle (see page 2962)	This is constant Graphics.clWebThistle.
clWebTomato (see page 2962)	This is constant Graphics.clWebTomato.
clWebTurquoise (see page 2963)	This is constant Graphics.clWebTurquoise.
clWebViolet (see page 2963)	This is constant Graphics.clWebViolet.
clWebWheat (see page 2963)	This is constant Graphics.clWebWheat.
clWebWhite (see page 2964)	This is constant Graphics.clWebWhite.
clWebWhiteSmoke (see page 2964)	This is constant Graphics.clWebWhiteSmoke.
clWebYellow (see page 2964)	This is constant Graphics.clWebYellow.
clWebYellowGreen (see page 2965)	This is constant Graphics.clWebYellowGreen.
clWhite (see page 2965)	Represents the color white.
clWindow (see page 2965)	Represents the default Window background color.
clWindowFrame (see page 2966)	Represents the default Window frame background color.
clWindowText (see page 2966)	Represents the default Window text color.
clYellow (see page 2967)	Represents the color yellow.
cmBlackness (see page 2967)	TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with black.
cmDstInvert (see page 2968)	TCopyMode (see page 2880) value : inverts the image on the canvas and ignores the source.
cmMergeCopy (see page 2968)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean AND operator.
cmMergePaint (see page 2969)	TCopyMode (see page 2880) value : combines the inverted source bitmap with the image on the canvas by using the Boolean OR operator.
cmNotSrcCopy (see page 2969)	TCopyMode (see page 2880) value : copies the inverted source bitmap to the canvas.
cmNotSrcErase (see page 2970)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator, and inverts the result.

cmPatCopy (see page 2970)	TCopyMode (see page 2880) value : copies the source pattern to the canvas.
cmPatInvert (see page 2971)	TCopyMode (see page 2880) value : combines the source pattern with the image on the canvas using the Boolean XOR operator.
cmPatPaint (see page 2971)	TCopyMode (see page 2880) value : combines the inverted source bitmap with the source pattern by using the Boolean OR operator. Combines the result of this operation with the image on the canvas by using the Boolean OR operator.
cmSrcAnd (see page 2972)	TCopyMode (see page 2880) value : combines the image on the canvas and source bitmap by using the Boolean AND operator.
cmSrcCopy (see page 2972)	TCopyMode (see page 2880) value : copies the source bitmap to the canvas.
cmSrcErase (see page 2973)	TCopyMode (see page 2880) value : inverts the image on the canvas and combines the result with the source bitmap by using the Boolean AND operator.
cmSrcInvert (see page 2973)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean XOR operator.
cmSrcPaint (see page 2974)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator.
cmWhiteness (see page 2974)	TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with white.
ExtendedColorsCount (see page 2975)	The total number of extended colors available
rc3_Cursor (see page 2976)	This is constant Graphics.rc3_Cursor.
rc3_Icon (see page 2976)	This is constant Graphics.rc3_Icon.
rc3_StockIcon (see page 2976)	This is constant Graphics.rc3_StockIcon.
StandardColorsCount (see page 2977)	The total number of standard colors available
WebColorsCount (see page 2978)	The total number of web colors available

Functions

	Name	Description
	AllocPatternBitmap (see page 2836)	Creates a TBitmap (see page 2628) filled with a pattern.
	BytesPerScanline (see page 2837)	This is function Graphics.BytesPerScanline.
	CharsetToIdent (see page 2837)	Obtains the name of a character set.
	ColorToIdent (see page 2838)	Provides the symbolic name of a TColor (see page 2878) value.
	ColorToRGB (see page 2838)	Converts a TColor (see page 2878) value into an RGB representation of the color.
	ColorToString (see page 2840)	Returns a string that represents the name of a TColor (see page 2878) value.
	CopyPalette (see page 2841)	Creates a new palette object that matches an existing palette.
	CreateGrayMappedBmp (see page 2841)	Remaps the standard gray colors in a bitmap with the system grays.
	CreateGrayMappedRes (see page 2842)	Remaps the standard gray colors in a bitmap resource with the system grays.
	CreateMappedBmp (see page 2842)	Changes the color table in a bitmap.
	CreateMappedRes (see page 2843)	Changes the color table in a bitmap resource.
	FreeMemoryContexts (see page 2844)	This is function Graphics.FreeMemoryContexts.
	GetCharsetValues (see page 2844)	Passes the name of every predefined character set string to a callback function.
	GetColorValues (see page 2848)	Passes the name of every predefined color constant to a callback function.
	GetDefFontCharSet (see page 2848)	Returns the character set of the default system font.
	GetDIB (see page 2849)	Returns the info header and image for a device independent bitmap.
	GetDIBSizes (see page 2849)	Returns the size of the info header and of the image for a device independent bitmap.
	GraphicExtension (see page 2850)	Returns the default file-name extension of a graphics object.
	GraphicFileMask (see page 2852)	Returns a file mask that specifies the valid extensions for a graphic class.
	GraphicFilter (see page 2854)	Returns a file filter compatible with the Filter property of an Open or Save dialog.
	IdentToCharset (see page 2857)	Translates the name of a character set constant to the corresponding character set.
	IdentToColor (see page 2857)	Translates the name of a color constant to the corresponding TColor (see page 2878) value.
	PaletteChanged (see page 2858)	This is function Graphics.PaletteChanged.
	StringToColor (see page 2858)	Translates a string representation of a color to the corresponding TColor (see page 2878) value.
	TransparentStretchBlt (see page 2859)	This is function Graphics.TransparentStretchBlt.

Interfaces

	Name	Description
	IChangeNotifier (see page 2834)	IChangeNotifier is the interface used for responding to status changes.

Structs, Records, Enums

	Name	Description
	TAlphaFormat (see page 2860)	This is record Graphics.TAlphaFormat.
	TBitmapHandleType (see page 2861)	TBitmapHandleType indicates the format used to store the in-memory image of a bitmap.
	TBrushData (see page 2861)	This is record Graphics.TBrushData.
	TBrushStyle (see page 2862)	TBrushStyle specifies the pattern on a brush.
	TCanvasOrientation (see page 2863)	TCanvasOrientation specifies the pixel coordinate system that a canvas uses.
	TCanvasStates (see page 2863)	This is record Graphics.TCanvasStates.
	TCursorOrIcon (see page 2864)	This is record Graphics.TCursorOrIcon.
	TFillMode (see page 2864)	This is record Graphics.TFillMode.
	TFillStyle (see page 2864)	TFillStyle indicates the type of color change defines the boundary of a possibly non-rectangular region n a canvas.
	TFontData (see page 2865)	This is record Graphics.TFontData.
	TFontPitch (see page 2866)	TFontPitch indicates whether the characters in a font have the same width.
	TFontStyle (see page 2866)	TFontStyle and TFontStyles (see page 2883) specify style characteristics of a font.
	TIconRec (see page 2867)	This is record Graphics.TIconRec.
	TPenData (see page 2868)	This is record Graphics.TPenData.
	TPenMode (see page 2868)	TPenMode indicates how the color of a pen interacts with the color of a canvas.
	TPenStyle (see page 2870)	TPenStyle indicates the type of line a pen draws.
	TPixelFormat (see page 2871)	TPixelFormat specifies the format of a bitmap.
	TProgressStage (see page 2872)	TProgressStage indicates the stage of a lengthy operation.
	TResData (see page 2872)	This is record Graphics.TResData.
	TResource (see page 2873)	This is record Graphics.TResource.
	TTextFormats (see page 2873)	This is record Graphics.TTextFormats.
	TTransparentMode (see page 2874)	TTransparentMode indicates how the transparent color of a bitmap is determined.

Types

Name	Description
HENHMETAFILE (see page 2875)	Meta file handle type.
HMETAFILE (see page 2876)	This is type Graphics.HMETAFILE.
PColor (see page 2876)	PColor is a pointer to a TColor (see page 2878) type.
PCursorOrIcon (see page 2876)	This is type Graphics.PCursorOrIcon.
PIconRec (see page 2877)	This is type Graphics.PIconRec.
PResource (see page 2877)	This is type Graphics.PResource.
TCanvasState (see page 2877)	This is type Graphics.TCanvasState.
TColor (see page 2878)	TColor is used to specify the color of a Windows-only control.
TCopyMode (see page 2880)	TCopyMode specifies how a graphical image is copied onto a canvas.
TFontCharset (see page 2881)	TFontCharset represents the character set of a font.
TFontDataName (see page 2882)	This is type Graphics.TFontDataName.
TFontName (see page 2882)	TFontName is a string that holds the typeface name of a font.
TFontStyles (see page 2883)	TFontStyle (see page 2866) and TFontStyles specify style characteristics of a font.
TFontStylesBase (see page 2887)	This is type Graphics.TFontStylesBase.
TGraphicClass (see page 2887)	TGraphicClass defines the metaclass for TGraphic (see page 2748).
TProgressEvent (see page 2888)	TProgressEvent is the type of event handlers that provide feedback during lengthy operations.
TTextFormat (see page 2889)	TTextFormat indicates how a text viewer control displays its contents.

Variables

Name	Description
DDBsOnly (see page 2890)	Determines whether bitmap handles are created as device-dependent bitmaps (DDB).
DefFontData (see page 2891)	This is variable Graphics.DefFontData.
SystemPalette16 (see page 2891)	Contains the 16 VGA system colors.

8.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInvalidGraphic (see page 2627)	EInvalidGraphic is the exception class for unrecognized graphic files.
	EInvalidGraphicOperation (see page 2628)	EInvalidGraphicOperation is the exception class for illegal operations on graphics.
	TBitmap (see page 2628)	TBitmap is an encapsulation of a Windows bitmap (HBITMAP), including its palette (HPALETTE).
	TBitmapImage (see page 2662)	TBitmapImage is the internal representation of the bitmap image for a TBitmap (see page 2628) object.
	TBrush (see page 2664)	TBrush represents the color and pattern used to fill solid shapes.
	TBrushRecall (see page 2671)	TBrushRecall saves and restores a TBrush (see page 2664) object.
	TCanvas (see page 2673)	TCanvas provides an abstract drawing space for objects that must render their own images.
	TFont (see page 2730)	TFont encapsulates a system font.
	TFontRecall (see page 2747)	TFontRecall saves and restores the properties of a TFont (see page 2730) object.
	TGraphic (see page 2748)	TGraphic is the abstract base class type for objects such as icons, bitmaps, and metafiles that can store and display visual images.
	TGraphicsObject (see page 2764)	TGraphicsObject is the abstract base class for objects which encapsulate a system graphics object: TBrush (see page 2664), TFont (see page 2730), and TPen (see page 2801).
	TIcon (see page 2768)	TIcon is an encapsulation of a Windows icon.
	TIconImage (see page 2778)	TIconImage is the internal representation of the bitmap image for a TIcon (see page 2768) object.
	TMetafile (see page 2780)	TMetafile is an encapsulation of the Win32 Enhanced (see page 2793) metafile.
	TMetafileCanvas (see page 2794)	TMetafileCanvas allows applications to create metafile images from scratch.
	TMetafileImage (see page 2799)	TMetafileImage is the internal representation of the metafile image for a TMetafile (see page 2780) object.
	TPen (see page 2801)	TPen is used to draw lines or outline shapes on a canvas.
	TPenRecall (see page 2811)	TPenRecall saves and restores the properties of a TPen (see page 2801) object.
	TPicture (see page 2812)	TPicture contains a bitmap, icon, metafile graphic, or user-defined graphic.
	TSharedImage (see page 2830)	TSharedImage is the base class for classes that contain images used for graphics objects.

8.1.1 EInvalidGraphic Class

EInvalidGraphic is the exception class for unrecognized graphic files.

Class Hierarchy

Pascal

```
EInvalidGraphic = class(Exception);
```

C++

```
class EInvalidGraphic : public Exception;
```

File

Graphics

Description

EInvalidGraphic is raised when

An application attempts to load a file that is not a valid bitmap, icon, metafile, or user-defined graphic type into a picture.

An application attempts to load a file with an unrecognized extension.

An image does not match the format specified in a call to LoadFromClipboardFormat or SaveToClipboardFormat.

An application attempts to set a bitmap's PixelFormat property to an unsupported value.

8.1.2 EInvalidGraphicOperation Class

EInvalidGraphicOperation is the exception class for illegal operations on graphics.

Class Hierarchy

Pascal

```
EInvalidGraphicOperation = class(Exception);
```

C++

```
class EInvalidGraphicOperation : public Exception;
```

File

Graphics

Description

EInvalidGraphicOperation is raised when an illegal operation is attempted on a graphic. For example, an EInvalidGraphicOperation exception is raised when an application attempts to resize an icon or copy an icon to the Clipboard.

TCanvas (see page 2673)

TIcon (see page 2768)

LoadFromClipboardFormat

SaveToClipboardFormat

TGraphic (see page 2748)

TGraphic (see page 2748)

8.1.3 TBitmap Class

TBitmap is an encapsulation of a Windows bitmap (HBITMAP), including its palette (HPALETTE).

Class Hierarchy

Pascal

```
TBitmap = class(TGraphic);
```

C++

```
class TBitmap : public TGraphic;
```

File

Graphics

Description

A bitmap is a powerful graphics object used to create, manipulate (scale, scroll, rotate, and paint), and store images in memory and as files on a disk.

TBitmap contains an internal image of the bitmap graphic and automatically manages realization of the palette when drawn.

To draw a bitmap on a canvas, call the Draw (see page 2636) or StretchDraw methods of a TCanvas (see page 2673) object, passing a TBitmap as a parameter.

Creating copies of a TBitmap is very fast since the handle is copied rather than the image. If the image is modified and the handle is shared by more than one TBitmap object, the image is copied before the modification is performed (that is, copy on write).

TGraphic (see page 2748)

TPicture (see page 2812)

Using the Main VCL

8.1.3.1 TBitmap Members

The following tables list the members exposed by TBitmap.

Protected Methods

	Name	Description
	Changed (see page 2635)	This is Changed, a member of class TBitmap.
	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Draw (see page 2636)	This is Draw, a member of class TBitmap.
	DrawTransparent (see page 2637)	This is DrawTransparent, a member of class TBitmap.
	Equals (see page 2752)	This is the overview for the Equals method overload.
	GetEmpty (see page 2638)	This is GetEmpty, a member of class TBitmap.
	GetHeight (see page 2638)	This is GetHeight, a member of class TBitmap.
	GetPalette (see page 2639)	This is GetPalette, a member of class TBitmap.
	GetSupportsPartialTransparency (see page 2639)	This is GetSupportsPartialTransparency, a member of class TBitmap.
	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.

	GetWidth (see page 2639)	This is GetWidth, a member of class TBitmap.
	HandleNeeded (see page 2640)	This is HandleNeeded, a member of class TBitmap.
	MaskHandleNeeded (see page 2644)	This is MaskHandleNeeded, a member of class TBitmap.
	PaletteNeeded (see page 2645)	This is PaletteNeeded, a member of class TBitmap.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.
	ReadData (see page 2645)	This is ReadData, a member of class TBitmap.
	SetHeight (see page 2649)	This is SetHeight, a member of class TBitmap.
	SetPalette (see page 2649)	This is SetPalette, a member of class TBitmap.
	SetTransparent (see page 2759)	This is SetTransparent, a member of class TGraphic.
	SetWidth (see page 2650)	This is SetWidth, a member of class TBitmap.
	WriteData (see page 2650)	This is WriteData, a member of class TBitmap.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	Assign (see page 2633)	Copies a new bitmap image to the bitmap object.
	Create (see page 2631)	Instantiates a bitmap object.
	Destroy (see page 2632)	Disposes of the instance of the bitmap object.
	Dormant (see page 2635)	Creates a memory bitmap image in order to release the bitmap handle, forcing the image into DIB format to save resources.
	FreeImage (see page 2637)	Frees the cached file image stored in memory by the bitmap.
	HandleAllocated (see page 2639)	Indicates whether the TBitmap (see page 2628) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2640)	Loads a bitmap from the Clipboard into the bitmap object.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromResourceID (see page 2642)	Loads a bitmap from a resource into the bitmap object.
	LoadFromResourceName (see page 2642)	Loads a bitmap resource into the bitmap object.
	LoadFromStream (see page 2643)	Loads the bitmap from a stream into the bitmap object.
	Mask (see page 2644)	Converts the current bitmap image into a monochrome mask, replacing TransparentColor (see page 2660) with white and every other color with black.
	ReleaseHandle (see page 2645)	Returns the handle to the bitmap so that the TBitmap (see page 2628) object no longer knows about the handle.
	ReleaseMaskHandle (see page 2646)	Returns the handle to the bitmap's mask so that the TBitmap (see page 2628) object no longer knows about the mask handle.
	ReleasePalette (see page 2647)	Returns the handle to the bitmap's palette and disassociates the palette from the TBitmap (see page 2628) object.
	SaveToClipboardFormat (see page 2647)	Creates a local copy of the bitmap in Clipboard format.
	SaveToFile (see page 2757)	Saves a graphics image to a file.
	SaveToStream (see page 2649)	Saves the bitmap to a stream.
	SetSize (see page 2650)	Specifies the size of the bitmap.

Public Properties

	Name	Description
	AlphaFormat (see page 2651)	This is AlphaFormat, a member of class TBitmap.
R	Canvas (see page 2651)	Provides access to a drawing surface that represents the bitmap.
R	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Handle (see page 2652)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	HandleType (see page 2653)	Indicates whether the bitmap is a device-dependent bitmap, or a device-independent bitmap.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	IgnorePalette (see page 2654)	Determines whether the bitmap realizes its palette when drawing its image.

	MaskHandle (see page 2654)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Monochrome (see page 2654)	Determines whether the bitmap displays its image in monochrome.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.
	PixelFormat (see page 2656)	Indicates the bit format of the bitmap image, specifying how the image is displayed and how the pixels of the bitmap image are stored in memory.
R	ScanLine (see page 2658)	Provides indexed access to each line of pixels.
R	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	TransparentColor (see page 2660)	Determines which color of the bitmap is to be transparent when the bitmap is drawn.
	TransparentMode (see page 2661)	Determines whether the TransparentColor (see page 2660) property's value is automatically calculated or stored with the bitmap object.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

8.1.3.2 TBitmap.Create Constructor

Instantiates a bitmap object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TBitmap();
```

Description

Call Create to instantiate a bitmap object at runtime. Create is also called automatically when a bitmap image is loaded into a TImage.

Create allocates memory for a bitmap object, and calls the inherited Create. Then it creates a TBitmapImage (see page 2662) as the internal image that represents the bitmap.

C++ Examples:

```
/*
This example requires a resource file in the sources directory.
*/

#pragma resource "extrares.res"
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromResourceName((int)HInstance, "Live");
    Canvas->Draw(12,12,Bitmap1.get());
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example demonstrates how to access a resource
```

```
file.  Specify the resource file with the $R directive
below. The RC file associated with the resource file
relates the resource name with the bitmap.
}

{$R extrares.res}

procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1 : TBitMap;
begin
  BitMap1 := TBitMap.Create;
  try
    BitMap1.LoadFromResourceName(HInstance,'Live');
    Canvas.Draw(12,12,BitMap1);
    BitMap1.LoadFromResourceName(HInstance,'Dead');
    Canvas.Draw(12,102,BitMap1);
  finally
    BitMap1.Free;
  end;
end;
```

See Also

TBitmapImage (see page 2662)

8.1.3.3 TBitmap.Destroy Destructor

Disposes of the instance of the bitmap object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBitmap();
```

Description

Destroy is the destructor for a TBitmap (see page 2628) object.

Do not call the destructor directly in an application. Instead, call Free. Free verifies that the bitmap object is not nil before it calls Destroy.

Destroy releases the internal bitmap image (TBitmapImage (see page 2662) object) and frees the canvas before calling the inherited destructor.

TBitmapImage (see page 2662)

8.1.3.4 TBitmap Methods

The methods of the TBitmap class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2635)	This is Changed, a member of class TBitmap.
	Draw (see page 2636)	This is Draw, a member of class TBitmap.
	DrawTransparent (see page 2637)	This is DrawTransparent, a member of class TBitmap.
	GetEmpty (see page 2638)	This is GetEmpty, a member of class TBitmap.
	GetHeight (see page 2638)	This is GetHeight, a member of class TBitmap.
	GetPalette (see page 2639)	This is GetPalette, a member of class TBitmap.
	GetSupportsPartialTransparency (see page 2639)	This is GetSupportsPartialTransparency, a member of class TBitmap.
	GetWidth (see page 2639)	This is GetWidth, a member of class TBitmap.
	HandleNeeded (see page 2640)	This is HandleNeeded, a member of class TBitmap.
	MaskHandleNeeded (see page 2644)	This is MaskHandleNeeded, a member of class TBitmap.
	PaletteNeeded (see page 2645)	This is PaletteNeeded, a member of class TBitmap.
	ReadData (see page 2645)	This is ReadData, a member of class TBitmap.
	SetHeight (see page 2649)	This is SetHeight, a member of class TBitmap.
	SetPalette (see page 2649)	This is SetPalette, a member of class TBitmap.
	SetWidth (see page 2650)	This is SetWidth, a member of class TBitmap.
	WriteData (see page 2650)	This is WriteData, a member of class TBitmap.

Public Methods

	Name	Description
	Assign (see page 2633)	Copies a new bitmap image to the bitmap object.
	Dormant (see page 2635)	Creates a memory bitmap image in order to release the bitmap handle, forcing the image into DIB format to save resources.
	FreeImage (see page 2637)	Frees the cached file image stored in memory by the bitmap.
	HandleAllocated (see page 2639)	Indicates whether the TBitmap (see page 2628) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2640)	Loads a bitmap from the Clipboard into the bitmap object.
	LoadFromResourceID (see page 2642)	Loads a bitmap from a resource into the bitmap object.
	LoadFromResourceName (see page 2642)	Loads a bitmap resource into the bitmap object.
	LoadFromStream (see page 2643)	Loads the bitmap from a stream into the bitmap object.
	Mask (see page 2644)	Converts the current bitmap image into a monochrome mask, replacing TransparentColor (see page 2660) with white and every other color with black.
	ReleaseHandle (see page 2645)	Returns the handle to the bitmap so that the TBitmap (see page 2628) object no longer knows about the handle.
	ReleaseMaskHandle (see page 2646)	Returns the handle to the bitmap's mask so that the TBitmap (see page 2628) object no longer knows about the mask handle.
	ReleasePalette (see page 2647)	Returns the handle to the bitmap's palette and disassociates the palette from the TBitmap (see page 2628) object.
	SaveToClipboardFormat (see page 2647)	Creates a local copy of the bitmap in Clipboard format.
	SaveToStream (see page 2649)	Saves the bitmap to a stream.
	SetSize (see page 2650)	Specifies the size of the bitmap.

8.1.3.4.1 TBitmap.Assign Method

Copies a new bitmap image to the bitmap object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the bitmap image contained in Source to the bitmap object. If Source is not a bitmap, Assign calls the inherited Assign method, which can copy an image from any class that knows how to copy to a TBitmap (see page 2628) object. If the

bitmap needs to be changed, the actual bitmap image is copied before the changes are made (copy on write).

Note: An object of one type can always be assigned to another object of the same type. Also, the Source can be of type TPicture (see page 2812) if the Graphic property of the picture is a bitmap.

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
   Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
   BitMap2.Monochrome := true;
   Canvas.Draw(80,80,BitMap2);
   BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
 finally
   BitMap1.Free;
```

```
    BitMap2.Free;
  end;
end;
```

8.1.3.4.2 TBitmap.Changed Method

Pascal

```
procedure Changed(Sender: TObject); override;
```

C++

```
virtual __fastcall Changed(TObject * Sender);
```

Description

This is Changed, a member of class TBitmap.

8.1.3.4.3 TBitmap.Dormant Method

Creates a memory bitmap image in order to release the bitmap handle, forcing the image into DIB format to save resources.

Pascal

```
procedure Dormant;
```

C++

```
__fastcall Dormant();
```

Description

Use Dormant to change the format of the bitmap in memory thereby reducing the amount of GDI resources used by the application.

Dormant creates a bitmap image in memory using a memory stream object. This preserves the image so that the bitmap can then free the HBITMAP (accessed through the Handle (see page 2652) property) that was assigned to it.

DIB handles may use fewer Win95 GDI resources than DDB, but DIBs may also use more memory than DDBs, depending on the current video driver and mode.

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
```

```
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
   Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
   BitMap2.Monochrome := true;
   Canvas.Draw(80,80,BitMap2);
   BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
 finally
   BitMap1.Free;
   BitMap2.Free;
 end;
end;
```

TMemoryStream

8.1.3.4.4 TBitmap.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

This is Draw, a member of class TBitmap.

8.1.3.4.5 TBitmap.DrawTransparent Method

Pascal

```
procedure DrawTransparent(ACanvas: TCanvas; const Rect: TRect; Opacity: Byte); override;
```

C++

```
virtual __fastcall DrawTransparent(TCanvas ACanvas, const TRect Rect, Byte Opacity);
```

Description

This is DrawTransparent, a member of class TBitmap.

8.1.3.4.6 TBitmap.FreeImage Method

Frees the cached file image stored in memory by the bitmap.

Pascal

```
procedure FreeImage;
```

C++

```
__fastcall FreeImage();
```

Description

Use FreeImage to reduce the memory requirements of an application when color depth and pixel format are not an issue. Freeing the image releases the memory allocated for the bitmap image when it was originally loaded to disk. Consequently, some of the original pixel format of the bitmap is lost (for example, if you changed its format to a DIB) as well as the color depth of the bitmap.

When a bitmap is loaded into a bitmap object, the bitmap object creates an image of the loaded bitmap in memory. If the bitmap isn't changed, the memory image is used when saving the bitmap, to verify that the bitmap has not lost color depth or changed the pixel format.

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
```

```
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
   Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
   BitMap2.Monochrome := true;
   Canvas.Draw(80,80,BitMap2);
   BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
 finally
   BitMap1.Free;
   BitMap2.Free;
 end;
end;
```

8.1.3.4.7 TBitmap.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

This is GetEmpty, a member of class TBitmap.

8.1.3.4.8 TBitmap.GetHeight Method

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TBitmap.

8.1.3.4.9 TBitmap.GetPalette Method

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

This is GetPalette, a member of class TBitmap.

8.1.3.4.10 TBitmap.GetSupportsPartialTransparency Method

Pascal

```
function GetSupportsPartialTransparency: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetSupportsPartialTransparency();
```

Description

This is GetSupportsPartialTransparency, a member of class TBitmap.

8.1.3.4.11 TBitmap.GetWidth Method

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TBitmap.

8.1.3.4.12 TBitmap.HandleAllocated Method

Indicates whether the TBitmap (see page 2628) object has acquired a handle to the underlying GDI object.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine whether the Handle (see page 2652) property is set to an HBITMAP value. HandleAllocated indicates whether the underlying GDI object has already been created. Use HandleAllocated rather than reading the Handle (see page 2652) property. When an application reads the Handle (see page 2652) property, it automatically creates a bitmap and returns its handle if the underlying GDI object does not already exist.

See Also

Handle (see page 2652)

8.1.3.4.13 TBitmap.HandleNeeded Method

Pascal

```
procedure HandleNeeded;
```

C++

```
__fastcall HandleNeeded();
```

Description

This is HandleNeeded, a member of class TBitmap.

8.1.3.4.14 TBitmap.LoadFromClipboardFormat Method

Loads a bitmap from the Clipboard into the bitmap object.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat is called if the bitmap is registered with the TPicture (see page 2812) object using the RegisterClipboardFormat method.

LoadFromClipboardFormat replaces the current image with the data pointed to by the AData parameter. The palette for the bitmap is specified by the APalette parameter.

C++ Examples:

```
/*
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
*/
#include <Clipbrd.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TClipboard *cb = Clipboard();
  if (cb->HasFormat(CF_BITMAP))
  {
    std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
    try
    {
      Bitmap->LoadFromClipboardFormat(CF_BITMAP, cb->GetAsHandle(CF_BITMAP), 0);
      Canvas->Draw(5, 5, Bitmap.get());
    }
    catch (...)
    {
      MessageBeep(0);
      ShowMessage("Error reading image from clipboard!");
    }
```

```
    cb->Clear();
  }
  else
  {
    MessageBeep(0);
    ShowMessage("Cannot find image in clipboard!");
  }
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  unsigned int DataHandle;
  HPALETTE APalette;
  unsigned short MyFormat;
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
  try
  {
    Bitmap->LoadFromFile("C:\\Program Files\\Common Files\\CodeGear
Shared\\Images\\Splash\\256Color\\FACTORY.BMP");
    // generate a clipboard format, with data and palette
    Bitmap->SaveToClipboardFormat(
      MyFormat,
      DataHandle,
      APalette);
    // save the data to the clipboard using that format and
    // the generated data
    Clipboard()->SetAsHandle(MyFormat,DataHandle);
  }
  catch (...)
  {
     ShowMessage("Failed to copy image to clipboard!");
  }
}
```

Delphi Examples:

```
{
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
}

procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitmap;
  s : string;
  Icon: TIcon;
begin
 Bitmap := TBitMap.Create;
 try
   Image1.Picture.RegisterClipboardFormat(cf_BitMap,TIcon);
   Bitmap.LoadFromClipBoardFormat(
     cf_BitMap,ClipBoard.GetAsHandle(cf_Bitmap),0);
   Canvas.draw(0,0,Bitmap);
 finally
   Bitmap.free;
   Clipboard.Clear;
 end;
end;

procedure TForm1.Button2Click(Sender: TObject);
var
  MyFormat : Word;
  Bitmap : TBitMap;
  AData : THandle;
  APalette : HPALETTE;
```

```
begin
  Bitmap := TBitmap.Create;
  try
    Bitmap.LoadFromFile('c:\Program Files\Common Files\CodeGear
Shared\Images\Splash\256color\factory.bmp');
    Bitmap.SaveToClipBoardFormat(
      MyFormat,
      AData,
      APalette);
    ClipBoard.SetAsHandle(MyFormat,AData);
  finally
    Bitmap.Free;
  end;
end;
```

See Also

TClipboard

TPicture (see page 2812)

RegisterClipboardFormat (see page 2819)

8.1.3.4.15 TBitmap.LoadFromResourceID Method

Loads a bitmap from a resource into the bitmap object.

Pascal

```
procedure LoadFromResourceID(Instance: THandle; ResID: Integer);
```

C++

```
__fastcall LoadFromResourceID(THandle Instance, int ResID);
```

Description

Use LoadFromResourceID to load a specified bitmap resource along with palette information from a module's executable file.

Instance is the handle of the module that contains the resource.

ResID is the resource ID for the bitmap.

See Also

LoadFromResourceName (see page 2642)

8.1.3.4.16 TBitmap.LoadFromResourceName Method

Loads a bitmap resource into the bitmap object.

Pascal

```
procedure LoadFromResourceName(Instance: THandle; const ResName: String);
```

C++

```
__fastcall LoadFromResourceName(THandle Instance, const UnicodeString ResName);
```

Description

LoadFromResourceName loads the specified bitmap resource along with palette information from a module's executable file.

Instance is the handle of the module that contains the resource.

ResName is the name of the resource to load.

Note: Use this routine to load bitmaps from RES files instead of the LoadBitmap API. LoadBitmap does not support 256-color

images.

C++ Examples:

```
/*
This example requires a resource file in the sources directory.
*/

#pragma resource "extrares.res"
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromResourceName((int)HInstance, "Live");
    Canvas->Draw(12,12,Bitmap1.get());
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example demonstrates how to access a resource
file.  Specify the resource file with the $R directive
below. The RC file associated with the resource file
relates the resource name with the bitmap.
}

{$R extrares.res}

procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1 : TBitMap;
begin
  BitMap1 := TBitMap.Create;
  try
    BitMap1.LoadFromResourceName(HInstance,'Live');
    Canvas.Draw(12,12,BitMap1);
    BitMap1.LoadFromResourceName(HInstance,'Dead');
    Canvas.Draw(12,102,BitMap1);
  finally
    BitMap1.Free;
  end;
end;
```

See Also

LoadFromResourceID (see page 2642)

HInstance

8.1.3.4.17 TBitmap.LoadFromStream Method

Loads the bitmap from a stream into the bitmap object.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to load the bitmap image from a stream. The Stream parameter specifies the stream from which to read the bitmap image. For example, use LoadFromStream to load a bitmap image from a BLOB stream that reads from a graphic field in a dataset.

See Also

LoadFromClipboardFormat (see page 2640)

LoadFromResourceName (see page 2642)

LoadFromResourceID (see page 2642)

LoadFromFile (see page 2755)

SaveToStream (see page 2649)

8.1.3.4.18 TBitmap.Mask Method

Converts the current bitmap image into a monochrome mask, replacing TransparentColor (see page 2660) with white and every other color with black.

Pascal

```
procedure Mask(TransparentColor: TColor);
```

C++

```
__fastcall Mask(TColor TransparentColor);
```

Description

Use Mask to produce a monochrome mask bitmap based on a given transparent color. Mask produces the same image that MaskHandle (see page 2654) does, except that the resulting mask image replaces the image in the TBitmap (see page 2628) object, so it only makes sense to call Mask once. Use MaskHandle (see page 2654) when only a bitmap handle of the mask image is needed.

See Also

ReleaseMaskHandle (see page 2646)

8.1.3.4.19 TBitmap.MaskHandleNeeded Method

Pascal

```
procedure MaskHandleNeeded;
```

C++

```
__fastcall MaskHandleNeeded();
```

Description

This is MaskHandleNeeded, a member of class TBitmap.

8.1.3.4.20 TBitmap.PaletteNeeded Method

Pascal

```
procedure PaletteNeeded;
```

C++

```
__fastcall PaletteNeeded();
```

Description

This is PaletteNeeded, a member of class TBitmap.

8.1.3.4.21 TBitmap.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); override;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TBitmap.

8.1.3.4.22 TBitmap.ReleaseHandle Method

Returns the handle to the bitmap so that the TBitmap (see page 2628) object no longer knows about the handle.

Pascal

```
function ReleaseHandle: HBITMAP;
```

C++

```
__fastcall HBITMAP ReleaseHandle();
```

Description

Use ReleaseHandle to disassociate the bitmap from the bitmap handle. Use it when you need to give a bitmap handle to a routine or object that will assume ownership (or destroy) the bitmap handle.

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
```

```
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
   Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
   BitMap2.Monochrome := true;
   Canvas.Draw(80,80,BitMap2);
   BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
 finally
   BitMap1.Free;
   BitMap2.Free;
 end;
end;
```

See Also

ReleaseMaskHandle (see page 2646)

Handle (see page 2652)

8.1.3.4.23 TBitmap.ReleaseMaskHandle Method

Returns the handle to the bitmap's mask so that the TBitmap (see page 2628) object no longer knows about the mask handle.

Pascal

```
function ReleaseMaskHandle: HBITMAP;
```

C++

```
__fastcall HBITMAP ReleaseMaskHandle();
```

Description

Use ReleaseMaskHandle to disassociate the bitmap object from the bitmap mask handle.

See Also

ReleaseHandle (see page 2645)

Handle (see page 2652)

Mask (see page 2644)

8.1.3.4.24 TBitmap.ReleasePalette Method

Returns the handle to the bitmap's palette and disassociates the palette from the TBitmap (see page 2628) object.

Pascal

```
function ReleasePalette: HPALETTE;
```

C++

```
__fastcall HPALETTE ReleasePalette();
```

Description

Use ReleasePalette to disassociate the palette from the bitmap image.

8.1.3.4.25 TBitmap.SaveToClipboardFormat Method

Creates a local copy of the bitmap in Clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var Format: Word; var Data: THandle; var APalette: HPALETTE);
override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word Format, THandle Data, HPALETTE APalette);
```

Description

Use SaveToClipboardFormat to copy the bitmap to a Clipboard format. The bitmap's palette is returned in the APalette parameter, the format in the AFormat parameter, and a handle to the data in the AData parameter. Before the bitmap can be saved, an application must have registered the format with the TBitmap (see page 2628) object using the RegisterClipboardFormat method.

C++ Examples:

```
/*
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
*/
#include <Clipbrd.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TClipboard *cb = Clipboard();
  if (cb->HasFormat(CF_BITMAP))
  {
    std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
    try
    {
      Bitmap->LoadFromClipboardFormat(CF_BITMAP, cb->GetAsHandle(CF_BITMAP), 0);
      Canvas->Draw(5, 5, Bitmap.get());
    }
    catch (...)
    {
      MessageBeep(0);
```

```
      ShowMessage("Error reading image from clipboard!");
    }
    cb->Clear();
  }
  else
  {
    MessageBeep(0);
    ShowMessage("Cannot find image in clipboard!");
  }
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  unsigned int DataHandle;
  HPALETTE APalette;
  unsigned short MyFormat;
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
  try
  {
    Bitmap->LoadFromFile("C:\\Program Files\\Common Files\\CodeGear
Shared\\Images\\Splash\\256Color\\FACTORY.BMP");
    // generate a clipboard format, with data and palette
    Bitmap->SaveToClipboardFormat(
      MyFormat,
      DataHandle,
      APalette);
    // save the data to the clipboard using that format and
    // the generated data
    Clipboard()->SetAsHandle(MyFormat,DataHandle);
  }
  catch (...)
  {
     ShowMessage("Failed to copy image to clipboard!");
  }
}
```

Delphi Examples:

```
{
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
}

procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitmap;
  s : string;
  Icon: TIcon;
begin
 Bitmap := TBitMap.Create;
 try
   Image1.Picture.RegisterClipboardFormat(cf_BitMap,TIcon);
   Bitmap.LoadFromClipBoardFormat(
     cf_BitMap,ClipBoard.GetAsHandle(cf_Bitmap),0);
   Canvas.draw(0,0,Bitmap);
 finally
   Bitmap.free;
   Clipboard.Clear;
 end;
end;

procedure TForm1.Button2Click(Sender: TObject);
var
  MyFormat : Word;
  Bitmap : TBitMap;
```

```
    AData : THandle;
    APalette : HPALETTE;
  begin
    Bitmap := TBitmap.Create;
    try
      Bitmap.LoadFromFile('c:\Program Files\Common Files\CodeGear
  Shared\Images\Splash\256color\factory.bmp');
      Bitmap.SaveToClipBoardFormat(
        MyFormat,
        AData,
        APalette);
      ClipBoard.SetAsHandle(MyFormat,AData);
    finally
      Bitmap.Free;
    end;
  end;
```

See Also

RegisterClipboardFormat (see page 2819)

LoadFromClipboardFormat (see page 2640)

8.1.3.4.26 TBitmap.SaveToStream Method

Saves the bitmap to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to write the bitmap image to the stream specified by the Stream parameter. For example, specify a TBlobStream object as the Stream parameter to save the bitmap image to a graphic field in a dataset.

See Also

LoadFromStream (see page 2643)

8.1.3.4.27 TBitmap.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

This is SetHeight, a member of class TBitmap.

8.1.3.4.28 TBitmap.SetPalette Method

Pascal

```
procedure SetPalette(Value: HPALETTE); override;
```

C++

```
virtual __fastcall SetPalette(HPALETTE Value);
```

Description

This is SetPalette, a member of class TBitmap.

8.1.3.4.29 TBitmap.SetSize Method

Specifies the size of the bitmap.

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer); override;
```

C++

```
virtual __fastcall SetSize(int AWidth, int AHeight);
```

Description

Use the SetSize method to set both the height and width of the bitmap. This results in better performance than setting the height and width separately.

8.1.3.4.30 TBitmap.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TBitmap.

8.1.3.4.31 TBitmap.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); override;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TBitmap.

8.1.3.5 TBitmap Properties

The properties of the TBitmap class are listed here.

Public Properties

	Name	Description
	AlphaFormat (see page 2651)	This is AlphaFormat, a member of class TBitmap.
R	Canvas (see page 2651)	Provides access to a drawing surface that represents the bitmap.

	Handle (see page 2652)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	HandleType (see page 2653)	Indicates whether the bitmap is a device-dependent bitmap, or a device-independent bitmap.
	IgnorePalette (see page 2654)	Determines whether the bitmap realizes its palette when drawing its image.
	MaskHandle (see page 2654)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	Monochrome (see page 2654)	Determines whether the bitmap displays its image in monochrome.
	PixelFormat (see page 2656)	Indicates the bit format of the bitmap image, specifying how the image is displayed and how the pixels of the bitmap image are stored in memory.
R	ScanLine (see page 2658)	Provides indexed access to each line of pixels.
	TransparentColor (see page 2660)	Determines which color of the bitmap is to be transparent when the bitmap is drawn.
	TransparentMode (see page 2661)	Determines whether the TransparentColor (see page 2660) property's value is automatically calculated or stored with the bitmap object.

8.1.3.5.1 TBitmap.AlphaFormat Property

Pascal

```
property AlphaFormat: TAlphaFormat;
```

C++

```
__property TAlphaFormat AlphaFormat;
```

Description

This is AlphaFormat, a member of class TBitmap.

8.1.3.5.2 TBitmap.Canvas Property

Provides access to a drawing surface that represents the bitmap.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Canvas allows drawing on the bitmap by providing a T Canvas object for this purpose. Drawing on the canvas effectively modifies the underlying bitmap image pixels. Any canvas operation is valid on a bitmap (not just Draw (see page 2636) and StretchDraw) including line drawing, rectangles, and circles. The bitmap object is passed as a parameter to these methods.

A canvas object is created automatically for the bitmap and the property is read-only.

C++ Examples:

```
/*
An examples of TBitmap Color, TGraphic Transparent, TBitmap
TransparentMode, TBitmap TransparentColor and TCanvas Draw.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bitmap(new Graphics::TBitmap);
  try
  {
    bitmap->LoadFromFile("..\\FACTORY.BMP ");
```

```
    bitmap->Transparent = true;
    bitmap->TransparentColor = bitmap->Canvas->Pixels[50][50];
    Form1->Canvas->Draw( 0, 0, bitmap.get());
    bitmap->TransparentMode = tmAuto;
    Form1->Canvas->Draw(50, 50, bitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or display bitmap");
  }
}
```

Delphi Examples:

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitMap;
begin
  Bitmap := TBitmap.Create;
  try
    with Bitmap do begin
      LoadFromFile('factory.bmp');
      Transparent := True;
      TransParentColor := BitMap.canvas.pixels[50,50];
      Form1.Canvas.Draw(0,0,BitMap);
      TransparentMode := tmAuto;
      Form1.Canvas.Draw(50,50,BitMap);
    end;
  finally
    Bitmap.Free;
  end;
end;
```

See Also

TCanvas (see page 2673)

Draw (see page 2685)

StretchDraw (see page 2704)

8.1.3.5.3 TBitmap.Handle Property

Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.

Pascal

```
property Handle: HBITMAP;
```

C++

```
__property HBITMAP Handle;
```

Description

Use Handle to call a Windows API function that requires the handle of a bitmap object. Pass Handle as the bitmap handle parameter to these functions.

Handle is the HBITMAP encapsulated by the bitmap object. Avoid grabbing the handle directly since it causes the HBITMAP to be copied if more than one TBitmap (see page 2628) shares the handle.

Warning: Be careful when giving the handle to an object or routine. If the receiver takes ownership (and destroys) the bitmap handle, call TBitmap (see page 2628).::ReleaseHandle (see page 2645).

Delphi Examples:

```
{
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
}
var
  bmpMask : TBitmap;
  bmpColor : TBitmap;
  iconInfo : TIconInfo;
const
  crMyCursor = 5;

procedure TForm1.Button2Click(Sender: TObject);
begin
  bmpMask := TBitmap.Create;
  bmpColor := TBitmap.Create;

  bmpMask.LoadFromFile('SquareMask.bmp');
  bmpColor.LoadFromFile('Square.bmp');

  with iconInfo do
  begin
    fIcon := false;
    xHotspot := 15;
    yHotspot := 15;
    hbmMask := bmpMask.Handle;
    hbmColor := bmpColor.Handle;
  end;

  Screen.Cursors[crMyCursor] := CreateIconIndirect(iconInfo);

  Screen.Cursor := crMyCursor;

  bmpMask.Free;
  bmpColor.Free;
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  DestroyIcon(Screen.Cursors[crMyCursor]);
end;
```

See Also

HandleType (see page 2653)

MaskHandle (see page 2654)

HandleAllocated (see page 2639)

8.1.3.5.4 TBitmap.HandleType Property

Indicates whether the bitmap is a device-dependent bitmap, or a device-independent bitmap.

Pascal

```
property HandleType: TBitmapHandleType;
```

C++

```
__property TBitmapHandleType HandleType;
```

Description

HandleType is used to find or modify the type of the bitmap. Device-dependent bitmaps (DDBs) may be faster to draw on the screen, but may be stored in memory in a device-specific format. Device-independent bitmaps (DIBs) are stored in memory in a

standard format supported by all devices (including printers).

See Also

Handle (see page 2652)

8.1.3.5.5 TBitmap.IgnorePalette Property

Determines whether the bitmap realizes its palette when drawing its image.

Pascal

```
property IgnorePalette: Boolean;
```

C++

```
__property Boolean IgnorePalette;
```

Description

Use IgnorePalette when speed of drawing is a priority. When IgnorePalette is true, the bitmap does not realize its palette when drawing itself, resulting in lower picture quality on 256-color video drivers, but faster drawing of the bitmap image.

Note:

See Also

TBitmapImage (see page 2662)

TDBCtrlGrid

TDBImage

8.1.3.5.6 TBitmap.MaskHandle Property

Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.

Pascal

```
property MaskHandle: HBITMAP;
```

C++

```
__property HBITMAP MaskHandle;
```

Description

Use MaskHandle to call a Windows API function that requires the handle of a bitmap object. Pass MaskHandle as the bitmap handle parameter to these functions. MaskHandle is the HBITMAP encapsulated by the bitmap object's mask.

See Also

Handle (see page 2652)

ReleaseMaskHandle (see page 2646)

8.1.3.5.7 TBitmap.Monochrome Property

Determines whether the bitmap displays its image in monochrome.

Pascal

```
property Monochrome: Boolean;
```

C++

```
__property Boolean Monochrome;
```

Description

If Monochrome is true if the bitmap displays as a monochrome bitmap. Monochrome is false if the bitmap displays in color, that is, if it contains more than one bit per pixel.

Note:

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
```

```
    Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
    BitMap2.Monochrome := true;
    Canvas.Draw(80,80,BitMap2);
    BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
  finally
    BitMap1.Free;
    BitMap2.Free;
  end;
end;
```

8.1.3.5.8 TBitmap.PixelFormat Property

Indicates the bit format of the bitmap image, specifying how the image is displayed and how the pixels of the bitmap image are stored in memory.

Pascal

```
property PixelFormat: TPixelFormat;
```

C++

```
__property TPixelFormat PixelFormat;
```

Description

Use PixelFormat to change a TBitmap (see page 2628)'s internal image to a particular memory format and color depth, or to find out what memory format and color depth a TBitmap (see page 2628) is using.

For example, PixelFormat can be used to set the pixel format of the bitmap image to 8-bit for video drivers that cannot display the native format of a bitmap image.

Note: The PixelFormat of a JPEG image object applies to the bitmap if the JPEG image is copied to it.

Changing the pixel format is most commonly used with ScanLine (see page 2658), because your code must decode the pixel data accessed by ScanLine (see page 2658). Image-editing tools usually use one pixel for all internal image operations and copy the results to the screen (in whatever format) as the last step.

C++ Examples:

```
/*
This example shows how to draw directly to a Bitmap.  It
loads a bitmap from a file and then copies it to another
bitmap twice it's size.  Then the two bitmaps are
displayed on the form canvas.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap);
  std::auto_ptr<Graphics::TBitmap> BigBitmap(new Graphics::TBitmap);
  TRGBTriple *ptr, *bigPtr;   // use a (byte *) for pf8bit color
  TPixelFormat pixForm, bigpixForm;
  try
  {
    Bitmap->LoadFromFile("../littlefac.bmp");
    pixForm = Bitmap->PixelFormat;
    bigpixForm  = BigBitmap->PixelFormat;
    Bitmap->PixelFormat = pf24bit;
    BigBitmap->PixelFormat = pf24bit;
    BigBitmap->Height = Bitmap->Height * 2;
    BigBitmap->Width = Bitmap->Width * 2;
    for (int y = 0; y < Bitmap->Height; y++)
    {
      ptr = reinterpret_cast<TRGBTriple *>(Bitmap->ScanLine[y]);
```

```
      for (int x = 0; x < Bitmap->Width; x++)
      {
        int bx = x * 2;
        int by = y * 2;
        bigPtr = reinterpret_cast<TRGBTriple *>(BigBitmap->ScanLine[by]);
        bigPtr[bx] = ptr[x];
        bigPtr[bx + 1] = ptr[x];
        bigPtr = reinterpret_cast<TRGBTriple *>(BigBitmap->ScanLine[by + 1]);
        bigPtr[bx] = ptr[x];
        bigPtr[bx + 1] = ptr[x];
      }
    }
    Canvas->Draw(0, 0, Bitmap.get());
    Canvas->Draw(200, 200, BigBitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or alter bitmap");
  }
}
```

Delphi Examples:

```
{
This example shows how to draw directly to a Bitmap.  It
loads a bitmap from a file and then copies it to another
bitmap twice it's size.  Then the two bitmaps are
displayed on the form canvas.
}
procedure TForm1.Button1Click(Sender: TObject);
type
  TRGBTripleArray = ARRAY[Word] of TRGBTriple;
  pRGBTripleArray = ^TRGBTripleArray; // use a PByteArray for pf8bit color
var
  x,y : Integer;
  bx, by : Integer;
  BitMap, BigBitMap : TBitMap;
  P, bigP : pRGBTripleArray;
  pixForm, bigpixForm : TPixelFormat;
begin
  BitMap := TBitMap.create;
  BigBitMap := TBitMap.create;
  try
    BitMap.LoadFromFile('littlefac.bmp');
    pixForm := BitMap.PixelFormat;
    bigpixForm := BigBitMap.PixelFormat;
    BitMap.PixelFormat := pf24bit;
    BigBitMap.PixelFormat := pf24bit;
    BigBitMap.Height := BitMap.Height * 2;
    BigBitMap.Width := BitMap.Width * 2;
    for y := 0 to BitMap.Height - 1 do
    begin
      P := BitMap.ScanLine[y];
      for x := 0 to BitMap.Width - 1 do
      begin
        bx := x * 2;
        by := y * 2;
        bigP := BigBitMap.ScanLine[by];
        bigP[bx] := P[x];
        bigP[bx + 1] := P[x];
        bigP := BigBitMap.ScanLine[by + 1];
        bigP[bx] := P[x];
        bigP[bx + 1] := P[x];
      end;
    end;
    Canvas.Draw(0, 0, BitMap);
    Canvas.Draw(200, 200, BigBitMap);
```

```
    finally
      BitMap.Free;
      BigBitMap.Free;
    end;
  end;
```

8.1.3.5.9 TBitmap.ScanLine Property

Provides indexed access to each line of pixels.

Pascal

```
property ScanLine [Row: Integer]: Pointer;
```

C++

```
__property void * ScanLine[int Row];
```

Description

ScanLine is used only with DIBs (Device Independent Bitmaps) for image editing tools that do low-level pixel work.

C++ Examples:

```
/*
This example shows how to draw directly to a Bitmap.  It
loads a bitmap from a file and then copies it to another
bitmap twice it's size.  Then the two bitmaps are
displayed on the form canvas.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap);
  std::auto_ptr<Graphics::TBitmap> BigBitmap(new Graphics::TBitmap);
  TRGBTriple *ptr, *bigPtr;   // use a (byte *) for pf8bit color
  TPixelFormat pixForm, bigpixForm;
  try
  {
    Bitmap->LoadFromFile("../littlefac.bmp");
    pixForm = Bitmap->PixelFormat;
    bigpixForm  = BigBitmap->PixelFormat;
    Bitmap->PixelFormat = pf24bit;
    BigBitmap->PixelFormat = pf24bit;
    BigBitmap->Height = Bitmap->Height * 2;
    BigBitmap->Width = Bitmap->Width * 2;
    for (int y = 0; y < Bitmap->Height; y++)
    {
      ptr = reinterpret_cast<TRGBTriple *>(Bitmap->ScanLine[y]);
      for (int x = 0; x < Bitmap->Width; x++)
      {
        int bx = x * 2;
        int by = y * 2;
        bigPtr = reinterpret_cast<TRGBTriple *>(BigBitmap->ScanLine[by]);
        bigPtr[bx] = ptr[x];
        bigPtr[bx + 1] = ptr[x];
        bigPtr = reinterpret_cast<TRGBTriple *>(BigBitmap->ScanLine[by + 1]);
```

```
        bigPtr[bx] = ptr[x];
        bigPtr[bx + 1] = ptr[x];
      }
    }
    Canvas->Draw(0, 0, Bitmap.get());
    Canvas->Draw(200, 200, BigBitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or alter bitmap");
  }
}
```

Delphi Examples:

```
{
This example shows how to draw directly to a Bitmap.  It
loads a bitmap from a file and then copies it to another
bitmap twice it's size.  Then the two bitmaps are
displayed on the form canvas.
}
procedure TForm1.Button1Click(Sender: TObject);
type
  TRGBTripleArray = ARRAY[Word] of TRGBTriple;
  pRGBTripleArray = ^TRGBTripleArray; // use a PByteArray for pf8bit color
var
  x,y : Integer;
  bx, by : Integer;
  BitMap, BigBitMap : TBitMap;
  P, bigP : pRGBTripleArray;
  pixForm, bigpixForm : TPixelFormat;
begin
  BitMap := TBitMap.create;
  BigBitMap := TBitMap.create;
  try
    BitMap.LoadFromFile('littlefac.bmp');
    pixForm := BitMap.PixelFormat;
    bigpixForm := BigBitMap.PixelFormat;
    BitMap.PixelFormat := pf24bit;
    BigBitMap.PixelFormat := pf24bit;
    BigBitMap.Height := BitMap.Height * 2;
    BigBitMap.Width := BitMap.Width * 2;
    for y := 0 to BitMap.Height - 1 do
    begin
      P := BitMap.ScanLine[y];
      for x := 0 to BitMap.Width - 1 do
      begin
        bx := x * 2;
        by := y * 2;
        bigP := BigBitMap.ScanLine[by];
        bigP[bx] := P[x];
        bigP[bx + 1] := P[x];
        bigP := BigBitMap.ScanLine[by + 1];
        bigP[bx] := P[x];
        bigP[bx + 1] := P[x];
      end;
    end;
    Canvas.Draw(0, 0, BitMap);
    Canvas.Draw(200, 200, BigBitMap);
  finally
    BitMap.Free;
    BigBitMap.Free;
  end;
end;
```

See Also

PixelFormat (see page 2656)

8.1.3.5.10 TBitmap.TransparentColor Property

Determines which color of the bitmap is to be transparent when the bitmap is drawn.

Pascal

```
property TransparentColor: TColor;
```

C++

```
__property TColor TransparentColor;
```

Description

Use TransparentColor to determine how to draw the bitmap transparently. When the TransparentMode (see page 2661) property is set to tmAuto (default), TransparentColor returns the color of the first pixel in the bitmap image data. For "bottom-up" bitmaps, the first pixel is the bottom leftmost pixel shown onscreen. For "top-down" bitmaps (less common), the first pixel is in the top left corner shown onscreen.

If TransparentColor is assigned, the TransparentMode (see page 2661) is automatically set to tmFixed so that the new transparent color can be used later. If you want TransparentColor to disregard any assignments and return the bottom leftmost pixel color again, set TransparentMode (see page 2661) to tmAuto.

C++ Examples:

```
/*
An examples of TBitmap Color, TGraphic Transparent, TBitmap
TransparentMode, TBitmap TransparentColor and TCanvas Draw.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bitmap(new Graphics::TBitmap);
  try
  {
    bitmap->LoadFromFile("..\\FACTORY.BMP ");
    bitmap->Transparent = true;
    bitmap->TransparentColor = bitmap->Canvas->Pixels[50][50];
    Form1->Canvas->Draw( 0, 0, bitmap.get());
    bitmap->TransparentMode = tmAuto;
    Form1->Canvas->Draw(50, 50, bitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or display bitmap");
  }
}
```

Delphi Examples:

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitMap;
begin
  Bitmap := TBitmap.Create;
  try
    with Bitmap do begin
      LoadFromFile('factory.bmp');
      Transparent := True;
```

```
      TransParentColor := BitMap.canvas.pixels[50,50];
      Form1.Canvas.Draw(0,0,BitMap);
      TransparentMode := tmAuto;
      Form1.Canvas.Draw(50,50,BitMap);
    end;
  finally
    Bitmap.Free;
  end;
end;
```

See Also

TransparentMode (see page 2661)

8.1.3.5.11 TBitmap.TransparentMode Property

Determines whether the TransparentColor (see page 2660) property's value is automatically calculated or stored with the bitmap object.

Pascal

```
property TransparentMode: TTransparentMode;
```

C++

```
__property TTransparentMode TransparentMode;
```

Description

When TransparentMode is set to tmAuto (the default), the TransparentColor (see page 2660) property returns the color of the bottom-leftmost pixel of the bitmap image. When TransparentMode is set to tmFixed, the TransparentColor (see page 2660) property refers to the color stored in the bitmap object.

C++ Examples:

```
/*
An examples of TBitmap Color, TGraphic Transparent, TBitmap
TransparentMode, TBitmap TransparentColor and TCanvas Draw.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bitmap(new Graphics::TBitmap);
  try
  {
    bitmap->LoadFromFile("..\\FACTORY.BMP ");
    bitmap->Transparent = true;
    bitmap->TransparentColor = bitmap->Canvas->Pixels[50][50];
    Form1->Canvas->Draw( 0, 0, bitmap.get());
    bitmap->TransparentMode = tmAuto;
    Form1->Canvas->Draw(50, 50, bitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or display bitmap");
  }
}
```

Delphi Examples:

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitMap;
begin
  Bitmap := TBitmap.Create;
```

```
    try
      with Bitmap do begin
        LoadFromFile('factory.bmp');
        Transparent := True;
        TransParentColor := BitMap.canvas.pixels[50,50];
        Form1.Canvas.Draw(0,0,BitMap);
        TransparentMode := tmAuto;
        Form1.Canvas.Draw(50,50,BitMap);
      end;
    finally
      Bitmap.Free;
    end;
  end;
```

TransparentColor (see page 2660)

8.1.4 TBitmapImage Class

TBitmapImage is the internal representation of the bitmap image for a TBitmap (see page 2628) object.

Class Hierarchy

Pascal

```
TBitmapImage = class(TSharedImage);
```

C++

```
class TBitmapImage : public TSharedImage;
```

File

Graphics

Description

TBitmapImage is used only for internal implementation of the TBitmap (see page 2628) component that is defined in the Graphics (see page 2619) unit. It represents the internal image of the bitmap. All of the data and methods introduced in TBitmapImage are private. They contain information about the specific Windows bitmap resource, including pointers to the standard HBITMAP structures defined by Windows. TBitmapImage is referenced in the constructor of the TBitmap (see page 2628) object when the bitmap image is created.

Note: TBitmapImage is how TBitmap (see page 2628) does reference counting and handle sharing. Multiple instances can refer to the same TBitmap (see page 2628) image. TBitmapImage is the actual owner of the bitmap handle.

See Also

TBitmap (see page 2628)

8.1.4.1 TBitmapImage Members

The following tables list the members exposed by TBitmapImage.

Protected Methods

	Name	Description
	FreeHandle (see page 2663)	This is FreeHandle, a member of class TBitmapImage.

	Reference (see page 2832)	This is Reference, a member of class TSharedImage.
	Release (see page 2832)	This is Release, a member of class TSharedImage.

Protected Properties

	Name	Description
R	RefCount (see page 2832)	This is RefCount, a member of class TSharedImage.

Public Methods

	Name	Description
V	Destroy (see page 2663)	Frees the memory associated with the TBitmapImage (see page 2662) object.

8.1.4.2 TBitmapImage.Destroy Destructor

Frees the memory associated with the TBitmapImage (see page 2662) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBitmapImage();
```

Description

Do not call Destroy. The bitmap object automatically destroys the bitmap image.

See Also

System::TObject::Free

delete

8.1.4.3 TBitmapImage Methods

The methods of the TBitmapImage class are listed here.

Protected Methods

	Name	Description
V	FreeHandle (see page 2663)	This is FreeHandle, a member of class TBitmapImage.

8.1.4.3.1 TBitmapImage.FreeHandle Method

Pascal

```
procedure FreeHandle; override;
```

C++

```
virtual __fastcall FreeHandle();
```

Description

This is FreeHandle, a member of class TBitmapImage.

8.1.5 TBrush Class

TBrush represents the color and pattern used to fill solid shapes.

Class Hierarchy

Pascal

```
TBrush = class(TGraphicsObject);
```

C++

```
class TBrush : public TGraphicsObject;
```

File

Graphics

Description

TBrush encapsulates the Windows brush object (HBRUSH) and is used to fill solid shapes, such as rectangles and ellipses, with a color or pattern.

See Also

TCanvas (see page 2673)

TPen (see page 2801)

Shapes

Using the Main VCL

8.1.5.1 TBrush Members

The following tables list the members exposed by TBrush.

Protected Methods

	Name	Description
	Changed (see page 2765)	Generates an OnChange (see page 2768) event when the properties of the graphics object change.
	GetBitmap (see page 2666)	This is GetBitmap, a member of class TBrush.
	GetColor (see page 2666)	This is GetColor, a member of class TBrush.
	GetHandle (see page 2667)	This is GetHandle, a member of class TBrush.
	GetStyle (see page 2667)	This is GetStyle, a member of class TBrush.
	Lock (see page 2766)	Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.
	SetBitmap (see page 2667)	This is SetBitmap, a member of class TBrush.
	SetColor (see page 2667)	This is SetColor, a member of class TBrush.
	SetHandle (see page 2668)	This is SetHandle, a member of class TBrush.
	SetStyle (see page 2668)	This is SetStyle, a member of class TBrush.
	Unlock (see page 2767)	Releases the lock on execution threads set by the Lock (see page 2766) method.

Public Events

	Name	Description
	OnChange (see page 2768)	Occurs immediately after the graphics object changes.

Public Methods

	Name	Description
	Assign (see page 2666)	Copies the contents of the brush to another brush.
	Create (see page 2665)	Creates and initializes a TBrush (see page 2664) instance.
	Destroy (see page 2665)	Destroys the TBrush (see page 2664) instance and frees its memory.
	HandleAllocated (see page 2766)	Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

Public Properties

	Name	Description
	Bitmap (see page 2668)	Specifies an external bitmap image that defines a pattern for the brush.
	Handle (see page 2670)	Provides access to the handle of a system brush.
	OwnerCriticalSection (see page 2767)	Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.

Published Properties

	Name	Description
	Color (see page 2669)	Indicates the color of the brush.
	Style (see page 2670)	Specifies the pattern for the brush.

8.1.5.2 TBrush.Create Constructor

Creates and initializes a TBrush (see page 2664) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall TBrush();
```

Description

Create generates a new TBrush (see page 2664) instance.

8.1.5.3 TBrush.Destroy Destructor

Destroys the TBrush (see page 2664) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBrush();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the TBrush (see page 2664) instance is not nil before calling Destroy.

See Also

System::TObject::Free

8.1.5.4 TBrush Methods

The methods of the TBrush class are listed here.

Protected Methods

	Name	Description
	GetBitmap (see page 2666)	This is GetBitmap, a member of class TBrush.
	GetColor (see page 2666)	This is GetColor, a member of class TBrush.
	GetHandle (see page 2667)	This is GetHandle, a member of class TBrush.
	GetStyle (see page 2667)	This is GetStyle, a member of class TBrush.
	SetBitmap (see page 2667)	This is SetBitmap, a member of class TBrush.
	SetColor (see page 2667)	This is SetColor, a member of class TBrush.
	SetHandle (see page 2668)	This is SetHandle, a member of class TBrush.
	SetStyle (see page 2668)	This is SetStyle, a member of class TBrush.

Public Methods

	Name	Description
	Assign (see page 2666)	Copies the contents of the brush to another brush.

8.1.5.4.1 TBrush.Assign Method

Copies the contents of the brush to another brush.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the brush's properties from another TBrush (see page 2664) instance.

See Also

Assign

8.1.5.4.2 TBrush.GetBitmap Method

Pascal

```
function GetBitmap: TBitmap;
```

C++

```
__fastcall TBitmap GetBitmap();
```

Description

This is GetBitmap, a member of class TBrush.

8.1.5.4.3 TBrush.GetColor Method

Pascal

```
function GetColor: TColor;
```

C++

```
__fastcall TColor GetColor();
```

Description

This is GetColor, a member of class TBrush.

8.1.5.4.4 TBrush.GetHandle Method

Pascal

```
function GetHandle: HBrush;
```

C++

```
__fastcall HBrush GetHandle();
```

Description

This is GetHandle, a member of class TBrush.

8.1.5.4.5 TBrush.GetStyle Method

Pascal

```
function GetStyle: TBrushStyle;
```

C++

```
__fastcall TBrushStyle GetStyle();
```

Description

This is GetStyle, a member of class TBrush.

8.1.5.4.6 TBrush.SetBitmap Method

Pascal

```
procedure SetBitmap(Value: TBitmap);
```

C++

```
__fastcall SetBitmap(TBitmap Value);
```

Description

This is SetBitmap, a member of class TBrush.

8.1.5.4.7 TBrush.SetColor Method

Pascal

```
procedure SetColor(Value: TColor);
```

C++

```
__fastcall SetColor(TColor Value);
```

Description

This is SetColor, a member of class TBrush.

8.1.5.4.8 TBrush.SetHandle Method

Pascal

```
procedure SetHandle(Value: HBrush);
```

C++

```
__fastcall SetHandle(HBrush Value);
```

Description

This is SetHandle, a member of class TBrush.

8.1.5.4.9 TBrush.SetStyle Method

Pascal

```
procedure SetStyle(Value: TBrushStyle);
```

C++

```
__fastcall SetStyle(TBrushStyle Value);
```

Description

This is SetStyle, a member of class TBrush.

8.1.5.5 TBrush Properties

The properties of the TBrush class are listed here.

Public Properties

	Name	Description
	Bitmap (see page 2668)	Specifies an external bitmap image that defines a pattern for the brush.
	Handle (see page 2670)	Provides access to the handle of a system brush.

Published Properties

	Name	Description
	Color (see page 2669)	Indicates the color of the brush.
	Style (see page 2670)	Specifies the pattern for the brush.

8.1.5.5.1 TBrush.Bitmap Property

Specifies an external bitmap image that defines a pattern for the brush.

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Bitmap points to a TBitmap (see page 2628) object that holds a bitmap image. If Bitmap is nonempty, the bitmap image (rather than the Style (see page 2670) property) defines the brush's pattern. If the image is larger than eight pixels by eight pixels, only the top left eight-by-eight region is used.

Changing the image does not affect the brush until the TBitmap (see page 2628) is reassigned to the Bitmap property. Be sure

to free the TBitmap (see page 2628) after finishing with the brush, since TBrush (see page 2664) will not free it.

C++ Examples:

```
/*
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> BrushBmp(new Graphics::TBitmap);
  BrushBmp->LoadFromFile("../bm1.BMP");
  Form1->Canvas->Brush->Bitmap = BrushBmp.get();
  Form1->Canvas->FillRect(Rect(0,0,100,100));
  Form1->Canvas->Brush->Bitmap = NULL;
}
```

Delphi Examples:

```
{
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
}
var
  Bitmap: TBitmap;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Bitmap := TBitmap.Create;
  try
    Bitmap.LoadFromFile('bm1.BMP');
    Form1.Canvas.Brush.Bitmap := Bitmap;
    Form1.Canvas.FillRect(Rect(0,0,100,100));
  finally
    Form1.Canvas.Brush.Bitmap := nil;
    Bitmap.Free;
  end;
end;
```

See Also

TBitmap (see page 2628)

Style (see page 2670)

8.1.5.5.2 TBrush.Color Property

Indicates the color of the brush.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the color of the brush. This is the color that is used to draw the pattern represented by the Style (see page 2670) property, not the background color of the brush (unless Style (see page 2670) is bsSolid).

Note: If the value of the Style (see page 2670) property is bsClear, the Color property is ignored. Further, any value assigned to the Color property is lost when Style (see page 2670) is set to bsClear.

C++ Examples:

```
/*
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TCanvas *pCanvas = Image1->Canvas;
  pCanvas->Brush->Color = clRed;
  pCanvas->Brush->Style = bsDiagCross;
  pCanvas->Ellipse(0, 0, Image1->Width, Image1->Height);
}
```

Delphi Examples:

```
{
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  with Image1 do begin
    Canvas.Brush.Color := clRed;
    Canvas.Brush.Style := bsDiagCross;
    Canvas.Ellipse(0, 0, Image1.Width, Image1.Height);
  end;
end;
```

See Also

Style (see page 2670)

8.1.5.5.3 TBrush.Handle Property

Provides access to the handle of a system brush.

Pascal

```
property Handle: HBrush;
```

C++

```
__property HBrush Handle;
```

Description

The Handle property provides access to the Windows GDI object handle. TBrush (see page 2664) encapsulates the Windows brush object (HBRUSH) and is used to fill solid shapes, such as rectangles and ellipses, with a color or pattern.

8.1.5.5.4 TBrush.Style Property

Specifies the pattern for the brush.

Pascal

```
property Style: TBrushStyle;
```

C++

```
__property TBrushStyle Style;
```

Description

The Style property determines the pattern painted by the brush, unless a value is assigned to Bitmap (see page 2668).

Tip: Set the Style property to bsClear to eliminate flicker when the object repaints.

C++ Examples:

```
/*
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TCanvas *pCanvas = Image1->Canvas;
  pCanvas->Brush->Color = clRed;
  pCanvas->Brush->Style = bsDiagCross;
  pCanvas->Ellipse(0, 0, Image1->Width, Image1->Height);
}
```

Delphi Examples:

```
{
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  with Image1 do begin
    Canvas.Brush.Color := clRed;
    Canvas.Brush.Style := bsDiagCross;
    Canvas.Ellipse(0, 0, Image1.Width, Image1.Height);
  end;
end;
```

Bitmap (see page 2668)

Color (see page 2669)

8.1.6 TBrushRecall Class

TBrushRecall saves and restores a TBrush (see page 2664) object.

Class Hierarchy

Pascal

```
TBrushRecall = class(TRecall);
```

C++

```
class TBrushRecall : public TRecall;
```

File

Graphics

Description

Use TBrushRecall to store the current state of a TBrush (see page 2664) object. You are then free to change the current state of the brush object. To restore the brush object to its original state, all that is necessary is to free the TBrushRecall object and the brush object is automatically restored to the saved property values.

You can update the TBrushRecall instance to reflect the current properties of the TBrush (see page 2664) object by calling the Store method. You can prevent the TBrushRecall destructor from updating the TBrush (see page 2664) object by calling the Forget method.

TRecall

TBrush (see page 2664)

Using Brushes

8.1.6.1 TBrushRecall Members

The following tables list the members exposed by TBrushRecall.

Public Methods

	Name	Description
	Create (see page 2672)	Instantiates a TBrushRecall (see page 2671) object.

8.1.6.2 TBrushRecall.Create Constructor

Instantiates a TBrushRecall (see page 2671) object.

Pascal

```
constructor Create(ABrush: TBrush);
```

C++

```
__fastcall TBrushRecall(TBrush ABrush);
```

Description

Call Create to instantiate a brush recall object at runtime. Create saves the current properties of the TBrush (see page 2664) object specified by ABrush, which becomes the value of the Reference property.

Subsequent calls to the Store method take snapshots of the properties of ABrush and save them, replacing the values saved by this constructor. When you destroy the TBrushRecall (see page 2671) instance, the most recently saved properties are assigned to ABrush, restoring it to a previous state.

8.1.7 TCanvas Class

TCanvas provides an abstract drawing space for objects that must render their own images.

Class Hierarchy

Pascal

```
TCanvas = class(TPersistent);
```

C++

```
class TCanvas : public TPersistent;
```

File

Graphics

Description

Use TCanvas as a drawing surface for objects that draw an image of themselves. Standard window controls such as edit controls or list boxes do not require a canvas, as they are drawn by the system.

TCanvas provides properties, events and methods that assist in creating an image by

Specifying the type of brush, pen and font to use.

Drawing and filling a variety of shapes and lines.

Writing text.

Rendering graphic images.

Enabling a response to changes in the current image.

TCanvas has two descendants, TControlCanvas and TMetafileCanvas (see page 2794), which assist in drawing images of controls and in creating metafile images for objects.

See Also

TControlCanvas

TMetafileCanvas (see page 2794)

8.1.7.1 TCanvas Members

The following tables list the members exposed by TCanvas.

Protected Methods

	Name	Description
	Changed (see page 2681)	This is Changed, a member of class TCanvas.
	Changing (see page 2682)	This is Changing, a member of class TCanvas.
	CreateHandle (see page 2685)	This is CreateHandle, a member of class TCanvas.
	RequiredState (see page 2702)	This is RequiredState, a member of class TCanvas.

Public Events

	Name	Description
	OnChange (see page 2729)	Occurs when the image has just changed.
	OnChanging (see page 2730)	Occurs just before a change is made to the image.

Public Methods

	Name	Description
	Arc (see page 2679)	Draws an arc on the image along the perimeter of the ellipse bounded by the specified rectangle.
	BrushCopy (see page 2680)	Copies a portion of a bitmap onto a rectangle on the canvas, replacing one of the colors of the bitmap with the brush of the canvas.
	Chord (see page 2682)	Draws a closed figure represented by the intersection of a line and an ellipse.
	CopyRect (see page 2683)	Copies part of an image from another canvas into the canvas.
	Create (see page 2675)	Creates an instance of TCanvas (see page 2673).
	Destroy (see page 2678)	Destroys an instance of TCanvas (see page 2673).
	Draw (see page 2685)	This is the overview for the Draw method overload.
	DrawFocusRect (see page 2687)	Draws a rectangle in the style used to indicate that the object inside the rectangle has focus.
	Ellipse (see page 2688)	This is the overview for the Ellipse method overload.
	FillRect (see page 2689)	Fills the specified rectangle on the canvas using the current brush.
	FloodFill (see page 2690)	Fills an area of the canvas using the current brush.
	FrameRect (see page 2692)	Draws a rectangle using the Brush (see page 2716) of the canvas to draw the border.
	HandleAllocated (see page 2693)	Indicates whether the TCanvas (see page 2673) object has acquired a handle to a device context.
	LineTo (see page 2693)	Draws a line on the canvas from PenPos (see page 2727) to the point specified by X and Y, and sets the pen position to (X, Y).
	Lock (see page 2694)	Prevents other threads from drawing on the canvas.
	MoveTo (see page 2695)	Changes the current drawing position to the point (X,Y).
	Pie (see page 2695)	Draws a pie-shaped the section of the ellipse bounded by the rectangle (X1, Y1) and (X2, Y2) on the canvas.
	PolyBezier (see page 2696)	Draws a set of Bezier curves.
	PolyBezierTo (see page 2697)	Draws a set of Bezier curves and updates the value of PenPos (see page 2727).
	Polygon (see page 2697)	Draws a series of lines on the canvas connecting the points passed in and closing the shape by drawing a line from the last point to the first point.
	Polyline (see page 2698)	Draws a series of lines on the canvas with the current pen, connecting each of the points passed to it in Points.
	Rectangle (see page 2700)	This is the overview for the Rectangle method overload.
	Refresh (see page 2701)	Deselects the Pen (see page 2725), Brush (see page 2716), and Font (see page 2721) from the device context.
	RoundRect (see page 2702)	This is the overview for the RoundRect method overload.
	StretchDraw (see page 2704)	Draws the graphic specified by the Graphic parameter in the rectangle specified by the Rect parameter.
	TextExtent (see page 2705)	Returns the width and height, in pixels, of a string rendered in the current font.
	TextHeight (see page 2706)	Returns the height, in pixels, of a string rendered in the current font.
	TextOut (see page 2707)	Writes a string on the canvas, starting at the point (X,Y), and then updates the PenPos (see page 2727) to the end of the string.
	TextRect (see page 2713)	This is the overview for the TextRect method overload.
	TextWidth (see page 2714)	Returns the width, in pixels, of a string rendered in the current font.
	TryLock (see page 2715)	Locks the canvas if it is currently unlocked.
	Unlock (see page 2716)	Decreases the LockCount (see page 2725) property, allowing other threads to execute when LockCount (see page 2725) reaches 0.

Public Properties

	Name	Description
R	CanvasOrientation (see page 2718)	Determines the orientation of the canvas as left-to-right or right-to-left.
R	ClipRect (see page 2718)	Read-only property that specifies the boundaries of the clipping rectangle.

	Handle (see page 2722)	Specifies the handle for this canvas.
R	LockCount (see page 2725)	Indicates the number of times the canvas has been locked to prevent interference from other threads.
	PenPos (see page 2727)	Specifies the current drawing position of the Pen (see page 2725).
	Pixels (see page 2727)	Specifies the color of the pixels within the current ClipRect (see page 2718).
	TextFlags (see page 2728)	Specifies how text is written to the canvas.

Published Properties

	Name	Description
	Brush (see page 2716)	Determines the color and pattern for filling graphical shapes and backgrounds.
	CopyMode (see page 2719)	Specifies how a graphical image is copied onto the canvas.
	Font (see page 2721)	Specifies the font to use when writing text on the image.
	Pen (see page 2725)	Specifies the kind of pen the canvas uses for drawing lines and outlining shapes.

8.1.7.2 TCanvas.Create Constructor

Creates an instance of TCanvas (see page 2673).

Pascal

```
constructor Create;
```

C++

```
__fastcall TCanvas();
```

Description

Call Create to instantiate a TCanvas (see page 2673) object at runtime. Create allocates memory for the instance of TCanvas (see page 2673) and creates the TFont (see page 2730), TBrush (see page 2664) and TPen (see page 2801) objects for the Font (see page 2721), Brush (see page 2716), and Pen (see page 2725) properties. Create also initializes the CopyMode (see page 2719) to cmSrcCopy (see page 2972).

C++ Examples:

```
/*
The GetFormImage allows you to easily obtain a bitmap of a
form. The following method can be added to a custom
TWinControl descendant to save itself as a bitmap.  Check the
produced BMP file to confirm.  Click the button and them
double click on the newly created foo.bmp file to view.
*/

#include <memory>       //for STL auto_ptr class

class TMyControl : public TColorListBox
{
__published:    // IDE-managed Components
    void __fastcall SaveAsBmp(TFileName fileName);
private:    // User declarations
public:     // User declarations
    __fastcall TMyControl(TComponent* Owner);
};

TForm1 *Form1;
TMyControl *MyControl1;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyControl::TMyControl(TComponent* Owner)
```

```
    : TColorListBox(Owner)
{
}

typedef struct {
  TLogPalette lpal;
  TPaletteEntry dummy[256];
} LogPal;

void __fastcall TMyControl::SaveAsBmp(TFileName fileName)
{
  std::auto_ptr<TCanvas> tempCanvas(new TCanvas);
  HWND notUsed;
  tempCanvas->Handle = GetDeviceContext(notUsed);
  std::auto_ptr<TImage> image2save(new TImage(Form1)); // The owner will clean this up.
  image2save->Height = Height;
  image2save->Width = Width;
  TRect destRect = Rect(0,0,Width,Height);
  TRect sourceRect = destRect;
  image2save->Canvas->CopyRect(destRect, tempCanvas.get(), sourceRect);
  LogPal SysPal;
  SysPal.lpal.palVersion = 0x300;
  SysPal.lpal.palNumEntries = 256;
  GetSystemPaletteEntries(tempCanvas->Handle,0,256,SysPal.lpal.palPalEntry);
  image2save->Picture->Bitmap->Palette =
    CreatePalette(dynamic_cast<const tagLOGPALETTE *>(&SysPal.lpal));
  image2save->Picture->SaveToFile(fileName);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  static_cast<TMyControl*>(MyControl1)->SaveAsBmp("../foo.bmp");
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TMyControl* control = new TMyControl(Form1); // The owner will clean this up.

  MyControl1 = control;
  control->Parent = this;
  control->Visible = true;
}
```

Delphi Examples:

```
{
The GetFormImage allows you to easily obtain a bitmap of a
form. The following method can be added to a custom
TWinControl descendant to save itself as a bitmap.  Check the
produced BMP file to confirm.  Click the button and then
double click on the newly created foo.bmp file to view.
}
type
  TMyControl = class(TColorListBox)
    procedure SaveAsBmp(fileName: TFileName);
  end;
  TForm1 = class(TForm)
    Button1: TButton;
    procedure Button1Click(Sender: TObject);
    procedure FormCreate(Sender: TObject);
  private
    { Private declarations }
  public
    { Public declarations }
  end;

var
```

```
    Form1: TForm1;
    MyControl1: TMyControl;
  implementation

  {$R *.dfm}

  type
    LogPal = record

    image2save: TImage;
    notUsed: HWND;
  begin
    tempCanvas := TCanvas.Create;
    try
      tempCanvas.Handle := GetDeviceContext(notUsed);
      image2save:=TImage.create(self);
      try
        with image2save do
        begin
          Height := Self.Height;
          Width :=  Self.Width;
          destRect := Rect(0,0,Width,Height);
          sourceRect := destRect;
          Canvas.CopyRect(destRect,tempCanvas,sourceRect);
          SysPal.lPal.palVersion:=$300;
          SysPal.lPal.palNumEntries:=256;
          GetSystemPaletteEntries(
            tempCanvas.Handle,0,256,SysPal.lpal.palPalEntry);
          Picture.Bitmap.Palette:= CreatePalette(Syspal.lpal);
        end;
        image2save.Picture.SaveToFile(fileName);
      finally
       image2save.Free;
      end;
    finally
      tempCanvas.Free;
    end;
  end;
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    MyControl1.SaveAsBmp('foo.bmp');
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    MyControl1:= TMyControl.Create(Form1);
    MyControl1.Parent:= Form1;
    MyControl1.visible := true;
  end;
```

8.1.7.3 TCanvas.Destroy Destructor

Destroys an instance of TCanvas (see page 2673).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCanvas();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCanvas (see page 2673) object is not nil and only then calls Destroy.

8.1.7.4 TCanvas Methods

The methods of the TCanvas class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2681)	This is Changed, a member of class TCanvas.
	Changing (see page 2682)	This is Changing, a member of class TCanvas.
	CreateHandle (see page 2685)	This is CreateHandle, a member of class TCanvas.
	RequiredState (see page 2702)	This is RequiredState, a member of class TCanvas.

Public Methods

	Name	Description
	Arc (see page 2679)	Draws an arc on the image along the perimeter of the ellipse bounded by the specified rectangle.
	BrushCopy (see page 2680)	Copies a portion of a bitmap onto a rectangle on the canvas, replacing one of the colors of the bitmap with the brush of the canvas.
	Chord (see page 2682)	Draws a closed figure represented by the intersection of a line and an ellipse.
	CopyRect (see page 2683)	Copies part of an image from another canvas into the canvas.
	Draw (see page 2685)	This is the overview for the Draw method overload.

	DrawFocusRect (see page 2687)	Draws a rectangle in the style used to indicate that the object inside the rectangle has focus.
	Ellipse (see page 2688)	This is the overview for the Ellipse method overload.
	FillRect (see page 2689)	Fills the specified rectangle on the canvas using the current brush.
	FloodFill (see page 2690)	Fills an area of the canvas using the current brush.
	FrameRect (see page 2692)	Draws a rectangle using the Brush (see page 2716) of the canvas to draw the border.
	HandleAllocated (see page 2693)	Indicates whether the TCanvas (see page 2673) object has acquired a handle to a device context.
	LineTo (see page 2693)	Draws a line on the canvas from PenPos (see page 2727) to the point specified by X and Y, and sets the pen position to (X, Y).
	Lock (see page 2694)	Prevents other threads from drawing on the canvas.
	MoveTo (see page 2695)	Changes the current drawing position to the point (X,Y).
	Pie (see page 2695)	Draws a pie-shaped the section of the ellipse bounded by the rectangle (X1, Y1) and (X2, Y2) on the canvas.
	PolyBezier (see page 2696)	Draws a set of Bezier curves.
	PolyBezierTo (see page 2697)	Draws a set of Bezier curves and updates the value of PenPos (see page 2727).
	Polygon (see page 2697)	Draws a series of lines on the canvas connecting the points passed in and closing the shape by drawing a line from the last point to the first point.
	Polyline (see page 2698)	Draws a series of lines on the canvas with the current pen, connecting each of the points passed to it in Points.
	Rectangle (see page 2700)	This is the overview for the Rectangle method overload.
	Refresh (see page 2701)	Deselects the Pen (see page 2725), Brush (see page 2716), and Font (see page 2721) from the device context.
	RoundRect (see page 2702)	This is the overview for the RoundRect method overload.
	StretchDraw (see page 2704)	Draws the graphic specified by the Graphic parameter in the rectangle specified by the Rect parameter.
	TextExtent (see page 2705)	Returns the width and height, in pixels, of a string rendered in the current font.
	TextHeight (see page 2706)	Returns the height, in pixels, of a string rendered in the current font.
	TextOut (see page 2707)	Writes a string on the canvas, starting at the point (X,Y), and then updates the PenPos (see page 2727) to the end of the string.
	TextRect (see page 2713)	This is the overview for the TextRect method overload.
	TextWidth (see page 2714)	Returns the width, in pixels, of a string rendered in the current font.
	TryLock (see page 2715)	Locks the canvas if it is currently unlocked.
	Unlock (see page 2716)	Decreases the LockCount (see page 2725) property, allowing other threads to execute when LockCount (see page 2725) reaches 0.

8.1.7.4.1 TCanvas.Arc Method

Draws an arc on the image along the perimeter of the ellipse bounded by the specified rectangle.

Pascal

```
procedure Arc(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer; X3: Integer; Y3: Integer;
X4: Integer; Y4: Integer);
```

C++

```
__fastcall Arc(int X1, int Y1, int X2, int Y2, int X3, int Y3, int X4, int Y4);
```

Description

Use Arc to draw an elliptically curved line with the current Pen (see page 2725). The arc traverses the perimeter of an ellipse that is bounded by the points (X1,Y1) and (X2,Y2). The arc is drawn following the perimeter of the ellipse, counterclockwise, from the starting point to the ending point. The starting point is defined by the intersection of the ellipse and a line defined by the center of the ellipse and (X3,Y3). The ending point is defined by the intersection of the ellipse and a line defined by the center of the ellipse and (X4, Y4).

Note: On Windows 9x or Windows ME, the sums X1 + X2 and Y1 + Y2 cannot exceed 32768. Also, the sum X1 + X2 + Y1 + Y2 cannot exceed 32768.

On NT or Windows 2000, the drawing direction can be changed to clockwise using the Windows API call SetArcDirection.

C++ Examples:

```
/*
The following lines of code draw the top quarter of an arc
bounded by the current window:
*/
void __fastcall TForm1::FormPaint(TObject *Sender)
{
  TRect R = GetClientRect();  // Gets the rectangular
                              // coordinates of
                              // the current window.
  Canvas->Arc(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
}
```

Delphi Examples:

```
{
The following lines of code draw the top quarter of an arc
bounded by the current window:
}
procedure TForm1.FormPaint(Sender: TObject);
var
  R: TRect;
begin
  R := GetClientRect;   { Gets the boundaries of the current window }
  Canvas.Arc(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
end;
```

See Also

Ellipse (see page 2688)

Pen (see page 2725)

8.1.7.4.2 TCanvas.BrushCopy Method

Copies a portion of a bitmap onto a rectangle on the canvas, replacing one of the colors of the bitmap with the brush of the canvas.

Pascal

```
procedure BrushCopy(const Dest: TRect; Bitmap: TBitmap; const Source: TRect; Color: TColor);
```

C++

```
__fastcall BrushCopy(const TRect Dest, TBitmap Bitmap, const TRect Source, TColor Color);
```

Description

Use BrushCopy to achieve special effects such as making the copied image partially transparent. BrushCopy is provided mainly for backward compatibility. Use a TImageList instead of BrushCopy.

Dest specifies the rectangular portion of the canvas that will receive the copy of the bitmap. Bitmap specifies the graphic to copy from. Source specifies the rectangular area of Bitmap to copy. Color specifies the color in Bitmap to replace with the Brush (see page 2716) of the canvas.

To use BrushCopy to make the copied image partially transparent, specify the color of the surface of the canvas (clBackground (see page 2899) for example) as the Color of the Brush (see page 2716) property, then call BrushCopy.

C++ Examples:

```
/*
The following code illustrates the differences between
CopyRect and BrushCopy. The bitmap graphic 'FACTORY.BMP' is
```

```
loaded into Bitmap and displayed on the Canvas of Form1.
BrushCopy replaces the color black in the graphic with the
brush of the canvas, while CopyRect leaves the colors intact.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TRect MyRect = Rect(10,10,100,100);
  TRect MyOther = Rect(10,111,100, 201);
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap);
  Bitmap->LoadFromFile("c:/Program Files/Common Files/CodeGear
Shared/Images/Splash/256color/factory.bmp");
  Form1->Canvas->BrushCopy(MyRect, Bitmap.get(), MyRect, clBlack);
  Form1->Canvas->CopyRect(MyOther, Bitmap->Canvas, MyRect);
}
```

Delphi Examples:

```
{
The following code illustrates the differences between
CopyRect and BrushCopy. The bitmap graphic 'FACTORY.BMP' is
loaded into Bitmap and displayed on the Canvas of Form1.
BrushCopy replaces the color black in the graphic with the
brush of the canvas, while CopyRect leaves the colors intact.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap: TBitmap;
  MyRect, MyOther: TRect;
begin
  MyRect := Rect(10,10,150,150);
  MyOther := Rect(10,161,150,301);
  Bitmap := TBitmap.Create;
  Bitmap.LoadFromFile(
    'c:\Program Files\Common Files\CodeGear Shared\Images\Splash\256color\factory.bmp');
  Form1.Canvas.BrushCopy(MyRect, Bitmap, MyRect, clBlack);
  Form1.Canvas.CopyRect(MyOther,Bitmap.Canvas,MyRect);
  Bitmap.Free;
end;
```

8.1.7.4.3 TCanvas.Changed Method

Pascal

```
procedure Changed; virtual;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class TCanvas.

8.1.7.4.4 TCanvas.Changing Method

Pascal

```
procedure Changing; virtual;
```

C++

```
virtual __fastcall Changing();
```

Description

This is Changing, a member of class TCanvas.

8.1.7.4.5 TCanvas.Chord Method

Draws a closed figure represented by the intersection of a line and an ellipse.

Pascal

```
procedure Chord(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer; X3: Integer; Y3: Integer;
X4: Integer; Y4: Integer);
```

C++

```
__fastcall Chord(int X1, int Y1, int X2, int Y2, int X3, int Y3, int X4, int Y4);
```

Description

Use Chord to create a shape that is defined by an arc and a line that joins the endpoints of the arc. The chord consists of a portion of an ellipse that is bounded by the points (X1,Y1) and (X2,Y2). The ellipse is bisected by a line that runs between the points (X3,Y3) and (X4,Y4).

The perimeter of the chord runs counter clockwise from (X3, Y3), counterclockwise along the ellipse to (X4,Y4), and straight back to (X3,Y3). If (X3,Y3) and (X4,Y4) are not on the surface of the ellipse, the corresponding corners on the chord are the closest points on the perimeter that intersect the line. The outline of the chord is drawn using the value of Pen (see page 2725), and the shape is filled using the value of Brush (see page 2716).

Note: On Windows 9x or Windows ME, the sums X1 + X2 and Y1 + Y2 cannot exceed 32768. Also, the sum X1 + X2 + Y1 + Y2 cannot exceed 32768.

On NT, the drawing direction can be changed to clockwise using the Windows API call SetArcDirection.

C++ Examples:

```
/*
This code draws a chord on the top of an ellipse bounded by
the current window.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TRect R = GetClientRect();  //Get coordinates of the current window.
  Canvas->Chord(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
}
```

Delphi Examples:

```
{
This code draws a chord on the top of an ellipse bounded by
the current window.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  R: TRect;
begin
  R := GetClientRect;  { Get coordinates of the current window. }
  Canvas.Chord(R.Left, R.Top, R.Right, R.Bottom, R.Right, R.Top, R.Left, R.Top);
end;
```

8.1.7.4.6 TCanvas.CopyRect Method

Copies part of an image from another canvas into the canvas.

Pascal

```
procedure CopyRect(const Dest: TRect; Canvas: TCanvas; const Source: TRect);
```

C++

```
__fastcall CopyRect(const TRect Dest, TCanvas Canvas, const TRect Source);
```

Description

Use CopyRect to transfer part of the image on another canvas to the image of the TCanvas (see page 2673) object. Dest specifies the rectangle on the canvas where the source image will be copied. The Canvas parameter specifies the canvas with the source image. Source specifies a rectangle bounding the portion of the source canvas that will be copied.

The portion of the source canvas is copied using the mode specified by CopyMode (see page 2719).

C++ Examples:

```
/*
The following code illustrates the differences between
CopyRect and BrushCopy. The bitmap graphic 'FACTORY.BMP' is
loaded into Bitmap and displayed on the Canvas of Form1.
BrushCopy replaces the color black in the graphic with the
brush of the canvas, while CopyRect leaves the colors intact.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TRect MyRect = Rect(10,10,100,100);
  TRect MyOther = Rect(10,111,100, 201);
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap);
  Bitmap->LoadFromFile("c:/Program Files/Common Files/CodeGear
Shared/Images/Splash/256color/factory.bmp");
  Form1->Canvas->BrushCopy(MyRect, Bitmap.get(), MyRect, clBlack);
  Form1->Canvas->CopyRect(MyOther, Bitmap->Canvas, MyRect);
}
/*
The following example uses the CopyMode of an image's canvas
to blank out the image when the user chooses the "Cut" menu
item.  This example requires a Main menu with a Copy and a
Cut menu item that have their OnClick error handlers populated.
Note: CopyMode and CopyRect are members of the destination
canvas.
```

```
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
    TRect SrcRect, DstRect;
    Image2->Canvas->CopyMode = cmSrcCopy;
    DstRect = Rect(0, 0, Image2->Width, Image2->Height);
    SrcRect = Rect(0, 0, Image1->Width, Image1->Height);
    Image2->Canvas->CopyRect(DstRect, Image1->Canvas, SrcRect);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
 TRect r;
 Copy1Click(Sender); // Do the same thing as the copy menu item.
 Image1->Canvas->CopyMode = cmWhiteness;
 r = Rect(0, 0, Image1->Width, Image1->Height);
 Image1->Canvas->CopyRect(r, Image1->Canvas, r);
 Image1->Canvas->CopyMode = cmSrcCopy; // Restore the copy mode.
}
```

Delphi Examples:

```
{
The following code illustrates the differences between
CopyRect and BrushCopy. The bitmap graphic 'FACTORY.BMP' is
loaded into Bitmap and displayed on the Canvas of Form1.
BrushCopy replaces the color black in the graphic with the
brush of the canvas, while CopyRect leaves the colors intact.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap: TBitmap;
  MyRect, MyOther: TRect;
begin
  MyRect := Rect(10,10,150,150);
  MyOther := Rect(10,161,150,301);
  Bitmap := TBitmap.Create;
  Bitmap.LoadFromFile(
    'c:\Program Files\Common Files\CodeGear Shared\Images\Splash\256color\factory.bmp');
  Form1.Canvas.BrushCopy(MyRect, Bitmap, MyRect, clBlack);
  Form1.Canvas.CopyRect(MyOther,Bitmap.Canvas,MyRect);
  Bitmap.Free;
end;
{
The following example uses the CopyMode of an image's canvas
to blank out the image when the user chooses the "Cut" menu
item.  This example requires a Main menu with a Copy and a
Cut menu item that have their OnClick error handlers populated.
Note: CopyMode and CopyRect are members of the destination
canvas.
}
procedure TForm1.Copy1Click(Sender: TObject);
var
  DstRect, SrcRect: TRect;
begin
  with Image2.Canvas do
  begin
    CopyMode := cmSrcCopy;
    DstRect := Rect(0, 0, Image2.Width, Image2.Height);
    SrcRect := Rect(0, 0, Image1.Width, Image1.Height);
    CopyRect(DstRect, Image1.Canvas, SrcRect);
  end;
end;

procedure TForm1.Cut1Click(Sender: TObject);
var
  ARect: TRect;
```

```
begin
  Copy1Click(Sender); { do the same thing as the copy menu item }
  with Image1.Canvas do
  begin
    CopyMode := cmWhiteness;
    ARect := Rect(0, 0, Image1.Width, Image1.Height);
    CopyRect(ARect, Image1.Canvas, ARect);
    CopyMode := cmSrcCopy; { restore the copy mode }
  end;
end;
```

8.1.7.4.7 TCanvas.CreateHandle Method

Pascal

```
procedure CreateHandle; virtual;
```

C++

```
virtual __fastcall CreateHandle();
```

Description

This is CreateHandle, a member of class TCanvas.

8.1.7.4.8 Draw Method

This is the overview for the Draw method overload.

Overload List

	Name	Description
	TCanvas.Draw (Integer, Integer, TGraphic) (see page 2685)	Renders the graphic specified by the Graphic parameter on the canvas at the location given by the coordinates (X, Y).
	TCanvas.Draw (Integer, Integer, TGraphic, Byte) (see page 2685)	Renders the graphic specified by the Graphic parameter on the canvas at the location given by the coordinates (X, Y).

8.1.7.4.8.1 TCanvas.Draw Method (Integer, Integer, TGraphic)

Renders the graphic specified by the Graphic parameter on the canvas at the location given by the coordinates (X, Y).

Pascal

```
procedure Draw(X: Integer; Y: Integer; Graphic: TGraphic); overload;
procedure Draw(X: Integer; Y: Integer; Graphic: TGraphic; Opacity: Byte); overload;
```

C++

```
__fastcall Draw(int X, int Y, TGraphic Graphic);
__fastcall Draw(int X, int Y, TGraphic Graphic, Byte Opacity);
```

Description

Call Draw to draw a graphic on the canvas. Draw calls the Draw method of the graphic. The image is rendered into a rectangle determined by the size of the graphic, with the upper left corner at the point (X, Y).

Graphics (see page 2619) can be bitmaps, icons, or metafiles. If the graphic is a TBitmap (see page 2628) object, the bitmap is rendered using the value of CopyMode (see page 2719).

C++ Examples:

```
/*
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PaintBox1->Canvas->Draw(0,0, Image1->Picture->Graphic);
}
/*
An examples of TBitmap Color, TGraphic Transparent, TBitmap
TransparentMode, TBitmap TransparentColor and TCanvas Draw.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bitmap(new Graphics::TBitmap);
  try
  {
    bitmap->LoadFromFile("..\\FACTORY.BMP ");
    bitmap->Transparent = true;
    bitmap->TransparentColor = bitmap->Canvas->Pixels[50][50];
    Form1->Canvas->Draw( 0, 0, bitmap.get());
    bitmap->TransparentMode = tmAuto;
    Form1->Canvas->Draw(50, 50, bitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or display bitmap");
  }
}
```

Delphi Examples:

```
{
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  PaintBox1.Canvas.Draw(0,0, Image1.Picture.Graphic);
end;
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitMap;
begin
  Bitmap := TBitmap.Create;
  try
    with Bitmap do begin
      LoadFromFile('factory.bmp');
      Transparent := True;
      TransParentColor := BitMap.canvas.pixels[50,50];
      Form1.Canvas.Draw(0,0,BitMap);
      TransparentMode := tmAuto;
      Form1.Canvas.Draw(50,50,BitMap);
    end;
  finally
    Bitmap.Free;
  end;
```

```
end;
```

8.1.7.4.9 TCanvas.DrawFocusRect Method

Draws a rectangle in the style used to indicate that the object inside the rectangle has focus.

Pascal

```
procedure DrawFocusRect(const Rect: TRect);
```

C++

```
__fastcall DrawFocusRect(const TRect Rect);
```

Description

Call DrawFocusRect for the perimeter of the image of a control when the control gets or loses input focus. Because DrawFocusRect uses an XOR function, calling it a second time while specifying the same rectangle removes the rectangle from the screen.

The rectangle this function draws cannot be scrolled. To scroll an area containing a rectangle drawn by DrawFocusRect, call DrawFocusRect to remove the rectangle from the screen, scroll the area, and then call DrawFocusRect to draw the rectangle in the new position.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

8.1.7.4.10 Ellipse Method

This is the overview for the Ellipse method overload.

Overload List

	Name	Description
	TCanvas.Ellipse (Integer, Integer, Integer, Integer) (see page 2688)	Draws the ellipse defined by a bounding rectangle on the canvas.
	TCanvas.Ellipse (TRect) (see page 2688)	Draws the ellipse defined by a bounding rectangle on the canvas.

8.1.7.4.10.1 TCanvas.Ellipse Method (Integer, Integer, Integer, Integer)

Draws the ellipse defined by a bounding rectangle on the canvas.

Pascal

```
procedure Ellipse(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer); overload;
procedure Ellipse(const Rect: TRect); overload;
```

C++

```
__fastcall Ellipse(int X1, int Y1, int X2, int Y2);
```

```
__fastcall Ellipse(const TRect Rect);
```

Description

Call Ellipse to draw a circle or ellipse on the canvas. Specify the bounding rectangle either by giving

The top left point at pixel coordinates (X1, Y1) and the bottom right point at (X2, Y2).

A TRect value.

If the bounding rectangle is a square, a circle is drawn.

The ellipse is outlined using the value of Pen (see page 2725), and filled using the value of Brush (see page 2716).

Note: On Windows 9x or Windows ME, the sums X1 + X2 and Y1 + Y2 cannot exceed 32768. Also, the sum X1 + X2 + Y1 + Y2 cannot exceed 32768.

C++ Examples:

```
/*
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TCanvas *pCanvas = Image1->Canvas;
  pCanvas->Brush->Color = clRed;
  pCanvas->Brush->Style = bsDiagCross;
  pCanvas->Ellipse(0, 0, Image1->Width, Image1->Height);
}
```

Delphi Examples:

```
{
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  with Image1 do begin
    Canvas.Brush.Color := clRed;
    Canvas.Brush.Style := bsDiagCross;
    Canvas.Ellipse(0, 0, Image1.Width, Image1.Height);
  end;
end;
```

8.1.7.4.11 TCanvas.FillRect Method

Fills the specified rectangle on the canvas using the current brush.

Pascal

```
procedure FillRect(const Rect: TRect);
```

C++

```
__fastcall FillRect(const TRect Rect);
```

Description

Use FillRect to fill a rectangular region using the current brush. The region is filled including the top and left sides of the rectangle, but excluding the bottom and right edges.

C++ Examples:

```
/*
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> BrushBmp(new Graphics::TBitmap);
  BrushBmp->LoadFromFile("../bm1.BMP");
  Form1->Canvas->Brush->Bitmap = BrushBmp.get();
  Form1->Canvas->FillRect(Rect(0,0,100,100));
  Form1->Canvas->Brush->Bitmap = NULL;
}
```

Delphi Examples:

```
{
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
}
var
  Bitmap: TBitmap;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Bitmap := TBitmap.Create;
  try
    Bitmap.LoadFromFile('bm1.BMP');
    Form1.Canvas.Brush.Bitmap := Bitmap;
    Form1.Canvas.FillRect(Rect(0,0,100,100));
  finally
    Form1.Canvas.Brush.Bitmap := nil;
    Bitmap.Free;
  end;
end;
```

See Also

FloodFill (see page 2690)

8.1.7.4.12 TCanvas.FloodFill Method

Fills an area of the canvas using the current brush.

Pascal

```
procedure FloodFill(X: Integer; Y: Integer; Color: TColor; FillStyle: TFillStyle);
```

C++

```
__fastcall FloodFill(int X, int Y, TColor Color, TFillStyle FillStyle);
```

Description

Use FloodFill to fill a possibly non-rectangular region of the image with the value of Brush (see page 2716). The boundaries of the region to be filled are determined by moving outward from the point (X,Y) until a color boundary involving the Color parameter is encountered.

X and X are the coordinates on the canvas where filling starts.

Color is the color that defines the boundary of the region to fill. Its interpretation depends on the value of FillStyle.

FillStyle specifies whether the region is defined by all pixels with the same value as Color, or all points with a different value.

Tip: Use the Pixels (see page 2727) property to get the exact value of the color at the point (X,Y) when using a FillStyle of fsSurface. Similarly, when FillStyle is fsBorder, use Pixels (see page 2727) to get the exact value of the boundary color if a point on the boundary is known.

C++ Examples:

```
/*
The following code floodfills from the center point of
Form1's client area until the color black is encountered:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Canvas->Brush->Color = clBlue;
  Canvas->Brush->Style = bsDiagCross;
  Canvas->FloodFill(
    ClientWidth/2, ClientHeight/2, clBlack, fsBorder);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  int ewidth = 400;
  int eheight = 200;
  Canvas->Brush->Color = clRed;
  Canvas->Pen->Color = clBlack;
  Canvas->Ellipse(
    (ClientWidth - ewidth)/2,
    (ClientHeight - eheight)/2,
    ewidth, eheight);
}
```

Delphi Examples:

```
{
The following code floodfills from the center point of
Form1's client area until the color black is encountered:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Canvas.Brush.Color := clBlue;
  Canvas.Brush.Style := bsDiagCross;
  Canvas.FloodFill(
    ClientWidth div 2, ClientHeight div 2, clBlack, fsBorder);
end;

procedure TForm1.Button2Click(Sender: TObject);
var ewidth, eheight: integer;
begin
  ewidth := 400;
  eheight := 200;
  Canvas.Brush.Color := clRed;
  Canvas.Pen.Color := clBlack;
  Canvas.Ellipse(
```

```
    (ClientWidth - ewidth) div 2,
    (ClientHeight - eheight) div 2,
    ewidth, eheight);
end;
```

FillRect (see page 2689)

Pixels (see page 2727)

8.1.7.4.13 TCanvas.FrameRect Method

Draws a rectangle using the Brush (see page 2716) of the canvas to draw the border.

Pascal

```
procedure FrameRect(const Rect: TRect);
```

C++

```
__fastcall FrameRect(const TRect Rect);
```

Description

Use FrameRect to draw a 1 pixel wide border around a rectangular region. FrameRect does not fill the interior of the rectangle with the Brush (see page 2716) pattern.

To draw a boundary using the Pen (see page 2725) instead, use the Polygon (see page 2697) method.

C++ Examples:

```
/*
The following code displays the text "Hello, world!" in a
rectangle defined by the coordinates (10, 10) and (100, 100).
After displaying the text with the TextRect method, the code
draws a black, vertical line frame around the rectangle.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TRect TheRect = Rect(10,10,100,100);
  Canvas->TextRect(TheRect, 10, 10, "Hello World");
  Canvas->Brush->Color = clBlack;
  Canvas->FrameRect(TheRect);
}
```

Delphi Examples:

```
{
The following code displays the text "Hello, world!" in a
rectangle defined by the coordinates (10, 10) and (100, 100).
After displaying the text with the TextRect method, the code
draws a black, vertical line frame around the rectangle.
}
procedure TForm1.Button1Click(Sender: TObject);
var TheRect: TRect;
begin
  TheRect := Rect(10,10,100,100);
  Form1.Canvas.TextRect(TheRect,10,10,'Hello, world!');
  Form1.Canvas.Brush.Color := clBlack;
  Form1.Canvas.FrameRect(TheRect);
end;
```

Rectangle (see page 2700)

RoundRect (see page 2702)

8.1.7.4.14 TCanvas.HandleAllocated Method

Indicates whether the TCanvas (see page 2673) object has acquired a handle to a device context.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine whether the Handle (see page 2722) property is set to an HDC value. HandleAllocated indicates whether the canvas has acquired a device context. Use HandleAllocated rather than reading the Handle (see page 2722) property. When an application reads the Handle (see page 2722) property, TCanvas (see page 2673) automatically allocates a new device context and returns its handle if the property had not been previously set.

See Also

Handle (see page 2722)

8.1.7.4.15 TCanvas.LineTo Method

Draws a line on the canvas from PenPos (see page 2727) to the point specified by X and Y, and sets the pen position to (X, Y).

Pascal

```
procedure LineTo(X: Integer; Y: Integer);
```

C++

```
__fastcall LineTo(int X, int Y);
```

Description

Use LineTo to draw a line from PenPos (see page 2727) up to, but not including the point (X,Y). LineTo changes the value of PenPos (see page 2727) to (X,Y).

The line is drawn using Pen (see page 2725).

Note: If the current Pen (see page 2725) does not have a style of psSolid, the line is drawn with a background specified by the current brush.

C++ Examples:

```
/*
The following code draws a line from the upper left corner
of a form to the mouse position when the mouse is moved,
creating a "rubber band" effect.
*/
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  /* first call FillRect to paint the surface of the form.
  this removes any previously drawn lines (and anything else!) */
```

```
  Canvas->FillRect(ClientRect);
  Canvas->MoveTo(0, 0);
  Canvas->LineTo(X, Y);
}
```

Delphi Examples:

```
{
The following code draws a line from the upper left corner
of a form to the mouse position when the mouse is moved,
creating a "rubber band" effect.
}
procedure TForm1.FormMouseMove(
  Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  { first call FillRect to paint the surface of the form.
  this removes any previously drawn lines (and anything else!) }
  Canvas.FillRect(ClientRect);
  Canvas.MoveTo(0, 0);
  Canvas.LineTo(X, Y);
end;
```

See Also

Pen (see page 2725)

PenPos (see page 2727)

Polyline (see page 2698)

Style (see page 2808)

Brush (see page 2716)

8.1.7.4.16 TCanvas.Lock Method

Prevents other threads from drawing on the canvas.

Pascal

```
procedure Lock;
```

C++

```
__fastcall Lock();
```

Description

Call Lock in a multithreaded application to prevent other threads from drawing on the canvas. Lock prevents other cooperating threads in the application from executing until the Unlock (see page 2716) method is called. Nested calls to Lock increment the LockCount (see page 2725) property so that the canvas is not unlocked until the last lock is released.

In multi-threaded applications that use Lock to protect a canvas, all calls that use the canvas must be protected by a call to Lock. Any thread that does not lock the canvas before using it will introduce potential bugs.

Because Lock prevents other threads from executing, it can adversely affect performance. Do not call Lock unless there is a danger that another thread might interfere with drawing on the canvas.

See Also

LockCount (see page 2725)

TryLock (see page 2715)

Unlock (see page 2716)

Locking Objects

8.1.7.4.17 TCanvas.MoveTo Method

Changes the current drawing position to the point (X,Y).

Pascal

```
procedure MoveTo(X: Integer; Y: Integer);
```

C++

```
__fastcall MoveTo(int X, int Y);
```

Description

Use MoveTo to set the value of PenPos (see page 2727) before calling LineTo (see page 2693). Calling MoveTo is equivalent to setting the PenPos (see page 2727) property.

C++ Examples:

```
/*
The following code draws a line from the upper left corner
of a form to the mouse position when the mouse is moved,
creating a "rubber band" effect.
*/
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  /* first call FillRect to paint the surface of the form.
  this removes any previously drawn lines (and anything else!) */
  Canvas->FillRect(ClientRect);
  Canvas->MoveTo(0, 0);
  Canvas->LineTo(X, Y);
}
```

Delphi Examples:

```
{
The following code draws a line from the upper left corner
of a form to the mouse position when the mouse is moved,
creating a "rubber band" effect.
}
procedure TForm1.FormMouseMove(
  Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  { first call FillRect to paint the surface of the form.
  this removes any previously drawn lines (and anything else!) }
  Canvas.FillRect(ClientRect);
  Canvas.MoveTo(0, 0);
  Canvas.LineTo(X, Y);
end;
```

See Also

LineTo (see page 2693)

PenPos (see page 2727)

8.1.7.4.18 TCanvas.Pie Method

Draws a pie-shaped the section of the ellipse bounded by the rectangle (X1, Y1) and (X2, Y2) on the canvas.

Pascal

```
procedure Pie(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer; X3: Integer; Y3: Integer;
X4: Integer; Y4: Integer);
```

C++

```
__fastcall Pie(int X1, int Y1, int X2, int Y2, int X3, int Y3, int X4, int Y4);
```

Description

Use Pie to draw a pie-shaped wedge on the image. The wedge is defined by the ellipse bounded by the rectangle determined by the points (X1, Y1) and X2, Y2). The section drawn is determined by two lines radiating from the center of the ellipse through the points (X3, Y3) and (X4, Y4).

The wedge is outlined using Pen (see page 2725), and filled using Brush (see page 2716).

Note: On Windows 9x or Windows ME, the sums X1 + X2 and Y1 + Y2 cannot exceed 32768. Also, the sum X1 + X2 + Y1 + Y2 cannot exceed 32768.

Brush (see page 2716)

Chord (see page 2682)

Pen (see page 2725)

8.1.7.4.19 TCanvas.PolyBezier Method

Draws a set of Bezier curves.

Pascal

```
procedure PolyBezier(const Points: array of TPoint);
```

C++

```
__fastcall PolyBezier(const array of TPoint Points);
```

Description

Use PolyBezier to draw cubic Bezier curves using the endpoints and control points specified by the Points parameter. The first curve is drawn from the first point to the fourth point, using the second and third points as control points. Each subsequent curve in the sequence needs exactly three more points: the ending point of the previous curve is used as the starting point, the next two points in the sequence are control points, and the third is the ending point.

The Points parameter gives the endpoints to use when generating the Bezier curves.

Note: The Points_Size parameter is the index of the last point in the array (one less than the total number of points).

This procedure draws lines by using the current pen.

Note: In Delphi, you can use the Slice function to pass a portion of an array of points to the PolyBezier method. For example, to form a Bezier curve using the first ten points from an array of 100 points, use the Slice function as follows:

```
Canvas.PolyBezier(Slice(PointArray, 10));
```

Control points after a[Index+3] are ignored. Nothing happens if there aren't enough control points.

See Also

Polyline (see page 2698)

PolyBezierTo (see page 2697)

Pen (see page 2725)

8.1.7.4.20 TCanvas.PolyBezierTo Method

Draws a set of Bezier curves and updates the value of PenPos (see page 2727).

Pascal

```
procedure PolyBezierTo(const Points: array of TPoint);
```

C++

```
__fastcall PolyBezierTo(const array of TPoint Points);
```

Description

Use PolyBezierTo to draw cubic Bezier curves using the endpoints and control points specified by the Points parameter. The first curve is drawn from the first point to the fourth point, using the second and third points as control points. Each subsequent curve in the sequence needs exactly three more points: the ending point of the previous curve is used as the starting point, the next two points in the sequence are control points, and the third is the ending point.

The Points parameter gives the endpoints to use when generating the Bezier curves.

Note: The Points_Size parameter is the index of the last point in the array (one less than the total number of points).

This procedure draws lines by using the current pen and updates the value of PenPos (see page 2727) to the value of the last endpoint.

Note: In Delphi, you can use the Slice function to pass a portion of an array of points to the PolyBezierTo method. For example, to form a Bezier curve using the first ten points from an array of 100 points, use the Slice function as follows:

```
Canvas.PolyBezierTo(Slice(PointArray, 10));
```

See Also

Polyline (see page 2698)

PolyBezier (see page 2696)

Pen (see page 2725)

PenPos (see page 2727)

8.1.7.4.21 TCanvas.Polygon Method

Draws a series of lines on the canvas connecting the points passed in and closing the shape by drawing a line from the last point to the first point.

Pascal

```
procedure Polygon(const Points: array of TPoint);
```

C++

```
__fastcall Polygon(const array of TPoint Points);
```

Description

Use Polygon to draw a closed, many-sided shape on the canvas, using the value of Pen (see page 2725). After drawing the complete shape, Polygon fills the shape using the value of Brush (see page 2716).

The Points parameter is an array of points that give the vertices of the polygon.

Note: The Points_Size parameter is the index of the last point in the array (one less than the total number of points).

The first point is always connected to the last point.

Note: In Delphi, you can use the Slice function to pass a portion of an array of points to the Polygon method. For example, to form a polygon using the first ten points from an array of 100 points, use the Slice function as follows:

```
Canvas.Polygon(Slice(PointArray, 10));
```

To draw a polygon on the canvas, without filling it, use the Polyline (see page 2698) method, specifying the first point a second time at the end.

C++ Examples:

```
/*
This example draws a polygon in the specified shape, and
fills it with the color teal.
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
  TPoint points[4];
  points[0] = Point(10,10);
  points[1] = Point(30,10);
  points[2] = Point(130,30);
  points[3] = Point(240,120);
  (dynamic_cast<TPaintBox *>(Sender))->Canvas->Brush->Color = clTeal;
  (dynamic_cast<TPaintBox *>(Sender))->Canvas->Polygon(points, 3);
}
```

Delphi Examples:

```
{
This example draws a polygon in the specified shape, and
fills it with the color teal.
}
procedure TForm1.FormPaint(Sender: TObject);
begin
  Canvas.Brush.Color := clTeal;
  Canvas.Polygon([Point(10, 10), Point(30, 10),
    Point(130, 30), Point(240, 120)]);
end;
```

See Also

Brush (see page 2716)

Pen (see page 2725)

Polyline (see page 2698)

Slice

8.1.7.4.22 TCanvas.Polyline Method

Draws a series of lines on the canvas with the current pen, connecting each of the points passed to it in Points.

Pascal

```
procedure Polyline(const Points: array of TPoint);
```

C++

```
__fastcall Polyline(const array of TPoint Points);
```

Description

Use Polyline to connect a set of points on the canvas. If you specify only two points, Polyline draws a single line.

The Points parameter is an array of points to be connected.

Note: The Points_Size parameter is the index of the last point in the array (one less than the total number of points).

Note: In Delphi, you can use the Slice function to pass a portion of an array of points to the Polyline method. For example, to form a line connecting the first ten points from an array of 100 points, use the Slice function as follows:

```
Canvas.Polyline(Slice(PointArray, 10));
```

Calling the MoveTo (see page 2695) function with the value of the first point, and then repeatedly calling LineTo (see page 2693) with all subsequent points will draw the same image on the canvas. However, unlike LineTo (see page 2693), Polyline does not change the value of PenPos (see page 2727).

C++ Examples:

```
/*
This example paints a white five-pointed star in a paintbox
control:
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
  TPaintBox *pPB = dynamic_cast<TPaintBox *>(Sender);
  TPoint points[6];
  pPB->Canvas->Pen->Color = clWhite;
  points[0].x = 40;
  points[0].y = 10;
  points[1].x = 20;
  points[1].y = 60;
  points[2].x = 70;
  points[2].y = 30;
  points[3].x = 10;
  points[3].y = 30;
  points[4].x = 60;
  points[4].y = 60;
  points[5].x = 40;
  points[5].y = 10;
  pPB->Canvas->Polyline(points,5);
}
```

Delphi Examples:

```
{
This example paints a white five-pointed star in a paintbox
control:
}
procedure TForm1.PaintBox1Paint(Sender: TObject);
begin
  with Sender as TPaintBox do
  begin
    Canvas.Pen.Color := clWhite;
    Canvas.Polyline([Point(40, 10), Point(20, 60), Point(70, 30),
    Point(10, 30), Point(60, 60), Point(40, 10)]);
  end;
end;
```

8.1.7.4.23 Rectangle Method

This is the overview for the Rectangle method overload.

Overload List

	Name	Description
	TCanvas.Rectangle (Integer, Integer, Integer, Integer) (see page 2700)	Draws a rectangle on the canvas.
	TCanvas.Rectangle (TRect) (see page 2700)	Draws a rectangle on the canvas.

8.1.7.4.23.1 TCanvas.Rectangle Method (Integer, Integer, Integer, Integer)

Draws a rectangle on the canvas.

Pascal

```
procedure Rectangle(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer); overload;
procedure Rectangle(const Rect: TRect); overload;
```

C++

```
__fastcall Rectangle(int X1, int Y1, int X2, int Y2);
__fastcall Rectangle(const TRect Rect);
```

Description

Use Rectangle to draw a rectangle using Pen (see page 2725) and fill it with Brush (see page 2716). Specify the rectangle's coordinates in one of two ways:

Giving four coordinates that define the upper left corner at the point (X1, Y1) and the lower right corner at the point (X2, Y2).

Using a TRect type.

To fill a rectangular region without drawing the boundary in the current pen, use FillRect (see page 2689). To outline a rectangular region without filling it, use FrameRect (see page 2692) or Polygon (see page 2697). To draw a rectangle with rounded corners, use RoundRect (see page 2702).

C++ Examples:

```
/*
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
*/
int x, y;

void __fastcall TForm1::FormActivate(TObject *Sender)
{
  WindowState = wsMaximized;
  Timer1->Interval = 50;
  randomize();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  x = random(Screen->Width - 10);
```

```
    y = random(Screen->Height - 10);
    Canvas->Pen->Color = (Graphics::TColor) random(65535);
    switch (random(5))
    {
      case 0: Canvas->Pen->Style = psSolid; break;
      case 1: Canvas->Pen->Style = psDash; break;
      case 2: Canvas->Pen->Style = psDot; break;
      case 3: Canvas->Pen->Style = psDashDot; break;
      case 4: Canvas->Pen->Style = psDashDotDot; break;
    }
    Canvas->Rectangle(x, y, x + random(400), y + random(400));
  }
```

Delphi Examples:

```
{
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
}
var
  X, Y: Integer;
procedure TForm1.FormActivate(Sender: TObject);
begin
  WindowState := wsMaximized;
  Timer1.Interval := 50;
  Randomize;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  X := Random(Screen.Width - 10);
  Y := Random(Screen.Height - 10);
  Canvas.Pen.Color := Random(65535);
  case Random(5) of
    0: Canvas.Pen.Style := psSolid;
    1: Canvas.Pen.Style := psDash;
    2: Canvas.Pen.Style := psDot;
    3: Canvas.Pen.Style := psDashDot;
    4: Canvas.Pen.Style := psDashDotDot;
  end;
  Canvas.Rectangle(X, Y, X + Random(400), Y + Random(400));
end;
```

8.1.7.4.24 TCanvas.Refresh Method

Deselects the Pen (see page 2725), Brush (see page 2716), and Font (see page 2721) from the device context.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh to return the HDC used by the canvas to a default state. Refresh does not change the values of the Font (see page 2721), Brush (see page 2716), or Pen (see page 2725) properties. Calling any of the drawing methods of the canvas after calling Refresh will reselect the Font (see page 2721), Brush (see page 2716), or Pen (see page 2725) into the HDC if it is used by the drawing method.

See Also

Brush (see page 2716)

Font (see page 2721)

Handle (see page 2722)

Pen (see page 2725)

8.1.7.4.25 TCanvas.RequiredState Method

Pascal

```
procedure RequiredState(ReqState: TCanvasState);
```

C++

```
__fastcall RequiredState(TCanvasState ReqState);
```

Description

This is RequiredState, a member of class TCanvas.

8.1.7.4.26 RoundRect Method

This is the overview for the RoundRect method overload.

Overload List

	Name	Description
	TCanvas.RoundRect (Integer, Integer, Integer, Integer, Integer, Integer) (see page 2702)	Draws a rectangle with rounded corners on the canvas.
	TCanvas.RoundRect (TRect, Integer, Integer) (see page 2702)	Draws a rectangle with rounded corners on the canvas.

8.1.7.4.26.1 TCanvas.RoundRect Method (Integer, Integer, Integer, Integer, Integer, Integer)

Draws a rectangle with rounded corners on the canvas.

Pascal

```
procedure RoundRect(X1: Integer; Y1: Integer; X2: Integer; Y2: Integer; X3: Integer; Y3:
Integer); overload;
procedure RoundRect(const Rect: TRect; CX: Integer; CY: Integer); overload;
```

C++

```
__fastcall RoundRect(int X1, int Y1, int X2, int Y2, int X3, int Y3);
__fastcall RoundRect(const TRect Rect, int CX, int CY);
```

Description

Use RoundRect to draw a rounded rectangle using Pen (see page 2725) and fill it with Brush (see page 2716). The rectangle will have edges defined by the points (X1,Y1), (X2,Y1), (X2,Y2), (X1,Y2), but the corners will be shaved to create a rounded appearance. The curve of the rounded corners matches the curvature of an ellipse with width X3 and height Y3.

To draw an ellipse instead, use Ellipse (see page 2688). To draw a true rectangle, use Rectangle (see page 2700).

C++ Examples:

```
/*
This example draws many rounded rectangles of various sizes
and colors on a form maximized to fill the entire screen:
*/
int x, y;

void __fastcall TForm1::FormActivate(TObject *Sender)
{
  WindowState = wsMaximized;
  Timer1->Interval = 50;
  randomize();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  x = random(Screen->Width - 10);
  y = random(Screen->Height - 10);
  Canvas->Pen->Color = (Graphics::TColor) random(65535);
  Canvas->Pen->Width = random(7);
  int Dx = random(400);
  int Dy = random(400);
  Canvas->RoundRect(x, y, x + Dx, y + Dy, Dx/2, Dy/2);
}
```

Delphi Examples:

```
{
This example draws many rounded rectangles of various sizes
and colors on a form maximized to fill the entire screen:
}
var
  X, Y, DX, DY: Integer;
procedure TForm1.FormActivate(Sender: TObject);
begin
  WindowState := wsMaximized;
  Timer1.Interval := 50;
  Randomize;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  X := Random(Screen.Width - 10);
  Y := Random(Screen.Height - 10);
  Canvas.Pen.Color := Random(65535);
  Canvas.Pen.Width := Random(7);
  DX := Random(400);
  DY := Random(400);
  Canvas.RoundRect(X, Y, X + DX, Y + DY, DX div 2, DY div 2);
end;
```

Brush (see page 2716)

Ellipse (see page 2688)

Pen (see page 2725)

Rectangle (see page 2700)

8.1.7.4.27 TCanvas.StretchDraw Method

Draws the graphic specified by the Graphic parameter in the rectangle specified by the Rect parameter.

Pascal

```
procedure StretchDraw(const Rect: TRect; Graphic: TGraphic);
```

C++

```
__fastcall StretchDraw(const TRect Rect, TGraphic Graphic);
```

Description

Call StretchDraw to draw a graphic on the canvas so that the image fits in the specified rectangle. StretchDraw calls the Draw (see page 2685) method of the graphic. The graphic object determines how to fit into the rectangle. This may involve changing magnification and/or aspect ratio.

To render the graphic in its natural size, use the Draw (see page 2685) method, instead.

If the graphic is a TBitmap (see page 2628) object, the bitmap is rendered using the value of CopyMode (see page 2719).

Note: If the graphic is an icon, it is not stretched.

C++ Examples:

```
/*
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
*/
void __fastcall TCustomDrawForm::TVCustomDraw(TCustomTreeView *Sender,
      const TRect &ARect, bool &DefaultDraw)
{
/*
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
*/
  if (None1 != NULL)
  {
    if (None1->Checked) //no picture
    {
      TV->Canvas->Brush->Color = BkgColorDialog->Color;
      TV->Canvas->Brush->Style = FBrushStyle;
      TV->Canvas->FillRect(ARect);
    }
    else if (Tile1->Checked) //tile bitmap
    {
      TV->Canvas->Brush->Bitmap = Image1->Picture->Bitmap;
```

```
      TV->Canvas->FillRect(ARect);
    }
    else //Stretch across the canvas.
      TV->Canvas->StretchDraw(ARect, Image1->Picture->Bitmap);
  };
  DefaultDraw = FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
}
```

Delphi Examples:

```
{
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
}
procedure TCustomDrawForm.TVCustomDraw(Sender: TCustomTreeView; const ARect: TRect;
  var DefaultDraw: Boolean);
begin
{
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
}
  with TV.Canvas do
  begin
    if None1 <> nil then
    begin
      if None1.Checked then //no picture
      begin
        Brush.Color := BkgColorDialog.Color;
        Brush.Style := FBrushStyle;
        FillRect(ARect);
      end else
        if Tile1.Checked then //tile bitmap
        begin
          Brush.Bitmap := Image1.Picture.Bitmap;
            FillRect(ARect);
          end else //Stretch across the canvas.
              StretchDraw(ARect, Image1.Picture.Bitmap);
    end;
  end;
  DefaultDraw := FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
end;
```

8.1.7.4.28 TCanvas.TextExtent Method

Returns the width and height, in pixels, of a string rendered in the current font.

Pascal

```
function TextExtent(const Text: string): TSize;
```

C++

```
__fastcall TSize TextExtent(const UnicodeString Text);
```

Description

Use TextExtent to determine the space a string will occupy in the image. Other elements in the image such as lines, boxes, or additional lines of text can be positioned to accommodate the size of the text. TextExtent returns the width and height of the rectangle that bounds the text on the canvas.

To check only the height, call TextHeight (see page 2706). To check only the width, call TextWidth (see page 2714).

See Also

Font (see page 2721)

TextHeight (see page 2706)

TextOut (see page 2707)

TextWidth (see page 2714)

8.1.7.4.29 TCanvas.TextHeight Method

Returns the height, in pixels, of a string rendered in the current font.

Pascal

```
function TextHeight(const Text: string): Integer;
```

C++

```
__fastcall int TextHeight(const UnicodeString Text);
```

Description

Use TextHeight to determine the height a string will occupy in the image. Other elements in the image such as lines, boxes, or additional lines of text can be positioned to accommodate the height of the text. TextHeight returns the height of the font, the ascenders plus the descenders, not the actual height of the specified string. If Font.Height is negative, then TextHeight is equal to abs(Font.Height) plus the internal leading of the font. If Font.Height is positive, then TextHeight equals Font.Height.

TextHeight returns the same value as TextExtent (see page 2705)(Text).cy.

C++ Examples:

```
/*
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
     AnsiString s = PageControl1->Pages[i]->Caption;
     if (Canvas->TextWidth(s) * 2 > PageControl1->TabWidth)
        PageControl1->TabWidth = Canvas->TextWidth(s) * 2;
      if (Canvas->TextHeight(s) * 2 > PageControl1->TabHeight)
        PageControl1->TabHeight = Canvas->TextHeight(s) * 2;
```

```
  }
}
```

Delphi Examples:

```
{
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  with PageControl1 do
  begin
    for i := 0 to PageCount - 1 do
    begin
      if (Canvas.TextWidth(Pages[i].Caption) * 2) > TabWidth then
        TabWidth := Canvas.TextWidth(Pages[i].Caption) * 2;
      if (Canvas.TextHeight(Pages[i].Caption) * 2) > TabHeight then
        TabHeight := Canvas.TextHeight(Pages[i].Caption) * 2;
    end;
  end;
end;
```

TextOut (see page 2707)

TextWidth (see page 2714)

8.1.7.4.30 TCanvas.TextOut Method

Writes a string on the canvas, starting at the point (X,Y), and then updates the PenPos (see page 2727) to the end of the string.

Pascal

```
procedure TextOut(X: Integer; Y: Integer; const Text: string);
```

C++

```
__fastcall TextOut(int X, int Y, const UnicodeString Text);
```

Description

Use TextOut to write a string onto the canvas. The string will be written using the current value of Font (see page 2721). Use the TextExtent (see page 2705) method to determine the space occupied by the text in the image. To write only the text that fits within a clipping rectangle, use TextRect (see page 2713) instead.

After a call to TextOut, the PenPos (see page 2727) property indicates the point at the top right of the text on the canvas.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
```

```
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
      (Section->Text).Length() *
      HeaderControl1->Font->Size;
    // Owner draw every other section
    if (i % 2 == 0)
      Section->Style = hsOwnerDraw;
    else
      Section->Style = hsText;
  }
}

8.1.7.4.31 TextRect Method

This is the overview for the TextRect method overload.

Overload List

	Name	Description
	TCanvas.TextRect (TRect, Integer, Integer, string) (see page 2713)	Writes a string inside a clipping rectangle.
	TCanvas.TextRect (TRect, string, TTextFormat) (see page 2713)	Writes a string inside a clipping rectangle.

8.1.7.4.31.1 TCanvas.TextRect Method (TRect, Integer, Integer, string)

Writes a string inside a clipping rectangle.

Pascal

```
procedure TextRect(var Rect: TRect; var Text: string; TextFormat: TTextFormat = []); overload;
procedure TextRect(Rect: TRect; X: Integer; Y: Integer; const Text: string); overload;
```

C++

```
__fastcall TextRect(TRect Rect, UnicodeString Text, TTextFormat TextFormat = []);
__fastcall TextRect(TRect Rect, int X, int Y, const UnicodeString Text);
```

Description

Use TextRect to write a string within a limited rectangular region. Any portions of the string that fall outside the rectangle passed in the Rect parameter are clipped and don't appear. The upper left corner of the text is placed at the point (X, Y).

C++ Examples:

```
/*
The following code displays the text "Hello, world!" in a
rectangle defined by the coordinates (10, 10) and (100, 100).
After displaying the text with the TextRect method, the code
draws a black, vertical line frame around the rectangle.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TRect TheRect = Rect(10,10,100,100);
  Canvas->TextRect(TheRect, 10, 10, "Hello World");
  Canvas->Brush->Color = clBlack;
  Canvas->FrameRect(TheRect);
}
```

Delphi Examples:

```
{
The following code displays the text "Hello, world!" in a
rectangle defined by the coordinates (10, 10) and (100, 100).
After displaying the text with the TextRect method, the code
draws a black, vertical line frame around the rectangle.
}
procedure TForm1.Button1Click(Sender: TObject);
var TheRect: TRect;
begin
  TheRect := Rect(10,10,100,100);
```

```
  Form1.Canvas.TextRect(TheRect,10,10,'Hello, world!');
  Form1.Canvas.Brush.Color := clBlack;
  Form1.Canvas.FrameRect(TheRect);
end;
```

8.1.7.4.32 TCanvas.TextWidth Method

Returns the width, in pixels, of a string rendered in the current font.

Pascal

```
function TextWidth(const Text: string): Integer;
```

C++

```
__fastcall int TextWidth(const UnicodeString Text);
```

Description

Use TextWidth to determine the length a string will occupy in the image. TextWidth indicates whether a given string will fit in the available space. Other graphical elements in the image such as lines, or additional strings can be positioned to accommodate the width of the text.

TextWidth returns the same value as TextExtent (see page 2705)(Text).cx.

C++ Examples:

```
/*
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
     AnsiString s = PageControl1->Pages[i]->Caption;
     if (Canvas->TextWidth(s) * 2 > PageControl1->TabWidth)
        PageControl1->TabWidth = Canvas->TextWidth(s) * 2;
      if (Canvas->TextHeight(s) * 2 > PageControl1->TabHeight)
        PageControl1->TabHeight = Canvas->TextHeight(s) * 2;
  }
}
```

Delphi Examples:

```
{
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
```

```
  number of pixels required to fit 46 characters.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    with PageControl1 do
    begin
      for i := 0 to PageCount - 1 do
      begin
        if (Canvas.TextWidth(Pages[i].Caption) * 2) > TabWidth then
          TabWidth := Canvas.TextWidth(Pages[i].Caption) * 2;
        if (Canvas.TextHeight(Pages[i].Caption) * 2) > TabHeight then
          TabHeight := Canvas.TextHeight(Pages[i].Caption) * 2;
      end;
    end;
  end;
```

8.1.7.4.33 TCanvas.TryLock Method

Locks the canvas if it is currently unlocked.

Pascal

```
function TryLock: Boolean;
```

C++

```
__fastcall Boolean TryLock();
```

Description

Call TryLock to prevent other threads from writing on the surface of the canvas until the Unlock (see page 2716) method is called. Unlike calls to the Lock (see page 2694) method, which nest so that every call to Lock (see page 2694) must be matched with a subsequent call to Unlock (see page 2716), TryLock need only be matched by a call to Unlock (see page 2716) if the canvas was not already locked.

If the canvas is unlocked, TryLock locks the canvas, sets the LockCount (see page 2725) property to 1, and returns true. If the canvas is already locked, TryLock returns false without making any changes.

Use TryLock before attempting changes to the canvas that could interfere with other code that is protected by a Lock (see page 2694)/Unlock (see page 2716) pair of method calls.

See Also

Lock (see page 2694)

LockCount (see page 2725)

Unlock (see page 2716)

8.1.7.4.34 TCanvas.Unlock Method

Decreases the LockCount (see page 2725) property, allowing other threads to execute when LockCount (see page 2725) reaches 0.

Pascal

```
procedure Unlock;
```

C++

```
__fastcall Unlock();
```

Description

Call Unlock at the end of a critical section begun with a call to the Lock (see page 2694) method. Every call to Lock (see page 2694) must be matched by a call to Unlock.

See Also

Lock (see page 2694)

TThread

Locking Objects

8.1.7.5 TCanvas Properties

The properties of the TCanvas class are listed here.

Public Properties

	Name	Description
R	CanvasOrientation (see page 2718)	Determines the orientation of the canvas as left-to-right or right-to-left.
R	ClipRect (see page 2718)	Read-only property that specifies the boundaries of the clipping rectangle.
	Handle (see page 2722)	Specifies the handle for this canvas.
R	LockCount (see page 2725)	Indicates the number of times the canvas has been locked to prevent interference from other threads.
	PenPos (see page 2727)	Specifies the current drawing position of the Pen (see page 2725).
	Pixels (see page 2727)	Specifies the color of the pixels within the current ClipRect (see page 2718).
	TextFlags (see page 2728)	Specifies how text is written to the canvas.

Published Properties

	Name	Description
	Brush (see page 2716)	Determines the color and pattern for filling graphical shapes and backgrounds.
	CopyMode (see page 2719)	Specifies how a graphical image is copied onto the canvas.
	Font (see page 2721)	Specifies the font to use when writing text on the image.
	Pen (see page 2725)	Specifies the kind of pen the canvas uses for drawing lines and outlining shapes.

8.1.7.5.1 TCanvas.Brush Property

Determines the color and pattern for filling graphical shapes and backgrounds.

Pascal

```
property Brush: TBrush;
```

C++

```
__property TBrush Brush;
```

Description

Set the Brush property to specify the color and pattern to use when drawing the background or filling in graphical shapes. The value of Brush is a TBrush (see page 2664) object. Set the properties of the TBrush (see page 2664) object to specify the color and pattern or bitmap to use when filling in spaces on the canvas.

Note: Setting the Brush property assigns the specified TBrush (see page 2664) object, rather than replacing the current TBrush (see page 2664) object.

C++ Examples:

```
/*
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> BrushBmp(new Graphics::TBitmap);
  BrushBmp->LoadFromFile("../bm1.BMP");
  Form1->Canvas->Brush->Bitmap = BrushBmp.get();
  Form1->Canvas->FillRect(Rect(0,0,100,100));
  Form1->Canvas->Brush->Bitmap = NULL;
}
```

Delphi Examples:

```
{
The following code loads a bitmap from a file and assigns it
to the Brush of the Canvas of Form1:
}
var
  Bitmap: TBitmap;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Bitmap := TBitmap.Create;
  try
    Bitmap.LoadFromFile('bm1.BMP');
    Form1.Canvas.Brush.Bitmap := Bitmap;
    Form1.Canvas.FillRect(Rect(0,0,100,100));
  finally
    Form1.Canvas.Brush.Bitmap := nil;
    Bitmap.Free;
  end;
end;
```

See Also

Chord (see page 2682)

Ellipse (see page 2688)

FillRect (see page 2689)

FloodFill (see page 2690)

FrameRect (see page 2692)

Pie (see page 2695)

Rectangle (see page 2700)

RoundRect (see page 2702)

8.1.7.5.2 TCanvas.CanvasOrientation Property

Determines the orientation of the canvas as left-to-right or right-to-left.

Pascal

```
property CanvasOrientation: TCanvasOrientation;
```

C++

```
__property TCanvasOrientation CanvasOrientation;
```

Description

CanvasOrientation is a read-only property used for bi-directional support. It indicates whether the orientation of the canvas is left-to-right (coLeftToRight) or right-to-left (coRightToLeft). The default is coLeftToRight, meaning that the 0,0 coordinate is at the top left corner of the canvas. In Middle eastern locales the orientation may be coRightToLeft, meaning that the 0,0 coordinate is at the top right corner of the canvas. This property is important for grid controls because it changes the grid's canvas orientation during drawing.

See Also

BiDiMode

8.1.7.5.3 TCanvas.ClipRect Property

Read-only property that specifies the boundaries of the clipping rectangle.

Pascal

```
property ClipRect: TRect;
```

C++

```
__property TRect ClipRect;
```

Description

Use ClipRect to determine where the canvas needs painting. ClipRect limits the drawing region of the canvas so that any drawing that occurs at coordinates outside the ClipRect is clipped and does not appear in the image.

When handling a form's OnPaint event, the canvas' ClipRect property is set to the rectangle that needs to be painted. Portions of the image that do not overlap the ClipRect do not need to be drawn. Thus, OnPaint routines can use the value of ClipRect to optimize painting, speeding the overall performance of the application.

Note: ClipRect can be modified using the SelectClipRgn Win32 API.

C++ Examples:

```
/*
This example creates a region and selects this region as the
clipping rectangle for the Image component's canvas. It then
sets the canvas's brush color to red and calls FillRect
using the ClipRect as the area to fill. Lastly, the ClipRect
is reset to the original value that it contained by calling
SelectClipRect with nil as the second parameter and deletes
the region.  Place a TImage object in the form.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
    HRGN MyRgn;

    MyRgn = ::CreateRectRgn(100,100,200,200);
    ::SelectClipRgn(Image1->Canvas->Handle,MyRgn);
    Image1->Canvas->Brush->Color = clRed;
    Image1->Canvas->FillRect(Image1->Canvas->ClipRect);
    Image1->Invalidate();
    ::SelectClipRgn(Image1->Canvas->Handle,NULL);
    ::DeleteObject(MyRgn);
}
```

Delphi Examples:

```
{
This example creates a region and selects this region as the
clipping rectangle for the Image component's canvas. It then
sets the canvas's brush color to red and calls FillRect
using the ClipRect as the area to fill. Lastly, the ClipRect
is reset to the original value that it contained by calling
SelectClipRect with nil as the second parameter and deletes
the region.  Place a TImage object in the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
    MyRgn: HRGN;
begin
    MyRgn := CreateRectRgn(100,100,200,200);
    SelectClipRgn(Image1.Canvas.Handle,MyRgn);
    Image1.Canvas.Brush.Color := clRed;
    Image1.Canvas.FillRect(Image1.Canvas.ClipRect);
    Image1.Invalidate;
    SelectClipRgn(Image1.Canvas.Handle, HRGN(nil));
    DeleteObject(MyRgn);
end;
```

See Also

OnPaint (see page 2233)

8.1.7.5.4 TCanvas.CopyMode Property

Specifies how a graphical image is copied onto the canvas.

Pascal

```
property CopyMode: TCopyMode;
```

C++

```
__property TCopyMode CopyMode;
```

Description

Set CopyMode to affect the way graphical images are drawn onto the canvas. The CopyMode is used when copying an image from another canvas using the CopyRect (see page 2683) method. CopyMode is also used by TBitmap (see page 2628) objects when they draw themselves to a canvas.

Use CopyMode to achieve a variety of affects when rendering an image. Achieve special effects like merged images and making parts of a bitmap transparent by combining multiple images with different CopyModes.

C++ Examples:

```
/*
The following example uses the CopyMode of an image’s canvas
```

```
to blank out the image when the user chooses the "Cut" menu
item.  This example requires a Main menu with a Copy and a
Cut menu item that have their OnClick error handlers populated.
Note: CopyMode and CopyRect are members of the destination
canvas.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
    TRect SrcRect, DstRect;
    Image2->Canvas->CopyMode = cmSrcCopy;
    DstRect = Rect(0, 0, Image2->Width, Image2->Height);
    SrcRect = Rect(0, 0, Image1->Width, Image1->Height);
    Image2->Canvas->CopyRect(DstRect, Image1->Canvas, SrcRect);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
 TRect r;
 Copy1Click(Sender); // Do the same thing as the copy menu item.
 Image1->Canvas->CopyMode = cmWhiteness;
 r = Rect(0, 0, Image1->Width, Image1->Height);
 Image1->Canvas->CopyRect(r, Image1->Canvas, r);
 Image1->Canvas->CopyMode = cmSrcCopy; // Restore the copy mode.
}
```

Delphi Examples:

```
{
The following example uses the CopyMode of an image's canvas
to blank out the image when the user chooses the "Cut" menu
item.  This example requires a Main menu with a Copy and a
Cut menu item that have their OnClick error handlers populated.
Note: CopyMode and CopyRect are members of the destination
canvas.
}
procedure TForm1.Copy1Click(Sender: TObject);
var
  DstRect, SrcRect: TRect;
begin
  with Image2.Canvas do
  begin
    CopyMode := cmSrcCopy;
    DstRect := Rect(0, 0, Image2.Width, Image2.Height);
    SrcRect := Rect(0, 0, Image1.Width, Image1.Height);
    CopyRect(DstRect, Image1.Canvas, SrcRect);
  end;
end;

procedure TForm1.Cut1Click(Sender: TObject);
var
  ARect: TRect;
begin
  Copy1Click(Sender); { do the same thing as the copy menu item }
  with Image1.Canvas do
  begin
    CopyMode := cmWhiteness;
    ARect := Rect(0, 0, Image1.Width, Image1.Height);
    CopyRect(ARect, Image1.Canvas, ARect);
    CopyMode := cmSrcCopy; { restore the copy mode }
  end;
end;
```

CopyRect (see page 2683)

Draw (see page 2685)

StretchDraw (see page 2704)

8.1.7.5.5 TCanvas.Font Property

Specifies the font to use when writing text on the image.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

Set Font to specify the font to use for writing text on the image. The value of Font is a T Font object. Set the properties of the T Font object to specify the font face, color, size, style, and any other aspects of the font.

The Canvas.Font property is only guaranteed to equal the Font property if you have an owner-drawn listbox (where you are expected to use the canvas). Even in that case, it is only guaranteed to equal the Font property once the first paint message is underway. If you use a canvas inside an ownerdraw event, everything should work as expected. Using the canvas for a reason outside the scope of its intended usage may give unpredictable results.

Note: Setting the Font property assigns the specified T Font object, rather than replacing the current T Font object.

C++ Examples:

```
/*
This example creates a rotated font and displays it on the
form by assigning the handle of the rotated to the Form's
Canvas Font via the Font's Handle property.  Rotating fonts
is a straightforward process, so long as the Windows Font
Mapper can supply a rotated font based on the font you
request. If you are using a TrueType font there is virtually
no reason for failure.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
    LOGFONT lf; // Windows native font structure

    Canvas->Brush->Style = bsClear; // set the brush style to transparent
    ZeroMemory(&lf, sizeof(LOGFONT));

    lf.lfHeight = 20;
    lf.lfEscapement = 10 * 45; // degrees to rotate
    lf.lfOrientation = 10 * 45;
    lf.lfCharSet = DEFAULT_CHARSET;
    strcpy(lf.lfFaceName, "Tahoma");

    Canvas->Font->Handle = CreateFontIndirect(&lf);
    Canvas->TextOut(10, 100, "Rotated text"); // output the rotated font
}
```

Delphi Examples:

```
{
This example creates a rotated font and displays it on the
form by assigning the handle of the rotated to the Form's
Canvas Font via the Font's Handle property.  Rotating fonts
is a straightforward process, so long as the Windows Font
Mapper can supply a rotated font based on the font you
```

```
request. If you are using a TrueType font there is virtually
no reason for failure.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  lf: LOGFONT; // Windows native font structure
begin
  Canvas.Brush.Style := bsClear; // set the brush style to transparent
  FillChar(lf, SizeOf(lf), Byte(0));
  lf.lfHeight := 20;
  lf.lfEscapement := 10 * 45; // degrees to rotate
  lf.lfOrientation := 10 * 45;
  lf.lfCharSet := DEFAULT_CHARSET;
  StrCopy(lf.lfFaceName, 'Tahoma');

  Canvas.Font.Handle := CreateFontIndirect(lf);
  Canvas.TextOut(10, 100, 'Rotated text'); // output the rotated font
end;
```

TextRect (see page 2713)

TFont (see page 2730)

Assign (see page 2733)

8.1.7.5.6 TCanvas.Handle Property

Specifies the handle for this canvas.

Pascal

```
property Handle: HDC;
```

C++

```
__property HDC Handle;
```

Description

The Handle property specifies the Windows GDI handle to the device context for this canvas.

Set Handle to the HDC for the device context the canvas must draw into. When a windowed control responds to a Windows paint message, the HDC for drawing is passed in to the PaintWindow method. In other cases, an HDC can be obtained for a window by calling the GetDeviceContext method of a control. Additionally, Windows provides API calls to obtain an HDC for a printer or for a memory image.

Read the Handle property to supplement the drawing services provided by the TCanvas (see page 2673) object with API calls that require a handle to a device context. Most of the Windows GDI calls require an HDC.

TCanvas (see page 2673) does not own the HDC. Applications must create an HDC and set the Handle property. Applications must release the HDC when the canvas no longer needs it. Setting the Handle property of a canvas that already has a valid HDC will not automatically release the initial HDC.

Note: Some descendants of TCanvas (see page 2673), such as TControlCanvas, do own the HDC. Do not set the Handle property for these objects. They fetch and free their own Handle.

C++ Examples:

```
/*
The GetFormImage allows you to easily obtain a bitmap of a
```

```
form. The following method can be added to a custom
TWinControl descendant to save itself as a bitmap.  Check the
produced BMP file to confirm.  Click the button and them
double click on the newly created foo.bmp file to view.
*/

#include <memory>       //for STL auto_ptr class

class TMyControl : public TColorListBox
{
__published:    // IDE-managed Components
    void __fastcall SaveAsBmp(TFileName fileName);
private:    // User declarations
public:     // User declarations
    __fastcall TMyControl(TComponent* Owner);
};

TForm1 *Form1;
TMyControl *MyControl1;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyControl::TMyControl(TComponent* Owner)
    : TColorListBox(Owner)
{
}

typedef struct {
  TLogPalette lpal;
  TPaletteEntry dummy[256];
} LogPal;

void __fastcall TMyControl::SaveAsBmp(TFileName fileName)
{
  std::auto_ptr<TCanvas> tempCanvas(new TCanvas);
  HWND notUsed;
  tempCanvas->Handle = GetDeviceContext(notUsed);
  std::auto_ptr<TImage> image2save(new TImage(Form1)); // The owner will clean this up.
  image2save->Height = Height;
  image2save->Width = Width;
  TRect destRect = Rect(0,0,Width,Height);
  TRect sourceRect = destRect;
  image2save->Canvas->CopyRect(destRect, tempCanvas.get(), sourceRect);
  LogPal SysPal;
  SysPal.lpal.palVersion = 0x300;
  SysPal.lpal.palNumEntries = 256;
  GetSystemPaletteEntries(tempCanvas->Handle,0,256,SysPal.lpal.palPalEntry);
  image2save->Picture->Bitmap->Palette =
    CreatePalette(dynamic_cast<const tagLOGPALETTE *>(&SysPal.lpal));
  image2save->Picture->SaveToFile(fileName);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  static_cast<TMyControl*>(MyControl1)->SaveAsBmp("../foo.bmp");
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TMyControl* control = new TMyControl(Form1); // The owner will clean this up.

  MyControl1 = control;
  control->Parent = this;
```

```
  control->Visible = true;
}
```

Delphi Examples:

```
{
The GetFormImage allows you to easily obtain a bitmap of a
form. The following method can be added to a custom
TWinControl descendant to save itself as a bitmap.  Check the
produced BMP file to confirm.  Click the button and then

GetDeviceContext

PaintWindow

8.1.7.5.7 TCanvas.LockCount Property

Indicates the number of times the canvas has been locked to prevent interference from other threads.

Pascal

```
property LockCount: Integer;
```

C++

```
__property int LockCount;
```

Description

Read LockCount to determine whether the canvas is locked. Whenever the Lock (see page 2694) method is called to block other threads from interfering with the canvas, LockCount increases. Whenever the Unlock (see page 2716) method is called at the end of a critical section, LockCount decreases. When LockCount is 0, other threads may draw on the canvas.

See Also

Lock (see page 2694)

TThread

Unlock (see page 2716)

8.1.7.5.8 TCanvas.Pen Property

Specifies the kind of pen the canvas uses for drawing lines and outlining shapes.

Pascal

```
property Pen: TPen;
```

C++

```
__property TPen Pen;
```

Description

Set Pen to specify the pen to use for drawing lines and outlining shapes in the image. The value of Pen is a TPen (see page

2801) object. Set the properties of the TPen (see page 2801) object to specify the color, style, width, and mode of the pen.

Note: Setting the Pen property assigns the specified TPen (see page 2801) object, rather than replacing the current TPen (see page 2801) object.

C++ Examples:

```
/*
This example paints a white five-pointed star in a paintbox
control:
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
  TPaintBox *pPB = dynamic_cast<TPaintBox *>(Sender);
  TPoint points[6];
  pPB->Canvas->Pen->Color = clWhite;
  points[0].x = 40;
  points[0].y = 10;
  points[1].x = 20;
  points[1].y = 60;
  points[2].x = 70;
  points[2].y = 30;
  points[3].x = 10;
  points[3].y = 30;
  points[4].x = 60;
  points[4].y = 60;
  points[5].x = 40;
  points[5].y = 10;
  pPB->Canvas->Polyline(points,5);
}
```

Delphi Examples:

```
{
This example paints a white five-pointed star in a paintbox
control:
}
procedure TForm1.PaintBox1Paint(Sender: TObject);
begin
  with Sender as TPaintBox do
  begin
    Canvas.Pen.Color := clWhite;
    Canvas.Polyline([Point(40, 10), Point(20, 60), Point(70, 30),
    Point(10, 30), Point(60, 60), Point(40, 10)]);
  end;
end;
```

TPen (see page 2801)

Assign (see page 2803)

8.1.7.5.9 TCanvas.PenPos Property

Specifies the current drawing position of the Pen (see page 2725).

Pascal

```
property PenPos: TPoint;
```

C++

```
__property TPoint PenPos;
```

Description

Read PenPos to learn the current drawing position of the Pen (see page 2725). This is the starting point of a line drawn by the LineTo (see page 2693) method. Setting the PenPos property is equivalent to calling the MoveTo (see page 2695) method.

See Also

LineTo (see page 2693)

MoveTo (see page 2695)

Pen (see page 2725)

8.1.7.5.10 TCanvas.Pixels Property

Specifies the color of the pixels within the current ClipRect (see page 2718).

Pascal

```
property Pixels [X, Y: Integer]: TColor;
```

C++

```
__property TColor Pixels[int X, Y];
```

Description

Read Pixels to learn the color on the drawing surface at a specific pixel position within the current clipping region. If the position is outside the clipping rectangle, reading the value of Pixels returns -1.

Write Pixels to change the color of individual pixels on the drawing surface. Use Pixels for detailed effects on an image. Pixels may also be used to determine the color that should be used for the FillRect (see page 2689) method.

Not every device context supports the Pixels property. Reading the Pixels property for such a device context will return a value of -1. Setting the Pixels property for such a device context does nothing.

C++ Examples:

```
/*
This example draws a red line (very slowly) when the user
presses a button. Attach the following code to the button's
OnClick event handler:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 10; i <= 200; i++)
```

```
    Canvas->Pixels[i][10] = clRed;
}
```

Delphi Examples:

```
{
This example draws a red line (very slowly) when the user
presses a button. Attach the following code to the button's
OnClick event handler:
}
procedure TForm1.Button1Click(Sender: TObject);
var
  W: Word;
begin
    for W := 10 to 200 do
      Canvas.Pixels[W, 10] := clRed;
end;
```

See Also

ClipRect (see page 2718)

Handle (see page 2722)

FillRect (see page 2689)

8.1.7.5.11 TCanvas.TextFlags Property

Specifies how text is written to the canvas.

Pascal

```
property TextFlags: Longint;
```

C++

```
__property Longint TextFlags;
```

Description

Use TextFlags to influence the way text is drawn when calling the TextOut (see page 2707) or TextRect (see page 2713) method. TextFlags is an integer made by combining any of the following constants:

Constant	Meaning
ETO_CLIPPED	Only the text that fits within a specified rectangle is displayed. This flag is automatically added when calling the TextRect (see page 2713) method. When writing text using TextOut (see page 2707) method, this flag has no effect because the drawing boundaries are determined by the TextExtent (see page 2705) property.
ETO_OPAQUE	The text is drawn with an opaque background color. Using this flag improves performance but does not allow images behind the text rectangle to show.
ETO_RTLREADING	Text strings are displayed from right to left. This is available only with Mideast versions of Windows, where text is written from right to left. Often this is used in combination with a CanvasOrientation (see page 2718) of coRightToLeft.
ETO_GLYPH_INDEX	The text is an array of character placement codes that are parsed directly by the Windows GDI. Glyph indexing only applies to TrueType fonts, but the flag can be used with other fonts to indicate that the GDI should process the text string directly without language processing. See the Windows GDI documentation for more details.
ETO_IGNORELANGUAGE	This is an undocumented Microsoft flag. Check updates of Microsoft documentation for when information is provided.
ETO_NUMERICSLOCAL	All numbers in the text are displayed using digits specific to the current locale.
ETO_NUMERICSLATIN	All numbers in the text are displayed using European digits.

ETO_PDY	This flag is only relevant when using the Windows API ExtTextOut. When this is set, the array pointed to by lpDx contains pairs of values. The first value of each pair is, as usual, the distance between origins of adjacent character cells, but the second value is the displacement along the vertical direction of the font.

See Also

CanvasOrientation (see page 2718)

TextExtent (see page 2705)

TextOut (see page 2707)

TextRect (see page 2713)

8.1.7.6 TCanvas Events

The events of the TCanvas class are listed here.

Public Events

	Name	Description
	OnChange (see page 2729)	Occurs when the image has just changed.
	OnChanging (see page 2730)	Occurs just before a change is made to the image.

8.1.7.6.1 TCanvas.OnChange Event

Occurs when the image has just changed.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the image on the canvas changes. When an application calls one of the drawing methods of TCanvas (see page 2673), the following steps occur.

1An OnChanging (see page 2730) event occurs.

2The TCanvas (see page 2673) method makes a change to the image.

3An OnChange event occurs.

OnChange events occur on changes to the image, not changes to the properties of the canvas. Applications can respond to changes in the Font (see page 2721), Brush (see page 2716), and Pen (see page 2725) properties by assigning OnChange event handlers to the corresponding TFont (see page 2730), TBrush (see page 2664), and TPen (see page 2801) objects. However, TCanvas (see page 2673) assigns its own OnChange event handlers for those objects. Before assigning an OnChange event handler to one of these objects, read the existing event handler. Use that value to call the TCanvas (see page 2673) event handler from the new event handler.

See Also

OnChanging (see page 2730)

OnChange (see page 2768)

8.1.7.6.2 TCanvas.OnChanging Event

Occurs just before a change is made to the image.

Pascal

```
property OnChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChanging;
```

Description

Write an OnChanging event handler to take specific action before the image on the canvas changes. When an application calls one of the drawing methods of TCanvas (see page 2673), the following steps occur.

1An OnChanging event occurs.

2The TCanvas (see page 2673) method makes a change to the image.

3An OnChange (see page 2729) event occurs.

See Also

OnChange (see page 2729)

8.1.8 TFont Class

TFont encapsulates a system font.

Class Hierarchy

Pascal

```
TFont = class(TGraphicsObject);
```

C++

```
class TFont : public TGraphicsObject;
```

File

Graphics

Description

TFont describes font characteristics used when displaying text. TFont defines a set of characters by specifying the height, font family (typeface), attributes (such as bold or italic) and so on.

TFont encapsulates a windows logical font.

See Also

TTextAttributes

Using the Main VCL

8.1.8.1 TFont Members

The following tables list the members exposed by TFont.

Protected Methods

	Name	Description
	Changed (see page 2734)	Generates an OnChange event when the properties of the graphics object change.
	GetCharset (see page 2735)	This is GetCharset, a member of class TFont.
	GetHandle (see page 2735)	This is GetHandle, a member of class TFont.
	GetHeight (see page 2735)	This is GetHeight, a member of class TFont.
	GetName (see page 2735)	This is GetName, a member of class TFont.
	GetOrientation (see page 2736)	This is GetOrientation, a member of class TFont.
	GetPitch (see page 2736)	This is GetPitch, a member of class TFont.
	GetSize (see page 2736)	This is GetSize, a member of class TFont.
	GetStyle (see page 2736)	This is GetStyle, a member of class TFont.
	Lock (see page 2766)	Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.
	SetCharset (see page 2737)	This is SetCharset, a member of class TFont.
	SetColor (see page 2737)	This is SetColor, a member of class TFont.
	SetHandle (see page 2737)	This is SetHandle, a member of class TFont.
	SetHeight (see page 2737)	This is SetHeight, a member of class TFont.
	SetName (see page 2737)	This is SetName, a member of class TFont.
	SetOrientation (see page 2738)	This is SetOrientation, a member of class TFont.
	SetPitch (see page 2738)	This is SetPitch, a member of class TFont.
	SetSize (see page 2738)	This is SetSize, a member of class TFont.
	SetStyle (see page 2738)	This is SetStyle, a member of class TFont.
	Unlock (see page 2767)	Releases the lock on execution threads set by the Lock (see page 2766) method.

Public Events

	Name	Description
	OnChange (see page 2768)	Occurs immediately after the graphics object changes.

Public Methods

	Name	Description
	Assign (see page 2733)	Copies the properties of another TFont (see page 2730) object.
	Create (see page 2732)	Creates and initializes an instance of TFont (see page 2730).
	Destroy (see page 2732)	Destroys an instance of TFont (see page 2730).
	HandleAllocated (see page 2766)	Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

Public Properties

	Name	Description
	FontAdapter (see page 2741)	Designates an interface for providing the font information to ActiveX controls.
	Handle (see page 2741)	Provides access to the handle of a system font.
	OwnerCriticalSection (see page 2767)	Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.
	PixelsPerInch (see page 2745)	Indicates the conversion factor between logical inches and the pixels of the device (printer or screen) using the font.

Published Properties

	Name	Description
	Charset (see page 2739)	Specifies the character set of the font.
	Color (see page 2739)	Specifies the color of the text.

	Height (see page 2742)	Specifies the height of the font.
	Name (see page 2743)	Identifies the typeface of the font.
	Orientation (see page 2744)	Specifies text orientation.
	Pitch (see page 2744)	Specifies whether the characters in the font all have the same width.
	Size (see page 2745)	Specifies the height of the font in points.
	Style (see page 2746)	Determines whether the font is normal, italic, underlined, bold, and so on.

8.1.8.2 TFont.Create Constructor

Creates and initializes an instance of TFont (see page 2730).

Pascal

```
constructor Create;
```

C++

```
__fastcall TFont();
```

Description

Call Create to create a font object at runtime.

Create allocates memory for the font resource, and initializes the Color (see page 2739) property to clWindowText (see page 2966). Create also initializes the PixelsPerInch (see page 2745) property based on the screen resolution.

See Also

PixelsPerInch (see page 2745)

8.1.8.3 TFont.Destroy Destructor

Destroys an instance of TFont (see page 2730).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFont();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TFont (see page 2730) reference is not nil, and only then calls Destroy. Destroy frees the resource identified by the Handle (see page 2741) property.

See Also

Handle (see page 2741)

System::TObject::Free

8.1.8.4 TFont Methods

The methods of the TFont class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2734)	Generates an OnChange event when the properties of the graphics object change.
	GetCharset (see page 2735)	This is GetCharset, a member of class TFont.
	GetHandle (see page 2735)	This is GetHandle, a member of class TFont.
	GetHeight (see page 2735)	This is GetHeight, a member of class TFont.
	GetName (see page 2735)	This is GetName, a member of class TFont.
	GetOrientation (see page 2736)	This is GetOrientation, a member of class TFont.
	GetPitch (see page 2736)	This is GetPitch, a member of class TFont.
	GetSize (see page 2736)	This is GetSize, a member of class TFont.
	GetStyle (see page 2736)	This is GetStyle, a member of class TFont.
	SetCharset (see page 2737)	This is SetCharset, a member of class TFont.
	SetColor (see page 2737)	This is SetColor, a member of class TFont.
	SetHandle (see page 2737)	This is SetHandle, a member of class TFont.
	SetHeight (see page 2737)	This is SetHeight, a member of class TFont.
	SetName (see page 2737)	This is SetName, a member of class TFont.
	SetOrientation (see page 2738)	This is SetOrientation, a member of class TFont.
	SetPitch (see page 2738)	This is SetPitch, a member of class TFont.
	SetSize (see page 2738)	This is SetSize, a member of class TFont.
	SetStyle (see page 2738)	This is SetStyle, a member of class TFont.

Public Methods

	Name	Description
	Assign (see page 2733)	Copies the properties of another TFont (see page 2730) object.

8.1.8.4.1 TFont.Assign Method

Copies the properties of another TFont (see page 2730) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to set the properties of the font to match the characteristics of the Source object. If Source is another TFont (see page 2730) object, Assign matches the font characteristics of the source. Assign does not copy the PixelsPerInch (see page 2745) property, so this method can be used to copy a screen font to a printer font, or vice versa.

If the Source parameter is not another TFont (see page 2730) object, Assign calls the inherited method so that the font can be copied from any object that can assign font properties in its AssignTo method.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
```

See Also

PixelsPerInch (see page 2745)

AssignTo

8.1.8.4.2 TFont.Changed Method

Generates an OnChange event when the properties of the graphics object change.

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

Descendants of TGraphicsObject call Changed after making changes to the properties encapsulated by the TGraphicsObject object.

See Also

OnChange (see page 2768)

8.1.8.4.3 TFont.GetCharset Method

Pascal

```
function GetCharset: TFontCharset;
```

C++

```
__fastcall TFontCharset GetCharset();
```

Description

This is GetCharset, a member of class TFont.

8.1.8.4.4 TFont.GetHandle Method

Pascal

```
function GetHandle: HFont;
```

C++

```
__fastcall HFont GetHandle();
```

Description

This is GetHandle, a member of class TFont.

8.1.8.4.5 TFont.GetHeight Method

Pascal

```
function GetHeight: Integer;
```

C++

```
__fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TFont.

8.1.8.4.6 TFont.GetName Method

Pascal

```
function GetName: TFontName;
```

C++

```
__fastcall TFontName GetName();
```

Description

This is GetName, a member of class TFont.

8.1.8.4.7 TFont.GetOrientation Method

Pascal

```
function GetOrientation: Integer;
```

C++

```
__fastcall int GetOrientation();
```

Description

This is GetOrientation, a member of class TFont.

8.1.8.4.8 TFont.GetPitch Method

Pascal

```
function GetPitch: TFontPitch;
```

C++

```
__fastcall TFontPitch GetPitch();
```

Description

This is GetPitch, a member of class TFont.

8.1.8.4.9 TFont.GetSize Method

Pascal

```
function GetSize: Integer;
```

C++

```
__fastcall int GetSize();
```

Description

This is GetSize, a member of class TFont.

8.1.8.4.10 TFont.GetStyle Method

Pascal

```
function GetStyle: TFontStyles;
```

C++

```
__fastcall TFontStyles GetStyle();
```

Description

This is GetStyle, a member of class TFont.

8.1.8.4.11 TFont.SetCharset Method

Pascal

```
procedure SetCharset(const Value: TFontCharset);
```

C++

```
__fastcall SetCharset(const TFontCharset Value);
```

Description

This is SetCharset, a member of class TFont.

8.1.8.4.12 TFont.SetColor Method

Pascal

```
procedure SetColor(const Value: TColor);
```

C++

```
__fastcall SetColor(const TColor Value);
```

Description

This is SetColor, a member of class TFont.

8.1.8.4.13 TFont.SetHandle Method

Pascal

```
procedure SetHandle(const Value: HFont);
```

C++

```
__fastcall SetHandle(const HFont Value);
```

Description

This is SetHandle, a member of class TFont.

8.1.8.4.14 TFont.SetHeight Method

Pascal

```
procedure SetHeight(const Value: Integer);
```

C++

```
__fastcall SetHeight(const int Value);
```

Description

This is SetHeight, a member of class TFont.

8.1.8.4.15 TFont.SetName Method

Pascal

```
procedure SetName(const Value: TFontName);
```

C++

```
__fastcall SetName(const TFontName Value);
```

Description

This is SetName, a member of class TFont.

8.1.8.4.16 TFont.SetOrientation Method

Pascal

```
procedure SetOrientation(const Value: Integer);
```

C++

```
__fastcall SetOrientation(const int Value);
```

Description

This is SetOrientation, a member of class TFont.

8.1.8.4.17 TFont.SetPitch Method

Pascal

```
procedure SetPitch(const Value: TFontPitch);
```

C++

```
__fastcall SetPitch(const TFontPitch Value);
```

Description

This is SetPitch, a member of class TFont.

8.1.8.4.18 TFont.SetSize Method

Pascal

```
procedure SetSize(const Value: Integer);
```

C++

```
__fastcall SetSize(const int Value);
```

Description

This is SetSize, a member of class TFont.

8.1.8.4.19 TFont.SetStyle Method

Pascal

```
procedure SetStyle(const Value: TFontStyles);
```

C++

```
__fastcall SetStyle(const TFontStyles Value);
```

Description

This is SetStyle, a member of class TFont.

8.1.8.5 TFont Properties

The properties of the TFont class are listed here.

Public Properties

	Name	Description
	FontAdapter (see page 2741)	Designates an interface for providing the font information to ActiveX controls.
	Handle (see page 2741)	Provides access to the handle of a system font.
	PixelsPerInch (see page 2745)	Indicates the conversion factor between logical inches and the pixels of the device (printer or screen) using the font.

Published Properties

	Name	Description
	Charset (see page 2739)	Specifies the character set of the font.
	Color (see page 2739)	Specifies the color of the text.
	Height (see page 2742)	Specifies the height of the font.
	Name (see page 2743)	Identifies the typeface of the font.
	Orientation (see page 2744)	Specifies text orientation.
	Pitch (see page 2744)	Specifies whether the characters in the font all have the same width.
	Size (see page 2745)	Specifies the height of the font in points.
	Style (see page 2746)	Determines whether the font is normal, italic, underlined, bold, and so on.

8.1.8.5.1 TFont.Charset Property

Specifies the character set of the font.

Pascal

```
property Charset: TFontCharset;
```

C++

```
__property TFontCharset Charset;
```

Description

Set Charset to identify the character set of the font. Each typeface (specified by the Name (see page 2743) property) supports one or more character sets. Check the information supplied by the font vendor to determine what values of Charset are valid.

See Also

Name (see page 2743)

8.1.8.5.2 TFont.Color Property

Specifies the color of the text.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to specify the color of the text characters (as opposed to the background color). If Color is set to a dithered color, the text appears in the closest non-dithered value.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
```

```
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
      (Section->Text).Length() *
      HeaderControl1->Font->Size;
    // Owner draw every other section
    if (i % 2 == 0)
      Section->Style = hsOwnerDraw;
    else
      Section->Style = hsText;
  }
}
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;

procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
  with HeaderControl.Canvas do
  begin
    // highlight pressed sections
    if Pressed then
      Font.Color := clRed
    else
      Font.Color := clBlue;
    TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
  end;
end;
```

See Also

Color

8.1.8.5.3 TFont.FontAdapter Property

Designates an interface for providing the font information to ActiveX controls.

Pascal

```
property FontAdapter: IChangeNotifier;
```

C++

```
__property IChangeNotifier FontAdapter;
```

Description

Do not use the FontAdapter property. FontAdapter is used internally by ActiveX controls to communicate font information through an OLE interface.

See Also

TFontAdapter

8.1.8.5.4 TFont.Handle Property

Provides access to the handle of a system font.

Pascal

```
property Handle: HFont;
```

C++

```
__property HFont Handle;
```

Description

The Handle property indicates the Windows GDI font object handle.

Use Handle as a parameter when calling Windows API functions that require a font handle. Set Handle to make the TFont (see page 2730) object represent the Windows font indicated by the font handle. Setting Handle releases the current Windows font resource.

Note: When possible, change a font by setting the other properties of TFont (see page 2730) rather than using the Handle property. Setting Handle does not reset the properties that describe the font. However, an OnChange (see page 2768) event does occur when Handle is set directly by an application.

C++ Examples:

```
/*
This example creates a rotated font and displays it on the
form by assigning the handle of the rotated to the Form's
Canvas Font via the Font's Handle property.  Rotating fonts
is a straightforward process, so long as the Windows Font
Mapper can supply a rotated font based on the font you
request. If you are using a TrueType font there is virtually
no reason for failure.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
    LOGFONT lf; // Windows native font structure
```

```
    Canvas->Brush->Style = bsClear; // set the brush style to transparent
    ZeroMemory(&lf, sizeof(LOGFONT));

    lf.lfHeight = 20;
    lf.lfEscapement = 10 * 45; // degrees to rotate
    lf.lfOrientation = 10 * 45;
    lf.lfCharSet = DEFAULT_CHARSET;
    strcpy(lf.lfFaceName, "Tahoma");

    Canvas->Font->Handle = CreateFontIndirect(&lf);
    Canvas->TextOut(10, 100, "Rotated text"); // output the rotated font
}
```

Delphi Examples:

```
{
This example creates a rotated font and displays it on the
form by assigning the handle of the rotated to the Form's
Canvas Font via the Font's Handle property.  Rotating fonts
is a straightforward process, so long as the Windows Font
Mapper can supply a rotated font based on the font you
request. If you are using a TrueType font there is virtually
no reason for failure.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  lf: LOGFONT; // Windows native font structure
begin
  Canvas.Brush.Style := bsClear; // set the brush style to transparent
  FillChar(lf, SizeOf(lf), Byte(0));
  lf.lfHeight := 20;
  lf.lfEscapement := 10 * 45; // degrees to rotate
  lf.lfOrientation := 10 * 45;
  lf.lfCharSet := DEFAULT_CHARSET;
  StrCopy(lf.lfFaceName, 'Tahoma');

  Canvas.Font.Handle := CreateFontIndirect(lf);
  Canvas.TextOut(10, 100, 'Rotated text'); // output the rotated font
end;
```

See Also

OnChange (see page 2768)

8.1.8.5.5 TFont.Height Property

Specifies the height of the font.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use Height to specify the height of the font in pixels. If the value is negative, the internal leading that appears at the top of each line of text is not measured. If the value is positive, Height represents the height of the characters plus the internal leading.

To specify the size of the font in points, use the Size (see page 2745) property instead. Users usually specify font size in points, while applications may be concerned with the actual size of the font in pixels when displaying the font on the screen.

The value of Height can be obtained from the point size using this formula:

```
Font.Height = -Font.Size * Font.PixelsPerInch / 72
```

When the Height property has a positive value, the Size (see page 2745) property has a negative value. When the Size (see page 2745) property has a positive value, the Height property has a negative value.

See Also

Size (see page 2745)

8.1.8.5.6 TFont.Name Property

Identifies the typeface of the font.

Pascal

```
property Name: TFontName;
```

C++

```
__property TFontName Name;
```

Description

Use Name to specify the typeface of the font. If the font family described by Name includes multiple character sets, be sure to set the Charset (see page 2739) property as well.

Note: If the combination of font family (typeface) and attributes (such as bold or italic) specifies a font that is not available on the system, the system substitutes a different font.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
```

```
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Charset (see page 2739)

Pitch (see page 2744)

Size (see page 2745)

8.1.8.5.7 TFont.Orientation Property

Specifies text orientation.

Pascal

```
property Orientation: Integer;
```

C++

```
__property int Orientation;
```

Description

Use Orientation to specify the orientation of text characters. It is the angle in tenths of degrees between the character's baseline and device x-axis. This is similar to the **lfOrientation** field of the Windows GDI **LOGFONT** structure that defines font attributes.

See Also

Color (see page 2739)

8.1.8.5.8 TFont.Pitch Property

Specifies whether the characters in the font all have the same width.

Pascal

```
property Pitch: TFontPitch;
```

C++

```
__property TFontPitch Pitch;
```

Description

Each typeface has an associated pitch. The characters in fixed-pitch fonts are all the same width. The characters in variable-pitch fonts differ in width. Fixed pitch fonts are generally used for representing source code, because they allow the indentation to line up properly. Variable pitch fonts are generally used to give text a more natural appearance

Here are the possible values for Pitch:

Value	Meaning
fpDefault	The font pitch is set to the default value, which depends on the font specified in the Name (see page 2743) property.
fpFixed	The font pitch is set to Fixed. All characters in the font have the same width.
fpVariable	The font pitch is set to Variable. The characters in the font have varying widths.

Setting the Pitch of a fixed-pitch font to fpVariable or a variable-pitch font to fpFixed will cause window system to find what it considers the best match to all of the font characteristics that have been specified. This might have no effect on the appearance of a font, or might cause the window system to substitute a different font with the appropriate pitch. For example, setting the pitch of Serif (a variable-pitch font) to fpFixed causes Courier to be displayed.

Name (see page 2743)

8.1.8.5.9 TFont.PixelsPerInch Property

Indicates the conversion factor between logical inches and the pixels of the device (printer or screen) using the font.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

PixelsPerInch is used to ensure that when a font is copied from the form's canvas to the printer, the font is the same size in points. The PixelsPerInch property affects printer fonts only and should not be modified.

To modify the size of a font, use the Size (see page 2745) or Height (see page 2742) properties.

See Also

Height (see page 2742)

Size (see page 2745)

8.1.8.5.10 TFont.Size Property

Specifies the height of the font in points.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Use Size to specify the point size of the font. If the value is negative, the internal leading that appears at the top of each line of text is included. If the value is positive, Size represents the height of the characters but not the internal leading.

To determine the size of the font in pixels, use the Height (see page 2742) property instead. The value of Size can be obtained from the height in pixels using this formula:

```
Font.Size = -Font.Height * 72 / Font.PixelsPerInch
```

When the Size property has a positive value, the Height (see page 2742) property has a negative value. When the Height (see page 2742) property has a positive value, the Size property has a negative value.

See Also

Height (see page 2742)

8.1.8.5.11 TFont.Style Property

Determines whether the font is normal, italic, underlined, bold, and so on.

Pascal

```
property Style: TFontStyles;
```

C++

```
__property TFontStyles Style;
```

Description

Use Style to add special characteristics to characters that use the font. Style is a set containing zero or more values from the following:

Value	Meaning
fsBold	The font is boldfaced.
fsItalic	The font is italicized.
fsUnderline	The font is underlined.
fsStrikeOut	The font is displayed with a horizontal line through it.

C++ Examples:

```
/*
This example demonstrates how to set and clear font styles.
This example requires a button and a label that has text
with some styles set.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
   Label1->Font->Style = TFontStyles() << fsBold << fsUnderline;
}
/*
This example demonstrates how to clear any Styles that were previously set.
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
   Label1->Font->Style = TFontStyles();
}
```

Delphi Examples:

```
{
This example demonstrates how to set and clear font styles.
This example requires a button and a label that has text
with some styles set.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   Label1.Font.Style := [fsBold, fsUnderline];
end;
{
This code demonstrates how to clear any Styles that were
previously set.
}
procedure TForm1.Button2Click(Sender: TObject);
begin
   Label1.Font.Style := [];
end;
```

Color (see page 2739)

8.1.9 TFontRecall Class

TFontRecall saves and restores the properties of a TFont (see page 2730) object.

Class Hierarchy

Pascal

```
TFontRecall = class(TRecall);
```

C++

```
class TFontRecall : public TRecall;
```

File

Graphics

Description

Use TFontRecall to store the current state of a TFont (see page 2730) object. You are then free to change the current state of the font object. To restore the font object to its original state, all that is necessary is to free the TFontRecall object and the TFont (see page 2730) object is automatically restored to the saved property values.

You can update the TFontRecall instance to reflect the current properties of the TFont (see page 2730) object by calling the Store method. You can prevent the TFontRecall destructor from updating the TFont (see page 2730) object by calling the Forget method.

See Also

TRecall

TFont (see page 2730)

8.1.9.1 TFontRecall Members

The following tables list the members exposed by TFontRecall.

Public Methods

	Name	Description
	Create (see page 2747)	Instantiates a TFontRecall (see page 2747) object.

8.1.9.2 TFontRecall.Create Constructor

Instantiates a TFontRecall (see page 2747) object.

Pascal

```
constructor Create(AFont: TFont);
```

C++

```
__fastcall TFontRecall(TFont AFont);
```

Description

Call Create to instantiate a font recall object at runtime. Create saves the current properties of the TFont (see page 2730) object specified by AFont, which becomes the value of the Reference property.

Subsequent calls to the Store method take snapshots of the properties of AFont and save them, replacing the values saved by this constructor. When you destroy the TFontRecall (see page 2747) instance, the most recently-saved properties are assigned to AFont, restoring it to a previous state.

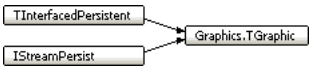
8.1.10 TGraphic Class

TGraphic is the abstract base class type for objects such as icons, bitmaps, and metafiles that can store and display visual images.

Class Hierarchy



Pascal

```
TGraphic = class(TInterfacedPersistent, IStreamPersist);
```

C++

```
class TGraphic : public TInterfacedPersistent, public IStreamPersist;
```

File

Graphics

Description

TGraphic is an abstract class that cannot be instantiated. Descendant graphics objects override many of the methods of TGraphic to address the needs of their particular file format and graphical characteristics. TGraphic also introduces methods that work with TPicture (see page 2812) objects and the Clipboard. Properties of TGraphic provide information about the state and size of the graphic image.

When the type of graphic is known, store the graphic in its specific type object. Otherwise, use a TPicture (see page 2812) object that can hold any type of TGraphic.

Graphic Controls

8.1.10.1 TGraphic Members

The following tables list the members exposed by TGraphic.

Protected Methods

	Name	Description
	Changed (see page 2751)	This is Changed, a member of class TGraphic.
	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Draw (see page 2752)	This is Draw, a member of class TGraphic.
	DrawTransparent (see page 2752)	This is DrawTransparent, a member of class TGraphic.
	Equals (see page 2752)	This is the overview for the Equals method overload.
	GetEmpty (see page 2753)	This is GetEmpty, a member of class TGraphic.
	GetHeight (see page 2753)	This is GetHeight, a member of class TGraphic.
	GetPalette (see page 2754)	This is GetPalette, a member of class TGraphic.
	GetSupportsPartialTransparency (see page 2754)	This is GetSupportsPartialTransparency, a member of class TGraphic.
	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.
	GetWidth (see page 2754)	This is GetWidth, a member of class TGraphic.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.
	ReadData (see page 2757)	This is ReadData, a member of class TGraphic.
	SetHeight (see page 2758)	This is SetHeight, a member of class TGraphic.
	SetPalette (see page 2759)	This is SetPalette, a member of class TGraphic.
	SetTransparent (see page 2759)	This is SetTransparent, a member of class TGraphic.
	SetWidth (see page 2759)	This is SetWidth, a member of class TGraphic.
	WriteData (see page 2760)	This is WriteData, a member of class TGraphic.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	Create (see page 2750)	Constructs an object and initializes its data before the object is first used.
	LoadFromClipboardFormat (see page 2754)	Introduces an abstract method that loads the image from a variable in Clipboard format.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromStream (see page 2756)	Introduces an abstract method that loads the image from a stream.
	SaveToClipboardFormat (see page 2757)	Introduces an abstract method that assigns the graphic to a variable in clipboard format.
	SaveToFile (see page 2757)	Saves a graphics image to a file.
	SaveToStream (see page 2758)	Introduces an abstract method that saves the graphic image to a stream.
	SetSize (see page 2759)	Specifies the size of the graphic.

Public Properties

	Name	Description
R	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.
R	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

8.1.10.2 TGraphic.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TGraphic();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy

System::TObject::Free

8.1.10.3 TGraphic Methods

The methods of the TGraphic class are listed here.

Protected Methods

	Name	Description
V	Changed (see page 2751)	This is Changed, a member of class TGraphic.
V	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.
A	Draw (see page 2752)	This is Draw, a member of class TGraphic.
V	DrawTransparent (see page 2752)	This is DrawTransparent, a member of class TGraphic.
V	Equals (see page 2752)	This is the overview for the Equals method overload.
A	GetEmpty (see page 2753)	This is GetEmpty, a member of class TGraphic.
A	GetHeight (see page 2753)	This is GetHeight, a member of class TGraphic.
V	GetPalette (see page 2754)	This is GetPalette, a member of class TGraphic.
V	GetSupportsPartialTransparency (see page 2754)	This is GetSupportsPartialTransparency, a member of class TGraphic.
V	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.
A	GetWidth (see page 2754)	This is GetWidth, a member of class TGraphic.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.

	ReadData (see page 2757)	This is ReadData, a member of class TGraphic.
	SetHeight (see page 2758)	This is SetHeight, a member of class TGraphic.
	SetPalette (see page 2759)	This is SetPalette, a member of class TGraphic.
	SetTransparent (see page 2759)	This is SetTransparent, a member of class TGraphic.
	SetWidth (see page 2759)	This is SetWidth, a member of class TGraphic.
	WriteData (see page 2760)	This is WriteData, a member of class TGraphic.

Public Methods

	Name	Description
	LoadFromClipboardFormat (see page 2754)	Introduces an abstract method that loads the image from a variable in Clipboard format.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromStream (see page 2756)	Introduces an abstract method that loads the image from a stream.
	SaveToClipboardFormat (see page 2757)	Introduces an abstract method that assigns the graphic to a variable in clipboard format.
	SaveToFile (see page 2757)	Saves a graphics image to a file.
	SaveToStream (see page 2758)	Introduces an abstract method that saves the graphic image to a stream.
	SetSize (see page 2759)	Specifies the size of the graphic.

8.1.10.3.1 TGraphic.Changed Method

Pascal

```
procedure Changed(Sender: TObject); virtual;
```

C++

```
virtual __fastcall Changed(TObject * Sender);
```

Description

This is Changed, a member of class TGraphic.

8.1.10.3.2 TGraphic.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Descendants of TPersistent override DefineProperties to designate a method for storing the object's unpublished data to a stream such as a form file. By default, writing an object to a stream writes the values of all its published properties, and reading the object in reads those values and assigns them to the properties. Objects can also specify methods that read and write data other than published properties by overriding the DefineProperties method.

When overriding DefineProperties, consider including some or all of the following:

A call to the inherited method

Calls to the filer object's DefineProperty method

Calls to the filer object's DefineBinaryProperty method

DefineProperties is virtual, so descendant classes can override it as necessary but are not required to do so.

See Also

DefineProperties

DefineBinaryProperty

DefineProperty

8.1.10.3.3 TGraphic.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); virtual; abstract;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect) = 0;
```

Description

This is Draw, a member of class TGraphic.

8.1.10.3.4 TGraphic.DrawTransparent Method

Pascal

```
procedure DrawTransparent(ACanvas: TCanvas; const Rect: TRect; Opacity: Byte); virtual;
```

C++

```
virtual __fastcall DrawTransparent(TCanvas ACanvas, const TRect Rect, Byte Opacity);
```

Description

This is DrawTransparent, a member of class TGraphic.

8.1.10.3.5 Equals Method

This is the overview for the Equals method overload.

Overload List

	Name	Description
	TGraphic.Equals (TGraphic) (see page 2752)	This is Equals, a member of class TGraphic.
	TGraphic.Equals (TObject) (see page 2753)	Checks if the current instance and the parameter are equal.

8.1.10.3.5.1 TGraphic.Equals Method (TGraphic)

Pascal

```
function Equals(Graphic: TGraphic): Boolean; virtual; overload; reintroduce;
```

C++

```
virtual __fastcall Boolean Equals(TGraphic Graphic);
```

Description

This is Equals, a member of class TGraphic.

8.1.10.3.5.2 TGraphic.Equals Method (TObject)

Checks if the current instance and the parameter are equal.

Pascal

```
function Equals(Obj: TObject): Boolean; override; overload;
```

C++

```
virtual __fastcall Boolean Equals(TObject * Obj);
```

Description

The function has one parameter, **Obj** of type TObject.

By default, the System::TObject::Equals method shows if the addresses corresponding to the object and the parameter are identical. Returns a boolean value that represents the equality between the two addresses.

Note: System::TObject::Equals is supposed to be overridden in user derived classes, in order to provide consumer objects with an equality determining function.

8.1.10.3.6 TGraphic.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean GetEmpty() = 0;
```

Description

This is GetEmpty, a member of class TGraphic.

8.1.10.3.7 TGraphic.GetHeight Method

Pascal

```
function GetHeight: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetHeight() = 0;
```

Description

This is GetHeight, a member of class TGraphic.

8.1.10.3.8 TGraphic.GetPalette Method

Pascal

```
function GetPalette: HPALETTE; virtual;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

This is GetPalette, a member of class TGraphic.

8.1.10.3.9 TGraphic.GetSupportsPartialTransparency Method

Pascal

```
function GetSupportsPartialTransparency: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetSupportsPartialTransparency();
```

Description

This is GetSupportsPartialTransparency, a member of class TGraphic.

8.1.10.3.10 TGraphic.GetTransparent Method

Pascal

```
function GetTransparent: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetTransparent();
```

Description

This is GetTransparent, a member of class TGraphic.

8.1.10.3.11 TGraphic.GetWidth Method

Pascal

```
function GetWidth: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetWidth() = 0;
```

Description

This is GetWidth, a member of class TGraphic.

8.1.10.3.12 TGraphic.LoadFromClipboardFormat Method

Introduces an abstract method that loads the image from a variable in Clipboard format.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); virtual;
abstract;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette) = 0;
```

Description

Each descendant graphic object defines a LoadFromClipboardFormat method that replaces the current graphic image with the graphic indicated by AData, which it loads from the Clipboard.

The format for the new graphic object must be registered with the Clipboard in the RegisterClipboardFormat method, or an exception is raised.

See Also

TClipboard

RegisterClipboardFormat (see page 2819)

8.1.10.3.13 TGraphic.LoadFromFile Method

Loads a graphic image stored in a file.

Pascal

```
procedure LoadFromFile(const Filename: string); virtual;
```

C++

```
virtual __fastcall LoadFromFile(const UnicodeString Filename);
```

Description

LoadFromFile reads the file specified in FileName and loads the data into the graphics object.

C++ Examples:

```
/*
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
Note: For the C++ Builder, capitalization matters for the file
name and path.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> Bitmap1(new Graphics::TBitmap());
  std::auto_ptr<Graphics::TBitmap> Bitmap2(new Graphics::TBitmap());
  try
  {
    Bitmap1->LoadFromFile("..\\FACTORY.BMP");
    Bitmap2->Assign(Bitmap1.get());     // Copy Bitmap1 into Bitmap2
    Bitmap2->Dormant();           // Free up GDI resources
    Bitmap2->FreeImage();         // Free up Memory.
    Canvas->Draw(20, 20, Bitmap2.get());  // Note that previous calls don't lose the image
    Bitmap2->Monochrome = true;
    Canvas->Draw(80, 80, Bitmap2.get());
    Bitmap2->ReleaseHandle();       // This will actually lose the bitmap;
  }
  catch (...)
  {
    MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form and creates two bitmaps
dynamically.  One bitmap is monchrome, which means all
non-white colors become black.  The bitmap file path is
relative to the Debug directory.
}
procedure TForm1.Button1Click(Sender: TObject);
var
 BitMap1,BitMap2 : TBitMap;
 MyFormat : Word;
begin
   BitMap2 := TBitMap.Create;
   BitMap1 := TBitMap.Create;
try
   BitMap1.LoadFromFile('factory.bmp');
   BitMap2.Assign(BitMap1);     // Copy BitMap1 into BitMap2
   BitMap2.Dormant;             // Free up GDI resources
   BitMap2.FreeImage;           // Free up Memory.
   Canvas.Draw(20,20,BitMap2);  // Note that previous calls don't lose the image
   BitMap2.Monochrome := true;
   Canvas.Draw(80,80,BitMap2);
   BitMap2.ReleaseHandle;       // This will actually lose the bitmap;
 finally
   BitMap1.Free;
   BitMap2.Free;
 end;
end;
```

See Also

LoadFromStream (see page 2756)

8.1.10.3.14 TGraphic.LoadFromStream Method

Introduces an abstract method that loads the image from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); virtual; abstract;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream) = 0;
```

Description

Each descendant graphic object defines a LoadFromStream method that loads a graphics object from Stream.

See Also

LoadFromFile (see page 2755)

TStream

8.1.10.3.15 TGraphic.Progress Method

Pascal

```
procedure Progress(Sender: TObject; Stage: TProgressStage; PercentDone: Byte; RedrawNow:
Boolean; const R: TRect; const Msg: string); dynamic;
```

C++

```
__fastcall Progress(TObject * Sender, TProgressStage Stage, Byte PercentDone, Boolean
RedrawNow, const TRect R, const UnicodeString Msg);
```

Description

This is Progress, a member of class TGraphic.

8.1.10.3.16 TGraphic.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TGraphic.

8.1.10.3.17 TGraphic.SaveToClipboardFormat Method

Introduces an abstract method that assigns the graphic to a variable in clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette:
HPALETTE); virtual; abstract;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette) = 0;
```

Description

Each descendant graphic object defines a SaveToClipboardFormat method that saves that particular graphic image type to a Clipboard format. An application must have registered the format with the TGraphic (see page 2748) object using the RegisterClipboardFormat method.

See Also

TClipboard

RegisterClipboardFormat (see page 2819)

8.1.10.3.18 TGraphic.SaveToFile Method

Saves a graphics image to a file.

Pascal

```
procedure SaveToFile(const Filename: string); virtual;
```

C++

```
virtual __fastcall SaveToFile(const UnicodeString Filename);
```

Description

SaveToFile writes the graphic to a file, specified by Filename.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
```

```
*/

#include <Jpeg.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
  std::auto_ptr<TJPEGImage> jp(new TJPEGImage());
  jp->Assign(Image1->Picture->Bitmap);
  jp->SaveToFile("..\\factory.jpg");
  Image2->Stretch = True;
  Image2->Picture->LoadFromFile("..\\factory.jpg");
}
```

Delphi Examples:

```
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
uses Jpeg;

procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

8.1.10.3.19 TGraphic.SaveToStream Method

Introduces an abstract method that saves the graphic image to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); virtual; abstract;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream) = 0;
```

Description

Each descendant graphic object defines a SaveToStream method that saves the object to a Stream.

8.1.10.3.20 TGraphic.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetHeight(int Value) = 0;
```

Description

This is SetHeight, a member of class TGraphic.

8.1.10.3.21 TGraphic.SetPalette Method

Pascal

```
procedure SetPalette(Value: HPALETTE); virtual;
```

C++

```
virtual __fastcall SetPalette(HPALETTE Value);
```

Description

This is SetPalette, a member of class TGraphic.

8.1.10.3.22 TGraphic.SetSize Method

Specifies the size of the graphic.

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer); virtual;
```

C++

```
virtual __fastcall SetSize(int AWidth, int AHeight);
```

Description

Use the SetSize method to set both the height and width of the graphic. This results in better performance than setting the height and width separately.

8.1.10.3.23 TGraphic.SetTransparent Method

Pascal

```
procedure SetTransparent(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetTransparent(Boolean Value);
```

Description

This is SetTransparent, a member of class TGraphic.

8.1.10.3.24 TGraphic.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetWidth(int Value) = 0;
```

Description

This is SetWidth, a member of class TGraphic.

8.1.10.3.25 TGraphic.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TGraphic.

8.1.10.4 TGraphic Properties

The properties of the TGraphic class are listed here.

Public Properties

	Name	Description
R	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.
R	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

8.1.10.4.1 TGraphic.Empty Property

Indicates whether the graphics object contains a graphic.

Pascal

```
property Empty: Boolean;
```

C++

```
__property Boolean Empty;
```

Description

Use Empty to determine whether the graphic is bound to an image. Each descendant graphic object defines its own Get method to access the Empty property.

8.1.10.4.2 TGraphic.Height Property

Specifies the vertical size of the graphic in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use Height to determine the height of the graphic image. Each descendant graphic object defines its own Get and Set methods

to access the Height property.

8.1.10.4.3 TGraphic.Modified Property

Indicates whether the graphics object has been changed or edited.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

If Modified is true, the graphic object has changed. If Modified is false, the graphics object is in the same state as when the object was loaded.

The Modified property indicates only if bitmap objects have been modified. Modified is not true if the graphics object contains an icon or metafile graphic, even if they have been modified.

If the graphics object was modified, save the changes to a file with the SaveToFile (see page 2757) method. The next time the application runs, it can load the graphic from the file with the LoadFromFile (see page 2755) method.

8.1.10.4.4 TGraphic.Palette Property

Indicates the color palette of the graphical image.

Pascal

```
property Palette: HPALETTE;
```

C++

```
__property HPALETTE Palette;
```

Description

Use Palette to get the color palette of a graphical image. If the graphic does not need or does not use a palette, the Palette property is zero.

8.1.10.4.5 TGraphic.PaletteModified Property

Indicates whether the palette has changed.

Pascal

```
property PaletteModified: Boolean;
```

C++

```
__property Boolean PaletteModified;
```

Description

Use PaletteModified to determine if the palette used for a graphical image has changed. PaletteModified is used in the OnChange (see page 2763) event. PaletteModified remains true until whoever is responsible for realizing this new palette (for example, TImage) sets it to false.

8.1.10.4.6 TGraphic.SupportsPartialTransparency Property

Pascal

```
property SupportsPartialTransparency: Boolean;
```

C++

```
__property Boolean SupportsPartialTransparency;
```

Description

This is SupportsPartialTransparency, a member of class TGraphic.

8.1.10.4.7 TGraphic.Transparent Property

Indicates whether the image covers its rectangular area.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Use Transparent to specify that the graphic be drawn transparently. Some descendants of TGraphic (see page 2748) such as TIcon (see page 2768) and TMetafile (see page 2780) are always transparent, so setting the property for those objects does not change their behavior. However, the TBitmap (see page 2628) graphic's drawing is affected by this property. The TImage component sets this property to be the same as its Transparent property to achieve transparent painting.

When the Transparent property is set to True, you can either specify a color as the transparent color or you can use the default color, which is the pixel in the lower left. The specified color is not displayed in the graphic, which lets the background show through. This can be useful in layering and for non-rectangular graphics.

C++ Examples:

```
/*
An examples of TBitmap Color, TGraphic Transparent, TBitmap
TransparentMode, TBitmap TransparentColor and TCanvas Draw.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<Graphics::TBitmap> bitmap(new Graphics::TBitmap);
  try
  {
    bitmap->LoadFromFile("..\\FACTORY.BMP ");
    bitmap->Transparent = true;
    bitmap->TransparentColor = bitmap->Canvas->Pixels[50][50];
    Form1->Canvas->Draw( 0, 0, bitmap.get());
    bitmap->TransparentMode = tmAuto;
    Form1->Canvas->Draw(50, 50, bitmap.get());
  }
  catch (...)
  {
    ShowMessage("Could not load or display bitmap");
  }
}
```

Delphi Examples:

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitMap;
begin
  Bitmap := TBitmap.Create;
  try
    with Bitmap do begin
      LoadFromFile('factory.bmp');
      Transparent := True;
      TransParentColor := BitMap.canvas.pixels[50,50];
      Form1.Canvas.Draw(0,0,BitMap);
      TransparentMode := tmAuto;
      Form1.Canvas.Draw(50,50,BitMap);
    end;
  finally
    Bitmap.Free;
  end;
end;
```

8.1.10.4.8 TGraphic.Width Property

Determines the maximum width of the graphics object in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Each descendant graphic object defines its own Get and Set methods to access the Width property.

8.1.10.5 TGraphic Events

The events of the TGraphic class are listed here.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

8.1.10.5.1 TGraphic.OnChange Event

Occurs whenever a graphical image changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use OnChange to write a handler to perform an action then the graphical image changes.

8.1.10.5.2 TGraphic.OnProgress Event

Occurs when a graphical image is in the process of changing.

Pascal

```
property OnProgress: TProgressEvent;
```

C++

```
__property TProgressEvent OnProgress;
```

Description

For certain descendants of TGraphic (see page 2748), OnProgress occurs during slow processes such as loading, storing, or transforming image data. OnProgress allows applications to provide feedback to the user about the progress of the slow process.

Component writers can generate OnProgress events for new descendants of TGraphic (see page 2748) by calling the protected Progress (see page 2756) method. These events are propagated to the TPicture (see page 2812) and TImage objects.

See Also

OnProgress (see page 1098)

OnProgress (see page 2830)

8.1.11 TGraphicsObject Class

TGraphicsObject is the abstract base class for objects which encapsulate a system graphics object: TBrush (see page 2664), TFont (see page 2730), and TPen (see page 2801).

Class Hierarchy

Pascal

```
TGraphicsObject = class(TPersistent);
```

C++

```
class TGraphicsObject : public TPersistent;
```

File

Graphics

Description

Create descendants of TGraphicsObject when drawing an image to a canvas (TCanvas (see page 2673)). Each TGraphicsObject object describes a system graphics object that is selected into the device context of the canvas.

TGraphicsObject introduces a mechanism for responding to changes in the properties of the graphics object.

See Also

TBrush (see page 2664)

TCanvas (see page 2673)

TFont (see page 2730)

TPen (see page 2801)

8.1.11.1 TGraphicsObject Members

The following tables list the members exposed by TGraphicsObject.

Protected Methods

	Name	Description
	Changed (see page 2765)	Generates an OnChange (see page 2768) event when the properties of the graphics object change.
	Lock (see page 2766)	Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.
	Unlock (see page 2767)	Releases the lock on execution threads set by the Lock (see page 2766) method.

Public Events

	Name	Description
	OnChange (see page 2768)	Occurs immediately after the graphics object changes.

Public Methods

	Name	Description
	HandleAllocated (see page 2766)	Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

Public Properties

	Name	Description
	OwnerCriticalSection (see page 2767)	Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.

8.1.11.2 TGraphicsObject Methods

The methods of the TGraphicsObject class are listed here.

Protected Methods

	Name	Description
	Changed (see page 2765)	Generates an OnChange (see page 2768) event when the properties of the graphics object change.
	Lock (see page 2766)	Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.
	Unlock (see page 2767)	Releases the lock on execution threads set by the Lock (see page 2766) method.

Public Methods

	Name	Description
	HandleAllocated (see page 2766)	Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

8.1.11.2.1 TGraphicsObject.Changed Method

Generates an OnChange (see page 2768) event when the properties of the graphics object change.

Pascal

```
procedure Changed; dynamic;
```

C++

```
__fastcall Changed();
```

Description

Descendants of TGraphicsObject (see page 2764) call Changed after making changes to the properties encapsulated by the TGraphicsObject (see page 2764) object.

See Also

OnChange (see page 2768)

8.1.11.2.2 TGraphicsObject.HandleAllocated Method

Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine whether the Handle property is set for the graphics object. HandleAllocated indicates whether the underlying GDI object has been acquired. Use HandleAllocated rather than reading the Handle property. When an application reads the Handle property, TGraphicsObject (see page 2764) descendants automatically create the underlying GDI object and return its handle if the property had not been previously set.

See Also

Handle (see page 2807)

Handle (see page 2741)

Handle (see page 2670)

8.1.11.2.3 TGraphicsObject.Lock Method

Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.

Pascal

```
procedure Lock;
```

C++

```
__fastcall Lock();
```

Description

Call Lock in a multithreaded application before using the graphics object in a section of code that would not otherwise be thread-safe. Lock prevents other cooperating threads in the application from using the associated canvas until the Unlock (see page 2767) method is called. Calls to Lock can be nested so that the canvas is not unlocked until the last lock is released.

Because Lock prevents other threads from executing, it can adversely affect performance. Do not call Lock unless there is a danger that another thread might interfere with the drawing.

Note: Lock will do nothing unless the drawing surface sets the OwnerCriticalSection (see page 2767) property. TCanvas (see page 2673) objects automatically set the OwnerCriticalSection (see page 2767) property when they use graphics objects.

See Also

OwnerCriticalSection (see page 2767)

TCanvas (see page 2673)

TThread

Unlock (see page 2767)

8.1.11.2.4 TGraphicsObject.Unlock Method

Releases the lock on execution threads set by the Lock (see page 2766) method.

Pascal

```
procedure Unlock;
```

C++

```
__fastcall Unlock();
```

Description

Call Unlock at the end of a thread-sensitive section of code that was started with a call to the Lock (see page 2766) method. When every call to Lock (see page 2766) is balanced by a call to Unlock, other threads are allowed to lock the associated canvas.

See Also

Lock (see page 2766)

TThread

TCanvas (see page 2673)

8.1.11.3 TGraphicsObject Properties

The properties of the TGraphicsObject class are listed here.

Public Properties

	Name	Description
	OwnerCriticalSection (see page 2767)	Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.

8.1.11.3.1 TGraphicsObject.OwnerCriticalSection Property

Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.

Pascal

```
property OwnerCriticalSection: PRTLCriticalSection;
```

C++

```
__property PRTLCriticalSection OwnerCriticalSection;
```

Description

Use OwnerCriticalSection to obtain information about the thread locking state of the canvas that draws with this graphics object. The canvas sets OwnerCriticalSection when it creates the graphics object. Do not change this property while the canvas is using

the graphics object.

If the graphics object is created on behalf of a drawing surface that is not a canvas, set OwnerCriticalSection to an initialized TRTLCriticalSection that is maintained by the drawing surface.

To use OwnerCriticalSection to block other execution threads, use the Lock (see page 2766) method.

See Also

Lock (see page 2766)

Unlock (see page 2767)

Lock (see page 2694)

8.1.11.4 TGraphicsObject Events

The events of the TGraphicsObject class are listed here.

Public Events

	Name	Description
	OnChange (see page 2768)	Occurs immediately after the graphics object changes.

8.1.11.4.1 TGraphicsObject.OnChange Event

Occurs immediately after the graphics object changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action when the graphics object changes. The properties of the graphics object reflect the new settings when OnChange occurs.

See Also

Changed (see page 2765)

8.1.12 TIcon Class

TIcon is an encapsulation of a Windows icon.

Class Hierarchy

Pascal

```
TIcon = class(TGraphic);
```

C++

```
class TIcon : public TGraphic;
```

File

Graphics

Description

Use TIcon to represent one of the icons in an image list. Assign (see page 2772) an icon to objects that have an Icon property, such as TForm or TPicture (see page 2812).

Icon objects represent the value loaded from a Windows icon file (.ICO file). Draw (see page 2773) an icon on a canvas, using the Draw (see page 2773) method of the TCanvas (see page 2673) object. Icons do not stretch, so do not use StretchDraw (TCanvas (see page 2673)) with an icon.

Note: TIcon can be used to display the value of a multi-resolution (>16 color) icon. However, it can not support the creation of multi-resolution icons, nor the resizing of the image after it is loaded from a file or stream.

See Also

TCanvas (see page 2673)

Icon

TImageList

TPicture (see page 2812)

8.1.12.1 TIcon Members

The following tables list the members exposed by TIcon.

Protected Methods

	Name	Description
	Changed (see page 2751)	This is Changed, a member of class TGraphic.
	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Draw (see page 2773)	This is Draw, a member of class TIcon.
	DrawTransparent (see page 2752)	This is DrawTransparent, a member of class TGraphic.
	Equals (see page 2752)	This is the overview for the Equals method overload.
	GetEmpty (see page 2773)	This is GetEmpty, a member of class TIcon.
	GetHeight (see page 2773)	This is GetHeight, a member of class TIcon.
	GetPalette (see page 2754)	This is GetPalette, a member of class TGraphic.
	GetSupportsPartialTransparency (see page 2754)	This is GetSupportsPartialTransparency, a member of class TGraphic.
	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.
	GetWidth (see page 2773)	This is GetWidth, a member of class TIcon.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.
	ReadData (see page 2757)	This is ReadData, a member of class TGraphic.
	SetHeight (see page 2776)	This is SetHeight, a member of class TIcon.
	SetPalette (see page 2759)	This is SetPalette, a member of class TGraphic.
	SetTransparent (see page 2777)	This is SetTransparent, a member of class TIcon.
	SetWidth (see page 2777)	This is SetWidth, a member of class TIcon.
	WriteData (see page 2760)	This is WriteData, a member of class TGraphic.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	Assign (see page 2772)	Copies an icon image from another TIcon (see page 2768) object.
	Create (see page 2770)	Creates an instance of TIcon (see page 2768).
	Destroy (see page 2772)	Destroys an instance of TIcon (see page 2768).
	HandleAllocated (see page 2774)	Indicates whether the TIcon (see page 2768) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2774)	Prevents applications from loading icons from the clipboard.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromResourceID (see page 2774)	This is LoadFromResourceID, a member of class TIcon.
	LoadFromResourceName (see page 2775)	Loads an icon resource into the icon object.
	LoadFromStream (see page 2775)	Loads the icon from a stream.
	ReleaseHandle (see page 2775)	Releases the Windows GDI object represented by the icon.
	SaveToClipboardFormat (see page 2776)	Prevents applications from saving icons to the clipboard.
	SaveToFile (see page 2757)	Saves a graphics image to a file.
	SaveToStream (see page 2776)	Saves the icon to a stream.
	SetSize (see page 2777)	Specifies the size of the icon.

Public Properties

	Name	Description
	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Handle (see page 2777)	Provides access to the Windows GDI icon handle.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.
	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

8.1.12.2 TIcon.Create Constructor

Creates an instance of TIcon (see page 2768).

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TIcon();
```

Description

Call Create to create an empty icon object. Once an image has been read into the icon from a file or stream, or by assigning another icon object, the icon can be drawn on a canvas or added to an image list. Do not create an icon object for setting the icon property of a form or picture. These objects create a TIcon (see page 2768) object in their own constructors. Instead, use the LoadFromFile (see page 2755), LoadFromStream (see page 2775), or LoadFromClipboardFormat (see page 2774) method on the TIcon (see page 2768) object that you can obtain by reading the Icon property.

C++ Examples:

```
/*
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
*/
```

```
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::ConvertIcon2BitmapClick(TObject *Sender)
{
  OpenDialog1->DefaultExt = ".ICO";
  OpenDialog1->Filter = "icons (*.ico)|*.ICO";
  OpenDialog1->Options << ofOverwritePrompt << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    std::auto_ptr<TIcon> pi(new Graphics::TIcon);
    AnsiString as;
    pi->LoadFromFile(OpenDialog1->FileName);
    as = ChangeFileExt(OpenDialog1->FileName,".BMP");
    Image1->Width = pi->Width;
    Image1->Height = pi->Height;
    Image1->Canvas->Draw(0, 0, pi.get());
    Image1->Picture->SaveToFile(as);
    ShowMessage(OpenDialog1->FileName + " Saved to " + as);
  }
}
```

Delphi Examples:

```
{
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
}
procedure TForm1.ConvertIcon2BitmapClick(Sender: TObject);
var
  s : string;
  Icon: TIcon;
begin
  OpenDialog1.DefaultExt := '.ICO';
  OpenDialog1.Filter := 'icons (*.ico)|*.ICO';
  OpenDialog1.Options := [ofOverwritePrompt, ofFileMustExist, ofHideReadOnly ];
  if OpenDialog1.Execute then
  begin
    Icon := TIcon.Create;
    try
      Icon.Loadfromfile(OpenDialog1.FileName);
      s:= ChangeFileExt(OpenDialog1.FileName,'.BMP');
      Image1.Width := Icon.Width;
      Image1.Height := Icon.Height;
      Image1.Canvas.Draw(0,0,Icon);
      Image1.Picture.SaveToFile(s);
      ShowMessage(OpenDialog1.FileName + ' Saved to ' + s);
    finally
      Icon.Free;
    end;
  end;
end;
```

See Also

Empty

LoadFromClipboardFormat (see page 2754)

LoadFromFile (see page 2755)

LoadFromStream (see page 2775)

8.1.12.3 TIcon.Destroy Destructor

Destroys an instance of TIcon (see page 2768).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIcon();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIcon (see page 2768) reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

ReleaseHandle (see page 2775)

8.1.12.4 TIcon Methods

The methods of the TIcon class are listed here.

Protected Methods

	Name	Description
	Draw (see page 2773)	This is Draw, a member of class TIcon.
	GetEmpty (see page 2773)	This is GetEmpty, a member of class TIcon.
	GetHeight (see page 2773)	This is GetHeight, a member of class TIcon.
	GetWidth (see page 2773)	This is GetWidth, a member of class TIcon.
	SetHeight (see page 2776)	This is SetHeight, a member of class TIcon.
	SetTransparent (see page 2777)	This is SetTransparent, a member of class TIcon.
	SetWidth (see page 2777)	This is SetWidth, a member of class TIcon.

Public Methods

	Name	Description
	Assign (see page 2772)	Copies an icon image from another TIcon (see page 2768) object.
	HandleAllocated (see page 2774)	Indicates whether the TIcon (see page 2768) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2774)	Prevents applications from loading icons from the clipboard.
	LoadFromResourceID (see page 2774)	This is LoadFromResourceID, a member of class TIcon.
	LoadFromResourceName (see page 2775)	Loads an icon resource into the icon object.
	LoadFromStream (see page 2775)	Loads the icon from a stream.
	ReleaseHandle (see page 2775)	Releases the Windows GDI object represented by the icon.
	SaveToClipboardFormat (see page 2776)	Prevents applications from saving icons to the clipboard.
	SaveToStream (see page 2776)	Saves the icon to a stream.
	SetSize (see page 2777)	Specifies the size of the icon.

8.1.12.4.1 TIcon.Assign Method

Copies an icon image from another TIcon (see page 2768) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy another icon object. Assign copies the icon image from the Source parameter if it is another TIcon (see page 2768) object. Otherwise, Assign calls the inherited method, which copies the icon image from any source object that specifies how to copy to a TIcon (see page 2768) in its AssignTo method.

See Also

AssignTo

8.1.12.4.2 TIcon.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

This is Draw, a member of class TIcon.

8.1.12.4.3 TIcon.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

This is GetEmpty, a member of class TIcon.

8.1.12.4.4 TIcon.GetHeight Method

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TIcon.

8.1.12.4.5 TIcon.GetWidth Method

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TIcon.

8.1.12.4.6 TIcon.HandleAllocated Method

Indicates whether the TIcon (see page 2768) object has acquired a handle to the underlying GDI object.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine whether the Handle (see page 2777) property is set to an HICON value. HandleAllocated indicates whether the underlying GDI object has already been created. Use HandleAllocated rather than reading the Handle (see page 2777) property. When an application reads the Handle (see page 2777) property, it automatically creates an icon and returns its handle if the underlying GDI object does not already exist.

See Also

Handle (see page 2777)

8.1.12.4.7 TIcon.LoadFromClipboardFormat Method

Prevents applications from loading icons from the clipboard.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat is overridden in TIcon (see page 2768) because the clipboard format is not supported.

See Also

RegisterClipboardFormat (see page 2819)

8.1.12.4.8 TIcon.LoadFromResourceID Method

Pascal

```
procedure LoadFromResourceID(Instance: THandle; ResID: Integer);
```

C++

```
__fastcall LoadFromResourceID(THandle Instance, int ResID);
```

Description

This is LoadFromResourceID, a member of class TIcon.

8.1.12.4.9 TIcon.LoadFromResourceName Method

Loads an icon resource into the icon object.

Pascal

```
procedure LoadFromResourceName(Instance: THandle; const ResName: String);
```

C++

```
__fastcall LoadFromResourceName(THandle Instance, const UnicodeString ResName);
```

Description

LoadFromResourceName loads the specified icon resource from a module's executable file.

Instance is the handle of the module that contains the resource.

ResName is the name of the resource to load.

See Also

LoadFromMimeSource

LoadFromStream (see page 2775)

8.1.12.4.10 TIcon.LoadFromStream Method

Loads the icon from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to read the icon image from a stream. Set the Stream parameter to a stream object that provides access to the memory image of the icon. To load the icon from a .ico file, use the LoadFromFile (see page 2755) method. To load the icon from the Clipboard, use the LoadFromClipboardFormat (see page 2774) method.

See Also

LoadFromClipboardFormat (see page 2754)

LoadFromFile (see page 2755)

SaveToStream (see page 2776)

8.1.12.4.11 TIcon.ReleaseHandle Method

Releases the Windows GDI object represented by the icon.

Pascal

```
function ReleaseHandle: HICON;
```

C++

```
__fastcall HICON ReleaseHandle();
```

Description

Call ReleaseHandle to release the resources used to represent the icon. ReleaseHandle sets the Handle (see page 2777)

property to nil (Delphi) or NULL (C++).

ReleaseHandle informs the TIcon (see page 2768) instance that it is no longer responsible for destroying the icon handle.

See Also

Handle (see page 2777)

8.1.12.4.12 TIcon.SaveToClipboardFormat Method

Prevents applications from saving icons to the clipboard.

Pascal

```
procedure SaveToClipboardFormat(var Format: Word; var Data: THandle; var APalette: HPALETTE);
override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word Format, THandle Data, HPALETTE APalette);
```

Description

SaveToClipboardFormat is overridden in TIcon (see page 2768) because the format is not supported for the Clipboard.

See Also

LoadFromClipboardFormat (see page 2774)

8.1.12.4.13 TIcon.SaveToStream Method

Saves the icon to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to write the icon image to a stream. Specify the Stream parameter as the stream object that receives the memory image of the icon. To write the icon to a .ico file, use the SaveToFile (see page 2757) method. To write the icon to the Clipboard, use the SaveToClipboardFormat (see page 2776) method.

See Also

LoadFromStream (see page 2775)

SaveToClipboardFormat (see page 2757)

SaveToFile (see page 2757)

8.1.12.4.14 TIcon.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

This is SetHeight, a member of class TIcon.

8.1.12.4.15 TIcon.SetSize Method

Specifies the size of the icon.

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer); override;
```

C++

```
virtual __fastcall SetSize(int AWidth, int AHeight);
```

Description

Use the SetSize method to set both the height and width of the icon. This results in better performance than setting the height and width separately.

8.1.12.4.16 TIcon.SetTransparent Method

Pascal

```
procedure SetTransparent(Value: Boolean); override;
```

C++

```
virtual __fastcall SetTransparent(Boolean Value);
```

Description

This is SetTransparent, a member of class TIcon.

8.1.12.4.17 TIcon.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TIcon.

8.1.12.5 TIcon Properties

The properties of the TIcon class are listed here.

Public Properties

	Name	Description
	Handle (see page 2777)	Provides access to the Windows GDI icon handle.

8.1.12.5.1 TIcon.Handle Property

Provides access to the Windows GDI icon handle.

Pascal

```
property Handle: HICON;
```

C++

```
__property HICON Handle;
```

Description

Use Handle to specify the icon when using a Windows API function that requires the handle of an icon object. The Handle property is nil (Delphi) or NULL (C++) if the icon has not been loaded.

Call the ReleaseHandle (see page 2775) method before changing the icon image by setting the Handle property. The icon image can also be loaded by assigning another icon object or using the LoadFromClipboardFormat (see page 2774), LoadFromFile (see page 2755), or LoadFromStream (see page 2775) method.

See Also

Assign (see page 2772)

Empty

LoadFromClipboardFormat (see page 2754)

LoadFromFile (see page 2755)

LoadFromStream (see page 2775)

ReleaseHandle (see page 2775)

8.1.13 TIconImage Class

TIconImage is the internal representation of the bitmap image for a TIcon (see page 2768) object.

Class Hierarchy

Pascal

```
TIconImage = class(TSharedImage);
```

C++

```
class TIconImage : public TSharedImage;
```

File

Graphics

Description

TIconImage is used for internal implementation only. It represents the internal image of the bitmap encapsulated by the TIcon (see page 2768) object. All of the data and methods introduced in TIconImage are private. They contain information about the specific icon resource, including pointers to the standard HICON structures defined by Windows. TIconImage is referenced in the constructor of the TIcon (see page 2768) object when the icon image is created.

See Also

TIcon (see page 2768)

8.1.13.1 TIconImage Members

The following tables list the members exposed by TIconImage.

Protected Methods

	Name	Description
	FreeHandle (see page 2779)	This is FreeHandle, a member of class TIconImage.
	Reference (see page 2832)	This is Reference, a member of class TSharedImage.
	Release (see page 2832)	This is Release, a member of class TSharedImage.

Protected Properties

	Name	Description
	RefCount (see page 2832)	This is RefCount, a member of class TSharedImage.

Public Methods

	Name	Description
	Destroy (see page 2779)	Destroys the TIconImage (see page 2778) instance and frees its memory.

8.1.13.2 TIconImage.Destroy Destructor

Destroys the TIconImage (see page 2778) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIconImage();
```

Description

You do not need to destroy the icon image. The TIconImage (see page 2778) object is automatically destroyed by the icon object.

See Also

System::TObject::Free

8.1.13.3 TIconImage Methods

The methods of the TIconImage class are listed here.

Protected Methods

	Name	Description
	FreeHandle (see page 2779)	This is FreeHandle, a member of class TIconImage.

8.1.13.3.1 TIconImage.FreeHandle Method

Pascal

```
procedure FreeHandle; override;
```

C++

```
virtual __fastcall FreeHandle();
```

Description

This is FreeHandle, a member of class TIconImage.

8.1.14 TMetafile Class

TMetafile is an encapsulation of the Win32 Enhanced (see page 2793) metafile.

Class Hierarchy

Pascal

```
TMetafile = class(TGraphic);
```

C++

```
class TMetafile : public TGraphic;
```

File

Graphics

Description

TMetafile contains a metafile graphic (EMF file format).

Properties of TMetafile indicate the size and characteristics of the metafile.

To draw a metafile on a canvas, call the Draw (see page 2785) or StretchDraw methods of a TCanvas (see page 2673) object, passing a TMetafile as a parameter. The Enhanced (see page 2793) property determines how the metafile will be stored on disk. If Enhanced (see page 2793) is true, the metafile is stored as an .EMF (Win32 Enhanced (see page 2793) Metafile) file. If Enhanced (see page 2793) is false, the metafile is stored as a .WMF (Windows 3.1 Metafile, with Aldus header).

See Also

TMetafileImage (see page 2799)

Using the Main VCL

8.1.14.1 TMetafile Members

The following tables list the members exposed by TMetafile.

Protected Methods

	Name	Description
	Changed (see page 2751)	This is Changed, a member of class TGraphic.
	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Draw (see page 2785)	This is Draw, a member of class TMetafile.
	DrawTransparent (see page 2752)	This is DrawTransparent, a member of class TGraphic.
	Equals (see page 2752)	This is the overview for the Equals method overload.
	GetEmpty (see page 2786)	This is GetEmpty, a member of class TMetafile.
	GetHeight (see page 2786)	This is GetHeight, a member of class TMetafile.

	GetPalette (see page 2786)	This is GetPalette, a member of class TMetafile.
	GetSupportsPartialTransparency (see page 2754)	This is GetSupportsPartialTransparency, a member of class TGraphic.
	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.
	GetWidth (see page 2786)	This is GetWidth, a member of class TMetafile.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.
	ReadData (see page 2787)	This is ReadData, a member of class TMetafile.
	ReadEMFStream (see page 2788)	This is ReadEMFStream, a member of class TMetafile.
	ReadWMFStream (see page 2788)	This is ReadWMFStream, a member of class TMetafile.
	SetHeight (see page 2790)	This is SetHeight, a member of class TMetafile.
	SetPalette (see page 2759)	This is SetPalette, a member of class TGraphic.
	SetTransparent (see page 2790)	This is SetTransparent, a member of class TMetafile.
	SetWidth (see page 2790)	This is SetWidth, a member of class TMetafile.
	TestEMF (see page 2791)	This is TestEMF, a member of class TMetafile.
	WriteData (see page 2791)	This is WriteData, a member of class TMetafile.
	WriteEMFStream (see page 2791)	This is WriteEMFStream, a member of class TMetafile.
	WriteWMFStream (see page 2791)	This is WriteWMFStream, a member of class TMetafile.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	Assign (see page 2785)	Copies an object to the metafile.
	Clear (see page 2785)	Deletes the metafile image.
	Create (see page 2782)	Instantiates a metafile object.
	Destroy (see page 2783)	Destroys an instance of a metafile object.
	HandleAllocated (see page 2786)	Indicates whether the TMetafile (see page 2780) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2787)	Loads a metafile from the Clipboard.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromStream (see page 2787)	Loads the metafile from a stream.
	ReleaseHandle (see page 2788)	Releases the Windows GDI object represented by the metafile.
	SaveToClipboardFormat (see page 2788)	Saves a metafile to a Clipboard format.
	SaveToFile (see page 2789)	Writes the metafile to disk.
	SaveToStream (see page 2789)	Writes the metafile to a stream.
	SetSize (see page 2790)	Specifies the size of the metafile.

Public Properties

	Name	Description
	CreatedBy (see page 2792)	Specifies the name of the author or application used to create the metafile.
	Description (see page 2792)	Provides an optional text description that is embedded in the metafile.
	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Enhanced (see page 2793)	Determines how the metafile will be stored on disk.
	Handle (see page 2793)	Provides access to the Windows GDI metafile handle, for accessing the GDI metafile object.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	Inch (see page 2793)	Returns the units per inch that are used for the metafile's coordinate mapping.
	MMHeight (see page 2793)	Contains the height of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.
	MMWidth (see page 2794)	Contains the width of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.

	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

8.1.14.2 TMetafile.Create Constructor

Instantiates a metafile object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TMetafile();
```

Description

Call Create to instantiate a metafile at runtime.

Create allocates memory for a metafile object, and calls the inherited Create. Then sets the Enhanced (see page 2793) and Transparent (see page 2762) properties to true.

To create a metafile image from scratch, draw the image in a metafile canvas. When the metafile canvas is destroyed, it transfers the image into the metafile object provided to the metafile canvas constructor. After the image is drawn on the canvas and the canvas is destroyed, the image is 'playable' in the metafile object.

C++ Examples:

```
/*
This example shows how to create or augment a metafile using
a metafile canvas object.  This metafile can then be used to
draw on the canvas of another object such as a paintbox or a
printer.
*/
#include <memory>       //for STL auto_ptr class

TMetafile *MyMetafile;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  static std::auto_ptr<TMetafile> _MyMetafileCleaner(MyMetafile = new TMetafile());
  TMetafileCanvas *canvas = new TMetafileCanvas(MyMetafile, 0);
  canvas->Brush->Color = clRed;
  canvas->Ellipse(0, 0, 100, 200);
  // ...
  delete canvas;
  Form1->Canvas->Draw(0, -50, MyMetafile); //1 red circle
  PaintBox1->Canvas->Draw(0, 0, MyMetafile); //1 red circle
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  if (MyMetafile == NULL) return;   // click Button1 first!
  TMetafileCanvas *canvas = new TMetafileCanvas(MyMetafile, 0);
  canvas->Draw(-50, 0, MyMetafile);
  canvas->Brush->Color = clBlue;
  canvas->Ellipse(100, 100, 300, 200);
  // ...
  delete canvas; // TMetaFile canvas paints in the destructor.
  Form1->Canvas->Draw(0, 0, MyMetafile); // 1 red circle and 1 blue circle
  PaintBox1->Canvas->Draw(0, 0, MyMetafile); // 1 red circle and 1 blue circle
}
```

Delphi Examples:

```
{
This example shows how to create or augment a metafile using
a metafile canvas object.  This metafile can then be used to
draw on the canvas of another object such as a paintbox or a
printer.
}

var
  MyMetafile: TMetafile;

procedure TForm1.Button1Click(Sender: TObject);
begin
  MyMetafile := TMetafile.Create;
  with TMetafileCanvas.Create(MyMetafile, 0) do
  try
    Brush.Color := clRed;
    Ellipse(0, 0, 100, 200);
    //  ...
  finally
//    Free;
  end;
  Form1.Canvas.Draw(0, 0, MyMetafile); {1 red circle }
  PaintBox1.Canvas.Draw(0, -50, MyMetafile); {1 red circle }
end;

{
To add to an existing metafile image, create a metafile
canvas and play the source metafile into the metafile canvas:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  if (MyMetafile = nil) then exit;  { click Button1 first! }

  with TMetafileCanvas.Create(MyMetafile, 0) do
  try
    Draw(-50, 0, MyMetafile);
    Brush.Color := clBlue;
    Ellipse(100, 100, 300, 200);
// ...
  finally
//    Free;
  end;
  Form1.Canvas.Draw(0, 0, MyMetafile); {1 red circle and 1 blue circle }
  PaintBox1.Canvas.Draw(0, 0, MyMetafile); {1 red circle and 1 blue circle }
end;
```

See Also

Enhanced (see page 2793)

System::TObject::Create

TMetafileCanvas (see page 2794)

TMetafileImage (see page 2799)

Transparent (see page 2762)

8.1.14.3 TMetafile.Destroy Destructor

Destroys an instance of a metafile object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMetafile();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the TMetafile (see page 2780) reference is not nil before it calls Destroy.

Destroy releases the image, which frees the image and the handle when the reference count on the metafile image is zero. Then Destroy calls the inherited Destroy.

See Also

System::TObject::Free

TMetafileImage (see page 2799)

System::TObject::Destroy

8.1.14.4 TMetafile Methods

The methods of the TMetafile class are listed here.

Protected Methods

	Name	Description
	Draw (see page 2785)	This is Draw, a member of class TMetafile.
	GetEmpty (see page 2786)	This is GetEmpty, a member of class TMetafile.
	GetHeight (see page 2786)	This is GetHeight, a member of class TMetafile.
	GetPalette (see page 2786)	This is GetPalette, a member of class TMetafile.
	GetWidth (see page 2786)	This is GetWidth, a member of class TMetafile.
	ReadData (see page 2787)	This is ReadData, a member of class TMetafile.
	ReadEMFStream (see page 2788)	This is ReadEMFStream, a member of class TMetafile.
	ReadWMFStream (see page 2788)	This is ReadWMFStream, a member of class TMetafile.
	SetHeight (see page 2790)	This is SetHeight, a member of class TMetafile.
	SetTransparent (see page 2790)	This is SetTransparent, a member of class TMetafile.
	SetWidth (see page 2790)	This is SetWidth, a member of class TMetafile.
	TestEMF (see page 2791)	This is TestEMF, a member of class TMetafile.
	WriteData (see page 2791)	This is WriteData, a member of class TMetafile.
	WriteEMFStream (see page 2791)	This is WriteEMFStream, a member of class TMetafile.
	WriteWMFStream (see page 2791)	This is WriteWMFStream, a member of class TMetafile.

Public Methods

	Name	Description
	Assign (see page 2785)	Copies an object to the metafile.
	Clear (see page 2785)	Deletes the metafile image.
	HandleAllocated (see page 2786)	Indicates whether the TMetafile (see page 2780) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2787)	Loads a metafile from the Clipboard.
	LoadFromStream (see page 2787)	Loads the metafile from a stream.
	ReleaseHandle (see page 2788)	Releases the Windows GDI object represented by the metafile.
	SaveToClipboardFormat (see page 2788)	Saves a metafile to a Clipboard format.
	SaveToFile (see page 2789)	Writes the metafile to disk.
	SaveToStream (see page 2789)	Writes the metafile to a stream.
	SetSize (see page 2790)	Specifies the size of the metafile.

8.1.14.4.1 TMetafile.Assign Method

Copies an object to the metafile.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the Enhanced (see page 2793) and Palette (see page 2761) properties of an object to the metafile. If the metafile is nil (Delphi) or NULL (C++), Assign creates one. Otherwise, Assign calls the inherited method. For assignment, metafiles are polymorphic with other TGraphic (see page 2748) objects, and with TPicture (see page 2812).

See Also

Enhanced (see page 2793)

Palette

Assign

Assign (see page 2815)

Graphic (see page 2827)

8.1.14.4.2 TMetafile.Clear Method

Deletes the metafile image.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use Clear to release the old metafile image, create a new image, and increment a reference count on it.

See Also

TMetafileImage (see page 2799)

8.1.14.4.3 TMetafile.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

This is Draw, a member of class TMetafile.

8.1.14.4.4 TMetafile.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

This is GetEmpty, a member of class TMetafile.

8.1.14.4.5 TMetafile.GetHeight Method

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TMetafile.

8.1.14.4.6 TMetafile.GetPalette Method

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

This is GetPalette, a member of class TMetafile.

8.1.14.4.7 TMetafile.GetWidth Method

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TMetafile.

8.1.14.4.8 TMetafile.HandleAllocated Method

Indicates whether the TMetafile (see page 2780) object has acquired a handle to the underlying GDI object.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine whether the Handle (see page 2793) property is set to an HMETAFILE (see page 2876) value. HandleAllocated indicates whether the underlying GDI object has already been created. Use HandleAllocated rather than reading the Handle (see page 2793) property. When an application reads the Handle (see page 2793) property, it automatically creates a metafile and returns its handle if the underlying GDI object does not already exist.

See Also

Handle (see page 2793)

8.1.14.4.9 TMetafile.LoadFromClipboardFormat Method

Loads a metafile from the Clipboard.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat replaces the current image with the data in the clipboard. LoadFromClipboardFormat ignores the AData and APalette parameters.

See Also

RegisterClipboardFormat (see page 2819)

8.1.14.4.10 TMetafile.LoadFromStream Method

Loads the metafile from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream by specifying the stream from which the metafile is loaded as the value of Stream. LoadFromStream reads a metafile from a stream and replaces the current image with it.

See Also

SaveToStream (see page 2789)

8.1.14.4.11 TMetafile.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); override;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TMetafile.

8.1.14.4.12 TMetafile.ReadEMFStream Method

Pascal

```
procedure ReadEMFStream(Stream: TStream);
```

C++

```
__fastcall ReadEMFStream(TStream Stream);
```

Description

This is ReadEMFStream, a member of class TMetafile.

8.1.14.4.13 TMetafile.ReadWMFStream Method

Pascal

```
procedure ReadWMFStream(Stream: TStream; Length: Longint);
```

C++

```
__fastcall ReadWMFStream(TStream Stream, Longint Length);
```

Description

This is ReadWMFStream, a member of class TMetafile.

8.1.14.4.14 TMetafile.ReleaseHandle Method

Releases the Windows GDI object represented by the metafile.

Pascal

```
function ReleaseHandle: HENHMETAFILE;
```

C++

```
__fastcall HENHMETAFILE ReleaseHandle();
```

Description

Call ReleaseHandle to release the resources used to represent the metafile. ReleaseHandle sets the Handle (see page 2793) property to nil. NULL.

Call ReleaseHandle before setting the Handle (see page 2793) property, so that the resources associated with the metafile are not lost.

See Also

Handle (see page 2793)

8.1.14.4.15 TMetafile.SaveToClipboardFormat Method

Saves a metafile to a Clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette:
HPALETTE); override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Use SaveToClipboardFormat to copy the metafile to a Clipboard format. The resulting values can then be copied to the Windows clipboard using the clipboard's SetAsHandle method.

The metafile's palette is returned in the APalette parameter, the format in the AFormat parameter, and a handle to the data in the AData parameter. Before the metafile can be saved, an application must have registered the format with the metafile object using the RegisterClipboardFormat method.

To save a metafile to a file, call SaveToFile (see page 2789).

See Also

LoadFromClipboardFormat (see page 2787)

SaveToFile (see page 2789)

SetAsHandle

8.1.14.4.16 TMetafile.SaveToFile Method

Writes the metafile to disk.

Pascal

```
procedure SaveToFile(const Filename: String); override;
```

C++

```
virtual __fastcall SaveToFile(const UnicodeString Filename);
```

Description

Use SaveToFile to save the metafile to a file provided by the Filename parameter. To load a metafile from a file, call the LoadFromFile (see page 2755) method.

See Also

SaveToStream (see page 2789)

LoadFromFile (see page 2755)

8.1.14.4.17 TMetafile.SaveToStream Method

Writes the metafile to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to save the metafile to the stream specified by the value of the Stream parameter.

See Also

LoadFromStream (see page 2787)

SaveToFile (see page 2789)

8.1.14.4.18 TMetafile.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

This is SetHeight, a member of class TMetafile.

8.1.14.4.19 TMetafile.SetSize Method

Specifies the size of the metafile.

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer); override;
```

C++

```
virtual __fastcall SetSize(int AWidth, int AHeight);
```

Description

Use the SetSize method to set both the height and width of the metafile. This results in better performance than setting the height and width separately.

8.1.14.4.20 TMetafile.SetTransparent Method

Pascal

```
procedure SetTransparent(Value: Boolean); override;
```

C++

```
virtual __fastcall SetTransparent(Boolean Value);
```

Description

This is SetTransparent, a member of class TMetafile.

8.1.14.4.21 TMetafile.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TMetafile.

8.1.14.4.22 TMetafile.TestEMF Method

Pascal

```
function TestEMF(Stream: TStream): Boolean;
```

C++

```
__fastcall Boolean TestEMF(TStream Stream);
```

Description

This is TestEMF, a member of class TMetafile.

8.1.14.4.23 TMetafile.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); override;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TMetafile.

8.1.14.4.24 TMetafile.WriteEMFStream Method

Pascal

```
procedure WriteEMFStream(Stream: TStream);
```

C++

```
__fastcall WriteEMFStream(TStream Stream);
```

Description

This is WriteEMFStream, a member of class TMetafile.

8.1.14.4.25 TMetafile.WriteWMFStream Method

Pascal

```
procedure WriteWMFStream(Stream: TStream);
```

C++

```
__fastcall WriteWMFStream(TStream Stream);
```

Description

This is WriteWMFStream, a member of class TMetafile.

8.1.14.5 TMetafile Properties

The properties of the TMetafile class are listed here.

Public Properties

	Name	Description
	CreatedBy (see page 2792)	Specifies the name of the author or application used to create the metafile.
	Description (see page 2792)	Provides an optional text description that is embedded in the metafile.
	Enhanced (see page 2793)	Determines how the metafile will be stored on disk.
	Handle (see page 2793)	Provides access to the Windows GDI metafile handle, for accessing the GDI metafile object.
	Inch (see page 2793)	Returns the units per inch that are used for the metafile's coordinate mapping.
	MMHeight (see page 2793)	Contains the height of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.
	MMWidth (see page 2794)	Contains the width of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.

8.1.14.5.1 TMetafile.CreatedBy Property

Specifies the name of the author or application used to create the metafile.

Pascal

```
property CreatedBy: String;
```

C++

```
__property UnicodeString CreatedBy;
```

Description

Use CreatedBy to set the string to an optional name of the author or application used to create the metafile. To set the CreatedBy string of a new metafile, call the TMetaFileCanvas CreateWithComment constructor (Delphi) or the TMetafileCanvas (see page 2794) constructor that takes a comment (C++).

See Also

TMetafileCanvas (see page 2794)

CreateWithComment (see page 2798)

Create_c

8.1.14.5.2 TMetafile.Description Property

Provides an optional text description that is embedded in the metafile.

Pascal

```
property Description: String;
```

C++

```
__property UnicodeString Description;
```

Description

Set the Description string of a new metafile by calling the TMetaFileCanvas CreateWithComment constructor (Delphi) or the TMetafileCanvas (see page 2794) constructor that takes a comment (C++)..

See Also

TMetafileCanvas (see page 2794)

CreateWithComment (see page 2798)

Create_c

8.1.14.5.3 TMetafile.Enhanced Property

Determines how the metafile will be stored on disk.

Pascal

```
property Enhanced: Boolean;
```

C++

```
__property Boolean Enhanced;
```

Description

Use Enhanced to determine how the metafile is stored on disk. If Enhanced is true, the metafile is stored as an .EMF (Win32 Enhanced Metafile). If Enhanced is false, the metafile is stored as a .WMF (Windows 3.1 Metafile, with Aldus header).

The in-memory format is always EMF. WMF has very limited capabilities; storing as WMF will lose information that would be retained by EMF. This property is set to match the metafile type when loaded from a stream or file. If loaded as WMF, then save as WMF.

8.1.14.5.4 TMetafile.Handle Property

Provides access to the Windows GDI metafile handle, for accessing the GDI metafile object.

Pascal

```
property Handle: HENHMETAFILE;
```

C++

```
__property HENHMETAFILE Handle;
```

Description

Use Handle when calling a Windows API function that requires the handle of a metafile object. Pass the handle from the Handle property of the metafile object to the function.

See Also

DestroyMetaPict (see page 6055)

8.1.14.5.5 TMetafile.Inch Property

Returns the units per inch that are used for the metafile's coordinate mapping.

Pascal

```
property Inch: Word;
```

C++

```
__property Word Inch;
```

Description

Use Inch to find the units per inch assumed by a WMF metafile, and to alter scale when writing as WMF, but otherwise this property is obsolete. Enhanced (see page 2793) metafiles maintain complete scale information internally. For example, if the metafile was created in a Twips coordinate system (using MM_TWIPS mapping), the value of Inch is 1440.

8.1.14.5.6 TMetafile.MMHeight Property

Contains the height of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.

Pascal

```
property MMHeight: Integer;
```

C++

```
__property int MMHeight;
```

Description

MMHeight is used for a more accurate reading of the vertical size of the graphic. The Height (see page 2760) property, by contrast, is always in screen device pixel units; to avoid loss of precision in converting between device pixels and millimeters, set or read the dimensions in millimeters with MMHeight.

See Also

MMWidth (see page 2794)

8.1.14.5.7 TMetafile.MMWidth Property

Contains the width of the metafile image in 0.01 millimeter units, the native scale used by enhanced metafiles.

Pascal

```
property MMWidth: Integer;
```

C++

```
__property int MMWidth;
```

Description

MMWidth is used for a more accurate reading of the horizontal size of the graphic. The Width (see page 2763) property, by contrast, is always in screen device pixel units; to avoid loss of precision in converting between device pixels and millimeters, set or read the dimensions in millimeters with MMWidth.

The MMWidth property is always in screen device pixel units.

See Also

MMHeight (see page 2793)

8.1.15 TMetafileCanvas Class

TMetafileCanvas allows applications to create metafile images from scratch.

Class Hierarchy

Pascal

```
TMetafileCanvas = class(TCanvas);
```

C++

```
class TMetafileCanvas : public TCanvas;
```

File

Graphics

Description

Use TMetafileCanvas as a surface on which to draw a metafile image. When the canvas is destroyed, it transfers the image into the metafile object provided to the canvas constructor. After the image is drawn on the canvas and the canvas is destroyed, the image is 'playable' in the metafile object.

See Also

TMetafile (see page 2780)

8.1.15.1 TMetafileCanvas Members

The following tables list the members exposed by TMetafileCanvas.

Protected Methods

	Name	Description
	Changed (see page 2681)	This is Changed, a member of class TCanvas.
	Changing (see page 2682)	This is Changing, a member of class TCanvas.
	CreateHandle (see page 2685)	This is CreateHandle, a member of class TCanvas.
	RequiredState (see page 2702)	This is RequiredState, a member of class TCanvas.

Public Events

	Name	Description
	OnChange (see page 2729)	Occurs when the image has just changed.
	OnChanging (see page 2730)	Occurs just before a change is made to the image.

Public Methods

	Name	Description
	Arc (see page 2679)	Draws an arc on the image along the perimeter of the ellipse bounded by the specified rectangle.
	BrushCopy (see page 2680)	Copies a portion of a bitmap onto a rectangle on the canvas, replacing one of the colors of the bitmap with the brush of the canvas.
	Chord (see page 2682)	Draws a closed figure represented by the intersection of a line and an ellipse.
	CopyRect (see page 2683)	Copies part of an image from another canvas into the canvas.
	Create (see page 2796)	Creates an instance of TMetafileCanvas (see page 2794) and acquires a handle to a metafile device context.
	CreateWithComment (see page 2798)	Creates an instance of TMetafileCanvas (see page 2794) and acquires a handle to a metafile device context with a comment string.
	Destroy (see page 2799)	Destroys an instance of the TMetafileCanvas (see page 2794) after transferring the image to the TMetafile (see page 2780) object that was passed to the constructor.
	Draw (see page 2685)	This is the overview for the Draw method overload.
	DrawFocusRect (see page 2687)	Draws a rectangle in the style used to indicate that the object inside the rectangle has focus.
	Ellipse (see page 2688)	This is the overview for the Ellipse method overload.
	FillRect (see page 2689)	Fills the specified rectangle on the canvas using the current brush.
	FloodFill (see page 2690)	Fills an area of the canvas using the current brush.
	FrameRect (see page 2692)	Draws a rectangle using the Brush (see page 2716) of the canvas to draw the border.
	HandleAllocated (see page 2693)	Indicates whether the TCanvas (see page 2673) object has acquired a handle to a device context.
	LineTo (see page 2693)	Draws a line on the canvas from PenPos (see page 2727) to the point specified by X and Y, and sets the pen position to (X, Y).
	Lock (see page 2694)	Prevents other threads from drawing on the canvas.
	MoveTo (see page 2695)	Changes the current drawing position to the point (X,Y).
	Pie (see page 2695)	Draws a pie-shaped the section of the ellipse bounded by the rectangle (X1, Y1) and (X2, Y2) on the canvas.

	PolyBezier (see page 2696)	Draws a set of Bezier curves.
	PolyBezierTo (see page 2697)	Draws a set of Bezier curves and updates the value of PenPos (see page 2727).
	Polygon (see page 2697)	Draws a series of lines on the canvas connecting the points passed in and closing the shape by drawing a line from the last point to the first point.
	Polyline (see page 2698)	Draws a series of lines on the canvas with the current pen, connecting each of the points passed to it in Points.
	Rectangle (see page 2700)	This is the overview for the Rectangle method overload.
	Refresh (see page 2701)	Deselects the Pen (see page 2725), Brush (see page 2716), and Font (see page 2721) from the device context.
	RoundRect (see page 2702)	This is the overview for the RoundRect method overload.
	StretchDraw (see page 2704)	Draws the graphic specified by the Graphic parameter in the rectangle specified by the Rect parameter.
	TextExtent (see page 2705)	Returns the width and height, in pixels, of a string rendered in the current font.
	TextHeight (see page 2706)	Returns the height, in pixels, of a string rendered in the current font.
	TextOut (see page 2707)	Writes a string on the canvas, starting at the point (X,Y), and then updates the PenPos (see page 2727) to the end of the string.
	TextRect (see page 2713)	This is the overview for the TextRect method overload.
	TextWidth (see page 2714)	Returns the width, in pixels, of a string rendered in the current font.
	TryLock (see page 2715)	Locks the canvas if it is currently unlocked.
	Unlock (see page 2716)	Decreases the LockCount (see page 2725) property, allowing other threads to execute when LockCount (see page 2725) reaches 0.

Public Properties

	Name	Description
R	CanvasOrientation (see page 2718)	Determines the orientation of the canvas as left-to-right or right-to-left.
R	ClipRect (see page 2718)	Read-only property that specifies the boundaries of the clipping rectangle.
	Handle (see page 2722)	Specifies the handle for this canvas.
R	LockCount (see page 2725)	Indicates the number of times the canvas has been locked to prevent interference from other threads.
	PenPos (see page 2727)	Specifies the current drawing position of the Pen (see page 2725).
	Pixels (see page 2727)	Specifies the color of the pixels within the current ClipRect (see page 2718).
	TextFlags (see page 2728)	Specifies how text is written to the canvas.

Published Properties

	Name	Description
	Brush (see page 2716)	Determines the color and pattern for filling graphical shapes and backgrounds.
	CopyMode (see page 2719)	Specifies how a graphical image is copied onto the canvas.
	Font (see page 2721)	Specifies the font to use when writing text on the image.
	Pen (see page 2725)	Specifies the kind of pen the canvas uses for drawing lines and outlining shapes.

8.1.15.2 TMetafileCanvas.Create Constructor

Creates an instance of TMetafileCanvas (see page 2794) and acquires a handle to a metafile device context.

Pascal

```
constructor Create(AMetafile: TMetafile; ReferenceDevice: HDC);
```

C++

```
__fastcall TMetafileCanvas(TMetafile AMetafile, HDC ReferenceDevice);
```

Description

Call Create to create an instantiate a TMetafileCanvas (see page 2794) object. Pass in the associated metafile whose image is about to be drawn as the AMetafile parameter. Pass in a handle to a device context on which to base the metafile's device context as the ReferenceDevice parameter. In most cases, this is the device context for a window on which the image is normally drawn.

Create sets the size of the TMetafile (see page 2780) object from ReferenceDevice if it does not already have the MMHeight and MMWidth properties set. Create then creates a metafile device context, and sets the Handle (see page 2722) property to its handle. All subsequent drawing methods will draw to the metafile device context.

When the TMetafileCanvas (see page 2794) is destroyed, The CreatedBy and Description strings will be used to set the properties of the same name in the TMetafile (see page 2780) object.

C++ Examples:

```
/*
This example shows how to create or augment a metafile using
a metafile canvas object.  This metafile can then be used to
draw on the canvas of another object such as a paintbox or a
printer.
*/
#include <memory>       //for STL auto_ptr class

TMetafile *MyMetafile;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  static std::auto_ptr<TMetafile> _MyMetafileCleaner(MyMetafile = new TMetafile());
  TMetafileCanvas *canvas = new TMetafileCanvas(MyMetafile, 0);
  canvas->Brush->Color = clRed;
  canvas->Ellipse(0, 0, 100, 200);
  // ...
  delete canvas;
  Form1->Canvas->Draw(0, -50, MyMetafile); //1 red circle
  PaintBox1->Canvas->Draw(0, 0, MyMetafile); //1 red circle
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  if (MyMetafile == NULL) return;   // click Button1 first!
  TMetafileCanvas *canvas = new TMetafileCanvas(MyMetafile, 0);
  canvas->Draw(-50, 0, MyMetafile);
  canvas->Brush->Color = clBlue;
  canvas->Ellipse(100, 100, 300, 200);
  // ...
  delete canvas; // TMetaFile canvas paints in the destructor.
  Form1->Canvas->Draw(0, 0, MyMetafile); // 1 red circle and 1 blue circle
  PaintBox1->Canvas->Draw(0, 0, MyMetafile); // 1 red circle and 1 blue circle
}
```

Delphi Examples:

```
{
This example shows how to create or augment a metafile using
a metafile canvas object.  This metafile can then be used to
draw on the canvas of another object such as a paintbox or a
printer.
}

var
  MyMetafile: TMetafile;

procedure TForm1.Button1Click(Sender: TObject);
begin
  MyMetafile := TMetafile.Create;
  with TMetafileCanvas.Create(MyMetafile, 0) do
  try
    Brush.Color := clRed;
    Ellipse(0, 0, 100, 200);
    //  ...
  finally
//    Free;
```

```
    end;
    Form1.Canvas.Draw(0, 0, MyMetafile); {1 red circle }
    PaintBox1.Canvas.Draw(0, -50, MyMetafile); {1 red circle }
  end;

  {
  To add to an existing metafile image, create a metafile
  canvas and play the source metafile into the metafile canvas:
  }
  procedure TForm1.Button2Click(Sender: TObject);
  begin
    if (MyMetafile = nil) then exit;  { click Button1 first! }

    with TMetafileCanvas.Create(MyMetafile, 0) do
    try
      Draw(-50, 0, MyMetafile);
      Brush.Color := clBlue;
      Ellipse(100, 100, 300, 200);
  // ...
    finally
  //    Free;
    end;
    Form1.Canvas.Draw(0, 0, MyMetafile); {1 red circle and 1 blue circle }
    PaintBox1.Canvas.Draw(0, 0, MyMetafile); {1 red circle and 1 blue circle }
  end;
```

See Also

CreateWithComment (see page 2798)

8.1.15.3 TMetafileCanvas.CreateWithComment Constructor

Creates an instance of TMetafileCanvas (see page 2794) and acquires a handle to a metafile device context with a comment string.

Pascal

```
constructor CreateWithComment(AMetafile: TMetafile; ReferenceDevice: HDC; const CreatedBy:
String; const Description: String);
```

C++

```
__fastcall TMetafileCanvas(TMetafile AMetafile, HDC ReferenceDevice, const UnicodeString
CreatedBy, const UnicodeString Description);
```

Description

Call CreateWithComment to create an instantiate a TMetafileCanvas (see page 2794) object for a metafile that will receive the CreatedBy and Description strings. CreateWithComment sets the size of the TMetafile (see page 2780) object from the ReferenceDevice if it does not already have the MMHeight and MMWidth properties set. Create (see page 2796) then creates a metafile device context using the CreatedBy and Description strings as a description, and sets the Handle (see page 2722) property to its handle. All subsequent drawing methods will draw to the metafile device context.

When the TMetafileCanvas (see page 2794) is destroyed, the CreatedBy and Description strings are used to set the properties of the same name in the TMetafile (see page 2780) object.

See Also

Description (see page 2792)

8.1.15.4 TMetafileCanvas.Destroy Destructor

Destroys an instance of the TMetafileCanvas (see page 2794) after transferring the image to the TMetafile (see page 2780) object that was passed to the constructor.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMetafileCanvas();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMetafileCanvas (see page 2794) reference is not nil, and only then calls Destroy.

Destroy sets the Handle (see page 2722) property of the TMetafile (see page 2780) object that was passed to the constructor before freeing the memory associated with the object.

See Also

System::TObject::Free

Handle (see page 2793)

8.1.16 TMetafileImage Class

TMetafileImage is the internal representation of the metafile image for a TMetafile (see page 2780) object.

Class Hierarchy

Pascal

```
TMetafileImage = class(TSharedImage);
```

C++

```
class TMetafileImage : public TSharedImage;
```

File

Graphics

Description

TMetafileImage is used for internal implementation only. It represents the internal image of the metafile encapsulated by the TMetafile (see page 2780) object. All of the data and methods introduced in TMetafileImage are private. They contain information about the specific metafile image, including pointers to the standard HENHMETAFILE (see page 2875) (enhanced metafile handle) and HPALETTE (handle to palette) structures defined by Windows.

See Also

TMetafile (see page 2780)

TMetafileCanvas (see page 2794)

8.1.16.1 TMetafileImage Members

The following tables list the members exposed by TMetafileImage.

Protected Methods

	Name	Description
	FreeHandle (see page 2800)	This is FreeHandle, a member of class TMetafileImage.
	Reference (see page 2832)	This is Reference, a member of class TSharedImage.
	Release (see page 2832)	This is Release, a member of class TSharedImage.

Protected Properties

	Name	Description
	RefCount (see page 2832)	This is RefCount, a member of class TSharedImage.

Public Methods

	Name	Description
	Destroy (see page 2800)	Disposes of the instance of a metafile image.

8.1.16.2 TMetafileImage.Destroy Destructor

Disposes of the instance of a metafile image.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMetafileImage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMetafileImage (see page 2799) reference is not nil before it calls Destroy.

Destroy frees the metafile handle and palette before calling the inherited Destroy.

System::TObject::Destroy

System::TObject::Free

8.1.16.3 TMetafileImage Methods

The methods of the TMetafileImage class are listed here.

Protected Methods

	Name	Description
	FreeHandle (see page 2800)	This is FreeHandle, a member of class TMetafileImage.

8.1.16.3.1 TMetafileImage.FreeHandle Method

Pascal

```
procedure FreeHandle; override;
```

C++

```
virtual __fastcall FreeHandle();
```

Description

This is FreeHandle, a member of class TMetafileImage.

8.1.17 TPen Class

TPen is used to draw lines or outline shapes on a canvas.

Class Hierarchy

Pascal

```
TPen = class(TGraphicsObject);
```

C++

```
class TPen : public TGraphicsObject;
```

File

Graphics

Description

Use TPen to describe the attributes of a Windows pen when drawing an image to a canvas (TCanvas (see page 2673)). TPen encapsulates the pen properties that are selected into the device context of the canvas.

See Also

TPen

TCanvas (see page 2673)

Using the Main VCL

8.1.17.1 TPen Members

The following tables list the members exposed by TPen.

Protected Methods

	Name	Description
	Changed (see page 2765)	Generates an OnChange (see page 2768) event when the properties of the graphics object change.
	GetColor (see page 2804)	This is GetColor, a member of class TPen.
	GetHandle (see page 2804)	This is GetHandle, a member of class TPen.
	GetStyle (see page 2804)	This is GetStyle, a member of class TPen.
	GetWidth (see page 2804)	This is GetWidth, a member of class TPen.
	Lock (see page 2766)	Blocks other execution threads from using the associated canvas until the Unlock (see page 2767) method is called.
	SetColor (see page 2805)	This is SetColor, a member of class TPen.
	SetHandle (see page 2805)	This is SetHandle, a member of class TPen.
	SetMode (see page 2805)	This is SetMode, a member of class TPen.
	SetStyle (see page 2805)	This is SetStyle, a member of class TPen.

	SetWidth (see page 2805)	This is SetWidth, a member of class TPen.
	Unlock (see page 2767)	Releases the lock on execution threads set by the Lock (see page 2766) method.

Public Events

	Name	Description
	OnChange (see page 2768)	Occurs immediately after the graphics object changes.

Public Methods

	Name	Description
	Assign (see page 2803)	Assigns the properties of the pen from another TPen (see page 2801) object.
	Create (see page 2802)	Creates an instance of TPen (see page 2801).
	Destroy (see page 2802)	Destroys an instance of TPen (see page 2801).
	HandleAllocated (see page 2766)	Indicates whether the TGraphicsObject (see page 2764) object has acquired a handle to the underlying GDI object.

Public Properties

	Name	Description
	Handle (see page 2807)	Specifies the Windows pen object handle.
	OwnerCriticalSection (see page 2767)	Points to information about the critical section that the canvas which draws with this graphics object uses to lock out other threads.

Published Properties

	Name	Description
	Color (see page 2806)	Determines the color used to draw lines on the canvas.
	Mode (see page 2808)	Determines how the pen draws lines on the canvas.
	Style (see page 2808)	Determines the style in which the pen draws lines.
	Width (see page 2809)	Specifies the width of the pen in pixels.

8.1.17.2 TPen.Create Constructor

Creates an instance of TPen (see page 2801).

Pascal

```
constructor Create;
```

C++

```
__fastcall TPen();
```

Description

Call Create to create a TPen (see page 2801) object for assigning the pen property of a canvas. The pen for the canvas is created automatically in the constructor for the TCanvas (see page 2673) object.

Create allocates memory for the TPen (see page 2801) object and initializes the Mode (see page 2808) property to pmCopy.

See Also

Mode (see page 2808)

Pen (see page 2725)

8.1.17.3 TPen.Destroy Destructor

Destroys an instance of TPen (see page 2801).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPen();
```

Description

Do not call Destroy directly from an application. Instead, call Free. Free verifies that the TPen (see page 2801) reference is not nil, and only then calls Destroy.Destroy frees the resource identified by the Handle (see page 2807) property.

See Also

System::TObject::Free

8.1.17.4 TPen Methods

The methods of the TPen class are listed here.

Protected Methods

	Name	Description
	GetColor (see page 2804)	This is GetColor, a member of class TPen.
	GetHandle (see page 2804)	This is GetHandle, a member of class TPen.
	GetStyle (see page 2804)	This is GetStyle, a member of class TPen.
	GetWidth (see page 2804)	This is GetWidth, a member of class TPen.
	SetColor (see page 2805)	This is SetColor, a member of class TPen.
	SetHandle (see page 2805)	This is SetHandle, a member of class TPen.
	SetMode (see page 2805)	This is SetMode, a member of class TPen.
	SetStyle (see page 2805)	This is SetStyle, a member of class TPen.
	SetWidth (see page 2805)	This is SetWidth, a member of class TPen.

Public Methods

	Name	Description
	Assign (see page 2803)	Assigns the properties of the pen from another TPen (see page 2801) object.

8.1.17.4.1 TPen.Assign Method

Assigns the properties of the pen from another TPen (see page 2801) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

If the Source parameter identifies another TPen (see page 2801) object, Assign copies the Color (see page 2806), Width (see page 2809), Style (see page 2808), and Mode (see page 2808) properties of the source pen. Otherwise, the inherited method copies the properties from any object that can write to a TPen (see page 2801) object in its AssignTo method.

See Also

Color (see page 2806)

Mode (see page 2808)

Style (see page 2808)

AssignTo

Width (see page 2809)

8.1.17.4.2 TPen.GetColor Method

Pascal

```
function GetColor: TColor;
```

C++

```
__fastcall TColor GetColor();
```

Description

This is GetColor, a member of class TPen.

8.1.17.4.3 TPen.GetHandle Method

Pascal

```
function GetHandle: HPen;
```

C++

```
__fastcall HPen GetHandle();
```

Description

This is GetHandle, a member of class TPen.

8.1.17.4.4 TPen.GetStyle Method

Pascal

```
function GetStyle: TPenStyle;
```

C++

```
__fastcall TPenStyle GetStyle();
```

Description

This is GetStyle, a member of class TPen.

8.1.17.4.5 TPen.GetWidth Method

Pascal

```
function GetWidth: Integer;
```

C++

```
__fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TPen.

8.1.17.4.6 TPen.SetColor Method

Pascal

```
procedure SetColor(Value: TColor);
```

C++

```
__fastcall SetColor(TColor Value);
```

Description

This is SetColor, a member of class TPen.

8.1.17.4.7 TPen.SetHandle Method

Pascal

```
procedure SetHandle(Value: HPen);
```

C++

```
__fastcall SetHandle(HPen Value);
```

Description

This is SetHandle, a member of class TPen.

8.1.17.4.8 TPen.SetMode Method

Pascal

```
procedure SetMode(Value: TPenMode);
```

C++

```
__fastcall SetMode(TPenMode Value);
```

Description

This is SetMode, a member of class TPen.

8.1.17.4.9 TPen.SetStyle Method

Pascal

```
procedure SetStyle(Value: TPenStyle);
```

C++

```
__fastcall SetStyle(TPenStyle Value);
```

Description

This is SetStyle, a member of class TPen.

8.1.17.4.10 TPen.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer);
```

C++

```
__fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TPen.

8.1.17.5 TPen Properties

The properties of the TPen class are listed here.

Public Properties

	Name	Description
	Handle (see page 2807)	Specifies the Windows pen object handle.

Published Properties

	Name	Description
	Color (see page 2806)	Determines the color used to draw lines on the canvas.
	Mode (see page 2808)	Determines how the pen draws lines on the canvas.
	Style (see page 2808)	Determines the style in which the pen draws lines.
	Width (see page 2809)	Specifies the width of the pen in pixels.

8.1.17.5.1 TPen.Color Property

Determines the color used to draw lines on the canvas.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Set Color to change the color used to draw lines or outline shapes. The way the color is used by the pen depends on the Mode (see page 2808) and Style (see page 2808) properties.

C++ Examples:

```
/*
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
*/
int x, y;

void __fastcall TForm1::FormActivate(TObject *Sender)
{
  WindowState = wsMaximized;
  Timer1->Interval = 50;
  randomize();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  x = random(Screen->Width - 10);
  y = random(Screen->Height - 10);
  Canvas->Pen->Color = (Graphics::TColor) random(65535);
  switch (random(5))
  {
```

```
      case 0: Canvas->Pen->Style = psSolid; break;
      case 1: Canvas->Pen->Style = psDash; break;
      case 2: Canvas->Pen->Style = psDot; break;
      case 3: Canvas->Pen->Style = psDashDot; break;
      case 4: Canvas->Pen->Style = psDashDotDot; break;
    }
    Canvas->Rectangle(x, y, x + random(400), y + random(400));
  }
```

Delphi Examples:

```
{
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
}
var
  X, Y: Integer;
procedure TForm1.FormActivate(Sender: TObject);
begin
  WindowState := wsMaximized;
  Timer1.Interval := 50;
  Randomize;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  X := Random(Screen.Width - 10);
  Y := Random(Screen.Height - 10);
  Canvas.Pen.Color := Random(65535);
  case Random(5) of
    0: Canvas.Pen.Style := psSolid;
    1: Canvas.Pen.Style := psDash;
    2: Canvas.Pen.Style := psDot;
    3: Canvas.Pen.Style := psDashDot;
    4: Canvas.Pen.Style := psDashDotDot;
  end;
  Canvas.Rectangle(X, Y, X + Random(400), Y + Random(400));
end;
```

See Also

Mode (see page 2808)

Style (see page 2808)

8.1.17.5.2 TPen.Handle Property

Specifies the Windows pen object handle.

Pascal

```
property Handle: HPen;
```

C++

```
__property HPen Handle;
```

Description

The Handle property provides access to the Windows GDI object handle. TPen (see page 2801) encapsulates the Windows pen object (HPEN). Use Handle when making a Windows API function call that requires the handle of a pen object. Handle is the Windows handle currently selected into the device context of the canvas.

See Also

Handle (see page 2722)

8.1.17.5.3 TPen.Mode Property

Determines how the pen draws lines on the canvas.

Pascal

```
property Mode: TPenMode;
```

C++

```
__property TPenMode Mode;
```

Description

Set Mode to determine how the color of the pen interacts with the color on the canvas.

See Also

Color (see page 2806)

TCanvas (see page 2673)

8.1.17.5.4 TPen.Style Property

Determines the style in which the pen draws lines.

Pascal

```
property Style: TPenStyle;
```

C++

```
__property TPenStyle Style;
```

Description

Use Style to draw a dotted or dashed line, or to omit the line that appears as a frame around shapes.

Note: Only the psInsideFrame style will produce a dithered color to match a Color (see page 2806) property that is not in the color table. All others choose the closest color from the Windows color table.

Note: Dotted or dashed pen styles are not available when the Width (see page 2809) property is not 1.

C++ Examples:

```
/*
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
*/
int x, y;

void __fastcall TForm1::FormActivate(TObject *Sender)
{
  WindowState = wsMaximized;
  Timer1->Interval = 50;
```

```
  randomize();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  x = random(Screen->Width - 10);
  y = random(Screen->Height - 10);
  Canvas->Pen->Color = (Graphics::TColor) random(65535);
  switch (random(5))
  {
    case 0: Canvas->Pen->Style = psSolid; break;
    case 1: Canvas->Pen->Style = psDash; break;
    case 2: Canvas->Pen->Style = psDot; break;
    case 3: Canvas->Pen->Style = psDashDot; break;
    case 4: Canvas->Pen->Style = psDashDotDot; break;
  }
  Canvas->Rectangle(x, y, x + random(400), y + random(400));
}
```

Delphi Examples:

```
{
This example draws many rectangles of various sizes and
colors on a form maximized to fill the entire screen. To run
the code, drop a TTimer component on the form and use the
object inspector to create the OnTimer and OnActivate event
handlers.
}
var
  X, Y: Integer;
procedure TForm1.FormActivate(Sender: TObject);
begin
  WindowState := wsMaximized;
  Timer1.Interval := 50;
  Randomize;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  X := Random(Screen.Width - 10);
  Y := Random(Screen.Height - 10);
  Canvas.Pen.Color := Random(65535);
  case Random(5) of
    0: Canvas.Pen.Style := psSolid;
    1: Canvas.Pen.Style := psDash;
    2: Canvas.Pen.Style := psDot;
    3: Canvas.Pen.Style := psDashDot;
    4: Canvas.Pen.Style := psDashDotDot;
  end;
  Canvas.Rectangle(X, Y, X + Random(400), Y + Random(400));
end;
```

See Also

Color (see page 2806)

Width (see page 2809)

8.1.17.5.5 TPen.Width Property

Specifies the width of the pen in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use Width to give the line greater weight. If you attempt to set Width to a value less than 0, the new value is ignored.

Note: The value of Width influences which values of Style (see page 2808) are valid.

C++ Examples:

```
/*
This example draws many rounded rectangles of various sizes
and colors on a form maximized to fill the entire screen:
*/
int x, y;

void __fastcall TForm1::FormActivate(TObject *Sender)
{
  WindowState = wsMaximized;
  Timer1->Interval = 50;
  randomize();
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  x = random(Screen->Width - 10);
  y = random(Screen->Height - 10);
  Canvas->Pen->Color = (Graphics::TColor) random(65535);
  Canvas->Pen->Width = random(7);
  int Dx = random(400);
  int Dy = random(400);
  Canvas->RoundRect(x, y, x + Dx, y + Dy, Dx/2, Dy/2);
}
```

Delphi Examples:

```
{
This example draws many rounded rectangles of various sizes
and colors on a form maximized to fill the entire screen:
}
var
  X, Y, DX, DY: Integer;
procedure TForm1.FormActivate(Sender: TObject);
begin
  WindowState := wsMaximized;
  Timer1.Interval := 50;
  Randomize;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  X := Random(Screen.Width - 10);
  Y := Random(Screen.Height - 10);
  Canvas.Pen.Color := Random(65535);
  Canvas.Pen.Width := Random(7);
  DX := Random(400);
  DY := Random(400);
  Canvas.RoundRect(X, Y, X + DX, Y + DY, DX div 2, DY div 2);
end;
```

See Also

Style (see page 2808)

8.1.18 TPenRecall Class

TPenRecall saves and restores the properties of a TPen (see page 2801) object.

Class Hierarchy

Pascal

```
TPenRecall = class(TRecall);
```

C++

```
class TPenRecall : public TRecall;
```

File

Graphics

Description

Use TPenRecall to store the current state of a TPen (see page 2801) object. You are then free to change the current state of the pen object. To restore the pen object to its original state, all that is necessary is to destroy the TPenRecall object and the pen object is automatically restored to the saved property values.

You can update the TPenRecall instance to reflect the current properties of the TPen (see page 2801) object by calling the Store method. You can prevent the TPenRecall destructor from updating the TPen (see page 2801) object by calling the Forget method.

See Also

TRecall

TPen (see page 2801)

Using Pens

8.1.18.1 TPenRecall Members

The following tables list the members exposed by TPenRecall.

Public Methods

	Name	Description
	Create (see page 2811)	Instantiates a TPenRecall (see page 2811) object.

8.1.18.2 TPenRecall.Create Constructor

Instantiates a TPenRecall (see page 2811) object.

Pascal

```
constructor Create(APen: TPen);
```

C++

```
__fastcall TPenRecall(TPen APen);
```

Description

Call Create to instantiate a pen recall object at runtime. Create saves the current properties of the TPen (see page 2801) object specified by APen, which becomes the value of the Reference property.

Subsequent calls to the Store method take snapshots of the properties of APen and save them, replacing the values saved by this constructor. When you destroy the TPenRecall (see page 2811) instance, the most recently-saved properties are assigned to APen, restoring it to a previous state.

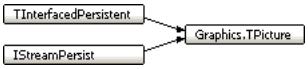
Store

8.1.19 TPicture Class

TPicture contains a bitmap, icon, metafile graphic, or user-defined graphic.

Class Hierarchy



Pascal

```
TPicture = class(TInterfacedPersistent, IStreamPersist);
```

C++

```
class TPicture : public TInterfacedPersistent, public IStreamPersist;
```

File

Graphics

Description

TPicture is a TGraphic (see page 2748) container, used to hold a graphic, the type of which is specified in the Graphic (see page 2827) property. It is used in place of a TGraphic (see page 2748) if the graphic can be of any TGraphic (see page 2748) class. LoadFromFile (see page 2818) and SaveToFile (see page 2823) are polymorphic. For example, if the TPicture is holding an Icon (see page 2828), it is valid to LoadFromFile (see page 2818) a bitmap file, where the class TIcon (see page 2768) can only read .ICO files.

If the TPicture contains a bitmap graphic, the Bitmap (see page 2825) property specifies the graphic. If the TPicture contains an icon graphic, the Icon (see page 2828) property specifies the graphic. If the TPicture contains a metafile graphic, the Metafile (see page 2828) property specifies the graphic.

The properties of TPicture indicate the type of graphic that the picture object contains, and its size. The methods of TPicture are used to load, save, and manipulate graphics.

To load or save a picture to the Clipboard, use the Assign (see page 2815) method of a TClipboard object.

To draw a picture on a canvas, call the Draw or StretchDraw methods of a TCanvas (see page 2673) object, passing the Graphic (see page 2827) property of a TPicture as a parameter.

See Also

TCanvas (see page 2673)

TClipboard

8.1.19.1 TPicture Members

The following tables list the members exposed by TPicture.

Protected Methods

	Name	Description
	AssignTo (see page 2816)	Copies the properties of an object to a destination object.
	Changed (see page 2817)	This is Changed, a member of class TPicture.
	DefineProperties (see page 2817)	Provides an interface for a method that reads and writes otherwise unpublished data.
	LoadFromStream (see page 2819)	Reads the picture from a Stream.
	Progress (see page 2819)	This is Progress, a member of class TPicture.
	SaveToStream (see page 2824)	Saves the picture to a stream.

Public Events

	Name	Description
	OnChange (see page 2830)	Occurs when the specific graphics item encapsulated by the picture object changes.
	OnProgress (see page 2830)	Occurs periodically during slow operations that affect the graphic.

Public Methods

	Name	Description
	Assign (see page 2815)	Copies one object to another by copying the contents of that object to the other.
	Create (see page 2814)	Creates a TPicture (see page 2812) object.
	Destroy (see page 2814)	Destroys an instance of a picture object.
	LoadFromClipboardFormat (see page 2818)	Reads the picture from the handle provided in the given Clipboard format.
	LoadFromFile (see page 2818)	Reads the file specified in Filename and loads the data into the TPicture (see page 2812) object.
	RegisterClipboardFormat (see page 2819)	Registers a new TGraphic (see page 2748) class for use in the LoadFromClipboardFormat (see page 2818) method.
	RegisterFileFormat (see page 2821)	Registers a new TGraphic (see page 2748) class for use in LoadFromFile (see page 2818).
	RegisterFileFormatRes (see page 2822)	Registers a new TGraphic (see page 2748) class for use in the LoadFromFile (see page 2818) method.
	SaveToClipboardFormat (see page 2822)	Allocates a global handle and writes the picture in its native Clipboard format (CF_BITMAP for bitmaps, CF_METAFILE for metafiles, and so on).
	SaveToFile (see page 2823)	Writes the picture to disk.
	SupportsClipboardFormat (see page 2824)	Indicates if the given Clipboard format is supported by the LoadFromClipboardFormat (see page 2818) method.
	UnregisterGraphicClass (see page 2825)	This is UnregisterGraphicClass, a member of class TPicture.

Public Properties

	Name	Description
	Bitmap (see page 2825)	Specifies the contents of the picture object as a bitmap graphic (.BMP file format).
	Graphic (see page 2827)	Specifies the graphic that the picture contains.
	Height (see page 2828)	Specifies the vertical size (in pixels) of the graphic.
	Icon (see page 2828)	Specifies the contents of the TPicture (see page 2812) object as an icon graphic (.ICO file format).
	Metafile (see page 2828)	Specifies the contents of the picture object as an Enhanced Windows metafile graphic (.EMF file format).
	PictureAdapter (see page 2829)	Represents an OLE interface for the picture.
	Width (see page 2829)	Specifies the horizontal size (in pixels) of the picture.

8.1.19.2 TPicture.Create Constructor

Creates a TPicture (see page 2812) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TPicture();
```

Description

Call Create to create an instance of TPicture (see page 2812) at runtime. Create allocates the memory for the picture object and initializes its internal formats. After creating the TPicture (see page 2812) object, use the LoadFromClipboardFormat (see page 2818) or LoadFromFile (see page 2818) method to assign a graphical image to the picture, so that it is available to the application.

See Also

LoadFromClipboardFormat (see page 2818)

LoadFromFile (see page 2818)

8.1.19.3 TPicture.Destroy Destructor

Destroys an instance of a picture object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPicture();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TPicture (see page 2812) reference is not nil before it calls Destroy.

Destroy frees the graphic image it contains before calling the inherited Destroy.

See Also

System::TObject::Free

System::TObject::Destroy

8.1.19.4 TPicture Methods

The methods of the TPicture class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 2816)	Copies the properties of an object to a destination object.
	Changed (see page 2817)	This is Changed, a member of class TPicture.
	DefineProperties (see page 2817)	Provides an interface for a method that reads and writes otherwise unpublished data.

	LoadFromStream (see page 2819)	Reads the picture from a Stream.
	Progress (see page 2819)	This is Progress, a member of class TPicture.
	SaveToStream (see page 2824)	Saves the picture to a stream.

Public Methods

	Name	Description
	Assign (see page 2815)	Copies one object to another by copying the contents of that object to the other.
	LoadFromClipboardFormat (see page 2818)	Reads the picture from the handle provided in the given Clipboard format.
	LoadFromFile (see page 2818)	Reads the file specified in Filename and loads the data into the TPicture (see page 2812) object.
	RegisterClipboardFormat (see page 2819)	Registers a new TGraphic (see page 2748) class for use in the LoadFromClipboardFormat (see page 2818) method.
	RegisterFileFormat (see page 2821)	Registers a new TGraphic (see page 2748) class for use in LoadFromFile (see page 2818).
	RegisterFileFormatRes (see page 2822)	Registers a new TGraphic (see page 2748) class for use in the LoadFromFile (see page 2818) method.
	SaveToClipboardFormat (see page 2822)	Allocates a global handle and writes the picture in its native Clipboard format (CF_BITMAP for bitmaps, CF_METAFILE for metafiles, and so on).
	SaveToFile (see page 2823)	Writes the picture to disk.
	SupportsClipboardFormat (see page 2824)	Indicates if the given Clipboard format is supported by the LoadFromClipboardFormat (see page 2818) method.
	UnregisterGraphicClass (see page 2825)	This is UnregisterGraphicClass, a member of class TPicture.

8.1.19.4.1 TPicture.Assign Method

Copies one object to another by copying the contents of that object to the other.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

When Source is a object type that is valid for the Graphic (see page 2827) property, Assign makes that graphic the value of the Graphic (see page 2827) property.

The actions performed by Assign depend on the actual types of the TPicture (see page 2812) Graphic (see page 2827) property and Source. For example, if the Graphic (see page 2827) property and Source are bitmaps (TBitmap (see page 2628)), the bitmap contained in Source is copied into the Graphic (see page 2827) property. Similar conversions are valid, for example, for TIcon (see page 2768) or TMetafile (see page 2780).

If the Source parameter is not a valid object for the Graphic (see page 2827) property, Assign calls the inherited method so that the picture can be copied from any object with which it is compatible.

C++ Examples:

```
/*
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
*/

#include <Clipbrd.hpp>
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Graphics::TBitmap *FormImage = GetFormImage();
  try
  {
    Clipboard()->Assign(FormImage);
    Image1->Picture->Assign(Clipboard());
  }
  __finally
  {
    delete FormImage;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Shape1->Shape = stEllipse;
  Shape1->Brush->Color = clLime;
  Image1->Stretch = true;
}
```

Delphi Examples:

```
{
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  FormImage: TBitmap;
begin
  FormImage := GetFormImage;
  try
    Clipboard.Assign(FormImage);
    Image1.Picture.Assign(Clipboard);
  finally
    FormImage.Free;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Shape1.Shape := stEllipse;
  Shape1.Brush.Color := clLime;
  Image1.Stretch := True;
end;
```

See Also

Graphic (see page 2827)

Assign

8.1.19.4.2 TPicture.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

8.1.19.4.3 TPicture.Changed Method

Pascal

```
procedure Changed(Sender: TObject); dynamic;
```

C++

```
__fastcall Changed(TObject * Sender);
```

Description

This is Changed, a member of class TPicture.

8.1.19.4.4 TPicture.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Descendants of TPersistent override DefineProperties to designate a method for storing the object's unpublished data to a stream such as a form file. By default, writing an object to a stream writes the values of all its published properties, and reading the object in reads those values and assigns them to the properties. Objects can also specify methods that read and write data other than published properties by overriding the DefineProperties method.

When overriding DefineProperties, consider including some or all of the following:

A call to the inherited method

Calls to the filer object's DefineProperty method

Calls to the filer object's DefineBinaryProperty method

DefineProperties is virtual, so descendant classes can override it as necessary but are not required to do so.

See Also

DefineProperties

DefineBinaryProperty

DefineProperty

8.1.19.4.5 TPicture.LoadFromClipboardFormat Method

Reads the picture from the handle provided in the given Clipboard format.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE);
```

C++

```
__fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Use LoadFromClipboardFormat to read in a graphic from the Clipboard. If the format is not supported, an EInvalidGraphic (see page 2627) exception is raised.

See Also

EInvalidGraphic (see page 2627)

RegisterClipboardFormat (see page 2819)

TClipboard

8.1.19.4.6 TPicture.LoadFromFile Method

Reads the file specified in Filename and loads the data into the TPicture (see page 2812) object.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const UnicodeString Filename);
```

Description

Use LoadFromFile to read a picture from disk. The TGraphic (see page 2748) class created is determined by the file extension of the file. If the file extension is not recognized an EInvalidGraphic (see page 2627) exception is raised.

See Also

EInvalidGraphic (see page 2627)

RegisterFileFormat (see page 2821)

TGraphic (see page 2748)

8.1.19.4.7 TPicture.LoadFromStream Method

Reads the picture from a Stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to read a picture from a TStream object. The TGraphic (see page 2748) class created is determined by the type of data contained in the stream.

The data in the stream should be previously written by a call to the SaveToStream (see page 2824) method of another TPicture (see page 2812) or of a TGraphic (see page 2748) descendant.

See Also

EInvalidGraphic (see page 2627)

LoadFromMimeSource

LoadFromFile (see page 2818)

SaveToStream (see page 2824)

SaveToStream (see page 2758)

8.1.19.4.8 TPicture.Progress Method

Pascal

```
procedure Progress(Sender: TObject; Stage: TProgressStage; PercentDone: Byte; RedrawNow:
Boolean; const R: TRect; const Msg: string); dynamic;
```

C++

```
__fastcall Progress(TObject * Sender, TProgressStage Stage, Byte PercentDone, Boolean
RedrawNow, const TRect R, const UnicodeString Msg);
```

Description

This is Progress, a member of class TPicture.

8.1.19.4.9 TPicture.RegisterClipboardFormat Method

Registers a new TGraphic (see page 2748) class for use in the LoadFromClipboardFormat (see page 2818) method.

Pascal

```
class procedure RegisterClipboardFormat(AFormat: Word; AGraphicClass: TGraphicClass);
```

C++

```
__fastcall RegisterClipboardFormat(Word AFormat, TGraphicClass AGraphicClass);
```

Description

Use RegisterClipboardFormat register a new graphic format with TPicture (see page 2812) so that it can be used with the LoadFromClipboardFormat (see page 2818) method.

C++ Examples:

```
/*
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
*/
#include <Clipbrd.hpp>
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TClipboard *cb = Clipboard();
  if (cb->HasFormat(CF_BITMAP))
  {
    std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
    try
    {
      Bitmap->LoadFromClipboardFormat(CF_BITMAP, cb->GetAsHandle(CF_BITMAP), 0);
      Canvas->Draw(5, 5, Bitmap.get());
    }
    catch (...)
    {
      MessageBeep(0);
      ShowMessage("Error reading image from clipboard!");
    }
    cb->Clear();
  }
  else
  {
    MessageBeep(0);
    ShowMessage("Cannot find image in clipboard!");
  }
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  unsigned int DataHandle;
  HPALETTE APalette;
  unsigned short MyFormat;
  std::auto_ptr<Graphics::TBitmap> Bitmap(new Graphics::TBitmap());
  try
  {
    Bitmap->LoadFromFile("C:\\Program Files\\Common Files\\CodeGear
Shared\\Images\\Splash\\256Color\\FACTORY.BMP");
    // generate a clipboard format, with data and palette
    Bitmap->SaveToClipboardFormat(
      MyFormat,
      DataHandle,
      APalette);
    // save the data to the clipboard using that format and
    // the generated data
    Clipboard()->SetAsHandle(MyFormat,DataHandle);
  }
  catch (...)
  {
     ShowMessage("Failed to copy image to clipboard!");
  }
}
```

Delphi Examples:

```
{
The following code draws a bitmap image from the Clipboard
when a button is pressed.  The SaveToClipboard button must
be selected before the LoadFromClipboard button in order to
place the icon on the clipboard.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Bitmap : TBitmap;
  s : string;
  Icon: TIcon;
begin
 Bitmap := TBitMap.Create;
 try
   Image1.Picture.RegisterClipboardFormat(cf_BitMap,TIcon);
   Bitmap.LoadFromClipBoardFormat(
     cf_BitMap,ClipBoard.GetAsHandle(cf_Bitmap),0);
   Canvas.draw(0,0,Bitmap);
 finally
   Bitmap.free;
   Clipboard.Clear;
 end;
end;

procedure TForm1.Button2Click(Sender: TObject);
var
  MyFormat : Word;
  Bitmap : TBitMap;
  AData : THandle;
  APalette : HPALETTE;
begin
  Bitmap := TBitmap.Create;
  try
    Bitmap.LoadFromFile('c:\Program Files\Common Files\CodeGear
Shared\Images\Splash\256color\factory.bmp');
    Bitmap.SaveToClipBoardFormat(
      MyFormat,
      AData,
      APalette);
    ClipBoard.SetAsHandle(MyFormat,AData);
  finally
    Bitmap.Free;
  end;
end;
```

See Also

LoadFromClipboardFormat (see page 2818)

TClipboard

UnRegisterGraphicClass (see page 2825)

8.1.19.4.10 TPicture.RegisterFileFormat Method

Registers a new TGraphic (see page 2748) class for use in LoadFromFile (see page 2818).

Pascal

```
class procedure RegisterFileFormat(const AExtension: string; const ADescription: string;
AGraphicClass: TGraphicClass);
```

C++

```
__fastcall RegisterFileFormat(const UnicodeString AExtension, const UnicodeString
ADescription, TGraphicClass AGraphicClass);
```

Description

Use RegisterFileFormat to register a graphic file format with TPicture (see page 2812) so that it can be used with a Open or Save dialog box.

The AExtension parameter specifies the three-character system file extension to associate with the graphic class (for example, "bmp" is associated with TBitmap (see page 2628)). The ADescription parameter specifies the description of the graphic to appear in the drop down list of the dialog box (for example, "Bitmaps" is the description of TBitmap (see page 2628)). The AGraphicClass parameter registers the new graphic class to associate with the file format.

See Also

LoadFromFile (see page 2818)

UnRegisterGraphicClass (see page 2825)

8.1.19.4.11 TPicture.RegisterFileFormatRes Method

Registers a new TGraphic (see page 2748) class for use in the LoadFromFile (see page 2818) method.

Pascal

```
class procedure RegisterFileFormatRes(const AExtension: String; ADescriptionResID: Integer;
AGraphicClass: TGraphicClass);
```

C++

```
__fastcall RegisterFileFormatRes(const UnicodeString AExtension, int ADescriptionResID,
TGraphicClass AGraphicClass);
```

Description

Use RegisterFileFormatRes by specifying a string resource.

The AExtension parameter specifies the three-character system file extension to associate with the graphic class (for example, "bmp" is associated with TBitmap (see page 2628)).

The ADescriptionResID parameter specifies the resource ID for a description of the graphic, which then appears in the drop down list of the dialog box (for example, "Bitmaps" is the description of TBitmap (see page 2628)).

The AGraphicClass parameter registers the new graphic class to associate with the file format.

See Also

LoadFromFile (see page 2818)

UnRegisterGraphicClass (see page 2825)

8.1.19.4.12 TPicture.SaveToClipboardFormat Method

Allocates a global handle and writes the picture in its native Clipboard format (CF_BITMAP for bitmaps, CF_METAFILE for metafiles, and so on).

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette: HPALETTE);
```

C++

```
__fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Use SaveToClipboardFormat to copy the picture to a Clipboard format. The resulting values can then be copied to the Windows clipboard using the clipboard's SetAsHandle method.

The picture's palette is returned in the APalette parameter, the format in the AFormat parameter, and a handle to the data in the AData parameter. Before the picture can be saved, an application must have registered the format using the RegisterClipboardFormat (see page 2819) method.

See Also

Formats

RegisterClipboardFormat (see page 2819)

8.1.19.4.13 TPicture.SaveToFile Method

Writes the picture to disk.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const UnicodeString Filename);
```

Description

Use SaveToFile to save a TPicture (see page 2812) object to the file specified in Filename.

The saved picture can be loaded to another TPicture (see page 2812) or to an appropriate TGraphic (see page 2748) descendant by calling its LoadFromFile (see page 2818) method.

C++ Examples:

```
/*
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::ConvertIcon2BitmapClick(TObject *Sender)
{
  OpenDialog1->DefaultExt = ".ICO";
  OpenDialog1->Filter = "icons (*.ico)|*.ICO";
  OpenDialog1->Options << ofOverwritePrompt << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    std::auto_ptr<TIcon> pi(new Graphics::TIcon);
    AnsiString as;
    pi->LoadFromFile(OpenDialog1->FileName);
    as = ChangeFileExt(OpenDialog1->FileName,".BMP");
    Image1->Width = pi->Width;
    Image1->Height = pi->Height;
    Image1->Canvas->Draw(0, 0, pi.get());
    Image1->Picture->SaveToFile(as);
    ShowMessage(OpenDialog1->FileName + " Saved to " + as);
  }
}
```

Delphi Examples:

```
{
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
}
procedure TForm1.ConvertIcon2BitmapClick(Sender: TObject);
var
  s : string;
```

```
  Icon: TIcon;
begin
  OpenDialog1.DefaultExt := '.ICO';
  OpenDialog1.Filter := 'icons (*.ico)|*.ICO';
  OpenDialog1.Options := [ofOverwritePrompt, ofFileMustExist, ofHideReadOnly ];
  if OpenDialog1.Execute then
  begin
    Icon := TIcon.Create;
    try
      Icon.Loadfromfile(OpenDialog1.FileName);
      s:= ChangeFileExt(OpenDialog1.FileName,'.BMP');
      Image1.Width := Icon.Width;
      Image1.Height := Icon.Height;
      Image1.Canvas.Draw(0,0,Icon);
      Image1.Picture.SaveToFile(s);
      ShowMessage(OpenDialog1.FileName + ' Saved to ' + s);
    finally
      Icon.Free;
    end;
  end;
end;
```

See Also

LoadFromFile (see page 2818)

LoadFromFile (see page 2755)

8.1.19.4.14 TPicture.SaveToStream Method

Saves the picture to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to save a picture to the TStream object specified by the Stream parameter.

The saved picture can be loaded to another TPicture (see page 2812) or to an appropriate TGraphic (see page 2748) descendant by calling its LoadFromStream (see page 2819) method.

See Also

LoadFromStream (see page 2819)

LoadFromStream (see page 2756)

8.1.19.4.15 TPicture.SupportsClipboardFormat Method

Indicates if the given Clipboard format is supported by the LoadFromClipboardFormat (see page 2818) method.

Pascal

```
class function SupportsClipboardFormat(AFormat: Word): Boolean;
```

C++

```
__fastcall Boolean SupportsClipboardFormat(Word AFormat);
```

Description

If the LoadFromClipboardFormat (see page 2818) method supports the Clipboard format specified as the value of AFormat, SupportsClipboardFormat returns true. If the format is not supported, the method returns false.

See Also

LoadFromClipboardFormat (see page 2818)

8.1.19.4.16 TPicture.UnregisterGraphicClass Method

Pascal

```
class procedure UnregisterGraphicClass(AClass: TGraphicClass);
```

C++

```
__fastcall UnregisterGraphicClass(TGraphicClass AClass);
```

Description

This is UnregisterGraphicClass, a member of class TPicture.

8.1.19.5 TPicture Properties

The properties of the TPicture class are listed here.

Public Properties

	Name	Description
	Bitmap (see page 2825)	Specifies the contents of the picture object as a bitmap graphic (.BMP file format).
	Graphic (see page 2827)	Specifies the graphic that the picture contains.
R	Height (see page 2828)	Specifies the vertical size (in pixels) of the graphic.
	Icon (see page 2828)	Specifies the contents of the TPicture (see page 2812) object as an icon graphic (.ICO file format).
	Metafile (see page 2828)	Specifies the contents of the picture object as an Enhanced Windows metafile graphic (.EMF file format).
	PictureAdapter (see page 2829)	Represents an OLE interface for the picture.
R	Width (see page 2829)	Specifies the horizontal size (in pixels) of the picture.

8.1.19.5.1 TPicture.Bitmap Property

Specifies the contents of the picture object as a bitmap graphic (.BMP file format).

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Use Bitmap to reference the picture object when it contains a bitmap. If Bitmap is referenced when the picture contains a Metafile (see page 2828) or Icon (see page 2828) graphic, the graphic won't be converted. Instead, the original contents of the picture are discarded and Bitmap returns a new, blank bitmap.

Note: When assigning the Bitmap property, TPicture (see page 2812) assigns the properties of a another TBitmap (see page 2628) object. It does not take ownership of the specified value.

C++ Examples:

```
/*
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
*/
void __fastcall TCustomDrawForm::TVCustomDraw(TCustomTreeView *Sender,
      const TRect &ARect, bool &DefaultDraw)
{
/*
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
*/
  if (None1 != NULL)
  {
    if (None1->Checked) //no picture
    {
      TV->Canvas->Brush->Color = BkgColorDialog->Color;
      TV->Canvas->Brush->Style = FBrushStyle;
      TV->Canvas->FillRect(ARect);
    }
    else if (Tile1->Checked) //tile bitmap
    {
      TV->Canvas->Brush->Bitmap = Image1->Picture->Bitmap;
      TV->Canvas->FillRect(ARect);
    }
    else //Stretch across the canvas.
      TV->Canvas->StretchDraw(ARect, Image1->Picture->Bitmap);
  };
  DefaultDraw = FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
}
```

Delphi Examples:

```
{
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
}
procedure TCustomDrawForm.TVCustomDraw(Sender: TCustomTreeView; const ARect: TRect;
  var DefaultDraw: Boolean);
begin
{
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
}
  with TV.Canvas do
  begin
    if None1 <> nil then
    begin
      if None1.Checked then //no picture
      begin
        Brush.Color := BkgColorDialog.Color;
        Brush.Style := FBrushStyle;
```

```
        FillRect(ARect);
      end else
        if Tile1.Checked then //tile bitmap
        begin
          Brush.Bitmap := Image1.Picture.Bitmap;
            FillRect(ARect);
          end else //Stretch across the canvas.
              StretchDraw(ARect, Image1.Picture.Bitmap);
    end;
  end;
  DefaultDraw := FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
end;
```

See Also

Graphic (see page 2827)

8.1.19.5.2 TPicture.Graphic Property

Specifies the graphic that the picture contains.

Pascal

```
property Graphic: TGraphic;
```

C++

```
__property TGraphic Graphic;
```

Description

Use Graphic to specify what graphic the TPicture (see page 2812) object contains. The graphic can be a bitmap, icon, metafile, or user-defined graphic class.

Note: When assigning the Graphic property, TPicture (see page 2812) assigns the properties of a another TGraphic (see page 2748) object. It does not take ownership of the specified object.

C++ Examples:

```
/*
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PaintBox1->Canvas->Draw(0,0, Image1->Picture->Graphic);
}
```

Delphi Examples:

```
{
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  PaintBox1.Canvas.Draw(0,0, Image1.Picture.Graphic);
end;
```

See Also

Bitmap (see page 2825)

Icon (see page 2828)

Metafile (see page 2828)

8.1.19.5.3 TPicture.Height Property

Specifies the vertical size (in pixels) of the graphic.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use Height to find the height of the graphic image contained in the picture object. Height is the native, unstretched, height of the picture.

See Also

Width (see page 2829)

8.1.19.5.4 TPicture.Icon Property

Specifies the contents of the TPicture (see page 2812) object as an icon graphic (.ICO file format).

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

If Icon is referenced when the TPicture (see page 2812) contains a Bitmap (see page 2825) or Metafile (see page 2828) graphic, the graphic won't be converted. Instead, the original contents of the TPicture (see page 2812) are discarded and Icon returns a new, blank icon.

Note: When assigning the Icon property, TPicture (see page 2812) assigns the properties of a another Icon object. It does not take ownership of the specified value.

See Also

Graphic (see page 2827)

8.1.19.5.5 TPicture.Metafile Property

Specifies the contents of the picture object as an Enhanced Windows metafile graphic (.EMF file format).

Pascal

```
property Metafile: TMetafile;
```

C++

```
__property TMetafile Metafile;
```

Description

If Metafile is referenced when the TPicture (see page 2812) contains a Bitmap (see page 2825) or Icon (see page 2828)

graphic, the graphic won't be converted. Instead, the original contents of the TPicture (see page 2812) are discarded and Metafile returns a new, blank metafile.

Note: When assigning the Metafile property, TPicture (see page 2812) assigns the properties of a another TMetafile (see page 2780) object. It does not take ownership of the specified value.

See Also

Graphic (see page 2827)

8.1.19.5.6 TPicture.PictureAdapter Property

Represents an OLE interface for the picture.

Pascal

```
property PictureAdapter: IChangeNotifier;
```

C++

```
__property IChangeNotifier PictureAdapter;
```

Description

PictureAdapter is for internal use only.

See Also

TPictureAdapter

8.1.19.5.7 TPicture.Width Property

Specifies the horizontal size (in pixels) of the picture.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use Width to find the width of a graphic image. Width contains the native, unstretched, width of the picture.

See Also

Height (see page 2828)

8.1.19.6 TPicture Events

The events of the TPicture class are listed here.

Public Events

	Name	Description
	OnChange (see page 2830)	Occurs when the specific graphics item encapsulated by the picture object changes.
	OnProgress (see page 2830)	Occurs periodically during slow operations that affect the graphic.

8.1.19.6.1 TPicture.OnChange Event

Occurs when the specific graphics item encapsulated by the picture object changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use OnChange to write an event handler to process an action when the graphic is modified.

8.1.19.6.2 TPicture.OnProgress Event

Occurs periodically during slow operations that affect the graphic.

Pascal

```
property OnProgress: TProgressEvent;
```

C++

```
__property TProgressEvent OnProgress;
```

Description

OnProgress is generated by the particular graphic that the picture object contains. Whether OnProgress occurs depends upon the type of graphic in the Graphic (see page 2827) property. Some graphics generate this event, others do not. Jpeg images, for example, generate an OnProgress event.

Write an OnProgress event handler to provide the user with feedback during slow operations such as loading large compressed images. TImage, for example, hooks the OnProgress event of TPicture (see page 2812).

Note: The PercentDone parameter on the event handler is only an approximation. With some image formats, the value of PercentDone may actually decrease from the value in previous events, as the graphic object discovers there is more work to do.

See Also

Graphic (see page 2827)

OnProgress (see page 1098)

8.1.20 TSharedImage Class

TSharedImage is the base class for classes that contain images used for graphics objects.

Class Hierarchy

Pascal

```
TSharedImage = class;
```

C++

```
class TSharedImage;
```

File

Graphics

Description

TSharedImage is used as a base class for classes that hold the internal representation of graphical images such as bitmaps and icons. TSharedImage is an abstract class. Its descendant classes are used internally by graphics objects, and are automatically created by their associated graphics objects.

See Also

TGraphic (see page 2748)

8.1.20.1 TSharedImage Members

The following tables list the members exposed by TSharedImage.

Protected Methods

	Name	Description
	FreeHandle (see page 2832)	This is FreeHandle, a member of class TSharedImage.
	Reference (see page 2832)	This is Reference, a member of class TSharedImage.
	Release (see page 2832)	This is Release, a member of class TSharedImage.

Protected Properties

	Name	Description
	RefCount (see page 2832)	This is RefCount, a member of class TSharedImage.

Public Methods

	Name	Description
	Destroy (see page 2831)	This is Destroy, a member of class TSharedImage.

8.1.20.2 TSharedImage.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSharedImage();
```

Description

This is Destroy, a member of class TSharedImage.

8.1.20.3 TSharedImage Methods

The methods of the TSharedImage class are listed here.

Protected Methods

	Name	Description
	FreeHandle (see page 2832)	This is FreeHandle, a member of class TSharedImage.
	Reference (see page 2832)	This is Reference, a member of class TSharedImage.
	Release (see page 2832)	This is Release, a member of class TSharedImage.

8.1.20.3.1 TSharedImage.FreeHandle Method

Pascal

```
procedure FreeHandle; virtual; abstract;
```

C++

```
virtual __fastcall FreeHandle() = 0;
```

Description

This is FreeHandle, a member of class TSharedImage.

8.1.20.3.2 TSharedImage.Reference Method

Pascal

```
procedure Reference;
```

C++

```
__fastcall Reference();
```

Description

This is Reference, a member of class TSharedImage.

8.1.20.3.3 TSharedImage.Release Method

Pascal

```
procedure Release;
```

C++

```
__fastcall Release();
```

Description

This is Release, a member of class TSharedImage.

8.1.20.4 TSharedImage Properties

The properties of the TSharedImage class are listed here.

Protected Properties

	Name	Description
	RefCount (see page 2832)	This is RefCount, a member of class TSharedImage.

8.1.20.4.1 TSharedImage.RefCount Property

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

This is RefCount, a member of class TSharedImage.

8.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IChangeNotifier (see page 2834)	IChangeNotifier is the interface used for responding to status changes.

8.2.1 IChangeNotifier Interface

IChangeNotifier is the interface used for responding to status changes.

Class Hierarchy

Graphics.IChangeNotifier

Pascal

```
IChangeNotifier = interface;
```

C++

```
__interface IChangeNotifier;
```

File

Graphics

Description

IChangeNotifier introduces one method, Changed (see page 2835) that is invoked when the status of the implementing class changes.

See Also

Changed (see page 2835)

8.2.1.1 IChangeNotifier Members

The following tables list the members exposed by IChangeNotifier.

Public Methods

	Name	Description
	Changed (see page 2835)	Called when a change occurs in the implementing class.

8.2.1.2 IChangeNotifier Methods

The methods of the IChangeNotifier class are listed here.

Public Methods

	Name	Description
	Changed (see page 2835)	Called when a change occurs in the implementing class.

8.2.1.2.1 IChangeNotifier.Changed Method

Called when a change occurs in the implementing class.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Changed is principally used internally by TFont (see page 2730) class TFontAdapter property and TPicture (see page 2812) class TPictureAdapter property.

See Also

TFontAdapter

TPictureAdapter

8.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AllocPatternBitmap (see page 2836)	Creates a TBitmap (see page 2628) filled with a pattern.
	BytesPerScanline (see page 2837)	This is function Graphics.BytesPerScanline.
	CharsetToIdent (see page 2837)	Obtains the name of a character set.
	ColorToIdent (see page 2838)	Provides the symbolic name of a TColor (see page 2878) value.
	ColorToRGB (see page 2838)	Converts a TColor (see page 2878) value into an RGB representation of the color.
	ColorToString (see page 2840)	Returns a string that represents the name of a TColor (see page 2878) value.
	CopyPalette (see page 2841)	Creates a new palette object that matches an existing palette.
	CreateGrayMappedBmp (see page 2841)	Remaps the standard gray colors in a bitmap with the system grays.
	CreateGrayMappedRes (see page 2842)	Remaps the standard gray colors in a bitmap resource with the system grays.
	CreateMappedBmp (see page 2842)	Changes the color table in a bitmap.
	CreateMappedRes (see page 2843)	Changes the color table in a bitmap resource.
	FreeMemoryContexts (see page 2844)	This is function Graphics.FreeMemoryContexts.
	GetCharsetValues (see page 2844)	Passes the name of every predefined character set string to a callback function.
	GetColorValues (see page 2848)	Passes the name of every predefined color constant to a callback function.
	GetDefFontCharSet (see page 2848)	Returns the character set of the default system font.
	GetDIB (see page 2849)	Returns the info header and image for a device independent bitmap.
	GetDIBSizes (see page 2849)	Returns the size of the info header and of the image for a device independent bitmap.
	GraphicExtension (see page 2850)	Returns the default file-name extension of a graphics object.
	GraphicFileMask (see page 2852)	Returns a file mask that specifies the valid extensions for a graphic class.
	GraphicFilter (see page 2854)	Returns a file filter compatible with the Filter property of an Open or Save dialog.
	IdentToCharset (see page 2857)	Translates the name of a character set constant to the corresponding character set.
	IdentToColor (see page 2857)	Translates the name of a color constant to the corresponding TColor (see page 2878) value.
	PaletteChanged (see page 2858)	This is function Graphics.PaletteChanged.
	StringToColor (see page 2858)	Translates a string representation of a color to the corresponding TColor (see page 2878) value.
	TransparentStretchBlt (see page 2859)	This is function Graphics.TransparentStretchBlt.

8.3.1 Graphics.AllocPatternBitmap Function

Creates a TBitmap (see page 2628) filled with a pattern.

Pascal

```
function AllocPatternBitmap(BkColor: TColor; FgColor: TColor): TBitmap;
```

C++

```
TBitmap AllocPatternBitmap(TColor BkColor, TColor FgColor);
```

File

Graphics

Description

AllocPatternBitmap returns a reference to an 8 by 8 pixel TBitmap (see page 2628) that is filled with a pattern. Pixels alternate between **BkColor** and **FgColor** colors horizontally and vertically in a quilt pattern.

See Also

TBitmap (see page 2628)

TColor (see page 2878)

8.3.2 Graphics.BytesPerScanline Function

Pascal

```
function BytesPerScanline(PixelsPerScanline: Longint; BitsPerPixel: Longint; Alignment:
Longint): Longint;
```

C++

```
Longint BytesPerScanline(Longint PixelsPerScanline, Longint BitsPerPixel, Longint Alignment);
```

File

Graphics

Description

This is function Graphics.BytesPerScanline.

8.3.3 Graphics.CharsetToIdent Function

Obtains the name of a character set.

Pascal

```
function CharsetToIdent(Charset: Longint; var Ident: string): Boolean;
```

C++

```
Boolean CharsetToIdent(Longint Charset, UnicodeString Ident);
```

File

Graphics

Description

Call CharsetToIdent to obtain the symbolic name for the character set of a font. CharsetToIdent returns true if the Ident parameter is successfully given an identifying name for the character set.

Note: The return value of CharsetToIdent does not indicate whether the Charset parameter is valid for a given font. Many fonts support only a limited number of character sets. Some fonts may support less common character sets that can't be mapped to identifiers by CharsetToIdent.

See Also

TFont (see page 2730)

8.3.4 Graphics.ColorToIdent Function

Provides the symbolic name of a TColor (see page 2878) value.

Pascal

```
function ColorToIdent(Color: Longint; var Ident: string): Boolean;
```

C++

```
Boolean ColorToIdent(Longint Color, UnicodeString Ident);
```

File

Graphics

Description

Call ColorToIdent to obtain the name of the symbolic constant that represents a TColor (see page 2878) value, such as clBlack (see page 2899) or clWindow (see page 2965). The Ident parameter is set to the symbolic name. If there is no symbolic constant defined for the color, ColorToIdent returns false.

See Also

ColorToString (see page 2840)

TColor (see page 2878)

IdentToColor (see page 2857)

8.3.5 Graphics.ColorToRGB Function

Converts a TColor (see page 2878) value into an RGB representation of the color.

Pascal

```
function ColorToRGB(Color: TColor): Longint;
```

C++

```
Longint ColorToRGB(TColor Color);
```

File

Graphics

Description

Call ColorToRGB to obtain an RGB representation of a color for using with Windows API calls. ColorToRGB strips away the information that is stored in the highest order bits about which palette to use for colors that are not always available.

C++ Examples:

```
/*
The following code converts the color of the current form,
Form1, to a Windows RGB value:
*/
int NumPaletteEntries = 20;
TPaletteEntry FPaletteEntries[20];

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  GetPaletteEntries(GetStockObject(DEFAULT_PALETTE), 0, NumPaletteEntries,
    FPaletteEntries);
  Form1->Color = clMoneyGreen;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Result = 0;
  int I = 0;
  TColor RealColor = Graphics::ColorToRGB(Form1->Color);
  while (I < NumPaletteEntries)
  {
//  with FPaletteEntries[I] do
    TColor paletteColor =
    RGB(
      FPaletteEntries[I].peRed,
      FPaletteEntries[I].peGreen,
      FPaletteEntries[I].peBlue);
    if (RealColor == paletteColor)
    {
      Label1->Caption = IntToStr(I);
      RedEdit->Text = IntToStr(FPaletteEntries[I].peRed);
      GreenEdit->Text = IntToStr(FPaletteEntries[I].peGreen);
      BlueEdit->Text = IntToStr(FPaletteEntries[I].peBlue);
      break;
    }
    I++;
  };
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form1->Color =
    (StrToInt(RedEdit->Text) << 16) +
    (StrToInt(GreenEdit->Text) << 8) +
    (StrToInt(BlueEdit->Text));
}
```

Delphi Examples:

```
{
The following code converts the color of the current form,
Form1, to a Windows RGB value:
}
const
  NumPaletteEntries = 20;
var
  FPaletteEntries: array[0..NumPaletteEntries - 1] of TPaletteEntry;

procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
  Result: Integer;
  RealColor, paletteColor: TColor;
begin
  Result := 0;
  I := 0;
  RealColor := Graphics.ColorToRGB(Form1.Color);
  while I < NumPaletteEntries do
  begin
    with FPaletteEntries[I] do
    begin
      paletteColor:= TColor(RGB(peRed, peGreen, peBlue));
      if RealColor = paletteColor then
      begin
        Label1.Caption := IntToStr(I);
```

```
          RedEdit.Text:= IntToStr(peRed);
          GreenEdit.Text:= IntToStr(peGreen);
          BlueEdit.Text:= IntToStr(peBlue);
          Exit;
        end;
      end;
      Inc(I)
    end;
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    Form1.Color:=
      StrToInt(RedEdit.Text) shl 16 +
      StrToInt(GreenEdit.Text) shl 8 +
      StrToInt(BlueEdit.Text);
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    GetPaletteEntries(GetStockObject(DEFAULT_PALETTE), 0, NumPaletteEntries,
      FPaletteEntries);
    Form1.Color:= clMoneyGreen;
  end;
```

See Also

ColorToIdent (see page 2838)

8.3.6 Graphics.ColorToString Function

Returns a string that represents the name of a TColor (see page 2878) value.

Pascal

```
function ColorToString(Color: TColor): string;
```

C++

```
UnicodeString ColorToString(TColor Color);
```

File

Graphics

Description

Call ColorToString to obtain a string that represents a TColor (see page 2878) value. If there is a symbolic constant defined for the color (such as clBlack (see page 2899) or clHighlightText (see page 2907)), ColorToString returns the name of the constant. Otherwise, ColorToString returns the hex value of the color, formatted as a string such as "$02FF8800" (Delphi) or "0x02FF8800" (C++).

See Also

ColorToIdent (see page 2838)

StringToColor (see page 2858)

8.3.7 Graphics.CopyPalette Function

Creates a new palette object that matches an existing palette.

Pascal

```
function CopyPalette(Palette: HPALETTE): HPALETTE;
```

C++

```
HPALETTE CopyPalette(HPALETTE Palette);
```

File

Graphics

Description

Call CopyPalette to create a new Windows palette object that exactly matches an existing palette. If the Palette parameter does not refer to a valid Windows palette, or if a problem occurs while copying the palette, CopyPalette returns 0.

8.3.8 Graphics.CreateGrayMappedBmp Function

Remaps the standard gray colors in a bitmap with the system grays.

Pascal

```
function CreateGrayMappedBmp(Handle: HBITMAP): HBITMAP;
```

C++

```
HBITMAP CreateGrayMappedBmp(HBITMAP Handle);
```

File

Graphics

Description

Call CreateGrayMappedBmp to create a bitmap that uses the system gray colors (clBtnHightlight, clBtnFace (see page 2900), clBtnShadow (see page 2901) and clBtnText (see page 2901)) from a bitmap that uses standard gray scale colors (clWhite (see page 2965), clSilver (see page 2916), clGray (see page 2905), and clBlack (see page 2899)). This allows an application to dynamically create images that match the user's control panel settings, given a base image.

CreateGrayMappedBmp creates a new bitmap. It does not alter the original bitmap, which has the handle specified by the Handle parameter.

Note: CreateGrayMappedBmp does not work with bitmaps that have more than 256 colors. For bitmaps with more than 256 colors (8bpp), this function returns the original bitmap.

See Also

TBitmap (see page 2628)

CreateMappedBmp (see page 2842)

CreateGrayMappedRes (see page 2842)

Graphics

8.3.9 Graphics.CreateGrayMappedRes Function

Remaps the standard gray colors in a bitmap resource with the system grays.

Pascal

```
function CreateGrayMappedRes(Instance: THandle; ResName: PChar): HBITMAP;
```

C++

```
HBITMAP CreateGrayMappedRes(THandle Instance, const char * ResName);
```

File

Graphics

Description

Call CreateGrayMappedRes to create a bitmap that uses the system gray colors (clBtnHightlight, clBtnFace (see page 2900), clBtnShadow (see page 2901) and clBtnText (see page 2901)) from a resourced bitmap that uses standard gray scale colors (clWhite (see page 2965), clSilver (see page 2916), clGray (see page 2905), and clBlack (see page 2899)). This allows an application to dynamically create images that match the user's control panel settings, by creating a base image as a bitmap resource.

Use the Instance and ResName parameters to identify the bitmap resource whose color table should be changed

Note: CreateMappedRes (see page 2843) does not work with bitmaps that have more than 256 colors. For bitmaps with more than 256 colors (8bpp), this function returns an instance of the original bitmap without color modifications.

TBitmap (see page 2628)

CreateGrayMappedBmp (see page 2841)

FindResourceHInstance

Hinstance

CreateMappedRes (see page 2843)

Graphics

8.3.10 Graphics.CreateMappedBmp Function

Changes the color table in a bitmap.

Pascal

```
function CreateMappedBmp(Handle: HBITMAP; const OldColors: array of TColor; const NewColors:
array of TColor): HBITMAP;
```

C++

```
HBITMAP CreateMappedBmp(HBITMAP Handle, const array of TColor OldColors, const array of TColor
NewColors);
```

File

Graphics

Description

Call CreateMappedBmp to make selective changes to the color map of a bitmap. This function replaces the colors specified by the OldColors parameter with the colors specified by the NewColors parameter and returns the handle for a new device dependent bitmap (DDB) that uses the new color table. Handle is the handle to the bitmap whose color table should be changed. In C++, specify the size of the color arrays in OldColors_Size and NewColors_Size. This value should be the index of the last entry in the corresponding array. The OldColors and NewColors arrays should contain the same number of elements.

CreateMappedBmp creates a new bitmap. It does not alter the original bitmap, which has the handle specified by the Handle parameter.

Note: CreateMappedBmp does not work with bitmaps that have more than 256 colors. For bitmaps with more than 256 colors (8bpp), this function returns the original bitmap.

See Also

TBitmap (see page 2628)

CreateMappedRes (see page 2843)

CreateGrayMappedBmp (see page 2841)

8.3.11 Graphics.CreateMappedRes Function

Changes the color table in a bitmap resource.

Pascal

```
function CreateMappedRes(Instance: THandle; ResName: PChar; const OldColors: array of TColor;
const NewColors: array of TColor): HBITMAP;
```

C++

```
HBITMAP CreateMappedRes(THandle Instance, const char * ResName, const array of TColor
OldColors, const array of TColor NewColors);
```

File

Graphics

Description

Call CreateMappedRes to make selective changes to the color map of a resourced bitmap. This function replaces the colors specified by the OldColors parameter with the colors specified by the NewColors parameter and returns the handle for a new device dependent bitmap (DDB) that uses the new color table. Use the Instance and ResName parameters to identify the bitmap resource whose color table should be changed. In C++, indicate the number of elements in the color arrays by the OldColors_Size and NewColors_Size parameters. These values should be the index of the last element in the corresponding color array, not the number of entries. The OldColors and NewColors arrays should contain the same number of elements.

Note: CreateMappedRes does not work with bitmaps that have more than 256 colors. For bitmaps with more than 256 colors (8bpp), this function returns an instance of the original bitmap without color modifications.

See Also

TBitmap (see page 2628)

CreateMappedBmp (see page 2842)

FindResourceHInstance

Hinstance

CreateGrayMappedRes (see page 2842)

8.3.12 Graphics.FreeMemoryContexts Function

Pascal

```
procedure FreeMemoryContexts;
```

C++

```
FreeMemoryContexts();
```

File

Graphics

Description

This is function Graphics.FreeMemoryContexts.

8.3.13 Graphics.GetCharsetValues Function

Passes the name of every predefined character set string to a callback function.

Pascal

```
procedure GetCharsetValues(Proc: TGetStrProc);
```

C++

```
GetCharsetValues(TGetStrProc Proc);
```

File

Graphics

Description

Call GetCharsetValues to execute a callback for every character set name that has a corresponding constant defined in the application. The Proc parameter is the callback function that is called for every character set constant name.

Note: To convert the strings that are passed to the callback into the TFontCharset (see page 2881) type, use the IdentToCharset (see page 2857) function.

C++ Examples:

```
/*
The following uses the GetCharsetValues procedure to fill a
string list with the names of all the available character
```

```
set constants. This string list can then be used to allow
the user to select a character set.  Here is the callback
that adds the character sets to the string list:
*/
TStringList *CharSetList;

void __fastcall TForm1::AddCharacterSet(const UnicodeString S)
{
  CharSetList->Add(S);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  CharSetList = new TStringList();
  GetCharsetValues(AddCharacterSet);
  CharSetList->Sort();
  ListBox1->Items = CharSetList;
  delete CharSetList;
}
/*
The following example shows how to complete partial strings
typed into a combo box. The code represents the OnKeyPress
event handler of the combo box, which performs most of the
default keystroke handling before finding a matching list
item and updating the text.
Note:   This OnKeyPress event handler does not deal with the
case when the user types the Delete key. That case must be
caught in the OnKeyDown event handler instead.
*/
void __fastcall TForm1::ComboBox1KeyPress(TObject *Sender, char &Key)
{
  // first, process the keystroke to obtain the current string
  // This code requires all items in list to be uppercase
  if (Key >= 'a' && Key <= 'z')
    Key -= 32; // Force Uppercase only!
  TComboBox *pCB = dynamic_cast<TComboBox *>(Sender);
  AnsiString TmpStr;
  bool BackSpace = (Key == (char)VK_BACK);
  if (BackSpace && pCB->SelLength)
    TmpStr = pCB->Text.SubString(1,pCB->SelStart)+
             pCB->Text.SubString(pCB->SelLength+pCB->SelStart+1,255);
  else if (BackSpace) // SelLength == 0
    TmpStr = pCB->Text.SubString(1,pCB->SelStart-1)+
             pCB->Text.SubString(pCB->SelStart+1,255);
  else //Key is a visible character
    TmpStr = pCB->Text.SubString(1,pCB->SelStart)+ Key +
             pCB->Text.SubString(pCB->SelLength+pCB->SelStart+1,255);
  if (TmpStr.IsEmpty())
    return;
  // set SelSt to the current insertion point
  int SelSt = pCB->SelStart;
  if (BackSpace && SelSt > 0)
    SelSt--;
  else if (!BackSpace)
    SelSt++;
  Key = 0; // indicate that key was handled
  if (SelSt == 0)
  {
    pCB->Text = "";
    return;
  }
  // Now that TmpStr is the currently typed string, see if we can locate a match
  bool Found = false;
  for (int i = 1; i < pCB->Items->Count; i++)
    if (TmpStr == pCB->Items->Strings[i-1].SubString(1,TmpStr.Length()))
    {
```

```
      pCB->Text = pCB->Items->Strings[i-1]; // update to the match that was found
      pCB->ItemIndex = i-1;
      Found = true;
      break;
    }
  if (Found) // select the untyped end of the string
  {
    pCB->SelStart = SelSt;
    pCB->SelLength = pCB->Text.Length() - SelSt;
  }
  else Beep();
}

TStringList *CharSetList;

void __fastcall TForm1::AddCharacterSet(String S)
{
  CharSetList->Add(S);
}

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  static std::auto_ptr<TStringList> _CharSetListCleaner(CharSetList = new TStringList);
  GetCharsetValues(AddCharacterSet);
  CharSetList->Sort();
  ComboBox1->Items = CharSetList;
}
```

Delphi Examples:

```
{
The following uses the GetCharsetValues procedure to fill a
string list with the names of all the available character
set constants. This string list can then be used to allow
the user to select a character set.  Here is the callback
that adds the character sets to the string list:
}
var
  CharSetList : TStringList;

procedure TForm1.AddCharacterSet(const S: string);
begin
  CharSetList.Add(S);
end;
{
Here is the code that creates the string list, fills it, and sorts the character set names.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  CharSetList := TStringList.Create;
  Graphics.GetCharsetValues(AddCharacterSet);
  CharSetList.Sort;
  ListBox1.Items := CharSetList;
  CharSetList.Destroy;
end;
{
The following example shows how to complete partial strings
typed into a combo box. The code represents the OnKeyPress
event handler of the combo box, which performs most of the
default keystroke handling before finding a matching list
item and updating the text.
Note:   This OnKeyPress event handler does not deal with the
case when the user types the Delete key. That case must be
caught in the OnKeyDown event handler instead.
Note: Set the TComboBox AutoComplete to false to turn off
```

```
  default auto completion.
  }
  procedure TForm1.ComboBox1KeyPress(Sender: TObject; var Key: Char);
  var
    Found: boolean;
    i, ct, SelSt: Integer;
    TmpStr: string;
  begin
    { first, process the keystroke to obtain the current string }
    { This code requires all items in list to be uppercase}
    if Key in ['a'..'z'] then Dec(Key,32); {Force Uppercase only!}
    ct := (Sender as TComboBox).Items.Count;
    with (Sender as TComboBox) do
    begin
      SelSt := SelStart;
      if (Key = Chr(vk_Back)) and (SelLength <> 0) then
       TmpStr := Copy(Text, 1, SelStart) + Copy(Text, SelLength + SelStart + 1, 255)
      else if Key = Chr(vk_Back) then {SelLength = 0}
       TmpStr := Copy(Text, 1, SelStart-1) + Copy(Text, SelStart + 1,255)
      else {Key in ['A'..'Z', etc]}
       TmpStr := Copy(Text, 1, SelStart) + Key + Copy(Text, SelLength + SelStart + 1, 255);
      if TmpStr = '' then Exit;
      { update SelSt to the current insertion point }
      if (Key = Chr(vk_Back)) and (SelSt > 0) then Dec(SelSt)
      else if Key <> Chr(vk_Back) then Inc(SelSt);
      Key := #0; { indicate that key was handled }
      if SelSt = 0 then
      begin
        Text:= '';
        Exit;
      end;
     {Now that TmpStr is the currently typed string, see if we can locate a match }
      Found := False;
      for i := 1 to ct do
      begin
        if Copy(Items[i - 1], 1, Length(TmpStr)) = TmpStr then
        begin
          Text := Items[i-1]; { update to the match that was found }
          ItemIndex := i-1;
          Found := True;
          Break;
        end;
      end;
      if Found then { select the untyped end of the string }
      begin
        SelStart := SelSt;
        SelLength := Length(Text) - SelSt;
      end
      else Beep;
    end;
  end;

  var
    CharSetList : TStringList;

  procedure TForm1.AddCharacterSet(const S: string);
  begin
    CharSetList.Add(S);
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    CharSetList := TStringList.Create;
    Graphics.GetCharsetValues(AddCharacterSet);
    ComboBox1.Items := CharSetList;
  end;
```

8.3.14 Graphics.GetColorValues Function

Passes the name of every predefined color constant to a callback function.

Pascal

```
procedure GetColorValues(Proc: TGetStrProc);
```

C++

```
GetColorValues(TGetStrProc Proc);
```

File

Graphics

Description

Call GetColorValues to execute a callback for every TColor (see page 2878) constant defined in the application. The Proc parameter is the callback function that is called for every color constant name.

Note: To convert the strings that are passed to the callback into the TColor (see page 2878) type, use the IdentToColor (see page 2857) function.

See Also

TColor (see page 2878)

IdentToColor (see page 2857)

8.3.15 Graphics.GetDefFontCharSet Function

Returns the character set of the default system font.

Pascal

```
function GetDefFontCharSet: TFontCharSet;
```

C++

```
TFontCharSet GetDefFontCharSet();
```

File

Graphics

Description

Call GetDefFontCharSet to determine the character set that is used when a font is not explicitly assigned to a control. This character set can be used to initialize a font that is specified by font name only, to best match the characters for the locale of the machine on which the application is running.

See Also

TFont (see page 2730)

8.3.16 Graphics.GetDIB Function

Returns the info header and image for a device independent bitmap.

Pascal

```
function GetDIB(Bitmap: HBITMAP; Palette: HPALETTE; var BitmapInfo; var Bits): Boolean;
```

C++

```
Boolean GetDIB(HBITMAP Bitmap, HPALETTE Palette,  BitmapInfo,  Bits);
```

File

Graphics

Description

Call GetDIB to convert a device dependent bitmap into a device independent bitmap (DIB). Pass the handle to a device dependent bitmap and a handle to its palette as the Bitmap and Palette parameters. GetDIB fills in the BitmapInfo and Bits parameters with the info header and image of the corresponding DIB. GetDIB returns true if the bitmap was successfully converted into a DIB, false otherwise.

Before calling GetDIB, the memory for the info header and image must be allocated. Call GetDIBSizes (see page 2849) to determine the amount of memory that must be allocated for the info header and image.

See Also

GetDIBSizes (see page 2849)

8.3.17 Graphics.GetDIBSizes Function

Returns the size of the info header and of the image for a device independent bitmap.

Pascal

```
procedure GetDIBSizes(Bitmap: HBITMAP; var InfoHeaderSize: DWORD; var ImageSize: DWORD);
```

C++

```
GetDIBSizes(HBITMAP Bitmap, DWORD InfoHeaderSize, DWORD ImageSize);
```

File

Graphics

Description

Call GetDIBSizes to determine the amount of memory needed to convert a device dependent bitmap into a device independent bitmap (DIB). Pass the handle to a device dependent bitmap as the Bitmap parameter. GetDIBSizes returns the sizes of the info header and image of the corresponding DIB as the InfoHeaderSize parameter and the ImageSize parameter, respectively.

Call GetDIBSizes to determine the amount of memory that must be allocated before calling GetDIB (see page 2849) to convert a device dependent bitmap into a device independent bitmap.

See Also

GetDIB (see page 2849)

8.3.18 Graphics.GraphicExtension Function

Returns the default file-name extension of a graphics object.

Pascal

```
function GraphicExtension(GraphicClass: TGraphicClass): string;
```

C++

```
UnicodeString GraphicExtension(TGraphicClass GraphicClass);
```

File

Graphics

Description

Call GraphicExtension to obtain a default extension value for the DefaultExt property of an Open, Open Picture, Save Picture or Save dialog. GraphicExtension returns the default extension for the type of graphics object specified by the GraphicClass parameter. In Delphi, the TGraphicClass (see page 2887) type is the class type for descendants TGraphic (see page 2748).

These are the file extensions returned for each built-in graphics class:

Graphic class	File extension returned
TBitmap (see page 2628)	bmp
TIcon (see page 2768)	ico
TMetafile (see page 2780)	emf

If custom graphics classes register a file extension, GraphicExtension will return that extension when passed the custom graphics class as an argument.

C++ Examples:

```
/*
The following example allows users to type the name of a
graphics class into an edit control and when a button is
pressed, the name of the default extension for that class is
displayed in another edit control.  In the form's OnCreate
event handler (or a similar place) you must register the
graphics classes so that GetClass can find them.
*/
#include <memory>       //for STL auto_ptr class

TMetaClass *MetaClass;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<TClassFinder> myClassFinder(new TClassFinder(MetaClass, False));
  TGraphicClass mygraphclass = (TGraphicClass) (myClassFinder->GetClass(Edit2->Text));
//  TGraphicClass mygraphclass = (TGraphicClass) GetClass(Edit2->Text);
  Edit1->Text = GraphicExtension(mygraphclass);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  MetaClass = __classid(TIcon); // ico
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(Graphics::TBitmap); // bmp
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TMetafile); // emf
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TShape);  // nographic extension
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TImage); // nographic extension
  RegisterClasses(&MetaClass, 0);
}
/*
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
*/
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString NewFileName, OldFileName;
  SavePictureDialog1->DefaultExt = GraphicExtension(__classid(Graphics::TBitmap));
  SavePictureDialog1->Filter = GraphicFilter(__classid(Graphics::TBitmap));
  OldFileName = "factory.bmp";
  if (SavePictureDialog1->Execute())
  {
    NewFileName = SavePictureDialog1->FileName;
    std::auto_ptr<TFileStream> OldFile(new TFileStream(OldFileName, (fmOpenRead |
fmShareDenyWrite)));
    std::auto_ptr<TFileStream> NewFile(new TFileStream(NewFileName, (fmCreate |
fmShareDenyRead)));
    NewFile->CopyFrom(OldFile.get(), OldFile->Size);
  };
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Image1->Picture->LoadFromFile("../factory.bmp");
}
```

Delphi Examples:

```
{
The following example allows users to type the name of a
graphics class into an edit control and when a button is
pressed, the name of the default extension for that class is
displayed in another edit control.  In the form's OnCreate
event handler (or a similar place) you must register the
graphics classes so that GetClass can find them.
}

uses ExtCtrls;

procedure TForm1.Button1Click(Sender: TObject);
var
  myClassFinder: TClassFinder;
  mygraphclass: TGraphicClass;
begin
  { make sure the classes are registered so that GetClass will work -- }
  { Usually, this goes in the initialization section where it is only executed once }
  RegisterClasses([TIcon, TBitmap, TButton, TShape, TImage, TMetafile]);
  try
    myClassFinder := TClassFinder.Create(TIcon, False);
    mygraphclass := TGraphicClass(myClassFinder.GetClass(Edit2.Text));
//    mygraphclass := TGraphicClass(GetClass(Edit2.Text));  // works as well
```

```
    Edit1.Text := GraphicExtension(mygraphclass);
  except
    on EAccessViolation do
      MessageDlg('Invalid class name.', mtError, [mbOK], 0)
  end;
end;
{
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
}
procedure TForm1.Button1Click(Sender: TObject);
var NewFileName, OldFileName: string;
    NewFile, OldFile: TFileStream;
begin
  SavePictureDialog1.DefaultExt := GraphicExtension(TBitmap);
  SavePictureDialog1.Filter := GraphicFilter(TBitmap);
  OldFileName := 'factory.bmp';
  if SavePictureDialog1.Execute then
  begin
    NewFileName := SavePictureDialog1.FileName;
    OldFile := TFileStream.Create(
      OldFileName, fmOpenRead or fmShareDenyWrite);
    try
      NewFile := TFileStream.Create(
        NewFileName, fmCreate or fmShareDenyRead);
      try
        NewFile.CopyFrom(OldFile, OldFile.Size);
      finally
        FreeAndNil(NewFile);
      end;
    finally
      FreeAndNil(OldFile);
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Image1.Picture.LoadFromFile('factory.bmp');
end;
```

8.3.19 Graphics.GraphicFileMask Function

Returns a file mask that specifies the valid extensions for a graphic class.

Pascal

```
function GraphicFileMask(GraphicClass: TGraphicClass): string;
```

C++

```
UnicodeString GraphicFileMask(TGraphicClass GraphicClass);
```

File

Graphics

Description

Call GraphicFileMask to obtain a mask to determine the file extensions associated with a graphic class. The GraphicClass parameter can specify one of these values: TBitmap (see page 2628), TGraphic (see page 2748), TIcon (see page 2768), TMetafile (see page 2780), or a user-defined descendant of TGraphic (see page 2748). These are the strings that are returned for each built-in graphics class:

Graphic class	Filter string returned
TBitmap (see page 2628)	*.bmp
TIcon (see page 2768)	*.ico
TMetafile (see page 2780)	*.emf;*.wmf
TGraphic (see page 2748)	*.bmp;*.ico;*.emf;*.wmf
TGraphic (see page 2748)	;*.bmp;*.png;*.xpm*.ico

C++ Examples:

```
/*
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  OpenPictureDialog1->DefaultExt = GraphicExtension(__classid(TIcon));
  OpenPictureDialog1->FileName = GraphicFileMask(__classid(TIcon));
  OpenPictureDialog1->Filter = GraphicFilter(__classid(TIcon));
  OpenPictureDialog1->Options.Clear();
  OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
  while (true)
  {
    if (OpenPictureDialog1->Execute())
    {
      if (!OpenPictureDialog1->Options.Contains(ofExtensionDifferent))
      {
        Application->Icon->LoadFromFile(OpenPictureDialog1->FileName);
        break;
      }
      else // reset Options to remove ofExtensionDifferent
      {
        OpenPictureDialog1->Options.Clear();
        OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
      }
    }
    else // user cancelled
      break;
  }
}
```

Delphi Examples:

```
{
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
}
procedure TForm1.Button1Click(Sender: TObject);
var
Done: Boolean;
filenamestring : String;
begin
  OpenPictureDialog1.DefaultExt := GraphicExtension(TIcon);
  filenamestring := GraphicFileMask(TIcon);
  OpenPictureDialog1.FileName := filenamestring;
  OpenPictureDialog1.Filter := GraphicFilter(TIcon);
  OpenPictureDialog1.Options := [ ofFileMustExist, ofHideReadOnly, ofNoChangeDir ];
  Done := False;
  while not Done do
  begin
  if OpenPictureDialog1.Execute then
    begin
    if not (ofExtensionDifferent in OpenPictureDialog1.Options) then
      begin
      Application.Icon.LoadFromFile(OpenPictureDialog1.FileName);
      Done := True;
      end
    else
//      OpenPictureDialog1.Options := OpenPictureDialog1.Options - ofExtensionDifferent;
    end
  else { User cancelled }
    Done := True;
  end;
end;
```

8.3.20 Graphics.GraphicFilter Function

Returns a file filter compatible with the Filter property of an Open or Save dialog.

Pascal

```
function GraphicFilter(GraphicClass: TGraphicClass): string;
```

C++

```
UnicodeString GraphicFilter(TGraphicClass GraphicClass);
```

File

Graphics

Description

Call GraphicFilter to obtain a value for the Filter property of an Open, Open Picture, Save Picture or Save dialog box. The GraphicClass parameter can specify one of these values: TBitmap (see page 2628), TGraphic (see page 2748), TIcon (see page 2768), TMetafile (see page 2780), or a user-defined descendant of TGraphic (see page 2748).

These are the strings that are returned for each built-in graphics class when the AllFilter parameter is true. (When AllFilter is false, the section labelled "All" is omitted):

Graphic class	Filter string returned
TBitmap (see page 2628)	Bitmaps (*.bmp;*.png;*.xpm)|*.bmp;*.png;*.xpm
TIcon (see page 2768)	Icons (*.ico)|*.ico
TGraphic (see page 2748)	All (*.bmp;*.png;*.xpm*.ico)|*.bmp;*.png;*.xpm*.ico|Bitmaps (*.bmp;*.png;*.xpm)|*.bmp;*.png;*.xpm|Icons (*.ico)|*.ico
TBitmap (see page 2628)	Bitmaps (*.bmp)|*.bmp
TIcon (see page 2768)	Icons (*.ico)|*.ico
TMetafile (see page 2780)	All (*.emf;*.wmf)|*.emf;*.wmf|Enhanced Metafiles (*.emf)|*.emf|Metafiles(*.wmf)|*.wmf
TGraphic (see page 2748)	All (*.bmp;*.ico;*.emf;*.wmf)|*.bmp;*.ico;*.emf; *.wmf|Bitmaps (*.bmp)|*.bmp|Icons (*.ico)|*.ico|Enhanced Metafiles (*.emf)|*.emf|Metafiles(*.wmf)|*.wmf

Graphic class	Filter string returned
TBitmap (see page 2628)	Bitmaps (*.bmp)|*.bmp
TIcon (see page 2768)	Icons (*.ico)|*.ico
TMetafile (see page 2780)	All (*.emf;*.wmf)|*.emf;*.wmf|Enhanced Metafiles (*.emf)|*.emf|Metafiles(*.wmf)|*.wmf
TGraphic (see page 2748)	All (*.bmp;*.ico;*.emf;*.wmf)|*.bmp;*.ico;*.emf; *.wmf|Bitmaps (*.bmp)|*.bmp|Icons (*.ico)|*.ico|Enhanced Metafiles (*.emf)|*.emf|Metafiles(*.wmf)|*.wmf

C++ Examples:

```
/*
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
*/
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString NewFileName, OldFileName;
  SavePictureDialog1->DefaultExt = GraphicExtension(__classid(Graphics::TBitmap));
  SavePictureDialog1->Filter = GraphicFilter(__classid(Graphics::TBitmap));
  OldFileName = "factory.bmp";
  if (SavePictureDialog1->Execute())
```

```
  {
    NewFileName = SavePictureDialog1->FileName;
    std::auto_ptr<TFileStream> OldFile(new TFileStream(OldFileName, (fmOpenRead |
fmShareDenyWrite)));
    std::auto_ptr<TFileStream> NewFile(new TFileStream(NewFileName, (fmCreate |
fmShareDenyRead)));
    NewFile->CopyFrom(OldFile.get(), OldFile->Size);
  };
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Image1->Picture->LoadFromFile("../factory.bmp");
}
```

Delphi Examples:

```
{
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
}
procedure TForm1.Button1Click(Sender: TObject);
var NewFileName, OldFileName: string;
    NewFile, OldFile: TFileStream;
begin
  SavePictureDialog1.DefaultExt := GraphicExtension(TBitmap);
  SavePictureDialog1.Filter := GraphicFilter(TBitmap);
  OldFileName := 'factory.bmp';
  if SavePictureDialog1.Execute then
  begin
    NewFileName := SavePictureDialog1.FileName;
    OldFile := TFileStream.Create(
      OldFileName, fmOpenRead or fmShareDenyWrite);
    try
      NewFile := TFileStream.Create(
        NewFileName, fmCreate or fmShareDenyRead);
      try
        NewFile.CopyFrom(OldFile, OldFile.Size);
      finally
        FreeAndNil(NewFile);
      end;
    finally
      FreeAndNil(OldFile);
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Image1.Picture.LoadFromFile('factory.bmp');
end;
```

8.3.21 Graphics.IdentToCharset Function

Translates the name of a character set constant to the corresponding character set.

Pascal

```
function IdentToCharset(const Ident: string; var Charset: Longint): Boolean;
```

C++

```
Boolean IdentToCharset(const UnicodeString Ident, Longint Charset);
```

File

Graphics

Description

Call IdentToCharset to reverse the translation performed by CharsetToIdent (see page 2837). This method is useful for converting the strings generated by GetCharsetValues (see page 2844) into useable character sets. IdentToCharset returns true if the Ident parameter is successfully converted into a character set that is returned by the Charset parameter. IdentToCharset returns false if the Ident parameter is not the name of one of the TFontCharset (see page 2881) constants.

See Also

TFont (see page 2730)

GetCharsetValues (see page 2844)

CharSetToIdent

TFontCharset (see page 2881)

8.3.22 Graphics.IdentToColor Function

Translates the name of a color constant to the corresponding TColor (see page 2878) value.

Pascal

```
function IdentToColor(const Ident: string; var Color: Longint): Boolean;
```

C++

```
Boolean IdentToColor(const UnicodeString Ident, Longint Color);
```

File

Graphics

Description

Call IdentToColor to reverse the translation performed by ColorToIdent (see page 2838). This method is useful for converting the strings generated by GetColorValues (see page 2848) into useable TColor (see page 2878) values. IdentToColor returns true if the Ident parameter is successfully converted into a color that is returned by the Color parameter. IdentToColor returns false if the Ident parameter is not the name of one of the TColor (see page 2878) constants.

Note: If the string identifier for a color may represent either a hex value or a color constant, use the StringToColor (see page 2858) function instead.

See Also

TColor (see page 2878)

GetColorValues (see page 2848)

ColorToIdent (see page 2838)

StringToColor (see page 2858)

8.3.23 Graphics.PaletteChanged Function

Pascal

```
procedure PaletteChanged;
```

C++

```
PaletteChanged();
```

File

Graphics

Description

This is function Graphics.PaletteChanged.

8.3.24 Graphics.StringToColor Function

Translates a string representation of a color to the corresponding TColor (see page 2878) value.

Pascal

```
function StringToColor(const S: string): TColor;
```

C++

```
TColor StringToColor(const UnicodeString S);
```

File

Graphics

Description

Call StringToColor to reverse the translation performed by ColorToString (see page 2840). This method is useful for converting the strings entered by the user into useable TColor (see page 2878) values.

The S parameter can be either the name of a built-in color constant, such as "clBtnFace (see page 2900)" (Windows) or "clBtnText (see page 2901)" (cross-platform), or the string representation of a valid TColor (see page 2878) value such as "$02FF8800" (Delphi) or "0x02FF8800" (C++). StringToColor returns the TColor (see page 2878) value that corresponds to the S parameter.

Note: If the string identifier can only be the name of a color constant, use IdentToColor (see page 2857) instead.

See Also

ColorToString (see page 2840)

IdentToColor (see page 2857)

8.3.25 Graphics.TransparentStretchBlt Function

Pascal

```
function TransparentStretchBlt(DstDC: HDC; DstX: Integer; DstY: Integer; DstW: Integer; DstH:
Integer; SrcDC: HDC; SrcX: Integer; SrcY: Integer; SrcW: Integer; SrcH: Integer; MaskDC: HDC;
MaskX: Integer; MaskY: Integer): Boolean;
```

C++

```
Boolean TransparentStretchBlt(HDC DstDC, int DstX, int DstY, int DstW, int DstH, HDC SrcDC,
int SrcX, int SrcY, int SrcW, int SrcH, HDC MaskDC, int MaskX, int MaskY);
```

File

Graphics

Description

This is function Graphics.TransparentStretchBlt.

8.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAlphaFormat (see page 2860)	This is record Graphics.TAlphaFormat.
	TBitmapHandleType (see page 2861)	TBitmapHandleType indicates the format used to store the in-memory image of a bitmap.
	TBrushStyle (see page 2862)	TBrushStyle specifies the pattern on a brush.
	TCanvasOrientation (see page 2863)	TCanvasOrientation specifies the pixel coordinate system that a canvas uses.
	TCanvasStates (see page 2863)	This is record Graphics.TCanvasStates.
	TFillMode (see page 2864)	This is record Graphics.TFillMode.
	TFillStyle (see page 2864)	TFillStyle indicates the type of color change defines the boundary of a possibly non-rectangular region n a canvas.
	TFontPitch (see page 2866)	TFontPitch indicates whether the characters in a font have the same width.
	TFontStyle (see page 2866)	TFontStyle and TFontStyles (see page 2883) specify style characteristics of a font.
	TPenMode (see page 2868)	TPenMode indicates how the color of a pen interacts with the color of a canvas.
	TPenStyle (see page 2870)	TPenStyle indicates the type of line a pen draws.
	TPixelFormat (see page 2871)	TPixelFormat specifies the format of a bitmap.
	TProgressStage (see page 2872)	TProgressStage indicates the stage of a lengthy operation.
	TTextFormats (see page 2873)	This is record Graphics.TTextFormats.
	TTransparentMode (see page 2874)	TTransparentMode indicates how the transparent color of a bitmap is determined.

Records

	Name	Description
	TBrushData (see page 2861)	This is record Graphics.TBrushData.
	TCursorOrIcon (see page 2864)	This is record Graphics.TCursorOrIcon.
	TFontData (see page 2865)	This is record Graphics.TFontData.
	TIconRec (see page 2867)	This is record Graphics.TIconRec.
	TPenData (see page 2868)	This is record Graphics.TPenData.
	TResData (see page 2872)	This is record Graphics.TResData.
	TResource (see page 2873)	This is record Graphics.TResource.

8.4.1 Graphics.TAlphaFormat Enumeration

Pascal

```
TAlphaFormat = (
  afIgnored,
  afDefined,
  afPremultiplied
);
```

C++

```
enum TAlphaFormat {
  afIgnored,
  afDefined,
  afPremultiplied
};
```

File

Graphics

Description

This is record Graphics.TAlphaFormat.

8.4.2 Graphics.TBitmapHandleType Enumeration

TBitmapHandleType indicates the format used to store the in-memory image of a bitmap.

Pascal

```
TBitmapHandleType = (
  bmDIB,
  bmDDB
);
```

C++

```
enum TBitmapHandleType {
  bmDIB,
  bmDDB
};
```

File

Graphics

Description

TBitmapHandleType can be any of the following values:

Value	Description
bmDIB	device-independent bitmap (DIB)
bmDDB	device-dependent bitmap (DDB)

8.4.3 Graphics.TBrushData Record

Pascal

```
TBrushData = record
  Handle: HBrush;
  Color: TColor;
  Bitmap: TBitmap;
  Style: TBrushStyle;
  OwnsBitmap: Boolean;
end;
```

C++

```
struct TBrushData {
  HBrush Handle;
  TColor Color;
  TBitmap Bitmap;
  TBrushStyle Style;
  Boolean OwnsBitmap;
```

```
};
```

File

Graphics

Description

This is record Graphics.TBrushData.

8.4.4 Graphics.TBrushStyle Enumeration

TBrushStyle specifies the pattern on a brush.

Pascal

```
TBrushStyle = (
  bsSolid,
  bsClear,
  bsHorizontal,
  bsVertical,
  bsFDiagonal,
  bsBDiagonal,
  bsCross,
  bsDiagCross
);
```

C++

```
enum TBrushStyle {
  bsSolid,
  bsClear,
  bsHorizontal,
  bsVertical,
  bsFDiagonal,
  bsBDiagonal,
  bsCross,
  bsDiagCross
};
```

File

Graphics

Description

The possible values of TBrushStyle are

ValuePatternValuePattern

Value	Pattern
bsSolid	bsCross
bsClear	bsDiagCross
bsBDiagonal	bsHorizontal
bsFDiagonal	bsVertical

See Also

TBrush (see page 2664)

8.4.5 Graphics.TCanvasOrientation Enumeration

TCanvasOrientation specifies the pixel coordinate system that a canvas uses.

Pascal

```
TCanvasOrientation = (
  coLeftToRight,
  coRightToLeft
);
```

C++

```
enum TCanvasOrientation {
  coLeftToRight,
  coRightToLeft
};
```

File

Graphics

Description

TCanvasOrientation determines where the (0,0) point falls on a canvas, and whether pixel coordinates are interpreted in a right-to-left or left-to-right manner.

The following table describes the possible values:

Value	Meaning
coLeftToRight	The origin (0,0) appears in the top-left corner. Pixel coordinates get larger as you move left or down.
coRightToLeft	The origin (0,0) appears in the top-right corner. Pixel coordinates get larger as you move right or down.

8.4.6 Graphics.TCanvasStates Enumeration

Pascal

```
TCanvasStates = (
  csHandleValid,
  csFontValid,
  csPenValid,
  csBrushValid
);
```

C++

```
enum TCanvasStates {
  csHandleValid,
  csFontValid,
  csPenValid,
  csBrushValid
};
```

File

Graphics

Description

This is record Graphics.TCanvasStates.

8.4.7 Graphics.TCursorOrIcon Record

Pascal

```
TCursorOrIcon = packed record
  Reserved: Word;
  wType: Word;
  Count: Word;
end;
```

C++

```
struct TCursorOrIcon {
  Word Reserved;
  Word wType;
  Word Count;
};
```

File

Graphics

Description

This is record Graphics.TCursorOrIcon.

8.4.8 Graphics.TFillMode Enumeration

Pascal

```
TFillMode = (
  fmAlternate,
  fmWinding
);
```

C++

```
enum TFillMode {
  fmAlternate,
  fmWinding
};
```

File

Graphics

Description

This is record Graphics.TFillMode.

8.4.9 Graphics.TFillStyle Enumeration

TFillStyle indicates the type of color change defines the boundary of a possibly non-rectangular region n a canvas.

Pascal

```
TFillStyle = (
  fsSurface,
  fsBorder
);
```

C++

```
enum TFillStyle {
  fsSurface,
  fsBorder
};
```

File

Graphics

Description

TFillStyle values determine what type of color changes define the boundaries of a (possibly) non-rectangular region of a canvas, as indicated in the following table.

Value	Meaning
fsSurface	The region is defined as all area that has a specified color. When another color is encountered, it is taken as the boundary of the region.
fsBorder	The region is defined as all area that does not have a specified color. When the specified color is encountered, it is taken as the boundary of the region.

8.4.10 Graphics.TFontData Record

Pascal

```
TFontData = record
  Handle: HFont;
  Height: Integer;
  Orientation: Integer;
  Pitch: TFontPitch;
  Style: TFontStylesBase;
  Charset: TFontCharset;
  Name: TFontDataName;
end;
```

C++

```
struct TFontData {
  HFont Handle;
  int Height;
  int Orientation;
  TFontPitch Pitch;
  TFontStylesBase Style;
  TFontCharset Charset;
  TFontDataName Name;
};
```

File

Graphics

Description

This is record Graphics.TFontData.

8.4.11 Graphics.TFontPitch Enumeration

TFontPitch indicates whether the characters in a font have the same width.

Pascal

```
TFontPitch = (
  fpDefault,
  fpVariable,
  fpFixed
);
```

C++

```
enum TFontPitch {
  fpDefault,
  fpVariable,
  fpFixed
};
```

File

Graphics

Description

The following table lists the possible values of the TFontPitch type:

Value	Meaning
fpDefault	The font pitch is set to the default value, which depends on the font specified in the font object's Name property.
fpFixed	The font pitch is set to fixed. All characters in the font have the same width.
fpVariable	The font pitch is set to variable. The characters in the font have different widths.

8.4.12 Graphics.TFontStyle Enumeration

TFontStyle and TFontStyles (see page 2883) specify style characteristics of a font.

Pascal

```
TFontStyle = (
  fsBold,
  fsItalic,
  fsUnderline,
  fsStrikeOut
);
```

C++

```
enum TFontStyle {
  fsBold,
  fsItalic,
  fsUnderline,
  fsStrikeOut
};
```

File

Graphics

Description

TFontStyles (see page 2883) is a set of TFontStyle values. The following table lists the possible values of the TFontStyle type:

Value	Meaning
fsBold	The font is boldfaced.
fsItalic	The font is italicized.
fsUnderline	The font is underlined.
fsStrikeOut	The font is displayed with a horizontal line through it.

Delphi Examples:

```
{
This example demonstrates how to set and clear font styles.
This example requires a button and a label that has text
with some styles set.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   Label1.Font.Style := [fsBold, fsUnderline];
end;
{
This code demonstrates how to clear any Styles that were
previously set.
}
procedure TForm1.Button2Click(Sender: TObject);
begin
   Label1.Font.Style := [];
end;
```

8.4.13 Graphics.TIconRec Record

Pascal

```
TIconRec = packed record
  Width: Byte;
  Height: Byte;
  Colors: Word;
  Reserved1: Word;
  Reserved2: Word;
  DIBSize: Longint;
  DIBOffset: Longint;
end;
```

C++

```
struct TIconRec {
  Byte Width;
  Byte Height;
  Word Colors;
  Word Reserved1;
  Word Reserved2;
  Longint DIBSize;
  Longint DIBOffset;
};
```

File

Graphics

Description

This is record Graphics.TIconRec.

8.4.14 Graphics.TPenData Record

Pascal

```
TPenData = record
  Handle: HPen;
  Color: TColor;
  Width: Integer;
  Style: TPenStyle;
end;
```

C++

```
struct TPenData {
  HPen Handle;
  TColor Color;
  int Width;
  TPenStyle Style;
};
```

File

Graphics

Description

This is record Graphics.TPenData.

8.4.15 Graphics.TPenMode Enumeration

TPenMode indicates how the color of a pen interacts with the color of a canvas.

Pascal

```
TPenMode = (
  pmBlack,
  pmWhite,
  pmNop,
  pmNot,
  pmCopy,
  pmNotCopy,
  pmMergePenNot,
  pmMaskPenNot,
  pmMergeNotPen,
  pmMaskNotPen,
  pmMerge,
  pmNotMerge,
  pmMask,
  pmNotMask,
  pmXor,
  pmNotXor
);
```

C++

```
enum TPenMode {
  pmBlack,
  pmWhite,
  pmNop,
  pmNot,
  pmCopy,
  pmNotCopy,
  pmMergePenNot,
  pmMaskPenNot,
  pmMergeNotPen,
  pmMaskNotPen,
  pmMerge,
  pmNotMerge,
  pmMask,
  pmNotMask,
  pmXor,
  pmNotXor
};
```

File

Graphics

Description

TPenMode indicates how a pen color interacts with the color of the canvas it is writing on. The following table lists the possible values:

Mode	Pixel color
pmBlack	Always black
pmWhite	Always white
pmNop	Unchanged
pmNot	Inverse of canvas background color
pmCopy	Pen color specified in Color property
pmNotCopy	Inverse of pen color
pmMergePenNot	Combination of pen color and inverse of canvas background
pmMaskPenNot	Combination of colors common to both pen and inverse of canvas background.
pmMergeNotPen	Combination of canvas background color and inverse of pen color
pmMaskNotPen	Combination of colors common to both canvas background and inverse of pen
pmMerge	Combination of pen color and canvas background color
pmNotMerge	Inverse of pmMerge: combination of pen color and canvas background color
pmMask	Combination of colors common to both pen and canvas background
pmNotMask	Inverse of pmMask: combination of colors common to both pen and canvas background
pmXor	Combination of colors in either pen or canvas background, but not both
pmNotXor	Inverse of pmXor: combination of colors in either pen or canvas background, but not both

8.4.16 Graphics.TPenStyle Enumeration

TPenStyle indicates the type of line a pen draws.

Pascal

```
TPenStyle = (
  psSolid,
  psDash,
  psDot,
  psDashDot,
  psDashDotDot,
  psClear,
  psInsideFrame,
  psUserStyle,
  psAlternate
);
```

C++

```
enum TPenStyle {
  psSolid,
  psDash,
  psDot,
  psDashDot,
  psDashDotDot,
  psClear,
  psInsideFrame,
  psUserStyle,
  psAlternate
};
```

File

Graphics

Description

TPenStyle can have one of the following values:

Value	Meaning
psSolid	A solid line.
psDash	A line made up of a series of dashes.
psDot	A line made up of a series of dots.
psDashDot	A line made up of alternating dashes and dots.
psDashDotDot	A line made up of a series of dash-dot-dot combinations.
psClear	No line is drawn (used to omit the line around shapes that draw an outline using the current pen).
psInsideFrame	A solid line, but one that may use a dithered color if Width is greater than 1.
psAlternate	The pen sets every other pixel. (This style is applicable only for cosmetic pens.) This style is only valid for pens created with the `ExtCreatePen` API function. (See MS Windows SDK docs.) This applies to both VCL and VCL.NET.
psUserStyle	The pen uses a styling array supplied by the user. Thus style is only valid for pens created with the `ExtCreatePen` API function. (See MS Windows SDK docs.) This applies to both VCL and VCL.NET.

8.4.17 Graphics.TPixelFormat Enumeration

TPixelFormat specifies the format of a bitmap.

Pascal

```
TPixelFormat = (
  pfDevice,
  pf1bit,
  pf4bit,
  pf8bit,
  pf15bit,
  pf16bit,
  pf24bit,
  pf32bit,
  pfCustom
);
```

C++

```
enum TPixelFormat {
  pfDevice,
  pf1bit,
  pf4bit,
  pf8bit,
  pf15bit,
  pf16bit,
  pf24bit,
  pf32bit,
  pfCustom
};
```

File

Graphics

Description

TPixelFormat can have one of the following values:

Value	Meaning
pfDevice	The bitmap is stored as a device-dependent bitmap.
pf1bit	The bitmap is a device-independent bitmap with one bit per pixel (black and white palette)
pf4bit	The bitmap is a device-independent bitmap that uses a 16-color palette.
pf8bit	The bitmap is a device-independent bitmap that uses a 256color palette.
pf15bit	The bitmap is a device-independent true-color bitmap that uses 15 bits per pixel (RGB compression).
pf16bit	The bitmap is a device-independent true-color bitmap that uses 16 bits per pixel (bitfield compression).
pf24bit	The bitmap is a device-independent true-color bitmap that uses 24 bits per pixel.
pf32bit	The bitmap is a device-independent true-color bitmap that uses 32 bits per pixel (RGB compression).
pfCustom	The bitmap uses some other format. TBitmap (see page 2628) does not support pfCustom.

8.4.18 Graphics.TProgressStage Enumeration

TProgressStage indicates the stage of a lengthy operation.

Pascal

```
TProgressStage = (
  psStarting,
  psRunning,
  psEnding
);
```

C++

```
enum TProgressStage {
  psStarting,
  psRunning,
  psEnding
};
```

File

Graphics

Description

The following table lists the possible values:

Value	Meaning
psStarting	The operation is about to begin.
psRunning	The operation is underway and has not yet completed.
psEnding	The operation has just completed.

8.4.19 Graphics.TResData Record

Pascal

```
TResData = record
  Handle: THandle;
end;
```

C++

```
struct TResData {
  THandle Handle;
};
```

File

Graphics

Description

This is record Graphics.TResData.

8.4.20 Graphics.TResource Record

Pascal

```
TResource = record
  Next: PResource;
  RefCount: Integer;
  Handle: THandle;
  HashCode: Word;
  case Integer of
    0: (Data: TResData;);
    1: (Font: TFontData;);
    2: (Pen: TPenData;);
    3: (Brush: TBrushData;);
end;
```

C++

```
struct TResource {
  PResource Next;
  int RefCount;
  THandle Handle;
  Word HashCode;
  TResData Data;
  TFontData Font;
  TPenData Pen;
  TBrushData Brush;
};
```

File

Graphics

Description

This is record Graphics.TResource.

8.4.21 Graphics.TTextFormats Enumeration

Pascal

```
TTextFormats = (
  tfBottom,
  tfCalcRect,
  tfCenter,
  tfEditControl,
  tfEndEllipsis,
  tfPathEllipsis,
  tfExpandTabs,
  tfExternalLeading,
  tfLeft,
  tfModifyString,
  tfNoClip,
  tfNoPrefix,
  tfRight,
  tfRtlReading,
  tfSingleLine,
  tfTop,
  tfVerticalCenter,
  tfWordBreak
```

```
);
```

C++

```
enum TTextFormats {
  tfBottom,
  tfCalcRect,
  tfCenter,
  tfEditControl,
  tfEndEllipsis,
  tfPathEllipsis,
  tfExpandTabs,
  tfExternalLeading,
  tfLeft,
  tfModifyString,
  tfNoClip,
  tfNoPrefix,
  tfRight,
  tfRtlReading,
  tfSingleLine,
  tfTop,
  tfVerticalCenter,
  tfWordBreak
};
```

File

Graphics

Description

This is record Graphics.TTextFormats.

8.4.22 Graphics.TTransparentMode Enumeration

TTransparentMode indicates how the transparent color of a bitmap is determined.

Pascal

```
TTransparentMode = (
  tmAuto,
  tmFixed
);
```

C++

```
enum TTransparentMode {
  tmAuto,
  tmFixed
};
```

File

Graphics

Description

The following table lists the possible values:

Value	Meaning
tmAuto	The transparent color is determined by the bottom-leftmost pixel of the bitmap image.
tmFixed	The transparent color is explicitly assigned and stored in the bitmap object.

8.5 Types

The following table lists types in this documentation.

Types

Name	Description
HENHMETAFILE (see page 2875)	Meta file handle type.
HMETAFILE (see page 2876)	This is type Graphics.HMETAFILE.
PColor (see page 2876)	PColor is a pointer to a TColor (see page 2878) type.
PCursorOrIcon (see page 2876)	This is type Graphics.PCursorOrIcon.
PIconRec (see page 2877)	This is type Graphics.PIconRec.
PResource (see page 2877)	This is type Graphics.PResource.
TCanvasState (see page 2877)	This is type Graphics.TCanvasState.
TColor (see page 2878)	TColor is used to specify the color of a Windows-only control.
TCopyMode (see page 2880)	TCopyMode specifies how a graphical image is copied onto a canvas.
TFontCharset (see page 2881)	TFontCharset represents the character set of a font.
TFontDataName (see page 2882)	This is type Graphics.TFontDataName.
TFontName (see page 2882)	TFontName is a string that holds the typeface name of a font.
TFontStyles (see page 2883)	TFontStyle (see page 2866) and TFontStyles specify style characteristics of a font.
TFontStylesBase (see page 2887)	This is type Graphics.TFontStylesBase.
TGraphicClass (see page 2887)	TGraphicClass defines the metaclass for TGraphic (see page 2748).
TProgressEvent (see page 2888)	TProgressEvent is the type of event handlers that provide feedback during lengthy operations.
TTextFormat (see page 2889)	TTextFormat indicates how a text viewer control displays its contents.

8.5.1 Graphics.HENHMETAFILE Type

Meta file handle type.

Pascal

```
HENHMETAFILE = THandle;
```

C++

```
THandle HENHMETAFILE;
```

File

Graphics

Description

ReleaseHandle is called to release the resources used to represent the metafile. HENHMETAFILE is the data type passed to that method.

See Also

ReleaseHandle

8.5.2 Graphics.HMETAFILE Type

Pascal

```
HMETAFILE = THandle;
```

C++

```
THandle HMETAFILE;
```

File

Graphics

Description

This is type Graphics.HMETAFILE.

8.5.3 Graphics.PColor Type

PColor is a pointer to a TColor (see page 2878) type.

Pascal

```
PColor = ^TColor;
```

C++

```
^TColor PColor;
```

File

Graphics

Description

The TColor (see page 2878) type represents a color as an integer.

Note: Static arrays are declared with an immutable size.

See Also

TColor (see page 2878)

8.5.4 Graphics.PCursorOrIcon Type

Pascal

```
PCursorOrIcon = ^TCursorOrIcon;
```

C++

```
^TCursorOrIcon PCursorOrIcon;
```

File

Graphics

Description

This is type Graphics.PCursorOrIcon.

8.5.5 Graphics.PIconRec Type

Pascal

```
PIconRec = ^TIconRec;
```

C++

```
^TIconRec PIconRec;
```

File

Graphics

Description

This is type Graphics.PIconRec.

8.5.6 Graphics.PResource Type

Pascal

```
PResource = ^TResource;
```

C++

```
^TResource PResource;
```

File

Graphics

Description

This is type Graphics.PResource.

8.5.7 Graphics.TCanvasState Type

Pascal

```
TCanvasState = set of TCanvasStates;
```

C++

```
TCanvasStates TCanvasState;
```

File

Graphics

Description

This is type Graphics.TCanvasState.

8.5.8 Graphics.TColor Type

TColor is used to specify the color of a Windows-only control.

Pascal

```
TColor = -$7FFFFFFF-1..$7FFFFFFF;
```

C++

```
-$7FFFFFFF-1..$7FFFFFFF TColor;
```

File

Graphics

Description

TColor is used to specify the color of a Windows-only control. It is used by the Color property of many components and by a number of other properties that specify color values.

The Graphics (see page 2619) unit contains definitions of useful constants for TColor. These constants map either directly to the closest matching color in the system palette (for example, clBlue (see page 2899) maps to blue) or to the corresponding system screen element color defined in the Color section of the Windows Control panel (for example, clBtnFace (see page 2900) maps to the system color for button faces).

If you specify TColor as a specific 4-byte hexadecimal number instead of using the constants defined in the Graphics (see page 2619) unit, the low three bytes represent RGB color intensities for blue, green, and red, respectively. The value $00FF0000 (Delphi) or 0x00FF0000 (C++) represents full-intensity, pure blue, $0000FF00 (Delphi) or 0x0000FF00 (C++) is pure green, and $000000FF (Delphi) or 0x000000FF (C++) is pure red. $00000000 (Delphi) or 0x00000000 (C++) is black and $00FFFFFF (Delphi) or 0x00FFFFFF (C++) is white.

If the highest-order byte is zero, the color obtained is the closest matching color in the system palette. If the highest-order byte is one ($01 or 0x01), the color obtained is the closest matching color in the currently realized palette. If the highest-order byte is two ($02 or 0x02), the value is matched with the nearest color in the logical palette of the current device context.

The following tables lists the color constants from the Graphics (see page 2619) unit. The first two columns list the colors that map to the closest matching color in the system palette, while the last two columns list the colors that are defined in the Windows Control panel.

Value	Meaning	Value	Meaning
clNone (see page 2914)	White on Windows 9x, Black on NT.	clScrollBar (see page 2916)	Current color for the of scroll bar track.
clAqua (see page 2898)	Aqua	clBackground (see page 2899)	Current background color of the Windows desktop
clBlack (see page 2899)	Black	clActiveCaption (see page 2897)	Current color of the title bar of the active window
clBlue (see page 2899)	Blue	clInactiveCaption (see page 2908)	Current color of the title bar of inactive windows

clCream (see page 2902)	Cream	clMenu (see page 2912)	Current background color of menus
clDkGray (see page 2903)	Dark Gray	clWindow (see page 2965)	Current background color of windows
clFuchsia (see page 2903)	Fuchsia	clWindowFrame (see page 2966)	Current color of window frames
clGray (see page 2905)	Gray	clMenuText (see page 2913)	Current color of text on menus
clGreen (see page 2906)	Green	clWindowText (see page 2966)	Current color of text in windows
clLime (see page 2910)	Lime green	clCaptionText (see page 2902)	Current color of the text on the title bar of the active window
clLtGray (see page 2910)	Light Gray	clActiveBorder (see page 2897)	Current border color of the active window
clMaroon (see page 2911)	Maroon	clInactiveBorder (see page 2908)	Current border color of inactive windows
clMedGray (see page 2911)	Medium Gray	clAppWorkSpace (see page 2898)	Current color of the application workspace
clMoneyGreen (see page 2913)	Mint green	clHighlight (see page 2906)	Current background color of selected text
clNavy (see page 2914)	Navy blue	clHightlightText	Current color of selected text
clOlive (see page 2915)	Olive green	clBtnFace (see page 2900)	Current color of a button face
clPurple (see page 2915)	Purple	clBtnShadow (see page 2901)	Current color of a shadow cast by a button
clRed (see page 2916)	Red	clGrayText (see page 2905)	Current color of text that is dimmed
clSilver (see page 2916)	Silver	clBtnText (see page 2901)	Current color of text on a button
clSkyBlue (see page 2917)	Sky blue	clInactiveCaptionText (see page 2908)	Current color of the text on the title bar of an inactive window
clTeal (see page 2918)	Teal	clBtnHighlight (see page 2900)	Current color of the highlighting on a button
clWhite (see page 2965)	White	cl3DDkShadow (see page 2896)	Windows 95 or NT 4.0 only: Dark shadow for three-dimensional display elements

clYellow (see page 2967)	Yellow	cl3DLight (see page 2896)	Windows 95 or NT 4.0 only: Light color for three-dimensional display elements (for edges facing the light source)
		clInfoText (see page 2909)	Windows 95 or NT 4.0 only: Text color for tool tip controls
		clInfoBk (see page 2909)	Windows 95 or NT 4.0 only: Background color for tool tip controls
		clGradientActiveCaption (see page 2904)	Windows 98 or Windows 2000: Right side color in the color gradient of an active window's title bar. clActiveCaption (see page 2897) specifies the left side color.
		clGradientInactiveCaption (see page 2904)	Windows 98 or Windows 2000: Right side color in the color gradient of an inactive window's title bar. clInactiveCaption (see page 2908) specifies the left side color.
		clDefault (see page 2903)	The default color for the control to which the color is assigned.

8.5.9 Graphics.TCopyMode Type

TCopyMode specifies how a graphical image is copied onto a canvas.

Pascal

```
TCopyMode = Longint;
```

C++

```
Longint TCopyMode;
```

File

Graphics

Description

TCopyMode values describe how to combine the colors of a source bitmap and a destination bitmap.

The Windows unit defines the following constants for TCopyMode values:

Value	Meaning
cmBlackness (see page 2967)	Fills the destination rectangle on the canvas with black.
cmDstInvert (see page 2968)	Inverts the image on the canvas and ignores the source.
cmMergeCopy (see page 2968)	Combines the image on the canvas and the source bitmap by using the Boolean AND operator.
cmMergePaint (see page 2969)	Combines the inverted source bitmap with the image on the canvas by using the Boolean OR operator.

cmNotSrcCopy (see page 2969)	Copies the inverted source bitmap to the canvas.
cmNotSrcErase (see page 2970)	Combines the image on the canvas and the source bitmap by using the Boolean OR operator, and inverts the result.
cmPatCopy (see page 2970)	Copies the source pattern to the canvas.
cmPatInvert (see page 2971)	Combines the source pattern with the image on the canvas using the Boolean XOR operator
cmPatPaint (see page 2971)	Combines the inverted source bitmap with the source pattern by using the Boolean OR operator. Combines the result of this operation with the image on the canvas by using the Boolean OR operator.
cmSrcAnd (see page 2972)	Combines the image on the canvas and source bitmap by using the Boolean AND operator.
cmSrcCopy (see page 2972)	Copies the source bitmap to the canvas.
cmSrcErase (see page 2973)	Inverts the image on the canvas and combines the result with the source bitmap by using the Boolean AND operator.
cmSrcInvert (see page 2973)	Combines the image on the canvas and the source bitmap by using the Boolean XOR operator.
cmSrcPaint (see page 2974)	Combines the image on the canvas and the source bitmap by using the Boolean OR operator.
cmWhiteness (see page 2974)	Fills the destination rectangle on the canvas with white.

8.5.10 Graphics.TFontCharset Type

TFontCharset represents the character set of a font.

Pascal

```
TFontCharset = 0..255;
```

C++

```
0..255 TFontCharset;
```

File

Graphics

Description

Each Windows typeface supports one or more character sets, which indicate what characters can be written using the font. For example, most fonts that can represent japanese characters use a particular multi-byte character set.

Each font supports its own, unique set of character sets. Check with the font vendor to determine which character sets are supported.

The following table lists the predefined constants provided for standard character sets:

Constant	Value	Description
ANSI_CHARSET	0	ANSI characters.
DEFAULT_CHARSET	1	Font is chosen based solely on Name and Size. If the described font is not available on the system, Windows will substitute another font.
SYMBOL_CHARSET	2	Standard symbol set.
MAC_CHARSET	77	Macintosh characters. Not available on NT 3.51.
SHIFTJIS_CHARSET	128	Japanese shift-JIS characters.
HANGEUL_CHARSET	129	Korean characters (Wansung).
JOHAB_CHARSET	130	Korean characters (Johab). Not available on NT 3.51
GB2312_CHARSET	134	Simplified Chinese characters (mainland china).
CHINESEBIG5_CHARSET	136	Traditional Chinese characters (Taiwanese).
GREEK_CHARSET	161	Greek characters. Not available on NT 3.51.
TURKISH_CHARSET	162	Turkish characters. Not available on NT 3.51
VIETNAMESE_CHARSET	163	Vietnamese characters. Not available on NT 3.51.
HEBREW_CHARSET	177	Hebrew characters. Not available on NT 3.51
ARABIC_CHARSET	178	Arabic characters. Not available on NT 3.51
BALTIC_CHARSET	186	Baltic characters. Not available on NT 3.51.
RUSSIAN_CHARSET	204	Cyrillic characters. Not available on NT 3.51.
THAI_CHARSET	222	Thai characters. Not available on NT 3.51
EASTEUROPE_CHARSET	238	Includes diacritical marks for eastern european countries. Not available on NT 3.51.
OEM_CHARSET	255	Depends on the codepage of the operating system.

8.5.11 Graphics.TFontDataName Type

Pascal

```
TFontDataName = string[(LF_FACESIZE - 1) * 4];
```

C++

```
string[(LF_FACESIZE - 1) * 4] TFontDataName;
```

File

Graphics

Description

This is type Graphics.TFontDataName.

8.5.12 Graphics.TFontName Type

TFontName is a string that holds the typeface name of a font.

Pascal

```
TFontName = type string;
```

C++

```
type string TFontName;
```

File

Graphics

Description

TFontName maps to a string. It is the type for representing the typeface name of a font.

8.5.13 Graphics.TFontStyles Type

TFontStyle (see page 2866) and TFontStyles specify style characteristics of a font.

Pascal

```
TFontStyles = set of TFontStyle;
```

C++

```
TFontStyle TFontStyles;
```

File

Graphics

Description

TFontStyles is a set of TFontStyle (see page 2866) values. The following table lists the possible values of the TFontStyle (see page 2866) type:

Value	Meaning
fsBold	The font is boldfaced.
fsItalic	The font is italicized.
fsUnderline	The font is underlined.
fsStrikeOut	The font is displayed with a horizontal line through it.

C++ Examples:

```
/*
The following code demonstrates background processing using
the OnIdle event, and using the HandleMessage method to
permit messages or background processing to get through.
Note: You must add MyIdleHandler to the Form1 methods.
*/
// global variables to show the order of events
int  XPos, YPos, Delta;

// This is a utility procedure to display messages
// add this at the beginning of the unit

void StatusMsg(TForm *Form, TCanvas *Canvas, char *Message, bool Bkg)
{
  if (!Bkg)
    Canvas->Font->Style = TFontStyles() << fsBold; // foreground messages are bold
  Canvas->TextOut(XPos, YPos, Message);
```

```
    if (!Bkg)
      Canvas->Font->Style = TFontStyles();
    // change Xpos and YPos to prepare for the next message
    YPos += Delta;
    if (YPos >= Form->ClientHeight - 10)
    {
      YPos = 10;
      XPos += 180;
    }
    if (XPos >= Form->ClientWidth - 100)
    {
      if (Canvas->Font->Color == clRed)
        Canvas->Font->Color = clBlack;
      else
        Canvas->Font->Color = clRed;
      XPos = 10;
    }
  }

  /*
  This is the OnCreate event handler for Form1.  It
  initializes global values and sets the application's OnIdle
  event handler
  */
  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    Button1->Caption = "Do not yield";
    Button2->Caption  = "Handle Message";
    Application->OnIdle = MyIdleHandler;
    XPos = 10;
    YPos = 10;
    if (Canvas->Font->Height > 0)
      Delta = Canvas->Font->Height + 1;
    else
      Delta = 1 - Canvas->Font->Height;
  }

  /*
  This is the OnIdle event handler. It is set in the Form's
  OnCreate event handler, so you need only add it as a private
  method of the form.  Usually it would perform some background
  processing for the application.  This one simply writes a
  message to let you know when it's there.
  */
  void __fastcall TForm1::MyIdleHandler(TObject *Sender, bool &Done)
  {
    StatusMsg(Form1, Canvas, "This represents a background process.", true);
  }

  /*
  This is the OnClick event handler for Button1.  It
  simulates a lengthy process
  */
  void __fastcall TForm1::Button1Click(TObject *Sender)
  {
    int X, Y;
    StatusMsg(Form1, Canvas, "The Button1Click handler is starting", false);
    for (int I = 0; I < 100; I++)
    {
      randomize();
      for (int J = 0; J < 100; J++)
        Y = random(J);
      X = random(I);
    }
    StatusMsg(Form1, Canvas, "The Button1Click handler is done", false);
  }
```

```
/*
This is the OnClick event handler for button2.  It
simulates a lengthy process that allows other messages to be
processed.
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  int X, Y;
  StatusMsg(Form1, Canvas, "The Button2Click handler is starting", false);
  for (int I = 0; I < 100; I++)
  {
    randomize();
    for (int J = 0; J < 100; J++)
    {
      Y = random(J);
    }
    // Yield to OnIdle or other messages
    Application->HandleMessage();
    X = random(I);
  }
  StatusMsg(Form1, Canvas, "The Button2Click handler is done", false);
}
```

Delphi Examples:

```
{
The following code demonstrates background processing using
the OnIdle event, and using the HandleMessage method to
permit messages or background processing to get through.
Note: You must add MyIdleHandler to the Form1 methods.
}
var
{ global variables to show the order of events. }
  XPos, YPos, Delta: integer;

{ This is a utility procedure to display messages }
{ add this at the beginning of the implementation section }
procedure StatusMsg(
  MyForm : TForm1; Canvas : TCanvas; Message : string; Bkg : Boolean);
begin
  if not bkg then
    Canvas.Font.Style := [fsBold]; {foreground messages are bold }
  Canvas.TextOut(XPos, YPos, Message);
  if not bkg then
    Canvas.Font.Style := [];
  { change Xpos and YPos to prepare for the next message }
  Ypos := Ypos + Delta;
  if YPos >= MyForm.ClientHeight - 10 then
  begin
    YPos := 10;
    Xpos := Xpos + 180;
  end;
  if (Xpos >= MyForm.ClientWidth - 100) then
  begin
    if (Canvas.Font.Color = clRed) then
      Canvas.Font.Color := clBlack
    else
      Canvas.Font.Color := clRed;
    Xpos := 10;
  end;
end;

{This is the Form's OnCreate event handler.  }
{ It initializes global variables and sets the  the OnIdle
event handler }
procedure TForm1.FormCreate(Sender: TObject);
```

```
begin
  Button1.Caption := 'Do not yield';
  Button2.Caption := 'Handle Message';
  Application.OnIdle:= MyIdleHandler;
  XPos := 10;
  YPos := 10;
  Delta := Abs(Canvas.Font.Height) + 1;
 end;

{
This is the OnIdle event handler. It is set in the Form's
OnCreate event handler, so you need only add it as a private
method of the form.  Usually it would perform some
background processing for the application.  This one simply
writes a message to let you know when it's there.
}
procedure TForm1.MyIdleHandler(Sender: TObject; var Done: Boolean);
begin
  StatusMsg(
    Form1, Canvas, 'This represents a background process.', True);
end;

{
Set this method as the OnClick event handler of Button1.  It
performs a calculation without yielding to other messages or
idle time.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, X, Y: Word;
begin
  StatusMsg(
    Form1, Canvas, 'The synchronous handler is starting', False);
  I := 0;
  J := 0;
  while I < 10 do
  begin
    Randomize;
    while J < 10 do
    begin
      Y := Random(J);
      Inc(J);
    end;
    X := Random(I);
    Inc(I);
  end;
  StatusMsg(
    Form1, Canvas, 'The synchronous handler is done', False);
end;

{
Set this method as the OnClick event handler of Button2.  It
performs a calculation but calls HandleMessage to allow idle
time or asynchronous message processing.
}
procedure TForm1.Button2Click(Sender: TObject);
var
  I, J, X, Y: Word;
begin
 StatusMsg(
    Form1, Canvas, 'The asynchronous handler is starting', False);
  I := 0;
  J := 0;
  while I < 10 do
  begin
    Randomize;
```

```
      while J < 10 do
      begin
        Y := Random(J);
        Inc(J);
      end;
      X := Random(I);
      Inc(I);
      { yield to OnIdle or other messages }
      Application.HandleMessage;
    end;
    StatusMsg(
      Form1, Canvas, 'The asynchronous handler is done', False);
  end;
```

8.5.14 Graphics.TFontStylesBase Type

Pascal

```
TFontStylesBase = set of TFontStyle;
```

C++

```
TFontStyle TFontStylesBase;
```

File

Graphics

Description

This is type Graphics.TFontStylesBase.

8.5.15 Graphics.TGraphicClass Type

TGraphicClass defines the metaclass for TGraphic (see page 2748).

Pascal

```
TGraphicClass = class of TGraphic;
```

C++

```
TGraphic TGraphicClass;
```

File

Graphics

Description

TGraphicClass is the metaclass for TGraphic (see page 2748). Its value is the class reference for TGraphic (see page 2748) or for one of its descendants.

C++ Examples:

```
/*
The following example allows users to type the name of a
graphics class into an edit control and when a button is
pressed, the name of the default extension for that class is
displayed in another edit control.  In the form's OnCreate
event handler (or a similar place) you must register the
graphics classes so that GetClass can find them.
```

```
*/
#include <memory>       //for STL auto_ptr class

TMetaClass *MetaClass;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<TClassFinder> myClassFinder(new TClassFinder(MetaClass, False));
  TGraphicClass mygraphclass = (TGraphicClass) (myClassFinder->GetClass(Edit2->Text));
//  TGraphicClass mygraphclass = (TGraphicClass) GetClass(Edit2->Text);
  Edit1->Text = GraphicExtension(mygraphclass);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  MetaClass = __classid(TIcon); // ico
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(Graphics::TBitmap); // bmp
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TMetafile); // emf
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TShape);  // nographic extension
  RegisterClasses(&MetaClass, 0);
  MetaClass = __classid(TImage); // nographic extension
  RegisterClasses(&MetaClass, 0);
}
```

Delphi Examples:

```
{
The following example allows users to type the name of a
graphics class into an edit control and when a button is
pressed, the name of the default extension for that class is
displayed in another edit control.  In the form's OnCreate
event handler (or a similar place) you must register the
graphics classes so that GetClass can find them.
}

uses ExtCtrls;

procedure TForm1.Button1Click(Sender: TObject);
var
  myClassFinder: TClassFinder;
  mygraphclass: TGraphicClass;
begin
  { make sure the classes are registered so that GetClass will work -- }
  { Usually, this goes in the initialization section where it is only executed once }
  RegisterClasses([TIcon, TBitmap, TButton, TShape, TImage, TMetafile]);
  try
    myClassFinder := TClassFinder.Create(TIcon, False);
    mygraphclass := TGraphicClass(myClassFinder.GetClass(Edit2.Text));
//    mygraphclass := TGraphicClass(GetClass(Edit2.Text));  // works as well
    Edit1.Text := GraphicExtension(mygraphclass);
  except
    on EAccessViolation do
      MessageDlg('Invalid class name.', mtError, [mbOK], 0)
  end;
end;
```

8.5.16 Graphics.TProgressEvent Type

TProgressEvent is the type of event handlers that provide feedback during lengthy operations.

Pascal

```
TProgressEvent = procedure (Sender: TObject; Stage: TProgressStage; PercentDone: Byte;
RedrawNow: Boolean; const R: TRect; const Msg: string) of object;
```

C++

```
(Sender: TObject; Stage: TProgressStage; PercentDone: Byte; RedrawNow: Boolean; const R:
TRect; const Msg: string) ( TProgressEvent)();
```

File

Graphics

Description

Sender is the object that receives the event notification. This is typically the component that initiated the lengthy operation.

Stage indicates whether the operation is beginning, continuing, or ending. If the event handler displays an indicator such as a progress bar, the indicator can be created when Stage is psStarting, updated while Stage is psRunning, and removed when Stage is psEnding.

PercentDone is an approximation of how much of the operation has completed. Use PercentDone to update the position of a progress bar or other indicator.

RedrawNow indicates whether the partial results of the operation can safely be drawn on screen at this point.

R gives the dimensions of the portion of the display that has changed and needs to be redrawn.

Msg contains one or two words that describe what operation is occurring. For example, the value of Msg could be a string such as Loading, Storing, or Reducing colors. The Msg string can also be empty.

8.5.17 Graphics.TTextFormat Type

TTextFormat indicates how a text viewer control displays its contents.

Pascal

```
TTextFormat = set of TTextFormats;
```

C++

```
TTextFormats TTextFormat;
```

File

Graphics

Description

TTextFormat has the following values:

Value	Meaning
tfAutoText	The control attempts to determine whether Text contains rich text. If a valid tag is seen on the first line, Text is assumed to be a rich text document. Otherwise, Text is displayed as plain text.
tfText	The control assumes that Text contains rich text, even if no tags are present. Note that in rich text, any sequence consisting entirely of spaces, tabs, and line breaks counts as a single space.
tfPlainText	The control assumes that Text contains plain text.

8.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DDBsOnly (see page 2890)	Determines whether bitmap handles are created as device-dependent bitmaps (DDB).
DefFontData (see page 2891)	This is variable Graphics.DefFontData.
SystemPalette16 (see page 2891)	Contains the 16 VGA system colors.

8.6.1 Graphics.DDBsOnly Variable

Determines whether bitmap handles are created as device-dependent bitmaps (DDB).

Pascal

```
DDBsOnly: Boolean = False;
```

C++

```
Boolean DDBsOnly = False;
```

File

Graphics

Description

Set DDBsOnly to force all bitmap handles to be created as device-dependent bitmaps (DDB). The default bitmap handle format is DIB (device-independent bitmap).

Setting DDBsOnly to true undercuts much of the graphics architecture; it should not be used unless it is absolutely required. Examples of when to set it to true are:

A graphics-intensive application does bitmap operations that Windows does not support with DIBs; you can either set each bitmap object to DDB before you access its handle property, or you can set this global variable to Truetrue.

An application uses hundreds of very small bitmaps. Each DIB consumes a separate 4k memory page. DIBs are less efficient for storing many small images than DDBs. Before resorting to changing the DDBsOnly flag to address this, however, consider switching your code to use image lists instead of individual tiny bitmaps. Image lists are more efficient than DIBs and DDBs for storing many same-size small images.

Note: Setting DDBsOnly to true introduces the issue of image alteration. When a BMP file or resource is loaded into a DDB, the color information in the original image is changed to fit the pixel format of the current video device and mode. If you read an image, touch its handle, and write it out, you will not get the same file you read in. DIBs solve this problem. Do not change DDBsOnly unless you have a specific need for device-dependent bitmaps and are willing to accept the image-altering DDB side effects.

TImageList

8.6.2 Graphics.DefFontData Variable

Pascal

```
DefFontData: TFontData = ( Handle: 0; Height: 0; Orientation: 0; Pitch: fpDefault; Style: [];
Charset : DEFAULT_CHARSET; Name: 'MS Sans Serif');
```

C++

```
TFontData DefFontData = ( Handle: 0; Height: 0; Orientation: 0; Pitch: fpDefault; Style: [];
Charset : DEFAULT_CHARSET; Name: 'MS Sans Serif');
```

File

Graphics

Description

This is variable Graphics.DefFontData.

8.6.3 Graphics.SystemPalette16 Variable

Contains the 16 VGA system colors.

Pascal

```
SystemPalette16: HPalette;
```

C++

```
HPalette SystemPalette16;
```

File

Graphics

Description

SystemPalette16 holds a palette handle that contains the 16 VGA system colors. This palette is built at runtime from the system colors defined by the current video card and driver. The actual color values of the stock VGA palette can vary from one video card vendor to the next. Therefore it is not safe to assume, for example, that clGray (see page 2905) will be RGB(128,128,128) on all systems.

This handle is available as a convenience. This is the palette that VCL forces on all 16 color bitmaps that are loaded from files or resources.

Note: Using custom 16-color palettes does not work on 16-color video systems. It is problematic on many 256 color drivers because the variation in colors interferes with transparency operations.

8.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cl3DDkShadow (see page 2896)	Represents the dark shadow of 3D components.
cl3DLight (see page 2896)	Represents the light part of 3D components.
clActiveBorder (see page 2897)	Represents the default border color of an active window.
clActiveCaption (see page 2897)	Represents the default color of the title bar of an active window.
clAppWorkSpace (see page 2898)	Represents the default Application WorkSpace color.
clAqua (see page 2898)	Represents the color Aqua.
clBackground (see page 2899)	Represents the default Windows background color.
clBlack (see page 2899)	Represents the color black.
clBlue (see page 2899)	Represents the color blue.
clBtnFace (see page 2900)	Represents the color of the face of a button.
clBtnHighlight (see page 2900)	Represents the color of the highlighting on a button.
clBtnShadow (see page 2901)	Represents the color of the shadow cast by of a button.
clBtnText (see page 2901)	Represents the default color of the text on a button.
clCaptionText (see page 2902)	Represents the default color of the text on the title bar of an active window.
clCream (see page 2902)	Represents the color cream.
clDefault (see page 2903)	Specifies the default color of a component.
clDkGray (see page 2903)	Represents the color dark gray.
clFuchsia (see page 2903)	Represents the color fuchsia.
clGradientActiveCaption (see page 2904)	Right side color in the color gradient of an active window's title bar.
clGradientInactiveCaption (see page 2904)	Right side color in the color gradient of an inactive window's title bar.
clGray (see page 2905)	Represents the color gray.
clGrayText (see page 2905)	Represents the color of text that is grayed out.
clGreen (see page 2906)	Represents the color green.
clHighlight (see page 2906)	Represents the color of the background of a block of selected text.
clHighlightText (see page 2907)	Represents the color of selected text.
clHotLight (see page 2907)	This is constant Graphics.clHotLight.
clInactiveBorder (see page 2908)	Represents the default border color of an inactive window.
clInactiveCaption (see page 2908)	Represents the default color of the title bar of an inactive window.
clInactiveCaptionText (see page 2908)	Represents the default color of the title text in an inactive window.
clInfoBk (see page 2909)	Represents the color of the background of a tool tip.
clInfoText (see page 2909)	Represents the color of tool tip text.
clLime (see page 2910)	Represents the color lime.
clLtGray (see page 2910)	Represents the color light gray.
clMaroon (see page 2911)	Represents the color maroon.
clMedGray (see page 2911)	Represents the color medium gray.
clMenu (see page 2912)	Represents the color of the background of an unselected menu sub item.
clMenuBar (see page 2912)	Represents the color of the background of an unselected main menu item.
clMenuHighlight (see page 2912)	Represents the color of the background of a selected menu item.
clMenuText (see page 2913)	Represents the default menu text color.
clMoneyGreen (see page 2913)	Represents the color money green.
clNavy (see page 2914)	Represents the color navy.
clNone (see page 2914)	Represents no selected color.
clOlive (see page 2915)	Represents the color olive.
clPurple (see page 2915)	Represents the color purple.

clRed (see page 2916)	Represents the color red.
clScrollBar (see page 2916)	This is constant Graphics.clScrollBar.
clSilver (see page 2916)	Represents the color silver.
clSkyBlue (see page 2917)	Represents the color sky blue.
clSystemColor (see page 2917)	Is a mask used to identify the set of system colors.
clTeal (see page 2918)	Represents the color teal.
clWebAliceBlue (see page 2918)	This is constant Graphics.clWebAliceBlue.
clWebAntiqueWhite (see page 2919)	This is constant Graphics.clWebAntiqueWhite.
clWebAqua (see page 2919)	This is constant Graphics.clWebAqua.
clWebAquamarine (see page 2919)	This is constant Graphics.clWebAquamarine.
clWebAzure (see page 2920)	This is constant Graphics.clWebAzure.
clWebBeige (see page 2920)	This is constant Graphics.clWebBeige.
clWebBisque (see page 2920)	This is constant Graphics.clWebBisque.
clWebBlack (see page 2921)	This is constant Graphics.clWebBlack.
clWebBlanchedAlmond (see page 2921)	This is constant Graphics.clWebBlanchedAlmond.
clWebBlue (see page 2921)	This is constant Graphics.clWebBlue.
clWebBlueViolet (see page 2922)	This is constant Graphics.clWebBlueViolet.
clWebBrown (see page 2922)	This is constant Graphics.clWebBrown.
clWebBurlywood (see page 2922)	This is constant Graphics.clWebBurlywood.
clWebCadetBlue (see page 2923)	This is constant Graphics.clWebCadetBlue.
clWebChartreuse (see page 2923)	This is constant Graphics.clWebChartreuse.
clWebChocolate (see page 2923)	This is constant Graphics.clWebChocolate.
clWebCoral (see page 2924)	This is constant Graphics.clWebCoral.
clWebCornFlowerBlue (see page 2924)	This is constant Graphics.clWebCornFlowerBlue.
clWebCornSilk (see page 2924)	This is constant Graphics.clWebCornSilk.
clWebCrimson (see page 2925)	This is constant Graphics.clWebCrimson.
clWebCyan (see page 2925)	This is constant Graphics.clWebCyan.
clWebDarkBlue (see page 2925)	This is constant Graphics.clWebDarkBlue.
clWebDarkCyan (see page 2926)	This is constant Graphics.clWebDarkCyan.
clWebDarkGoldenRod (see page 2926)	This is constant Graphics.clWebDarkGoldenRod.
clWebDarkGray (see page 2926)	This is constant Graphics.clWebDarkGray.
clWebDarkgreen (see page 2927)	This is constant Graphics.clWebDarkgreen.
clWebDarkKhaki (see page 2927)	This is constant Graphics.clWebDarkKhaki.
clWebDarkMagenta (see page 2927)	This is constant Graphics.clWebDarkMagenta.
clWebDarkOliveGreen (see page 2928)	This is constant Graphics.clWebDarkOliveGreen.
clWebDarkOrange (see page 2928)	This is constant Graphics.clWebDarkOrange.
clWebDarkOrchid (see page 2928)	This is constant Graphics.clWebDarkOrchid.
clWebDarkRed (see page 2929)	This is constant Graphics.clWebDarkRed.
clWebDarkSalmon (see page 2929)	This is constant Graphics.clWebDarkSalmon.
clWebDarkSeaGreen (see page 2929)	This is constant Graphics.clWebDarkSeaGreen.
clWebDarkSlateBlue (see page 2930)	This is constant Graphics.clWebDarkSlateBlue.
clWebDarkSlategray (see page 2930)	This is constant Graphics.clWebDarkSlategray.
clWebDarkTurquoise (see page 2930)	This is constant Graphics.clWebDarkTurquoise.
clWebDarkViolet (see page 2931)	This is constant Graphics.clWebDarkViolet.
clWebDeepPink (see page 2931)	This is constant Graphics.clWebDeepPink.
clWebDeepskyBlue (see page 2931)	This is constant Graphics.clWebDeepskyBlue.
clWebDimGray (see page 2932)	This is constant Graphics.clWebDimGray.
clWebDodgerBlue (see page 2932)	This is constant Graphics.clWebDodgerBlue.
clWebFirebrick (see page 2932)	This is constant Graphics.clWebFirebrick.
clWebFloralWhite (see page 2933)	This is constant Graphics.clWebFloralWhite.
clWebForestGreen (see page 2933)	This is constant Graphics.clWebForestGreen.
clWebFuchsia (see page 2933)	This is constant Graphics.clWebFuchsia.
clWebGainsboro (see page 2934)	This is constant Graphics.clWebGainsboro.
clWebGhostWhite (see page 2934)	This is constant Graphics.clWebGhostWhite.

clWebGold (see page 2934)	This is constant Graphics.clWebGold.
clWebGoldenRod (see page 2935)	This is constant Graphics.clWebGoldenRod.
clWebGray (see page 2935)	This is constant Graphics.clWebGray.
clWebGreen (see page 2935)	This is constant Graphics.clWebGreen.
clWebGreenYellow (see page 2936)	This is constant Graphics.clWebGreenYellow.
clWebHoneydew (see page 2936)	This is constant Graphics.clWebHoneydew.
clWebHotPink (see page 2936)	This is constant Graphics.clWebHotPink.
clWebIndianRed (see page 2937)	This is constant Graphics.clWebIndianRed.
clWebIndigo (see page 2937)	This is constant Graphics.clWebIndigo.
clWebIvory (see page 2937)	This is constant Graphics.clWebIvory.
clWebKhaki (see page 2938)	This is constant Graphics.clWebKhaki.
clWebLavender (see page 2938)	This is constant Graphics.clWebLavender.
clWebLavenderBlush (see page 2938)	This is constant Graphics.clWebLavenderBlush.
clWebLawnGreen (see page 2939)	This is constant Graphics.clWebLawnGreen.
clWebLemonChiffon (see page 2939)	This is constant Graphics.clWebLemonChiffon.
clWebLightBlue (see page 2939)	This is constant Graphics.clWebLightBlue.
clWebLightCoral (see page 2940)	This is constant Graphics.clWebLightCoral.
clWebLightCyan (see page 2940)	This is constant Graphics.clWebLightCyan.
clWebLightGoldenrodYellow (see page 2940)	This is constant Graphics.clWebLightGoldenrodYellow.
clWebLightGreen (see page 2941)	This is constant Graphics.clWebLightGreen.
clWebLightgrey (see page 2941)	This is constant Graphics.clWebLightgrey.
clWebLightPink (see page 2941)	This is constant Graphics.clWebLightPink.
clWebLightSalmon (see page 2942)	This is constant Graphics.clWebLightSalmon.
clWebLightSeaGreen (see page 2942)	This is constant Graphics.clWebLightSeaGreen.
clWebLightSkyBlue (see page 2942)	This is constant Graphics.clWebLightSkyBlue.
clWebLightSlateGray (see page 2943)	This is constant Graphics.clWebLightSlateGray.
clWebLightSteelBlue (see page 2943)	This is constant Graphics.clWebLightSteelBlue.
clWebLightYellow (see page 2943)	This is constant Graphics.clWebLightYellow.
clWebLime (see page 2944)	This is constant Graphics.clWebLime.
clWebLimeGreen (see page 2944)	This is constant Graphics.clWebLimeGreen.
clWebLinen (see page 2944)	This is constant Graphics.clWebLinen.
clWebMagenta (see page 2945)	This is constant Graphics.clWebMagenta.
clWebMaroon (see page 2945)	This is constant Graphics.clWebMaroon.
clWebMediumAquamarine (see page 2945)	This is constant Graphics.clWebMediumAquamarine.
clWebMediumBlue (see page 2946)	This is constant Graphics.clWebMediumBlue.
clWebMediumOrchid (see page 2946)	This is constant Graphics.clWebMediumOrchid.
clWebMediumPurple (see page 2946)	This is constant Graphics.clWebMediumPurple.
clWebMediumSeaGreen (see page 2947)	This is constant Graphics.clWebMediumSeaGreen.
clWebMediumSlateBlue (see page 2947)	This is constant Graphics.clWebMediumSlateBlue.
clWebMediumSpringGreen (see page 2947)	This is constant Graphics.clWebMediumSpringGreen.
clWebMediumTurquoise (see page 2948)	This is constant Graphics.clWebMediumTurquoise.
clWebMediumVioletRed (see page 2948)	This is constant Graphics.clWebMediumVioletRed.
clWebMidnightBlue (see page 2948)	This is constant Graphics.clWebMidnightBlue.
clWebMintcream (see page 2949)	This is constant Graphics.clWebMintcream.
clWebMistyRose (see page 2949)	This is constant Graphics.clWebMistyRose.
clWebMoccasin (see page 2949)	This is constant Graphics.clWebMoccasin.
clWebNavajoWhite (see page 2950)	This is constant Graphics.clWebNavajoWhite.
clWebNavy (see page 2950)	This is constant Graphics.clWebNavy.
clWebOldLace (see page 2950)	This is constant Graphics.clWebOldLace.
clWebOlive (see page 2951)	This is constant Graphics.clWebOlive.
clWebOliveDrab (see page 2951)	This is constant Graphics.clWebOliveDrab.
clWebOrange (see page 2951)	This is constant Graphics.clWebOrange.
clWebOrangeRed (see page 2952)	This is constant Graphics.clWebOrangeRed.
clWebOrchid (see page 2952)	This is constant Graphics.clWebOrchid.

clWebPaleGoldenrod (see page 2952)	This is constant Graphics.clWebPaleGoldenrod.
clWebPaleGreen (see page 2953)	This is constant Graphics.clWebPaleGreen.
clWebPaleTurquoise (see page 2953)	This is constant Graphics.clWebPaleTurquoise.
clWebPaleVioletRed (see page 2953)	This is constant Graphics.clWebPaleVioletRed.
clWebPapayaWhip (see page 2954)	This is constant Graphics.clWebPapayaWhip.
clWebPeachPuff (see page 2954)	This is constant Graphics.clWebPeachPuff.
clWebPeru (see page 2954)	This is constant Graphics.clWebPeru.
clWebPink (see page 2955)	This is constant Graphics.clWebPink.
clWebPlum (see page 2955)	This is constant Graphics.clWebPlum.
clWebPowderBlue (see page 2955)	This is constant Graphics.clWebPowderBlue.
clWebPurple (see page 2956)	This is constant Graphics.clWebPurple.
clWebRed (see page 2956)	This is constant Graphics.clWebRed.
clWebRosyBrown (see page 2956)	This is constant Graphics.clWebRosyBrown.
clWebRoyalBlue (see page 2957)	This is constant Graphics.clWebRoyalBlue.
clWebSaddleBrown (see page 2957)	This is constant Graphics.clWebSaddleBrown.
clWebSalmon (see page 2957)	This is constant Graphics.clWebSalmon.
clWebSandyBrown (see page 2958)	This is constant Graphics.clWebSandyBrown.
clWebSeaGreen (see page 2958)	This is constant Graphics.clWebSeaGreen.
clWebSeashell (see page 2958)	This is constant Graphics.clWebSeashell.
clWebSienna (see page 2959)	This is constant Graphics.clWebSienna.
clWebSilver (see page 2959)	This is constant Graphics.clWebSilver.
clWebSkyBlue (see page 2959)	This is constant Graphics.clWebSkyBlue.
clWebSlateBlue (see page 2960)	This is constant Graphics.clWebSlateBlue.
clWebSlateGray (see page 2960)	This is constant Graphics.clWebSlateGray.
clWebSnow (see page 2960)	This is constant Graphics.clWebSnow.
clWebSpringGreen (see page 2961)	This is constant Graphics.clWebSpringGreen.
clWebSteelBlue (see page 2961)	This is constant Graphics.clWebSteelBlue.
clWebTan (see page 2961)	This is constant Graphics.clWebTan.
clWebTeal (see page 2962)	This is constant Graphics.clWebTeal.
clWebThistle (see page 2962)	This is constant Graphics.clWebThistle.
clWebTomato (see page 2962)	This is constant Graphics.clWebTomato.
clWebTurquoise (see page 2963)	This is constant Graphics.clWebTurquoise.
clWebViolet (see page 2963)	This is constant Graphics.clWebViolet.
clWebWheat (see page 2963)	This is constant Graphics.clWebWheat.
clWebWhite (see page 2964)	This is constant Graphics.clWebWhite.
clWebWhiteSmoke (see page 2964)	This is constant Graphics.clWebWhiteSmoke.
clWebYellow (see page 2964)	This is constant Graphics.clWebYellow.
clWebYellowGreen (see page 2965)	This is constant Graphics.clWebYellowGreen.
clWhite (see page 2965)	Represents the color white.
clWindow (see page 2965)	Represents the default Window background color.
clWindowFrame (see page 2966)	Represents the default Window frame background color.
clWindowText (see page 2966)	Represents the default Window text color.
clYellow (see page 2967)	Represents the color yellow.
cmBlackness (see page 2967)	TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with black.
cmDstInvert (see page 2968)	TCopyMode (see page 2880) value : inverts the image on the canvas and ignores the source.
cmMergeCopy (see page 2968)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean AND operator.
cmMergePaint (see page 2969)	TCopyMode (see page 2880) value : combines the inverted source bitmap with the image on the canvas by using the Boolean OR operator.
cmNotSrcCopy (see page 2969)	TCopyMode (see page 2880) value : copies the inverted source bitmap to the canvas.
cmNotSrcErase (see page 2970)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator, and inverts the result.
cmPatCopy (see page 2970)	TCopyMode (see page 2880) value : copies the source pattern to the canvas.

cmPatInvert (see page 2971)	TCopyMode (see page 2880) value : combines the source pattern with the image on the canvas using the Boolean XOR operator.
cmPatPaint (see page 2971)	TCopyMode (see page 2880) value : combines the inverted source bitmap with the source pattern by using the Boolean OR operator. Combines the result of this operation with the image on the canvas by using the Boolean OR operator.
cmSrcAnd (see page 2972)	TCopyMode (see page 2880) value : combines the image on the canvas and source bitmap by using the Boolean AND operator.
cmSrcCopy (see page 2972)	TCopyMode (see page 2880) value : copies the source bitmap to the canvas.
cmSrcErase (see page 2973)	TCopyMode (see page 2880) value : inverts the image on the canvas and combines the result with the source bitmap by using the Boolean AND operator.
cmSrcInvert (see page 2973)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean XOR operator.
cmSrcPaint (see page 2974)	TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator.
cmWhiteness (see page 2974)	TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with white.
ExtendedColorsCount (see page 2975)	The total number of extended colors available
rc3_Cursor (see page 2976)	This is constant Graphics.rc3_Cursor.
rc3_Icon (see page 2976)	This is constant Graphics.rc3_Icon.
rc3_StockIcon (see page 2976)	This is constant Graphics.rc3_StockIcon.
StandardColorsCount (see page 2977)	The total number of standard colors available
WebColorsCount (see page 2978)	The total number of web colors available

8.7.1 Graphics.cl3DDkShadow Constant

Represents the dark shadow of 3D components.

Pascal

```
cl3DDkShadow = TColor(clSystemColor or COLOR_3DDKSHADOW);
```

C++

```
cl3DDkShadow = TColor(clSystemColor or COLOR_3DDKSHADOW);
```

File

Graphics

Description

For Windows 95 or NT 4.0 only, cl3DDkShadow represents the dark shadow for three-dimensional display elements.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.2 Graphics.cl3DLight Constant

Represents the light part of 3D components.

Pascal

```
cl3DLight = TColor(clSystemColor or COLOR_3DLIGHT);
```

C++

```
cl3DLight = TColor(clSystemColor or COLOR_3DLIGHT);
```

File

Graphics

Description

For Windows 95 or NT 4.0 only, cl3DLight represents the light color for three-dimensional display elements (for edges facing the light source).

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.3 Graphics.clActiveBorder Constant

Represents the default border color of an active window.

Pascal

```
clActiveBorder = TColor(clSystemColor or COLOR_ACTIVEBORDER);
```

C++

```
clActiveBorder = TColor(clSystemColor or COLOR_ACTIVEBORDER);
```

File

Graphics

Description

clActiveBorder is the default color used to paint the border of an active window. clActiveBorder is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.4 Graphics.clActiveCaption Constant

Represents the default color of the title bar of an active window.

Pascal

```
clActiveCaption = TColor(clSystemColor or COLOR_ACTIVECAPTION);
```

C++

```
clActiveCaption = TColor(clSystemColor or COLOR_ACTIVECAPTION);
```

File

Graphics

Description

clActiveCaption is the default color used to paint the border of an active window. clActiveCaption is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.5 Graphics.clAppWorkSpace Constant

Represents the default Application WorkSpace color.

Pascal

```
clAppWorkSpace = TColor(clSystemColor or COLOR_APPWORKSPACE);
```

C++

```
clAppWorkSpace = TColor(clSystemColor or COLOR_APPWORKSPACE);
```

File

Graphics

Description

clAppWorkSpace is the default Application WorkSpace color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.6 Graphics.clAqua Constant

Represents the color Aqua.

Pascal

```
clAqua = TColor($FFFF00);
```

C++

```
clAqua = TColor($FFFF00);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to Aqua. Aqua is the Delphi name for cyan - 100% blue and green with no red. Aqua is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.7 Graphics.clBackground Constant

Represents the default Windows background color.

Pascal

```
clBackground = TColor(clSystemColor or COLOR_BACKGROUND);
```

C++

```
clBackground = TColor(clSystemColor or COLOR_BACKGROUND);
```

File

Graphics

Description

clBackground is the default Windows background color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.8 Graphics.clBlack Constant

Represents the color black.

Pascal

```
clBlack = TColor($000000);
```

C++

```
clBlack = TColor($000000);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to black. Black is the complete absence of blue, green and red. Black is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.9 Graphics.clBlue Constant

Represents the color blue.

Pascal

```
clBlue = TColor($FF0000);
```

C++

```
clBlue = TColor($FF0000);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to blue. Blue is 100% blue with no green or red. Blue is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.10 Graphics.clBtnFace Constant

Represents the color of the face of a button.

Pascal

```
clBtnFace = TColor(clSystemColor or COLOR_BTNFACE);
```

C++

```
clBtnFace = TColor(clSystemColor or COLOR_BTNFACE);
```

File

Graphics

Description

clBtnFace is the color used to paint the face of a button.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.11 Graphics.clBtnHighlight Constant

Represents the color of the highlighting on a button.

Pascal

```
clBtnHighlight = TColor(clSystemColor or COLOR_BTNHIGHLIGHT);
```

C++

```
clBtnHighlight = TColor(clSystemColor or COLOR_BTNHIGHLIGHT);
```

File

Graphics

Description

clBtnHighlight is the color used to paint the highlighting on a button.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.12 Graphics.clBtnShadow Constant

Represents the color of the shadow cast by of a button.

Pascal

```
clBtnShadow = TColor(clSystemColor or COLOR_BTNSHADOW);
```

C++

```
clBtnShadow = TColor(clSystemColor or COLOR_BTNSHADOW);
```

File

Graphics

Description

clBtnShadow is the color used to paint the shadow cast by a button.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.13 Graphics.clBtnText Constant

Represents the default color of the text on a button.

Pascal

```
clBtnText = TColor(clSystemColor or COLOR_BTNTEXT);
```

C++

```
clBtnText = TColor(clSystemColor or COLOR_BTNTEXT);
```

File

Graphics

Description

clBtnText is the default color used to paint the text on a button.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.14 Graphics.clCaptionText Constant

Represents the default color of the text on the title bar of an active window.

Pascal

```
clCaptionText = TColor(clSystemColor or COLOR_CAPTIONTEXT);
```

C++

```
clCaptionText = TColor(clSystemColor or COLOR_CAPTIONTEXT);
```

File

Graphics

Description

clCaptionText is the default color used for the text on the title bar of an active window. clCaptionText is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.15 Graphics.clCream Constant

Represents the color cream.

Pascal

```
clCream = TColor($F0FBFF);
```

C++

```
clCream = TColor($F0FBFF);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to cream. Cream is an off white color. Cream is an extended color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.16 Graphics.clDefault Constant

Specifies the default color of a component.

Pascal

```
clDefault = TColor($20000000);
```

C++

```
clDefault = TColor($20000000);
```

File

Graphics

Description

clDefault is used to determine or set the default color of a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.17 Graphics.clDkGray Constant

Represents the color dark gray.

Pascal

```
clDkGray = TColor($808080);
```

C++

```
clDkGray = TColor($808080);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to dark gray. Dark gray comprises 50% intensity of each of blue, green and red - identical to clGray (see page 2905). Dark Gray is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.18 Graphics.clFuchsia Constant

Represents the color fuchsia.

Pascal

```
clFuchsia = TColor($FF00FF);
```

C++

```
clFuchsia = TColor($FF00FF);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to fuchsia. Fuchsia is 100% intensity red, 100% intensity blue and 0% green. Fuchsia is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.19 Graphics.clGradientActiveCaption Constant

Right side color in the color gradient of an active window's title bar.

Pascal

```
clGradientActiveCaption = TColor(clSystemColor or COLOR_GRADIENTACTIVECAPTION);
```

C++

```
clGradientActiveCaption = TColor(clSystemColor or COLOR_GRADIENTACTIVECAPTION);
```

File

Graphics

Description

For a Windows 98 and Windows 2000 color gradient in an active caption, clActiveCaption (see page 2897) defines the left side color, and clGradientActiveCaption defines the right side color. The left side color blends to the right side color.

See Also

clActiveCaption (see page 2897)

clInactiveCaption (see page 2908)

clGradientInactiveCaption (see page 2904)

Color (see page 2669)

TColor (see page 2878)

8.7.20 Graphics.clGradientInactiveCaption Constant

Right side color in the color gradient of an inactive window's title bar.

Pascal

```
clGradientInactiveCaption = TColor(clSystemColor or COLOR_GRADIENTINACTIVECAPTION);
```

C++

```
clGradientInactiveCaption = TColor(clSystemColor or COLOR_GRADIENTINACTIVECAPTION);
```

File

Graphics

Description

For a Windows 98 and Windows 2000 color gradient in an inactive caption, clInactiveCaption (see page 2908) defines the left side color, and clGradientInactiveCaption defines the right side color. The left side color blends to the right side color.

See Also

clActiveCaption (see page 2897)

clGradientActiveCaption (see page 2904)

clInactiveCaption (see page 2908)

Color (see page 2669)

TColor (see page 2878)

8.7.21 Graphics.clGray Constant

Represents the color gray.

Pascal

```
clGray = TColor($808080);
```

C++

```
clGray = TColor($808080);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to gray. Gray comprises 50% intensity of each of blue, green and red. Gray is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.22 Graphics.clGrayText Constant

Represents the color of text that is grayed out.

Pascal

```
clGrayText = TColor(clSystemColor or COLOR_GRAYTEXT);
```

C++

```
clGrayText = TColor(clSystemColor or COLOR_GRAYTEXT);
```

File

Graphics

Description

clGrayText is the color used to paint text that has been set inactive, such as in an inactive menu item. clGrayText is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.23 Graphics.clGreen Constant

Represents the color green.

Pascal

```
clGreen = TColor($008000);
```

C++

```
clGreen = TColor($008000);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to green. Green is 100% green with no blue or red. Green is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.24 Graphics.clHighlight Constant

Represents the color of the background of a block of selected text.

Pascal

```
clHighlight = TColor(clSystemColor or COLOR_HIGHLIGHT);
```

C++

```
clHighlight = TColor(clSystemColor or COLOR_HIGHLIGHT);
```

File

Graphics

Description

clHighlight is the default color used to paint the background of a selected block of text. clHighlight is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.25 Graphics.clHighlightText Constant

Represents the color of selected text.

Pascal

```
clHighlightText = TColor(clSystemColor or COLOR_HIGHLIGHTTEXT);
```

C++

```
clHighlightText = TColor(clSystemColor or COLOR_HIGHLIGHTTEXT);
```

File

Graphics

Description

clHighlightText is the default color used for a selected block of text. clHighlightText is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.26 Graphics.clHotLight Constant

Pascal

```
clHotLight = TColor(clSystemColor or COLOR_HOTLIGHT);
```

C++

```
clHotLight = TColor(clSystemColor or COLOR_HOTLIGHT);
```

File

Graphics

Description

This is constant Graphics.clHotLight.

8.7.27 Graphics.clInactiveBorder Constant

Represents the default border color of an inactive window.

Pascal

```
clInactiveBorder = TColor(clSystemColor or COLOR_INACTIVEBORDER);
```

C++

```
clInactiveBorder = TColor(clSystemColor or COLOR_INACTIVEBORDER);
```

File

Graphics

Description

clInactiveBorder is the default color used to paint the border of an inactive window. clInactiveBorder is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.28 Graphics.clInactiveCaption Constant

Represents the default color of the title bar of an inactive window.

Pascal

```
clInactiveCaption = TColor(clSystemColor or COLOR_INACTIVECAPTION);
```

C++

```
clInactiveCaption = TColor(clSystemColor or COLOR_INACTIVECAPTION);
```

File

Graphics

Description

clInactiveCaption is the default color used to paint the border of an inactive window. clInactiveCaption is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.29 Graphics.clInactiveCaptionText Constant

Represents the default color of the title text in an inactive window.

Pascal

```
clInactiveCaptionText = TColor(clSystemColor or COLOR_INACTIVECAPTIONTEXT);
```

C++

```
clInactiveCaptionText = TColor(clSystemColor or COLOR_INACTIVECAPTIONTEXT);
```

File

Graphics

Description

clInactiveCaptionText is the default color used for the title font an inactive window. clInactiveCaptionText is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.30 Graphics.clInfoBk Constant

Represents the color of the background of a tool tip.

Pascal

```
clInfoBk = TColor(clSystemColor or COLOR_INFOBK);
```

C++

```
clInfoBk = TColor(clSystemColor or COLOR_INFOBK);
```

File

Graphics

Description

clInfoBk is the default color used for the background of a tool tip. clInfoBk is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.31 Graphics.clInfoText Constant

Represents the color of tool tip text.

Pascal

```
clInfoText = TColor(clSystemColor or COLOR_INFOTEXT);
```

C++

```
clInfoText = TColor(clSystemColor or COLOR_INFOTEXT);
```

File

Graphics

Description

clInfoText is the default color used for tool tip text. clInfoText is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.32 Graphics.clLime Constant

Represents the color lime.

Pascal

```
clLime = TColor($00FF00);
```

C++

```
clLime = TColor($00FF00);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to lime. Lime is 100% green with no blue or red. It is identical to clGreen (see page 2906). Lime is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.33 Graphics.clLtGray Constant

Represents the color light gray.

Pascal

```
clLtGray = TColor($C0C0C0);
```

C++

```
clLtGray = TColor($C0C0C0);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to light gray. Light gray comprises 75% intensity of each of blue, green and red. It is identical to clSilver (see page 2916). Light Gray is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.34 Graphics.clMaroon Constant

Represents the color maroon.

Pascal

```
clMaroon = TColor($000080);
```

C++

```
clMaroon = TColor($000080);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to maroon. Maroon gray comprises 50% intensity red, with no blue or green. Maroon is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.35 Graphics.clMedGray Constant

Represents the color medium gray.

Pascal

```
clMedGray = TColor($A4A0A0);
```

C++

```
clMedGray = TColor($A4A0A0);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to medium gray. Medium gray lies between clGray (see page 2905) and clLtGray (see page 2910), but, unusually, with a blue tint. Medium Gray is an extended color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.36 Graphics.clMenu Constant

Represents the color of the background of an unselected menu sub item.

Pascal

```
clMenu = TColor(clSystemColor or COLOR_MENU);
```

C++

```
clMenu = TColor(clSystemColor or COLOR_MENU);
```

File

Graphics

Description

clMenu is the default color used for the background of a sub menu item. clMenuBar (see page 2912) defines the color used for the background of the main menu items. clMenu is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.37 Graphics.clMenuBar Constant

Represents the color of the background of an unselected main menu item.

Pascal

```
clMenuBar = TColor(clSystemColor or COLOR_MENUBAR);
```

C++

```
clMenuBar = TColor(clSystemColor or COLOR_MENUBAR);
```

File

Graphics

Description

clMenuBar is the default color used for the background of a main menu item. clMenu (see page 2912) defines the color used for the background of menu sub items. clMenuBar is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.38 Graphics.clMenuHighlight Constant

Represents the color of the background of a selected menu item.

Pascal

```
clMenuHighlight = TColor(clSystemColor or COLOR_MENUHILIGHT);
```

C++

```
clMenuHighlight = TColor(clSystemColor or COLOR_MENUHILIGHT);
```

File

Graphics

Description

clMenuHighlight is the default color used for the background of a selcetd main or sub menu item. clMenuHighlight is a System color - used for painting a component.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.39 Graphics.clMenuText Constant

Represents the default menu text color.

Pascal

```
clMenuText = TColor(clSystemColor or COLOR_MENUTEXT);
```

C++

```
clMenuText = TColor(clSystemColor or COLOR_MENUTEXT);
```

File

Graphics

Description

clMenuText is the default color for menu text.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.40 Graphics.clMoneyGreen Constant

Represents the color money green.

Pascal

```
clMoneyGreen = TColor($C0DCC0);
```

C++

```
clMoneyGreen = TColor($C0DCC0);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to money green. Money green is a green tinted light gray. Money green is an extended color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.41 Graphics.clNavy Constant

Represents the color navy.

Pascal

```
clNavy = TColor($800000);
```

C++

```
clNavy = TColor($800000);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to navy. Navy gray comprises 50% intensity blue, with no red or green. Navy is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.42 Graphics.clNone Constant

Represents no selected color.

Pascal

```
clNone = TColor($1FFFFFFF);
```

C++

```
clNone = TColor($1FFFFFFF);
```

File

Graphics

Description

clNone represents no selected color.

Note: clNone is white on Windows 9.x systems, and black on Windows NT systems.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.43 Graphics.clOlive Constant

Represents the color olive.

Pascal

```
clOlive = TColor($008080);
```

C++

```
clOlive = TColor($008080);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to olive. Olive is 50% intensity green, 50% intensity red with no blue. Olive is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.44 Graphics.clPurple Constant

Represents the color purple.

Pascal

```
clPurple = TColor($800080);
```

C++

```
clPurple = TColor($800080);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to purple. Purple is 50% intensity red, 50% intensity blue and 0% green. Purple is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.45 Graphics.clRed Constant

Represents the color red.

Pascal

```
clRed = TColor($0000FF);
```

C++

```
clRed = TColor($0000FF);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to red. Red is 100% red with no green or blue. Red is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.46 Graphics.clScrollBar Constant

Pascal

```
clScrollBar = TColor(clSystemColor or COLOR_SCROLLBAR);
```

C++

```
clScrollBar = TColor(clSystemColor or COLOR_SCROLLBAR);
```

File

Graphics

Description

This is constant Graphics.clScrollBar.

8.7.47 Graphics.clSilver Constant

Represents the color silver.

Pascal

```
clSilver = TColor($C0C0C0);
```

C++

```
clSilver = TColor($C0C0C0);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to silver. Silver comprises 75% intensity of each of blue, green and red. It is identical to clLtGray (see page 2910). Silver is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.48 Graphics.clSkyBlue Constant

Represents the color sky blue.

Pascal

```
clSkyBlue = TColor($F0CAA6);
```

C++

```
clSkyBlue = TColor($F0CAA6);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to sky blue. Sky blue light blue that is similar to the sky color. Sky blue is an extended color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.49 Graphics.clSystemColor Constant

Is a mask used to identify the set of system colors.

Pascal

```
clSystemColor = $FF000000;
```

C++

```
clSystemColor = 0xFF000000;
```

File

Graphics

Description

clSystemColor has the 1st byte bits set on as ameans of identifying a system color.

For example, clActiveBorder (see page 2897) is system color, used as the default color to paint the active border of a component - it has the high order byte set to $FF. clRed (see page 2916) is not a system color, since the high order byte is 0.

See Also

clActiveBorder (see page 2897)

clRed (see page 2916)

Color (see page 2669)

TColor (see page 2878)

8.7.50 Graphics.clTeal Constant

Represents the color teal.

Pascal

```
clTeal = TColor($808000);
```

C++

```
clTeal = TColor($808000);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to teal. Teal is dark cyan : 50% blue, 50% green, 0% red. Teal is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.51 Graphics.clWebAliceBlue Constant

Pascal

```
clWebAliceBlue = $FFF8F0;
```

C++

```
clWebAliceBlue = 0xFFF8F0;
```

File

Graphics

Description

This is constant Graphics.clWebAliceBlue.

8.7.52 Graphics.clWebAntiqueWhite Constant

Pascal

```
clWebAntiqueWhite = $D7EBFA;
```

C++

```
clWebAntiqueWhite = 0xD7EBFA;
```

File

Graphics

Description

This is constant Graphics.clWebAntiqueWhite.

8.7.53 Graphics.clWebAqua Constant

Pascal

```
clWebAqua = $FFFF00;
```

C++

```
clWebAqua = 0xFFFF00;
```

File

Graphics

Description

This is constant Graphics.clWebAqua.

8.7.54 Graphics.clWebAquamarine Constant

Pascal

```
clWebAquamarine = $D4FF7F;
```

C++

```
clWebAquamarine = 0xD4FF7F;
```

File

Graphics

Description

This is constant Graphics.clWebAquamarine.

8.7.55 Graphics.clWebAzure Constant

Pascal

```
clWebAzure = $FFFFF0;
```

C++

```
clWebAzure = 0xFFFFF0;
```

File

Graphics

Description

This is constant Graphics.clWebAzure.

8.7.56 Graphics.clWebBeige Constant

Pascal

```
clWebBeige = $DCF5F5;
```

C++

```
clWebBeige = 0xDCF5F5;
```

File

Graphics

Description

This is constant Graphics.clWebBeige.

8.7.57 Graphics.clWebBisque Constant

Pascal

```
clWebBisque = $C4E4FF;
```

C++

```
clWebBisque = 0xC4E4FF;
```

File

Graphics

Description

This is constant Graphics.clWebBisque.

8.7.58 Graphics.clWebBlack Constant

Pascal

```
clWebBlack = $000000;
```

C++

```
clWebBlack = 0x000000;
```

File

Graphics

Description

This is constant Graphics.clWebBlack.

8.7.59 Graphics.clWebBlanchedAlmond Constant

Pascal

```
clWebBlanchedAlmond = $CDEBFF;
```

C++

```
clWebBlanchedAlmond = 0xCDEBFF;
```

File

Graphics

Description

This is constant Graphics.clWebBlanchedAlmond.

8.7.60 Graphics.clWebBlue Constant

Pascal

```
clWebBlue = $FF0000;
```

C++

```
clWebBlue = 0xFF0000;
```

File

Graphics

Description

This is constant Graphics.clWebBlue.

8.7.61 Graphics.clWebBlueViolet Constant

Pascal

```
clWebBlueViolet = $E22B8A;
```

C++

```
clWebBlueViolet = 0xE22B8A;
```

File

Graphics

Description

This is constant Graphics.clWebBlueViolet.

8.7.62 Graphics.clWebBrown Constant

Pascal

```
clWebBrown = $2A2AA5;
```

C++

```
clWebBrown = 0x2A2AA5;
```

File

Graphics

Description

This is constant Graphics.clWebBrown.

8.7.63 Graphics.clWebBurlywood Constant

Pascal

```
clWebBurlywood = $87B8DE;
```

C++

```
clWebBurlywood = 0x87B8DE;
```

File

Graphics

Description

This is constant Graphics.clWebBurlywood.

8.7.64 Graphics.clWebCadetBlue Constant

Pascal

```
clWebCadetBlue = $A09E5F;
```

C++

```
clWebCadetBlue = 0xA09E5F;
```

File

Graphics

Description

This is constant Graphics.clWebCadetBlue.

8.7.65 Graphics.clWebChartreuse Constant

Pascal

```
clWebChartreuse = $00FF7F;
```

C++

```
clWebChartreuse = 0x00FF7F;
```

File

Graphics

Description

This is constant Graphics.clWebChartreuse.

8.7.66 Graphics.clWebChocolate Constant

Pascal

```
clWebChocolate = $1E69D2;
```

C++

```
clWebChocolate = 0x1E69D2;
```

File

Graphics

Description

This is constant Graphics.clWebChocolate.

8.7.67 Graphics.clWebCoral Constant

Pascal

```
clWebCoral = $507FFF;
```

C++

```
clWebCoral = 0x507FFF;
```

File

Graphics

Description

This is constant Graphics.clWebCoral.

8.7.68 Graphics.clWebCornFlowerBlue Constant

Pascal

```
clWebCornFlowerBlue = $ED9564;
```

C++

```
clWebCornFlowerBlue = 0xED9564;
```

File

Graphics

Description

This is constant Graphics.clWebCornFlowerBlue.

8.7.69 Graphics.clWebCornSilk Constant

Pascal

```
clWebCornSilk = $DCF8FF;
```

C++

```
clWebCornSilk = 0xDCF8FF;
```

File

Graphics

Description

This is constant Graphics.clWebCornSilk.

8.7.70 Graphics.clWebCrimson Constant

Pascal

```
clWebCrimson = $3C14DC;
```

C++

```
clWebCrimson = 0x3C14DC;
```

File

Graphics

Description

This is constant Graphics.clWebCrimson.

8.7.71 Graphics.clWebCyan Constant

Pascal

```
clWebCyan = $FFFF00;
```

C++

```
clWebCyan = 0xFFFF00;
```

File

Graphics

Description

This is constant Graphics.clWebCyan.

8.7.72 Graphics.clWebDarkBlue Constant

Pascal

```
clWebDarkBlue = $8B0000;
```

C++

```
clWebDarkBlue = 0x8B0000;
```

File

Graphics

Description

This is constant Graphics.clWebDarkBlue.

8.7.73 Graphics.clWebDarkCyan Constant

Pascal

```
clWebDarkCyan = $8B8B00;
```

C++

```
clWebDarkCyan = 0x8B8B00;
```

File

Graphics

Description

This is constant Graphics.clWebDarkCyan.

8.7.74 Graphics.clWebDarkGoldenRod Constant

Pascal

```
clWebDarkGoldenRod = $0B86B8;
```

C++

```
clWebDarkGoldenRod = 0x0B86B8;
```

File

Graphics

Description

This is constant Graphics.clWebDarkGoldenRod.

8.7.75 Graphics.clWebDarkGray Constant

Pascal

```
clWebDarkGray = $A9A9A9;
```

C++

```
clWebDarkGray = 0xA9A9A9;
```

File

Graphics

Description

This is constant Graphics.clWebDarkGray.

8.7.76 Graphics.clWebDarkgreen Constant

Pascal

```
clWebDarkgreen = $006400;
```

C++

```
clWebDarkgreen = 0x006400;
```

File

Graphics

Description

This is constant Graphics.clWebDarkgreen.

8.7.77 Graphics.clWebDarkKhaki Constant

Pascal

```
clWebDarkKhaki = $6BB7BD;
```

C++

```
clWebDarkKhaki = 0x6BB7BD;
```

File

Graphics

Description

This is constant Graphics.clWebDarkKhaki.

8.7.78 Graphics.clWebDarkMagenta Constant

Pascal

```
clWebDarkMagenta = $8B008B;
```

C++

```
clWebDarkMagenta = 0x8B008B;
```

File

Graphics

Description

This is constant Graphics.clWebDarkMagenta.

8.7.79 Graphics.clWebDarkOliveGreen Constant

Pascal

```
clWebDarkOliveGreen = $2F6B55;
```

C++

```
clWebDarkOliveGreen = 0x2F6B55;
```

File

Graphics

Description

This is constant Graphics.clWebDarkOliveGreen.

8.7.80 Graphics.clWebDarkOrange Constant

Pascal

```
clWebDarkOrange = $008CFF;
```

C++

```
clWebDarkOrange = 0x008CFF;
```

File

Graphics

Description

This is constant Graphics.clWebDarkOrange.

8.7.81 Graphics.clWebDarkOrchid Constant

Pascal

```
clWebDarkOrchid = $CC3299;
```

C++

```
clWebDarkOrchid = 0xCC3299;
```

File

Graphics

Description

This is constant Graphics.clWebDarkOrchid.

8.7.82 Graphics.clWebDarkRed Constant

Pascal

```
clWebDarkRed = $00008B;
```

C++

```
clWebDarkRed = 0x00008B;
```

File

Graphics

Description

This is constant Graphics.clWebDarkRed.

8.7.83 Graphics.clWebDarkSalmon Constant

Pascal

```
clWebDarkSalmon = $7A96E9;
```

C++

```
clWebDarkSalmon = 0x7A96E9;
```

File

Graphics

Description

This is constant Graphics.clWebDarkSalmon.

8.7.84 Graphics.clWebDarkSeaGreen Constant

Pascal

```
clWebDarkSeaGreen = $8FBC8F;
```

C++

```
clWebDarkSeaGreen = 0x8FBC8F;
```

File

Graphics

Description

This is constant Graphics.clWebDarkSeaGreen.

8.7.85 Graphics.clWebDarkSlateBlue Constant

Pascal

```
clWebDarkSlateBlue = $8B3D48;
```

C++

```
clWebDarkSlateBlue = 0x8B3D48;
```

File

Graphics

Description

This is constant Graphics.clWebDarkSlateBlue.

8.7.86 Graphics.clWebDarkSlategray Constant

Pascal

```
clWebDarkSlategray = $4F4F2F;
```

C++

```
clWebDarkSlategray = 0x4F4F2F;
```

File

Graphics

Description

This is constant Graphics.clWebDarkSlategray.

8.7.87 Graphics.clWebDarkTurquoise Constant

Pascal

```
clWebDarkTurquoise = $D1CE00;
```

C++

```
clWebDarkTurquoise = 0xD1CE00;
```

File

Graphics

Description

This is constant Graphics.clWebDarkTurquoise.

8.7.88 Graphics.clWebDarkViolet Constant

Pascal

```
clWebDarkViolet = $D30094;
```

C++

```
clWebDarkViolet = 0xD30094;
```

File

Graphics

Description

This is constant Graphics.clWebDarkViolet.

8.7.89 Graphics.clWebDeepPink Constant

Pascal

```
clWebDeepPink = $9314FF;
```

C++

```
clWebDeepPink = 0x9314FF;
```

File

Graphics

Description

This is constant Graphics.clWebDeepPink.

8.7.90 Graphics.clWebDeepskyBlue Constant

Pascal

```
clWebDeepskyBlue = $FFBF00;
```

C++

```
clWebDeepskyBlue = 0xFFBF00;
```

File

Graphics

Description

This is constant Graphics.clWebDeepskyBlue.

8.7.91 Graphics.clWebDimGray Constant

Pascal

```
clWebDimGray = $696969;
```

C++

```
clWebDimGray = 0x696969;
```

File

Graphics

Description

This is constant Graphics.clWebDimGray.

8.7.92 Graphics.clWebDodgerBlue Constant

Pascal

```
clWebDodgerBlue = $FF901E;
```

C++

```
clWebDodgerBlue = 0xFF901E;
```

File

Graphics

Description

This is constant Graphics.clWebDodgerBlue.

8.7.93 Graphics.clWebFirebrick Constant

Pascal

```
clWebFirebrick = $2222B2;
```

C++

```
clWebFirebrick = 0x2222B2;
```

File

Graphics

Description

This is constant Graphics.clWebFirebrick.

8.7.94 Graphics.clWebFloralWhite Constant

Pascal

```
clWebFloralWhite = $F0FAFF;
```

C++

```
clWebFloralWhite = 0xF0FAFF;
```

File

Graphics

Description

This is constant Graphics.clWebFloralWhite.

8.7.95 Graphics.clWebForestGreen Constant

Pascal

```
clWebForestGreen = $228B22;
```

C++

```
clWebForestGreen = 0x228B22;
```

File

Graphics

Description

This is constant Graphics.clWebForestGreen.

8.7.96 Graphics.clWebFuchsia Constant

Pascal

```
clWebFuchsia = $FF00FF;
```

C++

```
clWebFuchsia = 0xFF00FF;
```

File

Graphics

Description

This is constant Graphics.clWebFuchsia.

8.7.97 Graphics.clWebGainsboro Constant

Pascal

```
clWebGainsboro = $DCDCDC;
```

C++

```
clWebGainsboro = 0xDCDCDC;
```

File

Graphics

Description

This is constant Graphics.clWebGainsboro.

8.7.98 Graphics.clWebGhostWhite Constant

Pascal

```
clWebGhostWhite = $FFF8F8;
```

C++

```
clWebGhostWhite = 0xFFF8F8;
```

File

Graphics

Description

This is constant Graphics.clWebGhostWhite.

8.7.99 Graphics.clWebGold Constant

Pascal

```
clWebGold = $00D7FF;
```

C++

```
clWebGold = 0x00D7FF;
```

File

Graphics

Description

This is constant Graphics.clWebGold.

8.7.100 Graphics.clWebGoldenRod Constant

Pascal

```
clWebGoldenRod = $20A5DA;
```

C++

```
clWebGoldenRod = 0x20A5DA;
```

File

Graphics

Description

This is constant Graphics.clWebGoldenRod.

8.7.101 Graphics.clWebGray Constant

Pascal

```
clWebGray = $808080;
```

C++

```
clWebGray = 0x808080;
```

File

Graphics

Description

This is constant Graphics.clWebGray.

8.7.102 Graphics.clWebGreen Constant

Pascal

```
clWebGreen = $008000;
```

C++

```
clWebGreen = 0x008000;
```

File

Graphics

Description

This is constant Graphics.clWebGreen.

8.7.103 Graphics.clWebGreenYellow Constant

Pascal

```
clWebGreenYellow = $2FFFAD;
```

C++

```
clWebGreenYellow = 0x2FFFAD;
```

File

Graphics

Description

This is constant Graphics.clWebGreenYellow.

8.7.104 Graphics.clWebHoneydew Constant

Pascal

```
clWebHoneydew = $F0FFF0;
```

C++

```
clWebHoneydew = 0xF0FFF0;
```

File

Graphics

Description

This is constant Graphics.clWebHoneydew.

8.7.105 Graphics.clWebHotPink Constant

Pascal

```
clWebHotPink = $B469FF;
```

C++

```
clWebHotPink = 0xB469FF;
```

File

Graphics

Description

This is constant Graphics.clWebHotPink.

8.7.106 Graphics.clWebIndianRed Constant

Pascal

```
clWebIndianRed = $5C5CCD;
```

C++

```
clWebIndianRed = 0x5C5CCD;
```

File

Graphics

Description

This is constant Graphics.clWebIndianRed.

8.7.107 Graphics.clWebIndigo Constant

Pascal

```
clWebIndigo = $82004B;
```

C++

```
clWebIndigo = 0x82004B;
```

File

Graphics

Description

This is constant Graphics.clWebIndigo.

8.7.108 Graphics.clWebIvory Constant

Pascal

```
clWebIvory = $F0FFFF;
```

C++

```
clWebIvory = 0xF0FFFF;
```

File

Graphics

Description

This is constant Graphics.clWebIvory.

8.7.109 Graphics.clWebKhaki Constant

Pascal

```
clWebKhaki = $8CE6F0;
```

C++

```
clWebKhaki = 0x8CE6F0;
```

File

Graphics

Description

This is constant Graphics.clWebKhaki.

8.7.110 Graphics.clWebLavender Constant

Pascal

```
clWebLavender = $FAE6E6;
```

C++

```
clWebLavender = 0xFAE6E6;
```

File

Graphics

Description

This is constant Graphics.clWebLavender.

8.7.111 Graphics.clWebLavenderBlush Constant

Pascal

```
clWebLavenderBlush = $F5F0FF;
```

C++

```
clWebLavenderBlush = 0xF5F0FF;
```

File

Graphics

Description

This is constant Graphics.clWebLavenderBlush.

8.7.112 Graphics.clWebLawnGreen Constant

Pascal

```
clWebLawnGreen = $00FC7C;
```

C++

```
clWebLawnGreen = 0x00FC7C;
```

File

Graphics

Description

This is constant Graphics.clWebLawnGreen.

8.7.113 Graphics.clWebLemonChiffon Constant

Pascal

```
clWebLemonChiffon = $CDFAFF;
```

C++

```
clWebLemonChiffon = 0xCDFAFF;
```

File

Graphics

Description

This is constant Graphics.clWebLemonChiffon.

8.7.114 Graphics.clWebLightBlue Constant

Pascal

```
clWebLightBlue = $E6D8AD;
```

C++

```
clWebLightBlue = 0xE6D8AD;
```

File

Graphics

Description

This is constant Graphics.clWebLightBlue.

8.7.115 Graphics.clWebLightCoral Constant

Pascal

```
clWebLightCoral = $8080F0;
```

C++

```
clWebLightCoral = 0x8080F0;
```

File

Graphics

Description

This is constant Graphics.clWebLightCoral.

8.7.116 Graphics.clWebLightCyan Constant

Pascal

```
clWebLightCyan = $FFFFE0;
```

C++

```
clWebLightCyan = 0xFFFFE0;
```

File

Graphics

Description

This is constant Graphics.clWebLightCyan.

8.7.117 Graphics.clWebLightGoldenrodYellow Constant

Pascal

```
clWebLightGoldenrodYellow = $D2FAFA;
```

C++

```
clWebLightGoldenrodYellow = 0xD2FAFA;
```

File

Graphics

Description

This is constant Graphics.clWebLightGoldenrodYellow.

8.7.118 Graphics.clWebLightGreen Constant

Pascal

```
clWebLightGreen = $90EE90;
```

C++

```
clWebLightGreen = 0x90EE90;
```

File

Graphics

Description

This is constant Graphics.clWebLightGreen.

8.7.119 Graphics.clWebLightgrey Constant

Pascal

```
clWebLightgrey = $D3D3D3;
```

C++

```
clWebLightgrey = 0xD3D3D3;
```

File

Graphics

Description

This is constant Graphics.clWebLightgrey.

8.7.120 Graphics.clWebLightPink Constant

Pascal

```
clWebLightPink = $C1B6FF;
```

C++

```
clWebLightPink = 0xC1B6FF;
```

File

Graphics

Description

This is constant Graphics.clWebLightPink.

8.7.121 Graphics.clWebLightSalmon Constant

Pascal

```
clWebLightSalmon = $7AA0FF;
```

C++

```
clWebLightSalmon = 0x7AA0FF;
```

File

Graphics

Description

This is constant Graphics.clWebLightSalmon.

8.7.122 Graphics.clWebLightSeaGreen Constant

Pascal

```
clWebLightSeaGreen = $AAB220;
```

C++

```
clWebLightSeaGreen = 0xAAB220;
```

File

Graphics

Description

This is constant Graphics.clWebLightSeaGreen.

8.7.123 Graphics.clWebLightSkyBlue Constant

Pascal

```
clWebLightSkyBlue = $FACE87;
```

C++

```
clWebLightSkyBlue = 0xFACE87;
```

File

Graphics

Description

This is constant Graphics.clWebLightSkyBlue.

8.7.124 Graphics.clWebLightSlateGray Constant

Pascal

```
clWebLightSlateGray = $998877;
```

C++

```
clWebLightSlateGray = 0x998877;
```

File

Graphics

Description

This is constant Graphics.clWebLightSlateGray.

8.7.125 Graphics.clWebLightSteelBlue Constant

Pascal

```
clWebLightSteelBlue = $DEC4B0;
```

C++

```
clWebLightSteelBlue = 0xDEC4B0;
```

File

Graphics

Description

This is constant Graphics.clWebLightSteelBlue.

8.7.126 Graphics.clWebLightYellow Constant

Pascal

```
clWebLightYellow = $E0FFFF;
```

C++

```
clWebLightYellow = 0xE0FFFF;
```

File

Graphics

Description

This is constant Graphics.clWebLightYellow.

8.7.127 Graphics.clWebLime Constant

Pascal

```
clWebLime = $00FF00;
```

C++

```
clWebLime = 0x00FF00;
```

File

Graphics

Description

This is constant Graphics.clWebLime.

8.7.128 Graphics.clWebLimeGreen Constant

Pascal

```
clWebLimeGreen = $32CD32;
```

C++

```
clWebLimeGreen = 0x32CD32;
```

File

Graphics

Description

This is constant Graphics.clWebLimeGreen.

8.7.129 Graphics.clWebLinen Constant

Pascal

```
clWebLinen = $E6F0FA;
```

C++

```
clWebLinen = 0xE6F0FA;
```

File

Graphics

Description

This is constant Graphics.clWebLinen.

8.7.130 Graphics.clWebMagenta Constant

Pascal

```
clWebMagenta = $FF00FF;
```

C++

```
clWebMagenta = 0xFF00FF;
```

File

Graphics

Description

This is constant Graphics.clWebMagenta.

8.7.131 Graphics.clWebMaroon Constant

Pascal

```
clWebMaroon = $000080;
```

C++

```
clWebMaroon = 0x000080;
```

File

Graphics

Description

This is constant Graphics.clWebMaroon.

8.7.132 Graphics.clWebMediumAquamarine Constant

Pascal

```
clWebMediumAquamarine = $AACD66;
```

C++

```
clWebMediumAquamarine = 0xAACD66;
```

File

Graphics

Description

This is constant Graphics.clWebMediumAquamarine.

8.7.133 Graphics.clWebMediumBlue Constant

Pascal

```
clWebMediumBlue = $CD0000;
```

C++

```
clWebMediumBlue = 0xCD0000;
```

File

Graphics

Description

This is constant Graphics.clWebMediumBlue.

8.7.134 Graphics.clWebMediumOrchid Constant

Pascal

```
clWebMediumOrchid = $D355BA;
```

C++

```
clWebMediumOrchid = 0xD355BA;
```

File

Graphics

Description

This is constant Graphics.clWebMediumOrchid.

8.7.135 Graphics.clWebMediumPurple Constant

Pascal

```
clWebMediumPurple = $DB7093;
```

C++

```
clWebMediumPurple = 0xDB7093;
```

File

Graphics

Description

This is constant Graphics.clWebMediumPurple.

8.7.136 Graphics.clWebMediumSeaGreen Constant

Pascal

```
clWebMediumSeaGreen = $71B33C;
```

C++

```
clWebMediumSeaGreen = 0x71B33C;
```

File

Graphics

Description

This is constant Graphics.clWebMediumSeaGreen.

8.7.137 Graphics.clWebMediumSlateBlue Constant

Pascal

```
clWebMediumSlateBlue = $EE687B;
```

C++

```
clWebMediumSlateBlue = 0xEE687B;
```

File

Graphics

Description

This is constant Graphics.clWebMediumSlateBlue.

8.7.138 Graphics.clWebMediumSpringGreen Constant

Pascal

```
clWebMediumSpringGreen = $9AFA00;
```

C++

```
clWebMediumSpringGreen = 0x9AFA00;
```

File

Graphics

Description

This is constant Graphics.clWebMediumSpringGreen.

8.7.139 Graphics.clWebMediumTurquoise Constant

Pascal

```
clWebMediumTurquoise = $CCD148;
```

C++

```
clWebMediumTurquoise = 0xCCD148;
```

File

Graphics

Description

This is constant Graphics.clWebMediumTurquoise.

8.7.140 Graphics.clWebMediumVioletRed Constant

Pascal

```
clWebMediumVioletRed = $8515C7;
```

C++

```
clWebMediumVioletRed = 0x8515C7;
```

File

Graphics

Description

This is constant Graphics.clWebMediumVioletRed.

8.7.141 Graphics.clWebMidnightBlue Constant

Pascal

```
clWebMidnightBlue = $701919;
```

C++

```
clWebMidnightBlue = 0x701919;
```

File

Graphics

Description

This is constant Graphics.clWebMidnightBlue.

8.7.142 Graphics.clWebMintcream Constant

Pascal

```
clWebMintcream = $FAFFF5;
```

C++

```
clWebMintcream = 0xFAFFF5;
```

File

Graphics

Description

This is constant Graphics.clWebMintcream.

8.7.143 Graphics.clWebMistyRose Constant

Pascal

```
clWebMistyRose = $E1E4FF;
```

C++

```
clWebMistyRose = 0xE1E4FF;
```

File

Graphics

Description

This is constant Graphics.clWebMistyRose.

8.7.144 Graphics.clWebMoccasin Constant

Pascal

```
clWebMoccasin = $B5E4FF;
```

C++

```
clWebMoccasin = 0xB5E4FF;
```

File

Graphics

Description

This is constant Graphics.clWebMoccasin.

8.7.145 Graphics.clWebNavajoWhite Constant

Pascal

```
clWebNavajoWhite = $ADDEFF;
```

C++

```
clWebNavajoWhite = 0xADDEFF;
```

File

Graphics

Description

This is constant Graphics.clWebNavajoWhite.

8.7.146 Graphics.clWebNavy Constant

Pascal

```
clWebNavy = $800000;
```

C++

```
clWebNavy = 0x800000;
```

File

Graphics

Description

This is constant Graphics.clWebNavy.

8.7.147 Graphics.clWebOldLace Constant

Pascal

```
clWebOldLace = $E6F5FD;
```

C++

```
clWebOldLace = 0xE6F5FD;
```

File

Graphics

Description

This is constant Graphics.clWebOldLace.

8.7.148 Graphics.clWebOlive Constant

Pascal

```
clWebOlive = $008080;
```

C++

```
clWebOlive = 0x008080;
```

File

Graphics

Description

This is constant Graphics.clWebOlive.

8.7.149 Graphics.clWebOliveDrab Constant

Pascal

```
clWebOliveDrab = $238E6B;
```

C++

```
clWebOliveDrab = 0x238E6B;
```

File

Graphics

Description

This is constant Graphics.clWebOliveDrab.

8.7.150 Graphics.clWebOrange Constant

Pascal

```
clWebOrange = $00A5FF;
```

C++

```
clWebOrange = 0x00A5FF;
```

File

Graphics

Description

This is constant Graphics.clWebOrange.

8.7.151 Graphics.clWebOrangeRed Constant

Pascal

```
clWebOrangeRed = $0045FF;
```

C++

```
clWebOrangeRed = 0x0045FF;
```

File

Graphics

Description

This is constant Graphics.clWebOrangeRed.

8.7.152 Graphics.clWebOrchid Constant

Pascal

```
clWebOrchid = $D670DA;
```

C++

```
clWebOrchid = 0xD670DA;
```

File

Graphics

Description

This is constant Graphics.clWebOrchid.

8.7.153 Graphics.clWebPaleGoldenrod Constant

Pascal

```
clWebPaleGoldenrod = $AAE8EE;
```

C++

```
clWebPaleGoldenrod = 0xAAE8EE;
```

File

Graphics

Description

This is constant Graphics.clWebPaleGoldenrod.

8.7.154 Graphics.clWebPaleGreen Constant

Pascal

```
clWebPaleGreen = $98FB98;
```

C++

```
clWebPaleGreen = 0x98FB98;
```

File

Graphics

Description

This is constant Graphics.clWebPaleGreen.

8.7.155 Graphics.clWebPaleTurquoise Constant

Pascal

```
clWebPaleTurquoise = $EEEEAF;
```

C++

```
clWebPaleTurquoise = 0xEEEEAF;
```

File

Graphics

Description

This is constant Graphics.clWebPaleTurquoise.

8.7.156 Graphics.clWebPaleVioletRed Constant

Pascal

```
clWebPaleVioletRed = $9370DB;
```

C++

```
clWebPaleVioletRed = 0x9370DB;
```

File

Graphics

Description

This is constant Graphics.clWebPaleVioletRed.

8.7.157 Graphics.clWebPapayaWhip Constant

Pascal

```
clWebPapayaWhip = $D5EFFF;
```

C++

```
clWebPapayaWhip = 0xD5EFFF;
```

File

Graphics

Description

This is constant Graphics.clWebPapayaWhip.

8.7.158 Graphics.clWebPeachPuff Constant

Pascal

```
clWebPeachPuff = $B9DAFF;
```

C++

```
clWebPeachPuff = 0xB9DAFF;
```

File

Graphics

Description

This is constant Graphics.clWebPeachPuff.

8.7.159 Graphics.clWebPeru Constant

Pascal

```
clWebPeru = $3F85CD;
```

C++

```
clWebPeru = 0x3F85CD;
```

File

Graphics

Description

This is constant Graphics.clWebPeru.

8.7.160 Graphics.clWebPink Constant

Pascal

```
clWebPink = $CBC0FF;
```

C++

```
clWebPink = 0xCBC0FF;
```

File

Graphics

Description

This is constant Graphics.clWebPink.

8.7.161 Graphics.clWebPlum Constant

Pascal

```
clWebPlum = $DDA0DD;
```

C++

```
clWebPlum = 0xDDA0DD;
```

File

Graphics

Description

This is constant Graphics.clWebPlum.

8.7.162 Graphics.clWebPowderBlue Constant

Pascal

```
clWebPowderBlue = $E6E0B0;
```

C++

```
clWebPowderBlue = 0xE6E0B0;
```

File

Graphics

Description

This is constant Graphics.clWebPowderBlue.

8.7.163 Graphics.clWebPurple Constant

Pascal

```
clWebPurple = $800080;
```

C++

```
clWebPurple = 0x800080;
```

File

Graphics

Description

This is constant Graphics.clWebPurple.

8.7.164 Graphics.clWebRed Constant

Pascal

```
clWebRed = $0000FF;
```

C++

```
clWebRed = 0x0000FF;
```

File

Graphics

Description

This is constant Graphics.clWebRed.

8.7.165 Graphics.clWebRosyBrown Constant

Pascal

```
clWebRosyBrown = $8F8FBC;
```

C++

```
clWebRosyBrown = 0x8F8FBC;
```

File

Graphics

Description

This is constant Graphics.clWebRosyBrown.

8.7.166 Graphics.clWebRoyalBlue Constant

Pascal

```
clWebRoyalBlue = $E16941;
```

C++

```
clWebRoyalBlue = 0xE16941;
```

File

Graphics

Description

This is constant Graphics.clWebRoyalBlue.

8.7.167 Graphics.clWebSaddleBrown Constant

Pascal

```
clWebSaddleBrown = $13458B;
```

C++

```
clWebSaddleBrown = 0x13458B;
```

File

Graphics

Description

This is constant Graphics.clWebSaddleBrown.

8.7.168 Graphics.clWebSalmon Constant

Pascal

```
clWebSalmon = $7280FA;
```

C++

```
clWebSalmon = 0x7280FA;
```

File

Graphics

Description

This is constant Graphics.clWebSalmon.

8.7.169 Graphics.clWebSandyBrown Constant

Pascal

```
clWebSandyBrown = $60A4F4;
```

C++

```
clWebSandyBrown = 0x60A4F4;
```

File

Graphics

Description

This is constant Graphics.clWebSandyBrown.

8.7.170 Graphics.clWebSeaGreen Constant

Pascal

```
clWebSeaGreen = $578B2E;
```

C++

```
clWebSeaGreen = 0x578B2E;
```

File

Graphics

Description

This is constant Graphics.clWebSeaGreen.

8.7.171 Graphics.clWebSeashell Constant

Pascal

```
clWebSeashell = $EEF5FF;
```

C++

```
clWebSeashell = 0xEEF5FF;
```

File

Graphics

Description

This is constant Graphics.clWebSeashell.

8.7.172 Graphics.clWebSienna Constant

Pascal

```
clWebSienna = $2D52A0;
```

C++

```
clWebSienna = 0x2D52A0;
```

File

Graphics

Description

This is constant Graphics.clWebSienna.

8.7.173 Graphics.clWebSilver Constant

Pascal

```
clWebSilver = $C0C0C0;
```

C++

```
clWebSilver = 0xC0C0C0;
```

File

Graphics

Description

This is constant Graphics.clWebSilver.

8.7.174 Graphics.clWebSkyBlue Constant

Pascal

```
clWebSkyBlue = $EBCE87;
```

C++

```
clWebSkyBlue = 0xEBCE87;
```

File

Graphics

Description

This is constant Graphics.clWebSkyBlue.

8.7.175 Graphics.clWebSlateBlue Constant

Pascal

```
clWebSlateBlue = $CD5A6A;
```

C++

```
clWebSlateBlue = 0xCD5A6A;
```

File

Graphics

Description

This is constant Graphics.clWebSlateBlue.

8.7.176 Graphics.clWebSlateGray Constant

Pascal

```
clWebSlateGray = $908070;
```

C++

```
clWebSlateGray = 0x908070;
```

File

Graphics

Description

This is constant Graphics.clWebSlateGray.

8.7.177 Graphics.clWebSnow Constant

Pascal

```
clWebSnow = $FAFAFF;
```

C++

```
clWebSnow = 0xFAFAFF;
```

File

Graphics

Description

This is constant Graphics.clWebSnow.

8.7.178 Graphics.clWebSpringGreen Constant

Pascal

```
clWebSpringGreen = $7FFF00;
```

C++

```
clWebSpringGreen = 0x7FFF00;
```

File

Graphics

Description

This is constant Graphics.clWebSpringGreen.

8.7.179 Graphics.clWebSteelBlue Constant

Pascal

```
clWebSteelBlue = $B48246;
```

C++

```
clWebSteelBlue = 0xB48246;
```

File

Graphics

Description

This is constant Graphics.clWebSteelBlue.

8.7.180 Graphics.clWebTan Constant

Pascal

```
clWebTan = $8CB4D2;
```

C++

```
clWebTan = 0x8CB4D2;
```

File

Graphics

Description

This is constant Graphics.clWebTan.

8.7.181 Graphics.clWebTeal Constant

Pascal

```
clWebTeal = $808000;
```

C++

```
clWebTeal = 0x808000;
```

File

Graphics

Description

This is constant Graphics.clWebTeal.

8.7.182 Graphics.clWebThistle Constant

Pascal

```
clWebThistle = $D8BFD8;
```

C++

```
clWebThistle = 0xD8BFD8;
```

File

Graphics

Description

This is constant Graphics.clWebThistle.

8.7.183 Graphics.clWebTomato Constant

Pascal

```
clWebTomato = $4763FF;
```

C++

```
clWebTomato = 0x4763FF;
```

File

Graphics

Description

This is constant Graphics.clWebTomato.

8.7.184 Graphics.clWebTurquoise Constant

Pascal

```
clWebTurquoise = $D0E040;
```

C++

```
clWebTurquoise = 0xD0E040;
```

File

Graphics

Description

This is constant Graphics.clWebTurquoise.

8.7.185 Graphics.clWebViolet Constant

Pascal

```
clWebViolet = $EE82EE;
```

C++

```
clWebViolet = 0xEE82EE;
```

File

Graphics

Description

This is constant Graphics.clWebViolet.

8.7.186 Graphics.clWebWheat Constant

Pascal

```
clWebWheat = $B3DEF5;
```

C++

```
clWebWheat = 0xB3DEF5;
```

File

Graphics

Description

This is constant Graphics.clWebWheat.

8.7.187 Graphics.clWebWhite Constant

Pascal

```
clWebWhite = $FFFFFF;
```

C++

```
clWebWhite = 0xFFFFFF;
```

File

Graphics

Description

This is constant Graphics.clWebWhite.

8.7.188 Graphics.clWebWhiteSmoke Constant

Pascal

```
clWebWhiteSmoke = $F5F5F5;
```

C++

```
clWebWhiteSmoke = 0xF5F5F5;
```

File

Graphics

Description

This is constant Graphics.clWebWhiteSmoke.

8.7.189 Graphics.clWebYellow Constant

Pascal

```
clWebYellow = $00FFFF;
```

C++

```
clWebYellow = 0x00FFFF;
```

File

Graphics

Description

This is constant Graphics.clWebYellow.

8.7.190 Graphics.clWebYellowGreen Constant

Pascal

```
clWebYellowGreen = $32CD9A;
```

C++

```
clWebYellowGreen = 0x32CD9A;
```

File

Graphics

Description

This is constant Graphics.clWebYellowGreen.

8.7.191 Graphics.clWhite Constant

Represents the color white.

Pascal

```
clWhite = TColor($FFFFFF);
```

C++

```
clWhite = TColor($FFFFFF);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to white. White is 100% intensity blue, green and red. White is a standard color.

Color (see page 2669)

TColor (see page 2878)

8.7.192 Graphics.clWindow Constant

Represents the default Window background color.

Pascal

```
clWindow = TColor(clSystemColor or COLOR_WINDOW);
```

C++

```
clWindow = TColor(clSystemColor or COLOR_WINDOW);
```

File

Graphics

Description

clWindow is the default background color for a window.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.193 Graphics.clWindowFrame Constant

Represents the default Window frame background color.

Pascal

```
clWindowFrame = TColor(clSystemColor or COLOR_WINDOWFRAME);
```

C++

```
clWindowFrame = TColor(clSystemColor or COLOR_WINDOWFRAME);
```

File

Graphics

Description

clWindowFrame is the default background color for a window frame.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.194 Graphics.clWindowText Constant

Represents the default Window text color.

Pascal

```
clWindowText = TColor(clSystemColor or COLOR_WINDOWTEXT);
```

C++

```
clWindowText = TColor(clSystemColor or COLOR_WINDOWTEXT);
```

File

Graphics

Description

clWindowText is the default color for window text.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.195 Graphics.clYellow Constant

Represents the color yellow.

Pascal

```
clYellow = TColor($00FFFF);
```

C++

```
clYellow = TColor($00FFFF);
```

File

Graphics

Description

Use the Color property of a visual component to set its principle color to yellow. Yellow is 100% green, 100% red and 0% blue. Yellow is a standard color.

See Also

Color (see page 2669)

TColor (see page 2878)

8.7.196 Graphics.cmBlackness Constant

TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with black.

Pascal

```
cmBlackness = BLACKNESS;
```

C++

```
cmBlackness = BLACKNESS;
```

File

Graphics

Description

cmBlackness is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

cmBlackness results in the destination rectangle on the canvas simply being filled with the clBlack (see page 2899) color.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.197 Graphics.cmDstInvert Constant

TCopyMode (see page 2880) value : inverts the image on the canvas and ignores the source.

Pascal

```
cmDstInvert = DSTINVERT;
```

C++

```
cmDstInvert = DSTINVERT;
```

File

Graphics

Description

cmDstInvert is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

cmDstInvert results in the the bits of each pixel in destination rectangle on the canvas simply being inverted. The source rectangle is ignored.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.198 Graphics.cmMergeCopy Constant

TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean AND operator.

Pascal

```
cmMergeCopy = MERGECOPY;
```

C++

```
cmMergeCopy = MERGECOPY;
```

File

Graphics

Description

cmMergeCopy is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

cmMergeCopy results in the pixels in the source and destination rectangles being logically ANDed. For example, a green pixel in the source will merge with a blue destination pixel to result in a cyan pixel.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.199 Graphics.cmMergePaint Constant

TCopyMode (see page 2880) value : combines the inverted source bitmap with the image on the canvas by using the Boolean OR operator.

Pascal

```
cmMergePaint = MERGEPAINT;
```

C++

```
cmMergePaint = MERGEPAINT;
```

File

Graphics

Description

cmMergePaint is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmMergePaint, the source pixels are inverted before being logically ORed with the destination pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.200 Graphics.cmNotSrcCopy Constant

TCopyMode (see page 2880) value : copies the inverted source bitmap to the canvas.

Pascal

```
cmNotSrcCopy = NOTSRCCOPY;
```

C++

```
cmNotSrcCopy = NOTSRCCOPY;
```

File

Graphics

Description

cmNotSrcCopy is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmNotSrcCopy, the source pixels are inverted before being written to the target rectangle. The existing target rectangle contents are ignored and overwritten.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.201 Graphics.cmNotSrcErase Constant

TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator, and inverts the result.

Pascal

```
cmNotSrcErase = NOTSRCERASE;
```

C++

```
cmNotSrcErase = NOTSRCERASE;
```

File

Graphics

Description

cmNotSrcErase is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmNotSrcErase, the source and destination pixels are ORed together and the result inverted and stored in the target rectangle.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.202 Graphics.cmPatCopy Constant

TCopyMode (see page 2880) value : copies the source pattern to the canvas.

Pascal

```
cmPatCopy = PATCOPY;
```

C++

```
cmPatCopy = PATCOPY;
```

File

Graphics

Description

cmPatCopy is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmPatCopy, the source pattern is written to the target rectangle.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.203 Graphics.cmPatInvert Constant

TCopyMode (see page 2880) value : combines the source pattern with the image on the canvas using the Boolean XOR operator.

Pascal

```
cmPatInvert = PATINVERT;
```

C++

```
cmPatInvert = PATINVERT;
```

File

Graphics

Description

cmPatInvert is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

cmPatInvert, XORs each source pattern pixel with the target image pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.204 Graphics.cmPatPaint Constant

TCopyMode (see page 2880) value : combines the inverted source bitmap with the source pattern by using the Boolean OR operator. Combines the result of this operation with the image on the canvas by using the Boolean OR operator.

Pascal

```
cmPatPaint = PATPAINT;
```

C++

```
cmPatPaint = PATPAINT;
```

File

Graphics

Description

cmPatPaint is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmPatPaint, the source pattern and inverted bitmap pixels are ORed before ORing the resulting pixels with the target image pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.205 Graphics.cmSrcAnd Constant

TCopyMode (see page 2880) value : combines the image on the canvas and source bitmap by using the Boolean AND operator.

Pascal

```
cmSrcAnd = SRCAND;
```

C++

```
cmSrcAnd = SRCAND;
```

File

Graphics

Description

cmSrcAnd is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmSrcAnd, the source pixels are ANDed with the target target pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.206 Graphics.cmSrcCopy Constant

TCopyMode (see page 2880) value : copies the source bitmap to the canvas.

Pascal

```
cmSrcCopy = SRCCOPY;
```

C++

```
cmSrcCopy = SRCCOPY;
```

File

Graphics

Description

cmSrcCopy is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmSrcCopy, the source pixels are written unchanged to the target rectangle.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.207 Graphics.cmSrcErase Constant

TCopyMode (see page 2880) value : inverts the image on the canvas and combines the result with the source bitmap by using the Boolean AND operator.

Pascal

```
cmSrcErase = SRCERASE;
```

C++

```
cmSrcErase = SRCERASE;
```

File

Graphics

Description

cmSrcErase is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmSrcErase, the source pixels are ANDed with the inverted target pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.208 Graphics.cmSrcInvert Constant

TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean XOR operator.

Pascal

```
cmSrcInvert = SRCINVERT;
```

C++

```
cmSrcInvert = SRCINVERT;
```

File

Graphics

Description

cmSrcInvert is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmSrcInvert, the source pixels are XORed with the target pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.209 Graphics.cmSrcPaint Constant

TCopyMode (see page 2880) value : combines the image on the canvas and the source bitmap by using the Boolean OR operator.

Pascal

```
cmSrcPaint = SRCPAINT;
```

C++

```
cmSrcPaint = SRCPAINT;
```

File

Graphics

Description

cmSrcPaint is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

With cmSrcPaint, the source pixels are ORed with the target pixels.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.210 Graphics.cmWhiteness Constant

TCopyMode (see page 2880) value : fills the destination rectangle on the canvas with white.

Pascal

```
cmWhiteness = WHITENESS;
```

C++

```
cmWhiteness = WHITENESS;
```

File

Graphics

Description

cmWhiteness is a TCopyMode (see page 2880) value used in the TCanvas (see page 2673) CopyMode property.

The CopyMode property is used by the CopyRect routine when copying an image from another canvas onto the current canvas.

cmWhiteness results in the destination rectangle on the canvas simply being filled with the clWhite (see page 2965) color.

See Also

CopyMode (see page 2719)

CopyRect (see page 2683)

TCopyMode (see page 2880)

8.7.211 Graphics.ExtendedColorsCount Constant

The total number of extended colors available

Pascal

```
ExtendedColorsCount = 4;
```

C++

```
ExtendedColorsCount = 4;
```

File

Graphics

Description

TColor (see page 2878) can be assigned standard, extended, web and system color values. The system colors are default values for various visual component colors. Extended colors are :

Name	Meaning
clMoneyGreen (see page 2913)	Money Green.
clSkyBlue (see page 2917)	Sky blue.
clCream (see page 2902)	Cream.
clMedGray (see page 2911)	Medium Gray.

See Also

Color (see page 2669)

StandardColorsCount (see page 2977)

WebColorsCount (see page 2978)

TColor (see page 2878)

8.7.212 Graphics.rc3_Cursor Constant

Pascal

```
rc3_Cursor = 2;
```

C++

```
rc3_Cursor = 2;
```

File

Graphics

Description

This is constant Graphics.rc3_Cursor.

8.7.213 Graphics.rc3_Icon Constant

Pascal

```
rc3_Icon = 1;
```

C++

```
rc3_Icon = 1;
```

File

Graphics

Description

This is constant Graphics.rc3_Icon.

8.7.214 Graphics.rc3_StockIcon Constant

Pascal

```
rc3_StockIcon = 0;
```

C++

```
rc3_StockIcon = 0;
```

File

Graphics

Description

This is constant Graphics.rc3_StockIcon.

8.7.215 Graphics.StandardColorsCount Constant

The total number of standard colors available

Pascal

```
StandardColorsCount = 16;
```

C++

```
StandardColorsCount = 16;
```

File

Graphics

Description

TColor (see page 2878) can be assigned standard, extended, web and system color values. The system colors are default values for various visual component colors. Extended colors include clCream (see page 2902). The standard colors are :

Name	Meaning
clBlack (see page 2899)	Black.
clMaroon (see page 2911)	Maroon.
clOlive (see page 2915)	Olive.
clNavy (see page 2914)	Navy.
clPurple (see page 2915)	Purple.
clTeal (see page 2918)	Teal.
clGray (see page 2905)	Gray.
clSilver (see page 2916)	Silver.
clRed (see page 2916)	Red.
clLime (see page 2910)	Lime.
clYellow (see page 2967)	Yellow.
clBlue (see page 2899)	Blue.
clFuchsia (see page 2903)	Fuchsia.
clAqua (see page 2898)	Aqua (cyan).
clLtGray (see page 2910)	Light Gray.
clDkGray (see page 2903)	Dark Gray.
clWhite (see page 2965)	White.

See Also

Color (see page 2669)

ExtendedColorsCount (see page 2975)

WebColorsCount (see page 2978)

TColor (see page 2878)

8.7.216 Graphics.WebColorsCount Constant

The total number of web colors available

Pascal

```
WebColorsCount = 140;
```

C++

```
WebColorsCount = 140;
```

File

Graphics

Description

TColor (see page 2878) can be assigned standard, extended, web and system color values. The system colors are default values for various visual component colors. Web colors are those defined as uniformly displayable across the Internet - they represent the Internet standard colors.

See Also

Color (see page 2669)

ExtendedColorsCount (see page 2975)

StandardColorsCount (see page 2977)

TColor (see page 2878)

9 GraphUtil Namespace

This is namespace GraphUtil.

Topics

Name	Description
Functions (see page 2981)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2989)	The following table lists structs, records, enums in this documentation.
Types (see page 2992)	The following table lists types in this documentation.
Constants (see page 2993)	The following table lists constants in this documentation.

Constants

Name	Description
WebNamedColors (see page 2993)	This is constant GraphUtil.WebNamedColors.
WebNamedColorsCount (see page 2995)	This is constant GraphUtil.WebNamedColorsCount.

Functions

	Name	Description
	ColorAdjustLuma (see page 2981)	This is function GraphUtil.ColorAdjustLuma.
	ColorHLSToRGB (see page 2982)	This is function GraphUtil.ColorHLSToRGB.
	ColorRGBToHLS (see page 2982)	This is function GraphUtil.ColorRGBToHLS.
	ColorToWebColorName (see page 2982)	This is function GraphUtil.ColorToWebColorName.
	ColorToWebColorStr (see page 2983)	This is function GraphUtil.ColorToWebColorStr.
	DrawArrow (see page 2983)	This is function GraphUtil.DrawArrow.
	DrawCheck (see page 2983)	This is function GraphUtil.DrawCheck.
	DrawChevron (see page 2984)	This is function GraphUtil.DrawChevron.
	DrawTransparentBitmap (see page 2984)	This is function GraphUtil.DrawTransparentBitmap.
	DrawTransparentBitmap (see page 2984)	This is function GraphUtil.DrawTransparentBitmap.
	GetHighLightColor (see page 2985)	This is function GraphUtil.GetHighLightColor.
	GetShadowColor (see page 2985)	This is function GraphUtil.GetShadowColor.
	GradientFillCanvas (see page 2985)	This is function GraphUtil.GradientFillCanvas.
	LoadCompressedResourceBitmap (see page 2986)	This is function GraphUtil.LoadCompressedResourceBitmap.
	RGBToWebColorName (see page 2986)	This is function GraphUtil.RGBToWebColorName.
	RGBToWebColorStr (see page 2986)	This is function GraphUtil.RGBToWebColorStr.
	ScaleImage (see page 2987)	This is function GraphUtil.ScaleImage.
	SortColorArray (see page 2987)	This is function GraphUtil.SortColorArray.
	SplitTransparentBitmap (see page 2987)	This is function GraphUtil.SplitTransparentBitmap.

	WebColorNameToColor (see page 2988)	This is function GraphUtil.WebColorNameToColor.
	WebColorStrToColor (see page 2988)	This is function GraphUtil.WebColorStrToColor.
	WebColorToRGB (see page 2988)	This is function GraphUtil.WebColorToRGB.

Structs, Records, Enums

	Name	Description
	TArrowType (see page 2989)	This is record GraphUtil.TArrowType.
	TColorArraySortType (see page 2989)	This is record GraphUtil.TColorArraySortType.
	TGradientDirection (see page 2990)	This is record GraphUtil.TGradientDirection.
	TScrollDirection (see page 2990)	This is record GraphUtil.TScrollDirection.

Types

Name	Description
TColorArray (see page 2992)	This is type GraphUtil.TColorArray.

9.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ColorAdjustLuma (see page 2981)	This is function GraphUtil.ColorAdjustLuma.
	ColorHLSToRGB (see page 2982)	This is function GraphUtil.ColorHLSToRGB.
	ColorRGBToHLS (see page 2982)	This is function GraphUtil.ColorRGBToHLS.
	ColorToWebColorName (see page 2982)	This is function GraphUtil.ColorToWebColorName.
	ColorToWebColorStr (see page 2983)	This is function GraphUtil.ColorToWebColorStr.
	DrawArrow (see page 2983)	This is function GraphUtil.DrawArrow.
	DrawCheck (see page 2983)	This is function GraphUtil.DrawCheck.
	DrawChevron (see page 2984)	This is function GraphUtil.DrawChevron.
	DrawTransparentBitmap (see page 2984)	This is function GraphUtil.DrawTransparentBitmap.
	DrawTransparentBitmap (see page 2984)	This is function GraphUtil.DrawTransparentBitmap.
	GetHighLightColor (see page 2985)	This is function GraphUtil.GetHighLightColor.
	GetShadowColor (see page 2985)	This is function GraphUtil.GetShadowColor.
	GradientFillCanvas (see page 2985)	This is function GraphUtil.GradientFillCanvas.
	LoadCompressedResourceBitmap (see page 2986)	This is function GraphUtil.LoadCompressedResourceBitmap.
	RGBToWebColorName (see page 2986)	This is function GraphUtil.RGBToWebColorName.
	RGBToWebColorStr (see page 2986)	This is function GraphUtil.RGBToWebColorStr.
	ScaleImage (see page 2987)	This is function GraphUtil.ScaleImage.
	SortColorArray (see page 2987)	This is function GraphUtil.SortColorArray.
	SplitTransparentBitmap (see page 2987)	This is function GraphUtil.SplitTransparentBitmap.
	WebColorNameToColor (see page 2988)	This is function GraphUtil.WebColorNameToColor.
	WebColorStrToColor (see page 2988)	This is function GraphUtil.WebColorStrToColor.
	WebColorToRGB (see page 2988)	This is function GraphUtil.WebColorToRGB.

9.1.1 GraphUtil.ColorAdjustLuma Function

Pascal

```
function ColorAdjustLuma(clrRGB: TColor; n: Integer; fScale: BOOL): TColor;
```

C++

```
TColor ColorAdjustLuma(TColor clrRGB, int n, BOOL fScale);
```

File

GraphUtil

Description

This is function GraphUtil.ColorAdjustLuma.

9.1.2 GraphUtil.ColorHLSToRGB Function

Pascal

```
function ColorHLSToRGB(Hue: Word; Luminance: Word; Saturation: Word): TColorRef;
```

C++

```
TColorRef ColorHLSToRGB(Word Hue, Word Luminance, Word Saturation);
```

File

GraphUtil

Description

This is function GraphUtil.ColorHLSToRGB.

9.1.3 GraphUtil.ColorRGBToHLS Function

Pascal

```
procedure ColorRGBToHLS(clrRGB: TColorRef; var Hue: Word; var Luminance: Word; var Saturation:
Word);
```

C++

```
ColorRGBToHLS(TColorRef clrRGB, Word Hue, Word Luminance, Word Saturation);
```

File

GraphUtil

Description

This is function GraphUtil.ColorRGBToHLS.

9.1.4 GraphUtil.ColorToWebColorName Function

Pascal

```
function ColorToWebColorName(Color: TColor): string;
```

C++

```
UnicodeString ColorToWebColorName(TColor Color);
```

File

GraphUtil

Description

This is function GraphUtil.ColorToWebColorName.

9.1.5 GraphUtil.ColorToWebColorStr Function

Pascal

```
function ColorToWebColorStr(Color: TColor): string;
```

C++

```
UnicodeString ColorToWebColorStr(TColor Color);
```

File

GraphUtil

Description

This is function GraphUtil.ColorToWebColorStr.

9.1.6 GraphUtil.DrawArrow Function

Pascal

```
procedure DrawArrow(ACanvas: TCanvas; Direction: TScrollDirection; Location: TPoint; Size:
Integer);
```

C++

```
DrawArrow(TCanvas ACanvas, TScrollDirection Direction, TPoint Location, int Size);
```

File

GraphUtil

Description

This is function GraphUtil.DrawArrow.

9.1.7 GraphUtil.DrawCheck Function

Pascal

```
procedure DrawCheck(ACanvas: TCanvas; Location: TPoint; Size: Integer; Shadow: Boolean = True);
```

C++

```
DrawCheck(TCanvas ACanvas, TPoint Location, int Size, Boolean Shadow = True);
```

File

GraphUtil

Description

This is function GraphUtil.DrawCheck.

9.1.8 GraphUtil.DrawChevron Function

Pascal

```
procedure DrawChevron(ACanvas: TCanvas; Direction: TScrollDirection; Location: TPoint; Size:
Integer);
```

C++

```
DrawChevron(TCanvas ACanvas, TScrollDirection Direction, TPoint Location, int Size);
```

File

GraphUtil

Description

This is function GraphUtil.DrawChevron.

9.1.9 GraphUtil.DrawTransparentBitmap Function

Pascal

```
procedure DrawTransparentBitmap(Source: TBitmap; Destination: TCanvas; DestRect: TRect;
Opacity: Byte); overload;
```

C++

```
DrawTransparentBitmap(TBitmap Source, TCanvas Destination, TRect DestRect, Byte Opacity);
```

File

GraphUtil

Description

This is function GraphUtil.DrawTransparentBitmap.

9.1.10 GraphUtil.DrawTransparentBitmap Function

Pascal

```
procedure DrawTransparentBitmap(Source: TBitmap; SourceRect: TRect; Destination: TCanvas;
DestRect: TRect; Opacity: Byte); overload;
```

C++

```
DrawTransparentBitmap(TBitmap Source, TRect SourceRect, TCanvas Destination, TRect DestRect,
Byte Opacity);
```

File

GraphUtil

Description

This is function GraphUtil.DrawTransparentBitmap.

9.1.11 GraphUtil.GetHighLightColor Function

Pascal

```
function GetHighLightColor(const Color: TColor; Luminance: Integer = 19): TColor;
```

C++

```
TColor GetHighLightColor(const TColor Color, int Luminance = 19);
```

File

GraphUtil

Description

This is function GraphUtil.GetHighLightColor.

9.1.12 GraphUtil.GetShadowColor Function

Pascal

```
function GetShadowColor(const Color: TColor; Luminance: Integer = -50): TColor;
```

C++

```
TColor GetShadowColor(const TColor Color, int Luminance = -50);
```

File

GraphUtil

Description

This is function GraphUtil.GetShadowColor.

9.1.13 GraphUtil.GradientFillCanvas Function

Pascal

```
procedure GradientFillCanvas(const ACanvas: TCanvas; const AStartColor: TColor; const
AEndColor: TColor; const ARect: TRect; const Direction: TGradientDirection);
```

C++

```
GradientFillCanvas(const TCanvas ACanvas, const TColor AStartColor, const TColor AEndColor,
const TRect ARect, const TGradientDirection Direction);
```

File

GraphUtil

Description

This is function GraphUtil.GradientFillCanvas.

9.1.14 GraphUtil.LoadCompressedResourceBitmap Function

Pascal

```
function LoadCompressedResourceBitmap(ResID: string): TBitmap;
```

C++

```
TBitmap LoadCompressedResourceBitmap(UnicodeString ResID);
```

File

GraphUtil

Description

This is function GraphUtil.LoadCompressedResourceBitmap.

9.1.15 GraphUtil.RGBToWebColorName Function

Pascal

```
function RGBToWebColorName(RGB: Integer): string;
```

C++

```
UnicodeString RGBToWebColorName(int RGB);
```

File

GraphUtil

Description

This is function GraphUtil.RGBToWebColorName.

9.1.16 GraphUtil.RGBToWebColorStr Function

Pascal

```
function RGBToWebColorStr(RGB: Integer): string;
```

C++

```
UnicodeString RGBToWebColorStr(int RGB);
```

File

GraphUtil

Description

This is function GraphUtil.RGBToWebColorStr.

9.1.17 GraphUtil.ScaleImage Function

Pascal

```
procedure ScaleImage(const SourceBitmap: TBitmap; const ResizedBitmap: TBitmap; const
ScaleAmount: Double);
```

C++

```
ScaleImage(const TBitmap SourceBitmap, const TBitmap ResizedBitmap, const Double ScaleAmount);
```

File

GraphUtil

Description

This is function GraphUtil.ScaleImage.

9.1.18 GraphUtil.SortColorArray Function

Pascal

```
procedure SortColorArray(ColorArray: TColorArray; L: Integer; R: Integer; SortType:
TColorArraySortType; Reverse: Boolean = False);
```

C++

```
SortColorArray(TColorArray ColorArray, int L, int R, TColorArraySortType SortType, Boolean
Reverse = False);
```

File

GraphUtil

Description

This is function GraphUtil.SortColorArray.

9.1.19 GraphUtil.SplitTransparentBitmap Function

Pascal

```
function SplitTransparentBitmap(Source: TBitmap; SourceRect: TRect): TBitmap;
```

C++

```
TBitmap SplitTransparentBitmap(TBitmap Source, TRect SourceRect);
```

File

GraphUtil

Description

This is function GraphUtil.SplitTransparentBitmap.

9.1.20 GraphUtil.WebColorNameToColor Function

Pascal

```
function WebColorNameToColor(WebColorName: string): TColor;
```

C++

```
TColor WebColorNameToColor(UnicodeString WebColorName);
```

File

GraphUtil

Description

This is function GraphUtil.WebColorNameToColor.

9.1.21 GraphUtil.WebColorStrToColor Function

Pascal

```
function WebColorStrToColor(WebColor: string): TColor;
```

C++

```
TColor WebColorStrToColor(UnicodeString WebColor);
```

File

GraphUtil

Description

This is function GraphUtil.WebColorStrToColor.

9.1.22 GraphUtil.WebColorToRGB Function

Pascal

```
function WebColorToRGB(WebColor: Integer): Integer;
```

C++

```
int WebColorToRGB(int WebColor);
```

File

GraphUtil

Description

This is function GraphUtil.WebColorToRGB.

9.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TArrowType (see page 2989)	This is record GraphUtil.TArrowType.
	TColorArraySortType (see page 2989)	This is record GraphUtil.TColorArraySortType.
	TGradientDirection (see page 2990)	This is record GraphUtil.TGradientDirection.
	TScrollDirection (see page 2990)	This is record GraphUtil.TScrollDirection.

9.2.1 GraphUtil.TArrowType Enumeration

Pascal

```
TArrowType = (
  atSolid,
  atArrows
);
```

C++

```
enum TArrowType {
  atSolid,
  atArrows
};
```

File

GraphUtil

Description

This is record GraphUtil.TArrowType.

9.2.2 GraphUtil.TColorArraySortType Enumeration

Pascal

```
TColorArraySortType = (
  stHue,
  stSaturation,
  stLuminance,
  stRed,
  stGreen,
  stBlue,
  stCombo
);
```

C++

```
enum TColorArraySortType {
  stHue,
  stSaturation,
```

```
    stLuminance,
    stRed,
    stGreen,
    stBlue,
    stCombo
  };
```

File

GraphUtil

Description

This is record GraphUtil.TColorArraySortType.

9.2.3 GraphUtil.TGradientDirection Enumeration

Pascal

```
  TGradientDirection = (
    gdHorizontal,
    gdVertical
  );
```

C++

```
  enum TGradientDirection {
    gdHorizontal,
    gdVertical
  };
```

File

GraphUtil

Description

This is record GraphUtil.TGradientDirection.

9.2.4 GraphUtil.TScrollDirection Enumeration

Pascal

```
  TScrollDirection = (
    sdLeft,
    sdRight,
    sdUp,
    sdDown
  );
```

C++

```
  enum TScrollDirection {
    sdLeft,
    sdRight,
    sdUp,
    sdDown
  };
```

File

GraphUtil

Description

This is record GraphUtil.TScrollDirection.

9.3 Types

The following table lists types in this documentation.

Types

Name	Description
TColorArray (see page 2992)	This is type GraphUtil.TColorArray.

9.3.1 GraphUtil.TColorArray Type

Pascal

```
TColorArray = array of TIdentMapEntry;
```

C++

```
array of TIdentMapEntry TColorArray;
```

File

GraphUtil

Description

This is type GraphUtil.TColorArray.

9.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
WebNamedColors (see page 2993)	This is constant GraphUtil.WebNamedColors.
WebNamedColorsCount (see page 2995)	This is constant GraphUtil.WebNamedColorsCount.

9.4.1 GraphUtil.WebNamedColors Constant

Pascal

```
WebNamedColors: array[0..WebNamedColorsCount - 1] of TIdentMapEntry = ( (Value: clWebSnow;
Name: 'clWebSnow'), (Value: clWebFloralWhite; Name: 'clWebFloralWhite'), (Value:
clWebLavenderBlush; Name: 'clWebLavenderBlush'), (Value: clWebOldLace; Name: 'clWebOldLace'),
(Value: clWebIvory; Name: 'clWebIvory'), (Value: clWebCornSilk; Name: 'clWebCornSilk'),
(Value: clWebBeige; Name: 'clWebBeige'), (Value: clWebAntiqueWhite; Name:
'clWebAntiqueWhite'), (Value: clWebWheat; Name: 'clWebWheat'), (Value: clWebAliceBlue; Name:
'clWebAliceBlue'), (Value: clWebGhostWhite; Name: 'clWebGhostWhite'), (Value: clWebLavender;
Name: 'clWebLavender'), (Value: clWebSeashell; Name: 'clWebSeashell'), (Value:
clWebLightYellow; Name: 'clWebLightYellow'), (Value: clWebPapayaWhip; Name:
'clWebPapayaWhip'), (Value: clWebNavajoWhite; Name: 'clWebNavajoWhite'), (Value:
clWebMoccasin; Name: 'clWebMoccasin'), (Value: clWebBurlywood; Name: 'clWebBurlywood'),
(Value: clWebAzure; Name: 'clWebAzure'), (Value: clWebMintcream; Name: 'clWebMintcream'),
(Value: clWebHoneydew; Name: 'clWebHoneydew'), (Value: clWebLinen; Name: 'clWebLinen'),
(Value: clWebLemonChiffon; Name: 'clWebLemonChiffon'), (Value: clWebBlanchedAlmond; Name:
'clWebBlanchedAlmond'), (Value: clWebBisque; Name: 'clWebBisque'), (Value: clWebPeachPuff;
Name: 'clWebPeachPuff'), (Value: clWebTan; Name: 'clWebTan'), (Value: clWebYellow; Name:
'clWebYellow'), (Value: clWebDarkOrange; Name: 'clWebDarkOrange'), (Value: clWebRed; Name:
'clWebRed'), (Value: clWebDarkRed; Name: 'clWebDarkRed'), (Value: clWebMaroon; Name:
'clWebMaroon'), (Value: clWebIndianRed; Name: 'clWebIndianRed'), (Value: clWebSalmon; Name:
'clWebSalmon'), (Value: clWebCoral; Name: 'clWebCoral'), (Value: clWebGold; Name:
'clWebGold'), (Value: clWebTomato; Name: 'clWebTomato'), (Value: clWebCrimson; Name:
'clWebCrimson'), (Value: clWebBrown; Name: 'clWebBrown'), (Value: clWebChocolate; Name:
'clWebChocolate'), (Value: clWebSandyBrown; Name: 'clWebSandyBrown'), (Value:
clWebLightSalmon; Name: 'clWebLightSalmon'), (Value: clWebLightCoral; Name:
'clWebLightCoral'), (Value: clWebOrange; Name: 'clWebOrange'), (Value: clWebOrangeRed; Name:
'clWebOrangeRed'), (Value: clWebFirebrick; Name: 'clWebFirebrick'), (Value: clWebSaddleBrown;
Name: 'clWebSaddleBrown'), (Value: clWebSienna; Name: 'clWebSienna'), (Value: clWebPeru; Name:
'clWebPeru'), (Value: clWebDarkSalmon; Name: 'clWebDarkSalmon'), (Value: clWebRosyBrown; Name:
'clWebRosyBrown'), (Value: clWebPaleGoldenrod; Name: 'clWebPaleGoldenrod'), (Value:
clWebLightGoldenrodYellow; Name: 'clWebLightGoldenrodYellow'), (Value: clWebOlive; Name:
'clWebOlive'), (Value: clWebForestGreen; Name: 'clWebForestGreen'), (Value: clWebGreenYellow;
Name: 'clWebGreenYellow'), (Value: clWebChartreuse; Name: 'clWebChartreuse'), (Value:
clWebLightGreen; Name: 'clWebLightGreen'), (Value: clWebAquamarine; Name: 'clWebAquamarine'),
(Value: clWebSeaGreen; Name: 'clWebSeaGreen'), (Value: clWebGoldenRod; Name:
'clWebGoldenRod'), (Value: clWebKhaki; Name: 'clWebKhaki'), (Value: clWebOliveDrab; Name:
'clWebOliveDrab'), (Value: clWebGreen; Name: 'clWebGreen'), (Value: clWebYellowGreen; Name:
'clWebYellowGreen'), (Value: clWebLawnGreen; Name: 'clWebLawnGreen'), (Value: clWebPaleGreen;
Name: 'clWebPaleGreen'), (Value: clWebMediumAquamarine; Name: 'clWebMediumAquamarine'),
(Value: clWebMediumSeaGreen; Name: 'clWebMediumSeaGreen'), (Value: clWebDarkGoldenRod; Name:
'clWebDarkGoldenRod'), (Value: clWebDarkKhaki; Name: 'clWebDarkKhaki'), (Value:
clWebDarkOliveGreen; Name: 'clWebDarkOliveGreen'), (Value: clWebDarkgreen; Name:
'clWebDarkgreen'), (Value: clWebLimeGreen; Name: 'clWebLimeGreen'), (Value: clWebLime; Name:
'clWebLime'), (Value: clWebSpringGreen; Name: 'clWebSpringGreen'), (Value:
```

```
clWebMediumSpringGreen; Name: 'clWebMediumSpringGreen'), (Value: clWebDarkSeaGreen; Name:
'clWebDarkSeaGreen'), (Value: clWebLightSeaGreen; Name: 'clWebLightSeaGreen'), (Value:
clWebPaleTurquoise; Name: 'clWebPaleTurquoise'), (Value: clWebLightCyan; Name:
'clWebLightCyan'), (Value: clWebLightBlue; Name: 'clWebLightBlue'), (Value: clWebLightSkyBlue;
Name: 'clWebLightSkyBlue'), (Value: clWebCornFlowerBlue; Name: 'clWebCornFlowerBlue'), (Value:
clWebDarkBlue; Name: 'clWebDarkBlue'), (Value: clWebIndigo; Name: 'clWebIndigo'), (Value:
clWebMediumTurquoise; Name: 'clWebMediumTurquoise'), (Value: clWebTurquoise; Name:
'clWebTurquoise'), (Value: clWebCyan; Name: 'clWebCyan'), (Value: clWebPowderBlue; Name:
'clWebPowderBlue'), (Value: clWebSkyBlue; Name: 'clWebSkyBlue'), (Value: clWebRoyalBlue; Name:
'clWebRoyalBlue'), (Value: clWebMediumBlue; Name: 'clWebMediumBlue'), (Value:
clWebMidnightBlue; Name: 'clWebMidnightBlue'), (Value: clWebDarkTurquoise; Name:
'clWebDarkTurquoise'), (Value: clWebCadetBlue; Name: 'clWebCadetBlue'), (Value: clWebDarkCyan;
Name: 'clWebDarkCyan'), (Value: clWebTeal; Name: 'clWebTeal'), (Value: clWebDeepSkyBlue; Name:
'clWebDeepskyBlue'), (Value: clWebDodgerBlue; Name: 'clWebDodgerBlue'), (Value: clWebBlue;
Name: 'clWebBlue'), (Value: clWebNavy; Name: 'clWebNavy'), (Value: clWebDarkViolet; Name:
'clWebDarkViolet'), (Value: clWebDarkOrchid; Name: 'clWebDarkOrchid'), (Value: clWebMagenta;
Name: 'clWebMagenta'), (Value: clWebDarkMagenta; Name: 'clWebDarkMagenta'), (Value:
clWebMediumVioletRed; Name: 'clWebMediumVioletRed'), (Value: clWebPaleVioletRed; Name:
'clWebPaleVioletRed'), (Value: clWebBlueViolet; Name: 'clWebBlueViolet'), (Value:
clWebMediumOrchid; Name: 'clWebMediumOrchid'), (Value: clWebMediumPurple; Name:
'clWebMediumPurple'), (Value: clWebPurple; Name: 'clWebPurple'), (Value: clWebDeepPink; Name:
'clWebDeepPink'), (Value: clWebLightPink; Name: 'clWebLightPink'), (Value: clWebViolet; Name:
'clWebViolet'), (Value: clWebOrchid; Name: 'clWebOrchid'), (Value: clWebPlum; Name:
'clWebPlum'), (Value: clWebThistle; Name: 'clWebThistle'), (Value: clWebHotPink; Name:
'clWebHotPink'), (Value: clWebPink; Name: 'clWebPink'), (Value: clWebLightSteelBlue; Name:
'clWebLightSteelBlue'), (Value: clWebMediumSlateBlue; Name: 'clWebMediumSlateBlue'), (Value:
clWebLightSlateGray; Name: 'clWebLightSlateGray'), (Value: clWebWhite; Name: 'clWebWhite'),
(Value: clWebLightgrey; Name: 'clWebLightgrey'), (Value: clWebGray; Name: 'clWebGray'),
(Value: clWebSteelBlue; Name: 'clWebSteelBlue'), (Value: clWebSlateBlue; Name:
'clWebSlateBlue'), (Value: clWebSlateGray; Name: 'clWebSlateGray'), (Value: clWebWhiteSmoke;
Name: 'clWebWhiteSmoke'), (Value: clWebSilver; Name: 'clWebSilver'), (Value: clWebDimGray;
Name: 'clWebDimGray'), (Value: clWebMistyRose; Name: 'clWebMistyRose'), (Value:
clWebDarkSlateBlue; Name: 'clWebDarkSlateBlue'), (Value: clWebDarkSlategray; Name:
'clWebDarkSlategray'), (Value: clWebGainsboro; Name: 'clWebGainsboro'), (Value: clWebDarkGray;
Name: 'clWebDarkGray'), (Value: clWebBlack; Name: 'clWebBlack'));
```

C++

```
array[0..WebNamedColorsCount - 1] of TIdentMapEntry WebNamedColors = ( (Value: clWebSnow;
Name: 'clWebSnow'), (Value: clWebFloralWhite; Name: 'clWebFloralWhite'), (Value:
clWebLavenderBlush; Name: 'clWebLavenderBlush'), (Value: clWebOldLace; Name: 'clWebOldLace'),
(Value: clWebIvory; Name: 'clWebIvory'), (Value: clWebCornSilk; Name: 'clWebCornSilk'),
(Value: clWebBeige; Name: 'clWebBeige'), (Value: clWebAntiqueWhite; Name:

'clWebDarkgreen'), (Value: clWebLimeGreen; Name: 'clWebLimeGreen'), (Value: clWebLime; Name:
'clWebLime'), (Value: clWebSpringGreen; Name: 'clWebSpringGreen'), (Value:
clWebMediumSpringGreen; Name: 'clWebMediumSpringGreen'), (Value: clWebDarkSeaGreen; Name:
'clWebDarkSeaGreen'), (Value: clWebLightSeaGreen; Name: 'clWebLightSeaGreen'), (Value:
clWebPaleTurquoise; Name: 'clWebPaleTurquoise'), (Value: clWebLightCyan; Name:
'clWebLightCyan'), (Value: clWebLightBlue; Name: 'clWebLightBlue'), (Value: clWebLightSkyBlue;
Name: 'clWebLightSkyBlue'), (Value: clWebCornFlowerBlue; Name: 'clWebCornFlowerBlue'), (Value:
clWebDarkBlue; Name: 'clWebDarkBlue'), (Value: clWebIndigo; Name: 'clWebIndigo'), (Value:
clWebMediumTurquoise; Name: 'clWebMediumTurquoise'), (Value: clWebTurquoise; Name:
'clWebTurquoise'), (Value: clWebCyan; Name: 'clWebCyan'), (Value: clWebPowderBlue; Name:
'clWebPowderBlue'), (Value: clWebSkyBlue; Name: 'clWebSkyBlue'), (Value: clWebRoyalBlue; Name:
'clWebRoyalBlue'), (Value: clWebMediumBlue; Name: 'clWebMediumBlue'), (Value:
clWebMidnightBlue; Name: 'clWebMidnightBlue'), (Value: clWebDarkTurquoise; Name:
'clWebDarkTurquoise'), (Value: clWebCadetBlue; Name: 'clWebCadetBlue'), (Value: clWebDarkCyan;
Name: 'clWebDarkCyan'), (Value: clWebTeal; Name: 'clWebTeal'), (Value: clWebDeepSkyBlue; Name:
'clWebDeepskyBlue'), (Value: clWebDodgerBlue; Name: 'clWebDodgerBlue'), (Value: clWebBlue;
Name: 'clWebBlue'), (Value: clWebNavy; Name: 'clWebNavy'), (Value: clWebDarkViolet; Name:
'clWebDarkViolet'), (Value: clWebDarkOrchid; Name: 'clWebDarkOrchid'), (Value: clWebMagenta;
Name: 'clWebMagenta'), (Value: clWebDarkMagenta; Name: 'clWebDarkMagenta'), (Value:
clWebMediumVioletRed; Name: 'clWebMediumVioletRed'), (Value: clWebPaleVioletRed; Name:
'clWebPaleVioletRed'), (Value: clWebBlueViolet; Name: 'clWebBlueViolet'), (Value:
clWebMediumOrchid; Name: 'clWebMediumOrchid'), (Value: clWebMediumPurple; Name:
'clWebMediumPurple'), (Value: clWebPurple; Name: 'clWebPurple'), (Value: clWebDeepPink; Name:
'clWebDeepPink'), (Value: clWebLightPink; Name: 'clWebLightPink'), (Value: clWebViolet; Name:
'clWebViolet'), (Value: clWebOrchid; Name: 'clWebOrchid'), (Value: clWebPlum; Name:
'clWebPlum'), (Value: clWebThistle; Name: 'clWebThistle'), (Value: clWebHotPink; Name:
'clWebHotPink'), (Value: clWebPink; Name: 'clWebPink'), (Value: clWebLightSteelBlue; Name:
'clWebLightSteelBlue'), (Value: clWebMediumSlateBlue; Name: 'clWebMediumSlateBlue'), (Value:
clWebLightSlateGray; Name: 'clWebLightSlateGray'), (Value: clWebWhite; Name: 'clWebWhite'),
(Value: clWebLightgrey; Name: 'clWebLightgrey'), (Value: clWebGray; Name: 'clWebGray'),
(Value: clWebSteelBlue; Name: 'clWebSteelBlue'), (Value: clWebSlateBlue; Name:
'clWebSlateBlue'), (Value: clWebSlateGray; Name: 'clWebSlateGray'), (Value: clWebWhiteSmoke;
Name: 'clWebWhiteSmoke'), (Value: clWebSilver; Name: 'clWebSilver'), (Value: clWebDimGray;
Name: 'clWebDimGray'), (Value: clWebMistyRose; Name: 'clWebMistyRose'), (Value:
clWebDarkSlateBlue; Name: 'clWebDarkSlateBlue'), (Value: clWebDarkSlategray; Name:
'clWebDarkSlategray'), (Value: clWebGainsboro; Name: 'clWebGainsboro'), (Value: clWebDarkGray;
Name: 'clWebDarkGray'), (Value: clWebBlack; Name: 'clWebBlack'));
```

File

GraphUtil

Description

This is constant GraphUtil.WebNamedColors.

9.4.2 GraphUtil.WebNamedColorsCount Constant

Pascal

```
WebNamedColorsCount = 138;
```

C++

```
WebNamedColorsCount = 138;
```

File

GraphUtil

Description

This is constant GraphUtil.WebNamedColorsCount.

10 Grids Namespace

This is namespace Grids.

Topics

Name	Description
Classes (see page 2999)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3199)	The following table lists structs, records, enums in this documentation.
Types (see page 3205)	The following table lists types in this documentation.
Constants (see page 3212)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInvalidGridOperation (see page 2999)	EInvalidGridOperation is the exception class for illegal grid operations.
	TCustomDrawGrid (see page 3000)	TCustomDrawGrid is the base class for grids that publish events for painting and manipulating the cells in the grid.
	TCustomGrid (see page 3027)	TCustomGrid is the base type for all components that present information in a two-dimensional grid.
	TDrawGrid (see page 3083)	TDrawGrid represents a grid control that displays information in column and row format.
	TInplaceEdit (see page 3161)	TInplaceEdit provides text editing capabilities for grid controls.
	TInplaceEditList (see page 3171)	This is class Grids.TInplaceEditList.
	TStringGrid (see page 3180)	TStringGrid represents a grid control designed to simplify the handling of strings and associated objects.
	TStringGridStrings (see page 3192)	TStringGridStrings maintains a list of the strings that appear in the cells of a string grid.

Constants

Name	Description
MaxCustomExtents (see page 3212)	This is constant Grids.MaxCustomExtents.
MaxShortInt (see page 3212)	This is constant Grids.MaxShortInt.

Structs, Records, Enums

	Name	Description
	TEditStyle (see page 3199)	TEditStyle indicates whether a cell in a grid contains a drop-down arrow or ellipsis button.
	TGridAxisDrawInfo (see page 3200)	TGridAxisDrawInfo and TGridDrawInfo (see page 3201) represent information that is useful when rendering a grid.
	TGridCoord (see page 3200)	TGridCoord specifies a cell in a grid control.

	TGridDrawInfo (see page 3201)	This is record Grids.TGridDrawInfo.
	TGridOption (see page 3201)	TGridOption and TGridOptions (see page 3207) customize the appearance and behavior of a grid control.
	TGridRect (see page 3203)	TGridRect specifies a set of cells that occupy a rectangular region in a grid control.
	TGridState (see page 3203)	TGridState indicates any user actions that are currently changing the layout of the grid.

Types

Name	Description
TDrawCellEvent (see page 3205)	Function type for OnDrawCell event.
TGetEditEvent (see page 3206)	TGetEditEvent is the type of the event handlers that provide strings for the inplace editor of a grid.
TGetExtentsFunc (see page 3206)	This is type Grids.TGetExtentsFunc.
TGridDrawState (see page 3206)	TGridDrawState represents information that is useful when rendering the cell of a grid.
TGridMovement (see page 3207)	This is type Grids.TGridMovement.
TGridOptions (see page 3207)	TGridOptions and TGridOption (see page 3201) customize the appearance and behavior of a grid control.
TGridScrollDirection (see page 3209)	TGridScrollDirection indicates the direction in which to scroll the cells of a grid control.
TMovedEvent (see page 3210)	This is type Grids.TMovedEvent.
TOnGetPickListItems (see page 3210)	This is type Grids.TOnGetPickListItems.
TSelectCellEvent (see page 3210)	This is type Grids.TSelectCellEvent.
TSetEditEvent (see page 3211)	TSetEditEvent is the type of the event handlers that assign strings to a cell in a grid.

10.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInvalidGridOperation (see page 2999)	EInvalidGridOperation is the exception class for illegal grid operations.
	TCustomDrawGrid (see page 3000)	TCustomDrawGrid is the base class for grids that publish events for painting and manipulating the cells in the grid.
	TCustomGrid (see page 3027)	TCustomGrid is the base type for all components that present information in a two-dimensional grid.
	TDrawGrid (see page 3083)	TDrawGrid represents a grid control that displays information in column and row format.
	TInplaceEdit (see page 3161)	TInplaceEdit provides text editing capabilities for grid controls.
	TInplaceEditList (see page 3171)	This is class Grids.TInplaceEditList.
	TStringGrid (see page 3180)	TStringGrid represents a grid control designed to simplify the handling of strings and associated objects.
	TStringGridStrings (see page 3192)	TStringGridStrings maintains a list of the strings that appear in the cells of a string grid.

10.1.1 EInvalidGridOperation Class

EInvalidGridOperation is the exception class for illegal grid operations.

Class Hierarchy

Pascal

```
EInvalidGridOperation = class(Exception);
```

C++

```
class EInvalidGridOperation : public Exception;
```

File

Grids

Description

EInvalidGridOperation is raised when an application attempts an illegal operation on a grid. For example, EInvalidGridOperation is raised if an application tries to access a cell or column that does not exist within the grid.

See Also

TStringGrid (see page 3180)

TCustomGrid (see page 3027)

10.1.2 TCustomDrawGrid Class

TCustomDrawGrid is the base class for grids that publish events for painting and manipulating the cells in the grid.

Class Hierarchy

Pascal

```
TCustomDrawGrid = class(TCustomGrid);
```

C++

```
class TCustomDrawGrid : public TCustomGrid;
```

File

Grids

Description

Use TCustomDrawGrid as a base class when defining grid components that publish events for painting or manipulating the cells in the grid. TCustomDrawGrid introduces a number of events and methods that take advantage of the tabular organization of the grid in responding to user actions.

Do not create instances of TCustomDrawGrid. Instead, put a grid control in a form by instantiating a descendant of TCustomDrawGrid. Use TDrawGrid (see page 3083) to represent non-textual material in a tabular grid. For text, use a TStringGrid (see page 3180) object. If the text represents field values from a dataset, use TDBGrid. If you are displaying Name/Value pairs, use TValueListEditor.

See Also

TDrawGrid (see page 3083)

TStringGrid (see page 3180)

10.1.2.1 TCustomDrawGrid Members

The following tables list the members exposed by TCustomDrawGrid.

Protected Events

	Name	Description
	OnColumnMoved (see page 3019)	Occurs immediately after the position of a column changes.
	OnDrawCell (see page 3020)	Occurs when a cell in the grid needs to be drawn.
	OnGetEditMask (see page 3021)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3022)	Occurs when the in-place editor requests the value of a cell.
	OnRowMoved (see page 3023)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3025)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3026)	Occurs when the user edits the value of a cell.
	OnTopLeftChanged (see page 3027)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 3031)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FGridState (see page 3031)	This is FGridState, a member of class TCustomGrid.

	FSaveCellExtents (see page 3032)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 3032)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	AdjustSize (see page 3034)	Adds or deletes rows or columns from the grid.
	BeginColumnDrag (see page 3034)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 3034)	Starts the dragging of a row in the grid.
	BoxRect (see page 3035)	Returns the screen coordinates of a specified set of cells.
	CalcDrawInfo (see page 3035)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 3036)	Calculates the pixel locations of the fixed cells.
	CalcSizingState (see page 3036)	Determines the appearance of the mouse cursor during resizing.
	CanEditAcceptKey (see page 3036)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 3037)	Indicates whether the current cell in the grid can be edited.
	CanEditShow (see page 3037)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 3037)	Indicates whether the grid should respond to a given key combination.
	ChangeGridOrientation (see page 3038)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	CheckColumnDrag (see page 3039)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 3039)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	ColumnMoved (see page 3004)	Generates an OnColumnMoved (see page 3019) event.
	ColWidthsChanged (see page 3040)	Responds when the column widths change.
	CreateEditor (see page 3040)	Creates the inplace editor control.
	CreateParams (see page 3041)	Initializes the window-creation parameter record.
	DefineProperties (see page 3041)	Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.
	DeleteColumn (see page 3041)	Deletes a specified column from the grid.
	DeleteRow (see page 3042)	Deletes a specified from the grid.
	DoExit (see page 3042)	Hides the inplace editor when selection moves to another control in a form.
	DoMouseWheelDown (see page 3042)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 3043)	Performs tasks when the mouse wheel is rotated upward.
	DrawCell (see page 3004)	Generates an OnDrawCell (see page 3020) event.
	EndColumnDrag (see page 3044)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 3044)	Ends the dragging of a row in the grid.
	FocusCell (see page 3044)	Changes the current cell to a specified cell.
	GetEditLimit (see page 3045)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 3004)	Generates an OnGetEditMask (see page 3021) event.
	GetEditStyle (see page 3046)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 3005)	Generates an OnGetEditText (see page 3022) event.
	GetGridHeight (see page 3046)	Returns the value of the GridHeight (see page 3068) property.
	GetGridWidth (see page 3047)	Returns the value of the GridWidth (see page 3070) property.
	HideEdit (see page 3047)	Hides the inplace editor.
	HideEditor (see page 3048)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 3048)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 3048)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateEditor (see page 3049)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 3049)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 3050)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	KeyDown (see page 3050)	Provides special processing when the user presses a key.
	KeyPress (see page 3050)	Provides special processing when the user presses a key.

	MouseDown (see page 3051)	Provides special processing when the user presses a mouse button.
	MouseMove (see page 3052)	Provides special processing when the user moves the mouse.
	MouseUp (see page 3052)	Provides special processing when the user releases the mouse button.
	MoveColRow (see page 3053)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 3053)	Moves a column to a new position.
	MoveRow (see page 3053)	Moves a row to a new position.
	Paint (see page 3054)	Draws the image of the grid control on the screen.
	RowHeightsChanged (see page 3054)	Responds when the row heights change.
	RowMoved (see page 3005)	Generates an OnRowMoved (see page 3023) event.
	ScrollData (see page 3055)	Scrolls the visual image of the cells in the grid.
	SelectCell (see page 3006)	Determines whether a particular cell in the grid can be selected.
	SetEditText (see page 3006)	Generates an OnSetEditText (see page 3026) event.
	ShowEditor (see page 3056)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 3057)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 3057)	Responds to changes in the size of the grid.
	Sizing (see page 3057)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 3058)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 3007)	Generates an OnTopLeftChanged (see page 3027) event.
	UpdateDesigner (see page 3059)	Notifies the designer when rows and columns of the grid are moved or resized.

Protected Properties

	Name	Description
	BorderStyle (see page 3060)	Determines whether a single line border is drawn around the grid.
	ColCount (see page 3062)	Specifies the number of columns in the grid.
	Color (see page 3063)	Specifies the background color of the control.
	DefaultColWidth (see page 3064)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3066)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3066)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	FixedColor (see page 3067)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3067)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3068)	Specifies the number of rows on the top of the grid that cannot be scrolled.
	GridLineWidth (see page 3069)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	HitTest (see page 3071)	Indicates the current position of the mouse cursor.
	InplaceEditor (see page 3071)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	Options (see page 3072)	Specifies various display and behavioral properties of the grid.
	ParentColor (see page 3073)	Determines where a control looks for its color information.
	RowCount (see page 3075)	Specifies the number of rows in the grid.
	ScrollBars (see page 3077)	Specifies whether the grid includes horizontal and vertical scroll bars.
	VisibleColCount (see page 3082)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 3082)	Indicates the number of scrollable rows visible in the grid.

Public Methods

	Name	Description
	CellRect (see page 3003)	Returns the screen coordinates of a cell in the grid.
	Create (see page 3030)	Creates an instance of TCustomGrid (see page 3027).
	Destroy (see page 3031)	Destroys an instance of TCustomGrid (see page 3027).
	MouseCoord (see page 3051)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseToCell (see page 3005)	Returns the column and row of the cell at the position with screen coordinates (X,Y).

Public Properties

	Name	Description
	Canvas (see page 3007)	Specifies the TCanvas object that presents a drawing surface for the control.
	Col (see page 3009)	Specifies the index of the column that contains the selected cell.
	ColWidths (see page 3011)	Indicates the width (in pixels) of all the columns in the grid.
	EditorMode (see page 3011)	Determines whether the current cell can be edited.
	GridHeight (see page 3012)	Specifies the height of the grid in pixels.
	GridWidth (see page 3012)	Specifies the width of the grid in pixels.
	LeftCol (see page 3012)	Specifies the index of the first visible scrollable column in the grid.
	Row (see page 3013)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 3014)	Gives the height (in pixels) of all rows in the grid.
	Selection (see page 3015)	Indicates the boundaries of the current selection.
	TabStops (see page 3017)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3017)	Specifies the index of the first visible scrollable row in the grid.

Published Properties

	Name	Description
	TabStop (see page 3079)	Determines if the user can tab to a control.

10.1.2.2 TCustomDrawGrid Methods

The methods of the TCustomDrawGrid class are listed here.

Protected Methods

	Name	Description
	ColumnMoved (see page 3004)	Generates an OnColumnMoved (see page 3019) event.
	DrawCell (see page 3004)	Generates an OnDrawCell (see page 3020) event.
	GetEditMask (see page 3004)	Generates an OnGetEditMask (see page 3021) event.
	GetEditText (see page 3005)	Generates an OnGetEditText (see page 3022) event.
	RowMoved (see page 3005)	Generates an OnRowMoved (see page 3023) event.
	SelectCell (see page 3006)	Determines whether a particular cell in the grid can be selected.
	SetEditText (see page 3006)	Generates an OnSetEditText (see page 3026) event.
	TopLeftChanged (see page 3007)	Generates an OnTopLeftChanged (see page 3027) event.

Public Methods

	Name	Description
	CellRect (see page 3003)	Returns the screen coordinates of a cell in the grid.
	MouseToCell (see page 3005)	Returns the column and row of the cell at the position with screen coordinates (X,Y).

10.1.2.2.1 TCustomDrawGrid.CellRect Method

Returns the screen coordinates of a cell in the grid.

Pascal

```
function CellRect(ACol: Longint; ARow: Longint): TRect;
```

C++

```
__fastcall TRect CellRect(Longint ACol, Longint ARow);
```

Description

Call CellRect to obtain the boundaries, in pixels, of the cell in the column and row indicated by the ACol and ARow parameters. The top left cell is specified when ACol and ARow are set to zero.

If the indicated cell is not visible, CellRect returns an empty rectangle.

See Also

MouseToCell (see page 3005)

10.1.2.2.2 TCustomDrawGrid.ColumnMoved Method

Generates an OnColumnMoved (see page 3019) event.

Pascal

```
procedure ColumnMoved(FromIndex: Longint; ToIndex: Longint); override;
```

C++

```
virtual __fastcall ColumnMoved(Longint FromIndex, Longint ToIndex);
```

Description

ColumnMoved is called immediately after a column in the grid has moved. It overrides the inherited method to generate an OnColumnMoved (see page 3019) event. Descendants of TCustomDrawGrid (see page 3000) can override this method to make internal adjustments or to block the OnColumnMoved (see page 3019) event.

See Also

OnColumnMoved (see page 3019)

10.1.2.2.3 TCustomDrawGrid.DrawCell Method

Generates an OnDrawCell (see page 3020) event.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically whenever a cell in the grid is drawn. If the DefaultDrawing (see page 3066) property is true, the background of the cell is painted before DrawCell is called, and the 3D effects of the fixed cells or the focus rectangle around the focused cell are drawn after DrawCell. Descendants of TCustomDrawGrid (see page 3000) can override this method to draw the contents of the cell or to block the OnDrawCell (see page 3020) event.

See Also

DefaultDrawing (see page 3066)

FixedCols (see page 3067)

FixedRows (see page 3068)

OnDrawCell (see page 3020)

10.1.2.2.4 TCustomDrawGrid.GetEditMask Method

Generates an OnGetEditMask (see page 3021) event.

Pascal

```
function GetEditMask(ACol: Longint; ARow: Longint): string; override;
```

C++

```
virtual __fastcall UnicodeString GetEditMask(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditMask to obtain any input mask associated with the cell specified by the ACol and ARow parameters. GetEditMask returns the Value parameter set by the OnGetEditMask (see page 3021) event handler. If there is no OnGetEditMask (see page 3021) event handler, GetEditMask returns an empty string, indicating that there is no edit mask.

See Also

OnGetEditMask (see page 3021)

10.1.2.2.5 TCustomDrawGrid.GetEditText Method

Generates an OnGetEditText (see page 3022) event.

Pascal

```
function GetEditText(ACol: Longint; ARow: Longint): string; override;
```

C++

```
virtual __fastcall UnicodeString GetEditText(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditText to obtain the text for the indicated cell. GetEditText returns the Value parameter set by the OnGetEditText (see page 3022) event handler. If there is no OnGetEditText (see page 3022) event handler, GetEditText returns an empty string.

See Also

OnGetEditText (see page 3022)

10.1.2.2.6 TCustomDrawGrid.MouseToCell Method

Returns the column and row of the cell at the position with screen coordinates (X,Y).

Pascal

```
procedure MouseToCell(X: Integer; Y: Integer; var ACol: Longint; var ARow: Longint);
```

C++

```
__fastcall MouseToCell(int X, int Y, Longint ACol, Longint ARow);
```

Description

Call MouseToCell to convert from grid-relative screen coordinates to row and column indexes. The X and Y parameters are the screen coordinates of the point to be converted. MouseToCell returns the ACol parameter as the number of the column over the point (X,Y), and the ARow parameter as the number of the row.

Usually the MouseToCell method is used in a mouse event handler, which supplies the mouse coordinates as the X and Y parameters of the method call.

See Also

CellRect (see page 3003)

10.1.2.2.7 TCustomDrawGrid.RowMoved Method

Generates an OnRowMoved (see page 3023) event.

Pascal

```
procedure RowMoved(FromIndex: Longint; ToIndex: Longint); override;
```

C++

```
virtual __fastcall RowMoved(Longint FromIndex, Longint ToIndex);
```

Description

RowMoved is called immediately after a row in the grid changes position. It overrides the inherited method to generate an OnRowMoved (see page 3023) event. Descendants of TCustomDrawGrid (see page 3000) can override this method to make internal adjustments or to block the OnRowMoved (see page 3023) event.

See Also

OnRowMoved (see page 3023)

10.1.2.2.8 TCustomDrawGrid.SelectCell Method

Determines whether a particular cell in the grid can be selected.

Pascal

```
function SelectCell(ACol: Longint; ARow: Longint): Boolean; override;
```

C++

```
virtual __fastcall Boolean SelectCell(Longint ACol, Longint ARow);
```

Description

Grid controls call SelectCell internally before attempting to move selection to a the cell identified by the ACol and ARow parameters. ACol and ARow are the column and row indexes for the cell, where the first column has index 0, and the top row has index 0.

SelectCell generates an OnSelectCell (see page 3025) event. This method then returns true, unless the OnSelectCell (see page 3025) event handler indicates that the cell should not be selected. Descendants of TCustomDrawGrid (see page 3000) can override this method to check the properties of the information displayed in the cell or block the OnSelectCell (see page 3025) event.

See Also

OnSelectCell (see page 3025)

10.1.2.2.9 TCustomDrawGrid.SetEditText Method

Generates an OnSetEditText (see page 3026) event.

Pascal

```
procedure SetEditText(ACol: Longint; ARow: Longint; const Value: string); override;
```

C++

```
virtual __fastcall SetEditText(Longint ACol, Longint ARow, const UnicodeString Value);
```

Description

SetEditText is called by the inplace editor so that the grid can store the new value for the current cell. SetEditText overrides the inherited parent class's method to generate an OnSetEditText (see page 3026) event. Descendants of TCustomDrawGrid (see page 3000) can override this method to update an internal representation of the cell's value, or to block the OnSetEditText (see page 3026) event.

See Also

OnSetEditText (see page 3026)

10.1.2.2.10 TCustomDrawGrid.TopLeftChanged Method

Generates an OnTopLeftChanged (see page 3027) event.

Pascal

```
procedure TopLeftChanged; override;
```

C++

```
virtual __fastcall TopLeftChanged();
```

Description

Grid controls call TopLeftChanged internally, whenever the LeftCol (see page 3012) or TopRow (see page 3017) property changes. After calling the inherited parent class's method to update the position of the inplace editor, TopLeftChanged generates an OnTopLeftChanged (see page 3027) event.

See Also

LeftCol (see page 3072)

OnTopLeftChanged (see page 3027)

TopRow (see page 3080)

10.1.2.3 TCustomDrawGrid Properties

The properties of the TCustomDrawGrid class are listed here.

Public Properties

	Name	Description
	Canvas (see page 3007)	Specifies the TCanvas object that presents a drawing surface for the control.
	Col (see page 3009)	Specifies the index of the column that contains the selected cell.
	ColWidths (see page 3011)	Indicates the width (in pixels) of all the columns in the grid.
	EditorMode (see page 3011)	Determines whether the current cell can be edited.
	GridHeight (see page 3012)	Specifies the height of the grid in pixels.
	GridWidth (see page 3012)	Specifies the width of the grid in pixels.
	LeftCol (see page 3012)	Specifies the index of the first visible scrollable column in the grid.
	Row (see page 3013)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 3014)	Gives the height (in pixels) of all rows in the grid.
	Selection (see page 3015)	Indicates the boundaries of the current selection.
	TabStops (see page 3017)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3017)	Specifies the index of the first visible scrollable row in the grid.

10.1.2.3.1 TCustomDrawGrid.Canvas Property

Specifies the TCanvas object that presents a drawing surface for the control.

Pascal

```
property Canvas;
```

C++

```
__property Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control. Canvas encapsulates a Windows device context, providing all the tools and methods needed for drawing and painting.

Canvas is a protected property that is usually redeclared as public in descendants of TCustomControl.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStringGrid *myStringGrid;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStringGrid")
  {
    myStringGrid = dynamic_cast<TStringGrid *>(ListBox1->Items->Objects[Index]);
    // make sure we are using the TControls canvas and not the from's!
    myStringGrid->Canvas->MoveTo(myStringGrid->ClientRect.Left, myStringGrid->ClientRect.Top);
    myStringGrid->Canvas->LineTo(myStringGrid->ClientRect.Right,
myStringGrid->ClientRect.Bottom);
    myStringGrid = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
```

```
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TStringGrid) then
  begin
    myStringGrid:= (ListBox1.Items.Objects[Index] as TStringGrid);
    with myStringGrid.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myStringGrid.Canvas.MoveTo(Left, Top);
      myStringGrid.Canvas.LineTo(Right, Bottom);
    end;
  myStringGrid:= nil;
  end;

10.1.2.3.2 TCustomDrawGrid.Col Property

Specifies the index of the column that contains the selected cell.

Pascal

```
property Col: Longint;
```

C++

```
__property Longint Col;
```

Description

Use Col at runtime to determine the current column in the grid. Setting Col moves focus to the cell in the current row that is in the new column. The first column has an index of 0, the second column an index of 1, and so on.

The selected cell in the grid can be located by reading the Col property and the Row property to obtain the indexes of its column

and row. When focus moves to the grid, the selected cell gets input focus.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It uses a draw grid with a label above it on a form. When
the user clicks a cell in the grid, the location of the
cursor is displayed in the label caption. This example
requires a populated image list, or can just display an
empty grid.
*/
void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
  Label1->Caption = "From OnClick: The cursor is in column " +
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(index) +
      " has the focus.";
  }
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It uses a draw grid with a label above it on a form. When
the user clicks a cell in the grid, the location of the
cursor is displayed in the label caption. This example
requires a populated image list, or can just display an
empty grid.
}
procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
```

```
    DrawGrid1.Canvas.Brush.Color := clBackground;
    DrawGrid1.Canvas.FillRect(Rect);
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
    if (gdFocused in State) then
    begin
      DrawGrid1.Canvas.DrawFocusRect(Rect);
      Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(index) + ' has the focus.';
    end;
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
```

See Also

Row (see page 3074)

10.1.2.3.3 TCustomDrawGrid.ColWidths Property

Indicates the width (in pixels) of all the columns in the grid.

Pascal

```
property ColWidths [Index: Longint]: Integer;
```

C++

```
__property int ColWidths[Longint Index];
```

Description

Read ColWidths to determine the width of the cells in the column specified by the Index parameter. An index of 0 refers to the first column. Set ColWidths at runtime to change the width of an individual column.

If the width of a column has not been set explicitly by resizing with the mouse, or by using the ColWidths property, its width is DefaultColWidth.

Use the ColCount property to determine the number of entries in the ColWidths array.

See Also

ColCount (see page 3062)

DefaultColWidth (see page 3064)

RowHeights (see page 3076)

10.1.2.3.4 TCustomDrawGrid.EditorMode Property

Determines whether the current cell can be edited.

Pascal

```
property EditorMode: Boolean;
```

C++

```
__property Boolean EditorMode;
```

Description

Set EditorMode to true, at runtime, to put the grid in edit mode. When EditorMode is true, the user can edit cells in the grid. When the user presses F2, EditorMode is set to true. When the user presses Enter, the value of EditorMode is toggled.

Note: EditorMode has no effect if the Options property does not include goEditing or if the Options property includes goAlwaysShowEditor.

See Also

HideEditor (see page 3048)

Options (see page 3072)

ShowEditor (see page 3056)

10.1.2.3.5 TCustomDrawGrid.GridHeight Property

Specifies the height of the grid in pixels.

Pascal

```
property GridHeight: Integer;
```

C++

```
__property int GridHeight;
```

Description

Read GridHeight to determine the size of the grid. If GridHeight is less than the value of ClientHeight, all of the rows of the grid appear in the control with an empty region below the grid. If the underlying grid is too tall to appear in the control, GridHeight is the same as ClientHeight, and the user must scroll to see the entire contents of the grid.

See Also

ClientHeight

GridWidth (see page 3070)

10.1.2.3.6 TCustomDrawGrid.GridWidth Property

Specifies the width of the grid in pixels.

Pascal

```
property GridWidth: Integer;
```

C++

```
__property int GridWidth;
```

Description

Read GridWidth to determine the size of the grid. If GridWidth is less than the value of ClientWidth, all of the columns of the grid appear in the control with an empty region to the right of the grid. If the underlying grid is too wide to appear in the control, GridWidth is the same as ClientWidth, and the user must scroll to see the entire contents of the grid.

See Also

ClientWidth

GridHeight (see page 3068)

10.1.2.3.7 TCustomDrawGrid.LeftCol Property

Specifies the index of the first visible scrollable column in the grid.

Pascal

```
property LeftCol: Longint;
```

C++

```
__property Longint LeftCol;
```

Description

Read LeftCol to determine the index of the first column in the scrollable region that is visible. Set LeftCol to scroll the columns in the grid so that the column with index LeftCol is the first column after the fixed columns.

See Also

FixedCols (see page 3067)

ScrollData (see page 3055)

VisibleColCount (see page 3082)

10.1.2.3.8 TCustomDrawGrid.Row Property

Specifies the index of the row that contains the selected cell.

Pascal

```
property Row: Longint;
```

C++

```
__property Longint Row;
```

Description

Use Row at runtime to determine the current row in the grid. Setting Row moves focus to the cell in the current column that is in the new row. The first row has an index of 0, the second row an index of 1, and so on.

The selected cell in the grid can be located by reading the Row property and the Col property to obtain the indexes of its row and column. When focus moves to the grid, the selected cell gets input focus.

C++ Examples:

```
/*
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ListBox1->Items = StringGrid1->Rows[StringGrid1->Row];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{

  StringGrid1->Cells[1][0] = "Column 1";
  StringGrid1->Cells[2][0] = "Column 2";
  StringGrid1->Cells[3][0] = "Column 3";
  StringGrid1->Cells[4][0] = "Column 4";
  StringGrid1->Cells[0][1] = "Row 1";
  StringGrid1->Cells[1][1] = "Object";
  StringGrid1->Cells[2][1] = "Pascal";
```

```
    StringGrid1->Cells[3][1] = "is";
    StringGrid1->Cells[4][1] = "excellent";
    StringGrid1->Cells[0][2] = "Row 2";
    StringGrid1->Cells[1][2] = "Delphi";
    StringGrid1->Cells[2][2] = "is";
    StringGrid1->Cells[4][2] = "RAD";

}
```

Delphi Examples:

```
{
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ListBox1.Items := StringGrid1.Rows[StringGrid1.Row];
end;
procedure TForm1.FormCreate(Sender: TObject);
begin
  with StringGrid1 do
  begin
    Cells[1,0] := 'Column 1';
    Cells[2,0] := 'Column 2';
    Cells[3,0] := 'Column 3';
    Cells[4,0] := 'Column 4';
    Cells[0,1] := 'Row 1';
    Cells[1,1] := 'Object';
    Cells[2,1] := 'Pascal';
    Cells[3,1] := 'is';
    Cells[4,1] := 'excellent';
    Cells[0,2] := 'Row 2';
    Cells[1,2] := 'Delphi';
    Cells[2,2] := 'is';
    Cells[4,2] := 'RAD';
  end;
end;
```

See Also

Col (see page 3060)

10.1.2.3.9 TCustomDrawGrid.RowHeights Property

Gives the height (in pixels) of all rows in the grid.

Pascal

```
property RowHeights [Index: Longint]: Integer;
```

C++

```
__property int RowHeights[Longint Index];
```

Description

Read RowHeights to determine the height of the cells in the row specified by the Index parameter. An index of 0 refers to the first row. Set RowWidths at runtime to change the height of an individual row.

If the height of a row has not been set explicitly by resizing with the mouse, or by using the RowHeights property, it's height is DefaultRowHeight.

Use the RowCount property to determine the number of entries in the RowHeights array.

See Also

ColWidths (see page 3063)

DefaultRowHeight (see page 3066)

RowCount (see page 3075)

10.1.2.3.10 TCustomDrawGrid.Selection Property

Indicates the boundaries of the current selection.

Pascal

```
property Selection: TGridRect;
```

C++

```
__property TGridRect Selection;
```

Description

Set Selection to select a range of cells in the grid. Selection can either represent the first column, first row, last column and last row in the grid, or the row and column coordinates of the upper left and bottom right cells in the selected region.

Selection can only indicate more than one cell when Options includes goRangeSelect.

C++ Examples:

```
/*
The following code selects the rectangle containing rows 1
through 4, and columns 2 and 3.  goRangeSelect in the
DrawGrid Options parameter must be True to select a range of
cells.  This example requires a button, a DrawGrid and a
populated ImageList.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TGridRect myRect;
  myRect.Left = 3;
  myRect.Top = 1;
  myRect.Right = 2;
  myRect.Bottom = 4;
  DrawGrid1->Selection = myRect;
  DrawGrid1->Repaint();
}

void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
  Label1->Caption = "From OnClick: The cursor is in column " +
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = (ARow * DrawGrid1->ColCount + ACol) % (DrawGrid1->ColCount + 1);
  if (State.Contains(gdSelected))
    DrawGrid1->Canvas->Brush->Color = clYellow;
  else
    DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
```

```
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(ARow * DrawGrid1->ColCount + ACol) +
      " has the focus.";
  }
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code selects the rectangle containing rows 1
through 4, and columns 2 and 3.  goRangeSelect in the
DrawGrid Options parameter must be True to select a range of
cells.  This example requires a button, a DrawGrid and a
populated ImageList.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  myRect: TGridRect;
begin
  myRect.Left := 2;
  myRect.Top := 1;
  myRect.Right := 3;
  myRect.Bottom := 4;
  DrawGrid1.Selection := myRect;
  DrawGrid1.Repaint;
end;

procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := (ARow * DrawGrid1.ColCount + ACol) mod (DrawGrid1.ColCount + 1);
  if (gdSelected in State) then
    DrawGrid1.Canvas.Brush.Color := clYellow
  else
    DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(ARow * DrawGrid1.ColCount + ACol) +
      ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
```

```
end;
```

See Also

Col (see page 3060)

Options (see page 3072)

Row (see page 3074)

10.1.2.3.11 TCustomDrawGrid.TabStops Property

Indicates whether the user can tab to specified columns in the grid.

Pascal

```
property TabStops [Index: Longint]: Boolean;
```

C++

```
__property Boolean TabStops[Longint Index];
```

Description

Set TabStops to false to remove the column identified by Index from the tab order. The first column in the grid is identified by an Index of 0.

Note: When the Options property does not include goTabs, the user can't tab to any column, even if TabStops is true.

See Also

Options (see page 3072)

10.1.2.3.12 TCustomDrawGrid.TopRow Property

Specifies the index of the first visible scrollable row in the grid.

Pascal

```
property TopRow: Longint;
```

C++

```
__property Longint TopRow;
```

Description

Read TopRow to determine the index of the first row in the scrollable region that is visible. Set TopRow to scroll the rows in the grid so that the row with index TopRow is the first row after the fixed rows.

C++ Examples:

```
*/
This code uses a draw grid and a button on a form. When
the user clicks the button, the last row of the draw
grid becomes the top row.  This example requires a
button, a DrawGrid and a populated ImageList.
*/

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  DrawGrid1->TopRow = DrawGrid1->RowCount - 1;
}

void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
  Label1->Caption = "From OnClick: The cursor is in column " +
```

```
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = (ARow * DrawGrid1->ColCount + ACol) % (DrawGrid1->ColCount + 1);
  if (State.Contains(gdSelected))
    DrawGrid1->Canvas->Brush->Color = clYellow;
  else
    DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(ARow * DrawGrid1->ColCount + ACol) +
      " has the focus.";
  }
  if ((ARow >=  DrawGrid1->FixedRows) && (ACol >=  DrawGrid1->FixedCols))
    ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
This code uses a draw grid and a button on a form. When
the user clicks the button, the last row of the draw
grid becomes the top row.  This example requires a
button, a DrawGrid and a populated ImageList.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  DrawGrid1.TopRow := DrawGrid1.RowCount - 1;
end;

procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := (ARow * DrawGrid1.ColCount + ACol) mod (DrawGrid1.ColCount + 1);
  if (gdSelected in State) then
    DrawGrid1.Canvas.Brush.Color := clYellow
  else
    DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(ARow * DrawGrid1.ColCount + ACol) + '
has the focus.';
```

```
    end;
    if ((ARow >=  DrawGrid1.FixedRows) AND (ACol >=  DrawGrid1.FixedCols)) then
      ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

10.1.2.4 TCustomDrawGrid Events

The events of the TCustomDrawGrid class are listed here.

Protected Events

	Name	Description
	OnColumnMoved (see page 3019)	Occurs immediately after the position of a column changes.
	OnDrawCell (see page 3020)	Occurs when a cell in the grid needs to be drawn.
	OnGetEditMask (see page 3021)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3022)	Occurs when the in-place editor requests the value of a cell.
	OnRowMoved (see page 3023)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3025)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3026)	Occurs when the user edits the value of a cell.
	OnTopLeftChanged (see page 3027)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

10.1.2.4.1 TCustomDrawGrid.OnColumnMoved Event

Occurs immediately after the position of a column changes.

Pascal

```
property OnColumnMoved: TMovedEvent;
```

C++

```
__property TMovedEvent OnColumnMoved;
```

Description

Use OnColumnMoved to perform special processing when the position of a grid column changes. Columns can be moved programmatically or by user manipulation. OnColumnMoved does not occur unless the Options (see page 3072) property includes goColMoving.

See Also

OnRowMoved (see page 3023)

Options (see page 3072)

10.1.2.4.2 TCustomDrawGrid.OnDrawCell Event

Occurs when a cell in the grid needs to be drawn.

Pascal

```
property OnDrawCell: TDrawCellEvent;
```

C++

```
__property TDrawCellEvent OnDrawCell;
```

Description

Write an OnDrawCell event handler to draw the contents of all the cells in the grid. Draw on the cell using the methods of the Canvas (see page 3007) property. The Rect parameter indicates the location of the cell on the canvas. The Col (see page 3009) and Row (see page 3013) parameters indicate the column and row indexes of the cell that should be drawn. The State parameter indicates whether the cell has input focus, whether the cell is selected, and whether the cell is a fixed (nonscrolling) cell.

If the OnDrawCell event handler is not assigned, all cells in the draw grid will appear empty. If the DefaultDrawing (see page 3066) property is true, the draw grid paints the background color of the cell before the OnDrawCell event, and draws a focus rectangle around the selected cell after the OnDrawCell event handler finishes drawing the contents of the cell. If the DefaultDrawing (see page 3066) property is false, the OnDrawCell event handler should paint the background of the cell and provide all visual indication of selection and focus.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
```

```
  goDrawFocusSelect in the DrawGrid Options parameter must be
  True to set focus on a cell.  The ImageList Draw method must
  be called after DrawFocusRect. The OnSelectCell event handler
  must implemented to return true.
  }
  procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
    Rect: TRect; State: TGridDrawState);
  var
    index: Integer;
  begin
    index := ARow * DrawGrid1.ColCount + ACol;
    DrawGrid1.Canvas.Brush.Color := clWhite;
    DrawGrid1.Canvas.FillRect(Rect);
    if (gdFocused in State) then
    begin
      DrawGrid1.Canvas.DrawFocusRect(Rect);
      Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
    end;
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
```

10.1.2.4.3 TCustomDrawGrid.OnGetEditMask Event

Occurs when the in-place editor requests an edit mask.

Pascal

```
property OnGetEditMask: TGetEditEvent;
```

C++

```
__property TGetEditEvent OnGetEditMask;
```

Description

Write an OnGetEditMask event handler to provide the in-place editor with an edit mask that describes the valid input strings a user can type into a cell. Set the Value parameter to the string that describes the edit mask for the cell specified by the ACol and ARow parameters. If the cell does not have an edit mask, set the Value parameter to an empty string.

OnGetEditMask does not occur unless the Options (see page 3072) property includes goEditing.

C++ Examples:

```
/*
This example specifies an edit mask in a string grid to
limit the cells that contain telephone numbers, as indicated
by a label cell in the first row.  Include goEditing in the
TStringGrid Options property.  Set the title of one of the
columns to 'Phone Number'.  Set the DefaultColWidth large
enough to see a phone number.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
}
```

```
void __fastcall TForm1::StringGrid1GetEditMask(TObject *Sender, int ACol, int ARow,
          UnicodeString &Value)
{
  if (StringGrid1->Cells[ACol][0] == "Phone Number")
    Value =  "!\(999\)000-0000;1";
}
```

Delphi Examples:

```
{
This example specifies an edit mask in a string grid to
limit the cells that contain telephone numbers, as indicated
by a label cell in the first row.  Include goEditing in the
TStringGrid Options property.  Set the title of one of the
columns to 'Phone Number'.  Set the DefaultColWidth large
enough to see a phone number.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  StringGrid1.Cells[2, 0]:= 'Phone Number';
end;

procedure TForm1.StringGrid1GetEditMask(Sender: TObject; ACol, ARow: Longint; var Value:
string);
begin
  if StringGrid1.Cells[ACol, 0] = 'Phone Number' then
    Value :=  '!\(999\)000-0000;1';
end;
```

See Also

Options (see page 3072)

EditMask (see page 4604)

10.1.2.4.4 TCustomDrawGrid.OnGetEditText Event

Occurs when the in-place editor requests the value of a cell.

Pascal

```
property OnGetEditText: TGetEditEvent;
```

C++

```
__property TGetEditEvent OnGetEditText;
```

Description

Write an OnGetEditText event handler to provide the in-place editor with a string representing the contents of the cell. Set the Value parameter to the string for the cell specified by the ACol and ARow parameters. When the cell enters edit mode, the contents of the cell are drawn as the Value string returned by the OnGetEditText event handler. This image need not match the appearance of the cell when it is not in edit mode, which is drawn using the OnDrawCell (see page 3020) event handler.

OnGetEditText does not occur unless the Options (see page 3072) property includes goEditing.

C++ Examples:

```
/*
The following code lowercases the text for a string grid
cell when the user begins to edit it.
*/
void __fastcall TForm1::StringGrid1GetEditText(TObject *Sender, int ACol, int ARow,
          UnicodeString &Value)
{
  Value = AnsiLowerCase(Value);
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
  StringGrid1->Cells[2][1] = "(408)984-1234";
  StringGrid1->Cells[2][2] = "(415)434-6789";
  StringGrid1->Cells[2][3] = "(650)696-2345";
  StringGrid1->Cells[2][4] = "(831)431-2422";
  StringGrid1->Cells[2][5] = "(408)506-9876";
  StringGrid1->Cells[1][0] = "Name";
  StringGrid1->Cells[1][1] = "Clem Myers";
  StringGrid1->Cells[1][2] = "Ed Satchel";
  StringGrid1->Cells[1][3] = "Johanna Mills";
  StringGrid1->Cells[1][4] = "Stella Gables";
  StringGrid1->Cells[1][5] = "Ted Thompson";
  StringGrid1->Cells[3][0] = "POB";
  StringGrid1->Cells[3][1] = "Detroit";
  StringGrid1->Cells[3][2] = "Memphis";
  StringGrid1->Cells[3][3] = "New Orleans";
  StringGrid1->Cells[3][4] = "Lander";
  StringGrid1->Cells[3][5] = "Round Pond";
  StringGrid1->Cells[4][0] = "State";
  StringGrid1->Cells[4][1] = "Michigan";
  StringGrid1->Cells[4][2] = "Tennessee";
  StringGrid1->Cells[4][3] = "Lousiana";
  StringGrid1->Cells[4][4] = "Wyoming";
  StringGrid1->Cells[4][5] = "Maine";
  StringGrid1->Cells[5][0] = "Last Graduated";
  StringGrid1->Cells[5][1] = "Michigan State";
  StringGrid1->Cells[5][2] = "Univ-> Colorado";
  StringGrid1->Cells[5][3] = "Univ-> Washington";
  StringGrid1->Cells[5][4] = "USC";
  StringGrid1->Cells[5][5] = "Bowdoin";
}
```

Delphi Examples:

```
{
The following code lowercases the text for a string grid
cell when the user begins to edit it.
}
procedure TForm1.StringGrid1GetEditText(Sender: TObject; ACol, ARow: Longint; var Value:
string);
begin
  Value := AnsiLowerCase(Value);
end;
```

OnDrawCell (see page 3020)

OnSetEditText (see page 3026)

10.1.2.4.5 TCustomDrawGrid.OnRowMoved Event

Occurs immediately after the position of a row changes.

Pascal

```
property OnRowMoved: TMovedEvent;
```

C++

```
__property TMovedEvent OnRowMoved;
```

Description

Write an OnRowMoved event handler to provide special processing whenever a row in the grid changes position. Rows can be moved programmatically or by user manipulation. OnRowMoved does not occur unless the Options (see page 3072) property includes goRowMoving.

C++ Examples:

```
/*
The following code displays the number of rows a row was
moved in the first cell of the row.  To move rows in a
TStringGrid, goRowMoving must be included in the Options property.
*/
void __fastcall TForm1::StringGrid1RowMoved(TObject *Sender, int FromIndex, int ToIndex)

{
  int delta = (FromIndex > ToIndex) ? (FromIndex-ToIndex) : (ToIndex-FromIndex);
  StringGrid1->Cells[0][ToIndex] = IntToStr(delta);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
  StringGrid1->Cells[2][1] = "(408)984-1234";
  StringGrid1->Cells[2][2] = "(415)434-6789";
  StringGrid1->Cells[2][3] = "(650)696-2345";
  StringGrid1->Cells[2][4] = "(831)431-2422";
  StringGrid1->Cells[2][5] = "(408)506-9876";
  StringGrid1->Cells[1][0] = "Name";
  StringGrid1->Cells[1][1] = "Clem Myers";
  StringGrid1->Cells[1][2] = "Ed Satchel";
  StringGrid1->Cells[1][3] = "Johanna Mills";
  StringGrid1->Cells[1][4] = "Stella Gables";
  StringGrid1->Cells[1][5] = "Ted Thompson";
  StringGrid1->Cells[3][0] = "POB";
  StringGrid1->Cells[3][1] = "Detroit";
  StringGrid1->Cells[3][2] = "Memphis";
  StringGrid1->Cells[3][3] = "New Orleans";
  StringGrid1->Cells[3][4] = "Lander";
  StringGrid1->Cells[3][5] = "Round Pond";
  StringGrid1->Cells[4][0] = "State";
  StringGrid1->Cells[4][1] = "Michigan";
  StringGrid1->Cells[4][2] = "Tennessee";
  StringGrid1->Cells[4][3] = "Lousiana";
  StringGrid1->Cells[4][4] = "Wyoming";
  StringGrid1->Cells[4][5] = "Maine";
  StringGrid1->Cells[5][0] = "Last Graduated";
  StringGrid1->Cells[5][1] = "Michigan State";
  StringGrid1->Cells[5][2] = "Univ-> Colorado";
  StringGrid1->Cells[5][3] = "Univ-> Washington";
  StringGrid1->Cells[5][4] = "USC";
  StringGrid1->Cells[5][5] = "Bowdoin";
}
```

Delphi Examples:

```
{
The following code displays the number of rows a row was
moved in a label.  To move rows in a TStringGrid, goRowMoving
must be included in the Options property.
}
procedure TForm1.StringGrid1RowMoved(Sender: TObject; FromIndex, ToIndex: Longint);
begin
  Label1.Caption := IntToStr(Abs(FromIndex-ToIndex));
end;
```

See Also

OnColumnMoved (see page 3019)

Options (see page 3072)

10.1.2.4.6 TCustomDrawGrid.OnSelectCell Event

Occurs before a cell in the grid is selected.

Pascal

```
property OnSelectCell: TSelectCellEvent;
```

C++

```
__property TSelectCellEvent OnSelectCell;
```

Description

Write an OnSelectCell event handler to specify whether any particular cell in the grid can be selected. The Col (see page 3009) and Row (see page 3013) parameters indicate the column and row indexes of the cell that is about to be selected. Set the CanSelect parameter to false to prevent the cell being selected.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code ensures that the user cannot select a cell
unless it is empty.
*/
void __fastcall TForm1::StringGrid1SelectCell(TObject *Sender, int ACol, int ARow,
          bool &CanSelect)
{
  CanSelect = (StringGrid1->Cells[ACol][ARow]== "");
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code ensures that the user cannot select a cell
unless it is empty.
}
procedure TForm1.StringGrid1SelectCell(Sender: TObject; ACol, ARow: Longint; var CanSelect:
Boolean);
begin
  CanSelect := (StringGrid1.Cells[ACol, ARow]='')
end;
```

Col (see page 3060)

Row (see page 3074)

TabStops (see page 3079)

10.1.2.4.7 TCustomDrawGrid.OnSetEditText Event

Occurs when the user edits the value of a cell.

Pascal

```
property OnSetEditText: TSetEditEvent;
```

C++

```
__property TSetEditEvent OnSetEditText;
```

Description

Write an OnSetEditText event handler to perform any special processing of the text edited by the user in an in-place editor. For example, use the OnSetEditText event to retrieve and store the value of a cell so that it can be displayed in an OnDrawCell (see page 3020) event handler. OnSetEditText occurs every time the user changes the text.

The Value parameter is the new value for the cell specified by the ACol and ARow parameters.

OnSetEditText does not occur unless the Options (see page 3072) property includes goEditing.

See Also

OnDrawCell (see page 3020)

OnGetEditText (see page 3022)

Options (see page 3072)

10.1.2.4.8 TCustomDrawGrid.OnTopLeftChanged Event

Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Pascal

```
property OnTopLeftChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTopLeftChanged;
```

Description

Use OnTopLeftChanged to perform special processing when the non-fixed cells in the grid are scrolled.

See Also

LeftCol (see page 3072)

TopRow (see page 3080)

10.1.3 TCustomGrid Class

TCustomGrid is the base type for all components that present information in a two-dimensional grid.

Class Hierarchy

Pascal

```
TCustomGrid = class(TCustomControl);
```

C++

```
class TCustomGrid : public TCustomControl;
```

File

Grids

Description

Use TCustomGrid as a base class when defining components that represent information in a tabular format. TCustomGrid introduces properties and methods to control the appearance and behavior of the grid, including responses to mouse actions and user editing.

Do not create instances of TCustomGrid. Instead, put a grid control in a form by instantiating a descendant of TCustomGrid. Use TDrawGrid (see page 3083) to represent non-textual material in a tabular grid. For text, use a TStringGrid (see page 3180) object. If the text represents field values from a dataset, use TDBGrid.

See Also

TDBGrid

TDrawGrid (see page 3083)

TStringGrid (see page 3180)

10.1.3.1 TCustomGrid Members

The following tables list the members exposed by TCustomGrid.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 3031)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FGridState (see page 3031)	This is FGridState, a member of class TCustomGrid.
	FSaveCellExtents (see page 3032)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 3032)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	AdjustSize (see page 3034)	Adds or deletes rows or columns from the grid.
	BeginColumnDrag (see page 3034)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 3034)	Starts the dragging of a row in the grid.
	BoxRect (see page 3035)	Returns the screen coordinates of a specified set of cells.
	CalcDrawInfo (see page 3035)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 3036)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 3036)	Determines the appearance of the mouse cursor during resizing.
	CanEditAcceptKey (see page 3036)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 3037)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 3037)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 3037)	Indicates whether the grid should respond to a given key combination.
	CellRect (see page 3038)	Returns the screen coordinates of a cell in the grid.
	ChangeGridOrientation (see page 3038)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	CheckColumnDrag (see page 3039)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 3039)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	ColumnMoved (see page 3039)	Provides the interface for a method that responds when the position of a column changes.
	ColWidthsChanged (see page 3040)	Responds when the column widths change.
V	CreateEditor (see page 3040)	Creates the inplace editor control.
V	CreateParams (see page 3041)	Initializes the window-creation parameter record.
V	DefineProperties (see page 3041)	Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.
V	DeleteColumn (see page 3041)	Deletes a specified column from the grid.
V	DeleteRow (see page 3042)	Deletes a specified from the grid.
V	DoExit (see page 3042)	Hides the inplace editor when selection moves to another control in a form.
V	DoMouseWheelDown (see page 3042)	Performs tasks when the mouse wheel is rotated downward.
V	DoMouseWheelUp (see page 3043)	Performs tasks when the mouse wheel is rotated upward.
A	DrawCell (see page 3043)	Provides the prototype for a method that draws the contents of a cell in the grid.
	EndColumnDrag (see page 3044)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 3044)	Ends the dragging of a row in the grid.
	FocusCell (see page 3044)	Changes the current cell to a specified cell.

	GetEditLimit (see page 3045)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 3045)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 3046)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 3046)	Returns the value of the indicated cell formatted for editing.
	GetGridHeight (see page 3046)	Returns the value of the GridHeight (see page 3068) property.
	GetGridWidth (see page 3047)	Returns the value of the GridWidth (see page 3070) property.
	HideEdit (see page 3047)	Hides the inplace editor.
	HideEditor (see page 3048)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 3048)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 3048)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateEditor (see page 3049)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 3049)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 3050)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	KeyDown (see page 3050)	Provides special processing when the user presses a key.
	KeyPress (see page 3050)	Provides special processing when the user presses a key.
	MouseDown (see page 3051)	Provides special processing when the user presses a mouse button.
	MouseMove (see page 3052)	Provides special processing when the user moves the mouse.
	MouseUp (see page 3052)	Provides special processing when the user releases the mouse button.
	MoveColRow (see page 3053)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 3053)	Moves a column to a new position.
	MoveRow (see page 3053)	Moves a row to a new position.
	Paint (see page 3054)	Draws the image of the grid control on the screen.
	RowHeightsChanged (see page 3054)	Responds when the row heights change.
	RowMoved (see page 3055)	Provides the interface for a method that responds when the position of a row changes.
	ScrollData (see page 3055)	Scrolls the visual image of the cells in the grid.
	SelectCell (see page 3055)	Determines whether a particular cell in the grid can be selected.
	SetEditText (see page 3056)	Provides the interface for a method that updates the text associated with a cell.
	ShowEditor (see page 3056)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 3057)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 3057)	Responds to changes in the size of the grid.
	Sizing (see page 3057)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 3058)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 3058)	Updates the position of the inplace editor when the grid scrolls.
	UpdateDesigner (see page 3059)	Notifies the designer when rows and columns of the grid are moved or resized.

Protected Properties

	Name	Description
	BorderStyle (see page 3060)	Determines whether a single line border is drawn around the grid.
	Col (see page 3060)	Specifies the index of the column that contains the selected cell.
	ColCount (see page 3062)	Specifies the number of columns in the grid.
	Color (see page 3063)	Specifies the background color of the control.
	ColWidths (see page 3063)	Indicates the width (in pixels) of all the columns in the grid.
	DefaultColWidth (see page 3064)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3066)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3066)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	EditorMode (see page 3066)	Determines whether the current cell can be edited.
	FixedColor (see page 3067)	Specifies the background color of the fixed rows and columns in the grid.

	FixedCols (see page 3067)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3068)	Specifies the number of rows on the top of the grid that cannot be scrolled.
R	GridHeight (see page 3068)	Specifies the height of the grid in pixels.
	GridLineWidth (see page 3069)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
R	GridWidth (see page 3070)	Specifies the width of the grid in pixels.
R	HitTest (see page 3071)	Indicates the current position of the mouse cursor.
R	InplaceEditor (see page 3071)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	LeftCol (see page 3072)	Specifies the index of the first visible scrollable column in the grid.
	Options (see page 3072)	Specifies various display and behavioral properties of the grid.
	ParentColor (see page 3073)	Determines where a control looks for its color information.
	Row (see page 3074)	Specifies the index of the row that contains the selected cell.
	RowCount (see page 3075)	Specifies the number of rows in the grid.
	RowHeights (see page 3076)	Gives the height (in pixels) of all rows in the grid.
	ScrollBars (see page 3077)	Specifies whether the grid includes horizontal and vertical scroll bars.
	Selection (see page 3077)	Indicates the boundaries of the current selection.
	TabStops (see page 3079)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3080)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 3082)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 3082)	Indicates the number of scrollable rows visible in the grid.

Public Methods

	Name	Description
V	Create (see page 3030)	Creates an instance of TCustomGrid (see page 3027).
V	Destroy (see page 3031)	Destroys an instance of TCustomGrid (see page 3027).
	MouseCoord (see page 3051)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.

Published Properties

	Name	Description
	TabStop (see page 3079)	Determines if the user can tab to a control.

10.1.3.2 TCustomGrid.Create Constructor

Creates an instance of TCustomGrid (see page 3027).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomGrid(TComponent * AOwner);
```

Description

Call Create to create a grid control at runtime. Grid controls placed on a form at design time are created automatically.

Owner is a component that is responsible for freeing the grid and for initiating the streaming process when it is saved to a form file.

See Also

Owner

10.1.3.3 TCustomGrid.Destroy Destructor

Destroys an instance of TCustomGrid (see page 3027).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomGrid();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the grid reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

10.1.3.4 TCustomGrid Fields

The fields of the TCustomGrid class are listed here.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 3031)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FGridState (see page 3031)	This is FGridState, a member of class TCustomGrid.
	FSaveCellExtents (see page 3032)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 3032)	This is VirtualView, a member of class TCustomGrid.

10.1.3.4.1 TCustomGrid.DesignOptionsBoost Field

Pascal

```
DesignOptionsBoost: TGridOptions;
```

C++

```
TGridOptions DesignOptionsBoost;
```

Description

This is DesignOptionsBoost, a member of class TCustomGrid.

10.1.3.4.2 TCustomGrid.FGridState Field

Pascal

```
FGridState: TGridState;
```

C++

```
TGridState FGridState;
```

Description

This is FGridState, a member of class TCustomGrid.

10.1.3.4.3 TCustomGrid.FSaveCellExtents Field

Pascal

```
FSaveCellExtents: Boolean;
```

C++

```
Boolean FSaveCellExtents;
```

Description

This is FSaveCellExtents, a member of class TCustomGrid.

10.1.3.4.4 TCustomGrid.VirtualView Field

Pascal

```
VirtualView: Boolean;
```

C++

```
Boolean VirtualView;
```

Description

This is VirtualView, a member of class TCustomGrid.

10.1.3.5 TCustomGrid Methods

The methods of the TCustomGrid class are listed here.

Protected Methods

	Name	Description
	AdjustSize (see page 3034)	Adds or deletes rows or columns from the grid.
	BeginColumnDrag (see page 3034)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 3034)	Starts the dragging of a row in the grid.
	BoxRect (see page 3035)	Returns the screen coordinates of a specified set of cells.
	CalcDrawInfo (see page 3035)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 3036)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 3036)	Determines the appearance of the mouse cursor during resizing.
	CanEditAcceptKey (see page 3036)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 3037)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 3037)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 3037)	Indicates whether the grid should respond to a given key combination.
	CellRect (see page 3038)	Returns the screen coordinates of a cell in the grid.
	ChangeGridOrientation (see page 3038)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	CheckColumnDrag (see page 3039)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 3039)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	ColumnMoved (see page 3039)	Provides the interface for a method that responds when the position of a column changes.
	ColWidthsChanged (see page 3040)	Responds when the column widths change.
V	CreateEditor (see page 3040)	Creates the inplace editor control.
V	CreateParams (see page 3041)	Initializes the window-creation parameter record.
V	DefineProperties (see page 3041)	Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.

V	DeleteColumn (see page 3041)	Deletes a specified column from the grid.
V	DeleteRow (see page 3042)	Deletes a specified from the grid.
V	DoExit (see page 3042)	Hides the inplace editor when selection moves to another control in a form.
V	DoMouseWheelDown (see page 3042)	Performs tasks when the mouse wheel is rotated downward.
V	DoMouseWheelUp (see page 3043)	Performs tasks when the mouse wheel is rotated upward.
A	DrawCell (see page 3043)	Provides the prototype for a method that draws the contents of a cell in the grid.
	EndColumnDrag (see page 3044)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 3044)	Ends the dragging of a row in the grid.
	FocusCell (see page 3044)	Changes the current cell to a specified cell.
	GetEditLimit (see page 3045)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 3045)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 3046)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 3046)	Returns the value of the indicated cell formatted for editing.
	GetGridHeight (see page 3046)	Returns the value of the GridHeight (see page 3068) property.
	GetGridWidth (see page 3047)	Returns the value of the GridWidth (see page 3070) property.
	HideEdit (see page 3047)	Hides the inplace editor.
	HideEditor (see page 3048)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 3048)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 3048)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateEditor (see page 3049)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 3049)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 3050)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
V	KeyDown (see page 3050)	Provides special processing when the user presses a key.
V	KeyPress (see page 3050)	Provides special processing when the user presses a key.
V	MouseDown (see page 3051)	Provides special processing when the user presses a mouse button.
V	MouseMove (see page 3052)	Provides special processing when the user moves the mouse.
V	MouseUp (see page 3052)	Provides special processing when the user releases the mouse button.
	MoveColRow (see page 3053)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 3053)	Moves a column to a new position.
	MoveRow (see page 3053)	Moves a row to a new position.
V	Paint (see page 3054)	Draws the image of the grid control on the screen.
	RowHeightsChanged (see page 3054)	Responds when the row heights change.
	RowMoved (see page 3055)	Provides the interface for a method that responds when the position of a row changes.
	ScrollData (see page 3055)	Scrolls the visual image of the cells in the grid.
V	SelectCell (see page 3055)	Determines whether a particular cell in the grid can be selected.
	SetEditText (see page 3056)	Provides the interface for a method that updates the text associated with a cell.
	ShowEditor (see page 3056)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 3057)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 3057)	Responds to changes in the size of the grid.
	Sizing (see page 3057)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 3058)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 3058)	Updates the position of the inplace editor when the grid scrolls.
	UpdateDesigner (see page 3059)	Notifies the designer when rows and columns of the grid are moved or resized.

Public Methods

	Name	Description
	MouseCoord (see page 3051)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.

10.1.3.5.1 TCustomGrid.AdjustSize Method

Adds or deletes rows or columns from the grid.

Pascal

```
procedure AdjustSize(Index: Longint; Amount: Longint; Rows: Boolean); dynamic; reintroduce;
```

C++

```
__fastcall AdjustSize(Longint Index, Longint Amount, Boolean Rows);
```

Description

Grid components call AdjustSize internally to fix up the number of rows or columns when the user resizes them using the mouse. Index is the index of the row or column where the insertion or deletion should begin. Amount is the number of rows or columns to insert (Amount > 0) or delete (Amount < 0). Rows is a boolean that indicates whether the rows or the columns are changing.

See Also

DefaultColWidth (see page 3064)

DefaultRowHeight (see page 3066)

10.1.3.5.2 TCustomGrid.BeginColumnDrag Method

Starts the dragging of a column in the grid.

Pascal

```
function BeginColumnDrag(var Origin: Integer; var Destination: Integer; const MousePt:
TPoint): Boolean; dynamic;
```

C++

```
__fastcall Boolean BeginColumnDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

BeginColumnDrag is called automatically when the user clicks on a column to start dragging. It enables the grid to control whether the column can be repositioned and if so, which column.

Origin is the index of the column to be moved. When BeginColumnDrag is called, this is the index of the column in which the mouse was clicked. TCustomGrid (see page 3027) does not change this value. However, descendant classes can override this method to adjust which column can be moved.

Destination is the index of where the column should move. When BeginColumnDrag is called, this is the same as Origin. TCustomGrid (see page 3027) does not change this value because the mouse has not yet moved. Descendant classes can override this method to adjust the default destination of the column.

MousePt is the coordinates of the mouse button when the user clicked.

BeginColumnDrag returns true if the drag operation is permitted, false if the drag should be disallowed.

See Also

BeginRowDrag (see page 3034)

EndColumnDrag (see page 3044)

10.1.3.5.3 TCustomGrid.BeginRowDrag Method

Starts the dragging of a row in the grid.

Pascal

```
function BeginRowDrag(var Origin: Integer; var Destination: Integer; const MousePt: TPoint):
Boolean; dynamic;
```

C++

```
__fastcall Boolean BeginRowDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

Call BeginRowDrag to start a drag operation. BeginRowDrag enables the grid to control where the row can be dropped. It is exposed as a protected method so that descendants of TCustomGrid (see page 3027) can customize row dragging in a grid.

See Also

BeginColumnDrag (see page 3034)

EndRowDrag (see page 3044)

10.1.3.5.4 TCustomGrid.BoxRect Method

Returns the screen coordinates of a specified set of cells.

Pascal

```
function BoxRect(ALeft: Longint; ATop: Longint; ARight: Longint; ABottom: Longint): TRect;
```

C++

```
__fastcall TRect BoxRect(Longint ALeft, Longint ATop, Longint ARight, Longint ABottom);
```

Description

Call BoxRect to obtain the screen coordinates, in pixels, of the cells that run from the column with index ALeft to the column with index ARight and the row with index ATop to the row with index ABottom. The coordinates of cells that are not visible onscreen are not included in the final rectangle.

See Also

BoundsRect

CellRect (see page 3038)

10.1.3.5.5 TCustomGrid.CalcDrawInfo Method

Calculates the pixel locations of the grid boundaries.

Pascal

```
procedure CalcDrawInfo(var DrawInfo: TGridDrawInfo);
```

C++

```
__fastcall CalcDrawInfo(TGridDrawInfo DrawInfo);
```

Description

Use CalcDrawInfo to determine the pixel locations of the major grid boundaries in the X and Y directions, including things like the first visible column/row, the last visible column/row, the pixel extent of the fixed column/row, etc.

See Also

CalcFixedInfo (see page 3036)

10.1.3.5.6 TCustomGrid.CalcFixedInfo Method

Calculates the pixel locations of the fixed cells.

Pascal

```
procedure CalcFixedInfo(var DrawInfo: TGridDrawInfo);
```

C++

```
__fastcall CalcFixedInfo(TGridDrawInfo DrawInfo);
```

Description

Use CalcDrawInfo (see page 3035) to determine the pixel locations of the fixed cells in the X and Y directions.

See Also

CalcDrawInfo (see page 3035)

10.1.3.5.7 TCustomGrid.CalcSizingState Method

Determines the appearance of the mouse cursor during resizing.

Pascal

```
procedure CalcSizingState(X: Integer; Y: Integer; var State: TGridState; var Index: Longint;
var SizingPos: Integer; var SizingOfs: Integer; var FixedInfo: TGridDrawInfo); virtual;
```

C++

```
virtual __fastcall CalcSizingState(int X, int Y, TGridState State, Longint Index, int
SizingPos, int SizingOfs, TGridDrawInfo FixedInfo);
```

Description

Use CalcSizingState to determine if the mouse cursor should be changed to a resize or drag cursor based on where the mouse is in the grid. For example, cursor over a grid line, in the fixed cell region, and column resize is enabled = resize cursor.

See Also

CalcFixedInfo (see page 3036)

10.1.3.5.8 TCustomGrid.CanEditAcceptKey Method

Indicates whether the Key parameter can be entered into the current cell.

Pascal

```
function CanEditAcceptKey(Key: Char): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanEditAcceptKey(Char Key);
```

Description

CanEditAcceptKey provides a simple screening of keyboard input while the user is editing the contents of a cell. The CanEditAcceptKey method for TCustomGrid (see page 3027) always returns true. Descendants of TCustomGrid (see page 3027) override this method to screen out illegal characters.

More refined validation can be obtained by using an edit mask.

See Also

CanGridAcceptKey (see page 3037)

GetEditMask (see page 3045)

KeyPress (see page 3050)

10.1.3.5.9 TCustomGrid.CanEditModify Method

Indicates whether the current cell in the grid can be edited.

Pascal

```
function CanEditModify: Boolean; dynamic;
```

C++

```
__fastcall Boolean CanEditModify();
```

Description

Grid components use CanEditModify internally to determine whether to allow the user to edit the current cell. CanEditModify returns true unless the inplace editor has disallowed editing for the cell.

See Also

CanEditShow (see page 3037)

InplaceEditor (see page 3071)

10.1.3.5.10 TCustomGrid.CanEditShow Method

Indicates whether the inplace edit control can be created to allow editing.

Pascal

```
function CanEditShow: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanEditShow();
```

Description

Grid controls call CanEditShow internally before creating the editor for a cell. CanEditShow is called after the grid has determined that the field can be edited by calling CanEditModify (see page 3037).

CanEditShow returns false if the Options (see page 3072) property does not indicate that the grid allows editing, or if it indicates that the grid permits row selection. Otherwise, if the Options (see page 3072) property indicates that the grid is locked in edit mode, or if the grid has input focus, CanEditShow returns true. If the grid is not locked in edit mode and the grid does not have input focus, CanEditShow returns false.

See Also

CanEditModify (see page 3037)

InplaceEditor (see page 3071)

Options (see page 3072)

10.1.3.5.11 TCustomGrid.CanGridAcceptKey Method

Indicates whether the grid should respond to a given key combination.

Pascal

```
function CanGridAcceptKey(Key: Word; Shift: TShiftState): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanGridAcceptKey(Word Key, TShiftState Shift);
```

Description

Grid controls call CanGridAcceptKey internally to screen key combinations when the user first presses a key. The CanGridAcceptKey method for TCustomGrid (see page 3027) always returns true. Descendants of TCustomGrid (see page 3027) override this method to screen out irrelevant key combinations, or key combinations that indicate actions that would violate the Options (see page 3072) or mode of the grid.

See Also

CanEditAcceptKey (see page 3036)

KeyDown (see page 3050)

Options (see page 3072)

10.1.3.5.12 TCustomGrid.CellRect Method

Returns the screen coordinates of a cell in the grid.

Pascal

```
function CellRect(ACol: Longint; ARow: Longint): TRect;
```

C++

```
__fastcall TRect CellRect(Longint ACol, Longint ARow);
```

Description

Call CellRect to obtain the boundaries, in pixels, of the cell in the column and row indicated by the ACol and ARow parameters. The top left cell is specified when ACol and ARow are set to zero.

If the indicated cell is not visible, CellRect returns an empty rectangle.

See Also

BoxRect (see page 3035)

10.1.3.5.13 TCustomGrid.ChangeGridOrientation Method

Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.

Pascal

```
procedure ChangeGridOrientation(RightToLeftOrientation: Boolean);
```

C++

```
__fastcall ChangeGridOrientation(Boolean RightToLeftOrientation);
```

Description

TCustomGrid (see page 3027) uses ChangeGridOrientation internally when painting. ChangeGridOrientation sets the origin and dimensions of the grid's canvas so that painting occurs from right-to-left or from left-to-right based on the value of the RightToLeftOrientation parameter.

RightToLeftOrientation is true if the grid should prepare for painting from right to left. RightToLeftOrientation is false if the grid should restore the canvas to normal.

See Also

UseRightToLeftAlignment

BiDiMode

10.1.3.5.14 TCustomGrid.CheckColumnDrag Method

CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.

Pascal

```
function CheckColumnDrag(var Origin: Integer; var Destination: Integer; const MousePt:
TPoint): Boolean; dynamic;
```

C++

```
__fastcall Boolean CheckColumnDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

Use CheckColumnDrag to validate that the column currently selected for dragging can be dropped at the current location. CheckColumnDrag can change the Origin (the column being dragged) and/or the Destination (the drop target), as needed, to keep the grid's columns in order.

See Also

BeginColumnDrag (see page 3034)

EndColumnDrag (see page 3044)

10.1.3.5.15 TCustomGrid.CheckRowDrag Method

CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.

Pascal

```
function CheckRowDrag(var Origin: Integer; var Destination: Integer; const MousePt: TPoint):
Boolean; dynamic;
```

C++

```
__fastcall Boolean CheckRowDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

Use CheckRowDrag to validate that the row currently selected for dragging can be dropped at the current location. CheckRowDrag can change the Origin (the row being dragged) and/or the Destination (the drop target), as needed, to keep the grid's rows in order.

See Also

BeginRowDrag (see page 3034)

EndRowDrag (see page 3044)

10.1.3.5.16 TCustomGrid.ColumnMoved Method

Provides the interface for a method that responds when the position of a column changes.

Pascal

```
procedure ColumnMoved(FromIndex: Longint; ToIndex: Longint); dynamic;
```

C++

```
__fastcall ColumnMoved(Longint FromIndex, Longint ToIndex);
```

Description

ColumnMoved is called immediately after a column in the grid has moved. The FromIndex parameter is the old index of the column, and the ToIndex parameter is the new index. The ColumnMoved method of TCustomGrid (see page 3027) does nothing. Descendants of TCustomGrid (see page 3027) override this method to make internal adjustments or to generate an OnColumnMoved event.

See Also

MoveColumn (see page 3053)

10.1.3.5.17 TCustomGrid.ColWidthsChanged Method

Responds when the column widths change.

Pascal

```
procedure ColWidthsChanged; dynamic;
```

C++

```
__fastcall ColWidthsChanged();
```

Description

ColWidthsChanged is called immediately after the column widths change. The change can result from setting the ColWidths (see page 3063) property, from setting the DefaultColWidth (see page 3064) property, from moving one of the columns, or from resizing the columns with the mouse.

ColWidthsChanged adjusts the scroll bar and the position of the inplace editor to take into account the new column size and positions of the columns.

See Also

ColWidths (see page 3063)

DefaultColWidth (see page 3064)

InplaceEditor (see page 3071)

ScrollBars (see page 3077)

10.1.3.5.18 TCustomGrid.CreateEditor Method

Creates the inplace editor control.

Pascal

```
function CreateEditor: TInplaceEdit; virtual;
```

C++

```
virtual __fastcall TInplaceEdit CreateEditor();
```

Description

Grid controls call CreateEditor internally the first time the grid goes into edit mode. CreateEditor is exposed as a protected method so that descendants of TCustomGrid (see page 3027) can substitute a specialized descendant of TInplaceEdit (see page 3161) to handle cell editing.

See Also

EditorMode (see page 3066)

InplaceEditor (see page 3071)

ShowEditor (see page 3056)

10.1.3.5.19 TCustomGrid.CreateParams Method

Initializes the window-creation parameter record.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method is called internally to specify the properties of the window that implements this control. These properties are set in the window-creation parameter record passed as Params. The fields of this record become the parameters to a call to the CreateWindowEx API function.

After calling the inherited method, CreateParams adjusts the value of Params to request that the grid receive double click messages, and to implement the values of the ScrollBars (see page 3077) and BorderStyle (see page 3060) properties.

See Also

BorderStyle (see page 3060)

ScrollBars (see page 3077)

CreateWnd

10.1.3.5.20 TCustomGrid.DefineProperties Method

Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties overrides the inherited method to save the ColWidths (see page 3063) and RowHeights (see page 3076) properties with the grid when they contain values other than the default widths and heights.

See Also

ColWidths (see page 3063)

DefaultColWidth (see page 3064)

DefaultRowHeight (see page 3066)

RowHeights (see page 3076)

TFiler

10.1.3.5.21 TCustomGrid.DeleteColumn Method

Deletes a specified column from the grid.

Pascal

```
procedure DeleteColumn(ACol: Longint); virtual;
```

C++

```
virtual __fastcall DeleteColumn(Longint ACol);
```

Description

Call DeleteColumn to remove a column from the middle of the grid. Provide the index of the column to remove as ACol. To remove the last column from the grid, set the ColCount (see page 3062) property instead.

See Also

ColCount (see page 3062)

10.1.3.5.22 TCustomGrid.DeleteRow Method

Deletes a specified from the grid.

Pascal

```
procedure DeleteRow(ARow: Longint); virtual;
```

C++

```
virtual __fastcall DeleteRow(Longint ARow);
```

Description

Call DeleteRow to remove a row from the middle of the grid. Provide the index of the row to remove as ARow. To remove the last row from the grid, set the RowCount (see page 3075) property instead.

See Also

RowCount (see page 3075)

10.1.3.5.23 TCustomGrid.DoExit Method

Hides the inplace editor when selection moves to another control in a form.

Pascal

```
procedure DoExit; override;
```

C++

```
virtual __fastcall DoExit();
```

Description

After calling the inherited method, which generates an OnExit event, DoExit hides the inplace editor unless the Options (see page 3072) property includes goAlwaysShowEditor.

See Also

HideEditor (see page 3048)

Options (see page 3072)

OnExit

10.1.3.5.24 TCustomGrid.DoMouseWheelDown Method

Performs tasks when the mouse wheel is rotated downward.

Pascal

```
function DoMouseWheelDown(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelDown(TShiftState Shift, TPoint MousePos);
```

Description

Override DoMouseWheelDown to perform tasks when the mouse wheel is rotated downward.

DoMouseWheelDown returns false if the control's parent should handle the message.

In TCustomGrid (see page 3027), DoMouseWheelDown increments the current row and returns true.

See Also

DoMouseWheelUp (see page 3043)

Row (see page 3074)

10.1.3.5.25 TCustomGrid.DoMouseWheelUp Method

Performs tasks when the mouse wheel is rotated upward.

Pascal

```
function DoMouseWheelUp(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelUp(TShiftState Shift, TPoint MousePos);
```

Description

Override DoMouseWheelUp to perform tasks when the mouse wheel is rotated downward.

DoMouseWheelUp should return false if the control's parent should handle the message.

In TCustomGrid (see page 3027), DoMouseWheelUp decrements the current row and returns true.

See Also

DoMouseWheelDown (see page 3042)

Row (see page 3074)

10.1.3.5.26 TCustomGrid.DrawCell Method

Provides the prototype for a method that draws the contents of a cell in the grid.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
virtual; abstract;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState) =
0;
```

Description

Descendants of TCustomGrid (see page 3027) implement the DrawCell method to draw the contents of the cell or to generate an OnDrawCell event. If the DefaultDrawing (see page 3066) property is true, the background of the cell is painted before DrawCell is called, and the 3D effects of the fixed cells or the focus rectangle around the focused cell are drawn after DrawCell.

The ACol and ARow parameters give the column and row indexes of the cell that should be drawn. The ARect parameter gives the boundaries of the cell in the coordinates of the canvas. The AState parameter indicates whether the cell is selected, whether the cell has input focus, and whether the cell is in the fixed, non-scrolling portion of the grid.

See Also

DefaultDrawing (see page 3066)

FixedCols (see page 3067)

FixedRows (see page 3068)

Options (see page 3072)

10.1.3.5.27 TCustomGrid.EndColumnDrag Method

Ends the dragging of a column in the grid.

Pascal

```
function EndColumnDrag(var Origin: Integer; var Destination: Integer; const MousePt: TPoint):
Boolean; dynamic;
```

C++

```
__fastcall Boolean EndColumnDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

Call EndColumnDrag to end a drag operation. EndColumnDrag enables the grid to control where the column can be dropped. It is exposed as a protected method so that descendants of TCustomGrid (see page 3027) can customize column dragging in a grid.

See Also

BeginColumnDrag (see page 3034)

10.1.3.5.28 TCustomGrid.EndRowDrag Method

Ends the dragging of a row in the grid.

Pascal

```
function EndRowDrag(var Origin: Integer; var Destination: Integer; const MousePt: TPoint):
Boolean; dynamic;
```

C++

```
__fastcall Boolean EndRowDrag(int Origin, int Destination, const TPoint MousePt);
```

Description

Call EndRowDrag to end a drag operation. EndRowDrag enables the grid to control where the row can be dropped. It is exposed as a protected method so that descendants of TCustomGrid (see page 3027) can customize row dragging in a grid.

See Also

BeginRowDrag (see page 3034)

10.1.3.5.29 TCustomGrid.FocusCell Method

Changes the current cell to a specified cell.

Pascal

```
procedure FocusCell(ACol: Longint; ARow: Longint; MoveAnchor: Boolean);
```

C++

```
__fastcall FocusCell(Longint ACol, Longint ARow, Boolean MoveAnchor);
```

Description

TCustomGrid (see page 3027) calls FocusCell internally to change the currently selected cell. FocusCell changes the current cell and updates the selection appropriately.

ACol is the column of the cell to select.

ARow is the row of the cell to select.

MoveAnchor determines how the selection changes. If the grid does not allow multiple cells to be selected (Options (see page 3072) does not include goRangeSelect), MoveAnchor is ignored and the specified cell becomes the selected cell. If the grid allows multiple cells to be selected, MoveAnchor determines whether the new cell becomes the starting cell (anchor) of a new selection, or whether the current selection is updated to range from the current anchor to the specified cell.

See Also

Col (see page 3060)

Row (see page 3074)

Selection (see page 3077)

Options (see page 3072)

10.1.3.5.30 TCustomGrid.GetEditLimit Method

Provides the interface for a method that limits the number of characters the user can type into cells.

Pascal

```
function GetEditLimit: Integer; dynamic;
```

C++

```
__fastcall int GetEditLimit();
```

Description

The inplace editor calls GetEditLimit to determine if a limit should be placed on the number of characters a user can type into a cell. GetEditLimit sets no limits. Descendants of TCustomGrid (see page 3027) override this method to limit the text for certain cells.

See Also

InplaceEditor (see page 3071)

10.1.3.5.31 TCustomGrid.GetEditMask Method

Provides the interface for a method that returns an input mask for the specified cell.

Pascal

```
function GetEditMask(ACol: Longint; ARow: Longint): string; dynamic;
```

C++

```
__fastcall UnicodeString GetEditMask(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditMask to obtain any input mask associated with the cell specified by the ACol and ARow parameters. GetEditMask returns an empty string, indicating that the cell has no input mask. Descendants of TCustomGrid (see page 3027) override this method to provide an input mask or generate an OnGetEditMask event.

See Also

InplaceEditor (see page 3071)

EditMask (see page 4604)

10.1.3.5.32 TCustomGrid.GetEditStyle Method

Indicates whether a specified cell has an ellipsis button or drop-down arrow.

Pascal

```
function GetEditStyle(ACol: Longint; ARow: Longint): TEditStyle; dynamic;
```

C++

```
__fastcall TEditStyle GetEditStyle(Longint ACol, Longint ARow);
```

Description

GetEditStyle indicates whether the specified cell can only be edited directly (esSimple), whether it has an ellipsis button that users can click to launch an editor for modifying field values (esEllipsis), or whether it has a drop-down arrow that users can click to display a pick list of possible values (esPickList).

ACol is the column that contains the cell. ARow is the row that contains the cell.

In TCustomGrid (see page 3027), GetEditStyle always returns esSimple, indicating that there is no ellipsis button or drop-down arrow. Descendant classes can override this methods if they provide a way to add pick lists or ellipsis buttons to cells.

10.1.3.5.33 TCustomGrid.GetEditText Method

Returns the value of the indicated cell formatted for editing.

Pascal

```
function GetEditText(ACol: Longint; ARow: Longint): string; dynamic;
```

C++

```
__fastcall UnicodeString GetEditText(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditText to obtain the text for the indicated cell. GetEditText returns an empty string. Descendants of TCustomGrid (see page 3027) override the GetEditText method to return a string that represents the contents of the cell indicated by the ACol and ARow parameters.

See Also

InplaceEditor (see page 3071)

10.1.3.5.34 TCustomGrid.GetGridHeight Method

Returns the value of the GridHeight (see page 3068) property.

Pascal

```
function GetGridHeight: Integer;
```

C++

```
__fastcall int GetGridHeight();
```

Description

GetGridHeight is the protected property access method for the GridHeight (see page 3068) property. It computes the value of the GridHeight (see page 3068) property based on the row heights, separator width, and the size of the control.

See Also

ClientHeight

GetGridWidth (see page 3047)

GridHeight (see page 3068)

GridLineWidth (see page 3069)

RowHeights (see page 3076)

10.1.3.5.35 TCustomGrid.GetGridWidth Method

Returns the value of the GridWidth (see page 3070) property.

Pascal

```
function GetGridWidth: Integer;
```

C++

```
__fastcall int GetGridWidth();
```

Description

GetGridWidth is the protected property access method for the GridWidth (see page 3070) property. It computes the value of the GridWidth (see page 3070) property based on the column widths, separator width, and the size of the control.

See Also

ClientWidth

ColWidths (see page 3063)

GetGridHeight (see page 3046)

GridWidth (see page 3070)

GridLineWidth (see page 3069)

10.1.3.5.36 TCustomGrid.HideEdit Method

Hides the inplace editor.

Pascal

```
procedure HideEdit;
```

C++

```
__fastcall HideEdit();
```

Description

The HideEditor (see page 3048) method calls the protected HideEdit method to hide the editor. This method hides the editor window after updating the text to reflect the text in the editor.

See Also

HideEditor (see page 3048)

InplaceEditor (see page 3071)

10.1.3.5.37 TCustomGrid.HideEditor Method

Hides the inplace editor when it is not in use.

Pascal

```
procedure HideEditor;
```

C++

```
__fastcall HideEditor();
```

Description

Grid controls call HideEditor when the grid goes out of edit mode. HideEditor hides the window of the inplace editor.

See Also

EditorMode (see page 3066)

InplaceEditor (see page 3071)

ShowEditor (see page 3056)

10.1.3.5.38 TCustomGrid.InvalidateCell Method

Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.

Pascal

```
procedure InvalidateCell(ACol: Longint; ARow: Longint);
```

C++

```
__fastcall InvalidateCell(Longint ACol, Longint ARow);
```

Description

Call InvalidateCell when the contents of a cell change so that the cell will need to be repainted. The ACol parameter is the column index of the cell, and the ARow parameter is the row index.

See Also

CellRect (see page 3038)

InvalidateCol (see page 3048)

InvalidateEditor (see page 3049)

InvalidateRow (see page 3050)

10.1.3.5.39 TCustomGrid.InvalidateCol Method

Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.

Pascal

```
procedure InvalidateCol(ACol: Longint);
```

C++

```
__fastcall InvalidateCol(Longint ACol);
```

Description

Call InvalidateCol when a column changes so that the area it occupies will need to be repainted. The ACol parameter is the column index.

See Also

BoxRect (see page 3035)

InvalidateCell (see page 3048)

InvalidateRow (see page 3050)

10.1.3.5.40 TCustomGrid.InvalidateEditor Method

Causes the inplace editor to repaint itself, moving to a new location if necessary.

Pascal

```
procedure InvalidateEditor;
```

C++

```
__fastcall InvalidateEditor();
```

Description

InvalidateEditor is called when the selected cell changes while the grid is in edit mode.

See Also

EditorMode (see page 3066)

HideEditor (see page 3048)

InplaceEditor (see page 3071)

InvalidateCell (see page 3048)

ShowEditor (see page 3056)

10.1.3.5.41 TCustomGrid.InvalidateGrid Method

Tells Windows to repaint the grid after other important Windows messages are handled.

Pascal

```
procedure InvalidateGrid;
```

C++

```
__fastcall InvalidateGrid();
```

Description

InvalidateGrid is used internally to ensure that the grid is repainted when its properties change. It calls the Invalidate method to indicate that the grid needs repainting.

See Also

Invalidate

10.1.3.5.42 TCustomGrid.InvalidateRow Method

Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.

Pascal

```
procedure InvalidateRow(ARow: Longint);
```

C++

```
__fastcall InvalidateRow(Longint ARow);
```

Description

Call InvalidateRow when a row changes so that the area it occupies will need to be repainted. The ARow parameter is the row index.

See Also

BoxRect (see page 3035)

InvalidateCell (see page 3048)

InvalidateCol (see page 3048)

10.1.3.5.43 TCustomGrid.KeyDown Method

Provides special processing when the user presses a key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After generating an OnKeyDown event, KeyDown calls CanGridAcceptKey (see page 3037) to screen out problematic key combinations. KeyDown moves to the appropriate cell in response to navigational key combinations, or sets the EditorMode (see page 3066) property to true when the user presses F2.

See Also

CanGridAcceptKey (see page 3037)

EditorMode (see page 3066)

KeyPress (see page 3050)

OnKeyDown

10.1.3.5.44 TCustomGrid.KeyPress Method

Provides special processing when the user presses a key.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically after the KeyDown (see page 3050) method, but before the user releases the key.

After generating an OnKeyPress event, KeyPress toggles the EditorMode (see page 3066) property when the user presses the Enter key.

See Also

EditorMode (see page 3066)

KeyDown (see page 3050)

OnKeyPress

10.1.3.5.45 TCustomGrid.MouseCoord Method

Returns the row and column indexes of the cell that contains a point specified in screen coordinates.

Pascal

```
function MouseCoord(X: Integer; Y: Integer): TGridCoord;
```

C++

```
__fastcall TGridCoord MouseCoord(int X, int Y);
```

Description

Call MouseCoord to locate the column and row of the cell which contains a given screen coordinate. Usually, MouseCoord is used to locate the cell that is under the mouse.

See Also

CellRect (see page 3038)

MouseDown (see page 3051)

MouseMove (see page 3052)

MouseUp (see page 3052)

10.1.3.5.46 TCustomGrid.MouseDown Method

Provides special processing when the user presses a mouse button.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseDown hides the editor window so that it can move selection to the cell that receives the mouse click. If the mouse lands in the hot region for beginning a move or resize of a row or column, MouseDown starts the move or resize, and provides visual feedback by changing the cursor. If the editor window was hidden, it is brought back up in its new location. Finally, MouseDown generates an OnMouseDown event.

See Also

HideEditor (see page 3048)

InplaceEditor (see page 3071)

MouseMove (see page 3052)

MouseUp (see page 3052)

ShowEditor (see page 3056)

OnMouseDown

10.1.3.5.47 TCustomGrid.MouseMove Method

Provides special processing when the user moves the mouse.

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

If the grid is in the middle of moving or resizing a row or column, or in the middle of selecting a range of cells using the mouse, MouseMove calculates the changes implied by the mouse move and provides visual feedback to the user. Finally, MouseMove generates an OnMouseMove event.

See Also

MouseDown (see page 3051)

MouseUp (see page 3052)

OnMouseMove

10.1.3.5.48 TCustomGrid.MouseUp Method

Provides special processing when the user releases the mouse button.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseUp finishes a move or resize operation on a row or column, or if the user is selecting a range of cells using the mouse, MouseUp finishes the select operation. Finally, MouseUp generates an OnMouseUp event.

See Also

MouseDown (see page 3051)

MouseMove (see page 3052)

MoveColumn (see page 3053)

MoveRow (see page 3053)

OnMouseUp

10.1.3.5.49 TCustomGrid.MoveColRow Method

Selects the cell indicated by the ACol and ARow parameters.

Pascal

```
procedure MoveColRow(ACol: Longint; ARow: Longint; MoveAnchor: Boolean; Show: Boolean);
```

C++

```
__fastcall MoveColRow(Longint ACol, Longint ARow, Boolean MoveAnchor, Boolean Show);
```

Description

Grid controls call MoveColRow internally when changing the selected cell or cells. MoveColRow selects the indicated cell, but does not take care of removing any previous selection.

The ACol and ARow parameters are the column index and the row index of the cell to be selected. The MoveAnchor parameter indicates whether the new cell becomes the upper left corner of the selected region. MoveAnchor is true unless MoveColRow is called when extending a multicell selected region. The Show parameter indicates whether MoveColRow should ensure that the newly selected cell is visible.

See Also

Col (see page 3060)

Row (see page 3074)

SelectCell (see page 3055)

Selection (see page 3077)

10.1.3.5.50 TCustomGrid.MoveColumn Method

Moves a column to a new position.

Pascal

```
procedure MoveColumn(FromIndex: Longint; ToIndex: Longint);
```

C++

```
__fastcall MoveColumn(Longint FromIndex, Longint ToIndex);
```

Description

Call MoveColumn to move the column identified by the FromIndex parameter to the position specified by the ToIndex parameter.

See Also

ColumnMoved (see page 3039)

ColWidthsChanged (see page 3040)

10.1.3.5.51 TCustomGrid.MoveRow Method

Moves a row to a new position.

Pascal

```
procedure MoveRow(FromIndex: Longint; ToIndex: Longint);
```

C++

```
__fastcall MoveRow(Longint FromIndex, Longint ToIndex);
```

Description

Call MoveRow to move the row identified by the FromIndex parameter to the position specified by the ToIndex parameter.

See Also

RowHeightsChanged (see page 3054)

RowMoved (see page 3055)

10.1.3.5.52 TCustomGrid.Paint Method

Draws the image of the grid control on the screen.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint is called when the grid receives a paint message. Paint draws the grid, calling the DrawCell (see page 3043) method when it is time to paint the contents of each cell. If DefaultDrawing (see page 3066) is false, Paint does not draw the background of the cells, provide the raised 3D effects on the fixed cells, or draw the focus rectangle around the selected cell when it has focus.

See Also

DefaultDrawing (see page 3066)

DrawCell (see page 3043)

InvalidateCell (see page 3048)

InvalidateCol (see page 3048)

InvalidateRow (see page 3050)

10.1.3.5.53 TCustomGrid.RowHeightsChanged Method

Responds when the row heights change.

Pascal

```
procedure RowHeightsChanged; dynamic;
```

C++

```
__fastcall RowHeightsChanged();
```

Description

RowHeightsChanged is called immediately after the row heights change. The change can result from setting the RowHeights (see page 3076) property, from setting the DefaultRowHeight (see page 3066) property, from moving one of the rows, or from resizing the rows with the mouse.

RowHeightsChanged adjusts the scroll bar and the position of the inplace editor to take into account the new row size and positions of the rows.

See Also

DefaultRowHeight (see page 3066)

InplaceEditor (see page 3071)

RowHeights (see page 3076)

ScrollBars (see page 3077)

10.1.3.5.54 TCustomGrid.RowMoved Method

Provides the interface for a method that responds when the position of a row changes.

Pascal

```
procedure RowMoved(FromIndex: Longint; ToIndex: Longint); dynamic;
```

C++

```
__fastcall RowMoved(Longint FromIndex, Longint ToIndex);
```

Description

RowMoved is called immediately after a row in the grid changes position. The FromIndex parameter is the old index of the row, and the ToIndex parameter is the new index. The RowMoved method of TCustomGrid (see page 3027) does nothing. Descendants of TCustomGrid (see page 3027) override this method to make internal adjustments or to generate an OnRowMoved event.

See Also

MoveRow (see page 3053)

10.1.3.5.55 TCustomGrid.ScrollData Method

Scrolls the visual image of the cells in the grid.

Pascal

```
procedure ScrollData(DX: Integer; DY: Integer);
```

C++

```
__fastcall ScrollData(int DX, int DY);
```

Description

Grid controls call ScrollData internally when the nonfixed rows or columns scroll. ScrollData updates the image of the grid.

See Also

LeftCol (see page 3072)

TopRow (see page 3080)

10.1.3.5.56 TCustomGrid.SelectCell Method

Determines whether a particular cell in the grid can be selected.

Pascal

```
function SelectCell(ACol: Longint; ARow: Longint): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SelectCell(Longint ACol, Longint ARow);
```

Description

Grid controls call SelectCell internally before attempting to move selection to a the cell identified by the ACol and ARow parameters. ACol and ARow are the column and row indexes for the cell, where the first column has index 0, and the top row has index 0.

The SelectCell method for TCustomGrid (see page 3027) always returns true, allowing the cell to be selected. Descendants of TCustomGrid (see page 3027) override this method to check the properties of the information displayed in the cell or generating an OnSelectCell event.

See Also

MoveColRow (see page 3053)

TabStops (see page 3079)

10.1.3.5.57 TCustomGrid.SetEditText Method

Provides the interface for a method that updates the text associated with a cell.

Pascal

```
procedure SetEditText(ACol: Longint; ARow: Longint; const Value: string); dynamic;
```

C++

```
__fastcall SetEditText(Longint ACol, Longint ARow, const UnicodeString Value);
```

Description

SetEditText is called by the inplace editor so that the grid can store the new value for the current cell. The SetEditText method for TCustomGrid (see page 3027) does nothing. Descendants of TCustomGrid (see page 3027) override this method to update an internal representation of the cell's value, or to generate an OnSetEditText event.

See Also

GetEditText (see page 3046)

10.1.3.5.58 TCustomGrid.ShowEditor Method

Displays the inplace editor when the grid enters edit mode.

Pascal

```
procedure ShowEditor;
```

C++

```
__fastcall ShowEditor();
```

Description

Grid controls call ShowEditor when the grid enters edit mode. ShowEditor displays the window of the inplace editor over the currently selected cell. If the inplace editor does not yet exist, ShowEditor creates it.

See Also

CreateEditor (see page 3040)

EditorMode (see page 3066)

HideEditor (see page 3048)

InplaceEditor (see page 3071)

10.1.3.5.59 TCustomGrid.ShowEditorChar Method

Displays the inplace editor, with its text set to the specified character.

Pascal

```
procedure ShowEditorChar(Ch: Char);
```

C++

```
__fastcall ShowEditorChar(Char Ch);
```

Description

Grid controls call ShowEditorChar when the user types a character into a cell and the editor is not already showing. ShowEditorChar displays the window of the inplace editor over the currently selected cell, and sets its text property to the character Ch. If the inplace editor does not yet exist, ShowEditorChar creates it.

See Also

CreateEditor (see page 3040)

EditorMode (see page 3066)

HideEditor (see page 3048)

InplaceEditor (see page 3071)

ShowEditor (see page 3056)

10.1.3.5.60 TCustomGrid.SizeChanged Method

Responds to changes in the size of the grid.

Pascal

```
procedure SizeChanged(OldColCount: Longint; OldRowCount: Longint); dynamic;
```

C++

```
__fastcall SizeChanged(Longint OldColCount, Longint OldRowCount);
```

Description

SizeChanged provides the interface for a method that responds to changes in the number of rows or columns in the grid. The SizeChanged method of TCustomGrid (see page 3027) does nothing. Descendants of TCustomGrid (see page 3027) override this method to make internal adjustments or generate events.

See Also

ColCount (see page 3062)

RowCount (see page 3075)

10.1.3.5.61 TCustomGrid.Sizing Method

Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.

Pascal

```
function Sizing(X: Integer; Y: Integer): Boolean;
```

C++

```
__fastcall Boolean Sizing(int X, int Y);
```

Description

Grid controls call Sizing internally with the coordinates of a mouse click to determine whether the user is about to resize a row or column.

See Also

MouseDown (see page 3051)

10.1.3.5.62 TCustomGrid.TimedScroll Method

Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.

Pascal

```
procedure TimedScroll(Direction: TGridScrollDirection); dynamic;
```

C++

```
__fastcall TimedScroll(TGridScrollDirection Direction);
```

Description

TimedScroll is called periodically as the user continues to drag with the mouse outside of the scrollable cells in the grid. TimedScroll does nothing unless the user is moving a row or column, resizing a row or column, or selecting a multiple cell region using the mouse. TimedScroll scrolls the cells in the grid to allow the operation to continue into the portion of the grid that was hidden due to scrolling.

See Also

LeftCol (see page 3072)

MouseMove (see page 3052)

TopRow (see page 3080)

VisibleColCount (see page 3082)

VisibleRowCount (see page 3082)

10.1.3.5.63 TCustomGrid.TopLeftChanged Method

Updates the position of the inplace editor when the grid scrolls.

Pascal

```
procedure TopLeftChanged; dynamic;
```

C++

```
__fastcall TopLeftChanged();
```

Description

Grid controls call TopLeftChanged internally, whenever the LeftCol (see page 3072) or TopRow (see page 3080) property changes.

Descendants of TCustomGrid (see page 3027) override this method to make additional adjustments or to generate an OnTopLeftChanged event.

See Also

InplaceEditor (see page 3071)

LeftCol (see page 3072)

TopRow (see page 3080)

10.1.3.5.64 TCustomGrid.UpdateDesigner Method

Notifies the designer when rows and columns of the grid are moved or resized.

Pascal

```
procedure UpdateDesigner;
```

C++

```
__fastcall UpdateDesigner();
```

Description

At design time, the designer automatically keeps track of property changes so that it can prompt the user to save any changes. Moving or resizing the rows and columns of the grid using the mouse bypasses this system. When such changes occur, UpdateDesigner notifies the designer that the properties of the grid have changed and that the changes should be saved.

See Also

MouseUp (see page 3052)

10.1.3.6 TCustomGrid Properties

The properties of the TCustomGrid class are listed here.

Protected Properties

	Name	Description
	BorderStyle (see page 3060)	Determines whether a single line border is drawn around the grid.
	Col (see page 3060)	Specifies the index of the column that contains the selected cell.
	ColCount (see page 3062)	Specifies the number of columns in the grid.
	Color (see page 3063)	Specifies the background color of the control.
	ColWidths (see page 3063)	Indicates the width (in pixels) of all the columns in the grid.
	DefaultColWidth (see page 3064)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3066)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3066)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	EditorMode (see page 3066)	Determines whether the current cell can be edited.
	FixedColor (see page 3067)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3067)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3068)	Specifies the number of rows on the top of the grid that cannot be scrolled.
R	GridHeight (see page 3068)	Specifies the height of the grid in pixels.
	GridLineWidth (see page 3069)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
R	GridWidth (see page 3070)	Specifies the width of the grid in pixels.
R	HitTest (see page 3071)	Indicates the current position of the mouse cursor.
R	InplaceEditor (see page 3071)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	LeftCol (see page 3072)	Specifies the index of the first visible scrollable column in the grid.
	Options (see page 3072)	Specifies various display and behavioral properties of the grid.
	ParentColor (see page 3073)	Determines where a control looks for its color information.

	Row (see page 3074)	Specifies the index of the row that contains the selected cell.
	RowCount (see page 3075)	Specifies the number of rows in the grid.
	RowHeights (see page 3076)	Gives the height (in pixels) of all rows in the grid.
	ScrollBars (see page 3077)	Specifies whether the grid includes horizontal and vertical scroll bars.
	Selection (see page 3077)	Indicates the boundaries of the current selection.
	TabStops (see page 3079)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3080)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 3082)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 3082)	Indicates the number of scrollable rows visible in the grid.

Published Properties

	Name	Description
	TabStop (see page 3079)	Determines if the user can tab to a control.

10.1.3.6.1 TCustomGrid.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

10.1.3.6.2 TCustomGrid.Col Property

Specifies the index of the column that contains the selected cell.

Pascal

```
property Col: Longint;
```

C++

```
__property Longint Col;
```

Description

Use Col at runtime to determine the current column in the grid. Setting Col moves focus to the cell in the current row that is in the new column. The first column has an index of 0, the second column an index of 1, and so on.

The selected cell in the grid can be located by reading the Col property and the Row (see page 3074) property to obtain the indexes of its column and row. When focus moves to the grid, the selected cell gets input focus.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It uses a draw grid with a label above it on a form. When
the user clicks a cell in the grid, the location of the
cursor is displayed in the label caption. This example
requires a populated image list, or can just display an
empty grid.
*/
void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
```

```
  Label1->Caption = "From OnClick: The cursor is in column " +
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(index) +
      " has the focus.";
  }
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It uses a draw grid with a label above it on a form. When
the user clicks a cell in the grid, the location of the
cursor is displayed in the label caption. This example
requires a populated image list, or can just display an
empty grid.
}
procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(index) + ' has the focus.';
  end;
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

See Also

Row (see page 3074)

10.1.3.6.3 TCustomGrid.ColCount Property

Specifies the number of columns in the grid.

Pascal

```
property ColCount: Longint;
```

C++

```
__property Longint ColCount;
```

Description

Read ColCount to determine the number entries in the ColWidths (see page 3063) array. Set ColCount to add or delete columns at the righthand side of the grid. The value of ColCount includes any fixed columns at the left of the grid as well as the scrollable columns in the body of the grid.

C++ Examples:

```
/*
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int I, J, K;

  K = 0;

  for (I = 0; I < StringGrid1->ColCount; I++)
    for (J = 0; J < StringGrid1->RowCount; J++)
      StringGrid1->Cells[I][J] = IntToStr(++K);
}
```

Delphi Examples:

```
{
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, K : Integer;
begin
  K := 0;
  with StringGrid1 do
    for I := 0 to ColCount - 1 do
      for J:= 0 to RowCount - 1 do
        begin
          K := K + 1;
          Cells[I,J] := IntToStr(K);
        end;
end;
```

See Also

ColWidths (see page 3063)

RowCount (see page 3075)

VisibleColCount (see page 3082)

10.1.3.6.4 TCustomGrid.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

10.1.3.6.5 TCustomGrid.ColWidths Property

Indicates the width (in pixels) of all the columns in the grid.

Pascal

```
property ColWidths [Index: Longint]: Integer;
```

C++

```
__property int ColWidths[Longint Index];
```

Description

Read ColWidths to determine the width of the cells in the column specified by the Index parameter. An index of 0 refers to the first column. Set ColWidths at runtime to change the width of an individual column.

If the width of a column has not been set explicitly by resizing with the mouse, or by using the ColWidths property, its width is DefaultColWidth (see page 3064).

Use the ColCount (see page 3062) property to determine the number of entries in the ColWidths array.

See Also

ColCount (see page 3062)

DefaultColWidth (see page 3064)

RowHeights (see page 3076)

10.1.3.6.6 TCustomGrid.DefaultColWidth Property

Determines the width (in pixels) of all columns that have not been explicitly resized.

Pascal

```
property DefaultColWidth: Integer;
```

C++

```
__property int DefaultColWidth;
```

Description

Set DefaultColWidth to change the size of all columns in the grid. When DefaultColWidth is set, columns that have been resized using the mouse or by setting the ColWidths (see page 3063) property are given the DefaultColWidth as well.

When new columns are added to the grid using the ColCount (see page 3062) property, they are created with a width of DefaultColWidth.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
  else
    DrawGrid1->GridLineWidth = 1;
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
```

```
    int index = ARow * DrawGrid1->ColCount + ACol;
    DrawGrid1->Canvas->Brush->Color = clBackground;
    DrawGrid1->Canvas->FillRect(Rect);
    ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
    if (State.Contains(gdFocused))
    {
      DrawGrid1->Canvas->DrawFocusRect(Rect);
    }
  }

  void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
  &CanSelect)

  {
    CanSelect = True;
  }
```

Delphi Examples:

```
  {
  The following code uses the bitmaps in an image list
  component to draw the contents of each cell in a draw grid.
  This example includes a draw grid on a form. When the
  application runs and the form is created, the width of the
  lines on the draw grid changes if the default column width of
  the grid is over 90 pixels wide.  This example requires a
  populated image list, or can just display an empty grid.
  Set the drawgrid DefaultColWidth and GridLineWidth statically
  to values the cause the button click to do something.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    if DrawGrid1.DefaultColWidth > 90 then
      DrawGrid1.GridLineWidth := 2
    else
      DrawGrid1.GridLineWidth := 1;
  end;

  procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
    Rect: TRect; State: TGridDrawState);
  var
    index: Integer;
  begin
    index := ARow * DrawGrid1.ColCount + ACol;
    DrawGrid1.Canvas.Brush.Color := clBackground;
    DrawGrid1.Canvas.FillRect(Rect);
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
    if (gdFocused in State) then
    begin
      DrawGrid1.Canvas.DrawFocusRect(Rect);
    end;
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
```

See Also

ColCount (see page 3062)

ColWidths (see page 3063)

DefaultRowHeight (see page 3066)

10.1.3.6.7 TCustomGrid.DefaultDrawing Property

Determines whether the Cells are painted when the grid is drawn.

Pascal

```
property DefaultDrawing: Boolean;
```

C++

```
__property Boolean DefaultDrawing;
```

Description

Set DefaultDrawing to true to have the grid automatically paint the cells in the grid, including adding the background color, the 3-D effects on the fixed cells, and the focus rectangle around the selected cell. Set DefaultDrawing to false to skip the painting of the cells when the grid is drawn.

When DefaultDrawing is false, the cells should be painted using the DrawCell (see page 3043) method. For TCustomGrid (see page 3027), DrawCell (see page 3043) is an abstract method. Descendants of TCustomGrid (see page 3027) use DrawCell (see page 3043) to provide their own customized drawing code, or to generate an OnDrawCell event.

See Also

DrawCell (see page 3043)

OnDrawCell (see page 3134)

10.1.3.6.8 TCustomGrid.DefaultRowHeight Property

Specifies the height (in pixels) of all rows that have not been explicitly resized.

Pascal

```
property DefaultRowHeight: Integer;
```

C++

```
__property int DefaultRowHeight;
```

Description

Set DefaultRowHeight to change the size of all rows in the grid. When DefaultRowHeight is set, rows that have been resized using the mouse or by setting the RowHeights (see page 3076) property are given the DefaultRowHeight as well.

When new rows are added to the grid using the RowCount (see page 3075) property, they are created with a height of DefaultRowHeight.

See Also

DefaultColWidth (see page 3064)

RowCount (see page 3075)

RowHeights (see page 3076)

10.1.3.6.9 TCustomGrid.EditorMode Property

Determines whether the current cell can be edited.

Pascal

```
property EditorMode: Boolean;
```

C++

```
__property Boolean EditorMode;
```

Description

Set EditorMode to true, at runtime, to put the grid in edit mode. When EditorMode is true, the user can edit cells in the grid. When the user presses F2, EditorMode is set to true. When the user presses Enter, the value of EditorMode is toggled.

Note: EditorMode has no effect if the Options (see page 3072) property does not include goEditing or if the Options (see page 3072) property includes goAlwaysShowEditor.

See Also

HideEditor (see page 3048)

Options (see page 3072)

ShowEditor (see page 3056)

10.1.3.6.10 TCustomGrid.FixedColor Property

Specifies the background color of the fixed rows and columns in the grid.

Pascal

```
property FixedColor: TColor;
```

C++

```
__property TColor FixedColor;
```

Description

Set FixedColor to specify the color for the nonscrolling cells in the grid. The scrolling region of the grid is drawn using the Color (see page 3063) property.

See Also

Color

FixedCols (see page 3067)

FixedRows (see page 3068)

10.1.3.6.11 TCustomGrid.FixedCols Property

Specifies the number of columns on the left of the grid that cannot be scrolled.

Pascal

```
property FixedCols: Integer;
```

C++

```
__property int FixedCols;
```

Description

Set FixedCols to create or get rid of nonscrolling columns. Nonscrolling columns appear at the left of the grid, and are always visible, even when the user scrolls the other columns in the grid. Use nonscrolling columns for displaying row titles or row numbers, or to implement a scroll lock that the user can set.

Nonscrolling columns are visually distinct from the scrollable columns in the grid. They are painted with a separate background color, and their cells have a raised, 3-D look.

Note: Grids (see page 2997) must include at least one scrolling column. Do not set FixedCols to a value greater than ColCount (see page 3062) - 1.

See Also

ColCount (see page 3062)

DefaultDrawing (see page 3066)

FixedColor (see page 3067)

FixedRows (see page 3068)

10.1.3.6.12 TCustomGrid.FixedRows Property

Specifies the number of rows on the top of the grid that cannot be scrolled.

Pascal

```
property FixedRows: Integer;
```

C++

```
__property int FixedRows;
```

Description

Set FixedRows to create or get rid of nonscrolling rows. Nonscrolling rows appear at the top of the grid, and are always visible, even when the user scrolls the other rows in the grid. Use nonscrolling rows for displaying column titles or column numbers.

Nonscrolling rows are visually distinct from the scrollable rows in the grid. They are painted with a separate background color, and their cells have a raised, 3-D look.

Note: Grids (see page 2997) must include at least one scrolling row. Do not set FixedRows to a value greater than RowCount (see page 3075) - 1.

See Also

DefaultDrawing (see page 3066)

FixedColor (see page 3067)

FixedCols (see page 3067)

RowCount (see page 3075)

10.1.3.6.13 TCustomGrid.GridHeight Property

Specifies the height of the grid in pixels.

Pascal

```
property GridHeight: Integer;
```

C++

```
__property int GridHeight;
```

Description

Read GridHeight to determine the size of the grid. If GridHeight is less than the value of ClientHeight, all of the rows of the grid appear in the control with an empty region below the grid. If the underlying grid is too tall to appear in the control, GridHeight is the same as ClientHeight, and the user must scroll to see the entire contents of the grid.

See Also

ClientHeight

GridWidth (see page 3070)

10.1.3.6.14 TCustomGrid.GridLineWidth Property

Specifies the width (in pixels) of the lines that separate the cells of the grid.

Pascal

```
property GridLineWidth: Integer;
```

C++

```
__property int GridLineWidth;
```

Description

Set GridLineWidth to make the lines that separate the cells in the grid heavier or lighter. When GridLineWidth is zero, no separators are drawn between the cells of the grid.

GridLineWidth will have no effect if the Options (see page 3072) property does not include goFixedHorzLine, goFixedVertLine, goHorzLine, or goVertLine.

Note: Values greater than 3 pixels are not recommended for applications that run on Windows 9x or Windows ME because of distortions that can appear.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
  else
    DrawGrid1->GridLineWidth = 1;
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
  }
}
```

```
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)

{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if DrawGrid1.DefaultColWidth > 90 then
    DrawGrid1.GridLineWidth := 2
  else
    DrawGrid1.GridLineWidth := 1;
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
  end;
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

See Also

FixedCols (see page 3067)

FixedRows (see page 3068)

Options (see page 3072)

10.1.3.6.15 TCustomGrid.GridWidth Property

Specifies the width of the grid in pixels.

Pascal

```
property GridWidth: Integer;
```

C++

```
__property int GridWidth;
```

Description

Read GridWidth to determine the size of the grid. If GridWidth is less than the value of ClientWidth, all of the columns of the grid appear in the control with an empty region to the right of the grid. If the underlying grid is too wide to appear in the control, GridWidth is the same as ClientWidth, and the user must scroll to see the entire contents of the grid.

See Also

ClientWidth

GridHeight (see page 3068)

10.1.3.6.16 TCustomGrid.HitTest Property

Indicates the current position of the mouse cursor.

Pascal

```
property HitTest: TPoint;
```

C++

```
__property TPoint HitTest;
```

Description

Read HitTest to determine the position of the mouse when it is over the grid or when the grid has captured the mouse. HitTest may represent a position that is not within the client area of the grid control if the user is moving or resizing the rows or columns, or if the user is selecting a range of cells using the mouse. HitTest is the position of the mouse cursor in the coordinate system where (0,0) is the upper left corner of the grid control's client area.

See Also

ClientOrigin

MouseCoord (see page 3051)

10.1.3.6.17 TCustomGrid.InplaceEditor Property

Designates the edit control the grid uses to allow users to edit the contents of the selected cell.

Pascal

```
property InplaceEditor: TInplaceEdit;
```

C++

```
__property TInplaceEdit InplaceEditor;
```

Description

Read InplaceEditor to gain direct access to the edit control that sits on top of the selected cell when the grid is in edit mode. The inplace editor is created the first time the grid is put in edit mode. It is not destroyed until the grid is destroyed. The grid moves the editor when the selected cell changes. The grid hides the editor's window when the grid goes out of edit mode.

See Also

CreateEditor (see page 3040)

EditorMode (see page 3066)

HideEditor (see page 3048)

ShowEditor (see page 3056)

10.1.3.6.18 TCustomGrid.LeftCol Property

Specifies the index of the first visible scrollable column in the grid.

Pascal

```
property LeftCol: Longint;
```

C++

```
__property Longint LeftCol;
```

Description

Read LeftCol to determine the index of the first column in the scrollable region that is visible. Set LeftCol to scroll the columns in the grid so that the column with index LeftCol is the first column after the fixed columns.

See Also

FixedCols (see page 3067)

ScrollData (see page 3055)

VisibleColCount (see page 3082)

10.1.3.6.19 TCustomGrid.Options Property

Specifies various display and behavioral properties of the grid.

Pascal

```
property Options: TGridOptions;
```

C++

```
__property TGridOptions Options;
```

Description

Set Options to include the desired properties for the grid. See the type Grids.TGridOptions for definitions of these properties.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
```

```
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

See Also

ColWidths (see page 3011)

Selection (see page 3077)

TabStops (see page 3079)

10.1.3.6.20 TCustomGrid.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

10.1.3.6.21 TCustomGrid.Row Property

Specifies the index of the row that contains the selected cell.

Pascal

```
property Row: Longint;
```

C++

```
__property Longint Row;
```

Description

Use Row at runtime to determine the current row in the grid. Setting Row moves focus to the cell in the current column that is in the new row. The first row has an index of 0, the second row an index of 1, and so on.

The selected cell in the grid can be located by reading the Row property and the Col (see page 3060) property to obtain the indexes of its row and column. When focus moves to the grid, the selected cell gets input focus.

C++ Examples:

```
/*
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ListBox1->Items = StringGrid1->Rows[StringGrid1->Row];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{

  StringGrid1->Cells[1][0] = "Column 1";
  StringGrid1->Cells[2][0] = "Column 2";
  StringGrid1->Cells[3][0] = "Column 3";
  StringGrid1->Cells[4][0] = "Column 4";
  StringGrid1->Cells[0][1] = "Row 1";
```

```
  StringGrid1->Cells[1][1] = "Object";
  StringGrid1->Cells[2][1] = "Pascal";
  StringGrid1->Cells[3][1] = "is";
  StringGrid1->Cells[4][1] = "excellent";
  StringGrid1->Cells[0][2] = "Row 2";
  StringGrid1->Cells[1][2] = "Delphi";
  StringGrid1->Cells[2][2] = "is";
  StringGrid1->Cells[4][2] = "RAD";

}
```

Delphi Examples:

```
{
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ListBox1.Items := StringGrid1.Rows[StringGrid1.Row];
end;
procedure TForm1.FormCreate(Sender: TObject);
begin
  with StringGrid1 do
  begin
    Cells[1,0] := 'Column 1';
    Cells[2,0] := 'Column 2';
    Cells[3,0] := 'Column 3';
    Cells[4,0] := 'Column 4';
    Cells[0,1] := 'Row 1';
    Cells[1,1] := 'Object';
    Cells[2,1] := 'Pascal';
    Cells[3,1] := 'is';
    Cells[4,1] := 'excellent';
    Cells[0,2] := 'Row 2';
    Cells[1,2] := 'Delphi';
    Cells[2,2] := 'is';
    Cells[4,2] := 'RAD';
  end;
end;
```

Col (see page 3060)

10.1.3.6.22 TCustomGrid.RowCount Property

Specifies the number of rows in the grid.

Pascal

```
property RowCount: Longint;
```

C++

```
__property Longint RowCount;
```

Description

Read RowCount to determine the number entries in the RowHeights (see page 3076) array. Set RowCount to add or delete rows at the bottom of the grid. The value of RowCount includes any fixed rows at the top of the grid as well as the scrollable rows in the body of the grid.

C++ Examples:

```
/*
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int I, J, K;

  K = 0;

  for (I = 0; I < StringGrid1->ColCount; I++)
    for (J = 0; J < StringGrid1->RowCount; J++)
      StringGrid1->Cells[I][J] = IntToStr(++K);
}
```

Delphi Examples:

```
{
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, K : Integer;
begin
  K := 0;
  with StringGrid1 do
    for I := 0 to ColCount - 1 do
      for J:= 0 to RowCount - 1 do
        begin
          K := K + 1;
          Cells[I,J] := IntToStr(K);
        end;
end;
```

See Also

ColCount (see page 3062)

RowHeights (see page 3076)

VisibleRowCount (see page 3082)

10.1.3.6.23 TCustomGrid.RowHeights Property

Gives the height (in pixels) of all rows in the grid.

Pascal

```
property RowHeights [Index: Longint]: Integer;
```

C++

```
__property int RowHeights[Longint Index];
```

Description

Read RowHeights to determine the height of the cells in the row specified by the Index parameter. An index of 0 refers to the first row. Set RowWidths at runtime to change the height of an individual row.

If the height of a row has not been set explicitly by resizing with the mouse, or by using the RowHeights property, it's height is DefaultRowHeight (see page 3066).

Use the RowCount (see page 3075) property to determine the number of entries in the RowHeights array.

See Also

ColWidths (see page 3063)

DefaultRowHeight (see page 3066)

RowCount (see page 3075)

10.1.3.6.24 TCustomGrid.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars: TScrollStyle;
```

C++

```
__property TScrollStyle ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

See Also

ClientHeight

ClientWidth

10.1.3.6.25 TCustomGrid.Selection Property

Indicates the boundaries of the current selection.

Pascal

```
property Selection: TGridRect;
```

C++

```
__property TGridRect Selection;
```

Description

Set Selection to select a range of cells in the grid. Selection can either represent the first column, first row, last column and last row in the grid, or the row and column coordinates of the upper left and bottom right cells in the selected region.

Selection can only indicate more than one cell when Options (see page 3072) includes goRangeSelect.

C++ Examples:

```
/*
The following code selects the rectangle containing rows 1
through 4, and columns 2 and 3.  goRangeSelect in the
DrawGrid Options parameter must be True to select a range of
cells.  This example requires a button, a DrawGrid and a
populated ImageList.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TGridRect myRect;
  myRect.Left = 3;
```

```
  myRect.Top = 1;
  myRect.Right = 2;
  myRect.Bottom = 4;
  DrawGrid1->Selection = myRect;
  DrawGrid1->Repaint();
}

void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
  Label1->Caption = "From OnClick: The cursor is in column " +
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = (ARow * DrawGrid1->ColCount + ACol) % (DrawGrid1->ColCount + 1);
  if (State.Contains(gdSelected))
    DrawGrid1->Canvas->Brush->Color = clYellow;
  else
    DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(ARow * DrawGrid1->ColCount + ACol) +
      " has the focus.";
  }
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code selects the rectangle containing rows 1
through 4, and columns 2 and 3.  goRangeSelect in the
DrawGrid Options parameter must be True to select a range of
cells.  This example requires a button, a DrawGrid and a
populated ImageList.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  myRect: TGridRect;
begin
  myRect.Left := 2;
  myRect.Top := 1;
  myRect.Right := 3;
  myRect.Bottom := 4;
  DrawGrid1.Selection := myRect;
  DrawGrid1.Repaint;
end;

procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;
```

```
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := (ARow * DrawGrid1.ColCount + ACol) mod (DrawGrid1.ColCount + 1);
  if (gdSelected in State) then
    DrawGrid1.Canvas.Brush.Color := clYellow
  else
    DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(ARow * DrawGrid1.ColCount + ACol) +
      ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

Col (see page 3060)

Options (see page 3072)

Row (see page 3074)

10.1.3.6.26 TCustomGrid.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

10.1.3.6.27 TCustomGrid.TabStops Property

Indicates whether the user can tab to specified columns in the grid.

Pascal

```
property TabStops [Index: Longint]: Boolean;
```

C++

```
__property Boolean TabStops[Longint Index];
```

Description

Set TabStops to false to remove the column identified by Index from the tab order. The first column in the grid is identified by an Index of 0.

Note: When the Options (see page 3072) property does not include goTabs, the user can't tab to any column, even if TabStops is true.

See Also

Options (see page 3072)

10.1.3.6.28 TCustomGrid.TopRow Property

Specifies the index of the first visible scrollable row in the grid.

Pascal

```
property TopRow: Longint;
```

C++

```
__property Longint TopRow;
```

Description

Read TopRow to determine the index of the first row in the scrollable region that is visible. Set TopRow to scroll the rows in the grid so that the row with index TopRow is the first row after the fixed rows.

C++ Examples:

```
*/
This code uses a draw grid and a button on a form. When
the user clicks the button, the last row of the draw
grid becomes the top row.  This example requires a
button, a DrawGrid and a populated ImageList.
*/

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  DrawGrid1->TopRow = DrawGrid1->RowCount - 1;
}

void __fastcall TForm1::DrawGrid1Click(TObject *Sender)
{
  Label1->Caption = "From OnClick: The cursor is in column " +
                    IntToStr(DrawGrid1->Col + 1) +
                    ", row " +
                    IntToStr(DrawGrid1->Row + 1);
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = (ARow * DrawGrid1->ColCount + ACol) % (DrawGrid1->ColCount + 1);
  if (State.Contains(gdSelected))
    DrawGrid1->Canvas->Brush->Color = clYellow;
  else
    DrawGrid1->Canvas->Brush->Color = clBackground;
```

```
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label2->Caption = "From OnDrawCell: Cell " + IntToStr(ARow * DrawGrid1->ColCount + ACol) +
      " has the focus.";
  }
  if ((ARow >=  DrawGrid1->FixedRows) && (ACol >=  DrawGrid1->FixedCols))
    ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)
{
  CanSelect = True;
}
```

Delphi Examples:

```
{
This code uses a draw grid and a button on a form. When
the user clicks the button, the last row of the draw
grid becomes the top row.  This example requires a
button, a DrawGrid and a populated ImageList.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  DrawGrid1.TopRow := DrawGrid1.RowCount - 1;
end;

procedure TForm1.DrawGrid1Click(Sender: TObject);
begin
  Label1.Caption := 'From OnClick: The cursor is in column ' +
                    IntToStr(DrawGrid1.Col + 1) +
                    ', row ' +
                    IntToStr(DrawGrid1.Row + 1);
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := (ARow * DrawGrid1.ColCount + ACol) mod (DrawGrid1.ColCount + 1);
  if (gdSelected in State) then
    DrawGrid1.Canvas.Brush.Color := clYellow
  else
    DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label2.Caption:= 'From OnDrawCell: Cell ' + InttoStr(ARow * DrawGrid1.ColCount + ACol) + '
has the focus.';
  end;
  if ((ARow >=  DrawGrid1.FixedRows) AND (ACol >=  DrawGrid1.FixedCols)) then
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

See Also

FixedRows (see page 3068)

ScrollData (see page 3055)

VisibleRowCount (see page 3082)

10.1.3.6.29 TCustomGrid.VisibleColCount Property

Indicates the number of scrollable columns visible in the grid.

Pascal

```
property VisibleColCount: Integer;
```

C++

```
__property int VisibleColCount;
```

Description

Use VisibleColCount to determine the number of scrollable columns fully visible in the grid. VisibleColCount does not include the fixed columns counted by the FixedCols (see page 3067) property. It does not include any partially visible columns on the right edge of the grid.

See Also

ColCount (see page 3062)

FixedCols (see page 3067)

VisibleRowCount (see page 3082)

10.1.3.6.30 TCustomGrid.VisibleRowCount Property

Indicates the number of scrollable rows visible in the grid.

Pascal

```
property VisibleRowCount: Integer;
```

C++

```
__property int VisibleRowCount;
```

Description

Use VisibleRowCount to determine the number of scrollable rows fully visible in the grid. VisibleRowCount does not include the fixed rows counted by the FixedRows (see page 3068) property. It does not include any partially visible rows on the bottom of the grid.

See Also

FixedRows (see page 3068)

RowCount (see page 3075)

VisibleColCount (see page 3082)

10.1.4 TDrawGrid Class

TDrawGrid represents a grid control that displays information in column and row format.

Class Hierarchy

Pascal

```
TDrawGrid = class(TCustomDrawGrid);
```

C++

```
class TDrawGrid : public TCustomDrawGrid;
```

File

Grids

Description

Add a TDrawGrid object to a form to present arbitrary information in a tabular format. TDrawGrid provides many properties to control the appearance of the grid, as well as events and methods that take advantage of the tabular organization of the grid in responding to user actions.

TDrawGrid introduces several events and methods to allow applications to customize the appearance and behavior of the grid.

If the cells of the grid contain text strings that represent objects, consider using a TStringGrid (see page 3180) object instead. If the grid displays field values from the records in a dataset, use TDBGrid instead.

See Also

TDBGrid

TStringGrid (see page 3180)

Draw Grids

Grids

TGridOption (see page 3201)

10.1.4.1 TDrawGrid Members

The following tables list the members exposed by TDrawGrid.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 3031)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FGridState (see page 3031)	This is FGridState, a member of class TCustomGrid.
	FSaveCellExtents (see page 3032)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 3032)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	AdjustSize (see page 3034)	Adds or deletes rows or columns from the grid.
	BeginColumnDrag (see page 3034)	Starts the dragging of a column in the grid.

	BeginRowDrag (see page 3034)	Starts the dragging of a row in the grid.
	BoxRect (see page 3035)	Returns the screen coordinates of a specified set of cells.
	CalcDrawInfo (see page 3035)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 3036)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 3036)	Determines the appearance of the mouse cursor during resizing.
	CanEditAcceptKey (see page 3036)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 3037)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 3037)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 3037)	Indicates whether the grid should respond to a given key combination.
	CellRect (see page 3038)	Returns the screen coordinates of a cell in the grid.
	ChangeGridOrientation (see page 3038)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	CheckColumnDrag (see page 3039)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 3039)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
V	ColumnMoved (see page 3004)	Generates an OnColumnMoved (see page 3019) event.
	ColumnMoved (see page 3039)	Provides the interface for a method that responds when the position of a column changes.
	ColWidthsChanged (see page 3040)	Responds when the column widths change.
V	CreateEditor (see page 3040)	Creates the inplace editor control.
V	CreateParams (see page 3041)	Initializes the window-creation parameter record.
V	DefineProperties (see page 3041)	Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.
V	DeleteColumn (see page 3041)	Deletes a specified column from the grid.
V	DeleteRow (see page 3042)	Deletes a specified from the grid.
V	DoExit (see page 3042)	Hides the inplace editor when selection moves to another control in a form.
V	DoMouseWheelDown (see page 3042)	Performs tasks when the mouse wheel is rotated downward.
V	DoMouseWheelUp (see page 3043)	Performs tasks when the mouse wheel is rotated upward.
V	DrawCell (see page 3004)	Generates an OnDrawCell (see page 3020) event.
A	DrawCell (see page 3043)	Provides the prototype for a method that draws the contents of a cell in the grid.
	EndColumnDrag (see page 3044)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 3044)	Ends the dragging of a row in the grid.
	FocusCell (see page 3044)	Changes the current cell to a specified cell.
	GetEditLimit (see page 3045)	Provides the interface for a method that limits the number of characters the user can type into cells.
V	GetEditMask (see page 3004)	Generates an OnGetEditMask (see page 3021) event.
	GetEditMask (see page 3045)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 3046)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
V	GetEditText (see page 3005)	Generates an OnGetEditText (see page 3022) event.
	GetEditText (see page 3046)	Returns the value of the indicated cell formatted for editing.
	GetGridHeight (see page 3046)	Returns the value of the GridHeight (see page 3068) property.
	GetGridWidth (see page 3047)	Returns the value of the GridWidth (see page 3070) property.
	HideEdit (see page 3047)	Hides the inplace editor.
	HideEditor (see page 3048)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 3048)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 3048)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateEditor (see page 3049)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 3049)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 3050)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
V	KeyDown (see page 3050)	Provides special processing when the user presses a key.
V	KeyPress (see page 3050)	Provides special processing when the user presses a key.
V	MouseDown (see page 3051)	Provides special processing when the user presses a mouse button.

V	MouseMove (see page 3052)	Provides special processing when the user moves the mouse.
V	MouseUp (see page 3052)	Provides special processing when the user releases the mouse button.
	MoveColRow (see page 3053)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 3053)	Moves a column to a new position.
	MoveRow (see page 3053)	Moves a row to a new position.
V	Paint (see page 3054)	Draws the image of the grid control on the screen.
	RowHeightsChanged (see page 3054)	Responds when the row heights change.
V	RowMoved (see page 3005)	Generates an OnRowMoved (see page 3023) event.
	RowMoved (see page 3055)	Provides the interface for a method that responds when the position of a row changes.
	ScrollData (see page 3055)	Scrolls the visual image of the cells in the grid.
V	SelectCell (see page 3006)	Determines whether a particular cell in the grid can be selected.
V	SelectCell (see page 3055)	Determines whether a particular cell in the grid can be selected.
V	SetEditText (see page 3006)	Generates an OnSetEditText (see page 3026) event.
	SetEditText (see page 3056)	Provides the interface for a method that updates the text associated with a cell.
	ShowEditor (see page 3056)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 3057)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 3057)	Responds to changes in the size of the grid.
	Sizing (see page 3057)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 3058)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
V	TopLeftChanged (see page 3007)	Generates an OnTopLeftChanged (see page 3027) event.
	TopLeftChanged (see page 3058)	Updates the position of the inplace editor when the grid scrolls.
	UpdateDesigner (see page 3059)	Notifies the designer when rows and columns of the grid are moved or resized.

Protected Properties

	Name	Description
	Col (see page 3060)	Specifies the index of the column that contains the selected cell.
	ColWidths (see page 3063)	Indicates the width (in pixels) of all the columns in the grid.
	EditorMode (see page 3066)	Determines whether the current cell can be edited.
R	GridHeight (see page 3068)	Specifies the height of the grid in pixels.
R	GridWidth (see page 3070)	Specifies the width of the grid in pixels.
R	HitTest (see page 3071)	Indicates the current position of the mouse cursor.
R	InplaceEditor (see page 3071)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	LeftCol (see page 3072)	Specifies the index of the first visible scrollable column in the grid.
	Row (see page 3074)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 3076)	Gives the height (in pixels) of all rows in the grid.
	Selection (see page 3077)	Indicates the boundaries of the current selection.
	TabStops (see page 3079)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3080)	Specifies the index of the first visible scrollable row in the grid.

Public Methods

	Name	Description
	CellRect (see page 3003)	Returns the screen coordinates of a cell in the grid.
V	Create (see page 3030)	Creates an instance of TCustomGrid (see page 3027).
V	Destroy (see page 3031)	Destroys an instance of TCustomGrid (see page 3027).
	MouseCoord (see page 3051)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseToCell (see page 3005)	Returns the column and row of the cell at the position with screen coordinates (X,Y).

Public Properties

	Name	Description
	Canvas (see page 3007)	Specifies the TCanvas object that presents a drawing surface for the control.

	Col (see page 3009)	Specifies the index of the column that contains the selected cell.
	ColWidths (see page 3011)	Indicates the width (in pixels) of all the columns in the grid.
	EditorMode (see page 3011)	Determines whether the current cell can be edited.
	GridHeight (see page 3012)	Specifies the height of the grid in pixels.
	GridWidth (see page 3012)	Specifies the width of the grid in pixels.
	LeftCol (see page 3012)	Specifies the index of the first visible scrollable column in the grid.
	Row (see page 3013)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 3014)	Gives the height (in pixels) of all rows in the grid.
	Selection (see page 3015)	Indicates the boundaries of the current selection.
	TabStops (see page 3017)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3017)	Specifies the index of the first visible scrollable row in the grid.

Published Events

	Name	Description
	OnClick (see page 3125)	Occurs when the user clicks the control.
	OnColumnMoved (see page 3127)	Occurs immediately after the position of a column changes.
	OnContextPopup (see page 3127)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3128)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3128)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3131)	Occurs when the user drags an object over a control.
	OnDrawCell (see page 3134)	Occurs when a cell in the grid needs to be drawn.
	OnEndDock (see page 3135)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3135)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3136)	Occurs when a control receives the input focus.
	OnExit (see page 3139)	Occurs when the input focus shifts away from one control to another.
	OnGetEditMask (see page 3142)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3142)	Occurs when the in-place editor requests the value of a cell.
	OnKeyDown (see page 3142)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3146)	Occurs when a key is pressed.
	OnKeyUp (see page 3147)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 3149)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3150)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3152)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3152)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3153)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3155)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheelDown (see page 3157)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 3157)	Occurs when the mouse wheel is rotated upward.
	OnRowMoved (see page 3158)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3158)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3159)	Occurs when the user edits the value of a cell.
	OnStartDock (see page 3159)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3160)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTopLeftChanged (see page 3160)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Published Properties

	Name	Description
	Align (see page 3088)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3092)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 3092)	Specifies which edges of the control are beveled.
	BevelInner (see page 3093)	Specifies the cut of the inner bevel.
	BevelKind (see page 3093)	Specifies the control's bevel style.
	BevelOuter (see page 3094)	Specifies the cut of the outer bevel.
	BevelWidth (see page 3094)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 3095)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 3095)	Determines whether a single line border is drawn around the grid.
	ColCount (see page 3095)	Specifies the number of columns in the grid.
	Color (see page 3096)	Specifies the background color of the control.
	Constraints (see page 3097)	Specifies the size constraints for the control.
	Ctl3D (see page 3098)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 3098)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3100)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3100)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DoubleBuffered (see page 3101)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 3102)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3103)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3103)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 3105)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedColor (see page 3105)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3106)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3106)	Specifies the number of rows on the top of the grid that cannot be scrolled.
	Font (see page 3107)	Controls the attributes of text written on or in the control.
	GridLineWidth (see page 3108)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	Options (see page 3109)	Specifies various display and behavioral properties of the grid.
	ParentBiDiMode (see page 3111)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 3111)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3112)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 3112)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 3112)	Determines where a control looks for its font information.
	ParentShowHint (see page 3113)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3113)	Identifies the pop-up menu associated with the control.
	RowCount (see page 3118)	Specifies the number of rows in the grid.
	ScrollBars (see page 3119)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 3120)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3121)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3079)	Determines if the user can tab to a control.
	Visible (see page 3122)	Determines whether the component appears onscreen.
	VisibleColCount (see page 3123)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 3124)	Indicates the number of scrollable rows visible in the grid.

10.1.4.2 TDrawGrid Properties

The properties of the TDrawGrid class are listed here.

Published Properties

	Name	Description
	Align (see page 3088)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3092)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 3092)	Specifies which edges of the control are beveled.
	BevelInner (see page 3093)	Specifies the cut of the inner bevel.
	BevelKind (see page 3093)	Specifies the control's bevel style.
	BevelOuter (see page 3094)	Specifies the cut of the outer bevel.
	BevelWidth (see page 3094)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 3095)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 3095)	Determines whether a single line border is drawn around the grid.
	ColCount (see page 3095)	Specifies the number of columns in the grid.
	Color (see page 3096)	Specifies the background color of the control.
	Constraints (see page 3097)	Specifies the size constraints for the control.
	Ctl3D (see page 3098)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 3098)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3100)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3100)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DoubleBuffered (see page 3101)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 3102)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3103)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3103)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 3105)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedColor (see page 3105)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3106)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3106)	Specifies the number of rows on the top of the grid that cannot be scrolled.
	Font (see page 3107)	Controls the attributes of text written on or in the control.
	GridLineWidth (see page 3108)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	Options (see page 3109)	Specifies various display and behavioral properties of the grid.
	ParentBiDiMode (see page 3111)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 3111)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3112)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 3112)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 3112)	Determines where a control looks for its font information.
	ParentShowHint (see page 3113)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3113)	Identifies the pop-up menu associated with the control.
	RowCount (see page 3118)	Specifies the number of rows in the grid.
	ScrollBars (see page 3119)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 3120)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3121)	Indicates the position of the control in its parent's tab order.
	Visible (see page 3122)	Determines whether the component appears onscreen.
	VisibleColCount (see page 3123)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 3124)	Indicates the number of scrollable rows visible in the grid.

10.1.4.2.1 TDrawGrid.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
```

```
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

Parent

Anchors

10.1.4.2.2 TDrawGrid.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

10.1.4.2.3 TDrawGrid.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges;
```

C++

```
__property BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner

BevelOuter

BevelKind

10.1.4.2.4 TDrawGrid.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner;
```

C++

```
__property BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges

BevelOuter

BevelKind

BevelWidth

BorderWidth

10.1.4.2.5 TDrawGrid.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind;
```

C++

```
__property BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

BevelEdges

BevelOuter

BevelInner

BevelWidth

10.1.4.2.6 TDrawGrid.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter;
```

C++

```
__property BevelOuter;
```

Description

Use BevelOuter to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges

BevelInner

BevelKind

BevelWidth

10.1.4.2.7 TDrawGrid.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth;
```

C++

```
__property BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges

BevelInner

BevelKind

BevelOuter

10.1.4.2.8 TDrawGrid.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

10.1.4.2.9 TDrawGrid.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

10.1.4.2.10 TDrawGrid.ColCount Property

Specifies the number of columns in the grid.

Pascal

```
property ColCount: Longint;
```

C++

```
__property Longint ColCount;
```

Description

Read ColCount to determine the number entries in the ColWidths array. Set ColCount to add or delete columns at the righthand side of the grid. The value of ColCount includes any fixed columns at the left of the grid as well as the scrollable columns in the body of the grid.

C++ Examples:

```
/*
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int I, J, K;

  K = 0;

  for (I = 0; I < StringGrid1->ColCount; I++)
    for (J = 0; J < StringGrid1->RowCount; J++)
      StringGrid1->Cells[I][J] = IntToStr(++K);
}
```

Delphi Examples:

```
{
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, K : Integer;
begin
  K := 0;
  with StringGrid1 do
    for I := 0 to ColCount - 1 do
      for J:= 0 to RowCount - 1 do
        begin
          K := K + 1;
          Cells[I,J] := IntToStr(K);
        end;
end;
```

RowCount (see page 3075)

VisibleColCount (see page 3082)

10.1.4.2.11 TDrawGrid.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor

10.1.4.2.12 TDrawGrid.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

OnCanResize

10.1.4.2.13 TDrawGrid.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

BorderWidth

10.1.4.2.14 TDrawGrid.DefaultColWidth Property

Determines the width (in pixels) of all columns that have not been explicitly resized.

Pascal

```
property DefaultColWidth: Integer;
```

C++

```
__property int DefaultColWidth;
```

Description

Set DefaultColWidth to change the size of all columns in the grid. When DefaultColWidth is set, columns that have been resized using the mouse or by setting the ColWidths property are given the DefaultColWidth as well.

When new columns are added to the grid using the ColCount property, they are created with a width of DefaultColWidth.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
```

```
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
  else
    DrawGrid1->GridLineWidth = 1;
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
  }
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)

{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if DrawGrid1.DefaultColWidth > 90 then
    DrawGrid1.GridLineWidth := 2
  else
    DrawGrid1.GridLineWidth := 1;
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
  end;
end;
```

```
procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

See Also

ColCount (see page 3062)

ColWidths (see page 3063)

DefaultRowHeight (see page 3066)

10.1.4.2.15 TDrawGrid.DefaultDrawing Property

Determines whether the Cells are painted when the grid is drawn.

Pascal

```
property DefaultDrawing: Boolean;
```

C++

```
__property Boolean DefaultDrawing;
```

Description

Set DefaultDrawing to true to have the grid automatically paint the cells in the grid, including adding the background color, the 3-D effects on the fixed cells, and the focus rectangle around the selected cell. Set DefaultDrawing to false to skip the painting of the cells when the grid is drawn.

When DefaultDrawing is false, the cells should be painted using the DrawCell method. For TCustomGrid, DrawCell is an abstract method. Descendants of TCustomGrid use DrawCell to provide their own customized drawing code, or to generate an OnDrawCell event.

See Also

DrawCell (see page 3043)

OnDrawCell (see page 3134)

10.1.4.2.16 TDrawGrid.DefaultRowHeight Property

Specifies the height (in pixels) of all rows that have not been explicitly resized.

Pascal

```
property DefaultRowHeight: Integer;
```

C++

```
__property int DefaultRowHeight;
```

Description

Set DefaultRowHeight to change the size of all rows in the grid. When DefaultRowHeight is set, rows that have been resized using the mouse or by setting the RowHeights property are given the DefaultRowHeight as well.

When new rows are added to the grid using the RowCount property, they are created with a height of DefaultRowHeight.

See Also

DefaultColWidth (see page 3064)

RowCount (see page 3075)

RowHeights (see page 3076)

10.1.4.2.17 TDrawGrid.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
```

```
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

10.1.4.2.18 TDrawGrid.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

10.1.4.2.19 TDrawGrid.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

10.1.4.2.20 TDrawGrid.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
```

```
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;

Arranging the Order of Persistent Columns

10.1.4.2.21 TDrawGrid.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

10.1.4.2.22 TDrawGrid.FixedColor Property

Specifies the background color of the fixed rows and columns in the grid.

Pascal

```
property FixedColor: TColor;
```

C++

```
__property TColor FixedColor;
```

Description

Set FixedColor to specify the color for the nonscrolling cells in the grid. The scrolling region of the grid is drawn using the Color property.

See Also

Color

FixedCols (see page 3067)

FixedRows (see page 3068)

10.1.4.2.23 TDrawGrid.FixedCols Property

Specifies the number of columns on the left of the grid that cannot be scrolled.

Pascal

```
property FixedCols: Integer;
```

C++

```
__property int FixedCols;
```

Description

Set FixedCols to create or get rid of nonscrolling columns. Nonscrolling columns appear at the left of the grid, and are always visible, even when the user scrolls the other columns in the grid. Use nonscrolling columns for displaying row titles or row numbers, or to implement a scroll lock that the user can set.

Nonscrolling columns are visually distinct from the scrollable columns in the grid. They are painted with a separate background color, and their cells have a raised, 3-D look.

Note: Grids must include at least one scrolling column. Do not set FixedCols to a value greater than ColCount - 1.

See Also

ColCount (see page 3062)

DefaultDrawing (see page 3066)

FixedColor (see page 3067)

FixedRows (see page 3068)

10.1.4.2.24 TDrawGrid.FixedRows Property

Specifies the number of rows on the top of the grid that cannot be scrolled.

Pascal

```
property FixedRows: Integer;
```

C++

```
__property int FixedRows;
```

Description

Set FixedRows to create or get rid of nonscrolling rows. Nonscrolling rows appear at the top of the grid, and are always visible, even when the user scrolls the other rows in the grid. Use nonscrolling rows for displaying column titles or column numbers.

Nonscrolling rows are visually distinct from the scrollable rows in the grid. They are painted with a separate background color, and their cells have a raised, 3-D look.

Note: Grids must include at least one scrolling row. Do not set FixedRows to a value greater than RowCount - 1.

10.1.4.2.25 TDrawGrid.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

10.1.4.2.26 TDrawGrid.GridLineWidth Property

Specifies the width (in pixels) of the lines that separate the cells of the grid.

Pascal

```
property GridLineWidth: Integer;
```

C++

```
__property int GridLineWidth;
```

Description

Set GridLineWidth to make the lines that separate the cells in the grid heavier or lighter. When GridLineWidth is zero, no separators are drawn between the cells of the grid.

GridLineWidth will have no effect if the Options property does not include goFixedHorzLine, goFixedVertLine, goHorzLine, or goVertLine.

Note: Values greater than 3 pixels are not recommended for applications that run on Windows 9x or Windows ME because of distortions that can appear.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
  else
    DrawGrid1->GridLineWidth = 1;
}

10.1.4.2.27 TDrawGrid.Options Property

Specifies various display and behavioral properties of the grid.

Pascal

```
property Options: TGridOptions;
```

C++

```
__property TGridOptions Options;
```

Description

Set Options to include the desired properties for the grid. See the type Grids.TGridOptions for definitions of these properties.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

10.1.4.2.28 TDrawGrid.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

Parent

BiDiMode

10.1.4.2.29 TDrawGrid.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

10.1.4.2.30 TDrawGrid.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

10.1.4.2.31 TDrawGrid.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

10.1.4.2.32 TDrawGrid.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own

Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentColor

ParentShowHint

10.1.4.2.33 TDrawGrid.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

10.1.4.2.34 TDrawGrid.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
```

```
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
```

```
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
```

```
    else
      Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

10.1.4.2.35 TDrawGrid.RowCount Property

Specifies the number of rows in the grid.

Pascal

```
property RowCount: Longint;
```

C++

```
__property Longint RowCount;
```

Description

Read RowCount to determine the number entries in the RowHeights array. Set RowCount to add or delete rows at the bottom of the grid. The value of RowCount includes any fixed rows at the top of the grid as well as the scrollable rows in the body of the grid.

C++ Examples:

```
/*
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int I, J, K;

  K = 0;

  for (I = 0; I < StringGrid1->ColCount; I++)
    for (J = 0; J < StringGrid1->RowCount; J++)
      StringGrid1->Cells[I][J] = IntToStr(++K);
}
```

Delphi Examples:

```
{
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, K : Integer;
begin
  K := 0;
  with StringGrid1 do
    for I := 0 to ColCount - 1 do
      for J:= 0 to RowCount - 1 do
        begin
          K := K + 1;
          Cells[I,J] := IntToStr(K);
        end;
end;
```

ColCount (see page 3062)

RowHeights (see page 3076)

VisibleRowCount (see page 3082)

10.1.4.2.36 TDrawGrid.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars: TScrollStyle;
```

C++

```
__property TScrollStyle ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

ClientHeight

ClientWidth

10.1.4.2.37 TDrawGrid.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
```

```
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

10.1.4.2.38 TDrawGrid.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a

TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

10.1.4.2.39 TDrawGrid.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
```

```
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
