PIntfMetaData = ^TIntfMetaData;
```

C++

```
^TIntfMetaData PIntfMetaData;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMetaData.

37.4.2 IntfInfo.PIntfMethEntry Type

Pascal

```
PIntfMethEntry = ^TIntfMethEntry;
```

C++

```
^TIntfMethEntry PIntfMethEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMethEntry.

37.4.3 IntfInfo.PIntfParamEntry Type

Pascal

```
PIntfParamEntry = ^TIntfParamEntry;
```

C++

```
^TIntfParamEntry PIntfParamEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfParamEntry.

37.4.4 IntfInfo.TIntfMethEntryArray Type

Pascal

```
TIntfMethEntryArray = array of TIntfMethEntry;
```

C++

```
array of TIntfMethEntry TIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfMethEntryArray.

37.4.5 IntfInfo.TIntfParamEntryArray Type

Pascal

```
TIntfParamEntryArray = array of TIntfParamEntry;
```

C++

```
array of TIntfParamEntry TIntfParamEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfParamEntryArray.

37.4.6 IntfInfo.TPIntfMethEntryArray Type

Pascal

```
TPIntfMethEntryArray = array of PIntfMethEntry;
```

C++

```
array of PIntfMethEntry TPIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TPIntfMethEntryArray.

37.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CallingConventionName (see page 4345)	This is constant IntfInfo.CallingConventionName.
TypeInfoNames (see page 4345)	This is constant IntfInfo.TypeInfoNames.

37.5.1 IntfInfo.CallingConventionName Constant

Pascal

```
CallingConventionName: array[ccReg..ccSafeCall] of string = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

C++

```
array[ccReg..ccSafeCall] of string CallingConventionName = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

File

IntfInfo

Description

This is constant IntfInfo.CallingConventionName.

37.5.2 IntfInfo.TypeInfoNames Constant

Pascal

```
TypeInfoNames: array[0..37] of string = ( 'Boolean', 'bool', 'AnsiChar', 'char', 'AnsiChar',
'signed char', 'Char', 'wchar_t', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word',
'unsigned short', 'Integer', 'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal',
'unsigned long', 'Int64', '__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double',
'double', 'Extended', 'long double', 'string', 'UnicodeString', 'AnsiString', 'AnsiString',
'WideString', 'WideString');
```

C++

```
array[0..37] of string TypeInfoNames = ( 'Boolean', 'bool', 'AnsiChar', 'char', 'AnsiChar',
'signed char', 'Char', 'wchar_t', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word',
'unsigned short', 'Integer', 'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal',
'unsigned long', 'Int64', '__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double',
'double', 'Extended', 'long double', 'string', 'UnicodeString', 'AnsiString', 'AnsiString',
'WideString', 'WideString');
```

File

IntfInfo

Description

This is constant IntfInfo.TypeInfoNames.

38 InvokeRegistry Namespace

This is namespace InvokeRegistry.

Topics

Name	Description
Classes (see page 4350)	The following table lists classes in this documentation.
Interfaces (see page 4460)	The following table lists interfaces in this documentation.
Functions (see page 4470)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4475)	The following table lists structs, records, enums in this documentation.
Types (see page 4487)	The following table lists types in this documentation.
Variables (see page 4496)	The following table lists variables in this documentation.
Constants (see page 4497)	The following table lists constants in this documentation.

Classes

	Name	Description
	ERemotableException (see page 4350)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 4353)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 4354)	TDataContext stores temporary information about a set of objects, Variants, and other related values.
	THeaderList (see page 4363)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 4369)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 4373)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 4379)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 4408)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 4414)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 4432)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 4435)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 4448)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 4452)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 4464) interface.
	TSOAPHeadersBase (see page 4457)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Constants

Name	Description
AS_ATTRIBUTE (see page 4497)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 4497)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 4498)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 4498)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

Functions

	Name	Description
	GetRemotableDataContext (see page 4470)	Returns the TDataContext (see page 4354) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 4471)	Provides access to the invocation registry.
	RemClassRegistry (see page 4471)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 4472)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 4473)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 4474)	This is function InvokeRegistry.SubstituteStrings.

Interfaces

	Name	Description
	IHeadersSetter (see page 4460)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 4461)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 4464)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Structs, Records, Enums

	Name	Description
	eHeaderMethodType (see page 4475)	eHeaderMethodType and THeaderMethodTypeArray (see page 4490) indicate the types of messages that should include a given header type.
	ExtNameMapItem (see page 4476)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 4476)	IntfExceptionItem and TExceptionItemArray (see page 4489) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 4477)	IntfHeaderItem and THeaderItemArray (see page 4489) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 4478)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 4478)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 4480)	This is record InvokeRegistry.MethParamNameMapItem.
	ObjectConvertOptions (see page 4480)	ObjectConvertOptions and TObjectConvertOptions (see page 4491) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 4481)	SerializationOptions and TSerializationOptions (see page 4494) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TDynToClear (see page 4482)	This is record InvokeRegistry.TDynToClear.
	TIntfInvokeOption (see page 4483)	TIntfInvokeOption and TIntfInvokeOptions (see page 4490) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 4484)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.
	TRemHeaderEntry (see page 4485)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 4485)	TRemRegEntry stores information for the remotable type registry.

Types

Name	Description
ERemotableExceptionClass (see page 4487)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 4488)	This is type InvokeRegistry.InvString.
InvStringDynArray (see page 4488)	This is type InvokeRegistry.InvStringDynArray.
PTRemotable (see page 4488)	This is type InvokeRegistry.PTRemotable.

TCreateInstanceProc (see page 4489)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 4489)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 4489)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 4490)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 4490)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 4490)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 4491)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 4491)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 4491)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 4492)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 4492)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 4492)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 4493)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 4493)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 4493)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 4494)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 4494)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 4494)	This is type InvokeRegistry.TSOAPHeaderClass.

Variables

Name	Description
AppNameSpacePrefix (see page 4496)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

38.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERemotableException (see page 4350)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 4353)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 4354)	TDataContext stores temporary information about a set of objects, Variants, and other related values.
	THeaderList (see page 4363)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 4369)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 4373)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 4379)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 4408)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 4414)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 4432)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 4435)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 4448)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 4452)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 4464) interface.
	TSOAPHeadersBase (see page 4457)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

38.1.1 ERemotableException Class

ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.

Class Hierarchy

Pascal

```
ERemotableException = class(Exception);
```

C++

```
class ERemotableException : public Exception;
```

File

InvokeRegistry

Description

ERemotableException is the exception class for exceptions that a client raises based on a SOAP fault packet that it receives from a Web Service application. The ERemotableException properties represent standard elements of the SOAP fault packet.

Create (see page 4351) an ERemotableException descendant to define a custom exception class for problems encountered when executing the methods of an invokable interface in a Web Service application. When a Web Service application raises an ERemotableException descendant in the course of executing a request from a client application, it adds the values of any published properties to the fault packet, in addition to the value of the Message property. Note that these published properties must be remotable types: that is, the value must be a scalar type, or it must be a registered descendant of TRemotable (see page 4408).

Before the properties of an ERemotableException descendant can be transmitted in a fault packet, it must be registered with the remotable type registry (RemTypeRegistry (see page 4472)). Call the RegisterXSClass method of the remotable type registry, on both the client and the server application, to enable your exception class to be transmitted.

Creating Custom Exception Classes for Web Services

38.1.1.1 ERemotableException Members

The following tables list the members exposed by ERemotableException.

Public Methods

	Name	Description
	Create (see page 4351)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
	FaultActor (see page 4352)	Indicates the agent that raised the fault.
	FaultCode (see page 4352)	Indicates where the fault was encountered.
	FaultDetail (see page 4353)	Provides application-specific details about the exception that occurred.

38.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	ERemotableException.Create () (see page 4351)	Creates and initializes an instance of ERemotableException (see page 4350).
	ERemotableException.Create (string, InvString, InvString) (see page 4351)	Creates and initializes an instance of ERemotableException (see page 4350).

38.1.1.2.1 ERemotableException.Create Constructor ()

Creates and initializes an instance of ERemotableException (see page 4350).

Pascal

```
constructor Create; virtual; overload;
constructor Create(const Msg: string; const AFaultCode: InvString = ''; const AFaultActor:
InvString = ''); virtual; overload;
```

C++

```
virtual __fastcall ERemotableException();
virtual __fastcall ERemotableException(const UnicodeString Msg, const InvString AFaultCode =
'', const InvString AFaultActor = '');
```

Description

Create generates an ERemotableException (see page 4350) object.

Msg is the error message associated with the exception. It becomes the value of the Message property.

AFaultCode indicates where the fault that gave rise to the exception was encountered. It becomes the value of the FaultCode (see page 4352) property.

AFaultActor indicates the agent that gave rise to the fault. It becomes the value of the FaultActor (see page 4352) property.

See Also

Message

FaultCode (see page 4352)

FaultActor (see page 4352)

38.1.1.3 ERemotableException Properties

The properties of the ERemotableException class are listed here.

Public Properties

	Name	Description
	FaultActor (see page 4352)	Indicates the agent that raised the fault.
	FaultCode (see page 4352)	Indicates where the fault was encountered.
	FaultDetail (see page 4353)	Provides application-specific details about the exception that occurred.

38.1.1.3.1 ERemotableException.FaultActor Property

Indicates the agent that raised the fault.

Pascal

```
property FaultActor: InvString;
```

C++

```
__property InvString FaultActor;
```

Description

FaultActor is the URI of the agent that caused the fault. This is used when the SOAP request passes through multiple agents when processed. The FaultActor can be a proxy server, the Web Service application to which the request was addressed, or another agent that the target Web Service application calls on when processing the request.

This property is only set if the Web Service provider specifies a FaultActor in its SOAP fault packet.

See Also

FaultCode (see page 4352)

38.1.1.3.2 ERemotableException.FaultCode Property

Indicates where the fault was encountered.

Pascal

```
property FaultCode: InvString;
```

C++

```
__property InvString FaultCode;
```

Description

FaultCode is one of the following strings:

Value	Meaning
Server	The Web Service application raised the exception before it was able to begin processing the content of the SOAP request packet. For example, if the server can't process a request because it is out of memory, it specifies a FaultCode of 'Server'.
Client	The Web Service application raised the exception because of an error in the SOAP request packet that the client provided. For example, if the SOAP request packet specified a nonexistent method or invalid parameter, the server specifies a FaultCode of 'Client'.
VersionMismatch	The Web Service application is a different version than the one that the SOAP request packet specifies.
MustUnderstand	The Web Service application did not understand one of the SOAP headers in the request packet and the request packet set its MustUnderstand header to indicate that the server must handle all of its SOAP headers.

See Also

FaultActor (see page 4352)

38.1.1.3.3 ERemotableException.FaultDetail Property

Provides application-specific details about the exception that occurred.

Pascal

```
property FaultDetail: InvString;
```

C++

```
__property InvString FaultDetail;
```

Description

FaultDetail is a fragment of XML that the server generates to provide detailed information about the exception that occurred. FaultDetail provides context information in addition to the fault message that becomes the value of the Message property.

Each server defines the structure and meaning of FaultDetail in an application-specific way. When an ERemotableException (see page 4350) descendant includes published properties, their values are added to FaultDetail.

Message

38.1.2 ETypeRegistryException Class

ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.

Class Hierarchy

Pascal

```
ETypeRegistryException = class(Exception);
```

C++

```
class ETypeRegistryException : public Exception;
```

File

InvokeRegistry

Description

ETypeRegistryException is thrown when

An application tries to register an implementation class with the invocation registry and that class does not implement any interfaces.

An application tries to look up a type in the remotable type registry that is not remotable.

See Also

TInvokableClassRegistry (see page 4379)

TRemotableTypeRegistry (see page 4414)

38.1.3 TDataContext Class

TDataContext stores temporary information about a set of objects, Variants, and other related values.

Class Hierarchy

Pascal

```
TDataContext = class;
```

C++

```
class TDataContext;
```

File

InvokeRegistry

Description

TDataContext is a repository for information that belongs together. It introduces a number of methods for storing different types of information, including objects, Variants, pointers, and raw data (untyped bytes). When the TDataContext object is freed, it performs all necessary cleanup of the information it stores, freeing the objects, clearing the Variants, and so on.

Do not use TDataContext directly. It is intended as a base class for classes that need a temporary repository that serves a specific purpose. TDataContext does not allocate the internal dynamic arrays that store pointers and raw data: This task is left to descendant classes, such as TInvContext (see page 4369).

See Also

TInvContext (see page 4369)

38.1.3.1 TDataContext Members

The following tables list the members exposed by TDataContext.

Protected Fields

	Name	Description
	Data (see page 4356)	This is Data, a member of class TDataContext.
	DataOffset (see page 4356)	This is DataOffset, a member of class TDataContext.
	DataP (see page 4357)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 4357)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 4357)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 4357)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 4357)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 4358)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 4358)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 4358)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 4359)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 4359)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 4360)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 4360)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 4361)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 4361)	Returns a pointer to the data context's cache of raw memory.
	Create (see page 4355)	Creates an instance of TDataContext (see page 4354).
	Destroy (see page 4355)	Destroys an instance of TDataContext (see page 4354).
	GetDataPointer (see page 4362)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 4362)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 4362)	Stores a pointer in the internal cache of pointers.

38.1.3.2 TDataContext.Create Constructor

Creates an instance of TDataContext (see page 4354).

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataContext();
```

Description

Call Create to instantiate a TDataContext (see page 4354) object.

38.1.3.3 TDataContext.Destroy Destructor

Destroys an instance of TDataContext (see page 4354).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataContext();
```

Description

Destroy frees all the temporary data stored in the TDataContext (see page 4354) instance.

See Also

delete

38.1.3.4 TDataContext Fields

The fields of the TDataContext class are listed here.

Protected Fields

	Name	Description
	Data (see page 4356)	This is Data, a member of class TDataContext.
	DataOffset (see page 4356)	This is DataOffset, a member of class TDataContext.
	DataP (see page 4357)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 4357)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 4357)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 4357)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 4357)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 4358)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 4358)	This is WStrToClear, a member of class TDataContext.

38.1.3.4.1 TDataContext.Data Field

Pascal

```
Data: array of Byte;
```

C++

```
array of Byte Data;
```

Description

This is Data, a member of class TDataContext.

38.1.3.4.2 TDataContext.DataOffset Field

Pascal

```
DataOffset: Integer;
```

C++

```
int DataOffset;
```

Description

This is DataOffset, a member of class TDataContext.

38.1.3.4.3 TDataContext.DataP Field

Pascal

```
DataP: array of Pointer;
```

C++

```
array of Pointer DataP;
```

Description

This is DataP, a member of class TDataContext.

38.1.3.4.4 TDataContext.DynArrayToClear Field

Pascal

```
DynArrayToClear: array of TDynToClear;
```

C++

```
array of TDynToClear DynArrayToClear;
```

Description

This is DynArrayToClear, a member of class TDataContext.

38.1.3.4.5 TDataContext.FObjsToDestroy Field

Pascal

```
FObjsToDestroy: array of TObject;
```

C++

```
array of TObject FObjsToDestroy;
```

Description

This is FObjsToDestroy, a member of class TDataContext.

38.1.3.4.6 TDataContext.StrToClear Field

Pascal

```
StrToClear: array of Pointer;
```

C++

```
array of Pointer StrToClear;
```

Description

This is StrToClear, a member of class TDataContext.

38.1.3.4.7 TDataContext.UStrToClear Field

Pascal

```
UStrToClear: array of Pointer;
```

C++

```
array of Pointer UStrToClear;
```

Description

This is UStrToClear, a member of class TDataContext.

38.1.3.4.8 TDataContext.VarToClear Field

Pascal

```
VarToClear: array of Pointer;
```

C++

```
array of Pointer VarToClear;
```

Description

This is VarToClear, a member of class TDataContext.

38.1.3.4.9 TDataContext.WStrToClear Field

Pascal

```
WStrToClear: array of Pointer;
```

C++

```
array of Pointer WStrToClear;
```

Description

This is WStrToClear, a member of class TDataContext.

38.1.3.5 TDataContext Methods

The methods of the TDataContext class are listed here.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 4358)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 4359)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 4359)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 4360)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 4360)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 4361)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 4361)	Returns a pointer to the data context's cache of raw memory.
	GetDataPointer (see page 4362)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 4362)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 4362)	Stores a pointer in the internal cache of pointers.

38.1.3.5.1 TDataContext.AddDynArrayToClear Method

Stores a dynamic array that can be cleared when the data context is finished.

Pascal

```
procedure AddDynArrayToClear(P: Pointer; Info: PTypeInfo);
```

C++

```
__fastcall AddDynArrayToClear(void * P, PTypeInfo Info);
```

Description

Call AddDynArrayToClear to add a dynamic array to the list of temporary dynamic arrays that TDataContext (see page 4354) maintains. When the TDataContext (see page 4354) instance is freed, it clears all dynamic arrays in this list of temporary arrays.

P is a pointer to the dynamic array.

Info is the TypeInfo pointer for the dynamic array.

Note: TDataContext (see page 4354) does not provide access to this list. The caller must keep a reference to the dynamic arrays for use while the TDataContext (see page 4354) instance exists.

See Also

Destroy (see page 4355)

AddObjectToDestroy (see page 4359)

AddVariantToClear (see page 4360)

AddStrToClear (see page 4359)

AddWStrToClear (see page 4361)

38.1.3.5.2 TDataContext.AddObjectToDestroy Method

Stores an object that can be freed when the data context is finished.

Pascal

```
procedure AddObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall AddObjectToDestroy(TObject * Obj);
```

Description

Call AddObjectToDestroy to add an object instance to the list of temporary objects that TDataContext (see page 4354) maintains. When the TDataContext (see page 4354) instance is freed, it frees all the objects in this list of temporary objects.

Note: TDataContext (see page 4354) does not provide access to this list. The caller must keep a reference to the object for use while the TDataContext (see page 4354) instance exists.

See Also

Destroy (see page 4355)

AddDynArrayToClear (see page 4358)

AddVariantToClear (see page 4360)

RemoveObjectToDestroy (see page 4362)

AddStrToClear (see page 4359)

38.1.3.5.3 TDataContext.AddStrToClear Method

Stores a string that can be cleared when the data context is finished.

Pascal

```
procedure AddStrToClear(P: Pointer);
```

C++

```
__fastcall AddStrToClear(void * P);
```

Description

Call AddStrToClear to add a string to the list of temporary strings that TDataContext (see page 4354) maintains. When the TDataContext (see page 4354) instance is freed, it clears all strings in this list.

P is a pointer to the string.

Note: TDataContext (see page 4354) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 4354) instance exists.

See Also

Destroy (see page 4355)

AddObjectToDestroy (see page 4359)

AddVariantToClear (see page 4360)

AddDynArrayToClear (see page 4358)

AddWStrToClear (see page 4361)

38.1.3.5.4 TDataContext.AddUStrToClear Method

Pascal

```
procedure AddUStrToClear(P: Pointer);
```

C++

```
__fastcall AddUStrToClear(void * P);
```

Description

This is AddUStrToClear, a member of class TDataContext.

38.1.3.5.5 TDataContext.AddVariantToClear Method

Stores the value of a Variant that can be cleared when the data context is finished.

Pascal

```
procedure AddVariantToClear(P: PVarData);
```

C++

```
__fastcall AddVariantToClear(PVarData P);
```

Description

Call AddVariantToClear to add a Variant to the list of temporary Variant values that TDataContext (see page 4354) maintains. When the TDataContext (see page 4354) instance is freed, it clears all the Variants in this list of temporary Variant values.

Note: TDataContext (see page 4354) does not provide access to this list. The caller must keep a reference to the Variant for use while the TDataContext (see page 4354) instance exists.

See Also

Destroy (see page 4355)

AddStrToClear (see page 4359)

AddWStrToClear (see page 4361)

38.1.3.5.6 TDataContext.AddWStrToClear Method

Stores a wide string that can be cleared when the data context is finished.

Pascal

```
procedure AddWStrToClear(P: Pointer);
```

C++

```
__fastcall AddWStrToClear(void * P);
```

Description

Call AddWStrToClear to add a wide string to the list of temporary wide strings that TDataContext (see page 4354) maintains. When the TDataContext (see page 4354) instance is freed, it clears all strings in this list.

P is a pointer to the WideString.

Note: TDataContext (see page 4354) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 4354) instance exists.

See Also

Destroy (see page 4355)

AddObjectToDestroy (see page 4359)

AddVariantToClear (see page 4360)

AddDynArrayToClear (see page 4358)

AddStrToClear (see page 4359)

38.1.3.5.7 TDataContext.AllocData Method

Returns a pointer to the data context's cache of raw memory.

Pascal

```
function AllocData(Size: Integer): Pointer;
```

C++

```
__fastcall void * AllocData(int Size);
```

Description

Use AllocData to obtain a pointer to a chunk of temporary memory.

Size is the number of bytes desired.

AllocData returns a pointer to Size bytes.

Note: TDataContext (see page 4354) does not actually allocate the memory that AllocData returns. Descendant classes must initialize the internal cache that the returned pointer addresses.

See Also

GetDataPointer (see page 4362)

38.1.3.5.8 TDataContext.GetDataPointer Method

Returns a pointer from the internal cache of pointers.

Pascal

```
function GetDataPointer(Index: Integer): Pointer;
```

C++

```
__fastcall void * GetDataPointer(int Index);
```

Description

GetDataPointer returns a pointer from the internal cache of pointers. This value is assigned by a call to the SetDataPointer (see page 4362) method.

Index is the index of the desired pointer, where 0 is the first pointer, 1 is the second pointer, and so on.

Note: TDataContext (see page 4354) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 4354) uses to store pointers.

See Also

SetDataPointer (see page 4362)

38.1.3.5.9 TDataContext.RemoveObjectToDestroy Method

Remove an object from the list of objects to free when the data context is freed.

Pascal

```
procedure RemoveObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall RemoveObjectToDestroy(TObject * Obj);
```

Description

Call RemoveObjectToDestroy to remove an object instance from the list of temporary objects that TDataContext (see page 4354) maintains. This prevents TDataContext (see page 4354) from freeing the object when it is itself freed.

For example, TRemotable (see page 4408) descendants that are created by a Web Service application when it executes an invokable interface call are automatically added to a data context that persists for the length of the method call. When an application changes the remotable object's DataContext property, it automatically calls RemoveObjectToDestroy so that the object is not automatically freed when the method call is complete.

See Also

DataContext (see page 4413)

AddObjectToDestroy (see page 4359)

38.1.3.5.10 TDataContext.SetDataPointer Method

Stores a pointer in the internal cache of pointers.

Pascal

```
procedure SetDataPointer(Index: Integer; P: Pointer);
```

C++

```
__fastcall SetDataPointer(int Index, void * P);
```

Description

SetDataPointer stores a pointer that can later be retrieved by a call to GetDataPointer (see page 4362). TDataContext (see page 4354) owns only the pointer, not the data to which it points. When you free the TDataContext (see page 4354) instance, it frees its list of pointers, but not the memory to which they point, unless they are first obtained by a call to the AllocData (see page 4361) method.

Index is the index of the pointer in the internal cache of pointers, where 0 specifies the first pointer, 1 specifies the second pointer, and so on.

P is the pointer to store.

Note: TDataContext (see page 4354) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 4354) uses to store pointers.

See Also

GetDataPointer (see page 4362)

AllocData (see page 4361)

38.1.4 THeaderList Class

THeaderList maintains a list of SOAP headers.

Class Hierarchy

Pascal

```
THeaderList = class;
```

C++

```
class THeaderList;
```

File

InvokeRegistry

Description

Use THeaderList to store and maintain a list of SOAP headers (TSOAPHeader (see page 4448) descendants).

See Also

TSoapHeader

38.1.4.1 THeaderList Members

The following tables list the members exposed by THeaderList.

Protected Methods

	Name	Description
	GetCount (see page 4366)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 4367)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 4367)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 4367)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 4365)	This is the overview for the Add method overload.
	Clear (see page 4366)	Empties the list and frees the TSOAPHeader (see page 4448) objects.
	Create (see page 4364)	Creates and initializes a THeaderList (see page 4363) instance.
V	Destroy (see page 4364)	Destroys an instance of THeaderList (see page 4363).
	Extract (see page 4366)	Removes a specified header from the list without freeing it.
	IndexOf (see page 4367)	This is IndexOf, a member of class THeaderList.

Public Properties

	Name	Description
R	Count (see page 4368)	Indicates the number of headers in the list.
R	Headers (see page 4368)	Lists the headers.
	OwnsObjects (see page 4369)	Allows THeaderList (see page 4363) to free objects when they the list is cleared or destroyed.

38.1.4.2 THeaderList.Create Constructor

Creates and initializes a THeaderList (see page 4363) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall THeaderList();
```

Description

Create creates a THeaderList (see page 4363) instance.

38.1.4.3 THeaderList.Destroy Destructor

Destroys an instance of THeaderList (see page 4363).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THeaderList();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the THeaderList (see page 4363) reference is not nil, and only then calls Destroy.

Destroy frees the THeaderList (see page 4363) instance. If the OwnsObjects (see page 4369) property is true, it also frees the header objects in the list.

See Also

System::TObject::Free

OwnsObjects (see page 4369)

38.1.4.4 THeaderList Methods

The methods of the THeaderList class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 4366)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 4367)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 4367)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 4367)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 4365)	This is the overview for the Add method overload.
	Clear (see page 4366)	Empties the list and frees the TSOAPHeader (see page 4448) objects.
	Extract (see page 4366)	Removes a specified header from the list without freeing it.
	IndexOf (see page 4367)	This is IndexOf, a member of class THeaderList.

38.1.4.4.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	THeaderList.Add (TObject) (see page 4365)	Adds a new header to the end of the list.
	THeaderList.Add (TSOAPHeader) (see page 4365)	Adds a new header to the end of the list.

38.1.4.4.1.1 THeaderList.Add Method (TObject)

Adds a new header to the end of the list.

Pascal

```
procedure Add(Header: TSOAPHeader); overload;
procedure Add(Header: TObject); overload;
```

C++

```
__fastcall Add(TSOAPHeader Header);
__fastcall Add(TObject * Header);
```

Description

Call Add to add a header to the end of the Headers (see page 4368) property array. When you call Add, the new Header is added to the end of the array and the value of the Count (see page 4368) property is incremented.

Header is the TSOAPHeader (see page 4448) descendants that is added to the list.

See Also

Headers (see page 4368)

Count (see page 4368)

Clear (see page 4366)

38.1.4.4.2 THeaderList.Clear Method

Empties the list and frees the TSOAPHeader (see page 4448) objects.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Clear removes all of the headers from the list and, if the OwnsObjects (see page 4369) property is true, frees each one . After a call to Clear, the value of the Count (see page 4368) property is 0.

See Also

Headers (see page 4368)

Count (see page 4368)

OwnsObjects (see page 4369)

38.1.4.4.3 THeaderList.Extract Method

Removes a specified header from the list without freeing it.

Pascal

```
function Extract(Obj: TObject): TObject;
```

C++

```
__fastcall TObject * Extract(TObject * Obj);
```

Description

Call Extract to remove a header from the list without freeing the header object. After a header is removed, all the headers that follow it are moved up in index position and Count (see page 4368) is decremented.

See Also

Add (see page 4365)

Count (see page 4368)

Headers (see page 4368)

OwnsObjects (see page 4369)

38.1.4.4.4 THeaderList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class THeaderList.

38.1.4.4.5 THeaderList.GetHeader Method

Pascal

```
function GetHeader(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetHeader(int Index);
```

Description

This is GetHeader, a member of class THeaderList.

38.1.4.4.6 THeaderList.GetOwnsObjects Method

Pascal

```
function GetOwnsObjects: Boolean;
```

C++

```
__fastcall Boolean GetOwnsObjects();
```

Description

This is GetOwnsObjects, a member of class THeaderList.

38.1.4.4.7 THeaderList.IndexOf Method

Pascal

```
function IndexOf(Obj: TObject): Integer;
```

C++

```
__fastcall int IndexOf(TObject * Obj);
```

Description

This is IndexOf, a member of class THeaderList.

38.1.4.4.8 THeaderList.SetOwnsObjects Method

Pascal

```
procedure SetOwnsObjects(Val: Boolean);
```

C++

```
__fastcall SetOwnsObjects(Boolean Val);
```

Description

This is SetOwnsObjects, a member of class THeaderList.

38.1.4.5 THeaderList Properties

The properties of the THeaderList class are listed here.

Public Properties

	Name	Description
	Count (see page 4368)	Indicates the number of headers in the list.
	Headers (see page 4368)	Lists the headers.
	OwnsObjects (see page 4369)	Allows THeaderList (see page 4363) to free objects when they the list is cleared or destroyed.

38.1.4.5.1 THeaderList.Count Property

Indicates the number of headers in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of headers that the Headers (see page 4368) property lists. To change the value of Count, you can add headers using the Add (see page 4365) method, remove them using the Extract (see page 4366) method, or remove all headers using the Clear (see page 4366) method.

See Also

Headers (see page 4368)

Add (see page 4365)

Clear (see page 4366)

Extract (see page 4366)

38.1.4.5.2 THeaderList.Headers Property

Lists the headers.

Pascal

```
property Headers [Index: Integer]: TObject;
```

C++

```
__property TObject * Headers[int Index];
```

Description

Use Headers to access headers in the list. Headers is a zero-based array of TSOAPHeader (see page 4448) descendants: The first header is indexed as 0, the second header is indexed as 1, and so forth. You can read the value at a specific index, or use Headers with the Count (see page 4368) property to iterate through the list.

Note: In Delphi, Headers is the default property of THeaderList (see page 4363). This means you can omit the property name.

Note: In C++, you can use the subscript operator to achieve a similar effect.

See Also

OwnsObjects (see page 4369)

Add (see page 4365)

Extract (see page 4366)

Count (see page 4368)

Clear (see page 4366)

operator_sb

38.1.4.5.3 THeaderList.OwnsObjects Property

Allows THeaderList (see page 4363) to free objects when they the list is cleared or destroyed.

Pascal

```
property OwnsObjects: Boolean;
```

C++

```
__property Boolean OwnsObjects;
```

Description

OwnsObjects allows THeaderList (see page 4363) to control the memory of its TSOAPHeader (see page 4448) objects. If OwnsObjects is true,

calling Clear (see page 4366) frees all the headers in the list in addition to emptying the list.

freeing the THeaderList (see page 4363) object frees all the objects in the list in addition to destroying the THeaderList (see page 4363) itself.

Note: Even if OwnsObjects is true, the Extract (see page 4366) method removes objects from the list without freeing them.

See Also

Headers (see page 4368)

Clear

Destroy (see page 4364)

Extract (see page 4366)

38.1.5 TInvContext Class

TInvContext stores information about a method call on an invokeable interface.

Class Hierarchy

Pascal

```
TInvContext = class(TDataContext);
```

C++

```
class TInvContext : public TDataContext;
```

File

InvokeRegistry

Description

TInvContext is a helper object created and used by TRIO and TSoapPascalInvoker for generating calls to the methods on an invokeable interface. It stores temporary data needed when making the method call. TInvContext introduces methods for retrieving and setting information about the method being called, including its type signature, parameter values, and so on.

Component writers implementing their own classes to implement the IOPConvert interface must translate between the information stored in a TInvContext object and their class-specific encoding of a method call.

See Also

IOPConvert (see page 6152)

TRio

TSOAPPascalInvoker

38.1.5.1 TInvContext Members

The following tables list the members exposed by TInvContext.

Protected Fields

	Name	Description
	Data (see page 4356)	This is Data, a member of class TDataContext.
	DataOffset (see page 4356)	This is DataOffset, a member of class TDataContext.
	DataP (see page 4357)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 4357)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 4357)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 4357)	This is StrToClear, a member of class TDataContext.
	UStrToClear (see page 4357)	This is UStrToClear, a member of class TDataContext.
	VarToClear (see page 4358)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 4358)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 4358)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 4359)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 4359)	Stores a string that can be cleared when the data context is finished.
	AddUStrToClear (see page 4360)	This is AddUStrToClear, a member of class TDataContext.
	AddVariantToClear (see page 4360)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 4361)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 4361)	Returns a pointer to the data context's cache of raw memory.
	AllocServerData (see page 4371)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	Create (see page 4355)	Creates an instance of TDataContext (see page 4354).
	Destroy (see page 4355)	Destroys an instance of TDataContext (see page 4354).
	GetDataPointer (see page 4362)	Returns a pointer from the internal cache of pointers.
	GetParamPointer (see page 4371)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 4372)	Returns a pointer to the return value of the method call.
	RemoveObjectToDestroy (see page 4362)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 4362)	Stores a pointer in the internal cache of pointers.
	SetMethodInfo (see page 4372)	Initializes the TInvContext (see page 4369) for a particular method on the invokeable interface.
	SetParamPointer (see page 4373)	Sets the value of a specified parameter.
	SetResultPointer (see page 4373)	This is SetResultPointer, a member of class TInvContext.

38.1.5.2 TInvContext Methods

The methods of the TInvContext class are listed here.

Public Methods

	Name	Description
	AllocServerData (see page 4371)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	GetParamPointer (see page 4371)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 4372)	Returns a pointer to the return value of the method call.
	SetMethodInfo (see page 4372)	Initializes the TInvContext (see page 4369) for a particular method on the invokeable interface.
	SetParamPointer (see page 4373)	Sets the value of a specified parameter.
	SetResultPointer (see page 4373)	This is SetResultPointer, a member of class TInvContext.

38.1.5.2.1 TInvContext.AllocServerData Method

Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.

Pascal

```
procedure AllocServerData(const MD: TIntfMethEntry);
```

C++

```
__fastcall AllocServerData(const TIntfMethEntry MD);
```

Description

AllocServerData suballocates the memory that the SetMethodInfo (see page 4372) method allocates so that it can represent the parameters and return value of a method. It looks up the types of each parameter and of the return type for the method, allocates memory for their values using the AllocData (see page 4361) method, and stores the pointers to that memory by calling the SetParamPointer (see page 4373) and SetResultPointer (see page 4373) methods.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: AllocServerData must come after a call to SetMethodInfo (see page 4372) so that the pool of memory is available. After calling AllocServerData, an application can call GetParamPointer (see page 4371) and GetResultPointer (see page 4372) to obtain pointers to the memory allocated for each parameter and for the return value of the method.

See Also

AllocData (see page 4361)

SetParamPointer (see page 4373)

setresultpointer (see page 4373)

SetMethodInfo (see page 4372)

38.1.5.2.2 TInvContext.GetParamPointer Method

Returns a pointer to the value of a parameter on the called method.

Pascal

```
function GetParamPointer(Param: Integer): Pointer;
```

C++

```
__fastcall void * GetParamPointer(int Param);
```

Description

GetParamPointer returns a pointer to the value of a specified parameter.

Param is the index of the desired parameter, where 0 is the first parameter, 1 is the second parameter, and so on.

This value is assigned by a call to the SetParamPointer (see page 4373) method.

See Also

SetParamPointer (see page 4373)

38.1.5.2.3 TInvContext.GetResultPointer Method

Returns a pointer to the return value of the method call.

Pascal

```
function GetResultPointer: Pointer;
```

C++

```
__fastcall void * GetResultPointer();
```

Description

GetResultPointer returns a pointer to the return value of the method call. This value is assigned by a call to the SetResultPointer (see page 4373) method.

See Also

setresultpointer (see page 4373)

38.1.5.2.4 TInvContext.SetMethodInfo Method

Initializes the TInvContext (see page 4369) for a particular method on the invokeable interface.

Pascal

```
procedure SetMethodInfo(const MD: TIntfMethEntry);
```

C++

```
__fastcall SetMethodInfo(const TIntfMethEntry MD);
```

Description

SetMethodInfo initializes the invocation context so that it represents a particular method. Objects that implement the IOPConvert interface call this method to initialize an invocation context when implementing their MsgToInvContext method.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: SetMethodInfo allocates the memory used internally to store pointers and raw data. An application must call this method before any calls to the AllocData (see page 4361), SetDataPointer (see page 4362), or SetParamPointer (see page 4373) methods.

See Also

IOPConvert (see page 6152)

MsgToInvContext (see page 6157)

AllocData (see page 4361)

SetDataPointer (see page 4362)

SetParamPointer (see page 4373)

38.1.5.2.5 TInvContext.SetParamPointer Method

Sets the value of a specified parameter.

Pascal

```
procedure SetParamPointer(Param: Integer; P: Pointer);
```

C++

```
__fastcall SetParamPointer(int Param, void * P);
```

Description

SetParamPointer associates a pointer with a specified parameter.

Param identifies the parameter whose value is to be set, where 0 specifies the first parameter, 1 specifies the second parameter, and so on.

P is a pointer to the value of the parameter. Memory to contain the value of P can be allocated using the AllocData (see page 4361) method.

See Also

GetParamPointer (see page 4371)

AllocData (see page 4361)

38.1.5.2.6 TInvContext.SetResultPointer Method

Pascal

```
procedure SetResultPointer(P: Pointer);
```

C++

```
__fastcall SetResultPointer(void * P);
```

Description

This is SetResultPointer, a member of class TInvContext.

38.1.6 TInvokableClass Class

TInvokableClass is the base class for the implementation classes of invokable interfaces.

Class Hierarchy

Pascal

```
TInvokableClass = class(TObject, IInterface);
```

C++

```
class TInvokableClass : public TObject, public IInterface;
```

File

InvokeRegistry

Description

Use TInvokableClass as a base class when writing the implementation class of an invokable interface. TInvokableClass has the following important attributes:

The invocation registry (InvRegistry (see page 4471)) knows how to create instances of TInvokableClass and (because it has a virtual constructor) its descendants. This allows the registry to supply an invoker in a Web Service application with an instance of the invokable class that can handle an incoming request.

TInvokableClass is an interfaced object that frees itself when the reference count on its interface drops to zero. Invoker components do not know when to free the implementation classes of the interfaces they call. Because TInvokableClass knows when to free itself, you do not need to supply your own lifetime management for this object.

TInvokableClass supports the ISOAPHeaders (see page 4464) interface so that your server can process the headers that accompany requests and add headers to outgoing responses.

To use a TInvokableClass descendant in a Web Service application, you must register it with the invocation registry. Use the RegisterInvokableClass method of the invocation registry to register your TInvokableClass descendant.

Note: If you do not use TInvokableClass as a base class when writing the implementation class for an invokable interface, you must supply the invocation registry with a method to retrieve instances of your class and you must handle the lifetime management of your class. If you are sending or receiving SOAP headers, you must use the global GetSOAPHeaders function to obtain an ISOAPHeaders (see page 4464) interface instead of obtaining one from the implementation class.

38.1.6.1 TInvokableClass Members

The following tables list the members exposed by TInvokableClass.

Protected Fields

	Name	Description
	FRefCount (see page 4375)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 4376)	This is FSOAPHeaders, a member of class TInvokableClass.

Protected Methods

	Name	Description
	_AddRef (see page 4376)	Increments the reference count for this interface.
	_Release (see page 4377)	Decrements the reference count for this interface.
	QueryInterface (see page 4378)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 4377)	Responds after the last constructor executes.
	BeforeDestruction (see page 4377)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	Create (see page 4375)	Creates and initializes a TInvokableClass (see page 4373) object.
	NewInstance (see page 4378)	Allocates memory for each instance of an invokable object.

Public Properties

	Name	Description
	RefCount (see page 4379)	Indicates the number of interface pointers currently dependent upon the object.

38.1.6.2 TInvokableClass.Create Constructor

Creates and initializes a TInvokableClass (see page 4373) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TInvokableClass();
```

Description

The TInvokableClass (see page 4373) constructor does nothing special. It exists primarily because

The TInvokableClass (see page 4373) constructor exists primarily because

The invocation registry knows how to call it.

It is virtual, so that the invocation registry can also instantiate descendant classes.

In addition, the constructor initializes the invokable class so that it can support the ISOAPHeaders (see page 4464) interface.

See Also

InvRegistry (see page 4471)

ISOAPHeaders (see page 4464)

38.1.6.3 TInvokableClass Fields

The fields of the TInvokableClass class are listed here.

Protected Fields

	Name	Description
	FRefCount (see page 4375)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 4376)	This is FSOAPHeaders, a member of class TInvokableClass.

38.1.6.3.1 TInvokableClass.FRefCount Field

Pascal

```
FRefCount: Integer;
```

C++

```
int FRefCount;
```

Description

This is FRefCount, a member of class TInvokableClass.

38.1.6.3.2 TInvokableClass.FSOAPHeaders Field

Pascal

```
FSOAPHeaders: TSOAPHeaders;
```

C++

```
TSOAPHeaders FSOAPHeaders;
```

Description

This is FSOAPHeaders, a member of class TInvokableClass.

38.1.6.4 TInvokableClass Methods

The methods of the TInvokableClass class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 4376)	Increments the reference count for this interface.
	_Release (see page 4377)	Decrements the reference count for this interface.
	QueryInterface (see page 4378)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 4377)	Responds after the last constructor executes.
	BeforeDestruction (see page 4377)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	NewInstance (see page 4378)	Allocates memory for each instance of an invokable object.

38.1.6.4.1 TInvokableClass._AddRef Method

Increments the reference count for this interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

The Delphi compiler automatically generates a call to __AddRef for every reference to this interface. For most implementations, __AddRef increments the reference count for the interface and returns the new reference count. When the caller is through with the interface, the compiler generates a call to the _Release method, which decrements the reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __AddRef and _Release so that they do not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_Release

38.1.6.4.2 TInvokableClass._Release Method

Decrements the reference count for this interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

The Delphi compiler automatically generates a call to __Release whenever a reference to this interface goes out of scope. For most implementations, __Release decrements the reference count for the interface and returns the new reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __Release so that it does not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_AddRef

38.1.6.4.3 TInvokableClass.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of TInvokableClass (see page 4373) is allocated, RefCount (see page 4379) is incremented to prevent its destruction while processing the constructor. AfterConstruction decrements that RefCount (see page 4379) to re-establish the correct reference count after all constructors have executed.

See Also

BeforeDestruction (see page 4377)

NewInstance (see page 4378)

RefCount (see page 4379)

38.1.6.4.4 TInvokableClass.BeforeDestruction Method

Checks that the reference count is zero before allowing the interfaced object to be destroyed.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically immediately before the interfaced object's destructor. It checks that the reference count is zero, and, if it is not, raises an exception.

See Also

RefCount (see page 4379)

System::TObject::Free

38.1.6.4.5 TInvokableClass.NewInstance Method

Allocates memory for each instance of an invokable object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

Constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TInvokableClass (see page 4373) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 4379) of zero. The AfterConstruction (see page 4377) method decrements the value of RefCount (see page 4379) after all constructors have executed.

See Also

RefCount (see page 4379)

System::TObject::NewInstance

System::TObject::InstanceSize

AfterConstruction (see page 4377)

38.1.6.4.6 TInvokableClass.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

Do not call the protected QueryInterface method directly. QueryInterface is called through the IInterface interface to obtain an

interface pointer for the interface identified by the IID parameter. If the object supports the requested interface, it is returned in the Obj parameter and QueryInterface returns S_OK. If the object does not support the interface, QueryInterface returns E_NOINTERFACE.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

_addref (see page 4376)

38.1.6.5 TInvokableClass Properties

The properties of the TInvokableClass class are listed here.

Public Properties

	Name	Description
	RefCount (see page 4379)	Indicates the number of interface pointers currently dependent upon the object.

38.1.6.5.1 TInvokableClass.RefCount Property

Indicates the number of interface pointers currently dependent upon the object.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount defines the lifetime of the object. When RefCount is zero, the object is destroyed.

RefCount is incremented by calls to the _AddRef (see page 4376) method and decremented by the _Release (see page 4377) method.

Note:

See Also

_addref (see page 4376)

_release (see page 4377)

38.1.7 TInvokableClassRegistry Class

TInvokableClassRegistry is the type of the invocation registry.

Class Hierarchy

Pascal

```
TInvokableClassRegistry = class(TInterfacedObject);
```

C++

```
class TInvokableClassRegistry : public TInterfacedObject;
```

File

InvokeRegistry

Description

TInvokableClassRegistry manages information about invokable interfaces and the classes that implement them. Invokable interfaces are used in applications that work with Web Services.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component (such as THTTPSoapPascalInvoker or THTTPSoapCppInvoker) can then use the invocation registry to locate invokable interfaces and execute calls made to them. In addition, server applications should register the headers that are used with calls to the methods of the invokable interface and the exceptions that such calls can raise.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component (THTTPRio) can then use the invocation registry to generate a dynamic vtable for calling the invokable interfaces.

Do not create instances of TInvokableClassRegistry. Instead, use the global InvRegistry (see page 4471) function to access the invocation registry. Most applications need only call the RegisterInterface (see page 4404) and (if a server) the RegisterInvokableClass (see page 4405) methods. The other TInvokableClassRegistry methods are used by invoker components, remote interfaced object components, and the WSDL document importer. The allow these components to look up information about invokable interfaces and their implementation classes, access invokable interfaces, and so on.

38.1.7.1 TInvokableClassRegistry Members

The following tables list the members exposed by TInvokableClassRegistry.

Public Methods

	Name	Description
	Create (see page 4381)	Creates and initializes a TInvokableClassRegistry (see page 4379) object.
	Destroy (see page 4382)	Frees the memory associated with the TInvokableClassRegistry (see page 4379) object.
	GetActionURIOfIID (see page 4383)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 4384)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 4384)	Retrieves the implementation class that corresponds to the type info of an invokable interface.
	GetExceptionInfoForInterface (see page 4385)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 4385)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 4386)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 4386)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 4387)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 4388)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.

	GetInterfaceCount (see page 4388)	Returns the number of registered invokable interfaces.
	GetInterfaceExternalName (see page 4389)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 4390)	Returns information about a registered invokable interface given its name.
	GetInterfaceTypeInfo (see page 4390)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 4390)	This is the overview for the GetIntfInvokeOptions method overload.
	GetInvokableObjectFromClass (see page 4391)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 4392)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 4392)	Returns the name of the method that corresponds to an operation in a WSDL document.
	GetNamespaceByGUID (see page 4393)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 4393)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 4393)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 4394)	Returns the internal data that TInvokableClassRegistry (see page 4379) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 4394)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.
	GetResponseHeaderInfoForInterface (see page 4395)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 4396)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 4396)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 4397)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 4398)	Indicates whether there is a registered implementation class for an invokable interface.
	RegisterAllSOAPActions (see page 4398)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 4399)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 4399)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 4400)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 4400)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 4401)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 4402)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 4403)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 4404)	Registers an invokable interface.
	RegisterInvokableClass (see page 4405)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 4405)	This is the overview for the RegisterInvokeOptions method overload.
	RegisterReturnParamNames (see page 4406)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 4407)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
	UnRegisterInterface (see page 4407)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 4408)	Unregisters the implementation class for an invokable interface.

38.1.7.2 TInvokableClassRegistry.Create Constructor

Creates and initializes a TInvokableClassRegistry (see page 4379) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TInvokableClassRegistry();
```

Description

Do not create your own instances of TInvokableClassRegistry (see page 4379). Instead, use the global InvRegistry (see page 4471) function, which provides access to a single global instance of TInvokableClassRegistry (see page 4379).

See Also

InvRegistry (see page 4471)

38.1.7.3 TInvokableClassRegistry.Destroy Destructor

Frees the memory associated with the TInvokableClassRegistry (see page 4379) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TInvokableClassRegistry();
```

Description

Do not destroy the global TInvokableClassRegistry (see page 4379) instance that is available through the InvRegistry (see page 4471) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 4347) unit.

See Also

InvRegistry (see page 4471)

38.1.7.4 TInvokableClassRegistry Methods

The methods of the TInvokableClassRegistry class are listed here.

Public Methods

	Name	Description
	GetActionURIOfIID (see page 4383)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 4384)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 4384)	Retrieves the implementation class that corresponds to the type info of an invokable interface.
	GetExceptionInfoForInterface (see page 4385)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 4385)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 4386)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 4386)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 4387)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 4388)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.
	GetInterfaceCount (see page 4388)	Returns the number of registered invokable interfaces.
	GetInterfaceExternalName (see page 4389)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 4390)	Returns information about a registered invokable interface given its name.
	GetInterfaceTypeInfo (see page 4390)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 4390)	This is the overview for the GetIntfInvokeOptions method overload.

	GetInvokableObjectFromClass (see page 4391)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 4392)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 4392)	Returns the name of the method that corresponds to an operation in a WSDL document.
	GetNamespaceByGUID (see page 4393)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 4393)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 4393)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 4394)	Returns the internal data that TInvokableClassRegistry (see page 4379) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 4394)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.
	GetResponseHeaderInfoForInterface (see page 4395)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 4396)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 4396)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 4397)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 4398)	Indicates whether there is a registered implementation class for an invokable interface.
	RegisterAllSOAPActions (see page 4398)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 4399)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 4399)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 4400)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 4400)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 4401)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 4402)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 4403)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 4404)	Registers an invokable interface.
	RegisterInvokableClass (see page 4405)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 4405)	This is the overview for the RegisterInvokeOptions method overload.
	RegisterReturnParamNames (see page 4406)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 4407)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
	UnRegisterInterface (see page 4407)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 4408)	Unregisters the implementation class for an invokable interface.

38.1.7.4.1 TInvokableClassRegistry.GetActionURIOfIID Method

Returns the SOAP Action header associated with the interface with a specified GUID.

Pascal

```
function GetActionURIOfIID(const AGUID: TGUID): string;
```

C++

```
__fastcall UnicodeString GetActionURIOfIID(const TGUID AGUID);
```

Description

Typically, applications do not need to call GetActionURIOfIID. This method is called by remote interfaced objects (THTTPRIO) when generating the SOAP Action header of messages that call a method on a registered interface.

AGUID is the globally unique identifier (GUID) of the interface to call. The interface must be previously registered by a call to the RegisterInterface (see page 4404) method.

GetActionURIOfIID returns the string that should appear as the SOAP Action header on request messages to that interface.

See Also

GetActionURIOfInfo (see page 4384)

RegisterDefaultSOAPAction (see page 4399)

RegisterInterface (see page 4404)

THTTPRIO

38.1.7.4.2 TInvokableClassRegistry.GetActionURIOfInfo Method

Returns the SOAP Action header associated with the type info of a registered interface.

Pascal

```
function GetActionURIOfInfo(const IntfInfo: PTypeInfo; const MethodName: InvString;
MethodIndex: Integer): string;
```

C++

```
__fastcall UnicodeString GetActionURIOfInfo(const PTypeInfo IntfInfo, const InvString
MethodName, int MethodIndex);
```

Description

GetActionURIOfInfo looks up or generates the SOAP Action header that should be used with messages that call a specified method on an invokable interface.

IntfInfo (see page 4331) is the runtime type information (RTTI) that is compiled for the invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

MethodName is the name of the method to call on the specified interface.

MethodIndex indicates which method to use when the interface includes an overload of the method that MethodName specifies. 0 indicates the overload that is declared first, 1 the overload that is declared second, and so on.

GetActionURIOfInfo returns the string that should appear as the SOAP Action header on request messages to the specified method of the specified interface.

See Also

GetActionURIOfIID (see page 4383)

RegisterDefaultSOAPAction (see page 4399)

RegisterInterface (see page 4404)

THTTPRIO

38.1.7.4.3 TInvokableClassRegistry.GetClassFromIntfInfo Method

Retrieves the implementation class that corresponds to the type info of an invokable interface.

Pascal

```
procedure GetClassFromIntfInfo(Info: PTypeInfo; var AClass: TClass);
```

C++

```
__fastcall GetClassFromIntfInfo(PTypeInfo Info, TClass AClass);
```

Description

Typically, applications do not need to call GetClassFromIntfInfo. This method allows the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the implementation class for an interface it is invoking.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

AClass returns a class reference for the class that implements the invokable interface identified by Info. It can be passed to the GetInvokableObjectFromClass (see page 4391) method to obtain an instance of the implementation class.

See Also

GetInvokableObjectFromClass (see page 4391)

RegisterInvokableClass (see page 4405)

RegisterInterface (see page 4404)

THTTPSoapPascalInvoker

THTTPSoapCppInvoker

38.1.7.4.4 TInvokableClassRegistry.GetExceptionInfoForInterface Method

Retrieves an array of exceptions that are registered as associated with an invokable interface.

Pascal

```
function GetExceptionInfoForInterface(Info: PTypeInfo): TExceptionItemArray;
```

C++

```
__fastcall TExceptionItemArray GetExceptionInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetExceptionInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the exceptions that an invokable interface can raise.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

GetExceptionInfoForInterface returns an array of IntfExceptionItem (see page 4476) values, each of which describes a remotable exception that was registered for the invokable interface by a call to the RegisterException (see page 4399) method.

See Also

RegisterException (see page 4399)

TWSDLHTMLPublish

RegisterInterface (see page 4404)

38.1.7.4.5 TInvokableClassRegistry.GetHeaderClass Method

Returns the class reference for a header type, given its name and namespace.

Pascal

```
function GetHeaderClass(Name: InvString; Namespace: InvString): TClass;
```

C++

```
__fastcall TClass GetHeaderClass(InvString Name, InvString Namespace);
```

Description

Typically, applications do not need to call GetHeaderClass. This method is used internally to look up the class of a header that is identified by name.

Name is the name of the header node.

Namespace is the URI of the namespace in which Name is defined.

GetHeaderClass returns the class reference for the TSOAPHeader (see page 4448) descendant that represents the identified header.

See Also

RegisterHeaderClass (see page 4402)

TSOAPHeader (see page 4448)

GetHeaderName (see page 4386)

GetHeaderNamespace (see page 4387)

38.1.7.4.6 TInvokableClassRegistry.GetHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with an invokable interface.

Pascal

```
function GetHeaderInfoForInterface(Info: PTypeInfo; MethodType: eHeaderMethodType = hmtAll):
THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetHeaderInfoForInterface(PTypeInfo Info, eHeaderMethodType
MethodType = hmtAll);
```

Description

Typically, applications do not need to call GetHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages about an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

MethodType indicates whether to retrieve information about the headers to use on request messages, the headers to use on response messages, or both.

GetHeaderInfoForInterface returns an array of IntfHeaderItem (see page 4477) values, each of which describes a header that was registered for the invokable interface by a call to the RegisterHeaderClass (see page 4402) method.

See Also

RegisterHeaderClass (see page 4402)

TWSDLHTMLPublish

RegisterInterface (see page 4404)

38.1.7.4.7 TInvokableClassRegistry.GetHeaderName Method

Returns the name of a header that is identified by a specified class reference.

Pascal

```
function GetHeaderName(Info: PTypeInfo; AClass: TClass): InvString;
```

C++

```
__fastcall InvString GetHeaderName(PTypeInfo Info, TClass AClass);
```

Description

GetHeaderName returns the name of a header given the class that represents it. This is the name supplied to a call to RegisterHeaderClass (see page 4402) when the header was registered. If the header was registered without supplying a name, this is the same name as the type name supplied for the header when it is registered with the remotable type registry.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 4448) descendant that represents the header.

GetHeaderName returns the name of the header. This name is defined within the namespace that the GetHeaderNamespace (see page 4387) method returns.

See Also

RegisterHeaderClass (see page 4402)

TSOAPHeader (see page 4448)

GetHeaderNamespace (see page 4387)

GetHeaderClass (see page 4385)

38.1.7.4.8 GetHeaderNamespace Method

This is the overview for the GetHeaderNamespace method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetHeaderNamespace (PTypeInfo, TClass) (see page 4387)	Returns the namespace URI for a header that is identified by a specified class reference.
	TInvokableClassRegistry.GetHeaderNamespace (TClass) (see page 4387)	Returns the namespace URI for a header that is identified by a specified class reference.

38.1.7.4.8.1 TInvokableClassRegistry.GetHeaderNamespace Method (PTypeInfo, TClass)

Returns the namespace URI for a header that is identified by a specified class reference.

Pascal

```
function GetHeaderNamespace(Info: PTypeInfo; AClass: TClass): InvString; overload;
function GetHeaderNamespace(AClass: TClass): InvString; overload;
```

C++

```
__fastcall InvString GetHeaderNamespace(PTypeInfo Info, TClass AClass);
__fastcall InvString GetHeaderNamespace(TClass AClass);
```

Description

GetHeaderNamespace returns the namespace in which a header's name is defined. This is the namespace URI supplied to a call to RegisterHeaderClass (see page 4402) when the header was registered. If the header was registered without supplying a namespace URI, this is the same namespace as the one associated with the interface that uses the header.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 4448) descendant that represents the header.

GetHeaderNamespace returns the namespace URI to use for resolving the name of the header.

See Also

RegisterHeaderClass (see page 4402)

TSOAPHeader (see page 4448)

GetHeaderName (see page 4386)

GetHeaderClass (see page 4385)

38.1.7.4.9 TInvokableClassRegistry.GetInfoForURI Method

Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.

Pascal

```
function GetInfoForURI(const PathURI: string; const ActionURI: string; var AClass: TClass; var
IntfInfo: PTypeInfo; var AMeth: string): Boolean;
```

C++

```
__fastcall Boolean GetInfoForURI(const UnicodeString PathURI, const UnicodeString ActionURI,
TClass AClass, PTypeInfo IntfInfo, UnicodeString AMeth);
```

Description

Typically, applications do not need to call GetInfoForURI. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the target of a SOAP message that it is invoking.

PathURI is the path portion of the target URI on the SOAP message. When using a path to identify an invokable interface, the path portion must end in the name of the unit followed by the name of the interface. It is only used if ActionURI is an empty string.

ActionURI is the SOAP action header of the SOAP message. It identifies an interface based on the namespace in the SOAP action header. This namespace must match the namespace supplied to the RegisterInterface (see page 4404) method (or generated by that method if the caller did not supply a namespace). If ActionURI is an empty string, GetInfoForURI uses PathURI instead to identify the target interface.

AClass returns a class reference for the class that implements the invokable interface identified by PathURI or ActionURI.

IntfInfo (see page 4331) returns the runtime type information (RTTI) of the invokable interface identified by PathURI or ActionURI.

AMeth is not currently used.

See Also

DispatchSOAP

RegisterInterface (see page 4404)

38.1.7.4.10 TInvokableClassRegistry.GetInterfaceCount Method

Returns the number of registered invokable interfaces.

Pascal

```
function GetInterfaceCount: Integer;
```

C++

```
__fastcall int GetInterfaceCount();
```

Description

GetInterfaceCount returns the number of invokable interfaces that have been registered. Each invokable interface is registered by a call to the RegisterInterface (see page 4404) method.

See Also

RegisterInterface (see page 4404)

38.1.7.4.11 GetInterfaceExternalName Method

This is the overview for the GetInterfaceExternalName method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo) (see page 4389)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string) (see page 4389)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string, string) (see page 4389)	Returns the name of the port type that corresponds to an invokable interface.

38.1.7.4.11.1 TInvokableClassRegistry.GetInterfaceExternalName Method (PTypeInfo)

Returns the name of the port type that corresponds to an invokable interface.

Pascal

```
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string; const
InternalIntfName: string): InvString; overload;
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string): InvString;
overload;
function GetInterfaceExternalName(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const UnicodeString Namespace,
const UnicodeString InternalIntfName);
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const UnicodeString Namespace);
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info);
```

Description

GetInterfaceExternalName returns the name of the port type that corresponds to a specified invokable interface. This is the name given to the corresponding port type in a WSDL document. The association between the external name and the interface name is established by the RegisterInterface (see page 4404) method.

Info is the type information pointer for the invokable interface.

Namespace is the namespace assigned to the invokable interface when it was registered by a call to the RegisterInterface (see page 4404) method. If the interface was registered using the automatically-generated namespace, this parameter can be omitted or you can supply an empty string.

InternalIntfName is the name of the invokable interface.

See Also

RegisterInterface (see page 4404)

38.1.7.4.12 TInvokableClassRegistry.GetInterfaceInfoFromName Method

Returns information about a registered invokable interface given its name.

Pascal

```
procedure GetInterfaceInfoFromName(const UnitName: string; const IntfName: string; var Info:
PTypeInfo; var IID: TGUID);
```

C++

```
__fastcall GetInterfaceInfoFromName(const UnicodeString UnitName, const UnicodeString
IntfName, PTypeInfo Info, TGUID IID);
```

Description

GetInterfaceInfoFromName looks up a registered interface given its name and the name of the unit in which it is declared.

UnitName is the name of the unit that contains the interface definition.

IntfName is the name of the interface.

Info returns the type information that is compiled with the specified interface.

IID returns the globally unique identifier for the specified interface.

See Also

GetInterfaceTypeInfo (see page 4390)

GetInfoForURI (see page 4388)

38.1.7.4.13 TInvokableClassRegistry.GetInterfaceTypeInfo Method

Returns the runtime type information (RTTI) of an invokable interface.

Pascal

```
function GetInterfaceTypeInfo(const AGUID: TGUID): Pointer;
```

C++

```
__fastcall void * GetInterfaceTypeInfo(const TGUID AGUID);
```

Description

GetInterfaceTypeInfo returns a pointer to the RTTI that is compiled with an invokable interface.

AGUID is the globally unique identifier that specifies the desired interface.

See Also

GetInterfaceInfoFromName (see page 4390)

GetInfoForURI (see page 4388)

38.1.7.4.14 GetIntfInvokeOptions Method

This is the overview for the GetIntfInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetIntfInvokeOptions (PTypeInfo) (see page 4391)	Retrieves any flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.GetIntfInvokeOptions (TGUID) (see page 4391)	Retrieves any flags that customize the way calls to a registered interface are made.

38.1.7.4.14.1 TInvokableClassRegistry.GetIntfInvokeOptions Method (PTypeInfo)

Retrieves any flags that customize the way calls to a registered interface are made.

Pascal

```
function GetIntfInvokeOptions(const IntfInfo: PTypeInfo): TIntfInvokeOptions; overload;
function GetIntfInvokeOptions(const AGUID: TGUID): TIntfInvokeOptions; overload;
```

C++

```
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const PTypeInfo IntfInfo);
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const TGUID AGUID);
```

Description

GetIntfInvokeOptions retrieves any invocation options that have been registered for an interface using the RegisterInvokeOptions (see page 4406) method. Invocation options customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled. Remote interfaced objects (THTTPRIO) call this method to determine what options they need to set on the component that is the value of their Converter property.

AGUID identifies the registered interface using its GUID.

IntfInfo (see page 4331) identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or the __delphirtti operator (C++).

GetIntfInvokeOptions returns a set of flags that indicate how to make calls to the specified interface.

See Also

RegisterInvokeOptions (see page 4406)

Converter

Options (see page 6201)

RegisterInterface (see page 4404)

38.1.7.4.15 TInvokableClassRegistry.GetInvokableObjectFromClass Method

Returns an instance of the implementation class for a registered invokable interface.

Pascal

```
function GetInvokableObjectFromClass(AClass: TClass): TObject;
```

C++

```
__fastcall TObject * GetInvokableObjectFromClass(TClass AClass);
```

Description

Typically, applications do not need to call GetInvokableObjectFromClass. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to obtain an instance of the class that implements a registered invokable interface. When the invoker is finished with the object, it calls GetWSDLEncoding (see page 4397) to free the instance.

AClass identifies the class whose instance is desired. It must be registered by a call to RegisterInvokableClass (see page 4405). The invoker obtains this class reference by calling the GetInfoForURI (see page 4388) method.

See Also

GetInfoForURI (see page 4388)

RegisterInvokableClass (see page 4405)

GetWSDLEncoding (see page 4397)

38.1.7.4.16 TInvokableClassRegistry.GetMethExternalName Method

Returns the name of the operation that corresponds to a method on an invokable interface.

Pascal

```
function GetMethExternalName(Info: PTypeInfo; const MethodIntName: string): InvString;
```

C++

```
__fastcall InvString GetMethExternalName(PTypeInfo Info, const UnicodeString MethodIntName);
```

Description

GetMethExternalName returns the name of the operation that corresponds to a specified method. This is the name used to define the operation for that method in a WSDL document. The association between the external name and the method name is established by the RegisterExternalMethName (see page 4400) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodIntName is the name of the method on that invokable interface.

See Also

RegisterExternalMethName (see page 4400)

GetMethInternalName (see page 4392)

38.1.7.4.17 TInvokableClassRegistry.GetMethInternalName Method

Returns the name of the method that corresponds to an operation in a WSDL document.

Pascal

```
function GetMethInternalName(Info: PTypeInfo; const MethodExtName: InvString): string;
```

C++

```
__fastcall UnicodeString GetMethInternalName(PTypeInfo Info, const InvString MethodExtName);
```

Description

GetMethInternalName returns the name of a method on a registered invokable interface that corresponds to a specified operation. The operation name comes from a WSDL document that describes the invokable interface and its methods. The association between the operation name and the method name is established by the RegisterExternalMethName (see page 4400) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodExtName is the name of the operation for which you want the corresponding method name.

See Also

RegisterExternalMethName (see page 4400)

GetMethExternalName (see page 4392)

38.1.7.4.18 TInvokableClassRegistry.GetNamespaceByGUID Method

Returns a namespace that is uniquely associated with a registered interface.

Pascal

```
function GetNamespaceByGUID(const AGUID: TGUID): string;
```

C++

```
__fastcall UnicodeString GetNamespaceByGUID(const TGUID AGUID);
```

Description

GetNamespaceByGUID returns the namespace URI that identifies the specified interface. The namespace is originally associated with the interface when it is registered by a call to the RegisterInterface (see page 4404) method. This namespace can be supplied when the interface is registered, or automatically generated by the RegisterInterface (see page 4404) method.

AGUID is the globally unique identifier that identifies the interface whose namespace is desired..

See Also

GetInfoForURI (see page 4388)

RegisterInterface (see page 4404)

38.1.7.4.19 TInvokableClassRegistry.GetParamExternalName Method

Returns the name of the part that corresponds to a parameter on a method of an invokable interface.

Pascal

```
function GetParamExternalName(Info: PTypeInfo; const MethodName: string; const
InternalParamName: string): InvString;
```

C++

```
__fastcall InvString GetParamExternalName(PTypeInfo Info, const UnicodeString MethodName,
const UnicodeString InternalParamName);
```

Description

GetParamExternalName returns the name of the part that corresponds to a specified method parameter. This is the name used to define the part for that parameter in a WSDL document. The association between the external name and the parameter name is established by the RegisterExternalParamName (see page 4401) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

InternalParamName is the name of the parameter on the method of the invokable interface.

See Also

RegisterExternalParamName (see page 4401)

GetParamInternalName (see page 4393)

38.1.7.4.20 TInvokableClassRegistry.GetParamInternalName Method

Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.

Pascal

```
function GetParamInternalName(Info: PTypeInfo; const MethodName: string; const
ExternalParamName: InvString): string;
```

C++

```
__fastcall UnicodeString GetParamInternalName(PTypeInfo Info, const UnicodeString MethodName,
const InvString ExternalParamName);
```

Description

GetParamInternalName returns the name of the method parameter that corresponds to a specified part. This is the parameter of a method on an invokable interface that is registered to correspond to a part that is defined in a WSDL document. The association between the parameter name and the part name is established by the RegisterExternalParamName (see page 4401) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

ExternalParamName is the name of a part on one of the messages in the operation that corresponds to MethodName. GetParamInternalName returns the corresponding parameter name.

See Also

RegisterExternalParamName (see page 4401)

GetParamExternalName (see page 4393)

38.1.7.4.21 TInvokableClassRegistry.GetRegInterfaceEntry Method

Returns the internal data that TInvokableClassRegistry (see page 4379) maintains for one of its registered interfaces.

Pascal

```
function GetRegInterfaceEntry(Index: Integer): InvRegIntfEntry;
```

C++

```
__fastcall InvRegIntfEntry GetRegInterfaceEntry(int Index);
```

Description

TInvokableClassRegistry (see page 4379) maintains an InvRegIntfEntry (see page 4478) value for every registered invokable interface. GetRegInterfaceEntry provides indexed access to this information.

The InvRegIntfEntry (see page 4478) value for a registered interface is intended for internal use by the invocation registry and the components that use it.

See Also

GetInfoForURI (see page 4388)

GetInterfaceCount (see page 4388)

RegisterDefaultSOAPAction (see page 4399)

38.1.7.4.22 TInvokableClassRegistry.GetRequestHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with requests to an invokable interface.

Pascal

```
function GetRequestHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetRequestHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetRequestHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages that invoke a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

GetRequestHeaderInfoForInterface returns an array of IntfHeaderItem (see page 4477) values, each of which describes a header that was registered for request messages on the invokable interface by a call to the RegisterHeaderClass (see page 4402) method.

See Also

RegisterHeaderClass (see page 4402)

TWSDLHTMLPublish

RegisterInterface (see page 4404)

GetHeaderInfoForInterface (see page 4386)

38.1.7.4.23 TInvokableClassRegistry.GetResponseHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.

Pascal

```
function GetResponseHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetResponseHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetResponseHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in response messages that return the results of executing a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

GetResponseHeaderInfoForInterface returns an array of IntfHeaderItem (see page 4477) values, each of which describes a header that was registered for response messages on the invokable interface by a call to the RegisterHeaderClass (see page 4402) method.

See Also

RegisterHeaderClass (see page 4402)

TWSDLHTMLPublish

RegisterInterface (see page 4404)

GetHeaderInfoForInterface (see page 4386)

38.1.7.4.24 TInvokableClassRegistry.GetReturnParamNames Method

Returns the list of parameter names that map to return values of interface methods.

Pascal

```
function GetReturnParamNames(const IntfInfo: PTypeInfo): string;
```

C++

```
__fastcall UnicodeString GetReturnParamNames(const PTypeInfo IntfInfo);
```

Description

GetReturnParamNames returns the list of parameter names that have been registered as mapping to return values of methods on a specified interface. Any out messages in a port type with these names are identified as the return value of a method on the corresponding interface. If the application does not explicitly register output parameter names by a call to RegisterReturnParamNames (see page 4406), GetReturnParamNames returns the default list, 'Result;Return'.

IntfInfo (see page 4331) is the type information pointer for the invokable interface for which you want the registered parameter names.

GetReturnParamNames returns the list of parameter names as a semicolon delimited list.

See Also

RegisterReturnParamNames (see page 4406)

38.1.7.4.25 GetUDDIInfo Method

This is the overview for the GetUDDIInfo method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetUDDIInfo (PTypeInfo, string, string) (see page 4396)	Retrieves the description of the UDDI location that describes a registered interface.
	TInvokableClassRegistry.GetUDDIInfo (TGUID, string, string) (see page 4396)	Retrieves the description of the UDDI location that describes a registered interface.

38.1.7.4.25.1 TInvokableClassRegistry.GetUDDIInfo Method (PTypeInfo, string, string)

Retrieves the description of the UDDI location that describes a registered interface.

Pascal

```
function GetUDDIInfo(const IntfInfo: PTypeInfo; var Operator: string; var BindingKey: string):
Boolean; overload;
function GetUDDIInfo(const AGUID: TGUID; var Operator: string; var BindingKey: string):
Boolean; overload;
```

C++

```
__fastcall Boolean GetUDDIInfo(const PTypeInfo IntfInfo, UnicodeString Operator, UnicodeString
BindingKey);
__fastcall Boolean GetUDDIInfo(const TGUID AGUID, UnicodeString Operator, UnicodeString
BindingKey);
```

Description

Typically, applications do not need to call GetUDDIInfo. This method is used internally to provide fail-over support when a registered interface was imported using the UDDI browser. It retrieves the information that identifies the UDDI entry for a Web Service, so that the application can re-fetch the target URL for a registered interface. The UDDI information is previously registered by a call to the RegisterUDDIInfo (see page 4407) method.

IntfInfo (see page 4331) is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

AGUID is a GUID that identifies the registered interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

Operator returns the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

GetUDDIInfo returns true if it successfully locates and returns values for the Operator and BindingKey parameters. It returns false if there is no registered UDDI information for the specified interface.

See Also

RegisterUDDIInfo (see page 4407)

RegisterInterface (see page 4404)

38.1.7.4.26 GetWSDLEncoding Method

This is the overview for the GetWSDLEncoding method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo) (see page 4397)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string) (see page 4397)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string, string) (see page 4397)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

38.1.7.4.26.1 TInvokableClassRegistry.GetWSDLEncoding Method (PTypeInfo)

Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

Pascal

```
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string; const InternalIntfName:
string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const UnicodeString Namespace, const
UnicodeString InternalIntfName);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const UnicodeString Namespace);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info);
```

Description

GetWSDLEncoding returns the encoding attribute, if any, that is registered with the interface by a call to the RegisterInterface (see page 4404) method. The encoding attribute is an attribute of the xml header of a WSDL document, and describes the character set that should be used with all the elements that the document defines.

Info points to the type information of the registered interface.

Namespace specifies the namespace that was registered for the interface by the RegisterInterface (see page 4404) method. It can be an empty string.

InternalIntfName is the name of the interface (which may differ from the port type to which it corresponds).

See Also

RegisterInterface (see page 4404)

38.1.7.4.27 TInvokableClassRegistry.HasRegInterfaceImpl Method

Indicates whether there is a registered implementation class for an invokable interface.

Pascal

```
function HasRegInterfaceImpl(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean HasRegInterfaceImpl(int Index);
```

Description

Typically, applications do not need to call HasRegInterfaceImpl. This method is used internally to determine whether an implementation class has been registered for an invokable interface. The RegisterInvokableClass (see page 4405) method registers these implementation classes.

Index identifies the invokable interface for which an implementation class is sought. This index is the same as the index used in the GetRegInterfaceEntry (see page 4394) method, and reflects the order in which interfaces are registered.

HasRegInterfaceImpl returns true if there is a registered implementation class for the specified interface, false otherwise.

GetInterfaceCount (see page 4388)

GetRegInterfaceEntry (see page 4394)

RegisterInterface (see page 4404)

RegisterInvokableClass (see page 4405)

38.1.7.4.28 TInvokableClassRegistry.RegisterAllSOAPActions Method

Supplies a set of SOAP Action headers to use for an already-registered interface.

Pascal

```
procedure RegisterAllSOAPActions(Info: PTypeInfo; const AllSOAPActions: InvString);
```

C++

```
__fastcall RegisterAllSOAPActions(PTypeInfo Info, const InvString AllSOAPActions);
```

Description

RegisterDefaultSOAPAction (see page 4399) associates a registered invokable interface with a set of SOAP Action headers.

A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 4404) method. RegisterAllSOAPActions lets you supply or change the SOAP Action header to a set of headers after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a set of SOAP Action headers.

AllSOAPActions is a string that includes the SOAP headers to use for calls to the interface that Info identifies. The individual header strings are delimited by a character that is given by the first character in the string.

See Also

RegisterInterface (see page 4404)

RegisterDefaultSOAPAction (see page 4399)

38.1.7.4.29 TInvokableClassRegistry.RegisterDefaultSOAPAction Method

Supplies a SOAP Action header to use for an already-registered interface.

Pascal

```
procedure RegisterDefaultSOAPAction(Info: PTypeInfo; const DefSOAPAction: InvString);
```

C++

```
__fastcall RegisterDefaultSOAPAction(PTypeInfo Info, const InvString DefSOAPAction);
```

Description

RegisterDefaultSOAPAction associates a registered invokable interface with a SOAP Action header. A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 4404) method. RegisterDefaultSOAPAction lets you supply or change the SOAP Action header after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a default SOAP Action header.

DefSOAPAction is the SOAP Action header to use for calls to the interface that Info identifies. If this is an empty string, the server automatically generates a SOAP Action header based on the namespace in which the corresponding port type is defined.

See Also

RegisterInterface (see page 4404)

THTTPRIO

RegisterAllSOAPActions (see page 4398)

38.1.7.4.30 TInvokableClassRegistry.RegisterException Method

Registers the remotable exception classes that calls to an invokable interface can raise.

Pascal

```
procedure RegisterException(Info: PTypeInfo; AClass: TClass);
```

C++

```
__fastcall RegisterException(PTypeInfo Info, TClass AClass);
```

Description

Use RegisterException to register a remotable exception class. When an exception class is registered, its definition is exported to WSDL documents so that it can be used to communicate exception information between clients and servers.

Info points to the type information of the invokable interface that can raise the exception. If more than one interface can raise the

exception, you must call this method once for each interface type.

AClass describes the exception class. This must be the class reference for an ERemotableException (see page 4350) descendant.

Note: After a call to RegisterException, the exception class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods raise the exception, you can indicate this by calling the RegisterExceptionMethod (see page 4400) method for each method that can raise the exception.

See Also

RegisterInterface (see page 4404)

ERemotableException (see page 4350)

RegisterExceptionMethod (see page 4400)

Creating Custom Exception Classes for Web Services

38.1.7.4.31 TInvokableClassRegistry.RegisterExceptionMethod Method

Registers methods of an invokable interface that can raise a registered exception class.

Pascal

```
procedure RegisterExceptionMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string);
```

C++

```
__fastcall RegisterExceptionMethod(PTypeInfo Info, TClass AClass, const UnicodeString
MethodName);
```

Description

Call RegisterExceptionMethod for each method of an invokable interface that can raise a registered exception class. The exception class must be previously registered by a call to the RegisterException (see page 4399) method. If you do not call RegisterExceptionMethod, then the WSDL document for the interface treats the exception as associated with all methods of the interface. If you want to limit the use of the exception to a subset of the methods, call RegisterExceptionMethod for each method that can raise the exception. After the first method is registered this way, the exception becomes limited to that method alone (and to any method subsequently registered by another call to RegisterExceptionMethod).

Info points to the type information of the invokable interface that can raise the exception.

AClass describes the exception class. This must be the class reference used to register the exception previously by a call to the RegisterException (see page 4399) method.

MethodName is the name of a method that can raise the exception.

See Also

RegisterInterface (see page 4404)

ERemotableException (see page 4350)

RegisterException (see page 4399)

38.1.7.4.32 TInvokableClassRegistry.RegisterExternalMethName Method

Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.

Pascal

```
procedure RegisterExternalMethName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalMethName(PTypeInfo Info, const UnicodeString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalMethName to create an association between the name of an operation in a WSDL document and the corresponding method of the invokable interface that corresponds to that operation's port type. This allows the invokable interface to represent a port type that includes operations with names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

InternalName is the name used for the method of the invokable interface that corresponds to the operation.

ExternalName is the name of the operation that is defined in the WSDL document.

See Also

RegisterExternalParamName (see page 4401)

RegisterInterface (see page 4404)

38.1.7.4.33 TInvokableClassRegistry.RegisterExternalParamName Method

Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.

Pascal

```
procedure RegisterExternalParamName(Info: PTypeInfo; const MethodName: string; const
InternalName: string; const ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalParamName(PTypeInfo Info, const UnicodeString MethodName, const
UnicodeString InternalName, const InvString ExternalName);
```

Description

Use RegisterExternalParamName to create an association between the name of a part in a WSDL document and the corresponding parameter on a method of an invokable interface. This allows the invokable interface to handle definitions that have names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

MethodName is the name of the method on the invokable interface.

InternalName is the name used for the parameter of the specified method that corresponds to the part with the name specified by ExternalName.

ExternalName is the name of the part that is defined in the WSDL document.

See Also

RegisterExternalMethName (see page 4400)

RegisterInterface (see page 4404)

38.1.7.4.34 RegisterHeaderClass Method

This is the overview for the RegisterHeaderClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, eHeaderMethodType, Boolean) (see page 4402)	Registers a class that represents a headers which accompanies calls to an invokable interface.
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, InvString, InvString, eHeaderMethodType, Boolean) (see page 4402)	Registers a class that represents a headers which accompanies calls to an invokable interface.

38.1.7.4.34.1 TInvokableClassRegistry.RegisterHeaderClass Method (PTypeInfo, TClass, InvString, InvString, eHeaderMethodType, Boolean)

Registers a class that represents a headers which accompanies calls to an invokable interface.

Pascal

```
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; const HeaderName: InvString;
const HeaderNamespace: InvString; DefaultMethodType: eHeaderMethodType = hmtAll; Required:
Boolean = False); overload;
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; DefaultMethodType:
eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, const InvString HeaderName,
const InvString HeaderNamespace, eHeaderMethodType DefaultMethodType = hmtAll, Boolean
Required = False);
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, eHeaderMethodType
DefaultMethodType = hmtAll, Boolean Required = False);
```

Description

Use RegisterHeaderClass to register a TSOAPHeader (see page 4448) descendant. Registering a TSOAPHeader (see page 4448) descendant serves two purposes:

On servers, when a TSOAPHeader (see page 4448) descendant is registered, its definition is exported to WSDL documents so that applications using that WSDL document can recognize and process the header.

On both servers and clients, registering associates the TSOAPHeader (see page 4448) descendant with a header name and the namespace in which that name is defined.

Info points to the type information of the invokable interface that the header should accompany. If the header should be included in messages invoking more than one interface or in the responses to more than one interface, you must call this method once for each interface type.

AClass describes the TSOAPHeader (see page 4448) descendant that represents the header.

HeaderName is the name of the header, as defined within the header's namespace. If HeaderName is not supplied, the header's name is assumed to be the same as the type name under which it is registered in the remotable type registry.

HeaderNamespace is the URI for the namespace in which the header's name is defined. If HeaderName and HeaderNamespace are not supplied, the header is assumed to be defined in the same namespace as the interface with which it is associated.

DefaultMethodType indicates whether the header is to be used on request messages, response messages, or both. This default

value is associated with the interface as a whole. It can be changed for individual methods of the interface by subsequent calls to the RegisterHeaderMethod (see page 4403) method.

Required indicates whether the header must be included in messages about the interface. When Required is true, the header must be included and understood by the recipient of the message. When Required is false, the header is optional. Note that if the header is required by some but not all messages, you must set this Required parameter to false, and then add the requirement to individual methods by subsequent calls to the RegisterHeaderMethod (see page 4403) method.

Note: After a call to RegisterHeaderClass, the header class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods use the header, or if the header should have a different method type for some of the methods on the interface, or if the header is required by a subset of the methods on the interface, you can indicate this by calling the RegisterHeaderMethod (see page 4403) method for each method that the header accompanies.

See Also

RegisterInterface (see page 4404)

TSOAPHeader (see page 4448)

RegisterHeaderMethod (see page 4403)

38.1.7.4.35 TInvokableClassRegistry.RegisterHeaderMethod Method

Registers methods of an invokable interface that make use of a registered header.

Pascal

```
procedure RegisterHeaderMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string;
MethodType: eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderMethod(PTypeInfo Info, TClass AClass, const UnicodeString MethodName,
eHeaderMethodType MethodType = hmtAll, Boolean Required = False);
```

Description

Call RegisterHeaderMethod for each method of an invokable interface that uses a registered header type. The header class must be previously registered by a call to the RegisterHeaderClass (see page 4402) method. If you do not call RegisterHeaderMethod, then the WSDL document for the interface treats the header as associated with all methods of the interface. Use RegisterHeaderMethod if you want to

Limit the use of the header to a subset of the methods.

Specify whether the header is used for request messages, response messages, or both in a way that varies from method to method.

Indicate that the header is required for some methods but not others.

Call RegisterHeaderMethod for each method that uses the header. After the first method is registered this way, the header becomes limited to that method alone (and to any method subsequently registered by another call to RegisterHeaderMethod).

Info points to the type information of the invokable interface that the header should accompany.

AClass describes the TSOAPHeader (see page 4448) descendant that represents the header. This class must be previously registered by a call to RegisterHeaderClass (see page 4402).

MethodName is the name of a method that uses the header.

MethodType indicates whether the header is to be used on request messages, response messages, or both.

Required indicates whether the header must be included in messages about the specified method. When Required is true, the

header must be included and understood by the recipient of the message. When Required is false, the header is optional.

See Also

RegisterInterface (see page 4404)

TSOAPHeader (see page 4448)

RegisterHeaderClass (see page 4402)

38.1.7.4.36 TInvokableClassRegistry.RegisterInterface Method

Registers an invokable interface.

Pascal

```
procedure RegisterInterface(Info: PTypeInfo; const Namespace: InvString = ''; const
WSDLEncoding: InvString = ''; const Doc: string = ''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterInterface(PTypeInfo Info, const InvString Namespace = '', const InvString
WSDLEncoding = '', const UnicodeString Doc = '', const InvString ExtName = '');
```

Description

Call RegisterInterface to register an invokable interface with the invocation registry. Typically, the call to RegisterInterface is added by the WSDL importer or Web Service wizard. In Delphi, this call goes in the initialization section of the unit that defines the invokable interface. In C++, it is called within a RegTypes method that uses the pragma startup directive.

Once the invokable interface is registered, client applications can statically bind to it using THTTPRio. On the server side, you must also register the implementation class (using the RegisterInvokableClass (see page 4405) method) before the server can respond to incoming SOAP requests.

PInfo is a pointer to the type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function (Delphi) or __delphirtti (C++).

Namespace specifies a namespace URI that uniquely identifies the interface. If Namespace is set to an empty string, RegisterInterface automatically generates a unique string to use as a namespace URI. Note that RegisterInterface generates a SOAP Action header to use based on the Namespace of the interface. You can change this SOAP Action header using the RegisterDefaultSoapAction method.

WSDLEncoding specifies a encoding attribute that appears on the xml header of any WSDL document that includes the definition of this interface (or rather, the port type to which it corresponds). The encoding attribute describes the character set to use in the WSDL document.

Doc is a descriptive string that describes the purpose or use of the interface. It is used if the application publishes a WSDL document that defines this interface.

ExtName is the name of the port type that corresponds to this interface in a WSDL document. This can be an empty string if the port type and interface have the same name. It is useful when a port type in a WSDL document has a name that is not a valid Object Pascal identifier (for example, a keyword).

DefSOAPAction is the SOAP Action header that should be used for messages that represent calls to the methods on this interface. If you do not supply a default SOAP Action header, your application uses an automatically-generated header that is based on the namespace of the interface.

RegisterDefaultSOAPAction (see page 4399)

38.1.7.4.37 RegisterInvokableClass Method

This is the overview for the RegisterInvokableClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokableClass (TClass) (see page 4405)	Registers the implementation class for an invokable interface.
	TInvokableClassRegistry.RegisterInvokableClass (TClass, TCreateInstanceProc) (see page 4405)	Registers the implementation class for an invokable interface.

38.1.7.4.37.1 TInvokableClassRegistry.RegisterInvokableClass Method (TClass)

Registers the implementation class for an invokable interface.

Pascal

```
procedure RegisterInvokableClass(AClass: TClass; CreateProc: TCreateInstanceProc); overload;
procedure RegisterInvokableClass(AClass: TClass); overload;
```

C++

```
__fastcall RegisterInvokableClass(TClass AClass, TCreateInstanceProc CreateProc);
__fastcall RegisterInvokableClass(TClass AClass);
```

Description

RegisterInvokableClass registers the class that implements an already-registered invokable interface. It is only needed on server applications that implement Web Services. The interface itself is registered by the RegisterInterface (see page 4404) method.

The invocation registry must be able to instantiate the implementation class. If the class has a virtual constructor that takes no arguments, you do not need to supply a method to create the class instance. If the constructor takes any arguments, of if it is not virtual, you must supply a method to instantiate the class as the value of the CreateProc argument.

AClass is a class reference to the class being registered. In Delphi code, you need only supply the class name. In C++, you can obtain a class reference for a class using the __classid operator.

CreateProc is a procedure that returns an instance of AClass. If CreateProc is nil (Delphi) or NULL (C++), then AClass must be a descendant of TInvokableClass (see page 4373).

See Also

RegisterInterface (see page 4404)

UnRegisterInvokableClass (see page 4408)

TInvokableClass (see page 4373)

38.1.7.4.38 RegisterInvokeOptions Method

This is the overview for the RegisterInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOption) (see page 4406)	Registers flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOptions) (see page 4406)	Registers flags that customize the way calls to a registered interface are made.

38.1.7.4.38.1 TInvokableClassRegistry.RegisterInvokeOptions Method (PTypeInfo, TIntfInvokeOption)

Registers flags that customize the way calls to a registered interface are made.

Pascal

```
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOption: TIntfInvokeOption);
overload;
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOptions: TIntfInvokeOptions);
overload;
```

C++

```
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOption InvokeOption);
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOptions InvokeOptions);
```

Description

RegisterInvokeOptions associates the specified invocation flag or flags with a registered interface. The interface must be previously registered by a call to the RegisterInterface (see page 4404) method. Invocation flags customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled.

Info identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or __delphirtti (C++).

InvokeOption specifies a single invocation option to associate with the interface.

InvokeOptions specifies a set of invocation options to associate with the interface.

Note: RegisterInvokeOptions adds the specified option or options to the set of invocation flags already registered for the interface. It does not remove any previously registered options.

See Also

GetIntfInvokeOptions (see page 4391)

Converter

Options (see page 6201)

RegisterInterface (see page 4404)

38.1.7.4.39 TInvokableClassRegistry.RegisterReturnParamNames Method

Registers a list of parameter names that map to return values of interface methods.

Pascal

```
procedure RegisterReturnParamNames(Info: PTypeInfo; const RetParamNames: string);
```

C++

```
__fastcall RegisterReturnParamNames(PTypeInfo Info, const UnicodeString RetParamNames);
```

Description

RegisterReturnParamNames registers a list of parameter names that correspond to the return value of methods on a specified interface. Typically, this method is called by the WSDL importer. It is important that these names correspond exactly to those that the WSDL importer uses if the interface was imported from a WSDL document.

Info is the type information pointer for the invokable interface whose method return values map to the names in the list.

RetParamNames is a semicolon delimited list of parameter names that map to return values of methods on the specified interface. If RetParamNames is an empty string, the methods of the interface never have a return value (only output parameters). If no return parameter names are registered for an interface, the default list, 'Result;Return', is used.

See Also

GetReturnParamNames (see page 4396)

38.1.7.4.40 TInvokableClassRegistry.RegisterUDDIInfo Method

Registers the location of the UDDI description that can be used to import the location of a Web Service.

Pascal

```
procedure RegisterUDDIInfo(Info: PTypeInfo; const Operator: String; const BindingKey: string);
```

C++

```
__fastcall RegisterUDDIInfo(PTypeInfo Info, const UnicodeString Operator, const UnicodeString
BindingKey);
```

Description

Typically, applications do not need to call RegisterUDDIInfo. This method is called internally when a registered interface is imported using the UDDI browser. It associates the location of the imported UDDI entry with a registered interface so that the application can later provide fail-over support by re-fetching the location of the Web Service.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 4404) method.

Operator is the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

See Also

GetUDDIInfo (see page 4396)

RegisterInterface (see page 4404)

38.1.7.4.41 TInvokableClassRegistry.UnRegisterInterface Method

Unregisters an invokable interface.

Pascal

```
procedure UnRegisterInterface(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterInterface(PTypeInfo Info);
```

Description

Call UnRegisterInterface to unregister an invokable interface from the invocation registry. In Delphi, this call goes in the finalization section of the unit that defines the invokable interface. In C++, it is called from a method that uses the pragma exit directive.

Once an invokable interface is unregistered, client applications can no longer call it and server applications can't respond to calls directed at the interface methods.

Info is a pointer to the runtime type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function in Delphi or __delphirtti in C++.

See Also

UnRegisterInvokableClass (see page 4408)

IInvokable

RegisterInterface (see page 4404)

38.1.7.4.42 TInvokableClassRegistry.UnRegisterInvokableClass Method

Unregisters the implementation class for an invokable interface.

Pascal

```
procedure UnRegisterInvokableClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterInvokableClass(TClass AClass);
```

Description

UnRegisterInvokableClass unregisters an implementation class that was previously registered by a call to RegisterInvokableClass (see page 4405). Once a class is unregistered, the invocation registry can no longer create and use instances of the specified class to handle incoming method calls to its corresponding invokable interface.

AClass is a class reference to the class being unregistered.

See Also

UnRegisterInterface (see page 4407)

RegisterInvokableClass (see page 4405)

38.1.8 TRemotable Class

TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.

Class Hierarchy

Pascal

```
TRemotable = class;
```

C++

```
class TRemotable;
```

File

InvokeRegistry

Description

Use TRemotable as a base class when defining a class that can be used for parameters or return values on an invokable interface. TRemotable descendants can represent non-scalar types, or scalar types that do not correspond to Object Pascal types. TRemotable is compiled with runtime type information (RTTI) and has a virtual constructor that the remotable class registry recognizes and uses to supply class instances.

Note: To create a class that represents scalar values that do not correspond directly to an Object Pascal type, use TRemotableXS (see page 4432) as a base class instead. TRemotableXS (see page 4432) is a descendant of the TRemotable class.

Note: When writing a TRemotable descendant, you can control whether a property is encoded as an element node or as an attribute node by using the stored directive. Properties declared with a stored directive set to AS_ATTRIBUTE (see page 4497) are encoded as attribute nodes. Properties that are declared without a stored directive, or with a stored directive set to anything other than AS_ATTRIBUTE (see page 4497) are encoded as element nodes.

Both the client application and server application must register a TRemotable descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 4472) function returns.

On server applications, instances of TRemotable descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotable descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotable instances that it passes as input parameters, and for freeing any TRemotable instances it creates or that are returned as output parameters or method results.

TRemotableTypeRegistry (see page 4414)

IInvokable

Using Remotable Objects

38.1.8.1 TRemotable Members

The following tables list the members exposed by TRemotable.

Protected Fields

	Name	Description
	FSerializationOptions (see page 4411)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 4410)	Creates and initializes a TRemotable (see page 4408) object.

	Destroy (see page 4410)	Frees the memory associated with the TRemotable (see page 4408) object.
	ObjectToSOAP (see page 4411)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 4412)	Initializes this TRemotable (see page 4408) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	DataContext (see page 4413)	Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.
	SerializationOptions (see page 4413)	Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.

38.1.8.2 TRemotable.Create Constructor

Creates and initializes a TRemotable (see page 4408) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TRemotable();
```

Description

The TRemotable (see page 4408) constructor does nothing special. It exists primarily because

The remotable type registry knows how to call it.

It is virtual, so that the remotable type registry can also instantiate descendant classes.

See Also

RemTypeRegistry (see page 4472)

38.1.8.3 TRemotable.Destroy Destructor

Frees the memory associated with the TRemotable (see page 4408) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotable();
```

Description

Use the Free method to free a TRemotable (see page 4408) instance. Free checks that the object is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TRemotable (see page 4408) instance (for example, one created as a return value or output parameter). By default, when a TRemotable (see page 4408) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 4413) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TRemotable (see page 4408) instances that are passed in as a parameter belong to the data context.

On client applications, TRemotable (see page 4408) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

System::TObject::Free

DataContext (see page 4413)

38.1.8.4 TRemotable Fields

The fields of the TRemotable class are listed here.

Protected Fields

	Name	Description
	FSerializationOptions (see page 4411)	This is FSerializationOptions, a member of class TRemotable.

38.1.8.4.1 TRemotable.FSerializationOptions Field

Pascal

```
FSerializationOptions: TSerializationOptions;
```

C++

```
TSerializationOptions FSerializationOptions;
```

Description

This is FSerializationOptions, a member of class TRemotable.

38.1.8.5 TRemotable Methods

The methods of the TRemotable class are listed here.

Public Methods

	Name	Description
	ObjectToSOAP (see page 4411)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 4412)	Initializes this TRemotable (see page 4408) instance to represent the value of its SOAP representation.

38.1.8.5.1 TRemotable.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotable (see page 4408) descendant to its SOAP representation. In TRemotable (see page 4408), ObjectToSOAP simply calls the ObjInstanceToSOAP method of the converter that is supplied by the ObjConverter parameter.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 4463)

SOAPToObject (see page 4412)

38.1.8.5.2 TRemotable.SOAPToObject Method

Initializes this TRemotable (see page 4408) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); virtual;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific remotable type from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotable (see page 4408), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 4411)

InitObjectFromSOAP (see page 4463)

38.1.8.6 TRemotable Properties

The properties of the TRemotable class are listed here.

Public Properties

	Name	Description
	DataContext (see page 4413)	Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.
R	SerializationOptions (see page 4413)	Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.

38.1.8.6.1 TRemotable.DataContext Property

Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.

Pascal

```
property DataContext: TDataContext;
```

C++

```
__property TDataContext DataContext;
```

Description

By default, when a Web Service application creates an instance of a remotable object, that object exists only for the time it takes to marshal the information it represents or to unmarshal that information into the TRemotable (see page 4408) instance and then make a method call that uses the instance. The object specified by DataContext handles the freeing of the TRemotable (see page 4408) instance.

There are times when a server may not want the TRemotable (see page 4408) instance to be so transient. For example, if the object contains state information, it may be more efficient to have a single instance that is used for every message call. If you change DataContext, the TRemotable (see page 4408) instance is removed from the data context, and is not freed when the data context goes away at the end of the method call.

Note: If DataContext is nil (Delphi) or NULL (C++), the application is responsible for freeing the TRemotable (see page 4408) instance. For example, TRemotable (see page 4408) objects created on client applications are created with a nil (Delphi) or NULL (C++) value for DataContext and must be freed by the client application.

See Also

Using Remotable Objects

38.1.8.6.2 TRemotable.SerializationOptions Property

Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.

Pascal

```
property SerializationOptions: TSerializationOptions;
```

C++

```
__property TSerializationOptions SerializationOptions;
```

Description

SerializationOptions is used internally when an instance of TRemotable (see page 4408) is converted to or from its SOAP encoding. The value of this property is a set of flags that configure the mapping between the published properties of the TRemotable (see page 4408) descendant and the corresponding SOAP encoding.

Typically, the value of this read-only property is set by the constructor of a TRemotable (see page 4408) descendant or by the WSDL importer when it registers a remotable class.

See Also

SerializeOptions (see page 4427)

RegisterSerializeOptions (see page 4424)

38.1.9 TRemotableTypeRegistry Class

TRemotableTypeRegistry is the type of the remotable type registry.

Class Hierarchy

Pascal

```
TRemotableTypeRegistry = class;
```

C++

```
class TRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TRemotableTypeRegistry manages information about remotable classes and types that can be communicated between client applications and a Web Service provider. Remotable classes can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when the Web Service application is trying to execute a request. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances. Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types with the remotable type registry before they can use them. Use the RegisterXSClass (see page 4425) method to register a remotable class. Use the RegiterXSInfo method to register a dynamic array type or enumerated type.

Do not create instances of TRemotableTypeRegistry. Instead, use the global RemTypeRegistry (see page 4472) function to access the remotable type registry. Most applications need only call the RegisterXSClass (see page 4425) or RegisterXSInfo (see page 4426) methods. The other TRemotableTypeRegistry methods are used internally to create or look up information about remotable classes and types.

TInvokableClassRegistry (see page 4379)

38.1.9.1 TRemotableTypeRegistry Members

The following tables list the members exposed by TRemotableTypeRegistry.

Protected Methods

	Name	Description
	Lock (see page 4422)	Prevents other threads from accessing the type registry.
	UnLock (see page 4428)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 4417)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 4418)	This is the overview for the ClassToURI method overload.
	Create (see page 4415)	Creates and initializes a TRemotableTypeRegistry (see page 4414) object.
	Destroy (see page 4416)	Frees the memory associated with the TRemotableTypeRegistry (see page 4414) object.
	GetExternalPropName (see page 4418)	Returns the name of the XML element that corresponds to a property of a registered remotable class.
	GetInternalPropName (see page 4419)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 4419)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 4420)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 4421)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 4421)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 4421)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 4422)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 4423)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 4423)	Registers a remotable type whose type information must be extracted from a holder class.
	RegisterSerializeOptions (see page 4424)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 4425)	Registers a remotable class.
	RegisterXSInfo (see page 4426)	Registers a remotable type.
	SerializeOptions (see page 4426)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 4427)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 4428)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 4429)	Unregisters a remotable type.
	URIToClass (see page 4429)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 4430)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 4430)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 4431)	Returns the type information pointer associated with a specified type name.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 4431)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

38.1.9.2 TRemotableTypeRegistry.Create Constructor

Creates and initializes a TRemotableTypeRegistry (see page 4414) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TRemotableTypeRegistry();
```

Description

Do not create your own instances of TRemotableTypeRegistry (see page 4414). Instead, use the global RemTypeRegistry (see page 4472) function, which provides access to a single global instance of TRemotableTypeRegistry (see page 4414).

See Also

RemTypeRegistry (see page 4472)

38.1.9.3 TRemotableTypeRegistry.Destroy Destructor

Frees the memory associated with the TRemotableTypeRegistry (see page 4414) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotableTypeRegistry();
```

Description

Do not destroy the global TRemotableTypeRegistry (see page 4414) instance that is available through the RemClassRegistry (see page 4471) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 4347) unit.

See Also

RemClassRegistry (see page 4471)

38.1.9.4 TRemotableTypeRegistry Methods

The methods of the TRemotableTypeRegistry class are listed here.

Protected Methods

	Name	Description
	Lock (see page 4422)	Prevents other threads from accessing the type registry.
	UnLock (see page 4428)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 4417)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 4418)	This is the overview for the ClassToURI method overload.
	GetExternalPropName (see page 4418)	Returns the name of the XML element that corresponds to a property of a registered remotable class.
	GetInternalPropName (see page 4419)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 4419)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 4420)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 4421)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 4421)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 4421)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 4422)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 4423)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 4423)	Registers a remotable type whose type information must be extracted from a holder class.

	RegisterSerializeOptions (see page 4424)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 4425)	Registers a remotable class.
	RegisterXSInfo (see page 4426)	Registers a remotable type.
	SerializeOptions (see page 4426)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 4427)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 4428)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 4429)	Unregisters a remotable type.
	URIToClass (see page 4429)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 4430)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 4430)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 4431)	Returns the type information pointer associated with a specified type name.

38.1.9.4.1 TRemotableTypeRegistry.ClassOptions Method

Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.

Pascal

```
function ClassOptions(AClass: TClass): TObjMultiOptions;
```

C++

```
__fastcall TObjMultiOptions ClassOptions(TClass AClass);
```

Description

When an application converts a remotable class to its SOAP representation, it can convert multiple references to the same object in one of two ways. It can treat the object as if its properties have meaning, but not the reference itself. (That is, two references to the same object are equivalent values, but not the same thing.) Alternately, if the object reference itself has meaning, it can encode the fact that these are multiple references to the same entity in the SOAP packet.

Individual remotable classes can specify how they want this conversion to be handled, overriding any defaults that would otherwise be used. For example, THTTPRIO, THTTPSoapPascalInvoker, and THTTPSoapCppInvoker use TOPToSoapDomConvert to convert between remotable classes and their SOAP representation. TOPToSoapDomConvert has an Options property that specifies, among other things, whether to encode multiple references to the same object by value or as references. Individual remotable classes can supply an override to this default strategy when they are registered using the RegisterXSClass (see page 4425) method.

ClassOptions returns how to handle multiple references of a specified class.

AClass is a class reference for the registered class that you want to know how to convert.

See Also

RegisterXSClass (see page 4425)

Options (see page 6201)

IOPConvert (see page 6152)

THTTPSoapCppInvoker

THTTPSoapPascalInvoker

THTTPRIO

TOPToSoapDomConvert (see page 6167)

38.1.9.4.2 ClassToURI Method

This is the overview for the ClassToURI method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.ClassToURI (TClass, InvString, InvString) (see page 4418)	Returns the namespace URI associated with a specified remotable class.
	TRemotableTypeRegistry.ClassToURI (TClass, InvString, InvString, Boolean, Boolean) (see page 4418)	Returns the namespace URI associated with a specified remotable class.

38.1.9.4.2.1 TRemotableTypeRegistry.ClassToURI Method (TClass, InvString, InvString)

Returns the namespace URI associated with a specified remotable class.

Pascal

```
function ClassToURI(AClass: TClass; var URI: InvString; var Name: InvString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean; overload;
function ClassToURI(AClass: TClass; var URI: InvString; var Name: InvString): Boolean;
overload;
```

C++

```
__fastcall Boolean ClassToURI(TClass AClass, InvString URI, InvString Name, Boolean IsScalar,
Boolean tryToRegister = True);
__fastcall Boolean ClassToURI(TClass AClass, InvString URI, InvString Name);
```

Description

ClassToURI looks up a registered remotable class and retrieves its namespace URI and typename. The association of the class and its namespace URI and typename is established when you call RegisterXSClass (see page 4425) to register the remotable class.

AClass is a class reference for the remotable class you want to look up.

URI returns the namespace URI that is associated with the class.

Name returns the registered name of the type the class represents.

IsScalar indicates whether the class corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the class that AClass specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 4431) property is true.

See Also

RegisterXSClass (see page 4425)

URIToClass (see page 4429)

AutoRegisterNativeTypes (see page 4431)

38.1.9.4.3 TRemotableTypeRegistry.GetExternalPropName Method

Returns the name of the XML element that corresponds to a property of a registered remotable class.

Pascal

```
function GetExternalPropName(Info: PTypeInfo; InternalName: string): InvString;
```

C++

```
__fastcall InvString GetExternalPropName(PTypeInfo Info, UnicodeString InternalName);
```

Description

Use GetExternalPropName to obtain the name of the XML element that was registered as the XML schema analog of a property on a registered remotable class. The association between the element and the property must be previously registered by the RegisterExternalPropname method.

Info points to the type information of the remotable class that has the property.

InternalName is the name of the property from which you want to obtain the corresponding XML element name.

See Also

GetInternalPropName (see page 4419)

RegisterExternalPropName (see page 4423)

38.1.9.4.4 TRemotableTypeRegistry.GetInternalPropName Method

Returns the name of the property on a remotable class that corresponds to a specified XML element.

Pascal

```
function GetInternalPropName(Info: PTypeInfo; ExternalName: InvString): string;
```

C++

```
__fastcall UnicodeString GetInternalPropName(PTypeInfo Info, InvString ExternalName);
```

Description

Use GetInternalPropName to obtain the name of the property on a registered remotable class that corresponds to a specified XML element. The association between the element and the property must be previously registered by the RegisterExternalPropname method.

Info points to the type information of the remotable class that has the property.

ExternalName is the name of an XML element that is part of a complex type defined in an XML schema. The remotable class identified by Info must represent the complex type that includes ExternalName.

See Also

GetExternalPropName (see page 4418)

RegisterExternalPropName (see page 4423)

38.1.9.4.5 TRemotableTypeRegistry.GetURICount Method

Returns the number of entries in the remotable type registry.

Pascal

```
function GetURICount: Integer;
```

C++

```
__fastcall int GetURICount();
```

Description

GetURICount returns the number of entries in the remotable type registry. This value can be used as an upper bound for the index parameter of the GetURIMap (see page 4420) method.

Each entry in the remotable type registry represents a registered class or a registered type. The RegisterXSClass (see page 4425) method adds entries for classes, and the The RegisterXSInfo (see page 4426) method adds entries for types. Each entry associates the class or type with a unique namespace URI.

See Also

GetURIMap (see page 4420)

RegisterXSClass (see page 4425)

RegisterXSInfo (see page 4426)

38.1.9.4.6 GetURIMap Method

This is the overview for the GetURIMap method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.GetURIMap (Integer) (see page 4420)	Returns an entry from the remotable type registry.
	TRemotableTypeRegistry.GetURIMap (Integer, TRemRegEntry) (see page 4420)	Returns an entry from the remotable type registry.

38.1.9.4.6.1 TRemotableTypeRegistry.GetURIMap Method (Integer)

Returns an entry from the remotable type registry.

Pascal

```
function GetURIMap(Index: Integer): TRemRegEntry; overload;
function GetURIMap(Index: Integer; out RegEntry: TRemRegEntry): boolean; overload;
```

C++

```
__fastcall TRemRegEntry GetURIMap(int Index);
__fastcall boolean GetURIMap(int Index, TRemRegEntry RegEntry);
```

Description

GetURIMap returns an entry from the remotable type registry that is identified by its index. It is useful for operations that iterate over all the registered entries. Use the GetURICount (see page 4419) method to obtain an upper bound for the index.

Index is the index of the entry you want to see.

Using the first syntax, GetURIMap returns a TRemRegEntry (see page 4485) value that describes a registered class or type.

Using the second syntax, the RegEntry parameter returns the TRemRegEntry (see page 4485) at the specified index. Using this syntax, GetURIMap returns true if Index is a valid index, false if Index is out of range.

The TRemRegEntry (see page 4485) value that this method returns is used to represent both remotable classes, which are added using the RegisterXSClass (see page 4425) method, and remotable types, which are added using the RegisterXSInfo (see page 4426) method.

See Also

GetURICount (see page 4419)

RegisterXSClass (see page 4425)

38.1.9.4.7 TRemotableTypeRegistry.GetVarTypeFromXSD Method

Returns the variant type that corresponds to a registered remotable type.

Pascal

```
function GetVarTypeFromXSD(const URI: InvString; const TypeName: InvString): TVarType;
```

C++

```
__fastcall TVarType GetVarTypeFromXSD(const InvString URI, const InvString TypeName);
```

Description

GetVarTypeFromXSD returns the built-in Variant type that corresponds most naturally to a remotable type that was registered by a call to the RegisterXSInfo (see page 4426) method.

URI is the namespace URI associated with the type when it was registered.

TypeName is the type name associated with the type when it was registered.

See Also

VariantToInfo (see page 4430)

XSDToTypeInfo (see page 4431)

URIToInfo (see page 4430)

RegisterXSInfo (see page 4426)

38.1.9.4.8 TRemotableTypeRegistry.GetXSDInfoForClass Method

Returns type name and namespace URI that correspond to a remotable class.

Pascal

```
procedure GetXSDInfoForClass(Info: PTypeInfo; var URI: InvString; var TypeName: InvString);
```

C++

```
__fastcall GetXSDInfoForClass(PTypeInfo Info, InvString URI, InvString TypeName);
```

Description

GetXSDInfoForClass returns the type name under which a remotable class is registered, along with the namespace URI in which that type name is defined. The class must be previously registered by a call to the RegisterXSClass (see page 4425) method.

Info is the type info pointer for the registered remotable class.

URI returns the namespace URI that was associated with the class when it was registered.

TypeName returns the type name that was associated with the class when it was registered.

See Also

RegisterXSClass (see page 4425)

XSDToTypeInfo (see page 4431)

38.1.9.4.9 TRemotableTypeRegistry.InfoToURI Method

Returns the namespace URI and type name for a registered type.

Pascal

```
function InfoToURI(Info: PTypeInfo; var URI: InvString; var Name: InvString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean InfoToURI(PTypeInfo Info, InvString URI, InvString Name, Boolean IsScalar,
Boolean tryToRegister = True);
```

Description

InfoToURI returns the namespace URI and type name that is associated with the specified type description. This association is established when you register a type by calling the RegisterXSInfo (see page 4426) method.

Info is a pointer to the runtime type information (RTTI) for the registered type.

URI returns the namespace URI that is associated with the type.

Name returns the registered name of the type.

IsScalar indicates whether the type corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the type that Info specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 4431) property is true.

See Also

RegisterXSInfo (see page 4426)

AutoRegisterNativeTypes (see page 4431)

38.1.9.4.10 TRemotableTypeRegistry.IsClassScalar Method

Indicates whether a registered class represents a scalar type.

Pascal

```
function IsClassScalar(AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean IsClassScalar(TClass AClass);
```

Description

IsClassScalar returns true if the specified class represents a scalar type. Classes that represent scalar types descend from the TRemotableXS (see page 4432) class, and can convert their value to or from a string.

AClass identifes the class to check. It must be previously registered by a call to RegisterXSClass (see page 4425).

See Also

RegisterXSClass (see page 4425)

TRemotableXS (see page 4432)

38.1.9.4.11 TRemotableTypeRegistry.Lock Method

Prevents other threads from accessing the type registry.

Pascal

```
procedure Lock; virtual;
```

C++

```
virtual __fastcall Lock();
```

Description

Lock uses a critical section to prevent simultaneous use of the type registry by multiple threads in the same application. Once one thread has called Lock to obtain access to the type registry, no other thread can return from the Lock method until the first thread has called the UnLock (see page 4428) method to release its lock.

Lock is called automatically by the methods of TRemotableTypeRegistry (see page 4414).

See Also

UnLock (see page 4428)

38.1.9.4.12 TRemotableTypeRegistry.RegisterExternalPropName Method

Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.

Pascal

```
procedure RegisterExternalPropName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalPropName(PTypeInfo Info, const UnicodeString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalPropName to create an association between the name of an element in an XML schema complex type and the corresponding property of the remotable class that represents that type. This allows the remotable class to represent complex types that include elements with names that are not valid (for example, keywords).

Info points to the type information of the remotable class that corresponds to a complex type defined in an XML schema.

InternalName is the name used for the property of the remotable class that corresponds to the element.

ExternalName is the name of the element that is part of the complex type that the XML schema defines.

38.1.9.4.13 TRemotableTypeRegistry.RegisterHolderClsMember Method

Registers a remotable type whose type information must be extracted from a holder class.

Pascal

```
procedure RegisterHolderClsMember(ClsTypeInfo: PTypeInfo; const URI: InvString = ''; const
Name: InvString = ''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterHolderClsMember(PTypeInfo ClsTypeInfo, const InvString URI = '', const
InvString Name = '', const InvString ExtName = '');
```

Description

Use RegisterHolderClsMember to register a type that is used as the type of the only published property of a holder class. This method is used primarily for C++ applications, which can contain types that require a holder class so that the compiler can extract their runtime type information (RTTI). If the holder class contains more than one published property, use the RegisterXSInfo (see page 4426) method after extracting the type information from the property using the global GetClsMemberTypeInfo (see page 4334) function.

Info points to the type information of the holder class that has a single published member whose type you want to register.

URI is the namespace URI to associate with the type that is registered. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo (see page 4426) generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 4496) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 4496) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

GetClsMemberTypeInfo

RegisterXSInfo (see page 4426)

38.1.9.4.14 RegisterSerializeOptions Method

This is the overview for the RegisterSerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.RegisterSerializeOptions (PTypeInfo, TSerializationOptions) (see page 4424)	Registers a set of serialization options that should be used with a registered remotable class or type.
	TRemotableTypeRegistry.RegisterSerializeOptions (TClass, TSerializationOptions) (see page 4424)	Registers a set of serialization options that should be used with a registered remotable class or type.

38.1.9.4.14.1 TRemotableTypeRegistry.RegisterSerializeOptions Method (PTypeInfo, TSerializationOptions)

Registers a set of serialization options that should be used with a registered remotable class or type.

Pascal

```
procedure RegisterSerializeOptions(Info: PTypeInfo; SerialOpt: TSerializationOptions);
overload;
procedure RegisterSerializeOptions(AClass: TClass; SerialOpt: TSerializationOptions); overload;
```

C++

```
__fastcall RegisterSerializeOptions(PTypeInfo Info, TSerializationOptions SerialOpt);
__fastcall RegisterSerializeOptions(TClass AClass, TSerializationOptions SerialOpt);
```

Description

RegisterSerializeOptions associates a registered remotable class or type with a set of flags that indicate how to encode or decode its value. Typically, this method is called by the WSDL importer.

AClass identifes the class for which you are supplying serialization options. It must be previously registered by a call to RegisterXSClass (see page 4425).

Info is the runtime type information for a type when you are supplying serialization options for a type rather than a class. It must be previously registered by a call to RegisterXSInfo (see page 4426).

SerialOpt is the set of flags that customize how the class is encoded or decoded.

RegisterXSClass (see page 4425)

RegisterXSInfo (see page 4426)

Defining and Using SOAP Headers

38.1.9.4.15 TRemotableTypeRegistry.RegisterXSClass Method

Registers a remotable class.

Pascal

```
procedure RegisterXSClass(AClass: TClass; const URI: InvString = ''; const Name: InvString =
'', const ExtName: InvString = ''; IsScalar: Boolean = False; MultiRefOpt: TObjMultiOptions =
ocDefault);
```

C++

```
__fastcall RegisterXSClass(TClass AClass, const InvString URI = '', const InvString Name = '',
const InvString ExtName = '', Boolean IsScalar = False, TObjMultiOptions MultiRefOpt =
ocDefault);
```

Description

Call RegisterXSClass to register a remotable class so that it can be communicated between client applications and a Web Service provider. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances.

When the remotable class is a TRemotable (see page 4408) descendant, it can be used to represent non-scalar types for parameters and return values on an invokable interface. When it is an ERemotableException (see page 4350) descendant, it allows the Web Service application to send clients a fault packet that includes all the published properties of the exception class.

AClass is the class reference for the remotable class. In Delphi, you specify this in code using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

URI is the namespace URI to associate with that class. This should uniquely identify the class. If you omit this parameter (or supply an empty string), RegisterXSClass generates a namespace URI for you, based on the name of the class, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 4496) variable. Note that the namespace URI must be the same in both client and server applications. Thus, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 4496) must be the same in both applications.

Name is the name of a type that the class represents. This is used for the mapping between the class and its definition in a WSDL document.

ExtName is the same as Name.

IsScalar indicates whether the class represents a scalar type. Remotable classes that represent scalar types must implement the XSToNative and NativeToXS methods.

MultiRefOpt indicates how multiple references to the same instance of the class should be handled when converting them to their SOAP representation. For more information, see the ClassOptions (see page 4417) method.

Creating Custom Exception Classes for Web Services

Registering Nonscalar Types

38.1.9.4.16 TRemotableTypeRegistry.RegisterXSInfo Method

Registers a remotable type.

Pascal

```
procedure RegisterXSInfo(Info: PTypeInfo; const URI: InvString = ''; const Name: InvString =
'''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterXSInfo(PTypeInfo Info, const InvString URI = '', const InvString Name = '',
const InvString ExtName = '');
```

Description

Call RegisterXSInfo to register a type that requires special marshaling but does not need to be represented by a TRemotable (see page 4408) descendant before it can be marshaled for transport to or from a Web Services provider. Such types include dynamic arrays such as the dynamic array types defined in the Types unit (Delphi) or sysdyn.h (C++), enumerated types, and boolean types (Delphi) or types defined using a typedef statement (C++).

Info is the TypeInfo pointer for the type. It can be obtained using the global TypeInfo function (Delphi) or the __delphirtti keyword (C++). In C++, it is sometimes obtained from a global function such as GetClsMemberTypeInfo (see page 4334), which extracts the type information from a holder class.

URI is the namespace URI to associate with that type. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 4496) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 4496) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

GetClsMemberTypeInfo

Registering Nonscalar Types

38.1.9.4.17 SerializeOptions Method

This is the overview for the SerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.SerializeOptions (PTypeInfo) (see page 4427)	Returns the serialization options for a registered remotable class or type.
	TRemotableTypeRegistry.SerializeOptions (TClass) (see page 4427)	Returns the serialization options for a registered remotable class or type.

38.1.9.4.17.1 TRemotableTypeRegistry.SerializeOptions Method (PTypeInfo)

Returns the serialization options for a registered remotable class or type.

Pascal

```
function SerializeOptions(Info: PTypeInfo): TSerializationOptions; overload;
function SerializeOptions(AClass: TClass): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializeOptions(PTypeInfo Info);
__fastcall TSerializationOptions SerializeOptions(TClass AClass);
```

Description

SerializeOptions is used internally to retrieve the flags that describe how a remotable class or type is encoded and decoded. These flags are associated with the remotable class or type by calling the RegisterSerializeOptions (see page 4424) method.

AClass is the registered class for which you want to retrieve serialization options.

Info is the runtime type information for the registered type for which you want to retrieve serialization options.

SerializeOptions returns the value of SerializationOptions (see page 4481) for the class that AClass specifies or the registered options for the type that Info specifies..

See Also

SerializationOptions (see page 4413)

RegisterSerializeOptions (see page 4424)

38.1.9.4.18 TRemotableTypeRegistry.TypeInfoToXSD Method

Returns the type name and namespace URI registered with a remotable class or type.

Pascal

```
function TypeInfoToXSD(Info: PTypeInfo; var URI: InvString; var TypeName: InvString): Boolean;
```

C++

```
__fastcall Boolean TypeInfoToXSD(PTypeInfo Info, InvString URI, InvString TypeName);
```

Description

TypInfoToXSD returns a type name and namespace URI from a type information pointer. The type information can describe either a remotable class that was previously registered by a call to RegisterXSClass (see page 4425), or a remotable type that was previously registered by a call to RegisterXSInfo (see page 4426).

Info is the type information pointer that describes the class or type.

URI returns the namespace URI that was associated with the class or type when it was registered.

TypeName returns the type name that was associated with the class or type when it was registered.

See Also

XSDToTypeInfo (see page 4431)

RegisterXSInfo (see page 4426)

RegisterXSClass (see page 4425)

InfoToURI (see page 4421)

38.1.9.4.19 TRemotableTypeRegistry.UnLock Method

Allows other threads to access the type registry after it was locked.

Pascal

```
procedure UnLock; virtual;
```

C++

```
virtual __fastcall UnLock();
```

Description

UnLock exits the critical section that the Lock (see page 4422) method entered. It reenables other threads access to the type registry after a call to the Lock (see page 4422) method.

Every call to the Lock (see page 4422) method must be paired by a call to UnLock when the locking thread is finished with the type registry. The methods of TRemotableTypeRegistry (see page 4414) that call the Lock (see page 4422) method also call the UnLock method when they are finished.

See Also

Lock (see page 4422)

38.1.9.4.20 TRemotableTypeRegistry.UnRegisterXSClass Method

Unregisters a remotable class.

Pascal

```
procedure UnRegisterXSClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterXSClass(TClass AClass);
```

Description

Call UnRegisterXSClass to Unregister a remotable class that was previously registered by a call to the RegisterXSClass (see page 4425) method. In Delphi, this call is made in the finalization section of the unit that implements the remotable class. In C++, it is made from a method that uses the pragma exit directive in the unit that implements the remotable class.

AClass is the class reference for the remotable class. In Delphi code, you specify this using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

See Also

TRemotable (see page 4408)

ERemotableException (see page 4350)

RegisterXSClass (see page 4425)

38.1.9.4.21 TRemotableTypeRegistry.UnRegisterXSInfo Method

Unregisters a remotable type.

Pascal

```
procedure UnRegisterXSInfo(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterXSInfo(PTypeInfo Info);
```

Description

Call UnRegisterXSInfo to unregister a type that was previously registered (directly or indirectly) by a call to the RegisterXSInfo (see page 4426) method.

Info is the TypeInfo pointer for the type. It is the same as the Info parameter of the RegisterXSInfo (see page 4426) method.

See Also

RegisterXSInfo (see page 4426)

38.1.9.4.22 URIToClass Method

This is the overview for the URIToClass method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.URIToClass (InvString, InvString) (see page 4429)	Returns the class associated with a specified namespace URI.
	TRemotableTypeRegistry.URIToClass (InvString, InvString, Boolean) (see page 4429)	Returns the class associated with a specified namespace URI.

38.1.9.4.22.1 TRemotableTypeRegistry.URIToClass Method (InvString, InvString)

Returns the class associated with a specified namespace URI.

Pascal

```
function URIToClass(const URI: InvString; const Name: InvString; var IsScalar: Boolean):
TClass; overload;
function URIToClass(const URI: InvString; const Name: InvString): TClass; overload;
```

C++

```
__fastcall TClass URIToClass(const InvString URI, const InvString Name, Boolean IsScalar);
__fastcall TClass URIToClass(const InvString URI, const InvString Name);
```

Description

URIToClass looks up a registered remotable class given its namespace URI and typename.

URI is the namespace URI associated with the class. This association is established by the RegisterXSClass (see page 4425) method.

Name is the name of the type that the class represents. If the class does not have a corresponding type name, Name should be an empty string.

IsScalar returns true if the class represents a scalar type, false otherwise.

URIToClass returns the class reference for the class identified by URI (and Name).

See Also

RegisterXSClass (see page 4425)

ClassToURI (see page 4418)

38.1.9.4.23 TRemotableTypeRegistry.URIToInfo Method

Returns the type information pointer for a registered remotable class or type.

Pascal

```
function URIToInfo(const URI: InvString; const Name: InvString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo URIToInfo(const InvString URI, const InvString Name);
```

Description

URIToInfo looks up a registered remotable class or type given its namespace URI and typename. It returns the type information pointer that describes the type or class.

URI is the namespace URI associated with the class or type. This association is established by the RegisterXSClass (see page 4425) or RegisterXSInfo (see page 4426) method.

Name is the type name that was associated with the class or type when it was registered.

Tip: To look up the type information for a namespace and type that may possibly represent a built-in XML schema type, use the XSDToTypeInfo (see page 4431) method instead.

See Also

RegisterXSClass (see page 4425)

InfoToURI (see page 4421)

RegisterXSInfo (see page 4426)

38.1.9.4.24 TRemotableTypeRegistry.VariantToInfo Method

Returns the TypeInfo pointer for the type of a specified Variant's data.

Pascal

```
function VariantToInfo(const V: Variant; TryAllSchema: Boolean): PTypeInfo;
```

C++

```
__fastcall PTypeInfo VariantToInfo(const Variant V, Boolean TryAllSchema);
```

Description

VariantToInfo returns the TypeInfo pointer of the scalar type that represents the value of a Variant. If the Variant's value is not a scalar type that can be marshaled without using a registered object or type, VariantToInfo raises an ETypeRegistryException (see page 4353) exception.

V is the Variant for which you want the corresponding TypeInfo pointer.

TryAllSchema specifies whether VariantToInfo should check for corresponding scalar type definitions in the XML schema associated with this application, or whether it should check all the possible sets of XML schema types that are defined in the xmlschema unit.

See Also

VarType

ETypeRegistryException (see page 4353)

38.1.9.4.25 TRemotableTypeRegistry.XSDToTypeInfo Method

Returns the type information pointer associated with a specified type name.

Pascal

```
function XSDToTypeInfo(const URI: InvString; const TypeName: InvString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo XSDToTypeInfo(const InvString URI, const InvString TypeName);
```

Description

XSDToTypeInfo looks up a namespace URI and typename, and returns the type information pointer that describes the corresponding Object Pascal type or class. Unlike the URIToInfo (see page 4430) method, XSDToTypeInfo can look up built-in type correspondences that do not need to be registered.

URI is the namespace URI for the type.

TypeName is the type name to look up.

See Also

RegisterXSClass (see page 4425)

URIToInfo (see page 4430)

RegisterXSInfo (see page 4426)

38.1.9.5 TRemotableTypeRegistry Properties

The properties of the TRemotableTypeRegistry class are listed here.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 4431)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

38.1.9.5.1 TRemotableTypeRegistry.AutoRegisterNativeTypes Property

Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

Pascal

```
property AutoRegisterNativeTypes: Boolean;
```

C++

```
__property Boolean AutoRegisterNativeTypes;
```

Description

When AutoRegisterNativeTypes is true (the default), type definitions are automatically registered when the invokable interface or remotable class that uses them is registered. That is, when you register an invokable interface with the invocation registry or when you register a remotable class with the remotable type registry, the registry checks whether it makes use of types that are

not yet registered, and if so, registers them as well. Note that you can still provide your own registration (for example, to control the external name or namespace) by registering the type before the call that registers the interface or remotable class.

See Also

RegisterXSInfo (see page 4426)

RegisterXSClass (see page 4425)

38.1.10 TRemotableXS Class

TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.

Class Hierarchy

Pascal

```
TRemotableXS = class(TRemotable);
```

C++

```
class TRemotableXS : public TRemotable;
```

File

InvokeRegistry

Description

Use TRemotableXS as a base class when defining a class to represent scalar values from a WSDL document that have no corresponding Object Pascal type. When creating a TRemotableXS descendant, override the XSToNative (see page 4435) and NativeToXS (see page 4433) methods to indicate how the value of the class can be converted to and from the string representation that is used to encode the value for transport.

Both the client application and server application must register a TRemotableXS descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 4472) function returns.

On server applications, instances of TRemotableXS descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotableXS descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable (see page 4408) descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotableXS instances that it passes as input parameters, and for freeing any TRemotableXS instances it creates or that are returned as output parameters or method results.

RemTypeRegistry (see page 4472)

TRemotableTypeRegistry (see page 4414)

IInvokable

Using Remotable Objects

38.1.10.1 TRemotableXS Members

The following tables list the members exposed by TRemotableXS.

Protected Fields

	Name	Description
	FSerializationOptions (see page 4411)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 4410)	Creates and initializes a TRemotable (see page 4408) object.
	Destroy (see page 4410)	Frees the memory associated with the TRemotable (see page 4408) object.
	NativeToXS (see page 4433)	Returns a string that represents the value of a TRemotableXS (see page 4432) instance.
	ObjectToSOAP (see page 4434)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 4434)	Initializes this TRemotableXS (see page 4432) instance to represent the value of its SOAP representation.
	XSToNative (see page 4435)	Assigns the value of a string to the TRemotableXS (see page 4432) instance.

Public Properties

	Name	Description
	DataContext (see page 4413)	Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.
	SerializationOptions (see page 4413)	Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.

38.1.10.2 TRemotableXS Methods

The methods of the TRemotableXS class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 4433)	Returns a string that represents the value of a TRemotableXS (see page 4432) instance.
	ObjectToSOAP (see page 4434)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 4434)	Initializes this TRemotableXS (see page 4432) instance to represent the value of its SOAP representation.
	XSToNative (see page 4435)	Assigns the value of a string to the TRemotableXS (see page 4432) instance.

38.1.10.2.1 TRemotableXS.NativeToXS Method

Returns a string that represents the value of a TRemotableXS (see page 4432) instance.

Pascal

```
function NativeToXS: InvString; virtual; abstract;
```

C++

```
virtual __fastcall InvString NativeToXS() = 0;
```

Description

Override NativeToXS when implementing a TRemotableXS (see page 4432) descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS (see page 4432) instance. This string is used when marshaling the value of the TRemotableXS (see page 4432) descendant.

Classes that implement NativeToXS must also override the XSToNative (see page 4435) method so that it performs the converse transformation.

See Also

XSToNative (see page 4435)

Using Remotable Objects

38.1.10.2.2 TRemotableXS.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotableXS (see page 4432) descendant to its SOAP representation. In TRemotableXS (see page 4432), ObjectToSOAP uses the default conversion, replacing the text of the node with the value that the NativeToXS (see page 4433) method supplies.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

SOAPToObject (see page 4434)

NativeToXS (see page 4433)

38.1.10.2.3 TRemotableXS.SOAPToObject Method

Initializes this TRemotableXS (see page 4432) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
```

```
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a scalar value from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotableXS (see page 4432), SOAPToObject calls the XSToNative (see page 4435) method, passing in the text of the specified node.

See Also

ObjectToSOAP (see page 4434)

XSToNative (see page 4435)

38.1.10.2.4 TRemotableXS.XSToNative Method

Assigns the value of a string to the TRemotableXS (see page 4432) instance.

Pascal

```
procedure XSToNative(Data: InvString); virtual; abstract;
```

C++

```
virtual __fastcall XSToNative(InvString Data) = 0;
```

Description

Override XSToNative when implementing a TRemotableXS (see page 4432) descendant that represents a non-native scalar type. NativeToXS (see page 4433) interprets a string that represents the value of the TRemotableXS (see page 4432) instance and uses it to make any necessary changes so that the TRemotableXS (see page 4432) object reflects that value. It reverses the transformation that the NativeToXS (see page 4433) method performs.

Data is a string that represents the value of the TRemotableXS (see page 4432) instance.

See Also

NativeToXS (see page 4433)

Using Remotable Objects

38.1.11 TSOAPAttachment Class

TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPAttachment = class(TRemotable);
```

C++

```
class TSOAPAttachment : public TRemotable;
```

File

InvokeRegistry

Description

Use TSOAPAttachment to receive or send an attachment as a parameter or return value of a method on an invokable interface. When a SOAP method call requires an attachment, it is marshaled as a MIME multipart form, where any attachments are included as additional parts.

Warning: Some Web Services (such as .Net) use DIME multipart forms rather than MIME multipart forms for attachments. TSOAPAttachment will not work with such services.

Note: Only use TSOAPAttachment and its descendants as the type for parameters or the return value of a method of an invokable interface. TSOAPAttachment can't be used as part of a more complex type, such as the type of a published property on a remotable object.

When sending an attachment, use the SourceString (see page 4448) property or the SetSourceFile (see page 4442) or SetSourceStream (see page 4443) method to supply the attachment data. Use the ContentType (see page 4445) property to indicate the type (encoding) of the attachment data.

When receiving an attachment, the attachment is automatically stored in a temporary file, whose name is given by the CacheFile (see page 4444) property. You can copy the contents of this temporary file using the SaveToFile (see page 4441) or SaveToStream (see page 4441) method. To determine the format of the data, read the ContentType (see page 4445) property. You can read any of the other headers for the part of the multipart form that contained the attachment using the Headers (see page 4446) property. By default, when the TSOAPAttachment object is freed, it deletes the temporary file that contains the attachment data that was received. You can use the CacheFilePersist (see page 4445) property to prevent this file from being deleted.

Note: If you use TSOAPAttachment as a base class for a customized attachment class, it is marshaled as a TSOAPAttachment value. That is, the application that receives the attachment sees it only as a TSOAPAttachment instance, not as an instance of the descendant class.

The application must register TSOAPAttachment with the remotable class registry before it can use this class. To register TSOAPAttachment or one of its descendants, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 4472) function returns. When you import a WSDL document, the call to register TSOAPAttachment is automatically added if any of the interfaces use attachments.

The caller of an invokable interface (client) is responsible for creating any TSOAPAttachment instances that it passes as input parameters, and for freeing any TSOAPAttachment instances it creates or that are returned as output parameters or method results.

In Web Service applications (servers), any TSOAPAttachment instances that represent parameters or return values are added to the data context, which frees them as necessary.

IInvokable

Using Remotable Objects

38.1.11.1 TSOAPAttachment Members

The following tables list the members exposed by TSOAPAttachment.

Protected Fields

	Name	Description
	FSerializationOptions (see page 4411)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
V	GetSourceStream (see page 4439)	This is GetSourceStream, a member of class TSOAPAttachment.
V	InternalSetCacheFile (see page 4440)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 4440)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
V	SetOwnership (see page 4442)	This is SetOwnership, a member of class TSOAPAttachment.
V	SetSourceString (see page 4443)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
V	Create (see page 4437)	Creates and initializes a TSOAPAttachment (see page 4435) object.
V	Destroy (see page 4438)	Frees the memory associated with the TSOAPAttachment (see page 4435) object.
	Init (see page 4439)	Initializes the properties of a TSOAPAttachment (see page 4435) instance.
V	ObjectToSOAP (see page 4440)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 4441)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 4441)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 4442)	Specifies a file from which TSOAPAttachment (see page 4435) can read the content of the attachment.
V	SetSourceStream (see page 4443)	Specifies a stream from which TSOAPAttachment (see page 4435) can read the content of the attachment.
V	SOAPToObject (see page 4443)	Initializes this TSOAPAttachment (see page 4435) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
R	CacheFile (see page 4444)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 4445)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 4435) is freed.
	ContentType (see page 4445)	Specifies the MIME type of the attachment data.
	DataContext (see page 4413)	Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.
	Encoding (see page 4446)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 4446)	Indicates the values of the headers received with the attachment.
	Ownership (see page 4447)	Indicates whether the TSOAPAttachment (see page 4435) object should free its source stream.
R	SerializationOptions (see page 4413)	Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.
R	SourceStream (see page 4447)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 4448)	Specifies a string that is sent as the value of the attachment.

38.1.11.2 TSOAPAttachment.Create Constructor

Creates and initializes a TSOAPAttachment (see page 4435) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TSOAPAttachment();
```

Description

Call Create to instantiate a TSOAPAttachment (see page 4435) object for an attachment you wish to send. When an application receives a SOAP attachment, an instance of TSOAPAttachment (see page 4435) is created automatically to represent that attachment.

38.1.11.3 TSOAPAttachment.Destroy Destructor

Frees the memory associated with the TSOAPAttachment (see page 4435) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPAttachment();
```

Description

Do not call Destroy to free a TSOAPAttachment (see page 4435) object. Instead, use the Free method, which checks for a nil reference before calling Destroy.

On server applications, there is typically no need to explicitly free a TSOAPAttachment (see page 4435) instance (for example, one created as a return value or output parameter). By default, when a TSOAPAttachment (see page 4435) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 4413) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TSOAPAttachment (see page 4435) instances that are passed in as a parameter belong to the data context.

On client applications, TSOAPAttachment (see page 4435) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

DataContext (see page 4413)

System::TObject::Free

38.1.11.4 TSOAPAttachment Methods

The methods of the TSOAPAttachment class are listed here.

Protected Methods

	Name	Description
	GetSourceStream (see page 4439)	This is GetSourceStream, a member of class TSOAPAttachment.
	InternalSetCacheFile (see page 4440)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 4440)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
	SetOwnership (see page 4442)	This is SetOwnership, a member of class TSOAPAttachment.
	SetSourceString (see page 4443)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
	Init (see page 4439)	Initializes the properties of a TSOAPAttachment (see page 4435) instance.
V	ObjectToSOAP (see page 4440)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 4441)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 4441)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 4442)	Specifies a file from which TSOAPAttachment (see page 4435) can read the content of the attachment.
V	SetSourceStream (see page 4443)	Specifies a stream from which TSOAPAttachment (see page 4435) can read the content of the attachment.
V	SOAPToObject (see page 4443)	Initializes this TSOAPAttachment (see page 4435) instance to represent the value of its SOAP representation.

38.1.11.4.1 TSOAPAttachment.GetSourceStream Method

Pascal

```
function GetSourceStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetSourceStream();
```

Description

This is GetSourceStream, a member of class TSOAPAttachment.

38.1.11.4.2 TSOAPAttachment.Init Method

Initializes the properties of a TSOAPAttachment (see page 4435) instance.

Pascal

```
procedure Init(ATempLocation: string; AHeaders: TStrings; AContentType: String; AEncoding:
InvString);
```

C++

```
__fastcall Init(UnicodeString ATempLocation, TStrings AHeaders, UnicodeString AContentType,
InvString AEncoding);
```

Description

Init sets the values of the CacheFile (see page 4444), Headers (see page 4446), ContentType (see page 4445), and Encoding (see page 4446) properties to the values supplied as parameters. It is used internally to initialize a TSOAPAttachment (see page 4435) instance to describe an attachment that the application received.

ATempLocation is the name of the temporary file where the attachment has been stored. It becomes the value of the CacheFile (see page 4444) property.

AHeaders lists the headers from the portion of the multipart form that represented this attachment. It becomes the value of the Headers (see page 4446) property.

AContentType is the content-type of the attachment. It becomes the value of the ContentType (see page 4445) property.

AEncoding is the character set encoding used for the attachment. It becomes the value of the Encoding (see page 4446) property.

See Also

CacheFile (see page 4444)

Headers (see page 4446)

ContentType (see page 4445)

Encoding (see page 4446)

38.1.11.4.3 TSOAPAttachment.InternalSetCacheFile Method

Pascal

```
procedure InternalSetCacheFile(const Value: string); virtual;
```

C++

```
virtual __fastcall InternalSetCacheFile(const UnicodeString Value);
```

Description

This is InternalSetCacheFile, a member of class TSOAPAttachment.

38.1.11.4.4 TSOAPAttachment.InternalSetSourceStream Method

Pascal

```
procedure InternalSetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference);
```

C++

```
__fastcall InternalSetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

This is InternalSetSourceStream, a member of class TSOAPAttachment.

38.1.11.4.5 TSOAPAttachment.ObjectToSOAP Method

Converts this attachment object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjectToSOAP customizes the way an application converts a TSOAPAttachment (see page 4435) object to its SOAP representation. In TSOAPAttachment (see page 4435), ObjectToSOAP calls the inherited method, adding ocoDontSerializeProps and ocoDontPutTypeAttr to the ObjConvOpts flags so that the converter ignores the published properties and does not add type information to the generated node. It then generates a unique identifier for the attachment and calls the converter's AddAttachment method to properly generate the SOAP representation of the attachment.

RootNode is an ancestor of the generated node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated for the attachment.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 4463)

AddAttachment (see page 4462)

SOAPToObject (see page 4443)

38.1.11.4.6 TSOAPAttachment.SaveToFile Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToFile(AFileName: string);
```

C++

```
__fastcall SaveToFile(UnicodeString AFileName);
```

Description

Call SaveToFile to save the contents of the attachment to a specified file. This content can come from

The temporary file that the CacheFile (see page 4444) property indicates.

The stream that the SourceStream (see page 4447) property specifies.

The file that the SetSourceFile (see page 4442) method supplies.

The string that the SourceString (see page 4448) property specifies.

AFileName is the name of the file to which SaveToFile writes the content of the attachment.

See Also

CacheFile (see page 4444)

SourceStream (see page 4447)

SourceString (see page 4448)

SaveToStream (see page 4441)

38.1.11.4.7 TSOAPAttachment.SaveToStream Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToStream(AStream: TStream);
```

C++

```
__fastcall SaveToStream(TStream AStream);
```

Description

Call SaveToStream to write the contents of the attachment to a specified stream. This content can come from

The temporary file that the CacheFile (see page 4444) property indicates.

The stream that the SourceStream (see page 4447) property specifies.

The file that the SetSourceFile (see page 4442) method supplies.

The string that the SourceString (see page 4448) property specifies.

AStream is the stream to which SaveToStream writes the content of the attachment.

See Also

CacheFile (see page 4444)

SourceStream (see page 4447)

SourceString (see page 4448)

SaveToStream

SetSourceFile (see page 4442)

38.1.11.4.8 TSOAPAttachment.SetOwnership Method

Pascal

```
procedure SetOwnership(const Value: TStreamOwnership); virtual;
```

C++

```
virtual __fastcall SetOwnership(const TStreamOwnership Value);
```

Description

This is SetOwnership, a member of class TSOAPAttachment.

38.1.11.4.9 TSOAPAttachment.SetSourceFile Method

Specifies a file from which TSOAPAttachment (see page 4435) can read the content of the attachment.

Pascal

```
procedure SetSourceFile(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceFile(const UnicodeString Value);
```

Description

Call SetSourceFile to supply the content of an attachment that the application sends from a file. SetSourceFile reads the content from the specified file, clears the SourceStream (see page 4447) and SourceString (see page 4448) properties, and sets the ContentType (see page 4445) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 4445) property after calling SetSourceFile.

Value is the fully-qualified file name for the file whose content should be sent as an attachment.

See Also

ContentType (see page 4445)

SetSourceStream (see page 4443)

SourceString (see page 4448)

38.1.11.4.10 TSOAPAttachment.SetSourceStream Method

Specifies a stream from which TSOAPAttachment (see page 4435) can read the content of the attachment.

Pascal

```
procedure SetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference); virtual;
```

C++

```
virtual __fastcall SetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

Call SetSourceStream to supply the content of an attachment that the application sends from a stream object. SetSourceStream assigns the specified stream as the value of the SourceStream (see page 4447) property, clears the FileName and SourceString (see page 4448) properties, and sets the ContentType (see page 4445) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 4445) property after calling SetSourceStream.

Value is a stream from which TSOAPAttachment (see page 4435) can read the content of the attachment.

Ownership (see page 4447) indicates whether the TSOAPAttachment (see page 4435) object should free the stream (Value) when it no longer needs it. It becomes the value of the Ownership (see page 4447) property.

See Also

SourceStream (see page 4447)

ContentType (see page 4445)

Ownership (see page 4447)

SourceString (see page 4448)

SetSourceFile (see page 4442)

38.1.11.4.11 TSOAPAttachment.SetSourceString Method

Pascal

```
procedure SetSourceString(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceString(const UnicodeString Value);
```

Description

This is SetSourceString, a member of class TSOAPAttachment.

38.1.11.4.12 TSOAPAttachment.SOAPToObject Method

Initializes this TSOAPAttachment (see page 4435) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. In TSOAPAttachment (see page 4435), this method calls the converter's FindAttachment method to locate information about the attachment, and then calls the Init (see page 4439) method to initialize this object from the located information.

RootNode is an ancestor node of the attachment node that can contain information about the attachment node.

Node is the node in the SOAP envelope that represents a reference to the attachment.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TSOAPAttachment (see page 4435), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 4440)

FindAttachment (see page 4463)

Init (see page 4439)

38.1.11.5 TSOAPAttachment Properties

The properties of the TSOAPAttachment class are listed here.

Public Properties

	Name	Description
R	CacheFile (see page 4444)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 4445)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 4435) is freed.
	ContentType (see page 4445)	Specifies the MIME type of the attachment data.
	Encoding (see page 4446)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 4446)	Indicates the values of the headers received with the attachment.
	Ownership (see page 4447)	Indicates whether the TSOAPAttachment (see page 4435) object should free its source stream.
R	SourceStream (see page 4447)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 4448)	Specifies a string that is sent as the value of the attachment.

38.1.11.5.1 TSOAPAttachment.CacheFile Property

Identifies the temporary file where the attachment is saved.

Pascal

```
property CacheFile: string;
```

C++

```
__property UnicodeString CacheFile;
```

Description

CacheFile is set automatically when the application receives an attachment along with a SOAP message. This is the name of the

temporary file where the application stores the contents of the attachment.

To save this temporary file to another file of your choosing, use the SaveToFile (see page 4441) method. You can also save its contents to a stream, using the SaveToStream (see page 4441) method.

The ContentType (see page 4445) property indicates the format of the data in this temporary file.

By default, when the TSOAPAttachment (see page 4435) object is freed, it deletes the temporary file that CacheFile indicates. Use the CacheFilePersist (see page 4445) property to prevent this file from being deleted.

See Also

CacheFilePersist (see page 4445)

ContentType (see page 4445)

Data

SaveToFile (see page 4441)

SaveToStream (see page 4441)

38.1.11.5.2 TSOAPAttachment.CacheFilePersist Property

Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 4435) is freed.

Pascal

```
property CacheFilePersist: Boolean;
```

C++

```
__property Boolean CacheFilePersist;
```

Description

When CacheFilePersist is false (the default), the temporary file that the CacheFile (see page 4444) property identifies is automatically deleted when the TSOAPAttachment (see page 4435) instance is freed. You can save the information from the cache file using the SaveToFile (see page 4441) or SaveToStream (see page 4441) method before freeing the TSOAPAttachment (see page 4435) instance.

When CacheFilePersist is true, the temporary file is not deleted when the TSOAPAttachment (see page 4435) instance is freed.

See Also

CacheFile (see page 4444)

SaveToFile (see page 4441)

SaveToStream (see page 4441)

38.1.11.5.3 TSOAPAttachment.ContentType Property

Specifies the MIME type of the attachment data.

Pascal

```
property ContentType: string;
```

C++

```
__property UnicodeString ContentType;
```

Description

Use ContentType to determine the MIME type (format) used for the data in the attachment.

When receiving an attachment, the ContentType property is automatically set to reflect the value of the content-type header of the part of the multipart form that holds the attachment. You can read this property to determine how to interpret the contents of the file that the CacheFile (see page 4444) property indicates.

When sending an attachment, set ContentType to indicate the MIME type for the data you are sending. This property should not be set until after setting the SourceString (see page 4448) property calling the SetSourceFile (see page 4442) or SetSourceStream (see page 4443) method. That is because calling SetSourceStream (see page 4443) or SetSourceFile (see page 4442) automatically sets ContentType to 'Application/binary', and setting SourceString (see page 4448) automatically sets ContentType to 'Text/simple'. There is no need to reset ContentType if these values are correct.

See Also

CacheFile (see page 4444)

SourceString (see page 4448)

SetSourceFile (see page 4442)

SetSourceStream (see page 4443)

Data

38.1.11.5.4 TSOAPAttachment.Encoding Property

Indicates the encoding (character set) of the body of the attachment.

Pascal

```
property Encoding: InvString;
```

C++

```
__property InvString Encoding;
```

Description

Use Encoding to look up or set the encoding type of the attachment's content. When sending an attachment, set this property to indicate the encoding that was used for the source you supply.

If you supply the attachment data as a string by setting the SourceString (see page 4448) property, TSOAPAttachment (see page 4435) assumes an encoding of UTF-8 if you do not set the Encoding property. If you supply the attachment data by calling SetSourceFile (see page 4442) or SetSourceStream (see page 4443), you must set the Encoding property, as TSOAPAttachment (see page 4435) does not have a meaningful default encoding.

Note: Encoding indicates the encoding of the data that the SOAP attachment contains. The application does not automatically use this information to encode or decode that data.

See Also

ContentType (see page 4445)

38.1.11.5.5 TSOAPAttachment.Headers Property

Indicates the values of the headers received with the attachment.

Pascal

```
property Headers: TStrings;
```

C++

```
__property TStrings Headers;
```

Description

Read Headers to determine the headers that appeared in the part of the multipart form that contained the attachment. Headers is only intended for attachments that the application receives. When sending attachments, the application automatically generates the headers that accompany the attachment.

Headers is a string list where each string has the form HeaderName=Value. HeaderName is the name of the header, such as Content-Id, Content-Location, Content-Size, and so on. Value is the string that is the header value. Note that if you are only interested in the content type, you can use the ContentType (see page 4445) property instead.

Note: Although the MIME specification states that the Content-Length header is optional, TSoapAttachment requires this header and raises an exception if it is not present.

See Also

ContentType (see page 4445)

CacheFile (see page 4444)

38.1.11.5.6 TSOAPAttachment.Ownership Property

Indicates whether the TSOAPAttachment (see page 4435) object should free its source stream.

Pascal

```
property Ownership: TStreamOwnership;
```

C++

```
__property TStreamOwnership Ownership;
```

Description

Ownership indicates whether TSOAPAttachment (see page 4435) needs to free the stream that supplied the content of the attachment when the application supplied this data using the SetSourceStream (see page 4443) method.

See Also

SourceStream (see page 4447)

SetSourceStream (see page 4443)

38.1.11.5.7 TSOAPAttachment.SourceStream Property

Indicates a stream from which to read the content of an attachment that the application sends.

Pascal

```
property SourceStream: TStream;
```

C++

```
__property TStream SourceStream;
```

Description

Read SourceStream to access the content of an attachment that the application is sending. When SourceStream is not nil (Delphi) or NULL (C++), the content of the attachment is read from this stream and the SourceString (see page 4448) property is not set. Depending on the value of the Ownership (see page 4447) property, SourceStream can be owned by the TSOAPAttachment (see page 4435) object (in which case TSOAPAttachment (see page 4435) frees the stream object when

it is no longer needed) or can exist as an independent object that TSOAPAttachment (see page 4435) does not free.

SourceStream is a read-only property. To specify a stream from which TSOAPAttachment (see page 4435) reads its data, use the SetSourceStream (see page 4443) method.

See Also

SourceString (see page 4448)

SetSourceStream (see page 4443)

Ownership (see page 4447)

ContentType (see page 4445)

38.1.11.5.8 TSOAPAttachment.SourceString Property

Specifies a string that is sent as the value of the attachment.

Pascal

```
property SourceString: string;
```

C++

```
__property UnicodeString SourceString;
```

Description

Use SourceString to supply the content of an attachment as a string.

Setting the SourceString property causes TSOAPAttachment (see page 4435) to clear the SourceStream (see page 4447) property and to set the ContentType (see page 4445) property to 'Text/simple'. If another MIME type string better describes the data, reset the ContentType (see page 4445) property after setting SourceString.

See Also

Data

SourceStream (see page 4447)

SetSourceStream (see page 4443)

ContentType (see page 4445)

SetSourceFile (see page 4442)

38.1.12 TSOAPHeader Class

TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPHeader = class(TRemotable);
```

C++

```
class TSOAPHeader : public TRemotable;
```

File

InvokeRegistry

Description

TSOAPHeader is the base class for classes that represent SOAP headers. Each type of header has an associated TSOAPHeader descendant, which is registered with the remotable type registry. Register a TSOAPHeader descendant like any other remotable type, using the name of the header as the type name. If you import a WSDL document, the code to define and register the TSOAPHeader descendant is generated automtically.

You can also register the TSOAPHeader descendant with the invocation registry. The invocation registry's RegisterHeaderClass method associates the header class and the invokable interfaces with which it should be included. Registering the header with the invocation registry serves two purposes:

When a server publishes WSDL information about the Web Service, information about the header type is included in the resulting WSDL document.

On both servers and clients, the invocation registry associates the header class with a header name and a namespace in which that name is defined. This is important if the namespace for the header type is different than the namespace for the invokable interface that uses the header.

A SOAP header is a special remotable type that represents a node in the header section of a SOAP envelope. As with any other remotable type, the published properties of the TSOAPHeader descendant correspond to the child nodes and attributes of the corresponding header node. TSOAPHeader introduces two properties for common attributes of SOAP headers: MustUnderstand (see page 4452) and Actor (see page 4451). Typically, SOAP headers represent information that is associated with an entire invokable interface (port type) rather than just the method that is the focus of a single message.

When an application receives a SOAP message (that is, when a server receives a request to execute a method on an invokable interface or when a client receives a response after sending such a request), the headers on that message are automatically converted to the corresponding TSOAPHeader descendants that are registered with the remotable type registry. You can access these TSOAPHeader descendants using the ISOAPHeaders (see page 4464) interface, which can be obtained from the implementation class of the invokable interface or from the invokable interface of a remote interfaced object.

When an application sends a SOAP message (either a client sending a request or a server sending a response), supply the headers that should appear on that outgoing message by creating TSOAPHeader descendants and calling the Send method of an ISOAPHeaders (see page 4464) interface.

ISOAPHeaders (see page 4464)

TRemotableTypeRegistry (see page 4414)

TInvokableClassRegistry (see page 4379)

38.1.12.1 TSOAPHeader Members

The following tables list the members exposed by TSOAPHeader.

Protected Fields

	Name	Description
	FSerializationOptions (see page 4411)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 4410)	Creates and initializes a TRemotable (see page 4408) object.

	Destroy (see page 4410)	Frees the memory associated with the TRemotable (see page 4408) object.
	ObjectToSOAP (see page 4450)	Converts this TSOAPHeader (see page 4448) object to its SOAP representation.
	SOAPToObject (see page 4451)	Initializes this TSOAPHeader (see page 4448) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	Actor (see page 4451)	Identifies the agent to which the header is directed.
	DataContext (see page 4413)	Specifies the object that controls the lifetime of a TRemotable (see page 4408) instance.
	MustUnderstand (see page 4452)	Indicates whether an application is required to recognize and handle the header on received messages.
	SerializationOptions (see page 4413)	Indicates how the value of the TRemotable (see page 4408) descendant encodes its value.

38.1.12.2 TSOAPHeader Methods

The methods of the TSOAPHeader class are listed here.

Public Methods

	Name	Description
	ObjectToSOAP (see page 4450)	Converts this TSOAPHeader (see page 4448) object to its SOAP representation.
	SOAPToObject (see page 4451)	Initializes this TSOAPHeader (see page 4448) instance to represent the value of its SOAP representation.

38.1.12.2.1 TSOAPHeader.ObjectToSOAP Method

Converts this TSOAPHeader (see page 4448) object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TSOAPHeader (see page 4448) descendant to its SOAP representation. In TSOAPHeader (see page 4448), ObjectToSOAP uses the default conversion (supplied by the ObjConverter parameter), adding a MustUnderstand (see page 4452) attribute whose value reflects the value of the MustUnderstand (see page 4452) property.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

MustUnderstand (see page 4452)

ObjInstanceToSOAP (see page 4463)

SOAPToObject (see page 4451)

38.1.12.2.2 TSOAPHeader.SOAPToObject Method

Initializes this TSOAPHeader (see page 4448) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific type of header from its XML representation.

RootNode is an ancestor node of the header node that can contain information about the header node.

Node is the node in the SOAP envelope that represents the header.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

See Also

ObjectToSOAP (see page 4450)

InitObjectFromSOAP (see page 4463)

MustUnderstand (see page 4452)

38.1.12.3 TSOAPHeader Properties

The properties of the TSOAPHeader class are listed here.

Public Properties

	Name	Description
	Actor (see page 4451)	Identifies the agent to which the header is directed.
	MustUnderstand (see page 4452)	Indicates whether an application is required to recognize and handle the header on received messages.

38.1.12.3.1 TSOAPHeader.Actor Property

Identifies the agent to which the header is directed.

Pascal

```
property Actor: InvString;
```

C++

```
__property InvString Actor;
```

Description

Actor is the URI to which the header is directed. Set Actor to indicate the ultimate target of a header you are sending. Read Actor to determine whether a header the application receives is supposed to be handled by the application rather than merely passed on to the next processor.

Note: When the Actor property of a received header identifies this application and the application raises an exception concerning that header (such as a MustUnderstand (see page 4452) fault for a header that it does not know how to handle), the value of Actor should become the value of the FaultActor property on the ERemotableException (see page 4350) object.

See Also

MustUnderstand (see page 4452)

FaultActor (see page 4352)

38.1.12.3.2 TSOAPHeader.MustUnderstand Property

Indicates whether an application is required to recognize and handle the header on received messages.

Pascal

```
property MustUnderstand: Boolean;
```

C++

```
__property Boolean MustUnderstand;
```

Description

When MustUnderstand is false, applications can ignore this header if they do not recognize it and know how to handle it.

When MustUnderstand is true, applications that receive messages with this header but that do not recognize or handle it must throw a MustUnderstand fault.

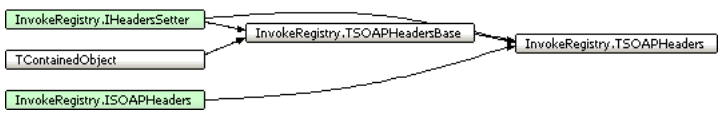
See Also

Actor (see page 4451)

38.1.13 TSOAPHeaders Class

TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 4464) interface.

Class Hierarchy



Pascal

```
TSOAPHeaders = class(TSOAPHeadersBase, ISOAPHeaders, IHeadersSetter);
```

C++

```
class TSOAPHeaders : public TSOAPHeadersBase, public ISOAPHeaders, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeaders implements the ISOAPHeaders (see page 4464) interface for a class that needs to provide access to the headers of SOAP messages that the application sends and receives Typically, an application does not work directly with instances of TSOAPHeaders. Rather, it uses the ISOAPHeaders (see page 4464) interface that this object implements for another class, such as TRIO or TInvokableClass (see page 4373).

See Also

ISOAPHeaders (see page 4464)

TSOAPHeader (see page 4448)

TRIO (see page 7408)

TInvokableClass (see page 4373)

38.1.13.1 TSOAPHeaders Members

The following tables list the members exposed by TSOAPHeaders.

Protected Fields

	Name	Description
	FHeadersInbound (see page 4458)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 4458)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 4458)	Sets the lists of incoming and outgoing headers.

Public Methods

	Name	Description
	Get (see page 4465)	This is the overview for the Get method overload.
	Get (see page 4454)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 4455)	Indicates whether the TSOAPHeaders (see page 4452) object frees headers that are added using the Send (see page 4455) method
	Send (see page 4455)	Adds a header to an outgoing message.
	SendAt (see page 4455)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 4456)	Indicates the number of headers that have been added to an outgoing message.
	SetHeadersInOut (see page 4461)	This is SetHeadersInOut, a member of class IHeadersSetter.
	SetOwnsSentHeaders (see page 4456)	Sets a flag that indicates who should free outgoing header objects.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 4468)	Indicates who is responsible for freeing header objects that are included in outbound messages.

38.1.13.2 TSOAPHeaders Methods

The methods of the TSOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 4454)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 4455)	Indicates whether the TSOAPHeaders (see page 4452) object frees headers that are added using the Send (see page 4455) method
	Send (see page 4455)	Adds a header to an outgoing message.
	SendAt (see page 4455)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 4456)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 4456)	Sets a flag that indicates who should free outgoing header objects.

38.1.13.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	TSOAPHeaders.Get (InvString, InvString) (see page 4454)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (TClass) (see page 4454)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (TClass, TSOAPHeader) (see page 4454)	Retrieves a header from an incoming message.

38.1.13.2.1.1 TSOAPHeaders.Get Method (InvString, InvString)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: InvString; const URI: InvString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const InvString Name, const InvString URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 4448) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 4455)

DataContext (see page 4413)

38.1.13.2.2 TSOAPHeaders.GetOwnsSentHeaders Method

Indicates whether the TSOAPHeaders (see page 4452) object frees headers that are added using the Send (see page 4455) method

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders returns true if the TSOAPHeaders (see page 4452) instance frees any header objects added using the Send (see page 4455) method. It returns false if the caller is responsible for freeing these header objects.

See Also

Send (see page 4455)

38.1.13.2.3 TSOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The SetOwnsSentHeaders (see page 4456) method controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 4455)

SendCount (see page 4456)

SetOwnsSentHeaders (see page 4456)

38.1.13.2.4 TSOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 4455) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 4456) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 4455)

SendCount (see page 4456)

38.1.13.2.5 TSOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 4455) method.

See Also

Send (see page 4455)

SendAt (see page 4455)

38.1.13.2.6 TSOAPHeaders.SetOwnsSentHeaders Method

Sets a flag that indicates who should free outgoing header objects.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

Call SetOwnsSentHeaders to specify who should free header objects that are added using the Send (see page 4455) method.

Flag indicates whether this TSOAPHeaders (see page 4452) frees the outgoing headers. If Flag is true, TSOAPHeaders (see page 4452) frees the headers that are added by calling Send (see page 4455). If Flag is false, the caller is responsible for freeing these header objects.

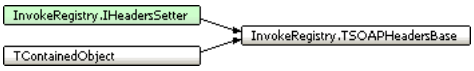
See Also

Send (see page 4455)

38.1.14 TSOAPHeadersBase Class

TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Class Hierarchy



Pascal

```
TSOAPHeadersBase = class(TContainedObject, IHeadersSetter);
```

C++

```
class TSOAPHeadersBase : public TContainedObject, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeadersBase provides support for maintaining two lists of TSOAPHeader (see page 4448) descendants. One list is for the headers that an application sends and the other is for the headers that are it receives with an incoming message.

TSOAPHeadersBase is a descendant of TContainedObject. As such, it is designed to be used as a helper object in supporting an interface for working with SOAP headers. TSOAPHeadersBase is intended only as a base class. For working with SOAP headers, use a TSOAPHeadersBase descendant such as TSOAPHeaders (see page 4452).

See Also

TSOAPHeaders (see page 4452)

TSOAPHeader (see page 4448)

38.1.14.1 TSOAPHeadersBase Members

The following tables list the members exposed by TSOAPHeadersBase.

Protected Fields

	Name	Description
	FHeadersInbound (see page 4458)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 4458)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 4458)	Sets the lists of incoming and outgoing headers.

38.1.14.2 TSOAPHeadersBase Fields

The fields of the TSOAPHeadersBase class are listed here.

Protected Fields

	Name	Description
	FHeadersInbound (see page 4458)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 4458)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

38.1.14.2.1 TSOAPHeadersBase.FHeadersInbound Field

Pascal

```
FHeadersInbound: THeaderList;
```

C++

```
THeaderList FHeadersInbound;
```

Description

This is FHeadersInbound, a member of class TSOAPHeadersBase.

38.1.14.2.2 TSOAPHeadersBase.FHeadersOutBound Field

Pascal

```
FHeadersOutBound: THeaderList;
```

C++

```
THeaderList FHeadersOutBound;
```

Description

This is FHeadersOutBound, a member of class TSOAPHeadersBase.

38.1.14.3 TSOAPHeadersBase Methods

The methods of the TSOAPHeadersBase class are listed here.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 4458)	Sets the lists of incoming and outgoing headers.

38.1.14.3.1 TSOAPHeadersBase.SetHeadersInOut Method

Sets the lists of incoming and outgoing headers.

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

Applications can't call the protected SetHeadersInOut method. It is used by descendant classes to initialize the lists of incoming and outgoing header objects.

InHdrs is a list of TSoapHeader descendants that represent the headers received in a SOAP message.

OutHdrs is a list of TSoapHeader descendants that represent the headers sent in a SOAP message.

See Also

TSoapHeader

38.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeadersSetter (see page 4460)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 4461)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 4464)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

38.2.1 IHeadersSetter Interface

Class Hierarchy

Pascal

```
IHeadersSetter = interface;
```

C++

```
__interface IHeadersSetter;
```

File

InvokeRegistry

Description

This is class InvokeRegistry.IHeadersSetter.

38.2.1.1 IHeadersSetter Members

The following tables list the members exposed by IHeadersSetter.

Public Methods

	Name	Description
	SetHeadersInOut (see page 4461)	This is SetHeadersInOut, a member of class IHeadersSetter.

38.2.1.2 IHeadersSetter Methods

The methods of the IHeadersSetter class are listed here.

Public Methods

	Name	Description
	SetHeadersInOut (see page 4461)	This is SetHeadersInOut, a member of class IHeadersSetter.

38.2.1.2.1 IHeadersSetter.SetHeadersInOut Method

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

This is SetHeadersInOut, a member of class IHeadersSetter.

38.2.2 IObjConverter Interface

IObjConverter is the interface for converting between a remotable class and its SOAP representation.

Class Hierarchy

Pascal

```
IObjConverter = interface;
```

C++

```
__interface IObjConverter;
```

File

InvokeRegistry

Description

IObjConverter defines methods that aid in the conversion between remotable classes (classes that descend from TRemotable (see page 4408)) and their representation in the messages that pass between clients and Web Service providers. That is, this interface provides methods that are used when converting between a remotable class, whether it represents a complex type in an invokable interface, an attachment, or a SOAP header, and its SOAP representation. The TSOAPDomConv class implements this interface.

Note: C++ method declarations that use IObjConverter use the _di_IObjConverter type instead. This type is a DelphiInterface wrapper around the IObjConverter interface:

Note: typedef System::DelphiInterface< IObjConverter > _di_IObjConverter;

See Also

TSOAPDomCOnv

TRemotable (see page 4408)

TSoapHeader

TSoapAttachment

38.2.2.1 IObjConverter Members

The following tables list the members exposed by IObjConverter.

Public Methods

	Name	Description
	AddAttachment (see page 4462)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 4463)	Returns a TSOAPAttachment (see page 4435) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 4463)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 4463)	Returns the SOAP representation of a remotable object.

38.2.2.2 IObjConverter Methods

The methods of the IObjConverter class are listed here.

Public Methods

	Name	Description
	AddAttachment (see page 4462)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 4463)	Returns a TSOAPAttachment (see page 4435) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 4463)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 4463)	Returns the SOAP representation of a remotable object.

38.2.2.2.1 IObjConverter.AddAttachment Method

Stores information about a SOAP attachment so that it is included in the final message that is created.

Pascal

```
procedure AddAttachment(Attachment: TSOAPAttachment; const AContentId: string);
```

C++

```
__fastcall AddAttachment(TSOAPAttachment Attachment, const UnicodeString AContentId);
```

Description

AddAttachment stores a SOAP attachment so that it can be used to generate part of the multipart form that includes the SOAP envelope as another of its parts.

Attachment is the attachment that should be added to the multipart form.

AContentId is a string that uniquely identifies the attachment. It is added as a header to the part of the form that contains the attachment so that XML in the SOAP envelope can refer to the attachment. When interpreting the encoded SOAP envelope, this value is passed to the FindAttachment (see page 4463) method so that the information in the attachment part can be used to recreate the TSOAPAttachment (see page 4435) instance.

See Also

FindAttachment (see page 4463)

38.2.2.2.2 IObjConverter.FindAttachment Method

Returns a TSOAPAttachment (see page 4435) instance that represent the attachment with a specified ID.

Pascal

```
function FindAttachment(const AContentId: string): TSOAPAttachment;
```

C++

```
__fastcall TSOAPAttachment FindAttachment(const UnicodeString AContentId);
```

Description

FindAttachment locates the attachment that is identified by a specified content ID (HREF).

AContentId is the unique identifier for the attachment that was supplied to the AddAttachment (see page 4462) method when the attachment was first added to the multipart form.

FindAttachment returns a TSOAPAttachment (see page 4435) instance that represents the attachment.

See Also

AddAttachment (see page 4462)

38.2.2.2.3 IObjConverter.InitObjectFromSOAP Method

Initializes an instance of a remotable object to reflect the values in its SOAP representation.

Pascal

```
procedure InitObjectFromSOAP(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall InitObjectFromSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

InitObjectFromSOAP assigns values to the published properties of a remotable object that represents a node from the SOAP envelope.

Instance is the remotable object to initialize from its SOAP representation.

RootNode is an ancestor node of the node for the remotable object that can contain information needed for initializing the remotable object.

Node is the node in the SOAP envelope that represents the remotable object.

See Also

ObjInstanceToSOAP (see page 4463)

38.2.2.2.4 IObjConverter.ObjInstanceToSOAP Method

Returns the SOAP representation of a remotable object.

Pascal

```
function ObjInstanceToSOAP(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
NodeName: InvString; const NodeNamespace: InvString; ObjConvOpts: TObjectConvertOptions; out
RefID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode ObjInstanceToSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode
```

```
ParentNode, const InvString NodeName, const InvString NodeNamespace, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjInstanceToSOAP adds a node to represent the value of a remotable object.

Instance is the remotable object to encode as its SOAP representation.

RootNode is an ancestor of the node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjInstanceToSOAP generates.

NodeName is the name of the node that is generated.

NodeNamespace is the URI for the namespace in which NodeName is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjInstanceToSOAP returns the XML for the newly generated node.

See Also

InitObjectFromSOAP (see page 4463)

38.2.3 ISOAPHeaders Interface

ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Class Hierarchy

Pascal

```
ISOAPHeaders = interface;
```

C++

```
__interface ISOAPHeaders;
```

File

InvokeRegistry

Description

ISOAPHeaders is the interface for accessing the headers of a SOAP envelope. It defines methods for adding headers that are sent with an outgoing message and for retrieving the headers that were included in an incoming message.

On the server, the implementation class for in invokable interface supports this interface. You can obtain a reference to the ISOAPHeaders interface from the implementation class (a TInvokableClass (see page 4373) descendant). You can then use this interface to retrieve the headers that were included in an incoming request or to add headers to an outgoing response message. If your implementation class does not descend from TInvokableClass (see page 4373), you can obtain a reference to this interface using the global GetSOAPHeaders function.

For client-side header support, TRIO implements the ISOAPHeaders interface. However, you can't obtain an ISOAPHeaders interface directly from a remote interfaced object, because when you try to obtain an interface from TRIO or one of its descendants, it assumes that you are trying to obtain an invokable interface for a server object and generates an in-memory vtable. Instead, you must access the ISOAPHeaders interface from the invokable interface that the remote interface object supports.

Note: C++ method declarations that use ISOAPHeaders use the _di_ISOAPHeaders type instead. This type is a DelphiInterface wrapper around the ISOAPHeaders interface:

Note: typedef System::DelphiInterface< ISOAPHeaders > _di_ISOAPHeaders;

TSOAPHeaders (see page 4452)

GetSOAPHeaders

Defining and Using SOAP Headers

Processing Headers in Client Applications

38.2.3.1 ISOAPHeaders Members

The following tables list the members exposed by ISOAPHeaders.

Public Methods

	Name	Description
	Get (see page 4465)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 4466)	Returns the value of the OwnsSentHeaders (see page 4468) property.
	Send (see page 4467)	Adds a header to an outgoing message.
	SendAt (see page 4467)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 4468)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 4468)	Sets the value of the OwnsSentHeaders (see page 4468) property.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 4468)	Indicates who is responsible for freeing header objects that are included in outbound messages.

38.2.3.2 ISOAPHeaders Methods

The methods of the ISOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 4465)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 4466)	Returns the value of the OwnsSentHeaders (see page 4468) property.
	Send (see page 4467)	Adds a header to an outgoing message.
	SendAt (see page 4467)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 4468)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 4468)	Sets the value of the OwnsSentHeaders (see page 4468) property.

38.2.3.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	ISOAPHeaders.Get (InvString, InvString) (see page 4466)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (TClass) (see page 4466)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (TClass, TSOAPHeader) (see page 4466)	Retrieves a header from an incoming message.

38.2.3.2.1.1 ISOAPHeaders.Get Method (InvString, InvString)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: InvString; const URI: InvString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const InvString Name, const InvString URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 4448) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 4467)

DataContext (see page 4413)

38.2.3.2.2 ISOAPHeaders.GetOwnsSentHeaders Method

Returns the value of the OwnsSentHeaders (see page 4468) property.

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders is the read implementation for the OwnsSentHeaders (see page 4468) property.

See Also

OwnsSentHeaders (see page 4468)

38.2.3.2.3 ISOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The OwnsSentHeaders (see page 4468) property controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 4467)

SendCount (see page 4468)

OwnsSentHeaders (see page 4468)

38.2.3.2.4 ISOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 4467) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 4468) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 4467)

SendCount (see page 4468)

38.2.3.2.5 ISOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 4467) method.

See Also

Send (see page 4467)

SendAt (see page 4467)

38.2.3.2.6 ISOAPHeaders.SetOwnsSentHeaders Method

Sets the value of the OwnsSentHeaders (see page 4468) property.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

SetOwnsSentHeaders is the write implementation for the OwnsSentHeaders (see page 4468) property.

Flag is the new value of the OwnsSentHeaders (see page 4468) property.

See Also

OwnsSentHeaders (see page 4468)

38.2.3.3 ISOAPHeaders Properties

The properties of the ISOAPHeaders class are listed here.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 4468)	Indicates who is responsible for freeing header objects that are included in outbound messages.

38.2.3.3.1 ISOAPHeaders.OwnsSentHeaders Property

Indicates who is responsible for freeing header objects that are included in outbound messages.

Pascal

```
property OwnsSentHeaders: Boolean;
```

C++

```
__property Boolean OwnsSentHeaders;
```

Description

Use OwnsSentHeaders to indicate whether the header object instances you create and add to messages by calling the Send (see page 4467) or SendAt (see page 4467) method should be freed by the object that implements this interface. When OwnsSentHeaders is true, the object implementing ISOAPHeaders (see page 4464) frees the header objects after sending them. When OwnsSentHeaders is false, the caller is responsible for freeing the header objects.

Note: For inbound headers (headers retrieved from incoming messages), the object that implements always frees them unless you call the Get (see page 4466) method. After a call to Get (see page 4466), the caller is responsible for freeing the header, except on the server, where the header object is freed by the header object's DataContext.

Send (see page 4467)

SendAt (see page 4467)

DataContext (see page 4413)

38.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetRemotableDataContext (see page 4470)	Returns the TDataContext (see page 4354) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 4471)	Provides access to the invocation registry.
	RemClassRegistry (see page 4471)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 4472)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 4473)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 4474)	This is function InvokeRegistry.SubstituteStrings.

38.3.1 InvokeRegistry.GetRemotableDataContext Function

Returns the TDataContext (see page 4354) object that provides temporary storage during a call to an invokable interface.

Pascal

```
function GetRemotableDataContext: Pointer;
```

C++

```
void * GetRemotableDataContext();
```

File

InvokeRegistry

Description

GetRemotableDataContext returns a pointer to the data context object that stores all the temporary objects and values needed for implementing a call to an invokable interface. When a client application calls an invokable interface on a Web Service application, the Web Service application automatically creates a data context for the call. Any objects or variables that are needed for marshaling the interface call are automatically added to the data context for the duration of the call. In addition, any remotable objects (TRemotable (see page 4408) descendants) that are created while there is a remotable data context available are automatically added to the data context. When the interface call is complete, the data context is freed, and it automatically frees the stored objects and variables.

See Also

SetRemotableDataContext (see page 4473)

TRemotable (see page 4408)

TDataContext (see page 4354)

38.3.2 InvokeRegistry.InvRegistry Function

Provides access to the invocation registry.

Pascal

```
function InvRegistry: TInvokableClassRegistry;
```

C++

```
TInvokableClassRegistry InvRegistry();
```

File

InvokeRegistry

Description

Call InvRegistry to access the invocation registry. The returned object has two methods, RegisterInterface and RegisterInvokableClass, that you can use for registering invokable interfaces (interfaces compiled with RTTI) and the classes that implement them.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component can then use the invocation registry to locate invokable interfaces and identify classes that implement them.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component can then use the invocation registry to generate a dynamic method table for calling the invokable interfaces.

Note: Both client and server applications must register invokable interfaces using the same namespace. You can either supply this namespace explicitly when you register an interface, or you can use the automatically generated namespace. If you use the automatically generated interface, the interface must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 4496) variable.

See Also

IInvokable

THTTPSoapPascalInvoker

THTTPRio

AppNamespacePrefix

RemTypeRegistry (see page 4472)

38.3.3 InvokeRegistry.RemClassRegistry Function

Provides access to the remotable class registry.

Pascal

```
function RemClassRegistry: TRemotableClassRegistry;
```

C++

```
TRemotableClassRegistry RemClassRegistry();
```

File

InvokeRegistry

Description

RemClassRegistry returns the object that implements the remotable class registry. Use its RegisterXSClass method to register a remotable class in an application that publishes or uses Web Services.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Both the client application and server application must register remotable classes before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 4496) variable.

Note: The remotable class registry is the same thing as the remotable type registry. You can use RemClassRegistry interchangeably with the RemTypeRegistry (see page 4472) function.

See Also

TRemotable (see page 4408)

ERemotableException (see page 4350)

AppNameSpacePrefix (see page 4496)

InvRegistry (see page 4471)

RemTypeRegistry (see page 4472)

38.3.4 InvokeRegistry.RemTypeRegistry Function

Provides access to the remotable type registry.

Pascal

```
function RemTypeRegistry: TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry RemTypeRegistry();
```

File

InvokeRegistry

Description

Call RemTypeRegistry to access to the remotable type registry. Use the RegisterXSClass method of the returned object to register a remotable class in an application that publishes or uses Web Services. Use its RegisterXSInfo method to register a remotable type.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with

runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class or type, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 4496) variable.

Note: The remotable type registry is the same thing as the remotable class registry. You can use RemTypeRegistry interchangeably with the RemClassRegistry (see page 4471) function.

See Also

TRemotable (see page 4408)

ERemotableException (see page 4350)

AppNameSpacePrefix (see page 4496)

InvRegistry (see page 4471)

38.3.5 InvokeRegistry.SetRemotableDataContext Function

Sets the data context that provides temporary storage during a call to an invokable interface.

Pascal

```
procedure SetRemotableDataContext(Value: Pointer);
```

C++

```
SetRemotableDataContext(void * Value);
```

File

InvokeRegistry

Description

SetRemotableDataContext assigns a data context for a remote call to an invokable interface. Once a data context is assigned, it is available to store the temporary objects and values needed for implementing a call to an invokable interface. If the application creates a TRemotable (see page 4408) descendant while there is a remotable data context, that remotable object is automatically added to the data context and freed when the application frees the data context.

Note: The invoker component in a Web Services application automatically calls SetRemotableDataContext to set up a data context for incoming SOAP requests. Thus, there is typically no need to call this method in server applications.

Value is a pointer to a TDataContext (see page 4354) descendant that temporarily stores information for remote interface calls.

See Also

GetRemotableDataContext (see page 4470)

TRemotable (see page 4408)

TDataContext (see page 4354)

38.3.6 InvokeRegistry.SubstituteStrings Function

Pascal

```
function SubstituteStrings(const InputString: WideString; const SubString: WideString; const
Replacement: WideString): WideString;
```

C++

```
BSTR SubstituteStrings(const BSTR InputString, const BSTR SubString, const BSTR Replacement);
```

File

InvokeRegistry

Description

This is function InvokeRegistry.SubstituteStrings.

38.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	eHeaderMethodType (see page 4475)	eHeaderMethodType and THeaderMethodTypeArray (see page 4490) indicate the types of messages that should include a given header type.
	ObjectConvertOptions (see page 4480)	ObjectConvertOptions and TObjectConvertOptions (see page 4491) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 4481)	SerializationOptions and TSerializationOptions (see page 4494) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TIntfInvokeOption (see page 4483)	TIntfInvokeOption and TIntfInvokeOptions (see page 4490) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 4484)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Records

	Name	Description
	ExtNameMapItem (see page 4476)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 4476)	IntfExceptionItem and TExceptionItemArray (see page 4489) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 4477)	IntfHeaderItem and THeaderItemArray (see page 4489) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 4478)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 4478)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 4480)	This is record InvokeRegistry.MethParamNameMapItem.
	TDynToClear (see page 4482)	This is record InvokeRegistry.TDynToClear.
	TRemHeaderEntry (see page 4485)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 4485)	TRemRegEntry stores information for the remotable type registry.

38.4.1 InvokeRegistry.eHeaderMethodType Enumeration

eHeaderMethodType and THeaderMethodTypeArray (see page 4490) indicate the types of messages that should include a given header type.

Pascal

```
eHeaderMethodType = (
  hmtAll,
  hmtRequest,
  hmtResponse
);
```

C++

```
enum eHeaderMethodType {
  hmtAll,
  hmtRequest,
  hmtResponse
};
```

File

InvokeRegistry

Description

THeaderMethodTypeArray (see page 4490) is a dynamic array of eHeaderMethodType values. The following table describes the possible eHeaderMethodType values:

Value	Meaning
hmtAll	The header should be included in all messages pertaining to the invokable interface.
hmtRequest	The header should be included in request messages in which the client attempts to invoke the invokable interface.
hmtResponse	The header should be included in response message that the server returns after executing a method on the invokable interface.

38.4.2 InvokeRegistry.ExtNameMapItem Record

Pascal

```
ExtNameMapItem = record
  Name: string;
  ExtName: InvString;
end;
```

C++

```
struct ExtNameMapItem {
  UnicodeString Name;
  InvString ExtName;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.ExtNameMapItem.

38.4.3 InvokeRegistry.IntfExceptionItem Record

IntfExceptionItem and TExceptionItemArray (see page 4489) describe the association between a remotable exception and an interface that can raise it.

Pascal

```
IntfExceptionItem = record
  ClassType: TClass;
  MethodNames: string;
end;
```

C++

```
struct IntfExceptionItem {
  TClass ClassType;
  UnicodeString MethodNames;
```

```
};
```

File

InvokeRegistry

Description

IntfExceptionItem describes a single remotable exception type. TExceptionItemArray (see page 4489) is an array of IntfExceptionItem descriptors. Typically, this array describes the set of exceptions associated with an invokable interface.

ClassType is the class reference for the remotable exception class.

MethodNames is a comma-delimited list of method names. If MethodNames is an empty string, the exception is associated with all the methods on an interface. If MethodNames is nonempty, the exception is associated only with those methods of the interface that the MethodNames field lists.

38.4.4 InvokeRegistry.IntfHeaderItem Record

IntfHeaderItem and THeaderItemArray (see page 4489) describe the association between a header and the SOAP messages that include it.

Pascal

```
IntfHeaderItem = record
  Info: PTypeInfo;
  ClassType: TClass;
  Namespace: InvString;
  Name: InvString;
  DefaultMethodType: eHeaderMethodType;
  DefaultRequired: Boolean;
  MethodNames: string;
  MethodTypes: THeaderMethodTypeArray;
  HeaderRequired: TRequiredArray;
end;
```

C++

```
struct IntfHeaderItem {
  PTypeInfo Info;
  TClass ClassType;
  InvString Namespace;
  InvString Name;
  eHeaderMethodType DefaultMethodType;
  Boolean DefaultRequired;
  UnicodeString MethodNames;
  THeaderMethodTypeArray MethodTypes;
  TRequiredArray HeaderRequired;
};
```

File

InvokeRegistry

Description

IntfHeaderItem describes a single header type. THeaderItemArray (see page 4489) is an array of IntfHeaderItem descriptors. Typically, this array describes the set of headers associated with an invokable interface.

Info is a pointer to the type description for the interface that the header is associated with.

ClassType is the class reference for the header class (a TSOAPHeader (see page 4448) descendant).

NameSpace is the namespace in which the header's name is defined.

Name is the name of the header node.

DefaultMethodType indicates whether the header is included in request messages, response messages, or both. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the MethodTypes field instead.

DefaultRequired indicates whether the header must appear in messages about the interface that Info describes. If DefaultRequired is false, the header is optional. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the HeaderRequired field instead.

MethodNames is a comma-delimited list of method names. If empty, the header is associated with all methods on the interface. If MethodNames includes one or more names, the header is only associated with those methods of the interface that are contained in the list.

MethodTypes is a dynamic array of values that indicate whether the header is included in request messages, response messages, or both. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, MethodTypes is not used.

HeaderRequired is a dynamic array of values that indicate whether the header is required or optional. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, HeaderRequired is not used.

38.4.5 InvokeRegistry.InvRegClassEntry Record

Pascal

```
InvRegClassEntry = record
  ClassType: TClass;
  Proc: TCreateInstanceProc;
  URI: string;
end;
```

C++

```
struct InvRegClassEntry {
  TClass ClassType;
  TCreateInstanceProc Proc;
  UnicodeString URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.InvRegClassEntry.

38.4.6 InvokeRegistry.InvRegIntfEntry Record

InvRegIntfEntry stores information about an invokable interface.

Pascal

```
InvRegIntfEntry = record
  Name: string;
  ExtName: InvString;
  UnitName: string;
  GUID: TGUID;
```

```
    Info: PTypeInfo;
    DefImpl: TClass;
    Namespace: InvString;
    WSDLEncoding: InvString;
    Documentation: string;
    SOAPAction: string;
    ReturnParamNames: string;
    InvokeOptions: TIntfInvokeOptions;
    MethNameMap: array of ExtNameMapItem;
    MethParamNameMap: array of MethParamNameMapItem;
    IntfHeaders: array of IntfHeaderItem;
    IntfExceptions: array of IntfExceptionItem;
    UDDIOperator: String;
    UDDIBindingKey: String;
  end;
```

C++

```
  struct InvRegIntfEntry {
    UnicodeString Name;
    InvString ExtName;
    UnicodeString UnitName;
    TGUID GUID;
    PTypeInfo Info;
    TClass DefImpl;
    InvString Namespace;
    InvString WSDLEncoding;
    UnicodeString Documentation;
    UnicodeString SOAPAction;
    UnicodeString ReturnParamNames;
    TIntfInvokeOptions InvokeOptions;
    array of ExtNameMapItem MethNameMap;
    array of MethParamNameMapItem MethParamNameMap;
    array of IntfHeaderItem IntfHeaders;
    array of IntfExceptionItem IntfExceptions;
    UnicodeString UDDIOperator;
    UnicodeString UDDIBindingKey;
  };
```

File

InvokeRegistry

Description

InvRegIntfEntry is used by the invocation registry to store information about a registered invokable interface.

Name is the name of the registered invokable interface.

ExtName is the name of the corresponding port type that appears in the WSDL document describing this Web Service. ExtName can be an empty string if the interface and port type have the same name.

UnitName is the name of the unit in which the interface is defined.

GUID is the globally unique identifier for the interface.

Info points to the runtime type information (RTTI) compiled with the interface.

DefImpl is the default implementation class for the interface.

Namespace is the namespace that is uniquely associated with the interface.

WSDLEncoding is the encoding attribute, if any, of the xml header on a WSDL document that defines the port type to which the invokable interface corresponds.

Documentation is a brief description that documents the interface.

DefaultSOAPAction is the SOAP Action header (or set of SOAP Action headers) to use on messages directed to this interface. If

this is an empty string, the application generates a SOAP Action header that is based on the Namespace field. Assign SOAP Action headers using the RegisterDefaultSOAPAction or RegisterAllSOAPActions method. Note that if you have more than one interface with the same namespace URI, you must register them with different SOAP Action headers so that the server can distinguish them.

ReturnParamNames is a semicolon-delimited list of parameter names that map to the return value of a function.

InvokeOptions are the options for the interface that have been registered using the RegisterInvokeOptions method. These options customize the way the interface is called.

MethNameMap is an array of entries that describe the relationship between methods on the invokable interface and the operation names to which they correspond (if different).

MethParamNameMap is an array of entries that describe the relationship between parameters on a method of the invokable interface and the part names to which they correspond (if different).

IntfHeaders is an array of entries that describe the SOAP headers that should accompany requests directed at the invokable interface.

IntfExceptions is an array of entries that describe the exceptions that the interface can raise.

UDDIOperator is the URL of the UDDI registry, if any, that was used to import the interface definition.

UDDIBindingKey is the unique identifier for the TModel from UDDIOperator that describes the Web Service to which the interface belongs.

38.4.7 InvokeRegistry.MethParamNameMapItem Record

Pascal

```
MethParamNameMapItem = record
  MethName: string;
  ParamNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct MethParamNameMapItem {
  UnicodeString MethName;
  array of ExtNameMapItem ParamNameMap;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.MethParamNameMapItem.

38.4.8 InvokeRegistry.ObjectConvertOptions Enumeration

ObjectConvertOptions and TObjectConvertOptions (see page 4491) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
ObjectConvertOptions = (
```

```
  ocoDontPrefixNode,
  ocoDontSerializeProps,
  ocoDontPutTypeAttr
);
```

C++

```
enum ObjectConvertOptions {
  ocoDontPrefixNode,
  ocoDontSerializeProps,
  ocoDontPutTypeAttr
};
```

File

InvokeRegistry

Description

TObjectConvertOptions (see page 4491) is a set of ObjectConvertOptions values. ObjectConvertOptions values are flags that can be supplied when customizing the conversion between an object and its SOAP representation.

Value	Meaning
ocoDontPrefixNode	When set, the SOAP representation does not include a namespace prefix on node names.
ocoDontSerializeProps	When set, the SOAP representation does not include any representation for the published properties of the remotable object.
ocoDontPutTypeAttr	When set, nodes do not include an xsi:type attribute that indicates their type.

38.4.9 InvokeRegistry.SerializationOptions Enumeration

SerializationOptions and TSerializationOptions (see page 4494) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
SerializationOptions = (
  xoHolderClass,
  xoAttributeOnLastMember,
  xoInlineArrays,
  xoLiteralParam,
  xoSimpleTypeWrapper,
  xoOption6,
  xoOption7,
  xoOption8,
  xoOption9,
  xoOptionA,
  xoOptionB,
  xoOptionC,
  xoOptionD,
  xoOptionE,
  xoOptionF,
  xoOptionG,
  xoOptionH,
  xoOptionI
);
```

C++

```
enum SerializationOptions {
  xoHolderClass,
  xoAttributeOnLastMember,
```

```
    xoInlineArrays,

    xoOption6,
    xoOption7,
    xoOption8,
    xoOption9,
    xoOptionA,
    xoOptionB,
    xoOptionC,
    xoOptionD,
    xoOptionE,
    xoOptionF,
    xoOptionG,
    xoOptionH,
    xoOptionI
  };
```

File

InvokeRegistry

Description

TSerializationOptions (see page 4494) is a set of SerializationOptions values. SerializationOptions values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
xoHolderClass	The remotable object corresponds to a "holder" class. That is, the SOAP representation does not include a node for the class itself, just for its members. This is used when a type that would otherwise not require a remotable class uses a feature only available on remotable classes (such as attributes).
xoAttributeOnLastMember	Attributes of the remotable class are stored on the last member of the class that maps to an element node rather than on the node that corresponds to the class itself. This is necessary if a holder class has attributes.
xoInlineArrays	If the remotable class contains class members that are array types, the encoding of those members omits the type name of the array types. This results in more efficient encoding of holder classes that represent array types.
xoLiteralParam	The remotable class represents one of the two top-level nodes (the input or output value) of a document-literal encoding. The class is treated as a holder class if it is used as the direct input or output parameter of a function.
xoSimpleTypeWrapper	The remotable class is a wrapper for a simple type such as a string or integer. The value that the class represents is represented as a single published property of the remotable class.
xoOption5 - xoOptionI	The remaining options are reserved for future use.

38.4.10 InvokeRegistry.TDynToClear Record

Pascal

```
  TDynToClear = record
    P: Pointer;
    Info: PTypeInfo;
  end;
```

C++

```
  struct TDynToClear {
    void * P;
```

```
  PTypeInfo Info;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TDynToClear.

38.4.11 InvokeRegistry.TIntfInvokeOption Enumeration

TIntfInvokeOption and TIntfInvokeOptions (see page 4490) represent flags that customize how to handle calls to an invokable interface.

Pascal

```
TIntfInvokeOption = (
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
);
```

C++

```
enum TIntfInvokeOption {
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
};
```

File

InvokeRegistry

Description

TIntfInvokeOptions (see page 4490) is a set of TIntfInvokeOption values. TIntfInvokeOption values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
ioDefault	Calls to the interface use the default options unless overridden by other options. (RPC-based SOAP encoding and HTTP as a transport protocol).
ioDocument	The Web Services server uses document-style encoding.
ioLiteral	The Web Services server uses document-literal style and the types for input and output values have not been unwound to create a method call.
ioHasDefaultSOAPAction	A default SOAP action header has been registered for use with the interface.

ioHasReturnParamNames	A set of parameter names have been registered for use with the interface that are reserved for the return value of function calls. If this option is not set, the strings 'Return' and 'Result' are used.
ioHasNamespace	A namespace was explicitly provided when the interface was registered, rather than using an automatically-generated namespace.
ioIsAppServerSOAP	The interface descends from IAppServerSOAP. Such interfaces are used in multi-tier database applications to interact with the application server.
ioHasUDDIInfo	UDDI information has been registered for the interface. This option is set when the Web Service description is imported using the UDDI browser.
ioHasAllSOAPActions	The SOAPAction headers could not be collapsed into a single string. When representing the SOAP action headers, a single string is created where the first character represents a delimiter that marks the boundary between the various SOAP action headers.

38.4.12 InvokeRegistry.TObjMultiOptions Enumeration

TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Pascal

```
TObjMultiOptions = (
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
);
```

C++

```
enum TObjMultiOptions {
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
};
```

File

InvokeRegistry

Description

TObjMultiOptions indicates a class-specific override to the default strategy for converting multiple references to the same object instance into the corresponding SOAP representation. It indicates whether a remotable object should be treated by value (like a structure) or by reference (where object identity is meaningful).

Value	Meaning
ocDefault	Use the default strategy for handling multiple references.
ocMultiRef	Always indicate in the SOAP packet when multiple references refer to the same instance of the specified class.
ocNoMultiRef	Never indicate in the SOAP packet when multiple references refer to the same instance of the specified class. That is, always treat it "by value".

38.4.13 InvokeRegistry.TRemHeaderEntry Record

Pascal

```
TRemHeaderEntry = record
  Name: InvString;
  ExtName: InvString;
  URI: InvString;
end;
```

C++

```
struct TRemHeaderEntry {
  InvString Name;
  InvString ExtName;
  InvString URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TRemHeaderEntry.

38.4.14 InvokeRegistry.TRemRegEntry Record

TRemRegEntry stores information for the remotable type registry.

Pascal

```
TRemRegEntry = record
  ClassType: TClass;
  Info: PTypeInfo;
  URI: InvString;
  Name: InvString;
  ExtName: InvString;
  IsScalar: Boolean;
  MultiRefOpt: TObjMultiOptions;
  SerializationOpt: TSerializationOptions;
  PropNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct TRemRegEntry {
  TClass ClassType;
  PTypeInfo Info;
  InvString URI;
  InvString Name;
  InvString ExtName;
  Boolean IsScalar;
  TObjMultiOptions MultiRefOpt;
  TSerializationOptions SerializationOpt;
  array of ExtNameMapItem PropNameMap;
};
```

File

InvokeRegistry

Description

TRemRegEntry is the type that the remotable type registry uses to store information about a registered type. The TRemRegEntry type is used to represent both remotable classes and remotable types. It contains the following members:

ClassType is the class reference for the class. It is not used for entries that represent types that are not classes.

Info is the type info pointer for a registered class or type.

URI is the namespace URI that the registry associates with the class or type.

Name is the type name of the class or type, as it appears in encoded method calls or WSDL documents.

ExtName is the same as Name.

IsScalar indicates whether the entry describes a class or type that is marshaled as a scalar type.

MultiRefOpt indicates how to marshal multiple instances of a registered class. It is not used for entries that represent types.

SerializationOpt indicates how to convert between a registered class and its encoded representation.

PropNameMap is an array of entries that describe the relationship between properties on the invokable interface and the external names to which they correspond (if different).

38.5 Types

The following table lists types in this documentation.

Types

Name	Description
ERemotableExceptionClass (see page 4487)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 4488)	This is type InvokeRegistry.InvString.
InvStringDynArray (see page 4488)	This is type InvokeRegistry.InvStringDynArray.
PTRemotable (see page 4488)	This is type InvokeRegistry.PTRemotable.
TCreateInstanceProc (see page 4489)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 4489)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 4489)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 4490)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 4490)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 4490)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 4491)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 4491)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 4491)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 4492)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 4492)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 4492)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 4493)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 4493)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 4493)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 4494)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 4494)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 4494)	This is type InvokeRegistry.TSOAPHeaderClass.

38.5.1 InvokeRegistry.ERemotableExceptionClass Type

Pascal

```
ERemotableExceptionClass = class of ERemotableException;
```

C++

```
ERemotableException ERemotableExceptionClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.ERemotableExceptionClass.

38.5.2 InvokeRegistry.InvString Type

Pascal

```
InvString = xmldom.DOMString;
```

C++

```
xmldom.DOMString InvString;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.InvString.

38.5.3 InvokeRegistry.InvStringDynArray Type

Pascal

```
InvStringDynArray = array of InvString;
```

C++

```
array of InvString InvStringDynArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.InvStringDynArray.

38.5.4 InvokeRegistry.PTRemotable Type

Pascal

```
PTRemotable = ^TRemotable;
```

C++

```
^TRemotable PTRemotable;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.PTRemotable.

38.5.5 InvokeRegistry.TCreateInstanceProc Type

TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.

Pascal

```
TCreateInstanceProc = procedure (out obj: TObject);
```

C++

```
(out obj: TObject) ( TCreateInstanceProc)();
```

File

InvokeRegistry

Description

TCreateInstanceProc is the type for procedures that return an instance of an invokable class on behalf of the invocation registry. When the class that implements an invokable interface is not a descendant of TInvokableClass (see page 4373), or when you want to control the instantiation of the implementation class (for example to use a single shared instance for all incoming requests), supply a procedure of this type when registering the implementation class.

obj returns an instance of the invokable class, which can handle the current incoming request.

38.5.6 InvokeRegistry.TExceptionItemArray Type

Pascal

```
TExceptionItemArray = array of IntfExceptionItem;
```

C++

```
array of IntfExceptionItem TExceptionItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TExceptionItemArray.

38.5.7 InvokeRegistry.THeaderItemArray Type

Pascal

```
THeaderItemArray = array of IntfHeaderItem;
```

C++

```
array of IntfHeaderItem THeaderItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderItemArray.

38.5.8 InvokeRegistry.THeaderMethodTypeArray Type

Pascal

```
THeaderMethodTypeArray = array of eHeaderMethodType;
```

C++

```
array of eHeaderMethodType THeaderMethodTypeArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderMethodTypeArray.

38.5.9 InvokeRegistry.TIntfInvokeOptions Type

Pascal

```
TIntfInvokeOptions = set of TIntfInvokeOption;
```

C++

```
TIntfInvokeOption TIntfInvokeOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TIntfInvokeOptions.

38.5.10 InvokeRegistry.TInvokableClassClass Type

Pascal

```
TInvokableClassClass = class of TInvokableClass;
```

C++

```
TInvokableClass TInvokableClassClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvokableClassClass.

38.5.11 InvokeRegistry.TInvRegIntfEntryArray Type

Pascal

```
TInvRegIntfEntryArray = array of InvRegIntfEntry;
```

C++

```
array of InvRegIntfEntry TInvRegIntfEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvRegIntfEntryArray.

38.5.12 InvokeRegistry.TObjectConvertOptions Type

Pascal

```
TObjectConvertOptions = set of ObjectConvertOptions;
```

C++

```
ObjectConvertOptions TObjectConvertOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TObjectConvertOptions.

38.5.13 InvokeRegistry.TPascalRemotableClassRegistry Type

TPascalRemotableClassRegistry is the type of the remotable class registry.

Pascal

```
TPascalRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableClassRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableClassRegistry is a synonym for TRemotableTypeRegistry (see page 4414). It is defined for compatibility with Delphi 6.

See Also

RemClassRegistry (see page 4471)

TRemotable (see page 4408)

38.5.14 InvokeRegistry.TPascalRemotableTypeRegistry Type

TPascalRemotableTypeRegistry is the type of the remotable type registry.

Pascal

```
TPascalRemotableTypeRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableTypeRegistry is a synonym for TRemotableTypeRegistry (see page 4414). It is defined for compatibility with Delphi 6.

See Also

RemTypeRegistry (see page 4472)

TRemotable (see page 4408)

38.5.15 InvokeRegistry.TRemotableClass Type

Pascal

```
TRemotableClass = class of TRemotable;
```

C++

```
TRemotable TRemotableClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClass.

38.5.16 InvokeRegistry.TRemotableClassRegistry Type

Pascal

```
TRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TRemotableClassRegistry;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClassRegistry.

38.5.17 InvokeRegistry.TRemotableXSClass Type

Pascal

```
TRemotableXSClass = class of TRemotableXS;
```

C++

```
TRemotableXS TRemotableXSClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableXSClass.

38.5.18 InvokeRegistry.TRemRegEntryArray Type

Pascal

```
TRemRegEntryArray = array of TRemRegEntry;
```

C++

```
array of TRemRegEntry TRemRegEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemRegEntryArray.

38.5.19 InvokeRegistry.TRequiredArray Type

TRequiredArray is a dynamic array of boolean values.

Pascal

```
TRequiredArray = array of Boolean;
```

C++

```
array of Boolean TRequiredArray;
```

File

InvokeRegistry

Description

TRequiredArray is a dynamic array of boolean values. Each value indicates whether a corresponding item is required (true) or optional (false).

38.5.20 InvokeRegistry.TSerializationOptions Type

Pascal

```
TSerializationOptions = set of SerializationOptions;
```

C++

```
SerializationOptions TSerializationOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSerializationOptions.

38.5.21 InvokeRegistry.TSOAPAttachmentClass Type

Pascal

```
TSOAPAttachmentClass = class of TSOAPAttachment;
```

C++

```
TSOAPAttachment TSOAPAttachmentClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPAttachmentClass.

38.5.22 InvokeRegistry.TSOAPHeaderClass Type

Pascal

```
TSOAPHeaderClass = class of TSOAPHeader;
```

C++

```
TSOAPHeader TSOAPHeaderClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPHeaderClass.

38.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
AppNameSpacePrefix (see page 4496)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

38.6.1 InvokeRegistry.AppNameSpacePrefix Variable

Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

Pascal

```
AppNameSpacePrefix: string;
```

C++

```
UnicodeString AppNameSpacePrefix;
```

File

InvokeRegistry

Description

Set AppNameSpacePrefix to a unique string that the invocation registry and remotable type registry use when generating namespaces. These generated namespaces must be unique strings that identify invokable interfaces and remotable classes in a Web Service application. They are generated by the RegisterInterface method of the invocation registry and the RegisterXSClass and RegisterXSInfo methods of the remotable class registry if the application does not explicitly supply a namespace.

The invocation registry and remotable type registry generate namespaces using the value of AppNameSpacePrefix, the name of the unit in which the interface or class is defined, and the name of the class, type, or interface. If your unit and interface or class names are at all generic, it is a good idea to supply a unique value to AppNameSpacePrefix to guard against the possibility of another interface, type, or class with the same name that is registered in another unit with the same name.

Both client and server applications must register invokable interfaces and remotable types and classes using the same namespace. If you rely on automatically-generated namespaces, be sure to use the same value of AppNameSpacePrefix in both the client and the server applications.

See Also

InvRegistry (see page 4471)

TInvokableClassRegistry (see page 4379)

TRemotableTypeRegistry (see page 4414)

RemTypeRegistry (see page 4472)

38.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AS_ATTRIBUTE (see page 4497)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 4497)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 4498)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 4498)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

38.7.1 InvokeRegistry.AS_ATTRIBUTE Constant

Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.

Pascal

```
AS_ATTRIBUTE = False;
```

C++

```
AS_ATTRIBUTE = False;
```

File

InvokeRegistry

Description

Assign AS_ATTRIBUTE as the value of the stored directive on a property declaration in a TRemotable (see page 4408) descendant to indicate that the property is encoded as an attribute node rather than as an element node. If a property declaration does not include a stored directive with a value of AS_ATTRIBUTE, it is encoded as an element node instead.

Note: Note:AS_ATTRIBUTE must be used directly. If you set the stored directive to a function that returns AS_ATTRIBUTE (false), the property is still encoded as an element node.

See Also

TRemotable (see page 4408)

TRemotableXS (see page 4432)

38.7.2 InvokeRegistry.XMLBase64Types Constant

Pascal

```
XMLBase64Types: array[0..1] of InvString = ('base64Binary', 'bin.base64');
```

C++

```
array[0..1] of InvString XMLBase64Types = ('base64Binary', 'bin.base64');
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLBase64Types.

38.7.3 InvokeRegistry.XMLSchemaInstNamepspaces Constant

Pascal

```
XMLSchemaInstNamepspaces: array[0..2] of InvString = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

C++

```
array[0..2] of InvString XMLSchemaInstNamepspaces = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaInstNamepspaces.

38.7.4 InvokeRegistry.XMLSchemaNamepspaces Constant

Pascal

```
XMLSchemaNamepspaces: array[0..2] of InvString = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

C++

```
array[0..2] of InvString XMLSchemaNamepspaces = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaNamepspaces.

39 ISAPIApp Namespace

This is namespace ISAPIApp.

Topics

Name	Description
Classes (see page 4500)	The following table lists classes in this documentation.
Functions (see page 4505)	The following table lists functions in this documentation.
Variables (see page 4507)	The following table lists variables in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 4500)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 4503)	

Functions

	Name	Description
	GetExtensionVersion (see page 4505)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 4505)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 4506)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Variables

Name	Description
DispatchThread (see page 4507)	This is variable ISAPIApp.DispatchThread.

39.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 4500)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 4503)	

39.1.1 TISAPIApplication Class

TISAPIApplication encapsulates an ISAPI or NSAPI server application.

Class Hierarchy

Pascal

```
TISAPIApplication = class(TWebApplication);
```

C++

```
class TISAPIApplication : public TWebApplication;
```

File

ISAPIApp

Description

TISAPIApplication provides the fundamental behavior of an ISAPI or NSAPI server application. The HTTP server calls the methods of TISAPIApplication when it receives an HTTP request message. TISAPIApplication creates a thread to manage the request message, and a creates a new instance of the Web module for that thread, or reuses an old instance that was deactivated after a previous response was sent.

TISAPIApplication creates TISAPIRequest (see page 4510) and TISAPIResponse (see page 4518) objects to represent the request message and any response that should be sent in return, passes these to the dispatcher so that the response can be filled in, and sends the response if it was not already sent by a TWebActionItem (see page 3335).

Each ISAPI server project automatically declares an Application variable of type TISAPIApplication as the instance of the application. This declaration overrides the Application variable declared in the Forms (see page 1921) unit if the ISAPIApp (see page 4499) unit is declared last in the uses list of the project file. Every ISAPI server application must include the ISAPIApp (see page 4499) unit.

To work with an Apache server, use the TApacheApplication object. To work with a CGI server, use the TCGIApplication object instead.

See Also

TCGIApplication

TISAPIRequest (see page 4510)

TISAPIResponse (see page 4518)

TWebActionItem (see page 3335)

TWebDispatcher (see page 3349)

39.1.1.1 TISAPIApplication Members

The following tables list the members exposed by TISAPIApplication.

Public Methods

	Name	Description
	Create (see page 4501)	Creates an instance of TWebApplication.
	Destroy (see page 4501)	Destroys an instance of TWebApplication.
	GetExtensionVersion (see page 4502)	Returns the application name and version number.
	HttpExtensionProc (see page 4502)	Responds to an HTTP request message.
	TerminateExtension (see page 4503)	Returns true.

39.1.1.2 TISAPIApplication.Create Constructor

Creates an instance of TWebApplication.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TISAPIApplication(TComponent * AOwner);
```

Description

Do not call Create. The single Web application object named Application is instantiated automatically when the CGIApp unit, the ISAPIApp unit, or the ApacheApp unit is included in the uses list of the project.

Create allocates the helper objects used by TWebApplication.

See Also

Create

39.1.1.3 TISAPIApplication.Destroy Destructor

Destroys an instance of TWebApplication.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TISAPIApplication();
```

Description

Never call the Destroy or Free method. The application is freed automatically when the application stops running.

Destroy frees the helper objects that were created at startup, as well as all Web modules created by the application.

See Also

System::TObject::Free

Run

39.1.1.4 TISAPIApplication Methods

The methods of the TISAPIApplication class are listed here.

Public Methods

	Name	Description
	GetExtensionVersion (see page 4502)	Returns the application name and version number.
	HttpExtensionProc (see page 4502)	Responds to an HTTP request message.
	TerminateExtension (see page 4503)	Returns true.

39.1.1.4.1 TISAPIApplication.GetExtensionVersion Method

Returns the application name and version number.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL;
```

C++

```
__fastcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

Description

The HTTP server calls GetExtensionVersion to obtain the application name and version number. GetExtensionVersion returns the version number for the HTTP functions in the runtime library, and the Title property of the ISAPI application object.

See Also

Title

39.1.1.4.2 TISAPIApplication.HttpExtensionProc Method

Responds to an HTTP request message.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD;
```

C++

```
__fastcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

Description

The HTTP server calls HttpExtensionProc when it receives an HTTP request message. HttpExtensionProc creates the TISAPIRequest (see page 4510) and TISAPIResponse (see page 4518) objects for the HTTP request message, and calls the HandleRequest message so that the response can be filled out and sent. Finally, HttpExtensionProc frees the request and response objects.

If the response is filled out and sent, HttpExtensionProc returns HSE_STATUS_SUCCESS. Otherwise it returns HSE_STATUS_ERROR.

See Also

TISAPIRequest (see page 4510)

TISAPIResponse (see page 4518)

HandleRequest

TWebDispatcher (see page 3349)

39.1.1.4.3 TISAPIApplication.TerminateExtension Method

Returns true.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL;
```

C++

```
__fastcall BOOL TerminateExtension(DWORD dwFlags);
```

Description

The HTTP server calls TerminateExtension when it wants to shut down the ISAPI application. TerminateExtension always returns true, allowing the server to shut down.

39.1.2 TISAPIFactory Class

Class Hierarchy

Pascal

```
TISAPIFactory = class(TObject);
```

C++

```
class TISAPIFactory : public TObject;
```

File

ISAPIApp

See Also

TCGIApplication

39.1.2.1 TISAPIFactory Members

The following tables list the members exposed by TISAPIFactory.

Protected Methods

	Name	Description
	NewRequest (see page 4504)	This is NewRequest, a member of class TISAPIFactory.
	NewResponse (see page 4504)	This is NewResponse, a member of class TISAPIFactory.

Public Methods

	Name	Description
	Create (see page 4503)	Creates an instance of Create. {Placeholder—Update for BCB}

39.1.2.2 TISAPIFactory.Create Constructor

Creates an instance of Create. {Placeholder—Update for BCB}

Pascal

```
constructor Create;
```

C++

```
__fastcall TISAPIFactory();
```

Description

Do not create instances of Create. Instead, use the new keyword, passing any arguments for the Create's constructor.

See Also

System::TObject::Destroy

new

39.1.2.3 TISAPIFactory Methods

The methods of the TISAPIFactory class are listed here.

Protected Methods

	Name	Description
	NewRequest (see page 4504)	This is NewRequest, a member of class TISAPIFactory.
	NewResponse (see page 4504)	This is NewResponse, a member of class TISAPIFactory.

39.1.2.3.1 TISAPIFactory.NewRequest Method

Pascal

```
function NewRequest(var AECB: TEXTENSION_CONTROL_BLOCK): TISAPIRequest; virtual;
```

C++

```
virtual __fastcall TISAPIRequest NewRequest(TEXTENSION_CONTROL_BLOCK AECB);
```

Description

This is NewRequest, a member of class TISAPIFactory.

39.1.2.3.2 TISAPIFactory.NewResponse Method

Pascal

```
function NewResponse(ISAPIRequest: TISAPIRequest): TISAPIResponse; virtual;
```

C++

```
virtual __fastcall TISAPIResponse NewResponse(TISAPIRequest ISAPIRequest);
```

Description

This is NewResponse, a member of class TISAPIFactory.

39.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetExtensionVersion (see page 4505)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 4505)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 4506)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

39.2.1 ISAPIApp.GetExtensionVersion Function

Returns the name and version number of an ISAPI or NSAPI application.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL; stdcall;
```

C++

```
__stdcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

File

ISAPIApp

Description

Do not call GetExtensionVersion. ISAPI and NSAPI DLLs export GetExtension to provide an entry point that is called by ISAPI or NSAPI Web servers. This allows the Web server to obtain version information about the web server application.

See Also

HttpExtensionProc (see page 4505)

TerminateExtension (see page 4506)

TIsapiapplication

39.2.2 ISAPIApp.HttpExtensionProc Function

Receives an HTTP request message for an ISAPI or NSAPI application.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD; stdcall;
```

C++

```
__stdcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

File

ISAPIApp

Description

Do not call HttpExtensionProc. ISAPI and NSAPI DLLs export HttpExtensionProc to provide an entry point that is called by ISAPI or NSAPI Web servers when they receive HTTP request messages.

See Also

GetExtensionVersion (see page 4505)

TerminateExtension (see page 4506)

39.2.3 ISAPIApp.TerminateExtension Function

Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL; stdcall;
```

C++

```
__stdcall BOOL TerminateExtension(DWORD dwFlags);
```

File

ISAPIApp

Description

Do not call TerminateExtension. TerminateExtension is exported by ISAPI and NSAPI DLLs. It provides an entry point that is called by ISAPI or NSAPI Web servers, when they are ready to shut down the ISAPI or NSAPI application, to check whether it would cause problems to do so.

See Also

HttpExtensionProc (see page 4505)

39.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DispatchThread (see page 4507)	This is variable ISAPIApp.DispatchThread.

39.3.1 ISAPIApp.DispatchThread Variable

Pascal

```
DispatchThread: function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object;
```

C++

```
function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object DispatchThread;
```

File

ISAPIApp

Description

This is variable ISAPIApp.DispatchThread.

40 IsapiHTTP Namespace

This is namespace IsapiHTTP.

Topics

Name	Description
Classes (see page 4510)	The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 4510)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 4518)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

40.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 4510)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 4518)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

40.1.1 TISAPIRequest Class

TISAPIRequest represents client request information that is passed to a server application DLL.

Class Hierarchy

Pascal

```
TISAPIRequest = class(TWebRequest);
```

C++

```
class TISAPIRequest : public TWebRequest;
```

File

IsapiHTTP

Description

Use TISAPIRequest to interpret a client request to a server application DLL.

ISAPI application objects create TISAPIRequest objects to capture client requests. The properties of the TISAPIRequest objects are obtained from the Web server. The ISAPI application uses TISAPIRequest objects to create corresponding TISAPIResponse (see page 4518) objects. The TWebDispatcher (see page 3349) for the application then invokes the TWebActionItem (see page 3335) that is associated with the path portion of the URL of the TISAPIRequest object.

See Also

TISAPIApplication (see page 4500)

TISAPIResponse (see page 4518)

TWebActionItem (see page 3335)

TWebDispatcher (see page 3349)

Accessing Client Request Information

40.1.1.1 TISAPIRequest Members

The following tables list the members exposed by TISAPIRequest.

Protected Methods

	Name	Description
	GetDateVariable (see page 4513)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 4514)	Extracts an integer value from the extension control block.
	GetInternalPathInfo (see page 3366)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 3366)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 4514)	Extracts a string value from the extension control block.
	UpdateMethodType (see page 3369)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	Create (see page 4512)	Creates an instance of TISAPIRequest (see page 4510) to represent the request message information contained in the AECB parameter.
	Destroy (see page 3361)	Destroys an instance of TWebRequest (see page 3358).
	ExtractContentFields (see page 3363)	Parses the Content (see page 3373) property into its constituent fields.
	ExtractCookieFields (see page 3363)	Parses the Cookie (see page 3377) property into its constituent fields.
	ExtractFields (see page 3363)	This is the overview for the ExtractFields method overload.
	ExtractQueryFields (see page 3364)	Parses the Query (see page 3384) property into its constituent fields.
	GetFieldByName (see page 4513)	Returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 4515)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 4515)	Reads Count bytes from the HTTP request into a string.
	ReadUnicodeString (see page 3368)	This is ReadUnicodeString, a member of class TWebRequest.
	TranslateURI (see page 4516)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 4516)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 4516)	Writes the header contents back to the HTTP client.
	WriteString (see page 4517)	Writes the string AString back to the HTTP client.

Public Properties

	Name	Description
	Accept (see page 3371)	Reports the value of the Accept header of the HTTP request message.
	Authorization (see page 3372)	Reports the value of the Authorization header of the HTTP request message.
	CacheControl (see page 3372)	Reports the value of the Cache-Control header of the HTTP request message.
	Connection (see page 3373)	Reports the value of the Connection header of the HTTP request message.
	Content (see page 3373)	Represents the unparsed contents of the HTTP request message.
	ContentEncoding (see page 3374)	Reports the value of the Content (see page 3373)-Encoding header of the HTTP request message.
	ContentFields (see page 3375)	Reports the parsed content of a POST request message.
	ContentLength (see page 3375)	Reports the value of the Content (see page 3373)-Length header of the HTTP request message.
	ContentParser (see page 3376)	Refers to the object's content parser object.
	ContentType (see page 3376)	Reports the value of the Content (see page 3373)-Type header of the HTTP request message.
	ContentVersion (see page 3376)	Reports the value of the Content (see page 3373)-Version header of the HTTP request message.
	Cookie (see page 3377)	Reports the value of the Cookie header of the HTTP request message.
	CookieFields (see page 3377)	Represents the parsed contents of the Cookie (see page 3377) header of an HTTP request message.
	Date (see page 3378)	Reports the value of the Date header of the HTTP request message.
	DerivedFrom (see page 3378)	Reports the value of the Derived-From (see page 3379) header of the HTTP request message.
	ECB (see page 4518)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.
	Expires (see page 3379)	Reports the value of the Expires header of the HTTP request message.
	Files (see page 3379)	Provides access to the files uploaded in the HTTP request.
	From (see page 3379)	Reports the value of the From header of the HTTP request message.

	Host (see page 3380)	Reports the value of the Host header of the HTTP request message.
	IfModifiedSince (see page 3380)	Reports the value of the If-Modified-Since header of the HTTP request message.
	InternalPathInfo (see page 3381)	Returns the path info portion of the URL (see page 3388).
	InternalScriptName (see page 3381)	Returns the ScriptName (see page 3386) part of the URL (see page 3388).
	Method (see page 3382)	This is Method, a member of class TWebRequest.
	MethodType (see page 3382)	This is MethodType, a member of class TWebRequest.
	PathInfo (see page 3382)	Reports the value of the path information (if any) of the URL (see page 3388) specified in the HTTP request message.
	PathTranslated (see page 3383)	Represents a translation of the PathInfo (see page 3382) property to a fully qualified path on the Web server.
	ProtocolVersion (see page 3383)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
	Query (see page 3384)	Indicates the value of the query information (if any) of the URL (see page 3388) specified in the HTTP request message.
	QueryFields (see page 3384)	Represents the parsed contents of the Query (see page 3384) in the URL (see page 3388) of the HTTP request message.
	RawContent (see page 3385)	This is RawContent, a member of class TWebRequest.
	Referer (see page 3385)	Reports the value of the Referer header of the HTTP request message.
	RemoteAddr (see page 3386)	Indicates the remote IP address of the client associated with the HTTP request message.
	RemoteHost (see page 3386)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
	ScriptName (see page 3386)	Indicates the value of the script information (if any) of the URL (see page 3388) specified in the HTTP request message.
	ServerPort (see page 3387)	Indicates the port number of the port on the Web server that receives the HTTP request message.
	Title (see page 3387)	Reports the value of the Title header of the HTTP request message.
	URL (see page 3388)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
	UserAgent (see page 3388)	Reports the value of the User-Agent header of the HTTP request message.

40.1.1.2 TISAPIRequest.Create Constructor

Creates an instance of TISAPIRequest (see page 4510) to represent the request message information contained in the AECB parameter.

Pascal

```
constructor Create(AECB: PEXTENSION_CONTROL_BLOCK);
```

C++

```
__fastcall TISAPIRequest(PEXTENSION_CONTROL_BLOCK AECB);
```

Description

Applications don't need to call Create to instantiate an ISAPI request object. TISAPIApplication creates a TISAPIRequest (see page 4510) object whenever it receives a client request.

See Also

ECB (see page 4518)

TISAPIApplication (see page 4500)

40.1.1.3 TISAPIRequest Methods

The methods of the TISAPIRequest class are listed here.

Protected Methods

	Name	Description
	GetDateVariable (see page 4513)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 4514)	Extracts an integer value from the extension control block.
	GetStringVariable (see page 4514)	Extracts a string value from the extension control block.

Public Methods

	Name	Description
	GetFieldByName (see page 4513)	Returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 4515)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 4515)	Reads Count bytes from the HTTP request into a string.
	TranslateURI (see page 4516)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 4516)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 4516)	Writes the header contents back to the HTTP client.
	WriteString (see page 4517)	Writes the string AString back to the HTTP client.

40.1.1.3.1 TISAPIRequest.GetDateVariable Method

Extracts a date value from the extension control block.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

GetDateVariable reads date-time values from the extension control block specified by the ECB (see page 4518) property. The ISAPI request object uses GetDateVariable to access the properties that represent dates from the HTTP request headers.

See Also

Date (see page 3378)

ECB (see page 4518)

Expires (see page 3379)

IfModifiedSince (see page 3380)

40.1.1.3.2 TISAPIRequest.GetFieldByName Method

Returns the value of the HTTP header variable specified by the Name parameter.

Pascal

```
function GetFieldByName(const Name: AnsiString): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetFieldByName(const AnsiString Name);
```

Description

Use GetFieldByName to read the value of an HTTP header variable that is not surfaced as one of the properties of TISAPIRequest (see page 4510). For information on possible HTTP request header variables, see the current Internet standards documents.

See Also

ECB (see page 4518)

GetStringVariable (see page 4514)

40.1.1.3.3 TISAPIRequest.GetIntegerVariable Method

Extracts an integer value from the extension control block.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

GetIntegerVariable reads integer values from the extension control block specified by the ECB (see page 4518) property. The ISAPI request object uses GetIntegerVariable to access the properties that represent integers from the HTTP request headers.

See Also

ContentLength (see page 3375)

ECB (see page 4518)

ServerPort (see page 3387)

40.1.1.3.4 TISAPIRequest.GetStringVariable Method

Extracts a string value from the extension control block.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

GetStringVariable reads string values from the extension control block specified by the ECB (see page 4518) property. The ISAPI request object uses GetStringVariable to access the properties that represent strings from the HTTP request headers.

See Also

Accept (see page 3371)

CacheControl (see page 3372)

Connection (see page 3373)

Content (see page 3373)

ContentEncoding (see page 3374)

ContentType (see page 3376)

ContentVersion (see page 3376)

Cookie (see page 3377)

DerivedFrom (see page 3378)

ECB (see page 4518)

From (see page 3379)

Host (see page 3380)

TISAPIRequest (see page 4510)

PathInfo (see page 3382)

PathTranslated (see page 3383)

ProtocolVersion (see page 3383)

Query (see page 3384)

Referer (see page 3385)

RemoteAddr (see page 3386)

RemoteHost (see page 3386)

ScriptName (see page 3386)

Title (see page 3387)

URL (see page 3388)

UserAgent (see page 3388)

40.1.1.3.5 TISAPIRequest.ReadClient Method

Reads Count bytes from the HTTP request into Buffer.

Pascal

```
function ReadClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int ReadClient( Buffer, int Count);
```

Description

Use ReadClient to load a chunk of information from the contents of an HTTP request into a buffer. ReadClient allows the server application to get the next chunk of information when the content of the request message is too large for the Content property. ReadClient returns the number of bytes actually read. If no more content is available, ReadClient returns -1.

See Also

ReadString (see page 4515)

WriteClient (see page 4516)

40.1.1.3.6 TISAPIRequest.ReadString Method

Reads Count bytes from the HTTP request into a string.

Pascal

```
function ReadString(Count: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString ReadString(int Count);
```

Description

Use ReadString to load the next chunk of content information form the HTTP request into a string. ReadString allows the server application to get the next chunk of information when the content of the request message is too large for the Content property.

See Also

GetStringVariable (see page 4514)

ReadClient (see page 4515)

WriteString (see page 4517)

40.1.1.3.7 TISAPIRequest.TranslateURI Method

Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.

Pascal

```
function TranslateURI(const URI: string): string; override;
```

C++

```
virtual __fastcall UnicodeString TranslateURI(const UnicodeString URI);
```

Description

Use TranslateURI is used to translate the URI specified in a client request into a format that can be used by the server application.

See Also

PathTranslated (see page 3383)

URL (see page 3388)

40.1.1.3.8 TISAPIRequest.WriteClient Method

Writes Count bytes from Buffer back to the HTTP client.

Pascal

```
function WriteClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int WriteClient( Buffer, int Count);
```

Description

Use WriteClient to write the contents of a response back to the Web client.

See Also

ReadClient (see page 4515)

TISAPIResponse (see page 4518)

WriteString (see page 4517)

WriteHeaders (see page 4516)

40.1.1.3.9 TISAPIRequest.WriteHeaders Method

Writes the header contents back to the HTTP client.

Pascal

```
function WriteHeaders(StatusCode: Integer; const StatusString: AnsiString; const Headers:
AnsiString): Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteHeaders(int StatusCode, const AnsiString StatusString, const
AnsiString Headers);
```

Description

WriteHeaders writes the HTTP headers of a response message before a call to the WriteClient (see page 4516) method. These headers are used on the HTTP message that the WriteClient (see page 4516) method sends in response to this request.

StatusCode is the status code of the response. This informs the client of the status of the request. For a list of status code values, see the StatusCode property of TWebResponse (see page 3389).

StatusString (see page 3442) is a text string that describes the status that StatusCode indicates.

Headers is a formatted string that includes any other HTTP headers to add. It represents each header as a string of the form 'Headername: Value', where name/value pairs are separated by line breaks.

WriteHeaders returns true if it succeeds in writing the specified headers.

See Also

WriteClient (see page 4516)

StatusCode (see page 3413)

40.1.1.3.10 TISAPIRequest.WriteString Method

Writes the string AString back to the HTTP client.

Pascal

```
function WriteString(const AString: AnsiString): Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteString(const AnsiString AString);
```

Description

Use WriteString to write the contents of a response back to the Web client.

See Also

ReadString (see page 4515)

TISAPIResponse (see page 4518)

WriteClient (see page 4516)

40.1.1.4 TISAPIRequest Properties

The properties of the TISAPIRequest class are listed here.

Public Properties

	Name	Description
	ECB (see page 4518)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

40.1.1.4.1 TISAPIRequest.ECB Property

Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

Pascal

```
property ECB: PEXTENSION_CONTROL_BLOCK;
```

C++

```
__property PEXTENSION_CONTROL_BLOCK ECB;
```

Description

Read ECB to gain direct access to the extension control block that the server application DLL uses to represent the client request message. Most applications will not need to use the ECB property because the header fields values can be read using the GetFieldByName (see page 4513) method.

See Also

GetFieldByName (see page 4513)

40.1.2 TISAPIResponse Class

TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

Class Hierarchy

Pascal

```
TISAPIResponse = class(TWebResponse);
```

C++

```
class TISAPIResponse : public TWebResponse;
```

File

IsapiHTTP

Description

Use TISAPIResponse to specify the response to an HTTP request message.

An ISAPI application creates a TISAPIResponse object based on the TISAPIRequest (see page 4510) object for an incoming HTTP request message. TWebDispatcher (see page 3349) then passes the TISAPIResponse object to the TWebActionItem (see page 3335) associated with the TISAPIRequest (see page 4510) object. The TWebActionItem (see page 3335) sets the properties of the TISAPIResponse object.

See Also

TISAPIApplication (see page 4500)

TISAPIRequest (see page 4510)

TWebActionItem (see page 3335)

TWebDispatcher (see page 3349)

Creating HTTP Response Messages

40.1.2.1 TISAPIResponse Members

The following tables list the members exposed by TISAPIResponse.

Protected Fields

	Name	Description
	FCustomHeaders (see page 3392)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 3393)	This is FHTTPRequest, a member of class TWebResponse.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 3394)	Appends the custom headers specified by the CustomHeaders (see page 3408) property to the Headers parameter.
	FormatAuthenticate (see page 3394)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).
V	GetContent (see page 4521)	Reads the value of the Content property.
V	GetDateVariable (see page 4521)	Extracts a date from the internal table of HTTP header variables.
V	GetIntegerVariable (see page 4522)	Extracts an integer value from the internal table of HTTP header variables.
V	GetLogMessage (see page 4522)	Reads the value of the LogMessage property.
V	GetStatusCode (see page 4522)	Reads the value of the StatusCode property.
V	GetStringVariable (see page 4523)	Extracts a string value from the internal table of HTTP header variables.
V	InitResponse (see page 4523)	This is InitResponse, a member of class TISAPIResponse.
V	SetContent (see page 4525)	Sets the Content property.
V	SetContentStream (see page 3400)	Sets the value of the ContentStream (see page 3406) property to the Value parameter.
V	SetDateVariable (see page 4525)	Sets a date-time valued HTTP header property.
V	SetIntegerVariable (see page 4526)	Sets an integer valued HTTP header property.
V	SetLogMessage (see page 4526)	Sets the value of the LogMessage property.
V	SetStatusCode (see page 4526)	Sets the StatusCode property.
V	SetStringVariable (see page 4527)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	Create (see page 4520)	Creates an instance of TISAPIResponse (see page 4518) to represent the response to the HTTPRequest parameter.
V	Destroy (see page 3392)	Disposes of an object instance.
	GetCustomHeader (see page 3395)	Returns the value of the custom header with the specified name.
V	SendRedirect (see page 4524)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
V	SendResponse (see page 4524)	Sends the ISAPI response message to the web client.
V	SendStream (see page 4524)	Sends the ISAPI response message with the contents set to the contents of AStream.
V	Sent (see page 4525)	Indicates whether the ISAPI response message has been sent.
	SetCookieField (see page 3400)	Adds a cookie header to the response message.
	SetCustomHeader (see page 3400)	Replaces the value of a specified custom header.

Public Properties

	Name	Description
	Allow (see page 3404)	Lists the HTTP request methods that the application can service.
	Content (see page 3404)	Contains the information sent to the web client in response to an HTTP request message.
	ContentEncoding (see page 3405)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 3405)	Specifies the length, in bytes, of the Content (see page 3404) property.
	ContentStream (see page 3406)	Specifies the stream object for writing the contents of the HTTP response message to the web client.

	ContentType (see page 3406)	Indicates the media type of the Content (see page 3404) of the HTTP response message.
	ContentVersion (see page 3407)	Represents the version associated with the Content (see page 3404) of the HTTP response message.
R	Cookies (see page 3407)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 3408)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 3408)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 3409)	Specifies the URI of the resource where the Content (see page 3404) of the HTTP response originated.
	Expires (see page 3409)	Specifies the date and time after which the Content (see page 3404) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 3410)	Represents the HTTP request message for which this is a response.
	LastModified (see page 3410)	Indicates the date and time that the value of the Content (see page 3404) property was last updated.
	Location (see page 3411)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 3411)	Describes the HTTP response message for event logging purposes.
	RawContent (see page 3411)	This is RawContent, a member of class TWebResponse.
	Realm (see page 3411)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 3412)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 3412)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 3413)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 3414)	Specifies a title for the Content (see page 3404) of the HTTP response message.
	Version (see page 3415)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 3415)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).

40.1.2.2 TISAPIResponse.Create Constructor

Creates an instance of TISAPIResponse (see page 4518) to represent the response to the HTTPRequest parameter.

Pascal

```
constructor Create(HTTPRequest: TWebRequest);
```

C++

```
__fastcall TISAPIResponse(TWebRequest HTTPRequest);
```

Description

Applications don't need to call Create to instantiate a ISAPI response object. TISAPIApplication creates a TISAPIResponse (see page 4518) for each TISAPIRequest (see page 4510) it creates.

See Also

TISAPIApplication (see page 4500)

TISAPIRequest (see page 4510)

40.1.2.3 TISAPIResponse Methods

The methods of the TISAPIResponse class are listed here.

Protected Methods

	Name	Description
	GetContent (see page 4521)	Reads the value of the Content property.
	GetDateVariable (see page 4521)	Extracts a date from the internal table of HTTP header variables.
	GetIntegerVariable (see page 4522)	Extracts an integer value from the internal table of HTTP header variables.
	GetLogMessage (see page 4522)	Reads the value of the LogMessage property.
	GetStatusCode (see page 4522)	Reads the value of the StatusCode property.
	GetStringVariable (see page 4523)	Extracts a string value from the internal table of HTTP header variables.
	InitResponse (see page 4523)	This is InitResponse, a member of class TISAPIResponse.
	SetContent (see page 4525)	Sets the Content property.
	SetDateVariable (see page 4525)	Sets a date-time valued HTTP header property.
	SetIntegerVariable (see page 4526)	Sets an integer valued HTTP header property.
	SetLogMessage (see page 4526)	Sets the value of the LogMessage property.
	SetStatusCode (see page 4526)	Sets the StatusCode property.
	SetStringVariable (see page 4527)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	SendRedirect (see page 4524)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
	SendResponse (see page 4524)	Sends the ISAPI response message to the web client.
	SendStream (see page 4524)	Sends the ISAPI response message with the contents set to the contents of AStream.
	Sent (see page 4525)	Indicates whether the ISAPI response message has been sent.

40.1.2.3.1 TISAPIResponse.GetContent Method

Reads the value of the Content property.

Pascal

```
function GetContent: AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetContent();
```

Description

GetContent is the protected access function for the Content property.

See Also

Content (see page 3404)

SetContent (see page 4525)

40.1.2.3.2 TISAPIResponse.GetDateVariable Method

Extracts a date from the internal table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

The ISAPI response object uses GetDateVariable to access the properties that represent dates.

See Also

Date (see page 3408)

Expires (see page 3409)

LastModified (see page 3410)

SetDateVariable (see page 4525)

40.1.2.3.3 TISAPIResponse.GetIntegerVariable Method

Extracts an integer value from the internal table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

The ISAPI response object uses GetIntegerVariable to access the properties that represent integers.

See Also

ContentLength (see page 3405)

SetIntegerVariable (see page 4526)

40.1.2.3.4 TISAPIResponse.GetLogMessage Method

Reads the value of the LogMessage property.

Pascal

```
function GetLogMessage: string; override;
```

C++

```
virtual __fastcall UnicodeString GetLogMessage();
```

Description

GetLogMessage is the protected access function for LogMessage property.

See Also

LogMessage (see page 3411)

SetLogMessage (see page 4526)

40.1.2.3.5 TISAPIResponse.GetStatusCode Method

Reads the value of the StatusCode property.

Pascal

```
function GetStatusCode: Integer; override;
```

C++

```
virtual __fastcall int GetStatusCode();
```

Description

GetStatusCode is the protected access function for the StatusCode property.

See Also

StatusCode (see page 3413)

SetStatusCode (see page 3402)

40.1.2.3.6 TISAPIResponse.GetStringVariable Method

Extracts a string value from the internal table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

The ISAPI response object uses GetStringVariable to access the properties that represent strings.

See Also

Allow (see page 3404)

ContentEncoding (see page 3405)

ContentType (see page 3406)

ContentVersion (see page 3407)

DerivedFrom (see page 3409)

Location (see page 3411)

Realm (see page 3411)

ReasonString (see page 3412)

Server (see page 3412)

SetStringVariable (see page 4527)

Title (see page 3414)

Version (see page 3415)

WWWAuthenticate (see page 3415)

40.1.2.3.7 TISAPIResponse.InitResponse Method

Pascal

```
procedure InitResponse; virtual;
```

C++

```
virtual __fastcall InitResponse();
```

Description

This is InitResponse, a member of class TISAPIResponse.

40.1.2.3.8 TISAPIResponse.SendRedirect Method

Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.

Pascal

```
procedure SendRedirect(const URI: AnsiString); override;
```

C++

```
virtual __fastcall SendRedirect(const AnsiString URI);
```

Description

Call SendRedirect to redirect the web client request to another URI that is the proper target of the request. SendRedirect does the same thing as setting the StatusCode to 301, the Location to URI, and calling SendResponse (see page 4524).

See Also

Location (see page 3411)

SendResponse (see page 4524)

StatusCode (see page 3413)

40.1.2.3.9 TISAPIResponse.SendResponse Method

Sends the ISAPI response message to the web client.

Pascal

```
procedure SendResponse; override;
```

C++

```
virtual __fastcall SendResponse();
```

Description

Call SendResponse after setting the properties of the HTTP response object to specify the response that should be made to the web client. If the request should be redirected to another URI, it is more efficient to call SendRedirect (see page 4524).

See Also

SendRedirect (see page 4524)

40.1.2.3.10 TISAPIResponse.SendStream Method

Sends the ISAPI response message with the contents set to the contents of AStream.

Pascal

```
procedure SendStream(AStream: TStream); override;
```

C++

```
virtual __fastcall SendStream(TStream AStream);
```

Description

Only call SendStream after first calling SendResponse (see page 4524). Unlike SendStream, SendResponse (see page 4524) fills the header of the HTTP response message, based on the properties of the TISAPIResponse (see page 4518) object. If SendResponse (see page 4524) has not been called first to set the header of the HTTP response message, set the ContentStream property to AStream, and call SendResponse (see page 4524).

See Also

ContentStream (see page 3406)

SendResponse (see page 4524)

Sent (see page 4525)

40.1.2.3.11 TISAPIResponse.Sent Method

Indicates whether the ISAPI response message has been sent.

Pascal

```
function Sent: Boolean; override;
```

C++

```
virtual __fastcall Boolean Sent();
```

Description

Sent returns true if the SendRedirect (see page 4524) or SendStream (see page 4524) method has been called. TISAPIApplication objects read Sent to determine whether they should send a response to the web client.

See Also

SendRedirect (see page 4524)

SendStream (see page 4524)

40.1.2.3.12 TISAPIResponse.SetContent Method

Sets the Content property.

Pascal

```
procedure SetContent(const Value: AnsiString); override;
```

C++

```
virtual __fastcall SetContent(const AnsiString Value);
```

Description

SetContent is the protected method used by ISAPI response objects to set the Content property.

See Also

Content (see page 3404)

GetContent (see page 4521)

40.1.2.3.13 TISAPIResponse.SetDateVariable Method

Sets a date-time valued HTTP header property.

Pascal

```
procedure SetDateVariable(Index: Integer; const Value: TDateTime); override;
```

C++

```
virtual __fastcall SetDateVariable(int Index, const TDateTime Value);
```

Description

SetDateVariable writes date-time to the internal table used to store HTTP header variables. The ISAPI response object uses SetDateVariable to set the properties that represent dates.

See Also

Date (see page 3408)

Expires (see page 3409)

GetDateVariable (see page 4521)

LastModified (see page 3410)

40.1.2.3.14 TISAPIResponse.SetIntegerVariable Method

Sets an integer valued HTTP header property.

Pascal

```
procedure SetIntegerVariable(Index: Integer; Value: Integer); override;
```

C++

```
virtual __fastcall SetIntegerVariable(int Index, int Value);
```

Description

SetIntegerVariable writes integer values to the internal table used to store HTTP header variables. The ISAPI response object uses SetIntegerVariable to set the properties that represent integers.

See Also

ContentLength (see page 3405)

GetIntegerVariable (see page 4522)

40.1.2.3.15 TISAPIResponse.SetLogMessage Method

Sets the value of the LogMessage property.

Pascal

```
procedure SetLogMessage(const Value: string); override;
```

C++

```
virtual __fastcall SetLogMessage(const UnicodeString Value);
```

Description

SetLogMessage is the protected method used by ISAPI response objects to set the LogMessage property.

See Also

GetLogMessage (see page 4522)

LogMessage (see page 3411)

40.1.2.3.16 TISAPIResponse.SetStatusCode Method

Sets the StatusCode property.

Pascal

```
procedure SetStatusCode(Value: Integer); override;
```

C++

```
virtual __fastcall SetStatusCode(int Value);
```

Description

SetStatusCode is the protected method used by ISAPI response objects to set the StatusCode property.

See Also

StatusCode (see page 3413)

GetStatusCode (see page 3396)

40.1.2.3.17 TISAPIResponse.SetStringVariable Method

Sets a string valued HTTP header property.

Pascal

```
procedure SetStringVariable(Index: Integer; const Value: AnsiString); override;
```

C++

```
virtual __fastcall SetStringVariable(int Index, const AnsiString Value);
```

Description

SetStringVariable writes string values to the internal table used to store HTTP header variables. The ISAPI response object uses SetStringVariable to set the properties that represent strings.

See Also

Allow (see page 3404)

ContentEncoding (see page 3405)

ContentType (see page 3406)

ContentVersion (see page 3407)

Version (see page 3415)

WWWAuthenticate (see page 3415)

41 Java Namespace

This is namespace Java.

Namespaces

Name	Description
Sql (see page 4530)	This is namespace Java.Sql.

41.1 Java.Sql Namespace

This is namespace Java.Sql.

Topics

Name	Description
Classes (see page 4530)	The following table lists classes in this documentation.

Classes

	Name	Description
	SQLException (see page 4530)	This is class Java.Sql.SQLException.

41.1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	SQLException (see page 4530)	This is class Java.Sql.SQLException.

41.1.1.1 SQLException Class

Class Hierarchy

Pascal

```
SQLException = class(System.Exception);
```

C++

```
class SQLException : public System.Exception;
```

File

SQLException.cs

Description

This is class Java.Sql.SQLException.

41.1.1.1.1 SQLException Members

The following tables list the members exposed by SQLException.

Public Methods

	Name	Description
	SQLException (see page 4531)	This is the overview for the SQLException constructor overload.

Public Properties

	Name	Description
	ErrorCode (see page 4531)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 4532)	This is SQLState, a member of class SQLException.

41.1.1.1.2 SQLException Constructor

This is the overview for the SQLException constructor overload.

Overload List

	Name	Description
	SQLException.SQLException (string) (see page 4531)	This is SQLException, a member of class SQLException.
	SQLException.SQLException (string, string, int, Exception) (see page 4531)	This is SQLException, a member of class SQLException.

41.1.1.1.2.1 SQLException.SQLException Constructor (string)

Pascal

```
constructor Create(reason: string);
```

C++

```
SQLException(string reason);
```

Description

This is SQLException, a member of class SQLException.

41.1.1.1.2.2 SQLException.SQLException Constructor (string, string, int, Exception)

Pascal

```
constructor Create(reason: string; SQLState: string; vendorCode: Integer; cause: Exception);
```

C++

```
SQLException(string reason, string SQLState, int vendorCode, Exception cause);
```

Description

This is SQLException, a member of class SQLException.

41.1.1.1.3 SQLException Properties

The properties of the SQLException class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 4531)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 4532)	This is SQLState, a member of class SQLException.

41.1.1.1.3.1 SQLException.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class SQLException.

41.1.1.1.3.2 SQLException.SQLState Property

Pascal

```
property SQLState: string;
```

C++

```
__property string SQLState;
```

Description

This is SQLState, a member of class SQLException.

42 ListActns Namespace

This is namespace ListActns.

Topics

Name	Description
Classes (see page 4535)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4586)	The following table lists structs, records, enums in this documentation.
Types (see page 4587)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 4535)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 4543)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 4548)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 4550)	This is class ListActns.TListActionLink.
	TListControlItem (see page 4554)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 4560)	TListControlItems manages a collection of TListControlItem (see page 4554) objects.
	TStaticListAction (see page 4567)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 4576)	TStaticListItems represents the items that TStaticListAction (see page 4567) supplies to client controls.
	TVirtualListAction (see page 4578)	TVirtualListAction provides items to a client controls.

Structs, Records, Enums

	Name	Description
	TListItemsSortType (see page 4586)	This is record ListActns.TListItemsSortType.

Types

Name	Description
TGetItemCountEvent (see page 4587)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 4587)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 4588)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 4588)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 4588)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 4589)	This is type ListActns.TListControlItemClass.

TListItemsCompare (see page 4589)	This is type ListActns.TListItemsCompare.

42.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 4535)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 4543)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 4548)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 4550)	This is class ListActns.TListActionLink.
	TListControlItem (see page 4554)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 4560)	TListControlItems manages a collection of TListControlItem (see page 4554) objects.
	TStaticListAction (see page 4567)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 4576)	TStaticListItems represents the items that TStaticListAction (see page 4567) supplies to client controls.
	TVirtualListAction (see page 4578)	TVirtualListAction provides items to a client controls.

42.1.1 TCustomListAction Class

TCustomListAction is the base class for action objects that provide items to client controls.

Class Hierarchy

Pascal

```
TCustomListAction = class(TCustomAction);
```

C++

```
class TCustomListAction : public TCustomAction;
```

File

ListActns

Description

TCustomListAction implements the common behavior for actions that supply the items to a list view, list box or combo box.

When an application sets the Active (see page 4540) property of a list action to true, the action fills all client list boxes and combo boxes with items. Each item may include information such as a text caption, an image, and a pointer to data.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 4542) event.

When a TCustomListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

See Also

TStaticListAction (see page 4567)

TVirtualListAction (see page 4578)

42.1.1.1 TCustomListAction Members

The following tables list the members exposed by TCustomListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 4542)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 4542)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 4537)	This is GetCount, a member of class TCustomListAction.
V	GetString (see page 4538)	Returns the value of the Strings (see page 4541) property.
V	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
V	SetString (see page 4539)	Sets the value of the Strings (see page 4541) property.

Protected Properties

	Name	Description
	Images (see page 4540)	Lists the images that the list action supplies along with items.
R	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
V	Create (see page 4536)	Creates an instance of TCustomListAction (see page 4535).
V	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
V	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 4540)	Indicates whether the list action has supplied items to its client controls.
R	Count (see page 4540)	This is Count, a member of class TCustomListAction.
	ItemIndex (see page 4541)	Specifies the index of the selected item.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

42.1.1.2 TCustomListAction.Create Constructor

Creates an instance of TCustomListAction (see page 4535).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomListAction (see page 4535) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomListAction (see page 4535) instance.

See Also

Owner

42.1.1.3 TCustomListAction Methods

The methods of the TCustomListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 4537)	This is GetCount, a member of class TCustomListAction.
	GetString (see page 4538)	Returns the value of the Strings (see page 4541) property.
	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
	SetString (see page 4539)	Sets the value of the Strings (see page 4541) property.

Public Methods

	Name	Description
	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

42.1.1.3.1 TCustomListAction.ExecuteTarget Method

Generates an OnItemSelected (see page 4542) event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget is called automatically when the user selects one of the items that the list action supplies to a client list box or combo box.

Target is the control whose item was selected.

ExecuteTarget updates the ItemIndex (see page 4541) property of all client controls that descend from TCustomListControl, and then generates an OnItemSelected (see page 4542) event, where your application can respond to the user's selection.

See Also

OnItemSelected (see page 4542)

ItemIndex (see page 4541)

42.1.1.3.2 TCustomListAction.GetCount Method

Pascal

```
function GetCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TCustomListAction.

42.1.1.3.3 TCustomListAction.GetString Method

Returns the value of the Strings (see page 4541) property.

Pascal

```
function GetString(Index: Integer): String; virtual;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings (see page 4541) property.

In TCustomListAction (see page 4535), GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings (see page 4541) property. For example, TStaticListAction (see page 4567) overrides GetString to return the caption of the specified item.

See Also

strings (see page 4541)

42.1.1.3.4 TCustomListAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget always returns true because the list action's ability to perform its function is not dependant on any particular target.

See Also

ExecuteTarget (see page 4537)

UpdateTarget

42.1.1.3.5 TCustomListAction.Loaded Method

Initializes the action after it is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically when the form or data module containing the action has been completely loaded into memory. TCustomListAction (see page 4535) overrides the inherited method to set Active (see page 4540) and Images (see page 4540) properties now that the other components involved (the client controls whose items are set when Active (see page 4540) becomes true and the image list component that is the value of Images (see page 4540)) are known to be loaded into memory.

See Also

Loaded

Images (see page 4540)

Active (see page 4540)

42.1.1.3.6 TCustomListAction.SetString Method

Sets the value of the Strings (see page 4541) property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); virtual;
```

C++

```
virtual __fastcall SetString(int Index, const UnicodeString Value);
```

Description

SetString is the protected write implementation of the Strings (see page 4541) property.

In TCustomListAction (see page 4535), SetString does nothing.

Override SetString to provide a more meaningful value to the Strings (see page 4541) property. For example, TStaticListAction (see page 4567) overrides SetString to set the caption of the specified item.

See Also

strings (see page 4541)

42.1.1.4 TCustomListAction Properties

The properties of the TCustomListAction class are listed here.

Protected Properties

	Name	Description
	Images (see page 4540)	Lists the images that the list action supplies along with items.
R	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Properties

	Name	Description
	Active (see page 4540)	Indicates whether the list action has supplied items to its client controls.
R	Count (see page 4540)	This is Count, a member of class TCustomListAction.
	ItemIndex (see page 4541)	Specifies the index of the selected item.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

42.1.1.4.1 TCustomListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count (see page 4540).

See Also

GetItem

getitem

Items

items

Items

count (see page 4540)

Items

strings (see page 4541)

42.1.1.4.2 TCustomListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomListAction.

42.1.1.4.3 TCustomListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

42.1.1.4.4 TCustomListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction (see page 4535) automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 4542)

ItemIndex

42.1.1.4.5 TCustomListAction.Loading Property

Indicates whether the action is currently adding items to client controls.

Pascal

```
property Loading: Boolean;
```

C++

```
__property Boolean Loading;
```

Description

Loading is used internally to detect when the list action is in the process of supplying client controls with items.

See Also

Active (see page 4540)

42.1.1.4.6 TCustomListAction.Strings Property

Pascal

```
property Strings [Index: Integer]: String;
```

C++

```
__property UnicodeString Strings[int Index];
```

Description

This is Strings, a member of class TCustomListAction.

42.1.1.5 TCustomListAction Events

The events of the TCustomListAction class are listed here.

Protected Events

	Name	Description
	OnGetItemCount (see page 4542)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 4542)	Occurs when a client control executes the action because a user selected one of the items.

42.1.1.5.1 TCustomListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount (see page 4537) method generates an OnGetItemCount event to supply the value of the Count (see page 4540) property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count (see page 4540) returns the number of items this list action supplies to client controls.

See Also

getcount (see page 4537)

count (see page 4540)

42.1.1.5.2 TCustomListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex (see page 4541) property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 4537)

ItemIndex (see page 4541)

42.1.2 TCustomStaticListAction Class

Class Hierarchy

Pascal

```
TCustomStaticListAction = class(TCustomListAction);
```

C++

```
class TCustomStaticListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomStaticListAction.

42.1.2.1 TCustomStaticListAction Members

The following tables list the members exposed by TCustomStaticListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 4542)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 4542)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 4545)	This is GetCount, a member of class TCustomStaticListAction.
	GetItem (see page 4545)	This is GetItem, a member of class TCustomStaticListAction.
V	GetItemClass (see page 4545)	This is GetItemClass, a member of class TCustomStaticListAction.
V	GetString (see page 4546)	Returns the value of the Strings property.
V	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
V	SetString (see page 4546)	Sets the value of the Strings property.

Protected Properties

	Name	Description
	Clients (see page 4547)	This is Clients, a member of class TCustomStaticListAction.
	Images (see page 4540)	Lists the images that the list action supplies along with items.
R	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Events

	Name	Description
	OnGetItem (see page 4547)	This is OnGetItem, a member of class TCustomStaticListAction.

Public Methods

	Name	Description
	Create (see page 4544)	Creates an instance of TCustomListAction.
	Destroy (see page 4544)	Frees an instance of TCustomAction.
	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 4540)	Indicates whether the list action has supplied items to its client controls.
	Count (see page 4547)	This is Count, a member of class TCustomStaticListAction.
	ItemIndex (see page 4541)	Specifies the index of the selected item.
	Items (see page 4547)	This is Items, a member of class TCustomStaticListAction.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

42.1.2.2 TCustomStaticListAction.Create Constructor

Creates an instance of TCustomListAction.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStaticListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomListAction constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomListAction instance.

See Also

Owner

42.1.2.3 TCustomStaticListAction.Destroy Destructor

Frees an instance of TCustomAction.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStaticListAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create

Actions

42.1.2.4 TCustomStaticListAction Methods

The methods of the TCustomStaticListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 4545)	This is GetCount, a member of class TCustomStaticListAction.
	GetItem (see page 4545)	This is GetItem, a member of class TCustomStaticListAction.
	GetItemClass (see page 4545)	This is GetItemClass, a member of class TCustomStaticListAction.
	GetString (see page 4546)	Returns the value of the Strings property.
	SetString (see page 4546)	Sets the value of the Strings property.

42.1.2.4.1 TCustomStaticListAction.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TCustomStaticListAction.

42.1.2.4.2 TCustomStaticListAction.GetItem Method

Pascal

```
function GetItem(const Index: Integer; AnItem: TListControlItem): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, TListControlItem AnItem);
```

Description

This is GetItem, a member of class TCustomStaticListAction.

42.1.2.4.3 TCustomStaticListAction.GetItemClass Method

Pascal

```
function GetItemClass: TListControlItemClass; virtual;
```

C++

```
virtual __fastcall TListControlItemClass GetItemClass();
```

Description

This is GetItemClass, a member of class TCustomStaticListAction.

42.1.2.4.4 TCustomStaticListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

strings (see page 4541)

42.1.2.4.5 TCustomStaticListAction.SetString Method

Sets the value of the Strings property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); override;
```

C++

```
virtual __fastcall SetString(int Index, const UnicodeString Value);
```

Description

SetString is the protected write implementation of the Strings property.

In TCustomListAction, SetString does nothing.

Override SetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides SetString to set the caption of the specified item.

See Also

strings (see page 4541)

42.1.2.5 TCustomStaticListAction Properties

The properties of the TCustomStaticListAction class are listed here.

Protected Properties

	Name	Description
	Clients (see page 4547)	This is Clients, a member of class TCustomStaticListAction.

Public Properties

	Name	Description
	Count (see page 4547)	This is Count, a member of class TCustomStaticListAction.
	Items (see page 4547)	This is Items, a member of class TCustomStaticListAction.

42.1.2.5.1 TCustomStaticListAction.Clients Property

Pascal

```
property Clients;
```

C++

```
__property Clients;
```

Description

This is Clients, a member of class TCustomStaticListAction.

42.1.2.5.2 TCustomStaticListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomStaticListAction.

42.1.2.5.3 TCustomStaticListAction.Items Property

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

This is Items, a member of class TCustomStaticListAction.

42.1.2.6 TCustomStaticListAction Events

The events of the TCustomStaticListAction class are listed here.

Public Events

	Name	Description
	OnGetItem (see page 4547)	This is OnGetItem, a member of class TCustomStaticListAction.

42.1.2.6.1 TCustomStaticListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TCustomStaticListAction.

42.1.3 TCustomVirtualListAction Class

Class Hierarchy

Pascal

```
TCustomVirtualListAction = class(TCustomListAction);
```

C++

```
class TCustomVirtualListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomVirtualListAction.

42.1.3.1 TCustomVirtualListAction Members

The following tables list the members exposed by TCustomVirtualListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 4542)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 4542)	Occurs when a client control executes the action because a user selected one of the items.

Protected Methods

	Name	Description
V	GetCount (see page 4537)	This is GetCount, a member of class TCustomListAction.
	GetItem (see page 4549)	This is GetItem, a member of class TCustomVirtualListAction.
V	GetString (see page 4549)	Returns the value of the Strings property.
V	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
V	SetString (see page 4539)	Sets the value of the Strings (see page 4541) property.

Protected Properties

	Name	Description
	Images (see page 4540)	Lists the images that the list action supplies along with items.
R	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Events

	Name	Description
	OnGetItem (see page 4550)	This is OnGetItem, a member of class TCustomVirtualListAction.

Public Methods

	Name	Description
	Create (see page 4536)	Creates an instance of TCustomListAction (see page 4535).
	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Active (see page 4540)	Indicates whether the list action has supplied items to its client controls.
	Count (see page 4550)	This is Count, a member of class TCustomVirtualListAction.
	ItemIndex (see page 4541)	Specifies the index of the selected item.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

42.1.3.2 TCustomVirtualListAction Methods

The methods of the TCustomVirtualListAction class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 4549)	This is GetItem, a member of class TCustomVirtualListAction.
	GetString (see page 4549)	Returns the value of the Strings property.

42.1.3.2.1 TCustomVirtualListAction.GetItem Method

Pascal

```
function GetItem(const Index: Integer; var Value: String; var ImageIndex: Integer; var Data:
TCustomData): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, UnicodeString Value, int ImageIndex, TCustomData
Data);
```

Description

This is GetItem, a member of class TCustomVirtualListAction.

42.1.3.2.2 TCustomVirtualListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall UnicodeString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

strings (see page 4541)

42.1.3.3 TCustomVirtualListAction Properties

The properties of the TCustomVirtualListAction class are listed here.

Public Properties

	Name	Description
	Count (see page 4550)	This is Count, a member of class TCustomVirtualListAction.

42.1.3.3.1 TCustomVirtualListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomVirtualListAction.

42.1.3.4 TCustomVirtualListAction Events

The events of the TCustomVirtualListAction class are listed here.

Public Events

	Name	Description
	OnGetItem (see page 4550)	This is OnGetItem, a member of class TCustomVirtualListAction.

42.1.3.4.1 TCustomVirtualListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TCustomVirtualListAction.

42.1.4 TListActionLink Class

Class Hierarchy

Pascal

```
TListActionLink = class(TWinControlActionLink);
```

C++

```
class TListActionLink : public TWinControlActionLink;
```

File

ListActns

Description

This is class ListActns.TListActionLink.

42.1.4.1 TListActionLink Members

The following tables list the members exposed by TListActionLink.

Protected Methods

	Name	Description
	AddItem (see page 4551)	This is the overview for the AddItem method overload.
	IsActiveLinked (see page 4552)	This is IsActiveLinked, a member of class TListActionLink.
	IsImagesLinked (see page 4552)	This is IsImagesLinked, a member of class TListActionLink.
	RefreshControl (see page 4553)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 4553)	This is SetAction, a member of class TListActionLink.
	SetActive (see page 4553)	This is SetActive, a member of class TListActionLink.
	SetImages (see page 4553)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 4553)	This is SetItemIndex, a member of class TListActionLink.

42.1.4.2 TListActionLink Methods

The methods of the TListActionLink class are listed here.

Protected Methods

	Name	Description
	AddItem (see page 4551)	This is the overview for the AddItem method overload.
	IsActiveLinked (see page 4552)	This is IsActiveLinked, a member of class TListActionLink.
	IsImagesLinked (see page 4552)	This is IsImagesLinked, a member of class TListActionLink.
	RefreshControl (see page 4553)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 4553)	This is SetAction, a member of class TListActionLink.
	SetActive (see page 4553)	This is SetActive, a member of class TListActionLink.
	SetImages (see page 4553)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 4553)	This is SetItemIndex, a member of class TListActionLink.

42.1.4.2.1 AddItem Method

This is the overview for the AddItem method overload.

Overload List

	Name	Description
	TListActionLink.AddItem (String, Integer, TCustomData) (see page 4552)	This is AddItem, a member of class TListActionLink.

	TListActionLink.AddItem (TListControlItem) (see page 4552)	This is AddItem, a member of class TListActionLink.

42.1.4.2.1.1 TListActionLink.AddItem Method (String, Integer, TCustomData)

Pascal

```
procedure AddItem(ACaption: String; AImageIndex: Integer; DataPtr: TCustomData); virtual;
overload;
```

C++

```
virtual __fastcall AddItem(UnicodeString ACaption, int AImageIndex, TCustomData DataPtr);
```

Description

This is AddItem, a member of class TListActionLink.

42.1.4.2.1.2 TListActionLink.AddItem Method (TListControlItem)

Pascal

```
procedure AddItem(AnItem: TListControlItem); virtual; overload;
```

C++

```
virtual __fastcall AddItem(TListControlItem AnItem);
```

Description

This is AddItem, a member of class TListActionLink.

42.1.4.2.2 TListActionLink.IsActiveLinked Method

Pascal

```
function IsActiveLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsActiveLinked();
```

Description

This is IsActiveLinked, a member of class TListActionLink.

42.1.4.2.3 TListActionLink.IsImagesLinked Method

Pascal

```
function IsImagesLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsImagesLinked();
```

Description

This is IsImagesLinked, a member of class TListActionLink.

42.1.4.2.4 TListActionLink.RefreshControl Method

Pascal

```
procedure RefreshControl;
```

C++

```
__fastcall RefreshControl();
```

Description

This is RefreshControl, a member of class TListActionLink.

42.1.4.2.5 TListActionLink.SetAction Method

Pascal

```
procedure SetAction(Value: TBasicAction); override;
```

C++

```
virtual __fastcall SetAction(TBasicAction Value);
```

Description

This is SetAction, a member of class TListActionLink.

42.1.4.2.6 TListActionLink.SetActive Method

Pascal

```
procedure SetActive(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetActive(const Boolean Value);
```

Description

This is SetActive, a member of class TListActionLink.

42.1.4.2.7 TListActionLink.SetImages Method

Pascal

```
procedure SetImages(Value: TCustomImageList); virtual;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

This is SetImages, a member of class TListActionLink.

42.1.4.2.8 TListActionLink.SetItemIndex Method

Pascal

```
procedure SetItemIndex(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

This is SetItemIndex, a member of class TListActionLink.

42.1.5 TListControlItem Class

TListControlItem represents an item with a text value, an image, and a data pointer.

Class Hierarchy

Pascal

```
TListControlItem = class(TCollectionItem);
```

C++

```
class TListControlItem : public TCollectionItem;
```

File

ListActns

Description

TListControlItem represents a single item in a control that lists items. TListControlItem objects are used by TStaticListAction (see page 4567) to represent the items in a variety of client controls such as list views, list boxes, and combo boxes. In addition, TListControlItem is the base class for TComboExItem, which is specialized to work with the TComboBoxEx control.

Each TListControlItem has

A text value, which it stores as the Caption (see page 4559) property.

An associated image, which is identified by the ImageIndex (see page 4560) property.

A data pointer, which it stores as the Data (see page 4560) property.

See Also

TListControlItems (see page 4560)

TComboExItem

42.1.5.1 TListControlItem Members

The following tables list the members exposed by TListControlItem.

Protected Fields

	Name	Description
	FCaption (see page 4555)	This is FCaption, a member of class TListControlItem.
	FData (see page 4556)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 4556)	This is FImageIndex, a member of class TListControlItem.

Protected Methods

	Name	Description
	Changed (see page 4557)	Responds when any of the item's properties changes.
	GetDisplayName (see page 4558)	Specifies the name of the item as it appears in the Object Inspector.
	SetCaption (see page 4558)	Sets the value of the Caption (see page 4559) property.

	SetData (see page 4558)	Sets the value of the Data (see page 4560) property.
	SetImageIndex (see page 4559)	Sets the value of the ImageIndex (see page 4560) property.

Public Methods

	Name	Description
	Assign (see page 4556)	Copies the contents of another, similar object.
	Create (see page 4555)	Creates and initializes a TListControlItem (see page 4554) instance.

Public Properties

	Name	Description
	Data (see page 4560)	Points to user-defined data associated with the control.

Published Properties

	Name	Description
	Caption (see page 4559)	Specifies the text value of the item.
	ImageIndex (see page 4560)	Identifies the image associated with this item.

42.1.5.2 TListControlItem.Create Constructor

Creates and initializes a TListControlItem (see page 4554) instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TListControlItem(TCollection Collection);
```

Description

Do not call the constructor to create a TListControlItem (see page 4554) instance. Instead, use the collection's Add method to create a new list control item.

Collection is the collection object that owns and manages this list control item.

Add

42.1.5.3 TListControlItem Fields

The fields of the TListControlItem class are listed here.

Protected Fields

	Name	Description
	FCaption (see page 4555)	This is FCaption, a member of class TListControlItem.
	FData (see page 4556)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 4556)	This is FImageIndex, a member of class TListControlItem.

42.1.5.3.1 TListControlItem.FCaption Field

Pascal

```
FCaption: String;
```

C++

```
UnicodeString FCaption;
```

Description

This is FCaption, a member of class TListControlItem.

42.1.5.3.2 TListControlItem.FData Field

Pascal

```
FData: TCustomData;
```

C++

```
TCustomData FData;
```

Description

This is FData, a member of class TListControlItem.

42.1.5.3.3 TListControlItem.FImageIndex Field

Pascal

```
FImageIndex: TImageIndex;
```

C++

```
TImageIndex FImageIndex;
```

Description

This is FImageIndex, a member of class TListControlItem.

42.1.5.4 TListControlItem Methods

The methods of the TListControlItem class are listed here.

Protected Methods

	Name	Description
	Changed (see page 4557)	Responds when any of the item's properties changes.
	GetDisplayName (see page 4558)	Specifies the name of the item as it appears in the Object Inspector.
	SetCaption (see page 4558)	Sets the value of the Caption (see page 4559) property.
	SetData (see page 4558)	Sets the value of the Data (see page 4560) property.
	SetImageIndex (see page 4559)	Sets the value of the ImageIndex (see page 4560) property.

Public Methods

	Name	Description
	Assign (see page 4556)	Copies the contents of another, similar object.

42.1.5.4.1 TListControlItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError

42.1.5.4.2 TListControlItem.Changed Method

Responds when any of the item's properties changes.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Changed is called automatically when the item's properties change. It calls the Update method of the corresponding TListControlItems (see page 4560) object, so that the collection can perform any necessary adjustments.

See Also

Update

42.1.5.4.3 TListControlItem.GetDisplayName Method

Specifies the name of the item as it appears in the Object Inspector.

Pascal

```
function GetDisplayName: String; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName returns the string that represents the item in the Collection editor and the Object Inspector.

GetDisplayName returns the value of the Caption (see page 4559) if it is set. Otherwise, it returns the class name of the TListControlItem (see page 4554) descendant for which this is an instance, with a number added to ensure uniqueness.

See Also

Caption (see page 4559)

42.1.5.4.4 TListControlItem.SetCaption Method

Sets the value of the Caption (see page 4559) property.

Pascal

```
procedure SetCaption(const Value: String); virtual;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString Value);
```

Description

SetCaption is the protected write implementation of the Caption (see page 4559) property. It sets the Caption (see page 4559) property to Value, and then calls the Changed (see page 4557) method so that the collection can update itself.

See Also

Caption (see page 4559)

Changed (see page 4557)

42.1.5.4.5 TListControlItem.SetData Method

Sets the value of the Data (see page 4560) property.

Pascal

```
procedure SetData(const Value: TCustomData); virtual;
```

C++

```
virtual __fastcall SetData(const TCustomData Value);
```

Description

SetData is the protected write implementation of the Data (see page 4560) property. It sets the Data (see page 4560) property to Value, and then calls the Changed (see page 4557) method so that the collection can update itself.

See Also

Data (see page 4560)

Changed (see page 4557)

42.1.5.4.6 TListControlItem.SetImageIndex Method

Sets the value of the ImageIndex (see page 4560) property.

Pascal

```
procedure SetImageIndex(const Value: TImageIndex); virtual;
```

C++

```
virtual __fastcall SetImageIndex(const TImageIndex Value);
```

Description

SetImageIndex is the protected write implementation of the ImageIndex (see page 4560) property. It sets the ImageIndex (see page 4560) property to Value, and then calls the Changed (see page 4557) method so that the collection can update itself.

See Also

ImageIndex (see page 4560)

Changed (see page 4557)

42.1.5.5 TListControlItem Properties

The properties of the TListControlItem class are listed here.

Public Properties

	Name	Description
	Data (see page 4560)	Points to user-defined data associated with the control.

Published Properties

	Name	Description
	Caption (see page 4559)	Specifies the text value of the item.
	ImageIndex (see page 4560)	Identifies the image associated with this item.

42.1.5.5.1 TListControlItem.Caption Property

Specifies the text value of the item.

Pascal

```
property Caption: String;
```

C++

```
__property UnicodeString Caption;
```

Description

Set Caption to provide the item with a text value. This is the value that appears in list boxes or combo boxes, or which labels items in list view controls.

See Also

ImageIndex (see page 4560)

Data (see page 4560)

42.1.5.5.2 TListControlItem.Data Property

Points to user-defined data associated with the control.

Pascal

```
property Data: TCustomData;
```

C++

```
__property TCustomData Data;
```

Description

Set Data to associate this item with application-specific data. Data has no predefined meaning, although it is used for sorting items when the managing collection's SortType property is stData.

See Also

SortType (see page 4566)

ImageIndex (see page 4560)

Caption (see page 4559)

42.1.5.5.3 TListControlItem.ImageIndex Property

Identifies the image associated with this item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to associate this item with an image. ImageIndex is an index into the Images property of the component that uses this TListControlItem (see page 4554) object to represent one of its items.

See Also

Images (see page 4540)

Images

42.1.6 TListControlItems Class

TListControlItems manages a collection of TListControlItem (see page 4554) objects.

Class Hierarchy

Pascal

```
TListControlItems = class(TOwnedCollection);
```

C++

```
class TListControlItems : public TOwnedCollection;
```

File

ListActns

Description

TListControlItems manages a collection of items that each include a text value, associated image, and a data pointer.

Use the properties and methods of TListControlItems to:

Access a specific item.

Add (see page 4562) or delete items from the collection.

Find out how many items are in the collection.

Sort (see page 4564) the items in the collection.

Although TListControlItems can be used on its own, it also acts as a base class to classes that manage the items for a specific component. TListControlItems descendants include TComboExItems, which manages the items of a TComboBoxEx control, and TStaticListItems (see page 4576), which manages items for a list action component.

See Also

TListControlItem (see page 4554)

TStaticListItems (see page 4576)

TComboExItems

42.1.6.1 TListControlItems Members

The following tables list the members exposed by TListControlItems.

Protected Methods

	Name	Description
	CompareItems (see page 4563)	Returns the relative order of two items in the collection.
	Update (see page 4564)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 4562)	Adds a new item to the collection.
	Create (see page 4562)	Creates and initializes a TOwnedCollection instance.
	CustomSort (see page 4563)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 4564)	Sorts the items in the collection.

Public Properties

	Name	Description
	Items (see page 4565)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 4567)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 4565)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 4566)	Indicates how the items should be sorted.

42.1.6.2 TListControlItems.Create Constructor

Creates and initializes a TOwnedCollection instance.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass); virtual;
```

C++

```
virtual __fastcall TListControlItems(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes two parameters: the name of an instance object descended from TPersistent and the name of a TCollectionItem descendant class. The first parameter is the owner of the TOwnedCollection instance. The second parameter determines the class of the items created by the Add method.

See Also

Add

42.1.6.3 TListControlItems Methods

The methods of the TListControlItems class are listed here.

Protected Methods

	Name	Description
	CompareItems (see page 4563)	Returns the relative order of two items in the collection.
	Update (see page 4564)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 4562)	Adds a new item to the collection.
	CustomSort (see page 4563)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 4564)	Sorts the items in the collection.

42.1.6.3.1 TListControlItems.Add Method

Adds a new item to the collection.

Pascal

```
function Add: TListControlItem;
```

C++

```
__fastcall TListControlItem Add();
```

Description

Call Add to add a new item to the collection. Add instantiates an object of the type that was specified when the TListControlItems (see page 4560) instance was created. It returns the newly created object.

See Also

Items (see page 4565)

Delete

42.1.6.3.2 TListControlItems.CompareItems Method

Returns the relative order of two items in the collection.

Pascal

```
function CompareItems(I1: TListControlItem; I2: TListControlItem): Integer; virtual;
```

C++

```
virtual __fastcall int CompareItems(TListControlItem I1, TListControlItem I2);
```

Description

CompareItems is used internally to provide the default sort order for items in the list. It is used when the SortType (see page 4566) property is not stNone. The Sort (see page 4564) method also uses this as a comparison function.

If I1 is greater than I2, CompareItems returns a value greater than 0. If I1 is the same as I2, CompareItems returns 0. If I1 is less than I2, CompareItems returns a value less than 0.

CompareItems always uses an OnCompare (see page 4567) event handler if it is assigned. Otherwise, it compares the captions of the items, taking into account the CaseSensitive (see page 4565) property. Descendant classes can override CompareItems to provide a different default sort order.

See Also

SortType (see page 4566)

CustomSort (see page 4563)

Sort (see page 4564)

CaseSensitive (see page 4565)

OnCompare (see page 4567)

42.1.6.3.3 TListControlItems.CustomSort Method

Sorts the items in the collection using a specified comparison function.

Pascal

```
procedure CustomSort(Compare: TListItemsCompare);
```

C++

```
__fastcall CustomSort(TListItemsCompare Compare);
```

Description

Call Sort (see page 4564) to sort the items in the collection based on the comparison function that is the value of the Compare parameter.

Compare is a function that compares two items in the list. Its List parameter is this TListControlItems (see page 4560) object. The Index1 and Index2 parameters are the indexes of the items to compare in the Items (see page 4565) property array. This comparison function should return a value less than 0 if the first item is less than the second, a value greater than 0 if it is greater than the second, and 0 if the two items are equivalent.

Note: CustomSort sorts the items in the list, but does not maintain the sort order when new items are added. To provide a custom sort order that persists when new items are added, set the SortType (see page 4566) property to stData and supply an OnCompare (see page 4567) event handler.

See Also

SortType (see page 4566)

Sort (see page 4564)

OnCompare (see page 4567)

Items (see page 4565)

42.1.6.3.4 TListControlItems.Sort Method

Sorts the items in the collection.

Pascal

```
procedure Sort;
```

C++

```
__fastcall Sort();
```

Description

Call Sort to sort the items in the collection. Sort uses the comparison function specified by the protected CompareItems (see page 4563) method to determine the sort order.

Note: Sort sorts the items in the list, but does not maintain the sort order when new items are added. To impose a sort order that persists when new items are added, set the SortType (see page 4566) property to a value other than stNone and, if desired, supply an OnCompare (see page 4567) event handler.

See Also

SortType (see page 4566)

CustomSort (see page 4563)

OnCompare (see page 4567)

Items (see page 4565)

CompareItems (see page 4563)

42.1.6.3.5 TListControlItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed

Changed

42.1.6.4 TListControlItems Properties

The properties of the TListControlItems class are listed here.

Public Properties

	Name	Description
	Items (see page 4565)	Lists the items in the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 4565)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 4566)	Indicates how the items should be sorted.

42.1.6.4.1 TListControlItems.CaseSensitive Property

Controls whether items are sorted in a case-sensitive or case-insensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the case of item captions should be considered when sorting the items in the list.

See Also

Items (see page 4565)

SortType (see page 4566)

Caption (see page 4559)

42.1.6.4.2 TListControlItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [const Index: Integer]: TListControlItem;
```

C++

```
__property TListControlItem Items[int const Index];
```

Description

Use Items to access the items in this collection.

Index indicates the item to access, where 0 is the index of the first item, 1 is the index of the second item, and so on. The Count property indicates the maximum number of items.

Note: In Delphi code, Items is the default property for TListControlItems (see page 4560). This means that the property name can be omitted when using the Items property. For example,

```
StaticListAction.Items.Items[0].Caption := Edit1.Text;
```

Note: can also be written

```
StaticListAction.Items[0].Caption := Edit1.Text;
```

Note: Items is a read-only property. To add or delete items from the collection, use the Add (see page 4562) and Delete methods.

See Also

Add (see page 4562)

Delete

Count

operator_[]

42.1.6.4.3 TListControlItems.SortType Property

Indicates how the items should be sorted.

Pascal

```
property SortType: TListItemsSortType;
```

C++

```
__property TListItemsSortType SortType;
```

Description

Use SortType to indicate how you want the items sorted, if at all. The following table lists the possible values:

Value	Meaning
stNone	Items (see page 4565) are not automatically sorted. You can still sort the items explicitly by calling the Sort (see page 4564) or CustomSort (see page 4563) method.
stData	Items (see page 4565) are sorted based on the value of their Data property. You must supply an OnCompare (see page 4567) event handler to specify the sort order.
stText	Items (see page 4565) are sorted base on the value of their Caption property. The CaseSensitive (see page 4565) property specifies whether comparisons are case-sensitive.
stBoth	Items (see page 4565) are sorted based on an OnCompare (see page 4567) event handler if one is assigned, otherwise based on the value of their Caption property.

See Also

Items (see page 4565)

OnCompare (see page 4567)

Data (see page 4560)

CaseSensitive (see page 4565)

CustomSort (see page 4563)

Sort (see page 4564)

42.1.6.5 TListControlItems Events

The events of the TListControlItems class are listed here.

Published Events

	Name	Description
	OnCompare (see page 4567)	Occurs to when two items need to be compared for sorting the collection.

42.1.6.5.1 TListControlItems.OnCompare Event

Occurs to when two items need to be compared for sorting the collection.

Pascal

```
property OnCompare: TListCompareEvent;
```

C++

```
__property TListCompareEvent OnCompare;
```

Description

Write an OnCompare event handler to indicate the sort order when the SortType (see page 4566) property is stData or stBoth.

The OnCompare event handler compares the items passed as the Item1 and Item2 parameters. If Item1 is the same as Item2 in the sort order, the event handler should return 0. If Item1 is less than Item2, the event handler should return a value less than 0. If Item1 is greater than Item2, the event handler should return value greater than 0.

See Also

SortType (see page 4566)

42.1.7 TStaticListAction Class

TStaticListAction provides items to client controls.

Class Hierarchy

Pascal

```
TStaticListAction = class(TCustomStaticListAction);
```

C++

```
class TStaticListAction : public TCustomStaticListAction;
```

File

ListActns

Description

TStaticListAction supplies items to client controls such as list views, list boxes, or combo boxes. TStaticListAction maintains a list of items in its Items (see page 4572) property. This lets you specify, at design time, the items it supplies to clients.

When an application sets the Active (see page 4569) property of a list action to true, the action fills all client controls with

items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 4574) event.

When a TStaticListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

42.1.7.1 TStaticListAction Members

The following tables list the members exposed by TStaticListAction.

Protected Events

	Name	Description
	OnGetItemCount (see page 4542)	Occurs when the list action needs to determine the number of items it supplies to client controls.

Protected Methods

	Name	Description
V	GetCount (see page 4537)	This is GetCount, a member of class TCustomListAction.
V	GetCount (see page 4545)	This is GetCount, a member of class TCustomStaticListAction.
	GetItem (see page 4545)	This is GetItem, a member of class TCustomStaticListAction.
V	GetItemClass (see page 4545)	This is GetItemClass, a member of class TCustomStaticListAction.
V	GetString (see page 4538)	Returns the value of the Strings (see page 4541) property.
V	GetString (see page 4546)	Returns the value of the Strings property.
V	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
V	SetString (see page 4539)	Sets the value of the Strings (see page 4541) property.
V	SetString (see page 4546)	Sets the value of the Strings property.

Protected Properties

	Name	Description
	Clients (see page 4547)	This is Clients, a member of class TCustomStaticListAction.
R	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
V	Create (see page 4536)	Creates an instance of TCustomListAction (see page 4535).
V	Create (see page 4544)	Creates an instance of TCustomListAction.
V	Destroy (see page 4544)	Frees an instance of TCustomAction.
V	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
V	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
R	Count (see page 4540)	This is Count, a member of class TCustomListAction.

	Count (see page 4547)	This is Count, a member of class TCustomStaticListAction.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

Published Events

	Name	Description
	OnGetItem (see page 4574)	This is OnGetItem, a member of class TStaticListAction.
	OnHint (see page 4574)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 4574)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 4575)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Active (see page 4569)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 4570)	Represents the caption of client controls and menu items.
	Enabled (see page 4570)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 4571)	Indicates the help context ID for client controls and menu items.
	Hint (see page 4571)	Indicates the Help hint for client controls and menu items.
	Images (see page 4571)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 4572)	Specifies the index of the selected item.
	Items (see page 4572)	Lists the items that this list action supplies to clients.
	SecondaryShortCuts (see page 4572)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 4573)	Specifies the ShortCut property for client menu items.
	Visible (see page 4573)	Specifies the Visible property for client controls and menu items.

42.1.7.2 TStaticListAction Properties

The properties of the TStaticListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 4569)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 4570)	Represents the caption of client controls and menu items.
	Enabled (see page 4570)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 4571)	Indicates the help context ID for client controls and menu items.
	Hint (see page 4571)	Indicates the Help hint for client controls and menu items.
	Images (see page 4571)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 4572)	Specifies the index of the selected item.
	Items (see page 4572)	Lists the items that this list action supplies to clients.
	SecondaryShortCuts (see page 4572)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 4573)	Specifies the ShortCut property for client menu items.
	Visible (see page 4573)	Specifies the Visible property for client controls and menu items.

42.1.7.2.1 TStaticListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

42.1.7.2.2 TStaticListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption

Caption (see page 4902)

42.1.7.2.3 TStaticListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 4912)

42.1.7.2.4 TStaticListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext;
```

C++

```
__property HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType

HelpKeyword

42.1.7.2.5 TStaticListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint;
```

C++

```
__property Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint

Hint (see page 4916)

42.1.7.2.6 TStaticListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text

value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

42.1.7.2.7 TStaticListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 4542)

ItemIndex

42.1.7.2.8 TStaticListAction.Items Property

Lists the items that this list action supplies to clients.

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

Set Items to indicate the items that this action supplies to clients. At design time, you can use the collection editor to add items to the list and set their properties.

See Also

Count

strings

42.1.7.2.9 TStaticListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts;
```

C++

```
__property SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut

Execute

42.1.7.2.10 TStaticListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut;
```

C++

```
__property ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 4920)

SecondaryShortCuts

42.1.7.2.11 TStaticListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 4921)

Visible

42.1.7.3 TStaticListAction Events

The events of the TStaticListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 4574)	This is OnGetItem, a member of class TStaticListAction.
	OnHint (see page 4574)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 4574)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 4575)	Occurs when the application is idle or when the action list updates.

42.1.7.3.1 TStaticListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TStaticListAction.

42.1.7.3.2 TStaticListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint;
```

C++

```
__property OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

42.1.7.3.3 TStaticListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 4537)

ItemIndex (see page 4541)

42.1.7.3.4 TStaticListAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate;
```

C++

```
__property OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
Boolean checked;

void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     checked = ToolBar1->Visible;
   }
//   pa->Checked = True;  // set this statically and don't change it!
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
```

```
  applications to execute centralized code for enabling and
  disabling, checking and unchecking, and so on. For example,
  the following code illustrates the OnUpdate event handler
  for an action that is "checked" when the toolbar is visible.
  This example requires a TActionList (with one TAction) and a
  TToolBar on a form. This example requires a TActionList
  (with one TAction) and a TToolBar on a form.  Double click
  on the TActionList and create an TAction named Action1.  The
  TAction has an OnUpdate event handler called Action1Update.
  Then set an object's (such as a button or menu item) Action
  to Action1.
  }
  procedure TMainForm.Action1Update(Sender: TObject);
  begin
    if ((Sender as TAction).Checked <> ToolBar1.Visible) then
      lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
      { Indicate whether ToolBar1 is currently visible }
      (Sender as TAction).Checked := ToolBar1.Visible;
  end;
```

UpdateAction

42.1.8 TStaticListItems Class

TStaticListItems represents the items that TStaticListAction (see page 4567) supplies to client controls.

Class Hierarchy

Pascal

```
TStaticListItems = class(TListControlItems);
```

C++

```
class TStaticListItems : public TListControlItems;
```

File

ListActns

Description

TStaticListItems manages a collection of items for a TStaticListAction (see page 4567) component. Each item in the collection can include a text value, associated image, and a data pointer. If the associated TStaticListAction (see page 4567) is active, then when items are added to or deleted from TStaticListItems, the list action's clients are updated so that they reflect the current set of items.

See Also

TStaticListAction (see page 4567)

42.1.8.1 TStaticListItems Members

The following tables list the members exposed by TStaticListItems.

Protected Methods

	Name	Description
	CompareItems (see page 4563)	Returns the relative order of two items in the collection.
	Notify (see page 4577)	Responds when items are added to or removed from the collection.
	Update (see page 4578)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 4562)	Adds a new item to the collection.
	Create (see page 4562)	Creates and initializes a TOwnedCollection instance.
	CustomSort (see page 4563)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 4564)	Sorts the items in the collection.

Public Properties

	Name	Description
	Items (see page 4565)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 4567)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 4565)	Controls whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 4566)	Indicates how the items should be sorted.

42.1.8.2 TStaticListItems Methods

The methods of the TStaticListItems class are listed here.

Protected Methods

	Name	Description
	Notify (see page 4577)	Responds when items are added to or removed from the collection.
	Update (see page 4578)	Updates the collection to reflect changes to its items.

42.1.8.2.1 TStaticListItems.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added

Deleting

42.1.8.2.2 TStaticListItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

Changed

42.1.9 TVirtualListAction Class

TVirtualListAction provides items to a client controls.

Class Hierarchy

Pascal

```
TVirtualListAction = class(TCustomVirtualListAction);
```

C++

```
class TVirtualListAction : public TCustomVirtualListAction;
```

File

ListActns

Description

TVirtualListAction supplies items dynamically at runtime to client controls such as list views, list boxes, or combo boxes. These items are supplied by the code you supply to an OnGetItem (see page 4584) event handler.

When an application sets the Active (see page 4580) property of a list action to true, the action fills all client controls with items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the

item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 4585) event.

When a TVirtualListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

42.1.9.1 TVirtualListAction Members

The following tables list the members exposed by TVirtualListAction.

Protected Methods

	Name	Description
	GetCount (see page 4537)	This is GetCount, a member of class TCustomListAction.
	GetItem (see page 4549)	This is GetItem, a member of class TCustomVirtualListAction.
	GetString (see page 4538)	Returns the value of the Strings (see page 4541) property.
	GetString (see page 4549)	Returns the value of the Strings property.
	Loaded (see page 4538)	Initializes the action after it is loaded into memory.
	SetString (see page 4539)	Sets the value of the Strings (see page 4541) property.

Protected Properties

	Name	Description
	Loading (see page 4541)	Indicates whether the action is currently adding items to client controls.

Public Methods

	Name	Description
	Create (see page 4536)	Creates an instance of TCustomListAction (see page 4535).
	ExecuteTarget (see page 4537)	Generates an OnItemSelected (see page 4542) event.
	HandlesTarget (see page 4538)	Indicates whether the action can execute its function.

Public Properties

	Name	Description
	Count (see page 4540)	This is Count, a member of class TCustomListAction.
	Count (see page 4550)	This is Count, a member of class TCustomVirtualListAction.
	Strings (see page 4541)	This is Strings, a member of class TCustomListAction.

Published Events

	Name	Description
	OnGetItem (see page 4584)	This is OnGetItem, a member of class TVirtualListAction.
	OnGetItemCount (see page 4584)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 4585)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 4585)	Occurs when a client control executes the action because a user selected one of the items.

Published Properties

	Name	Description
	Active (see page 4580)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 4581)	Represents the caption of client controls and menu items.
	Enabled (see page 4581)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 4581)	Indicates the help context ID for client controls and menu items.
	Hint (see page 4582)	Indicates the Help hint for client controls and menu items.
	Images (see page 4582)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 4582)	Specifies the index of the selected item.
	SecondaryShortCuts (see page 4583)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 4583)	Specifies the ShortCut property for client menu items.
	Visible (see page 4584)	Specifies the Visible property for client controls and menu items.

42.1.9.2 TVirtualListAction Properties

The properties of the TVirtualListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 4580)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 4581)	Represents the caption of client controls and menu items.
	Enabled (see page 4581)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 4581)	Indicates the help context ID for client controls and menu items.
	Hint (see page 4582)	Indicates the Help hint for client controls and menu items.
	Images (see page 4582)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 4582)	Specifies the index of the selected item.
	SecondaryShortCuts (see page 4583)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 4583)	Specifies the ShortCut property for client menu items.
	Visible (see page 4584)	Specifies the Visible property for client controls and menu items.

42.1.9.2.1 TVirtualListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem

getitem

Items

items

Items

count (see page 4540)

42.1.9.2.2 TVirtualListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption

Caption (see page 4902)

42.1.9.2.3 TVirtualListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled

Enabled (see page 4912)

42.1.9.2.4 TVirtualListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext;
```

C++

```
__property HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType

HelpKeyword

42.1.9.2.5 TVirtualListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint;
```

C++

```
__property Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint

Hint (see page 4916)

42.1.9.2.6 TVirtualListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages

Images

42.1.9.2.7 TVirtualListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 4542)

ItemIndex

42.1.9.2.8 TVirtualListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts;
```

C++

```
__property SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut

Execute

42.1.9.2.9 TVirtualListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut;
```

C++

```
__property ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 4920)

SecondaryShortCuts

42.1.9.2.10 TVirtualListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 4921)

Visible

42.1.9.3 TVirtualListAction Events

The events of the TVirtualListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 4584)	This is OnGetItem, a member of class TVirtualListAction.
	OnGetItemCount (see page 4584)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 4585)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 4585)	Occurs when a client control executes the action because a user selected one of the items.

42.1.9.3.1 TVirtualListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TVirtualListAction.

42.1.9.3.2 TVirtualListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount method generates an OnGetItemCount event to supply the value of the Count property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count returns the number of items this list action supplies to client controls.

See Also

getcount (see page 4537)

count (see page 4540)

42.1.9.3.3 TVirtualListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint;
```

C++

```
__property OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

42.1.9.3.4 TVirtualListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 4537)

ItemIndex (see page 4541)

42.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TListItemsSortType (see page 4586)	This is record ListActns.TListItemsSortType.

42.2.1 ListActns.TListItemsSortType Enumeration

Pascal

```
TListItemsSortType = (
  stNone,
  stData,
  stText,
  stBoth
);
```

C++

```
enum TListItemsSortType {
  stNone,
  stData,
  stText,
  stBoth
};
```

File

ListActns

Description

This is record ListActns.TListItemsSortType.

42.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetItemCountEvent (see page 4587)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 4587)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 4588)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 4588)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 4588)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 4589)	This is type ListActns.TListControlItemClass.
TListItemsCompare (see page 4589)	This is type ListActns.TListItemsCompare.

42.3.1 ListActns.TGetItemCountEvent Type

Pascal

```
TGetItemCountEvent = procedure (Sender: TCustomListAction; var Count: Integer) of object;
```

C++

```
(Sender: TCustomListAction; var Count: Integer) ( TGetItemCountEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemCountEvent.

42.3.2 ListActns.TGetItemEvent Type

Pascal

```
TGetItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Item:
TListControlItem) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Item: TListControlItem) (
TGetItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemEvent.

42.3.3 ListActns.TGetVirtualItemEvent Type

Pascal

```
TGetVirtualItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Value:
String; var ImageIndex: Integer; var Data: TCustomData) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Value: String; var ImageIndex: Integer;
var Data: TCustomData) ( TGetVirtualItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetVirtualItemEvent.

42.3.4 ListActns.TItemSelectedEvent Type

Pascal

```
TItemSelectedEvent = procedure (Sender: TCustomListAction; Control: TControl) of object;
```

C++

```
(Sender: TCustomListAction; Control: TControl) ( TItemSelectedEvent)();
```

File

ListActns

Description

This is type ListActns.TItemSelectedEvent.

42.3.5 ListActns.TListCompareEvent Type

Pascal

```
TListCompareEvent = function (List: TListControlItems; Item1, Item2: TListControlItem):
Integer of object;
```

C++

```
(List: TListControlItems; Item1, Item2: TListControlItem): Integer ( TListCompareEvent)();
```

File

ListActns

Description

This is type ListActns.TListCompareEvent.

42.3.6 ListActns.TListControlItemClass Type

Pascal

```
TListControlItemClass = class of TListControlItem;
```

C++

```
TListControlItem TListControlItemClass;
```

File

ListActns

Description

This is type ListActns.TListControlItemClass.

42.3.7 ListActns.TListItemsCompare Type

Pascal

```
TListItemsCompare = function (List: TListControlItems; Index1, Index2: Integer): Integer;
```

C++

```
(List: TListControlItems; Index1, Index2: Integer): Integer ( TListItemsCompare)();
```

File

ListActns

Description

This is type ListActns.TListItemsCompare.

43 Mask Namespace

This is namespace Mask.

Topics

Name	Description
Classes (see page 4592)	The following table lists classes in this documentation.
Types (see page 4681)	The following table lists types in this documentation.

Classes

	Name	Description
	EDBEditError (see page 4592)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 4592)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 4610)	TMaskEdit implements a generic masked edit control.

Types

Name	Description
TMaskedState (see page 4681)	TMaskedState is a set of flags that describe the current state of a masked edit control.

43.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDBEditError (see page 4592)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 4592)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 4610)	TMaskEdit implements a generic masked edit control.

43.1.1 EDBEditError Class

EDBEditError is the exception class for data that are incompatible with a specified mask.

Class Hierarchy

Pascal

```
EDBEditError = class(Exception);
```

C++

```
class EDBEditError : public Exception;
```

File

Mask

Description

EDBEditError is raised when an application attempts to use data that are incompatible with the mask specified for a field.

A mask restricts the data that can be put into an edit box or data field. Use the EditMask property to specify a mask.

See Also

TCustomMaskEdit (see page 4592)

EditMask

43.1.2 TCustomMaskEdit Class

TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.

Class Hierarchy

Pascal

```
TCustomMaskEdit = class(TCustomEdit);
```

C++

```
class TCustomMaskEdit : public TCustomEdit;
```

File

Mask

Description

TCustomMaskEdit introduces new properties and methods to expand the capabilities of TCustomEdit for validity checking using an edit mask. To create an edit control that takes advantage of the masking capabilities of TCustomMaskEdit, use a TMaskEdit (see page 4610) object. To create an edit control that does not validate the input, use the TEdit object instead.

Do not create instances of TCustomMaskEdit. Use TCustomMaskEdit as a base class when declaring control objects that implement a masked edit control. Properties and methods of TCustomMaskEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

EDBEditError (see page 4592)

TDBEdit

TEdit

TMaskEdit (see page 4610)

43.1.2.1 TCustomMaskEdit Members

The following tables list the members exposed by TCustomMaskEdit.

Protected Methods

	Name	Description
	CheckCursor (see page 4595)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
V	EditCanModify (see page 4596)	Permits the user to edit control contents.
	GetFirstEditChar (see page 4596)	Returns the index in the EditMask (see page 4604) of the first nonliteral character.
	GetLastEditChar (see page 4597)	Returns the index in the EditMask (see page 4604) of the last nonliteral character.
	GetMaxChars (see page 4597)	Returns the length of the EditText (see page 4606).
	GetNextEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 4599)	Returns the endpoints of the current selection in the EditText (see page 4606).
V	KeyDown (see page 4599)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 4600)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 4600)	Key up event dispatcher.
	ReformatText (see page 4601)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 4601)	Returns the EditText (see page 4606) to its value at the time when the edit control last lost focus.
	SetCursor (see page 4602)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 4602)	Selects character range.
V	Validate (see page 4603)	Validates a specified string against the current mask.

	ValidateError (see page 4603)	Beeps and raises an EDBEditError (see page 4592) exception.

Protected Properties

	Name	Description
	EditMask (see page 4604)	Specifies the mask that represents what text is valid for the masked edit control.
	MaskState (see page 4607)	Indicates state information about how the mask is being applied.
	MaxLength (see page 4607)	Specifies the maximum number of characters that can appear in the edit control.

Public Methods

	Name	Description
	Clear (see page 4595)	Sets the Text (see page 4608) property to an empty string.
	Create (see page 4594)	Creates an instance of TCustomMaskEdit (see page 4592).
	GetTextLen (see page 4599)	Returns the length of the underlying text.
	ValidateEdit (see page 4603)	Validates the EditText (see page 4606) against the current mask.

Public Properties

	Name	Description
	EditText (see page 4606)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 4606)	Indicates whether a mask exists for the edit control.
	Text (see page 4608)	Denotes the underlying text for the masked edit control before the mask has been applied.

43.1.2.2 TCustomMaskEdit.Create Constructor

Creates an instance of TCustomMaskEdit (see page 4592).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMaskEdit(TComponent * AOwner);
```

Description

Call Create to instantiate a masked edit control at runtime. AOwner is the component that is responsible for freeing the masked edit control (typically the form). It becomes the value of the Owner property.

See Also

Owner

43.1.2.3 TCustomMaskEdit Methods

The methods of the TCustomMaskEdit class are listed here.

Protected Methods

	Name	Description
	CheckCursor (see page 4595)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
	EditCanModify (see page 4596)	Permits the user to edit control contents.
	GetFirstEditChar (see page 4596)	Returns the index in the EditMask (see page 4604) of the first nonliteral character.
	GetLastEditChar (see page 4597)	Returns the index in the EditMask (see page 4604) of the last nonliteral character.
	GetMaxChars (see page 4597)	Returns the length of the EditText (see page 4606).
	GetNextEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or greater than an offset.

	GetPriorEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 4599)	Returns the endpoints of the current selection in the EditText (see page 4606).
V	KeyDown (see page 4599)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 4600)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 4600)	Key up event dispatcher.
	ReformatText (see page 4601)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 4601)	Returns the EditText (see page 4606) to its value at the time when the edit control last lost focus.
	SetCursor (see page 4602)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 4602)	Selects character range.
V	Validate (see page 4603)	Validates a specified string against the current mask.
V	ValidateError (see page 4603)	Beeps and raises an EDBEditError (see page 4592) exception.

Public Methods

	Name	Description
V	Clear (see page 4595)	Sets the Text (see page 4608) property to an empty string.
	GetTextLen (see page 4599)	Returns the length of the underlying text.
V	ValidateEdit (see page 4603)	Validates the EditText (see page 4606) against the current mask.

43.1.2.3.1 TCustomMaskEdit.CheckCursor Method

Moves the cursor to the closest editable character and selects it if nothing is currently selected.

Pascal

```
procedure CheckCursor;
```

C++

```
__fastcall CheckCursor();
```

Description

CheckCursor is called whenever the position of the cursor may have changed. It ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

GetSel (see page 4599)

SetCursor (see page 4602)

SetSel (see page 4602)

43.1.2.3.2 TCustomMaskEdit.Clear Method

Sets the Text (see page 4608) property to an empty string.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to remove all text that was entered into the masked edit control. Clear sets the value of Text (see page 4608) to an empty string. It does not clear the EditMask (see page 4604). If the edit control has a mask, EditText (see page 4606) is not empty, but has all non-literal characters replaced by blanks.

See Also

EditMask (see page 4604)

EditText (see page 4606)

IsMasked (see page 4606)

Reset (see page 4601)

Text (see page 4608)

43.1.2.3.3 TCustomMaskEdit.EditCanModify Method

Permits the user to edit control contents.

Pascal

```
function EditCanModify: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean EditCanModify();
```

Description

The EditCanModify method defined by TCustomMaskEdit (see page 4592) always returns true, allowing the Text (see page 4608) to be edited. EditCanModify exists primarily to provide an interface for a method that can conditionally disallow changes to the Text (see page 4608) by returning false.

See Also

Text (see page 4608)

43.1.2.3.4 TCustomMaskEdit.GetFirstEditChar Method

Returns the index in the EditMask (see page 4604) of the first nonliteral character.

Pascal

```
function GetFirstEditChar: Integer;
```

C++

```
__fastcall int GetFirstEditChar();
```

Description

Use GetFirstEditChar to find the first position of the EditMask (see page 4604) where the user can modify the EditText (see page 4606). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetFirstEditChar returns zero.

Use GetFirstEditChar as a starting point for programmatically processing all the nonliteral characters in the EditText (see page 4606). Use GetNextEditChar (see page 4598) to continue to loop through the editable characters in the EditText (see page 4606), and GetLastEditChar (see page 4597) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 4604)

EditText (see page 4606)

GetLastEditChar (see page 4597)

GetNextEditChar (see page 4598)

GetPriorEditChar (see page 4598)

43.1.2.3.5 TCustomMaskEdit.GetLastEditChar Method

Returns the index in the EditMask (see page 4604) of the last nonliteral character.

Pascal

```
function GetLastEditChar: Integer;
```

C++

```
__fastcall int GetLastEditChar();
```

Description

Use GetLastEditChar to find the last position of the EditMask (see page 4604) where the user can modify the EditText (see page 4606). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetLastEditChar returns the length of the text.

See Also

EditMask (see page 4604)

EditText (see page 4606)

GetFirstEditChar (see page 4596)

GetMaxChars (see page 4597)

GetNextEditChar (see page 4598)

GetPriorEditChar (see page 4598)

43.1.2.3.6 TCustomMaskEdit.GetMaxChars Method

Returns the length of the EditText (see page 4606).

Pascal

```
function GetMaxChars: Integer;
```

C++

```
__fastcall int GetMaxChars();
```

Description

If there is a mask, GetMaxChars returns the length of the EditText (see page 4606), including all blanks. This is the same as MaxLength (see page 4607), because editing in a masked edit control consists of replacing nonliteral characters. If there is no mask, GetMaxChars returns the length of the text in the window. In this case, the value returned by GetMaxChars may be less than MaxLength (see page 4607), which is the maximum number of characters that can be entered into the edit control.

See Also

EditText (see page 4606)

GetLastEditChar (see page 4597)

MaxLength (see page 4607)

Text (see page 4608)

43.1.2.3.7 TCustomMaskEdit.GetNextEditChar Method

Returns the first index of a nonliteral character equal to or greater than an offset.

Pascal

```
function GetNextEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetNextEditChar(int Offset);
```

Description

Call GetNextEditChar to find the first position of the EditMask (see page 4604) at or following Offset where the user can modify the EditText (see page 4606). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or following Offset, GetNextEditChar returns MaxLength (see page 4607).

Use GetNextEditChar to loop through the editable characters in the EditText (see page 4606), starting with the value returned by GetFirstEditChar (see page 4596) and using GetLastEditChar (see page 4597) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 4604)

EditText (see page 4606)

GetFirstEditChar (see page 4596)

GetLastEditChar (see page 4597)

GetPriorEditChar (see page 4598)

43.1.2.3.8 TCustomMaskEdit.GetPriorEditChar Method

Returns the first index of a nonliteral character equal to or less than an offset.

Pascal

```
function GetPriorEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetPriorEditChar(int Offset);
```

Description

Call GetPriorEditChar to find the first position of the EditMask (see page 4604) at or preceding Offset, where the user can modify the EditText (see page 4606). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or preceding Offset, GetPriorEditChar returns the index of the first editable character following Offset.

See Also

EditMask (see page 4604)

EditText (see page 4606)

GetFirstEditChar (see page 4596)

GetLastEditChar (see page 4597)

GetNextEditChar (see page 4598)

43.1.2.3.9 TCustomMaskEdit.GetSel Method

Returns the endpoints of the current selection in the EditText (see page 4606).

Pascal

```
procedure GetSel(var SelStart: Integer; var SelStop: Integer);
```

C++

```
__fastcall GetSel(int SelStart, int SelStop);
```

Description

Use GetSel to obtain the indexes of the first and last selected characters of the EditText (see page 4606), where 0 is the index of the first character. Not all the characters in the selection will necessarily be editable, if the mask contains literal characters. Do not use the resulting indexes on the Text (see page 4608) property if there is a mask, because the EditText (see page 4606) may contain blanks or nonliteral characters not found in the Text (see page 4608).

To programmatically change the selected text, use GetNextEditChar (see page 4598) to cycle through the editable characters of the selection from SelStart to SelStop.

See Also

EditText (see page 4606)

GetNextEditChar (see page 4598)

SelText

SetSel (see page 4602)

Text (see page 4608)

43.1.2.3.10 TCustomMaskEdit.GetTextLen Method

Returns the length of the underlying text.

Pascal

```
function GetTextLen: Integer; reintroduce;
```

C++

```
__fastcall int GetTextLen();
```

Description

Use GetTextLen to determine the length of the underlying text for the masked edit control. The underlying text has not been formatted for display by the mask, and may differ from the EditText (see page 4606) that appears in the window of the control.

See Also

EditText (see page 4606)

GetTextBuf

MaxLength (see page 4607)

Text (see page 4608)

43.1.2.3.11 TCustomMaskEdit.KeyDown Method

Supplements the inherited KeyDown to process navigation keys and the Delete key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After calling the inherited KeyDown, KeyDown ensures that moving the cursor within the masked edit control places the cursor on an editable character, and that deleting the current selection replaces nonliteral characters with blanks. Derived objects can override this method to further supplement the processing that takes place when the user presses a key down.

See Also

CheckCursor (see page 4595)

KeyPress (see page 4600)

KeyUp (see page 4600)

SetSel (see page 4602)

43.1.2.3.12 TCustomMaskEdit.KeyPress Method

Supplements the inherited method to process the Esc and Enter keys.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

After calling the inherited method, KeyPress calls the Reset (see page 4601) method in response to the Esc key, or calls the ValidateEdit (see page 4603) method in response to the Enter key. Derived classes can override this method to further supplement the processing of specific keystrokes.

See Also

KeyDown (see page 4599)

Reset (see page 4601)

ValidateEdit (see page 4603)

43.1.2.3.13 TCustomMaskEdit.KeyUp Method

Key up event dispatcher.

Pascal

```
procedure KeyUp(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyUp(Word Key, TShiftState Shift);
```

Description

After calling the inherited method, KeyUp makes sure that selection using the Ctrl+Left and Ctrl+Right key combinations ends with an editable selection in the edit window. Derived classes can override this method to further supplement the processing that

takes place when the user releases a key.

See Also

CheckCursor (see page 4595)

KeyDown (see page 4599)

KeyPress (see page 4600)

SetSel (see page 4602)

43.1.2.3.14 TCustomMaskEdit.ReformatText Method

Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.

Pascal

```
procedure ReformatText(const NewMask: string);
```

C++

```
__fastcall ReformatText(const UnicodeString NewMask);
```

Description

ReformatText does the bulk of the work of setting the EditMask (see page 4604) property at runtime. ReformatText should not be used in place of the EditMask (see page 4604) property, however, as it does not deal with the MaskState (see page 4607) property or the positioning of the cursor.

See Also

CheckCursor (see page 4595)

EditMask (see page 4604)

EditText (see page 4606)

MaskState (see page 4607)

Text (see page 4608)

43.1.2.3.15 TCustomMaskEdit.Reset Method

Returns the EditText (see page 4606) to its value at the time when the edit control last lost focus.

Pascal

```
procedure Reset; virtual;
```

C++

```
virtual __fastcall Reset();
```

Description

Reset cancels the most recent edits to the masked edit control. The EditText (see page 4606) returns to the value at the time the control last lost focus, not the time when it first regained focus. Thus, any changes to the EditText (see page 4606) that occurred programmatically while the edit control did not have focus are also discarded.

See Also

Clear (see page 4595)

EditText (see page 4606)

KeyPress (see page 4600)

43.1.2.3.16 TCustomMaskEdit.SetCursor Method

Moves the cursor to the first editable character at or before Pos, and selects that character.

Pascal

```
procedure SetCursor(Pos: Integer);
```

C++

```
__fastcall SetCursor(int Pos);
```

Description

SetCursor handles positioning of the cursor within the EditText (see page 4606) so that it is always on an editable character. It also ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

CheckCursor (see page 4595)

GetPriorEditChar (see page 4598)

SetSel (see page 4602)

43.1.2.3.17 TCustomMaskEdit.SetSel Method

Selects character range.

Pascal

```
procedure SetSel(SelStart: Integer; SelStop: Integer);
```

C++

```
__fastcall SetSel(int SelStart, int SelStop);
```

Description

SetSel selects the indicated range of characters in the EditText (see page 4606), regardless of whether any of them are editable. If SelStart is the same as SelStop, SetSel positions the cursor at the SelStart character. When using SetSel, leave the cursor in an editable position if the intent is to create a selection for the user to replace.

SetSel can be used to select non-editable characters that can then be captured by using the SelText property or by copying to the Clipboard. Once the selection has been captured, return the cursor to an editable position by calling CheckCursor (see page 4595).

See Also

CheckCursor (see page 4595)

EditText (see page 4606)

GetSel (see page 4599)

SelText

SetCursor (see page 4602)

43.1.2.3.18 TCustomMaskEdit.Validate Method

Validates a specified string against the current mask.

Pascal

```
function Validate(const Value: string; var Pos: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Validate(const UnicodeString Value, int Pos);
```

Description

The ValidateEdit (see page 4603) method calls Validate to perform the actual validation of the current text against the edit mask. It returns true if the string specified by Value is consistent with the edit mask, false if it detects an invalid character. If ValidateEdit (see page 4603) returns false, it returns the position of the invalid character as the Pos parameter.

See Also

EditMask (see page 4604)

ValidateEdit (see page 4603)

43.1.2.3.19 TCustomMaskEdit.ValidateEdit Method

Validates the EditText (see page 4606) against the current mask.

Pascal

```
procedure ValidateEdit; virtual;
```

C++

```
virtual __fastcall ValidateEdit();
```

Description

ValidateEdit attempts to validate the EditText (see page 4606) after each keystroke, and when the user attempts to leave the masked edit field. If the EditText (see page 4606) does not match the specifications of the EditMask (see page 4604), ValidateEdit calls ValidateError (see page 4603) to raise an exception, and returns the cursor to the first position where the EditText (see page 4606) did not comply with the EditMask (see page 4604).

See Also

EditMask (see page 4604)

EditText (see page 4606)

KeyPress (see page 4600)

ValidateError (see page 4603)

43.1.2.3.20 TCustomMaskEdit.ValidateError Method

Beeps and raises an EDBEditError (see page 4592) exception.

Pascal

```
procedure ValidateError; virtual;
```

C++

```
virtual __fastcall ValidateError();
```

Description

ValidateEdit (see page 4603) calls ValidateError when the EditText (see page 4606) fails to comply with the EditMask (see page 4604).

See Also

EditMask (see page 4604)

EditText (see page 4606)

ValidateEdit (see page 4603)

43.1.2.4 TCustomMaskEdit Properties

The properties of the TCustomMaskEdit class are listed here.

Protected Properties

	Name	Description
	EditMask (see page 4604)	Specifies the mask that represents what text is valid for the masked edit control.
	MaskState (see page 4607)	Indicates state information about how the mask is being applied.
	MaxLength (see page 4607)	Specifies the maximum number of characters that can appear in the edit control.

Public Properties

	Name	Description
	EditText (see page 4606)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 4606)	Indicates whether a mask exists for the edit control.
	Text (see page 4608)	Denotes the underlying text for the masked edit control before the mask has been applied.

43.1.2.4.1 TCustomMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit (see page 4603) method.

Setting EditMask to an empty string removes the mask.

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
```

```
  using bit-wise AND operations and displayed in the third mask edit box.
  An additional test is made to assure that the values in the IP address
  and in the subnet mask are in the interval from 0 to 255,
  as this validation test cannot be accomplished
  using the edit mask property alone.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    { initialize the maskedit boxes to contain the empty string }
    MaskEdit1.Text := '';
    MaskEdit2.Text := '';
    MaskEdit3.Text := '';

    { use the Courier font in the maskedit boxes }
    MaskEdit1.Font.Name := 'Courier';
    MaskEdit2.Font.Name := 'Courier';
    MaskEdit3.Font.Name := 'Courier';

    {
    initialize the mask of each maskedit box
    according to IP address coding conventions
    }
    MaskEdit1.EditMask := '!099.099.099.099;1; ';
    MaskEdit2.EditMask := '!099.099.099.099;1; ';
    MaskEdit3.EditMask := '!099.099.099.099;1; ';

    MaskEdit2.OnExit := MaskEdit2Exit;
  end;

  procedure TForm1.MaskEdit2Exit(Sender: TObject);
  var
    net1, net2, host1, host2,
    netmask1, netmask2, hostmask1, hostmask2,
    sub_net1, sub_net2, sub_host1, sub_host2: Integer;

    IP, mask: String;

  begin
    // extract the net and host address from the IP
    IP := MaskEdit1.Text;
    net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
    net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
    host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
    host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');
```

```
    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
```

43.1.2.4.2 TCustomMaskEdit.EditText Property

Specifies the text that appears in the window of the masked edit control.

Pascal

```
property EditText: string;
```

C++

```
__property UnicodeString EditText;
```

Description

EditText is the value of the text for the edit control after it is formatted using the EditMask (see page 4604). Before the text is fully entered into a masked edit control, the EditText includes a blank character for each unentered character. As characters are entered, the blank characters in the EditText are replaced by the values that the user types.

If literal mask characters are included in the text, and no character is substituted for blanks, the values of EditText and Text (see page 4608) are the same.

Note: EditText only applies at runtime.

See Also

EditMask (see page 4604)

Text (see page 4608)

43.1.2.4.3 TCustomMaskEdit.IsMasked Property

Indicates whether a mask exists for the edit control.

Pascal

```
property IsMasked: Boolean;
```

C++

```
__property Boolean IsMasked;
```

Description

Read IsMasked to determine whether the EditMask (see page 4604) property has been set. If IsMasked is true, the control has a mask, and input is validated at runtime. If IsMasked is false, the control does not restrict editing at runtime.

See Also

EditMask (see page 4604)

43.1.2.4.4 TCustomMaskEdit.MaskState Property

Indicates state information about how the mask is being applied.

Pascal

```
property MaskState: TMaskedState;
```

C++

```
__property TMaskedState MaskState;
```

Description

MaskState is used internally to determine appropriate actions based on how the mask is currently being applied. MaskState is a set drawn from among the following values:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked (see page 4606) is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

MaskState is exposed as a protected property so that derived classes can maintain and use this state information in the implementation of properties and methods.

See Also

IsMasked (see page 4606)

ValidateEdit (see page 4603)

43.1.2.4.5 TCustomMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

MaxLength is the length of the EditText (see page 4606). Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask (see page 4604). If there is an EditMask (see page 4604), MaxLength is implied by the mask itself, and cannot be changed. The EditText (see page 4606) contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

43.1.2.4.6 TCustomMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TMaskedText;
```

C++

```
__property TMaskedText Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText (see page 4606) visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText (see page 4606) is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
```

```
    MaskEdit2.EditMask := '!099.099.099.099;1; ';
    MaskEdit3.EditMask := '!099.099.099.099;1; ';

    MaskEdit2.OnExit := MaskEdit2Exit;
  end;

  procedure TForm1.MaskEdit2Exit(Sender: TObject);
  var
    net1, net2, host1, host2,
    netmask1, netmask2, hostmask1, hostmask2,
    sub_net1, sub_net2, sub_host1, sub_host2: Integer;

    IP, mask: String;

  begin
    // extract the net and host address from the IP
    IP := MaskEdit1.Text;
    net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
    net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
    host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
    host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or

        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
```

43.1.3 TMaskEdit Class

TMaskEdit implements a generic masked edit control.

Class Hierarchy

Pascal

```
TMaskEdit = class(TCustomMaskEdit);
```

C++

```
class TMaskEdit : public TCustomMaskEdit;
```

File

Mask

Description

Use a TMaskEdit object to put a masked edit control on your form. Masked edit controls validate the text the user enters against a mask that encodes the valid forms the text can take. The mask can also format text that is displayed to the user.

TMaskEdit implements the generic behavior introduced in TCustomMaskEdit (see page 4592). TMaskEdit publishes many of the properties and methods inherited from TCustomMaskEdit (see page 4592), but does not introduce any new behavior.

Edit Controls

43.1.3.1 TMaskEdit Members

The following tables list the members exposed by TMaskEdit.

Protected Methods

	Name	Description
	CheckCursor (see page 4595)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
V	EditCanModify (see page 4596)	Permits the user to edit control contents.
	GetFirstEditChar (see page 4596)	Returns the index in the EditMask (see page 4604) of the first nonliteral character.
	GetLastEditChar (see page 4597)	Returns the index in the EditMask (see page 4604) of the last nonliteral character.
	GetMaxChars (see page 4597)	Returns the length of the EditText (see page 4606).
	GetNextEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 4599)	Returns the endpoints of the current selection in the EditText (see page 4606).
V	KeyDown (see page 4599)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 4600)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 4600)	Key up event dispatcher.

	ReformatText (see page 4601)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 4601)	Returns the EditText (see page 4606) to its value at the time when the edit control last lost focus.
	SetCursor (see page 4602)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 4602)	Selects character range.
V	Validate (see page 4603)	Validates a specified string against the current mask.
V	ValidateError (see page 4603)	Beeps and raises an EDBEditError (see page 4592) exception.

Protected Properties

	Name	Description
	MaskState (see page 4607)	Indicates state information about how the mask is being applied.

Public Methods

	Name	Description
V	Clear (see page 4595)	Sets the Text (see page 4608) property to an empty string.
V	Create (see page 4594)	Creates an instance of TCustomMaskEdit (see page 4592).
	GetTextLen (see page 4599)	Returns the length of the underlying text.
V	ValidateEdit (see page 4603)	Validates the EditText (see page 4606) against the current mask.

Public Properties

	Name	Description
	EditText (see page 4606)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 4606)	Indicates whether a mask exists for the edit control.

Published Events

	Name	Description
	OnChange (see page 4649)	Occurs when the text for the edit control may have changed.
	OnClick (see page 4649)	Occurs when the user clicks the control.
	OnDblClick (see page 4651)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4652)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4655)	Occurs when the user drags an object over a control.
	OnEndDock (see page 4658)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4658)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4659)	Occurs when a control receives the input focus.
	OnExit (see page 4662)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 4664)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4668)	Occurs when a key is pressed.
	OnKeyUp (see page 4669)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 4671)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4672)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4674)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4674)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4675)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4677)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 4679)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4680)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 4614)	Determines how the control aligns within its container (parent control).
	Alignment (see page 4617)	Determines how the text is aligned within the text edit control.
	Anchors (see page 4618)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 4618)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 4619)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 4620)	Specifies which edges of the control are beveled.
	BevelInner (see page 4620)	Specifies the cut of the inner bevel.
	BevelKind (see page 4620)	Specifies the control's bevel style.
	BevelOuter (see page 4621)	Specifies the cut of the outer bevel.
	BevelWidth (see page 4621)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 4622)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 4622)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 4622)	Determines the case of the text within the edit control.
	Color (see page 4623)	Specifies the background color of the control.
	Constraints (see page 4624)	Specifies the size constraints for the control.
	Ctl3D (see page 4624)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 4625)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 4627)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4627)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4627)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 4629)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 4631)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4631)	Controls the attributes of text written on or in the control.
	ImeMode (see page 4632)	Determines the behavior of the input method editor (IME).
	ImeName (see page 4633)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	MaxLength (see page 4633)	Specifies the maximum number of characters that can appear in the edit control.
	ParentBiDiMode (see page 4634)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4634)	Determines where a control looks for its color information.
	ParentCtl3D (see page 4635)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 4635)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 4635)	Determines where a control looks for its font information.
	ParentShowHint (see page 4636)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 4636)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 4637)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 4642)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 4642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4644)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4644)	Determines if the user can tab to a control.
	Text (see page 4645)	Denotes the underlying text for the masked edit control before the mask has been applied.
	TextHint (see page 4647)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 4647)	Determines whether the component appears onscreen.

43.1.3.2 TMaskEdit Properties

The properties of the TMaskEdit class are listed here.

Published Properties

	Name	Description
	Align (see page 4614)	Determines how the control aligns within its container (parent control).
	Alignment (see page 4617)	Determines how the text is aligned within the text edit control.
	Anchors (see page 4618)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 4618)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 4619)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 4620)	Specifies which edges of the control are beveled.
	BevelInner (see page 4620)	Specifies the cut of the inner bevel.
	BevelKind (see page 4620)	Specifies the control's bevel style.
	BevelOuter (see page 4621)	Specifies the cut of the outer bevel.
	BevelWidth (see page 4621)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 4622)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 4622)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 4622)	Determines the case of the text within the edit control.
	Color (see page 4623)	Specifies the background color of the control.
	Constraints (see page 4624)	Specifies the size constraints for the control.
	Ctl3D (see page 4624)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DoubleBuffered (see page 4625)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 4627)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4627)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4627)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 4629)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 4631)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4631)	Controls the attributes of text written on or in the control.
	ImeMode (see page 4632)	Determines the behavior of the input method editor (IME).
	ImeName (see page 4633)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	MaxLength (see page 4633)	Specifies the maximum number of characters that can appear in the edit control.
	ParentBiDiMode (see page 4634)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4634)	Determines where a control looks for its color information.
	ParentCtl3D (see page 4635)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 4635)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 4635)	Determines where a control looks for its font information.
	ParentShowHint (see page 4636)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 4636)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 4637)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 4642)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 4642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4644)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4644)	Determines if the user can tab to a control.

	Text (see page 4645)	Denotes the underlying text for the masked edit control before the mask has been applied.
	TextHint (see page 4647)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 4647)	Determines whether the component appears onscreen.

43.1.3.2.1 TMaskEdit.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
```

```
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
```

```
  run this example, add ExtCtrls and FileCtrl to the uses
  clause of the form's implementation section.
  Note that when creating a splitter dynamically at runtime,
  it is important to set its position to the appropriate side
  of the control it will resize.
  }
  procedure TForm1.FormCreate(Sender: TObject);

43.1.3.2.2 TMaskEdit.Alignment Property

Determines how the text is aligned within the text edit control.

Pascal

```
property Alignment;
```

C++

```
__property Alignment;
```

Description

Use Alignment to change the way the text is formatted in the text edit control. Alignment can take one of the following values:

Value	Meaning
taLeftJustify	Align text to the left side of the control
taCenter	Center text horizontally in the control.
taRightJustify	Align text to the right side of the control.

Displaying and Editing Fields in an Edit Box

43.1.3.2.3 TMaskEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Align

43.1.3.2.4 TMaskEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

43.1.3.2.5 TMaskEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

43.1.3.2.6 TMaskEdit.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges;
```

C++

```
__property BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner

BevelOuter

BevelKind

43.1.3.2.7 TMaskEdit.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner;
```

C++

```
__property BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges

BevelOuter

BevelKind

BevelWidth

BorderWidth

43.1.3.2.8 TMaskEdit.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind;
```

C++

```
__property BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

43.1.3.2.9 TMaskEdit.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter;
```

C++

```
__property BevelOuter;
```

Description

Use BevelOuter to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

BevelEdges

BevelInner

BevelKind

BevelWidth

43.1.3.2.10 TMaskEdit.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth;
```

C++

```
__property BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges

BevelInner

BevelKind

BevelOuter

43.1.3.2.11 TMaskEdit.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

43.1.3.2.12 TMaskEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle;
```

C++

```
__property BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

43.1.3.2.13 TMaskEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase;
```

C++

```
__property CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

Text

43.1.3.2.14 TMaskEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
```

```
end;
```

ParentColor

43.1.3.2.15 TMaskEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

43.1.3.2.16 TMaskEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

43.1.3.2.17 TMaskEdit.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
```

```
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

43.1.3.2.19 TMaskEdit.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

43.1.3.2.20 TMaskEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{

43.1.3.2.21 TMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit method.

Setting EditMask to an empty string removes the mask.

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
```

```
    MaskEdit2.Font.Name := 'Courier';
    MaskEdit3.Font.Name := 'Courier';

    {
    initialize the mask of each maskedit box
    according to IP address coding conventions
    }
    MaskEdit1.EditMask := '!099.099.099.099;1; ';
    MaskEdit2.EditMask := '!099.099.099.099;1; ';
    MaskEdit3.EditMask := '!099.099.099.099;1; ';

    MaskEdit2.OnExit := MaskEdit2Exit;
  end;

  procedure TForm1.MaskEdit2Exit(Sender: TObject);
  var
    net1, net2, host1, host2,
    netmask1, netmask2, hostmask1, hostmask2,
    sub_net1, sub_net2, sub_host1, sub_host2: Integer;

    IP, mask: String;

  begin
    // extract the net and host address from the IP
    IP := MaskEdit1.Text;
    net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
    net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
    host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
    host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
```

43.1.3.2.22 TMaskEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

43.1.3.2.23 TMaskEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;

Displaying and Editing Text in a Memo Control

43.1.3.2.24 TMaskEdit.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode;
```

C++

```
__property ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

ResetImeComposition

SetIme

SetImeCompositionWindow

43.1.3.2.25 TMaskEdit.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName;
```

C++

```
__property ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

43.1.3.2.26 TMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

MaxLength is the length of the EditText. Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask. If there is an EditMask, MaxLength is implied by the mask itself, and cannot be changed. The EditText contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

43.1.3.2.27 TMaskEdit.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

Parent

BiDiMode

43.1.3.2.28 TMaskEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

43.1.3.2.29 TMaskEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

43.1.3.2.30 TMaskEdit.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

43.1.3.2.31 TMaskEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

Parent

ParentColor

ParentShowHint

43.1.3.2.32 TMaskEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

43.1.3.2.33 TMaskEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar;
```

C++

```
__property PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

Text

43.1.3.2.34 TMaskEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
```

```
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {

43.1.3.2.35 TMaskEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

43.1.3.2.36 TMaskEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

43.1.3.2.37 TMaskEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

43.1.3.2.38 TMaskEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

43.1.3.2.39 TMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TMaskedText;
```

C++

```
__property TMaskedText Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
```

```
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

begin
  // extract the net and host address from the IP
  IP := MaskEdit1.Text;
  net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
  net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
  host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
  host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

  // a range test that you cannot validate through edit masks
  if ((net1 < 0) Or (net1 > 255) Or
      (net2 < 0) Or (net2 > 255) Or
      (host1 < 0) Or (host1 > 255) Or
      (host2 < 0) Or (host2 > 255)) then
    raise EArgumentException.Create('Not a valid IP address.');

  // extract the net and host mask from the subnet mask
  mask := MaskEdit2.Text;
  netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
  netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
  hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
  hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

  // a range test that you cannot validate through edit masks
  if ((netmask1 < 0) Or (netmask1 > 255) Or
      (netmask2 < 0) Or (netmask2 > 255) Or
      (hostmask1 < 0) Or (hostmask1 > 255) Or
      (hostmask2 < 0) Or (hostmask2 > 255)) then
    raise EArgumentException.Create('Not a valid subnet mask.');

  // compute the subnet address using bit-wise AND
  sub_net1 := net1 And netmask1;
  sub_net2 := net2 And netmask2;
  sub_host1 := host1 And hostmask1;
  sub_host2 := host2 And hostmask2;

  // display the subnet address
  MaskEdit3.Text :=
    IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
    IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
end;
```

43.1.3.2.40 TMaskEdit.TextHint Property

A hint or message to be displayed when the Text property is empty.

Pascal

```
property TextHint;
```

C++

```
__property TextHint;
```

Description

Use TextHint to cue the user on what kind of entry is expected in the text field. Runtime themes must be enabled.

43.1.3.2.41 TMaskEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
```

```
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;

43.1.3.3 TMaskEdit Events

The events of the TMaskEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 4649)	Occurs when the text for the edit control may have changed.
	OnClick (see page 4649)	Occurs when the user clicks the control.
	OnDblClick (see page 4651)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4652)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4655)	Occurs when the user drags an object over a control.

	OnEndDock (see page 4658)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4658)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4659)	Occurs when a control receives the input focus.
	OnExit (see page 4662)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 4664)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4668)	Occurs when a key is pressed.
	OnKeyUp (see page 4669)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 4671)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4672)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4674)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4674)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4675)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4677)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 4679)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4680)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

43.1.3.3.1 TMaskEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

Change

Text

43.1.3.3.2 TMaskEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an

OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
```

```
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

43.1.3.3.3 TMaskEdit.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

43.1.3.3.4 TMaskEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
```

```
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

TDragObject

43.1.3.3.5 TMaskEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
```

```
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{

43.1.3.3.7 TMaskEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
```

```
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;

43.1.3.3.8 TMaskEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter

event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.

43.1.3.3.9 TMaskEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
```

```
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,

OnEnter

ActiveControl (see page 2145)

43.1.3.3.10 TMaskEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/

OnKeyPress

OnKeyUp

43.1.3.3.11 TMaskEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not

generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyUp

KeyPreview (see page 2167)

43.1.3.3.12 TMaskEdit.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
```

```
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{

OnKeyPress

43.1.3.3.13 TMaskEdit.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

43.1.3.3.14 TMaskEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:

43.1.3.3.15 TMaskEdit.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

43.1.3.3.16 TMaskEdit.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

43.1.3.3.17 TMaskEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;

43.1.3.3.19 TMaskEdit.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

43.1.3.3.20 TMaskEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

43.2 Types

The following table lists types in this documentation.

Types

Name	Description
TMaskedState (see page 4681)	TMaskedState is a set of flags that describe the current state of a masked edit control.

43.2.1 Mask.TMaskedState Type

TMaskedState is a set of flags that describe the current state of a masked edit control.

Pascal

```
TMaskedState = set of (msMasked, msReEnter, msDBSetText);
```

C++

```
(msMasked, msReEnter, msDBSetText) TMaskedState;
```

File

Mask

Description

The following table indicates the meaning of the various TMaskedState flags:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

44 Masks Namespace

This is namespace Masks.

Topics

Name	Description
Classes (see page 4684)	The following table lists classes in this documentation.
Functions (see page 4688)	The following table lists functions in this documentation.

Classes

	Name	Description
	EMaskException (see page 4684)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 4684)	TMask allows the comparison of strings containing wildcards to a file mask.

Functions

	Name	Description
	MatchesMask (see page 4688)	Indicates whether a file name conforms to the format specified by a filter string.

44.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMaskException (see page 4684)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 4684)	TMask allows the comparison of strings containing wildcards to a file mask.

44.1.1 EMaskException Class

EMaskException is the exception class for errors that occur when comparing a file name to a mask.

Class Hierarchy

Pascal

```
EMaskException = class(Exception);
```

C++

```
class EMaskException : public Exception;
```

File

Masks

Description

EMaskException is raised when the TMask (see page 4684) object or the global MatchesMask (see page 4688) function encounters an improperly formed mask string.

See Also

TMask (see page 4684)

MatchesMask (see page 4688)

44.1.2 TMask Class

TMask allows the comparison of strings containing wildcards to a file mask.

Class Hierarchy

Pascal

```
TMask = class;
```

C++

```
class TMask;
```

File

Masks

Description

Use TMask to determine if a string matches the format described by a mask. The mask contains literal characters, wildcards that can match any character, and sets that match a single character that is included in the set.

Note: Do not confuse TMask with the EditMask of a field or masked edit object. While both are used for comparing strings to a symbolic description of valid values, the special mask symbols and matching rules are completely different.

See Also

TCustomMaskEdit (see page 4592)

TField

44.1.2.1 TMask Members

The following tables list the members exposed by TMask.

Public Methods

	Name	Description
	Create (see page 4685)	Creates an instance of TMask (see page 4684) for a given mask.
	Destroy (see page 4686)	Destroys an instance of TMask (see page 4684).
	Matches (see page 4686)	Indicates whether a specified string matches the mask.

44.1.2.2 TMask.Create Constructor

Creates an instance of TMask (see page 4684) for a given mask.

Pascal

```
constructor Create(const MaskValue: string);
```

C++

```
__fastcall TMask(const UnicodeString MaskValue);
```

Description

Call Create to create a mask object for comparing strings to the mask given by the MaskValue parameter. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a

single arbitrary character.

See Also

Matches (see page 4686)

44.1.2.3 TMask.Destroy Destructor

Destroys an instance of TMask (see page 4684).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMask();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TMask (see page 4684) reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store a parsed image of the mask.

See Also

System::TObject::Free

44.1.2.4 TMask Methods

The methods of the TMask class are listed here.

Public Methods

	Name	Description
	Matches (see page 4686)	Indicates whether a specified string matches the mask.

44.1.2.4.1 TMask.Matches Method

Indicates whether a specified string matches the mask.

Pascal

```
function Matches(const Filename: string): Boolean;
```

C++

```
__fastcall Boolean Matches(const UnicodeString Filename);
```

Description

Call Matches to compare the Filename parameter to the mask that describes valid values. Matches returns true if the string matches the mask. Matches returns false if the string does not match the mask. Matches raises an exception if the mask is syntactically invalid.

The mask is set when the TMask (see page 4684) object is created.

Note: Filename parameter does not need to be a file name. TMask (see page 4684) can be used to check strings against any syntactically correct mask.

See Also

Create (see page 4685)

44.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	MatchesMask (see page 4688)	Indicates whether a file name conforms to the format specified by a filter string.

44.2.1 Masks.MatchesMask Function

Indicates whether a file name conforms to the format specified by a filter string.

Pascal

```
function MatchesMask(const Filename: string; const Mask: string): Boolean;
```

C++

```
Boolean MatchesMask(const UnicodeString Filename, const UnicodeString Mask);
```

File

Masks

Description

Call MatchesMask to check the Filename parameter using the Mask (see page 4591) parameter to describe valid values. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a single arbitrary character.

MatchesMask returns true if the string matches the mask. MatchesMask returns false if the string does not match the mask. MatchesMask raises an exception if the mask is syntactically invalid.

Note: The Filename parameter does not need to be a file name. MatchesMask can be used to check strings against any syntactically correct mask.

	PadInputLiterals (see page 4697)	PadInputLiterals is used internally.

45.1.1 MaskUtils.FormatMaskText Function

Returns a string formatted using an edit mask.

Pascal

```
function FormatMaskText(const EditMask: string; const Value: string): string;
```

C++

```
UnicodeString FormatMaskText(const UnicodeString EditMask, const UnicodeString Value);
```

File

MaskUtils

Description

Call FormatMaskText to apply the mask specified by the EditMask parameter to the text string specified by the Value parameter. The edit mask string consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of the mask are matched to characters in the Value parameter or are inserted into the Value string. The third part of the mask is the character used to represent missing characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the returned string as leading blanks. If a ! character is not present, optional characters are represented in the returned string as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.

<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case present in the Value parameter.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.
C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel, that character is substituted in the returned string.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel, that character is substituted in the returned string.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the returned string.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters are inserted automatically if the second field of the mask is 0, or matched to characters in the Value parameter if the second field is any other value. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask are included in the Value parameter. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Value parameter should consist of the 10 digits of the phone number, rather than the 14 characters that make up the final formatted string.

A 0 in the second field indicates that literals are inserted into the Value string, any other character indicates that they should be included. The character to indicate whether literals should be included can be changed by changing the MaskNoSave (see page 4703) constant that is declared in the MaskUtils (see page 4689) unit.

The third field of the mask is the character that appears in the returned string for blanks (characters that do not appear in Value). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in the returned string.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify double-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be doubled as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

45.1.2 MaskUtils.IsLiteralChar Function

IsLiteralChar is used internally.

Pascal

```
function IsLiteralChar(const EditMask: string; Offset: Integer): Boolean;
```

C++

```
Boolean IsLiteralChar(const UnicodeString EditMask, int Offset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call IsLiteralChar directly.

See Also

FormatMaskText (see page 4691)

45.1.3 MaskUtils.MaskDoFormatText Function

MaskDoFormatText is used internally.

Pascal

```
function MaskDoFormatText(const EditMask: string; const Value: string; Blank: Char): string;
```

C++

```
UnicodeString MaskDoFormatText(const UnicodeString EditMask, const UnicodeString Value, Char
Blank);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskDoFormatText directly.

See Also

FormatMaskText (see page 4691)

45.1.4 MaskUtils.MaskGetCharType Function

MaskGetCharType is used internally.

Pascal

```
function MaskGetCharType(const EditMask: string; MaskOffset: Integer): TMaskCharType;
```

C++

```
TMaskCharType MaskGetCharType(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskGetCharType directly.

See Also

FormatMaskText (see page 4691)

45.1.5 MaskUtils.MaskGetCurrentDirectives Function

MaskGetCurrentDirectives is used internally.

Pascal

```
function MaskGetCurrentDirectives(const EditMask: string; MaskOffset: Integer):
TMaskDirectives;
```

C++

```
TMaskDirectives MaskGetCurrentDirectives(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskGetCurrentDirectives directly.

See Also

FormatMaskText (see page 4691)

45.1.6 MaskUtils.MaskGetFldSeparator Function

MaskGetFldSeparator is used internally.

Pascal

```
function MaskGetFldSeparator(const EditMask: string): Integer;
```

C++

```
int MaskGetFldSeparator(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskGetFldSeparator directly.

See Also

FormatMaskText (see page 4691)

45.1.7 MaskUtils.MaskGetMaskBlank Function

MaskGetMaskBlank is used internally.

Pascal

```
function MaskGetMaskBlank(const EditMask: string): Char;
```

C++

```
Char MaskGetMaskBlank(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskGetMaskBlank directly.

See Also

FormatMaskText (see page 4691)

45.1.8 MaskUtils.MaskGetMaskSave Function

MaskGetMaskSave is used internally.

Pascal

```
function MaskGetMaskSave(const EditMask: string): Boolean;
```

C++

```
Boolean MaskGetMaskSave(const UnicodeString EditMask);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskGetMaskSave directly.

See Also

FormatMaskText (see page 4691)

45.1.9 MaskUtils.MaskIntlLiteralToChar Function

MaskIntlLiteralToChar is used internally.

Pascal

```
function MaskIntlLiteralToChar(IChar: Char): Char;
```

C++

```
Char MaskIntlLiteralToChar(Char IChar);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskIntlLiteralToChar directly.

See Also

FormatMaskText (see page 4691)

45.1.10 MaskUtils.MaskOffsetToOffset Function

MaskOffsetToOffset is used internally.

Pascal

```
function MaskOffsetToOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToOffset(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskOffsetToOffset directly.

See Also

FormatMaskText (see page 4691)

45.1.11 MaskUtils.MaskOffsetToWideOffset Function

MaskOffsetToWideOffset is used internally.

Pascal

```
function MaskOffsetToWideOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToWideOffset(const UnicodeString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call MaskOffsetToWideOffset directly.

See Also

FormatMaskText (see page 4691)

45.1.12 MaskUtils.OffsetToMaskOffset Function

OffsetToMaskOffset is used internally.

Pascal

```
function OffsetToMaskOffset(const EditMask: string; Offset: Integer): Integer;
```

C++

```
int OffsetToMaskOffset(const UnicodeString EditMask, int Offset);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call OffsetToMaskOffset directly.

See Also

FormatMaskText (see page 4691)

45.1.13 MaskUtils.PadInputLiterals Function

PadInputLiterals is used internally.

Pascal

```
function PadInputLiterals(const EditMask: String; const Value: string; Blank: Char): string;
```

C++

```
UnicodeString PadInputLiterals(const UnicodeString EditMask, const UnicodeString Value, Char
Blank);
```

File

MaskUtils

Description

This function is used internally by FormatMaskText (see page 4691). Do not call PadInputLiterals directly.

See Also

FormatMaskText (see page 4691)

45.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMaskCharType (see page 4698)	TMaskCharType is used internally.

45.2.1 MaskUtils.TMaskCharType Enumeration

TMaskCharType is used internally.

Pascal

```
TMaskCharType = (
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
);
```

C++

```
enum TMaskCharType {
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
};
```

File

MaskUtils

Description

This record is used internally by FormatMaskText (see page 4691). Do not use TMaskCharType directly.

See Also

FormatMaskText (see page 4691)

45.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEditMask (see page 4699)	Represents the mask that validates and formats user input.
TMaskDirectives (see page 4700)	TMaskDirectives is used internally.
TMaskedText (see page 4701)	TMaskedText is the type for the text that is typed into a masked edit control.

45.3.1 MaskUtils.TEditMask Type

Represents the mask that validates and formats user input.

Pascal

```
TEditMask = type string;
```

C++

```
type string TEditMask;
```

File

MaskUtils

Description

TEditMask is a string that consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of a mask are saved as part of the data. The third part of the mask is the character used to represent unentered characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the text as leading blanks. If a ! character is not present, optional characters are represented in the text as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.
<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case the user uses to enter the data.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal in the data.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.

C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the text. When the user enters characters in the field, the cursor skips the _ character.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters must be matched exactly in the edit control. They are inserted automatically, and the cursor skips over them during editing. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask should be included as part of the text for the edit control. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Text property for the edit control would consist of the 10 digits that were entered, rather than the 14 characters that make up the telephone number as it appears in the edit control.

A 0 in the second field indicates that literals should not be included, any other character indicates that they should be included. The character that indicates whether literals should be included can be changed in the Edit Mask (see page 4591) property editor, or programmatically by changing the MaskNoSave (see page 4703) typed constant.

The third field of the mask is the character that appears in the edit control for blanks (characters that have not been entered). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in an edit window. However, when a user edits the text in a masked edit control, the cursor selects each blank character in turn, and skips over the space character.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify multi-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be duplicated as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

45.3.2 MaskUtils.TMaskDirectives Type

TMaskDirectives is used internally.

Pascal

```
TMaskDirectives = set of (mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar);
```

C++

```
(mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar) TMaskDirectives;
```

File

MaskUtils

Description

This record is used internally by FormatMaskText (see page 4691). Do not use TMaskDirectives directly.

See Also

FormatMaskText (see page 4691)

45.3.3 MaskUtils.TMaskedText Type

TMaskedText is the type for the text that is typed into a masked edit control.

Pascal

```
TMaskedText = type string;
```

C++

```
type string TMaskedText;
```

File

MaskUtils

Description

TMaskedText is the value of a masked edit control's text before the mask is applied.

45.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefaultBlank (see page 4702)	DefaultBlank is used internally.
MaskFieldSeparator (see page 4702)	MaskFieldSeparator is used internally.
MaskNoSave (see page 4703)	MaskNoSave is used internally.

45.4.1 MaskUtils.DefaultBlank Variable

DefaultBlank is used internally.

Pascal

```
DefaultBlank: Char = '_';
```

C++

```
Char DefaultBlank = '_';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 4691). Do not use DefaultBlank directly.

See Also

FormatMaskText (see page 4691)

45.4.2 MaskUtils.MaskFieldSeparator Variable

MaskFieldSeparator is used internally.

Pascal

```
MaskFieldSeparator: Char = ';';
```

C++

```
Char MaskFieldSeparator = ';';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 4691). Do not use MaskFieldSeparator directly.

See Also

FormatMaskText (see page 4691)

45.4.3 MaskUtils.MaskNoSave Variable

MaskNoSave is used internally.

Pascal

```
MaskNoSave: Char = '0';
```

C++

```
Char MaskNoSave = '0';
```

File

MaskUtils

Description

This variable is used internally by FormatMaskText (see page 4691). Do not use MaskNoSave directly.

See Also

FormatMaskText (see page 4691)

45.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
mDirLiteral (see page 4704)	mDirLiteral is used internally.
mDirLowerCase (see page 4704)	mDirLowerCase is used internally.
mDirReverse (see page 4705)	mDirReverse is used internally.
mDirUpperCase (see page 4705)	mDirUpperCase is used internally.
mMskAlpha (see page 4706)	mMskAlpha is used internally.
mMskAlphaNum (see page 4706)	mMskAlphaNum is used internally.
mMskAlphaNumOpt (see page 4706)	mMskAlphaNumOpt is used internally.
mMskAlphaOpt (see page 4707)	mMskAlphaOpt is used internally.
mMskAscii (see page 4707)	mMskAscii is used internally.
mMskAsciiOpt (see page 4708)	mMskAsciiOpt is used internally.
mMskDateSeparator (see page 4708)	mMskDateSeparator is used internally.
mMskNumeric (see page 4708)	mMskNumeric is used internally.
mMskNumericOpt (see page 4709)	mMskNumericOpt is used internally.
mMskNumSymOpt (see page 4709)	mMskNumSymOpt is used internally.
mMskTimeSeparator (see page 4710)	mMskTimeSeparator is used internally.

45.5.1 MaskUtils.mDirLiteral Constant

mDirLiteral is used internally.

Pascal

```
mDirLiteral = '\';
```

C++

```
mDirLiteral = '\';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mDirLiteral directly.

See Also

FormatMaskText (see page 4691)

45.5.2 MaskUtils.mDirLowerCase Constant

mDirLowerCase is used internally.

Pascal

```
mDirLowerCase = '<';
```

C++

```
mDirLowerCase = '<';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mDirLowerCase directly.

See Also

FormatMaskText (see page 4691)

45.5.3 MaskUtils.mDirReverse Constant

mDirReverse is used internally.

Pascal

```
mDirReverse = '!';
```

C++

```
mDirReverse = '!';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mDirReverse directly.

See Also

FormatMaskText (see page 4691)

45.5.4 MaskUtils.mDirUpperCase Constant

mDirUpperCase is used internally.

Pascal

```
mDirUpperCase = '>';
```

C++

```
mDirUpperCase = '>';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mDirUpperCase directly.

See Also

FormatMaskText (see page 4691)

45.5.5 MaskUtils.mMskAlpha Constant

mMskAlpha is used internally.

Pascal

```
mMskAlpha = 'L';
```

C++

```
mMskAlpha = 'L';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAlpha directly.

See Also

FormatMaskText (see page 4691)

45.5.6 MaskUtils.mMskAlphaNum Constant

mMskAlphaNum is used internally.

Pascal

```
mMskAlphaNum = 'A';
```

C++

```
mMskAlphaNum = 'A';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAlphaNum directly.

See Also

FormatMaskText (see page 4691)

45.5.7 MaskUtils.mMskAlphaNumOpt Constant

mMskAlphaNumOpt is used internally.

Pascal

```
mMskAlphaNumOpt = 'a';
```

C++

```
mMskAlphaNumOpt = 'a';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAlphaNumOpt directly.

See Also

FormatMaskText (see page 4691)

45.5.8 MaskUtils.mMskAlphaOpt Constant

mMskAlphaOpt is used internally.

Pascal

```
mMskAlphaOpt = 'l';
```

C++

```
mMskAlphaOpt = 'l';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAlphaOpt directly.

See Also

FormatMaskText (see page 4691)

45.5.9 MaskUtils.mMskAscii Constant

mMskAscii is used internally.

Pascal

```
mMskAscii = 'C';
```

C++

```
mMskAscii = 'C';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAscii directly.

See Also

FormatMaskText (see page 4691)

45.5.10 MaskUtils.mMskAsciiOpt Constant

mMskAsciiOpt is used internally.

Pascal

```
mMskAsciiOpt = 'c';
```

C++

```
mMskAsciiOpt = 'c';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskAsciiOpt directly.

See Also

FormatMaskText (see page 4691)

45.5.11 MaskUtils.mMskDateSeparator Constant

mMskDateSeparator is used internally.

Pascal

```
mMskDateSeparator = '/';
```

C++

```
mMskDateSeparator = '/';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskDateSeparator directly.

See Also

FormatMaskText (see page 4691)

45.5.12 MaskUtils.mMskNumeric Constant

mMskNumeric is used internally.

Pascal

```
mMskNumeric = '0';
```

C++

```
mMskNumeric = '0';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskNumeric directly.

See Also

FormatMaskText (see page 4691)

45.5.13 MaskUtils.mMskNumericOpt Constant

mMskNumericOpt is used internally.

Pascal

```
mMskNumericOpt = '9';
```

C++

```
mMskNumericOpt = '9';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskNumericOpt directly.

See Also

FormatMaskText (see page 4691)

45.5.14 MaskUtils.mMskNumSymOpt Constant

mMskNumSymOpt is used internally.

Pascal

```
mMskNumSymOpt = '#';
```

C++

```
mMskNumSymOpt = '#';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskNumSymOpt directly.

See Also

FormatMaskText (see page 4691)

45.5.15 MaskUtils.mMskTimeSeparator Constant

mMskTimeSeparator is used internally.

Pascal

```
mMskTimeSeparator = ':';
```

C++

```
mMskTimeSeparator = ':';
```

File

MaskUtils

Description

This constant is used internally by FormatMaskText (see page 4691). Do not use mMskTimeSeparator directly.

See Also

FormatMaskText (see page 4691)

46 Math Namespace

This is namespace Math.

Topics

Name	Description
Classes (see page 4715)	The following table lists classes in this documentation.
Functions (see page 4717)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4769)	The following table lists structs, records, enums in this documentation.
Types (see page 4773)	The following table lists types in this documentation.
Constants (see page 4776)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 4715)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Constants

Name	Description
Infinity (see page 4776)	Infinity represents positive infinity.
MaxComp (see page 4777)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 4777)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 4777)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 4778)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 4778)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 4779)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 4779)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 4779)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 4780)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 4780)	NegativeValue defines a negative number result from using Sign (see page 4761).
NegInfinity (see page 4781)	NegInfinity represents negative infinity.
PositiveValue (see page 4781)	PositiveValue defines a positive number result from using Sign (see page 4761).
ZeroValue (see page 4782)	ZeroValue defines a zero value number result from using Sign (see page 4761).

Functions

	Name	Description
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 4720)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 4720)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 4721)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 4721)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 4722)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 4722)	Calculates the inverse secant of a given number.
	ArcSecH (see page 4722)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSinh (see page 4723)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 4724)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 4724)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 4725)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 4725)	Clears exception bits in FPU status word.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	Cosecant (see page 4726)	Returns the cosecant of an angle.
	Cosh (see page 4727)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 4727)	Calculates the cotangent of an angle.
	Cotan (see page 4728)	Calculates the cotangent of an angle.
	CotH (see page 4728)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 4729)	Returns the cosecant of an angle.
	CscH (see page 4729)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 4730)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 4730)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 4730)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 4731)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 4731)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 4732)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 4732)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 4732)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	Floor (see page 4733)	Rounds variables toward negative infinity.
	Frexp (see page 4734)	Separates the Mantissa and Exponent of X
	FutureValue (see page 4734)	Calculates the future value of an investment.
	GetExceptionMask (see page 4735)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 4735)	Returns the FPU precision control mode.
	GetRoundMode (see page 4736)	Returns the FPU rounding mode.
	GradToCycle (see page 4737)	Converts grad measurements to cycles.
	GradToDeg (see page 4737)	Converts grad measurements to degrees.
	GradToRad (see page 4737)	Converts grad measurements to radians.
	Hypot (see page 4738)	Calculates the length of the hypotenuse.

	IfThen (see page 4738)	Conditionally returns one of two specified values.
	IfThen (see page 4738)	Conditionally returns one of two specified values.
	IfThen (see page 4738)	Conditionally returns one of two specified values.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 4739)	Calculates the interest portion of a loan payment.
	InterestRate (see page 4740)	Returns the interest rate required to increase PresentValue (see page 4753) to FutureValue (see page 4734).
	InternalRateOfReturn (see page 4740)	Calculates the internal rate of return for an investment.
	IntPower (see page 4741)	Calculates the integral power of a base value.
	IsInfinite (see page 4741)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 4743)	Calculates X times (2 to the power of P).
	LnXP1 (see page 4743)	Returns the natural log of (X+1)
	Log10 (see page 4743)	Calculates log base 10.
	Log2 (see page 4744)	Calculates log base 2.
	LogN (see page 4744)	Calculates the log of X for a specified base.
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 4745)	Returns the largest signed value in an integer array.
	MaxValue (see page 4746)	Returns the largest signed value in an array.
	Mean (see page 4746)	Returns the average of all values in an array.
	MeanAndStdDev (see page 4747)	Calculates the mean and standard deviation of array elements.
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 4748)	Returns the smallest signed value in an integer array.
	MinValue (see page 4748)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 4749)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 4749)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 4750)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 4750)	Returns the number of payment periods for an investment.
	Payment (see page 4751)	Calculates a fully amortized payment.
	PeriodPayment (see page 4751)	Returns the principal amount from a full payment.
	Poly (see page 4751)	Evaluates a uniform polynomial of one variable at the value X.
	PopnStdDev (see page 4752)	Calculates the population standard deviation.
	PopnVariance (see page 4752)	Calculates the population variance.
	Power (see page 4753)	Raises Base to any power.
	Power (see page 4753)	Raises Base to any power.
	Power (see page 4753)	Raises Base to any power.
	PresentValue (see page 4753)	Calculates the present value of an investment.
	RadToCycle (see page 4754)	Converts radians to cycles.

	RadToDeg (see page 4754)	Converts radians to degrees.
	RadToGrad (see page 4754)	Converts radians to grads.
	RandG (see page 4755)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomRange (see page 4756)	Returns a random integer from a specified range.
	RoundTo (see page 4756)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 4758)	Calculates the secant of an angle.
	Secant (see page 4758)	Calculates the secant of an angle.
	SecH (see page 4759)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 4759)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 4760)	Sets the FPU precision control mode.
	SetRoundMode (see page 4760)	Sets the FPU rounding mode.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 4761)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 4762)	Returns sine and cosine of an angle.
	Sinh (see page 4762)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 4763)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 4763)	Returns the sample standard deviation for elements in an array.
	Sum (see page 4764)	Returns the sum of the elements in an array.
	SumInt (see page 4764)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 4765)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 4765)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 4766)	Calculates depreciation for an asset.
	Tan (see page 4766)	Returns the tangent of X.
	Tanh (see page 4767)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 4767)	Returns the statistical variance from an array of values.
	Variance (see page 4768)	Calculates statistical sample variance from an array of data.

Structs, Records, Enums

	Name	Description
	TFPUException (see page 4769)	TFPUException defines TFPUExceptionMask (see page 4773) values.
	TFPUPrecisionMode (see page 4770)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 4771)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 4772)	TPaymentTime is an enumerated type used as a parameter in financial functions.

Types

Name	Description
TFPUExceptionMask (see page 4773)	TFPUExceptionMask defines a set of TFPUException (see page 4769) values.
TRoundToEXRangeExtended (see page 4774)	This is type Math.TRoundToEXRangeExtended.
TRoundToRange (see page 4774)	TRoundToRange defines the RoundTo (see page 4756) rounding limits.
TValueSign (see page 4774)	TValueSign defines the Sign (see page 4761) returned value.

46.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 4715)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

46.1.1 EInvalidArgument Class

EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Class Hierarchy

Pascal

```
EInvalidArgument = class(EMathError);
```

C++

```
class EInvalidArgument : public EMathError;
```

File

Math

Description

EInvalidArgument is raised by some functions in the Math (see page 4711) unit (mostly financial functions) when one of the parameters is out of range or makes the calculation impossible.

Note: On Windows, because EInvalidArgument descends (indirectly) from EExternal, it saves the Windows exception record (if there is one) in its ExceptionRecord data structure.

46.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCos (see page 4719)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 4720)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 4720)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 4721)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 4721)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 4722)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 4722)	Calculates the inverse secant of a given number.
	ArcSecH (see page 4722)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSin (see page 4723)	Calculates the inverse sine of a given number.
	ArcSinh (see page 4723)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 4724)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 4724)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 4725)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 4725)	Clears exception bits in FPU status word.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	CompareValue (see page 4726)	Returns the relationship between two numeric values.
	Cosecant (see page 4726)	Returns the cosecant of an angle.
	Cosh (see page 4727)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 4727)	Calculates the cotangent of an angle.
	Cotan (see page 4728)	Calculates the cotangent of an angle.
	CotH (see page 4728)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 4729)	Returns the cosecant of an angle.
	CscH (see page 4729)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 4730)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 4730)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 4730)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 4731)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 4731)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 4732)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 4732)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 4732)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 4733)	Returns the closest value to a specified value within a specified range.
	Floor (see page 4733)	Rounds variables toward negative infinity.
	Frexp (see page 4734)	Separates the Mantissa and Exponent of X
	FutureValue (see page 4734)	Calculates the future value of an investment.

	GetExceptionMask (see page 4735)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 4735)	Returns the FPU precision control mode.
	GetRoundMode (see page 4736)	Returns the FPU rounding mode.
	GradToCycle (see page 4737)	Converts grad measurements to cycles.
	GradToDeg (see page 4737)	Converts grad measurements to degrees.
	GradToRad (see page 4737)	Converts grad measurements to radians.
	Hypot (see page 4738)	Calculates the length of the hypotenuse.
	IfThen (see page 4738)	Conditionally returns one of two specified values.
	IfThen (see page 4738)	Conditionally returns one of two specified values.
	IfThen (see page 4738)	Conditionally returns one of two specified values.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InRange (see page 4738)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 4739)	Calculates the interest portion of a loan payment.
	InterestRate (see page 4740)	Returns the interest rate required to increase PresentValue (see page 4753) to FutureValue (see page 4734).
	InternalRateOfReturn (see page 4740)	Calculates the internal rate of return for an investment.
	IntPower (see page 4741)	Calculates the integral power of a base value.
	IsInfinite (see page 4741)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 4742)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 4742)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 4743)	Calculates X times (2 to the power of P).
	LnXP1 (see page 4743)	Returns the natural log of (X+1)
	Log10 (see page 4743)	Calculates log base 10.
	Log2 (see page 4744)	Calculates log base 2.
	LogN (see page 4744)	Calculates the log of X for a specified base.
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	Max (see page 4745)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 4745)	Returns the largest signed value in an integer array.
	MaxValue (see page 4746)	Returns the largest signed value in an array.
	Mean (see page 4746)	Returns the average of all values in an array.
	MeanAndStdDev (see page 4747)	Calculates the mean and standard deviation of array elements.
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 4747)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 4748)	Returns the smallest signed value in an integer array.
	MinValue (see page 4748)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 4749)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 4749)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 4750)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 4750)	Returns the number of payment periods for an investment.
	Payment (see page 4751)	Calculates a fully amortized payment.
	PeriodPayment (see page 4751)	Returns the principal amount from a full payment.
	Poly (see page 4751)	Evaluates a uniform polynomial of one variable at the value X.

	PopnStdDev (see page 4752)	Calculates the population standard deviation.
	PopnVariance (see page 4752)	Calculates the population variance.
	Power (see page 4753)	Raises Base to any power.
	Power (see page 4753)	Raises Base to any power.
	Power (see page 4753)	Raises Base to any power.
	PresentValue (see page 4753)	Calculates the present value of an investment.
	RadToCycle (see page 4754)	Converts radians to cycles.
	RadToDeg (see page 4754)	Converts radians to degrees.
	RadToGrad (see page 4754)	Converts radians to grads.
	RandG (see page 4755)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomFrom (see page 4755)	Returns a randomly selected element from an array.
	RandomRange (see page 4756)	Returns a random integer from a specified range.
	RoundTo (see page 4756)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 4757)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 4758)	Calculates the secant of an angle.
	Secant (see page 4758)	Calculates the secant of an angle.
	SecH (see page 4759)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 4759)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 4760)	Sets the FPU precision control mode.
	SetRoundMode (see page 4760)	Sets the FPU rounding mode.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 4761)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 4761)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 4762)	Returns sine and cosine of an angle.
	Sinh (see page 4762)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 4763)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 4763)	Returns the sample standard deviation for elements in an array.
	Sum (see page 4764)	Returns the sum of the elements in an array.
	SumInt (see page 4764)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 4765)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 4765)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 4766)	Calculates depreciation for an asset.
	Tan (see page 4766)	Returns the tangent of X.
	Tanh (see page 4767)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 4767)	Returns the statistical variance from an array of values.
	Variance (see page 4768)	Calculates statistical sample variance from an array of data.

46.2.1 Math.ArcCos Function

Calculates the inverse cosine of a given number.

Pascal

```
function ArcCos(const X: Extended): Extended; overload;
function ArcCos(const X: Double): Double; overload;
function ArcCos(const X: Single): Single; overload;
```

C++

```
Extended ArcCos(const Extended X);
Double ArcCos(const Double X);
Single ArcCos(const Single X);
```

File

Math

Description

ArcCos returns the inverse cosine of X.

X must be between -1 and 1.

The return value is in the range [0..Pi], in radians.

See Also

Cos

ArcCosh (see page 4720)

ArcSin (see page 4723)

46.2.2 Math.ArcCosh Function

Calculates the inverse hyperbolic cosine of a given number.

Pascal

```
function ArcCosh(const X: Extended): Extended;
```

C++

```
Extended ArcCosh(const Extended X);
```

File

Math

Description

ArcCosh returns the inverse hyperbolic cosine of X. The value of X must be greater than or equal to 1.

See Also

Cosh (see page 4727)

ArcCos (see page 4719)

46.2.3 Math.ArcCot Function

Calculates the inverse cotangent of a given number.

Pascal

```
function ArcCot(const X: Extended): Extended;
```

C++

```
Extended ArcCot(const Extended X);
```

File

Math

Description

ArcCot returns the inverse cotangent of X.

See Also

Cot (see page 4727)

ArcCoth

46.2.4 Math.ArcCotH Function

Calculates the inverse hyperbolic cotangent of a given number.

Pascal

```
function ArcCotH(const X: Extended): Extended;
```

C++

```
Extended ArcCotH(const Extended X);
```

File

Math

Description

ArcCot (see page 4720) returns the inverse hyperbolic cotangent of X.

See Also

Cot (see page 4727)

ArcCoth

46.2.5 Math.ArcCsc Function

Calculates the inverse cosecant of a given number.

Pascal

```
function ArcCsc(const X: Extended): Extended;
```

C++

```
Extended ArcCsc(const Extended X);
```

File

Math

Description

ArcCsc returns the inverse cosecant of X.

See Also

Csc (see page 4729)

ArcCsch

46.2.6 Math.ArcCscH Function

Calculates the inverse hyperbolic cosecant of a given number.

Pascal

```
function ArcCscH(const X: Extended): Extended;
```

C++

```
Extended ArcCscH(const Extended X);
```

File

Math

Description

ArcCsc (see page 4721) returns the inverse hyperbolic cosecant of X.

See Also

Csc (see page 4729)

Csch

46.2.7 Math.ArcSec Function

Calculates the inverse secant of a given number.

Pascal

```
function ArcSec(const X: Extended): Extended;
```

C++

```
Extended ArcSec(const Extended X);
```

File

Math

Description

ArcSec returns the inverse secant of X.

See Also

Sec (see page 4758)

ArcSech

46.2.8 Math.ArcSecH Function

Calculates the inverse hyperbolic secant of a given number.

Pascal

```
function ArcSecH(const X: Extended): Extended;
```

C++

```
Extended ArcSecH(const Extended X);
```

File

Math

Description

ArcSec (see page 4722) returns the inverse hyperbolic secant of X.

See Also

Sec (see page 4758)

Sech

46.2.9 Math.ArcSin Function

Calculates the inverse sine of a given number.

Pascal

```
function ArcSin(const X: Extended): Extended; overload;
function ArcSin(const X: Double): Double; overload;
function ArcSin(const X: Single): Single; overload;
```

C++

```
Extended ArcSin(const Extended X);
Double ArcSin(const Double X);
Single ArcSin(const Single X);
```

File

Math

Description

ArcSin returns the inverse sine of X. X must be between -1 and 1. The return value will be in the range [-Pi/2..Pi/2], in radians.

See Also

Sin

ArcSinh (see page 4723)

ArcCos (see page 4719)

46.2.10 Math.ArcSinh Function

Calculates the inverse hyperbolic sine of a given number.

Pascal

```
function ArcSinh(const X: Extended): Extended;
```

C++

```
Extended ArcSinh(const Extended X);
```

File

Math

Description

ArcSinh returns the inverse hyperbolic sine of X.

See Also

Sinh (see page 4762)

46.2.11 Math.ArcTan2 Function

Calculates the arctangent angle and quadrant of a given number.

Pascal

```
function ArcTan2(const Y: Extended; const X: Extended): Extended;
```

C++

```
Extended ArcTan2(const Extended Y, const Extended X);
```

File

Math

Description

ArcTan2 calculates ArcTan(Y/X), and returns an angle in the correct quadrant. The values of X and Y must be between –2^64 and 2^64. In addition, the value of X can't be 0. The return value will fall in the range from -Pi to Pi radians.

46.2.12 Math.ArcTanh Function

Calculates the inverse hyperbolic tangent of a given number.

Pascal

```
function ArcTanh(const X: Extended): Extended;
```

C++

```
Extended ArcTanh(const Extended X);
```

File

Math

Description

ArcTanh returns the inverse hyperbolic tangent of X. The value of X must be between -1 and 1 (inclusive).

See Also

Tanh (see page 4767)

46.2.13 Math.Ceil Function

Rounds variables up toward positive infinity.

Pascal

```
function Ceil(const X: Extended): Integer;
```

C++

```
int Ceil(const Extended X);
```

File

Math

Description

Call Ceil to obtain the lowest integer greater than or equal to X. The absolute value of X must be less than MaxInt. For example:

Ceil(-2.8) = -2

Ceil(2.8) = 3

Ceil(-1.0) = -1

See Also

Trunc

Floor (see page 4733)

Ceil

46.2.14 Math.ClearExceptions Function

Clears exception bits in FPU status word.

Pascal

```
procedure ClearExceptions(RaisePending: Boolean = True);
```

C++

```
ClearExceptions(Boolean RaisePending = True);
```

File

Math

Description

ClearExceptions clears the exception bits in the FPU status word. If RaisePending is true, any pending floating point exceptions cause an error to be raised.

See Also

GetExceptionMask (see page 4735)

SetExceptionMask (see page 4759)

Set8087CW

46.2.15 Math.CompareValue Function

Returns the relationship between two numeric values.

Pascal

```
function CompareValue(const A: Extended; const B: Extended; Epsilon: Extended = 0):
TValueRelationship; overload;
function CompareValue(const A: Double; const B: Double; Epsilon: Double = 0):
TValueRelationship; overload;
function CompareValue(const A: Single; const B: Single; Epsilon: Single = 0):
TValueRelationship; overload;
function CompareValue(const A: Integer; const B: Integer): TValueRelationship; overload;
function CompareValue(const A: Int64; const B: Int64): TValueRelationship; overload;
```

C++

```
TValueRelationship CompareValue(const Extended A, const Extended B, Extended Epsilon = 0);
TValueRelationship CompareValue(const Double A, const Double B, Double Epsilon = 0);
TValueRelationship CompareValue(const Single A, const Single B, Single Epsilon = 0);
TValueRelationship CompareValue(const int A, const int B);
TValueRelationship CompareValue(const Int64 A, const Int64 B);
```

File

Math

Description

Call CompareValue to determine the relationship between two numeric values. When comparing floating-point values, CompareValue lets you specify a maximum difference to use when comparing values, so that they are considered the same if they are within that amount.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

CompareValue returns

LessThanValue if A is less than B (by more than Epsilon if A and B are floating-point numbers).

EqualsValue if A is equivalent to B (the same, or within Epsilon if A and B are floating-point numbers).

GreaterThanValue if A is larger than B (by more than Epsilon if A and B are floating-point numbers).

See Also

SameValue (see page 4757)

VarCompareValue

46.2.16 Math.Cosecant Function

Returns the cosecant of an angle.

Pascal

```
function Cosecant(const X: Extended): Extended;
```

C++

```
Extended Cosecant(const Extended X);
```

File

Math

Description

Use the Cosecant to calculate the cosecant of X, where X is an angle in radians. The cosecant is calculated as 1/ Sin(X).

See Also

ArcCsc (see page 4721)

CscH (see page 4729)

Secant (see page 4758)

Sin

46.2.17 Math.Cosh Function

Calculates the hyperbolic cosine of an angle.

Pascal

```
function Cosh(const X: Extended): Extended;
```

C++

```
Extended Cosh(const Extended X);
```

File

Math

Description

Use the Cosh to calculate the hyperbolic cosine of X.

See Also

Cos

ArcCosh (see page 4720)

Sinh (see page 4762)

46.2.18 Math.Cot Function

Calculates the cotangent of an angle.

Pascal

```
function Cot(const X: Extended): Extended;
```

C++

```
Extended Cot(const Extended X);
```

File

Math

Description

Call Cot to obtain the cotangent of X. The cotangent is calculated using the formula 1 / Tan (see page 4766)(X).

See Also

Tan (see page 4766)

Sin

Cos

ArcTan

46.2.19 Math.Cotan Function

Calculates the cotangent of an angle.

Pascal

```
function Cotan(const X: Extended): Extended;
```

C++

```
Extended Cotan(const Extended X);
```

File

Math

Description

Call Cotan to obtain the cotangent of X. The cotangent is calculated using the formula

1 / Tan (see page 4766)(X)

Note: Do not call Cotan with X = 0.

See Also

Tan (see page 4766)

Sin

Cos

ArcTan

46.2.20 Math.CotH Function

Calculates the hyperbolic cotangent of an angle.

Pascal

```
function CotH(const X: Extended): Extended;
```

C++

```
Extended CotH(const Extended X);
```

File

Math

Description

Call CotH to obtain the hyperbolic cotangent of X, where X is an angle in Radians.

See Also

Cot (see page 4727)

ArcCot (see page 4720)

46.2.21 Math.Csc Function

Returns the cosecant of an angle.

Pascal

```
function Csc(const X: Extended): Extended;
```

C++

```
Extended Csc(const Extended X);
```

File

Math

Description

Use the Csc to calculate the cosecant of X, where X is an angle in radians.

See Also

ArcCsc (see page 4721)

CscH (see page 4729)

Sec (see page 4758)

Sin

46.2.22 Math.CscH Function

Returns the hyperbolic cosecant of an angle.

Pascal

```
function CscH(const X: Extended): Extended;
```

C++

```
Extended CscH(const Extended X);
```

File

Math

Description

Use the CscH to calculate the hyperbolic cosecant of X, where X is an angle in radians.

See Also

ArcCscH (see page 4722)

Csc (see page 4729)

SecH (see page 4759)

46.2.23 Math.CycleToDeg Function

Converts an angle measurement from cycles to degrees.

Pascal

```
function CycleToDeg(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToDeg(const Extended Cycles);
```

File

Math

Description

CycleToDeg converts angles measured in cycles into degrees, where

degrees = cycles * 360.

46.2.24 Math.CycleToGrad Function

Converts an angle measurement from cycles to grads.

Pascal

```
function CycleToGrad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToGrad(const Extended Cycles);
```

File

Math

Description

CycleToGrad converts angles measured in cycles into grads.

46.2.25 Math.CycleToRad Function

Converts an angle measurement from cycles to radians.

Pascal

```
function CycleToRad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToRad(const Extended Cycles);
```

File

Math

Description

CycleToRad converts angles measured in cycles into radians, where

radians = 2pi * cycles.

46.2.26 Math.DegToCycle Function

Returns the value of a degree measurement expressed in cycles.

Pascal

```
function DegToCycle(const Degrees: Extended): Extended;
```

C++

```
Extended DegToCycle(const Extended Degrees);
```

File

Math

Description

Use DegToCycle to convert angles expressed in degrees to the corresponding value in cycles.

46.2.27 Math.DegToGrad Function

Returns the value of a degree measurement expressed in grads.

Pascal

```
function DegToGrad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToGrad(const Extended Degrees);
```

File

Math

Description

Use DegToGrad to convert angles expressed in degrees to the corresponding value in grads.

46.2.28 Math.DegToRad Function

Returns the value of a degree measurement expressed in radians.

Pascal

```
function DegToRad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToRad(const Extended Degrees);
```

File

Math

Description

Use DegToRad to convert angles expressed in degrees to the corresponding value in radians, where

radians = degrees(pi/180).

46.2.29 Math.DivMod Function

Returns the result of an integer division, including the remainder.

Pascal

```
procedure DivMod(Dividend: Cardinal; Divisor: Word; var Result: Word; var Remainder: Word);
```

C++

```
DivMod(unsigned Dividend, Word Divisor, Word Result, Word Remainder);
```

File

Math

Description

Call DivMod to perform 16-bit integer division and fetch the remainder as well, all in one operation.

Dividend is the integer into which you are dividing.

Divisor is the value by which to divide Dividend.

Result returns the result of the integer division.

Remainder returns the remainder (the difference between Result * Divisor and Dividend).

46.2.30 Math.DoubleDecliningBalance Function

Calculates the depreciation of an asset using the double-declining balance method.

Pascal

```
function DoubleDecliningBalance(const Cost: Extended; const Salvage: Extended; Life: Integer;
Period: Integer): Extended;
```

C++

```
Extended DoubleDecliningBalance(const Extended Cost, const Extended Salvage, int Life, int
Period);
```

File

Math

Description

DoubleDecliningBalance determines accelerated depreciation values for an asset, given the initial cost, life expectancy, end value, and depreciation period.

46.2.31 Math.EnsureRange Function

Returns the closest value to a specified value within a specified range.

Pascal

```
function EnsureRange(const AValue: Integer; const AMin: Integer; const AMax: Integer):
Integer; overload;
function EnsureRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Int64;
overload;
function EnsureRange(const AValue: Double; const AMin: Double; const AMax: Double): Double;
overload;
```

C++

```
int EnsureRange(const int AValue, const int AMin, const int AMax);
Int64 EnsureRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Double EnsureRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

EnsureRange returns a value that is guaranteed to be within a specified range.

AValue is the value you want as long as it is in range. If AValue is in range, EnsureRange returns AValue.

AMin is the minimum acceptable value. If AValue is less than AMin, EnsureRange returns AMin.

AMax is the maximum acceptable value. If AValue is greater than AMax, EnsureRange returns AMax.

See Also

VarEnsureRange

InRange (see page 4738)

46.2.32 Math.Floor Function

Rounds variables toward negative infinity.

Pascal

```
function Floor(const X: Extended): Integer;
```

C++

```
int Floor(const Extended X);
```

File

Math

Description

Call Floor to obtain the highest integer less than or equal to X. For example:

Floor(-2.8) = -3

Floor(2.8) = 2

Floor(-1.0) = -1

Note: The absolute value of X must be less than MaxInt.

See Also

Trunc

Ceil (see page 4725)

46.2.33 Math.Frexp Function

Separates the Mantissa and Exponent of X

Pascal

```
procedure Frexp(const X: Extended; var Mantissa: Extended; var Exponent: Integer);
```

C++

```
Frexp(const Extended X, Extended Mantissa, int Exponent);
```

File

Math

Description

Frexp returns the mantissa of X as Mantissa and the exponent as Exponent.

46.2.34 Math.FutureValue Function

Calculates the future value of an investment.

Pascal

```
function FutureValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
PresentValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended FutureValue(const Extended Rate, int NPeriods, const Extended Payment, const Extended
PresentValue, TPaymentTime PaymentTime);
```

File

Math

Description

FutureValue returns the future value of an investment of PresentValue (see page 4753) where Payment (see page 4751) is invested for NPeriods at the rate of Rate per period. The PaymentTime parameter indicates whether the investment is an ordinary annuity or an annuity due (enter ptEndOfPeriod if payments are at the end of each period, ptStartOfPeriod if they are at the beginning).

46.2.35 Math.GetExceptionMask Function

Returns the exception mask from the FPU control word.

Pascal

```
function GetExceptionMask: TFPUExceptionMask;
```

C++

```
TFPUExceptionMask GetExceptionMask();
```

File

Math

Description

Call GetExceptionMask to ascertain the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 4780), Infinity (see page 4776), or NegInfinity (see page 4781). The value depends on the operation and the current rounding mode.

See Also

Set8087CW

SetExceptionMask (see page 4759)

NaN (see page 4780)

Infinity (see page 4776)

NegInfinity (see page 4781)

IsInfinite (see page 4741)

IsNaN

46.2.36 Math.GetPrecisionMode Function

Returns the FPU precision control mode.

Pascal

```
function GetPrecisionMode: TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode GetPrecisionMode();
```

File

Math

Description

Call GetPrecisionMode to ascertain the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

See Also

Set8087CW

SetPrecisionMode (see page 4760)

46.2.37 Math.GetRoundMode Function

Returns the FPU rounding mode.

Pascal

```
function GetRoundMode: TFPURoundingMode;
```

C++

```
TFPURoundingMode GetRoundMode();
```

File

Math

Description

Call GetRoundingMode to ascertain how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

SetRoundMode (see page 4760)

46.2.38 Math.GradToCycle Function

Converts grad measurements to cycles.

Pascal

```
function GradToCycle(const Grads: Extended): Extended;
```

C++

```
Extended GradToCycle(const Extended Grads);
```

File

Math

Description

GradToCycle converts angles measured in grads into cycles.

46.2.39 Math.GradToDeg Function

Converts grad measurements to degrees.

Pascal

```
function GradToDeg(const Grads: Extended): Extended;
```

C++

```
Extended GradToDeg(const Extended Grads);
```

File

Math

Description

GradToDeg converts angles measured in grads into degrees.

46.2.40 Math.GradToRad Function

Converts grad measurements to radians.

Pascal

```
function GradToRad(const Grads: Extended): Extended;
```

C++

```
Extended GradToRad(const Extended Grads);
```

File

Math

Description

GradToRad converts angles measured in grads into radians, where

radians = grads(pi/200).

46.2.41 Math.Hypot Function

Calculates the length of the hypotenuse.

Pascal

```
function Hypot(const X: Extended; const Y: Extended): Extended;
```

C++

```
Extended Hypot(const Extended X, const Extended Y);
```

File

Math

Description

Hypot returns the length of the hypotenuse of a right triangle. Specify the lengths of the sides adjacent to the right angle in X and Y. Hypot uses the formula

Sqrt(X**2 + Y**2)

46.2.42 Math.IfThen Function

Conditionally returns one of two specified values.

Pascal

```
function IfThen(AValue: Boolean; const ATrue: Integer; const AFalse: Integer = 0): Integer;
overload;
function IfThen(AValue: Boolean; const ATrue: Int64; const AFalse: Int64 = 0): Int64; overload;
function IfThen(AValue: Boolean; const ATrue: Double; const AFalse: Double = 0.0): Double;
overload;
```

C++

```
int IfThen(Boolean AValue, const int ATrue, const int AFalse = 0);
Int64 IfThen(Boolean AValue, const Int64 ATrue, const Int64 AFalse = 0);
Double IfThen(Boolean AValue, const Double ATrue, const Double AFalse = 0.0);
```

File

Math

Description

IfThen checks the expression passed as AValue and returns ATrue if it evaluates to true, or AFalse if it evaluates to false. In Delphi, if the AFalse parameter is omitted, IfThen returns 0 or an empty string when AValue evaluates to False.

46.2.43 Math.InRange Function

Indicates whether a value falls within a specified range.

Pascal

```
function InRange(const AValue: Integer; const AMin: Integer; const AMax: Integer): Boolean;
overload;
function InRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Boolean; overload;
function InRange(const AValue: Double; const AMin: Double; const AMax: Double): Boolean;
overload;
```

C++

```
Boolean InRange(const int AValue, const int AMin, const int AMax);
Boolean InRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Boolean InRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

InRange returns true if AValue is greater than or equal to AMin and less than or Equal to AMax. It returns false if AValue is less than AMin or greater than AMax.

See Also

VarInRange

EnsureRange (see page 4733)

46.2.44 Math.InterestPayment Function

Calculates the interest portion of a loan payment.

Pascal

```
function InterestPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Call InterestPayment to calculate the portion of a loan payment that reflects the interest.

Rate represents the fixed periodic interest rate.

Period identifies the payment period.

NPeriods is the number of periods of the loan.

PresentValue (see page 4753) represents the amount borrowed (the principal).

FutureValue (see page 4734) is the future value of the investment.

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

46.2.45 Math.InterestRate Function

Returns the interest rate required to increase PresentValue (see page 4753) to FutureValue (see page 4734).

Pascal

```
function InterestRate(NPeriods: Integer; const Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestRate(int NPeriods, const Extended Payment, const Extended PresentValue, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

InterestRate calculates the interest rate required in order for an investment of PresentValue (see page 4753), with periodic payments of Payment (see page 4751), to be worth FutureValue (see page 4734) within NPeriods compounding periods. If NPeriods represents years, an annual interest rate results; if NPeriods represents months, a monthly interest rate results, and so on. The PaymentTime parameter indicates whether the cash flows occur at the beginning or end of the period.

46.2.46 Math.InternalRateOfReturn Function

Calculates the internal rate of return for an investment.

Pascal

```
function InternalRateOfReturn(const Guess: Extended; const CashFlows: array of Double):
Extended;
```

C++

```
Extended InternalRateOfReturn(const Extended Guess, const array of Double CashFlows);
```

File

Math

Description

InternalRateOfReturn determines the internal rate of return on an investment. It references an array that contains cash flow information and uses the supplied internal rate of return estimate to calculate results.

Before using this function, define an array containing expected cash flow amounts over a period of time. It is assumed that the amounts are received at regular intervals. Negative amounts are interpreted as cash outflows, and positive amounts as inflows. The first amount must be a negative number, to reflect the initial investment. The following amounts can all be the same for each time period, or they can be different (including a mixture of negatives, positives, or zeros).

Specify the estimated rate of return as the Guess parameter. Pass the array of expected cash flow amounts as the CashFlows parameter. In C++, the CashFlows_Size parameter gives the index of the last entry in CashFlows (one less than the number of entries).

46.2.47 Math.IntPower Function

Calculates the integral power of a base value.

Pascal

```
function IntPower(const Base: Extended; const Exponent: Integer): Extended;
```

C++

```
Extended IntPower(const Extended Base, const int Exponent);
```

File

Math

Description

IntPower raises Base to the power specified by Exponent.

See Also

Power (see page 4753)

46.2.48 Math.IsInfinite Function

Indicates when a variable or expression represents an infinite value.

Pascal

```
function IsInfinite(const AValue: Double): Boolean;
```

C++

```
Boolean IsInfinite(const Double AValue);
```

File

Math

Description

Use IsInfinite to test whether the value specified by AValue represents positive or negative infinity. Use the Sign (see page 4761) function to distinguish positive infinity from negative infinity.

See Also

GetExceptionMask (see page 4735)

NegInfinity (see page 4781)

IsNan (see page 4742)

Infinity (see page 4776)

IsZero (see page 4742)

Sign (see page 4761)

46.2.49 Math.IsNan Function

Indicates when a variable or expression does not evaluate to a numeric value.

Pascal

```
function IsNan(const AValue: Double): Boolean; overload;
function IsNan(const AValue: Single): Boolean; overload;
function IsNan(const AValue: Extended): Boolean; overload;
```

C++

```
Boolean IsNan(const Double AValue);
Boolean IsNan(const Single AValue);
Boolean IsNan(const Extended AValue);
```

File

Math

Description

Use IsNan to test whether the value specified by AValue represents NaN (see page 4780) (not a number). Note that NaN (see page 4780) is distinct from positive and negative infinity, which can be detected using the IsInfinite (see page 4741) function.

See Also

GetExceptionMask (see page 4735)

Nan

IsInfinite (see page 4741)

46.2.50 Math.IsZero Function

Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.

Pascal

```
function IsZero(const A: Extended; Epsilon: Extended = 0): Boolean; overload;
function IsZero(const A: Double; Epsilon: Double = 0): Boolean; overload;
function IsZero(const A: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean IsZero(const Extended A, Extended Epsilon = 0);
Boolean IsZero(const Double A, Double Epsilon = 0);
Boolean IsZero(const Single A, Single Epsilon = 0);
```

File

Math

Description

Use IsZero to test whether the value specified by AValue is zero, or differs from zero by at most Epsilon.

See Also

SameValue (see page 4757)

IsInfinite (see page 4741)

Sign (see page 4761)

46.2.51 Math.Ldexp Function

Calculates X times (2 to the power of P).

Pascal

```
function Ldexp(const X: Extended; const P: Integer): Extended;
```

C++

```
Extended Ldexp(const Extended X, const int P);
```

File

Math

Description

Ldexp returns X times (2 to the power of P).

46.2.52 Math.LnXP1 Function

Returns the natural log of (X+1)

Pascal

```
function LnXP1(const X: Extended): Extended;
```

C++

```
Extended LnXP1(const Extended X);
```

File

Math

Description

LnXP1 returns the natural logarithm of (X+1). Use LnXP1 when X is a value near 0.

46.2.53 Math.Log10 Function

Calculates log base 10.

Pascal

```
function Log10(const X: Extended): Extended;
```

C++

```
Extended Log10(const Extended X);
```

File

Math

Description

Log10 returns the log base 10 of X.

See Also

Log2 (see page 4744)

Ln

LogN (see page 4744)

46.2.54 Math.Log2 Function

Calculates log base 2.

Pascal

```
function Log2(const X: Extended): Extended;
```

C++

```
Extended Log2(const Extended X);
```

File

Math

Description

Log2 returns the log base 2 of X.

See Also

Log10 (see page 4743)

Ln

LogN (see page 4744)

46.2.55 Math.LogN Function

Calculates the log of X for a specified base.

Pascal

```
function LogN(const Base: Extended; const X: Extended): Extended;
```

C++

```
Extended LogN(const Extended Base, const Extended X);
```

File

Math

Description

LogN returns the log base Base of X.

See Also

Log2 (see page 4744)

Log10 (see page 4743)

Ln

46.2.56 Math.Max Function

Returns the greater of two numeric values (Delphi only).

Pascal

```
function Max(const A: Integer; const B: Integer): Integer; overload;
function Max(const A: Int64; const B: Int64): Int64; overload;
function Max(const A: Single; const B: Single): Single; overload;
function Max(const A: Double; const B: Double): Double; overload;
function Max(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Max(const int A, const int B);
Int64 Max(const Int64 A, const Int64 B);
Single Max(const Single A, const Single B);
Double Max(const Double A, const Double B);
Extended Max(const Extended A, const Extended B);
```

File

Math

Description

In Delphi, call Max to compare two numeric values. Max returns the greater value of the two.

See Also

MaxValue (see page 4746)

Min (see page 4747)

MaxIntValue (see page 4745)

46.2.57 Math.MaxIntValue Function

Returns the largest signed value in an integer array.

Pascal

```
function MaxIntValue(const Data: array of Integer): Integer;
```

C++

```
int MaxIntValue(const array of Integer Data);
```

File

Math

Description

Call MaxIntValue to obtain the largest integer from the Data array. In C++, Data_Size is the index of the last element in the array (one less than the number of elements).

See Also

MaxValue (see page 4746)

MinIntValue (see page 4748)

46.2.58 Math.MaxValue Function

Returns the largest signed value in an array.

Pascal

```
function MaxValue(const Data: array of Double): Double;
```

C++

```
Double MaxValue(const array of Double Data);
```

File

Math

Description

MaxValue returns the largest signed value in the Data array. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MaxIntValue (see page 4745)

MinValue (see page 4748)

46.2.59 Math.Mean Function

Returns the average of all values in an array.

Pascal

```
function Mean(const Data: array of Double): Extended;
```

C++

```
Extended Mean(const array of Double Data);
```

File

Math

Description

Mean calculates the arithmetic average of all the values in the Data array parameter. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MeanAndStdDev (see page 4747)

46.2.60 Math.MeanAndStdDev Function

Calculates the mean and standard deviation of array elements.

Pascal

```
procedure MeanAndStdDev(const Data: array of Double; var Mean: Extended; var StdDev: Extended);
```

C++

```
MeanAndStdDev(const array of Double Data, Extended Mean, Extended StdDev);
```

File

Math

Description

MeanAndStdDev calculates Mean (see page 4746) and standard deviation in one pass. Using this is twice as fast as calculating them separately. Precision may be lost when the Mean (see page 4746) is very large (> 10e7) or the variance is very small.

Data specifies the data to be summarized. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). The mean is returned as Mean (see page 4746) and the standard deviation is returned as StdDev (see page 4763).

Note: If the sample size is 1 (that is, if Data contains only one entry), StdDev (see page 4763) returns the value of Data[0] and not zero.

See Also

Mean (see page 4746)

StdDev (see page 4763)

46.2.61 Math.Min Function

Returns the lesser of two numeric values (Delphi only).

Pascal

```
function Min(const A: Integer; const B: Integer): Integer; overload;
function Min(const A: Int64; const B: Int64): Int64; overload;
function Min(const A: Single; const B: Single): Single; overload;
function Min(const A: Double; const B: Double): Double; overload;
function Min(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Min(const int A, const int B);
Int64 Min(const Int64 A, const Int64 B);
Single Min(const Single A, const Single B);
Double Min(const Double A, const Double B);
Extended Min(const Extended A, const Extended B);
```

File

Math

Description

Call Min to compare two numeric values in Delphi. Min returns the smaller value of the two.

See Also

MinValue (see page 4748)

Max (see page 4745)

MinIntValue (see page 4748)

46.2.62 Math.MinIntValue Function

Returns the smallest signed value in an integer array.

Pascal

```
function MinIntValue(const Data: array of Integer): Integer;
```

C++

```
int MinIntValue(const array of Integer Data);
```

File

Math

Description

Call MinIntValue to obtain the smallest integer in the Data array. In C++, the Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxIntValue (see page 4745)

MinValue (see page 4748)

46.2.63 Math.MinValue Function

Returns smallest signed value in an array.

Pascal

```
function MinValue(const Data: array of Double): Double;
```

C++

```
Double MinValue(const array of Double Data);
```

File

Math

Description

MinValue returns the smallest signed value in the Data array. The Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxValue (see page 4746)

MinIntValue (see page 4748)

46.2.64 Math.MomentSkewKurtosis Function

Calculates the mean, variance, skew, and kurtosis.

Pascal

```
procedure MomentSkewKurtosis(const Data: array of Double; var M1: Extended; var M2: Extended;
var M3: Extended; var M4: Extended; var Skew: Extended; var Kurtosis: Extended);
```

C++

```
MomentSkewKurtosis(const array of Double Data, Extended M1, Extended M2, Extended M3, Extended
M4, Extended Skew, Extended Kurtosis);
```

File

Math

Description

MomentSkewKurtosis calculates the core factors of statistical analysis: the first four moments plus the coefficients of skew and kurtosis.

Data specifies the data to be analyzed. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). M1, M2, M3 and M4 return the first four moments (M1 is the mean, M2 is the variance, and so on). Skew reflects symmetry of distribution. Kurtosis reflects flatness of distribution.

46.2.65 Math.NetPresentValue Function

Calculates the current value from an array of estimated cash flow values.

Pascal

```
function NetPresentValue(const Rate: Extended; const CashFlows: array of Double; PaymentTime:
TPaymentTime): Extended;
```

C++

```
Extended NetPresentValue(const Extended Rate, const array of Double CashFlows, TPaymentTime
PaymentTime);
```

File

Math

Description

NetPresentValue calculates the current value of an array of estimated cash flow values, discounted at the given interest rate of Rate.

CashFlows is the array of estimated cash flow values. In C++, CashFlows_Size is the index of the last element in that array (one less than the number of elements).

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

NetPresentValue helps determine how much an investment is currently worth, based on expected earnings, although its accuracy depends on the accuracy of the cash flows in the array.

46.2.66 Math.Norm Function

Returns the Euclidean 'L-2' norm.

Pascal

```
function Norm(const Data: array of Double): Extended;
```

C++

```
Extended Norm(const array of Double Data);
```

File

Math

Description

Norm returns the Euclidean 'L-2' norm for the values in the Data array. The 'L-2' norm is the square root of the sum of squares.

Note: In C++, Data is an array of values, and Data_Size is the index of the last value in the array (one less than the number of values).

See Also

SumOfSquares (see page 4765)

46.2.67 Math.NumberOfPeriods Function

Returns the number of payment periods for an investment.

Pascal

```
function NumberOfPeriods(const Rate: Extended; Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended NumberOfPeriods(const Extended Rate, Extended Payment, const Extended PresentValue,
const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

NumberOfPeriods computes the number of payment periods required for an investment of PresentValue (see page 4753) to reach a value of FutureValue (see page 4734), while making regular payments of Payment (see page 4751) and accruing interest at the rate of Rate per compounding period. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

46.2.68 Math.Payment Function

Calculates a fully amortized payment.

Pascal

```
function Payment(Rate: Extended; NPeriods: Integer; const PresentValue: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended Payment(Extended Rate, int NPeriods, const Extended PresentValue, const Extended
FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Payment calculates the fully amortized payment of borrowing PresentValue (see page 4753) at Rate percent per period over NPeriods. It assumes that interest is paid at the end of each period.

FutureValue (see page 4734) is the value that the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

46.2.69 Math.PeriodPayment Function

Returns the principal amount from a full payment.

Pascal

```
function PeriodPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PeriodPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PeriodPayment gives the part of the payment that is principal. The InterestPayment (see page 4739) function gives the part of the payment that is interest.

The Rate parameter is the interest rate. Period is the number of periods into the loan for which the principal is desired, and NPeriods is the number of periods of the loan. FutureValue (see page 4734) is the value the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

46.2.70 Math.Poly Function

Evaluates a uniform polynomial of one variable at the value X.

Pascal

```
function Poly(const X: Extended; const Coefficients: array of Double): Extended;
```

C++

```
Extended Poly(const Extended X, const array of Double Coefficients);
```

File

Math

Description

Call Poly to evaluate the polynomial represented by the Coefficients parameter at the point where the variable equals the value of the X parameter. The coefficients are ordered in increasing powers of X, as shown in the following Delphi-like example:

Coefficients[0] + Coefficients[1]*X + ... + Coefficients[N]*(X**N)

Note: In C++, the Coefficients_Size parameter is N, the highest power to which X is raised.

46.2.71 Math.PopnStdDev Function

Calculates the population standard deviation.

Pascal

```
function PopnStdDev(const Data: array of Double): Extended;
```

C++

```
Extended PopnStdDev(const array of Double Data);
```

File

Math

Description

PopnStdDev calculates the population standard deviation (the square root of the population variance) of all values in the Data array parameter. In C++, the Data_Size parameter indicates the index of the last element in Data (one less than the number of data points).

This function is used in some business and financial calculations.

See Also

StdDev (see page 4763)

PopnVariance (see page 4752)

46.2.72 Math.PopnVariance Function

Calculates the population variance.

Pascal

```
function PopnVariance(const Data: array of Double): Extended;
```

C++

```
Extended PopnVariance(const array of Double Data);
```

File

Math

Description

PopnVariance calculates the population variance of all values in the Data array parameter, using the n method (biased): TotalVariance (see page 4767) / n. In C++,. the Data_Size parameter is the index of the last value in the Data array (one less than the number of data items).

See Also

Variance (see page 4768)

TotalVariance (see page 4767)

PopnStdDev (see page 4752)

46.2.73 Math.Power Function

Raises Base to any power.

Pascal

```
function Power(const Base: Extended; const Exponent: Extended): Extended; overload;
function Power(const Base: Double; const Exponent: Double): Double; overload;
function Power(const Base: Single; const Exponent: Single): Single; overload;
```

C++

```
Extended Power(const Extended Base, const Extended Exponent);
Double Power(const Double Base, const Double Exponent);
Single Power(const Single Base, const Single Exponent);
```

File

Math

Description

Power raises Base to any power. For fractional exponents or exponents greater than MaxInt, Base must be greater than 0.

See Also

IntPower (see page 4741)

Sqrt

46.2.74 Math.PresentValue Function

Calculates the present value of an investment.

Pascal

```
function PresentValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PresentValue(const Extended Rate, int NPeriods, const Extended Payment, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PresentValue calculates the present value of an investment where Payment (see page 4751) is received for NPeriods and is discounted at the rate of Rate per period. FutureValue (see page 4734) is the value the investment may reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

46.2.75 Math.RadToCycle Function

Converts radians to cycles.

Pascal

```
function RadToCycle(const Radians: Extended): Extended;
```

C++

```
Extended RadToCycle(const Extended Radians);
```

File

Math

Description

Use RadToCycle to convert angles measured in radians into cycles, where

cycles = radians/(2pi).

46.2.76 Math.RadToDeg Function

Converts radians to degrees.

Pascal

```
function RadToDeg(const Radians: Extended): Extended;
```

C++

```
Extended RadToDeg(const Extended Radians);
```

File

Math

Description

Use RadToDeg to convert angles measured in radians to degrees, where

degrees = radians(180/pi).

46.2.77 Math.RadToGrad Function

Converts radians to grads.

Pascal

```
function RadToGrad(const Radians: Extended): Extended;
```

C++

```
Extended RadToGrad(const Extended Radians);
```

File

Math

Description

Use RadToGrad to convert angles measured in radians to grads, where

grads = radians(200/pi).

46.2.78 Math.RandG Function

Generates random numbers with Gaussian distribution.

Pascal

```
function RandG(Mean: Extended; StdDev: Extended): Extended;
```

C++

```
Extended RandG(Extended Mean, Extended StdDev);
```

File

Math

Description

RandG produces random numbers with Gaussian distribution about the Mean (see page 4746). This is useful for simulating data with sampling errors and expected deviations from the Mean (see page 4746).

46.2.79 Math.RandomFrom Function

Returns a randomly selected element from an array.

Pascal

```
function RandomFrom(const AValues: array of Integer): Integer; overload;
function RandomFrom(const AValues: array of Int64): Int64; overload;
function RandomFrom(const AValues: array of Double): Double; overload;
```

C++

```
int RandomFrom(const array of Integer AValues);
Int64 RandomFrom(const array of Int64 AValues);
Double RandomFrom(const array of Double AValues);
```

File

Math

Description

RandomFrom returns a randomly selected element from the array passed as the AValues argument. In C++, AValues_Size is

the index of the last array element (one less than the number of elements.)

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomFrom.

See Also

Randomize

RandSeed

46.2.80 Math.RandomRange Function

Returns a random integer from a specified range.

Pascal

```
function RandomRange(const AFrom: Integer; const ATo: Integer): Integer;
```

C++

```
int RandomRange(const int AFrom, const int ATo);
```

File

Math

Description

RandomRange returns a random integer from the range that extends between AFrom and ATo (non-inclusive). RandomRange can handle negative ranges (where AFrom is greater than ATo).

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomRange.

See Also

Randomize

RandSeed

RandomFrom (see page 4755)

Random

46.2.81 Math.RoundTo Function

Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".

Pascal

```
function RoundTo(const AValue: Extended; const ADigit: TRoundToEXRangeExtended): Extended;
```

C++

```
Extended RoundTo(const Extended AValue, const TRoundToEXRangeExtended ADigit);
```

File

Math

Description

Call RoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

RoundTo uses "Banker's Rounding" to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method rounds to an even number in the case that AValue is not nearer to either value.

The following examples illustrate the use of RoundTo:

Expression	Value
RoundTo(1234567, 3)	1235000
RoundTo(1.234, -2)	1.23
RoundTo(1.235, -2)	1.24
RoundTo(1.245, -2)	1.24

Note: The behavior of RoundTo can be affected by the Set8087CW procedure or SetRoundMode (see page 4760) function.

See Also

Round

SetRoundMode (see page 4760)

Set8087CW

SimpleRoundTo (see page 4761)

46.2.82 Math.SameValue Function

Indicates whether two floating-point values are (approximately) equal.

Pascal

```
function SameValue(const A: Extended; const B: Extended; Epsilon: Extended = 0): Boolean;
overload;
function SameValue(const A: Double; const B: Double; Epsilon: Double = 0): Boolean; overload;
function SameValue(const A: Single; const B: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean SameValue(const Extended A, const Extended B, Extended Epsilon = 0);
Boolean SameValue(const Double A, const Double B, Double Epsilon = 0);
Boolean SameValue(const Single A, const Single B, Single Epsilon = 0);
```

File

Math

Description

Call SameValue to determine when two floating-point values are equal, or approximately equal.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

See Also

CompareValue (see page 4726)

IsZero (see page 4742)

46.2.83 Math.Sec Function

Calculates the secant of an angle.

Pascal

```
function Sec(const X: Extended): Extended;
```

C++

```
Extended Sec(const Extended X);
```

File

Math

Description

Call Sec to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

Note: Sec is identical to the Secant (see page 4758) function.

See Also

ArcSec (see page 4722)

Secant (see page 4758)

SecH (see page 4759)

Cos

46.2.84 Math.Secant Function

Calculates the secant of an angle.

Pascal

```
function Secant(const X: Extended): Extended;
```

C++

```
Extended Secant(const Extended X);
```

File

Math

Description

Call Secant to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

See Also

Sec (see page 4758)

SecH (see page 4759)

Cos

46.2.85 Math.SecH Function

Calculates the hyperbolic secant of an angle.

Pascal

```
function SecH(const X: Extended): Extended;
```

C++

```
Extended SecH(const Extended X);
```

File

Math

Description

Call SecH to obtain the hyperbolic secant of X, where X is an angle in Radians.

See Also

Sec (see page 4758)

ArcSec (see page 4722)

46.2.86 Math.SetExceptionMask Function

Sets the exception mask on the FPU control word.

Pascal

```
function SetExceptionMask(const Mask: TFPUExceptionMask): TFPUExceptionMask;
```

C++

```
TFPUExceptionMask SetExceptionMask(const TFPUExceptionMask Mask);
```

File

Math

Description

Call SetExceptionMask to specify the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 4780), Infinity (see page 4776), or NegInfinity (see page 4781). The value depends on the operation and the current rounding mode.

SetExceptionMask returns the previous exception mask.

See Also

Set8087CW

GetExceptionMask (see page 4735)

NaN (see page 4780)

Infinity (see page 4776)

NegInfinity (see page 4781)

46.2.87 Math.SetPrecisionMode Function

Sets the FPU precision control mode.

Pascal

```
function SetPrecisionMode(const Precision: TFPUPrecisionMode): TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode SetPrecisionMode(const TFPUPrecisionMode Precision);
```

File

Math

Description

Call SetPrecisionMode to specify the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

SetPrecisionMode returns the previous precision control mode.

See Also

Set8087CW

GetPrecisionMode (see page 4735)

46.2.88 Math.SetRoundMode Function

Sets the FPU rounding mode.

Pascal

```
function SetRoundMode(const RoundMode: TFPURoundingMode): TFPURoundingMode;
```

C++

```
TFPURoundingMode SetRoundMode(const TFPURoundingMode RoundMode);
```

File

Math

Description

Call SetRoundingMode to specify how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

GetRoundMode (see page 4736)

46.2.89 Math.Sign Function

Indicates whether a numeric value is positive, negative, or zero.

Pascal

```
function Sign(const AValue: Integer): TValueSign; overload;
function Sign(const AValue: Int64): TValueSign; overload;
function Sign(const AValue: Double): TValueSign; overload;
```

C++

```
TValueSign Sign(const int AValue);
TValueSign Sign(const Int64 AValue);
TValueSign Sign(const Double AValue);
```

File

Math

Description

Use Sign to test the sign of a numeric value. Sign returns

0 if AValue is zero.

1 if AValue is greater than zero.

-1 if AValue is less than zero.

See Also

IsZero (see page 4742)

46.2.90 Math.SimpleRoundTo Function

Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.

Pascal

```
function SimpleRoundTo(const AValue: Extended; const ADigit: TRoundToRange = -2): Extended;
```

C++

```
Extended SimpleRoundTo(const Extended AValue, const TRoundToRange ADigit = -2);
```

File

Math

Description

Call SimpleRoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

SimpleRoundTo uses asymmetric arithmetic rounding to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method always rounds to the larger value.

The following examples illustrate the use of SimpleRoundTo:

Expression	Value
SimpleRoundTo(1234567, 3)	1234000
SimpleRoundTo(1.234, -2)	1.23
SimpleRoundTo(1.235, -2)	1.24
SimpleRoundTo(-1.235, -2)	-1.23

See Also

Round

RoundTo (see page 4756)

46.2.91 Math.SinCos Function

Returns sine and cosine of an angle.

Pascal

```
procedure SinCos(const Theta: Extended; var Sin: Extended; var Cos: Extended);
```

C++

```
SinCos(const Extended Theta, Extended Sin, Extended Cos);
```

File

Math

Description

Call SinCos to obtain the sine and cosine of an angle expressed in radians. Theta specifies the angle. The sine and cosine are returned in the Sin and Cos parameters, respectively.

SinCos is twice as fast as calling Sin and Cos separately for the same angle.

46.2.92 Math.Sinh Function

Returns the hyperbolic sine of an angle.

Pascal

```
function Sinh(const X: Extended): Extended;
```

C++

```
Extended Sinh(const Extended X);
```

File

Math

Description

Sinh calculates the hyperbolic sine of X.

46.2.93 Math.SLNDepreciation Function

Returns the straight-line depreciation allowance of an asset.

Pascal

```
function SLNDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer):
Extended;
```

C++

```
Extended SLNDepreciation(const Extended Cost, const Extended Salvage, int Life);
```

File

Math

Description

SLNDepreciation calculates the straight-line depreciation allowance for an asset over one period of its life. The function divides the Cost minus the Salvage by the number of years of useful Life of the asset. Cost is the amount initially paid for the asset. Salvage is the value of the asset at the end of its useful life.

To compute accelerated depreciation (allowing higher depreciation values in the first years of the assets life), use the SYDDepreciation (see page 4766) function.

See Also

SYDDepreciation (see page 4766)

46.2.94 Math.StdDev Function

Returns the sample standard deviation for elements in an array.

Pascal

```
function StdDev(const Data: array of Double): Extended;
```

C++

```
Extended StdDev(const array of Double Data);
```

File

Math

Description

StdDev calculates the sample standard deviation (the square root of the sample variance) of all values in the Data array parameter. In C++, Data_Size indicates the index of the last element in the array (one less than the number of elements).

See Also

TotalVariance (see page 4767)

Variance (see page 4768)

46.2.95 Math.Sum Function

Returns the sum of the elements in an array.

Pascal

```
function Sum(const Data: array of Double): Extended;
```

C++

```
Extended Sum(const array of Double Data);
```

File

Math

Description

Sum returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

SumInt (see page 4764)

46.2.96 Math.SumInt Function

Returns the sum of the elements in an integer array.

Pascal

```
function SumInt(const Data: array of Integer): Integer;
```

C++

```
int SumInt(const array of Integer Data);
```

File

Math

Description

Sum (see page 4764) returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 4764)

46.2.97 Math.SumOfSquares Function

Returns the sum of the squared values from a data array.

Pascal

```
function SumOfSquares(const Data: array of Double): Extended;
```

C++

```
Extended SumOfSquares(const array of Double Data);
```

File

Math

Description

SumOfSquares returns the sum of the squares of the Data values: Data[0]^2 + Data[1]^2 + Data[2]^2... In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 4764)

SumsAndSquares (see page 4765)

46.2.98 Math.SumsAndSquares Function

Returns the sum of the values and the sum of the squared values in an array.

Pascal

```
procedure SumsAndSquares(const Data: array of Double; var Sum: Extended; var SumOfSquares:
Extended);
```

C++

```
SumsAndSquares(const array of Double Data, Extended Sum, Extended SumOfSquares);
```

File

Math

Description

SumsAndSquares returns the sum of the Data values in Sum (see page 4764) and the sum of the squares in SumOfSquares (see page 4765). The data to sum is specified in the Data array parameter. In C++, Data_Size indicates the index of the last value (one less than the number of values in Data).

This function is faster than calculating the sums separately.

See Also

Sum (see page 4764)

SumOfSquares (see page 4765)

TotalVariance (see page 4767)

46.2.99 Math.SYDDepreciation Function

Calculates depreciation for an asset.

Pascal

```
function SYDDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer; Period: Integer): Extended;
```

C++

```
Extended SYDDepreciation(const Extended Cost, const Extended Salvage, int Life, int Period);
```

File

Math

Description

SYDDepreciation (for "sum-of-years-digits depreciation") calculates depreciation amounts for an asset using an accelerated depreciation method. This allows for higher depreciation in the earlier years of an asset's life.

Cost is the initial cost of the asset. Salvage is the value of the asset at the end of its life expectancy. Life is the length of the asset's life expectancy. Period is the period for which to calculate the depreciation.

See Also

SLNDepreciation (see page 4763)

46.2.100 Math.Tan Function

Returns the tangent of X.

Pascal

```
function Tan(const X: Extended): Extended;
```

C++

```
Extended Tan(const Extended X);
```

File

Math

Description

Tan returns the tangent of X. Tan(X) = Sin(X) / Cos(X).

See Also

Sin

Cos

ArcTan

46.2.101 Math.Tanh Function

Returns the hyperbolic tangent of X.

Pascal

```
function Tanh(const X: Extended): Extended;
```

C++

```
Extended Tanh(const Extended X);
```

File

Math

Description

Tanh calculates the hyperbolic tangent of X.

See Also

Cosh (see page 4727)

Sinh (see page 4762)

46.2.102 Math.TotalVariance Function

Returns the statistical variance from an array of values.

Pascal

```
function TotalVariance(const Data: array of Double): Extended;
```

C++

```
Extended TotalVariance(const array of Double Data);
```

File

Math

Description

TotalVariance returns the sum of the squares of the difference between each Data value and the mean of the data values.

Total Variance (see page 4768): SUM(i=1,N)[(X(i) - Mean (see page 4746))**2]

See Also

SumOfSquares (see page 4765)

Variance (see page 4768)

StdDev (see page 4763)

Mean (see page 4746)

46.2.103 Math.Variance Function

Calculates statistical sample variance from an array of data.

Pascal

```
function Variance(const Data: array of Double): Extended;
```

C++

```
Extended Variance(const array of Double Data);
```

File

Math

Description

Variance calculates the sample variance of all values in the Data array parameter, using the n-1 method (unbiased). In C++, Data_Size specifies the index of the last value in Data (on less than the number of data values).

See Also

TotalVariance (see page 4767)

StdDev (see page 4763)

Mean (see page 4746)

PopnVariance (see page 4752)

46.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFPUException (see page 4769)	TFPUException defines TFPUExceptionMask (see page 4773) values.
	TFPUPrecisionMode (see page 4770)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 4771)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 4772)	TPaymentTime is an enumerated type used as a parameter in financial functions.

46.3.1 Math.TFPUException Enumeration

TFPUException defines TFPUExceptionMask (see page 4773) values.

Pascal

```
TFPUException = (
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
);
```

C++

```
enum TFPUException {
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 4759) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 4780), Infinity (see page 4776), or NegInfinity (see page 4781). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 4736) and SetRoundMode (see page 4760)).

TFPUExceptionMask (see page 4773) can have none, one, some or all of the following TFPUException values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.

exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 4735)

GetRoundMode (see page 4736)

SetExceptionMask (see page 4759)

SetRoundMode (see page 4760)

TFPUExceptionMask (see page 4773)

46.3.2 Math.TFPUPrecisionMode Enumeration

TFPUPrecisionMode defines how the FPU handles precision.

Pascal

```
TFPUPrecisionMode = (
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
);
```

C++

```
enum TFPUPrecisionMode {
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetPrecisionMode (see page 4735) is used to read, and SetPrecisionMode (see page 4760) is used to set the precision control mode, with TFPUPrecisionMode defining this mode.

TFPUPrecisionMode can be one of the following values :

Value	Meaning
pmSingle	Single precision : 7 significant digits, exponent from -38 to +38.
pmReserved	Reserved for future use.
pmDouble	Double precision : 15 significant digits, exponent from -308 to +308.
pmExtended	Extended precision : 19 significant digits, exponent from -4932 to +4932.

See Also

GetPrecisionMode (see page 4735)

GetRoundMode (see page 4736)

SetPrecisionMode (see page 4760)

SetRoundMode (see page 4760)

46.3.3 Math.TFPURoundingMode Enumeration

TFPURoundingMode defines how the FPU handles rounding issues.

Pascal

```
TFPURoundingMode = (
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
);
```

C++

```
enum TFPURoundingMode {
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetRoundMode (see page 4736) is used to read, and SetRoundMode (see page 4760) is used to set the rounding mode, with TFPURoundingMode defining this mode.

TFPURoundingMode can be one of the following values :

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

GetPrecisionMode (see page 4735)

GetRoundMode (see page 4736)

SetPrecisionMode (see page 4760)

SetRoundMode (see page 4760)

46.3.4 Math.TPaymentTime Enumeration

TPaymentTime is an enumerated type used as a parameter in financial functions.

Pascal

```
TPaymentTime = (
  ptEndOfPeriod,
  ptStartOfPeriod
);
```

C++

```
enum TPaymentTime {
  ptEndOfPeriod,
  ptStartOfPeriod
};
```

File

Math

Description

TPaymentTime indicates when interest is calculated. The following table lists the possible values:

Value	Meaning
ptStartOfPeriod	Interest is calculated on the principle balance at the beginning of the payment period
ptEndOfPeriod	Interest is calculated at the end of the payment period

46.4 Types

The following table lists types in this documentation.

Types

Name	Description
TFPUExceptionMask (see page 4773)	TFPUExceptionMask defines a set of TFPUException (see page 4769) values.
TRoundToEXRangeExtended (see page 4774)	This is type Math.TRoundToEXRangeExtended.
TRoundToRange (see page 4774)	TRoundToRange defines the RoundTo (see page 4756) rounding limits.
TValueSign (see page 4774)	TValueSign defines the Sign (see page 4761) returned value.

46.4.1 Math.TFPUExceptionMask Type

TFPUExceptionMask defines a set of TFPUException (see page 4769) values.

Pascal

```
TFPUExceptionMask = set of TFPUException;
```

C++

```
TFPUException TFPUExceptionMask;
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 4759) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 4780), Infinity (see page 4776), or NegInfinity (see page 4781). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 4736) and SetRoundMode (see page 4760)).

TFPUExceptionMask can have none, one, some or all of the following TFPUException (see page 4769) values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.
exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 4735)

GetRoundMode (see page 4736)

SetExceptionMask (see page 4759)

SetRoundMode (see page 4760)

TFPUException (see page 4769)

46.4.2 Math.TRoundToEXRangeExtended Type

Pascal

```
TRoundToEXRangeExtended = -20..20;
```

C++

```
-20..20 TRoundToEXRangeExtended;
```

File

Math

Description

This is type Math.TRoundToEXRangeExtended.

46.4.3 Math.TRoundToRange Type

TRoundToRange defines the RoundTo (see page 4756) rounding limits.

Pascal

```
TRoundToRange = -37..37;
```

C++

```
-37..37 TRoundToRange;
```

File

Math

Description

The RoundTo (see page 4756) routine rounds a floating-point value to a specified digit or power of ten using "Banker's rounding". A negative TRoundToRange value rounds to this number of decimal places. A positive value removes all decimal places, and zeroes this number of significant digits to the left of the decimal point. Banker's rounding always rounds down to an even value last digit when it has a choice.

See Also

RoundTo (see page 4756)

46.4.4 Math.TValueSign Type

TValueSign defines the Sign (see page 4761) returned value.

Pascal

```
TValueSign = -1..1;
```

C++

```
-1..1 TValueSign;
```

File

Math

Description

The Sign (see page 4761) routine determines whether a number is negative, zero or positive. It returns the result in a TValueSign value as follows :

Value	Associated constant	Meaning
-1	NegativeValue (see page 4780)	Negative number.
0	ZeroValue (see page 4782)	Zero.
+1	PositiveValue (see page 4781)	Positive number.

See Also

NegativeValue (see page 4780)

PositiveValue (see page 4781)

ZeroValue (see page 4782)

RoundTo (see page 4756)

46.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Infinity (see page 4776)	Infinity represents positive infinity.
MaxComp (see page 4777)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 4777)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 4777)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 4778)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 4778)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 4779)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 4779)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 4779)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 4780)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 4780)	NegativeValue defines a negative number result from using Sign (see page 4761).
NegInfinity (see page 4781)	NegInfinity represents negative infinity.
PositiveValue (see page 4781)	PositiveValue defines a positive number result from using Sign (see page 4761).
ZeroValue (see page 4782)	ZeroValue defines a zero value number result from using Sign (see page 4761).

46.5.1 Math.Infinity Constant

Infinity represents positive infinity.

Pascal

```
Infinity = 1.0 / 0.0;
```

C++

```
Infinity = 1.0 / 0.0;
```

File

Math

Description

Infinity is literally defined as 1.0/0.0 : positive infinity.

Note: Only use Infinity in assignments : use IsInfinite (see page 4741).

See Also

IsInfinite (see page 4741)

NegInfinity (see page 4781)

46.5.2 Math.MaxComp Constant

MaxComp defines the maximum absolute value for a Comp variable.

Pascal

```
MaxComp = 9.223372036854775807e+18;
```

C++

```
MaxComp = 9.223372036854775807e+18;
```

File

Math

Description

MaxComp defines the maximum absolute value for a Comp variable.

See Also

MinComp (see page 4778)

46.5.3 Math.MaxDouble Constant

MaxDouble defines the maximum absolute value for a Double variable.

Pascal

```
MaxDouble = 1.7e+308;
```

C++

```
MaxDouble = 1.7e+308;
```

File

Math

Description

MaxDouble defines the maximum absolute value for a Double variable.

See Also

MinDouble (see page 4779)

46.5.4 Math.MaxExtended Constant

MaxExtended defines the maximum absolute value for an Extended variable.

Pascal

```
MaxExtended = 1.1e+4932;
```

C++

```
MaxExtended = 1.1e+4932;
```

File

Math

Description

MaxExtended defines the maximum absolute value for an Extended variable.

See Also

MinExtended (see page 4779)

46.5.5 Math.MaxSingle Constant

MaxSingle defines the maximum absolute value for a Single variable.

Pascal

```
MaxSingle = 3.4e+38;
```

C++

```
MaxSingle = 3.4e+38;
```

File

Math

Description

MaxSingle defines the maximum absolute value for a Single variable.

See Also

MinSingle (see page 4779)

46.5.6 Math.MinComp Constant

MinComp defines the smallest absolute value for a Comp variable.

Pascal

```
MinComp = -9.223372036854775807e+18;
```

C++

```
MinComp = -9.223372036854775807e+18;
```

File

Math

Description

MinComp defines the smallest absolute value for a Comp variable.

See Also

MaxComp (see page 4777)

46.5.7 Math.MinDouble Constant

MinDouble defines the smallest absolute value for a Double variable.

Pascal

```
MinDouble = 5.0e-324;
```

C++

```
MinDouble = 5.0e-324;
```

File

Math

Description

MinDouble defines the smallest absolute value for a Double variable.

See Also

MaxDouble (see page 4777)

46.5.8 Math.MinExtended Constant

MinExtended defines the smallest absolute value for an Extended variable.

Pascal

```
MinExtended = 3.4e-4932;
```

C++

```
MinExtended = 3.4e-4932;
```

File

Math

Description

MinExtended defines the smallest absolute value for an Extended variable.

See Also

MaxExtended (see page 4777)

46.5.9 Math.MinSingle Constant

MinSingle defines the smallest absolute value for a Single variable.

Pascal

```
MinSingle = 1.5e-45;
```

C++

```
MinSingle = 1.5e-45;
```

File

Math

Description

MinSingle defines the smallest absolute value for a Single variable.

See Also

MaxSingle (see page 4778)

46.5.10 Math.NaN Constant

NaN represents a value that cannot be represented as a valid number.

Pascal

```
NaN = 0.0 / 0.0;
```

C++

```
NaN = 0.0 / 0.0;
```

File

Math

Description

NaN is literally defined as 0.0/0.0 : an undefined value.

Note: Only use NaN in assignments : use IsNaN.

See Also

IsNaN

46.5.11 Math.NegativeValue Constant

NegativeValue defines a negative number result from using Sign (see page 4761).

Pascal

```
NegativeValue = Low(TValueSign);
```

C++

```
NegativeValue = Low(TValueSign);
```

File

Math

Description

Sign (see page 4761) determines the sign of a number, returning the result in a TValueSign (see page 4774) value. TValueSign (see page 4774) will be NegativeValue if the number is negative.

See Also

PositiveValue (see page 4781)

Sign (see page 4761)

TValueSign (see page 4774)

ZeroValue (see page 4782)

46.5.12 Math.NegInfinity Constant

NegInfinity represents negative infinity.

Pascal

```
NegInfinity = -1.0 / 0.0;
```

C++

```
NegInfinity = -1.0 / 0.0;
```

File

Math

Description

NegInfinity is literally defined as -1.0/0.0 : negative infinity.

Note: Only use NegInfinity in assignments : use IsInfinite (see page 4741).

See Also

Infinity (see page 4776)

IsInfinity

IsInfinite (see page 4741)

46.5.13 Math.PositiveValue Constant

PositiveValue defines a positive number result from using Sign (see page 4761).

Pascal

```
PositiveValue = High(TValueSign);
```

C++

```
PositiveValue = High(TValueSign);
```

File

Math

Description

Sign (see page 4761) determines the sign of a number, returning the result in a TValueSign (see page 4774) value. TValueSign (see page 4774) will be PositiveValue if the number is positive.

See Also

NegativeValue (see page 4780)

Sign (see page 4761)

TValueSign (see page 4774)

ZeroValue (see page 4782)

46.5.14 Math.ZeroValue Constant

ZeroValue defines a zero value number result from using Sign (see page 4761).

Pascal

```
ZeroValue = 0;
```

C++

```
ZeroValue = 0;
```

File

Math

Description

Sign (see page 4761) determines the sign of a number, returning the result in a TValueSign (see page 4774) value. TValueSign (see page 4774) will be ZeroValue if the number is zero.

See Also

NegativeValue (see page 4780)

PositiveValue (see page 4781)

Sign (see page 4761)

TValueSign (see page 4774)

47 MConnect Namespace

This is namespace MConnect.

Topics

Name	Description
Classes (see page 4784)	The following table lists classes in this documentation.
Functions (see page 4823)	The following table lists functions in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 4784)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 4787)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 4790)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 4794)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 4796)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 4811)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 4814)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Functions

	Name	Description
	GetMIDASAppServerList (see page 4823)	This is function MConnect.GetMIDASAppServerList.

47.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 4784)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 4787)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 4790)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 4794)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 4796)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 4811)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 4814)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

47.1.1 TCOMConnection Class

TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.

Class Hierarchy

Pascal

```
TCOMConnection = class(TDispatchConnection);
```

C++

```
class TCOMConnection : public TDispatchConnection;
```

File

MConnect

Description

Do not create instances of TCOMConnection. Instead, use TCOMConnection as a base class when created a custom component that forms a COM-based connection to an application server.

TCOMConnection adds to the ability to work with COM objects to the generic connection capabilities inherited from TDispatchConnection (see page 4796). It has two descendants: TDCOMConnection (see page 4790), which creates and manages connections using DCOM, and TOLEnterpriseConnection (see page 4811), which is provided for backward compatibility and handles connections using OLEnterprise.

See Also

TClientDataSet

TDCOMConnection (see page 4790)

TOLEnterpriseConnection (see page 4811)

TDataSetProvider (see page 6510)

IAppServer (see page 5222)

Writing Applications Using COM

47.1.1.1 TCOMConnection Members

The following tables list the members exposed by TCOMConnection.

Protected Methods

	Name	Description
	DoConnect (see page 4786)	Connects to an application server.
	DoDisconnect (see page 4798)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.
	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4786)	Sets the Connected (see page 4802) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 4806)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 4797)	Creates an instance of a dispatch connection component.
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.

47.1.1.2 TCOMConnection Methods

The methods of the TCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 4786)	Connects to an application server.
	SetConnected (see page 4786)	Sets the Connected (see page 4802) property.

47.1.1.2.1 TCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected (see page 4802) property is set to true. DoConnect creates a COM object for the application server (based on the ServerName (see page 4807) or ServerGUID (see page 4807) property), and sets the value of the AppServer property to this COM object.

Descendants of TCOMConnection (see page 4784) override DoConnect to change the way the client application forms a connection to an application server.

See Also

AfterConnect

BeforeConnect

Connected

AppServer

ServerName (see page 4807)

ServerGUID (see page 4807)

47.1.1.2.2 TCOMConnection.SetConnected Method

Sets the Connected (see page 4802) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 4802) property.

If Value is false, SetConnected generates a BeforeDisconnect (see page 4809) event, closes the connection, and generates an AfterDisconnect (see page 4808) event.

If Value is true, SetConnected performs the following actions:

1. It checks the value of the ServerGUID (see page 4807) or ServerName (see page 4807) property and raises an exception if these do not specify a valid application server.

2. If LoginPrompt (see page 4802) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 4810) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
3. It generates a BeforeConnect (see page 4809) event.
4. It opens the connection.
5. It generates an AfterConnect (see page 4808) event.
6. If LoginPrompt (see page 4802) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 4810) event.

AfterDisconnect

LoginPrompt

OnGetUserName

OnLogin

47.1.2 TCustomObjectBroker Class

TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.

Class Hierarchy

Pascal

```
TCustomObjectBroker = class(TComponent);
```

C++

```
class TCustomObjectBroker : public TComponent;
```

File

MConnect

Description

TCustomObjectBroker defines the methods by which a connection component obtains information about available application servers. When a connection component uses an object broker, it does not save any properties that identify a particular server machine. Instead, when it needs to open a connection, it uses the methods of the object broker to get that identifying information. This process allows client applications to locate server systems dynamically at runtime. If there are redundant server systems, this allows client applications to continue functioning when a server goes down.

TCustomObjectBroker does not implement any of the methods that provide information to connection components. Instead,

descendants such as TSimpleObjectBroker implement a mechanism for choosing servers and identifying them to connection components. Application developers can derive more elaborate object brokers that provide additional benefits such as intelligent load balancing.

See Also

TDispatchConnection (see page 4796)

TSimpleObjectBroker (see page 5916)

47.1.2.1 TCustomObjectBroker Members

The following tables list the members exposed by TCustomObjectBroker.

Public Methods

	Name	Description
	GetComputerForGUID (see page 4788)	Returns a string that identifies a server machine for an interface identified by its GUID.
	GetComputerForProgID (see page 4789)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetPortForComputer (see page 4789)	Returns a port number for connecting to a specified remote server.
	SetConnectStatus (see page 4790)	Records whether a connection was established to a specified server.

47.1.2.2 TCustomObjectBroker Methods

The methods of the TCustomObjectBroker class are listed here.

Public Methods

	Name	Description
	GetComputerForGUID (see page 4788)	Returns a string that identifies a server machine for an interface identified by its GUID.
	GetComputerForProgID (see page 4789)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetPortForComputer (see page 4789)	Returns a port number for connecting to a specified remote server.
	SetConnectStatus (see page 4790)	Records whether a connection was established to a specified server.

47.1.2.2.1 TCustomObjectBroker.GetComputerForGUID Method

Returns a string that identifies a server machine for an interface identified by its GUID.

Pascal

```
function GetComputerForGUID(GUID: TGUID): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetComputerForGUID(TGUID GUID) = 0;
```

Description

Call GetComputerForGUID to obtain a string that identifies a server machine on which a given interface is registered. The GUID parameter specifies the global unique identifier of the desired interface.

TCustomObjectBroker (see page 4787) declares GetComputerForGUID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components call this method, passing in the value of their ServerGUID property. They use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForProgID (see page 4789)

ServerGUID (see page 4807)

computername (see page 4793)

Address

Host

URL

47.1.2.2.2 TCustomObjectBroker.GetComputerForProgID Method

Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.

Pascal

```
function GetComputerForProgID(const ProgID): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetComputerForProgID(const  ProgID) = 0;
```

Description

Call GetComputerForProgID to obtain the name or address of a server machine on which a given interface is registered. The ProgID parameter specifies the name of the desired interface. If the server was created using one of the remote data module wizards, this is the value that was entered as the class name for the wizard.

TCustomObjectBroker (see page 4787) declares GetComputerForProgID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components can call this method, passing in the value of their ServerName property. They can use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForGUID (see page 4788)

ServerName (see page 4807)

computername (see page 4793)

Address

Host

URL

47.1.2.2.3 TCustomObjectBroker.GetPortForComputer Method

Returns a port number for connecting to a specified remote server.

Pascal

```
function GetPortForComputer(const ComputerName: string): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetPortForComputer(const UnicodeString ComputerName) = 0;
```

Description

Socket connection components call GetPortForComputer to get a value for their Port property. The ComputerName parameter specifies a Host name or IP address that was returned by GetComputerForGUID (see page 4788) or GetComputerForProgID (see page 4789).

None of the connection components that work on Linux explicitly use a Port number. GetPortForComputer is included in TCustomObjectBroker (see page 4787) to allow for the possibility of connection components that use an explicit Port number. The ComputerName parameter is a Host name or IP address that is returned by the GetComputerForGUID (see page 4788) or GetComputerForProgID (see page 4789) method.

TCustomObjectBroker (see page 4787) declares GetPortForComputer as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Note: This interface assumes that a single socket dispatcher on each server system handles all client requests, even when they are destined for different application servers on the same host.

See Also

GetComputerForProgID (see page 4789)

GetComputerForGUID (see page 4788)

Port

47.1.2.2.4 TCustomObjectBroker.SetConnectStatus Method

Records whether a connection was established to a specified server.

Pascal

```
procedure SetConnectStatus(ComputerName: string; Success: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SetConnectStatus(UnicodeString ComputerName, Boolean Success) = 0;
```

Description

After calling GetComputerForGUID (see page 4788) or GetComputerForProgID (see page 4789), connection components use the returned value to open a connection to the identified server. They then call SetConnectStatus to tell the broker whether the connection was successfully opened.

TCustomObjectBroker (see page 4787) declares SetConnectStatus as an abstract (pure virtual) method. Descendants override this method to keep track of when server machines are down or to monitor the number of connections created for each server.

See Also

GetComputerForGUID (see page 4788)

GetComputerForProgID (see page 4789)

47.1.3 TDCOMConnection Class

TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.

Class Hierarchy

Pascal

```
TDCOMConnection = class(TCOMConnection);
```

C++

```
class TDCOMConnection : public TCOMConnection;
```

File

MConnect

Description

TDCOMConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The DCOM connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer (see page 5222) for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TDCOMConnection uses DCOM to establish the initial connection between the client application and a remote application server. In order to do so, the application server must be registered on the client machine.

Once the connection is established, the client registers any or all of its client datasets with TDCOMConnection, and these client datasets use the IAppServer (see page 5222) interface from the DCOM connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection instead. To connect to remote application servers using HTTP, use the TWebConnection component. To connect to application servers using SOAP, use TSoapConnection.

Specifying a Connection Using DCOM

47.1.3.1 TDCOMConnection Members

The following tables list the members exposed by TDCOMConnection.

Protected Methods

	Name	Description
	DoConnect (see page 4793)	Connects to an application server.
	DoDisconnect (see page 4798)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.

	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4786)	Sets the Connected (see page 4802) property.
	SetConnected (see page 4800)	Sets the Connected (see page 4802) property.

Public Methods

	Name	Description
	Create (see page 4792)	Creates and initializes a DCOM connection component.
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	ComputerName (see page 4793)	This is ComputerName, a member of class TDCOMConnection.
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ObjectBroker (see page 4794)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.

47.1.3.2 TDCOMConnection.Create Constructor

Creates and initializes a DCOM connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDCOMConnection(TComponent * AOwner);
```

Description

Call Create to instantiate TDCOMConnection (see page 4790) at runtime. DCOM connection components placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually the form or data module) that is responsible for freeing the DCOM connection component.

47.1.3.3 TDCOMConnection Methods

The methods of the TDCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 4793)	Connects to an application server.

47.1.3.3.1 TDCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 4802) property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName (see page 4793) property. If the ObjectBroker (see page 4794) property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

47.1.3.4 TDCOMConnection Properties

The properties of the TDCOMConnection class are listed here.

Published Properties

	Name	Description
	ComputerName (see page 4793)	This is ComputerName, a member of class TDCOMConnection.
	ObjectBroker (see page 4794)	Specifies an Object Broker that allows the connection component to choose from several application servers.

47.1.3.4.1 TDCOMConnection.ComputerName Property

Pascal

```
property ComputerName: string;
```

C++

```
__property UnicodeString ComputerName;
```

Description

This is ComputerName, a member of class TDCOMConnection.

47.1.3.4.2 TDCOMConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

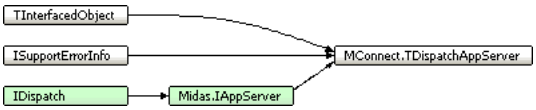
47.1.4 TDispatchAppServer Class

Class Hierarchy



Pascal

```
TDispatchAppServer = class(TInterfacedObject, IAppServer, ISupportErrorInfo);
```

C++

```
class TDispatchAppServer : public TInterfacedObject, public IAppServer, public
ISupportErrorInfo;
```

File

MConnect

Description

This is class MConnect.TDispatchAppServer.

47.1.4.1 TDispatchAppServer Members

The following tables list the members exposed by TDispatchAppServer.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 5223)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 5224)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 5224)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 5225)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 5226)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 5227)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 5228)	Returns information from a specified record of the provider's dataset.
	Create (see page 4795)	This is Create, a member of class TDispatchAppServer.
V	SafeCallException (see page 4795)	Handles exceptions in methods declared using the safecall calling convention.

47.1.4.2 TDispatchAppServer.Create Constructor

Pascal

```
constructor Create(const AppServer: IAppServerDisp);
```

C++

```
__fastcall TDispatchAppServer(const IAppServerDisp AppServer);
```

Description

This is Create, a member of class TDispatchAppServer.

47.1.4.3 TDispatchAppServer Methods

The methods of the TDispatchAppServer class are listed here.

Public Methods

	Name	Description
V	SafeCallException (see page 4795)	Handles exceptions in methods declared using the safecall calling convention.

47.1.4.3.1 TDispatchAppServer.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

System::TObject::SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur.

As implemented in System::TObject::TObject, System::TObject::SafeCallException simply returns E_UNEXPECTED. This is the appropriate response for classes that do no support interfaces

47.1.5 TDispatchConnection Class

TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.

Class Hierarchy

Pascal

```
TDispatchConnection = class(TCustomRemoteServer);
```

C++

```
class TDispatchConnection : public TCustomRemoteServer;
```

File

MConnect

Description

Do not create instances of TDispatchConnection. Instead, use TDispatchConnection as a base class when creating a custom component that forms a connection to a COM-based application server in a multi-tiered database application.

TDispatchConnection introduces the infrastructure for logging on to an application server, obtaining an IAppServer (see page 5222) interface, calling the application server's interface, and managing a remote connection. Additionally, TCustomRemoteServer inherits the ability to work with one or more client datasets.

TDispatchConnection is not capable of connecting to an application server. This ability is added by descendants, which are specialized for different connection types. Once a connection is formed, however, TDispatchConnection makes the application server's IAppServer (see page 5222) interface available to TClientDataSet components.

To enable a client application to connect to a COM-based application server, use a descendant of TDispatchConnection such as TSocketConnection, TWebConnection, or TDCOMConnection (see page 4790).

47.1.5.1 TDispatchConnection Members

The following tables list the members exposed by TDispatchConnection.

Protected Methods

	Name	Description
	DoDisconnect (see page 4798)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.
	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4800)	Sets the Connected (see page 4802) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 4806)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 4797)	Creates an instance of a dispatch connection component.
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.

47.1.5.2 TDispatchConnection.Create Constructor

Creates an instance of a dispatch connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDispatchConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a dispatch connection component at runtime. Connection components placed in forms or data modules

at design time are created automatically.

After calling the inherited constructor, Create initializes the LoginPrompt (see page 4802) property to false.

See Also

LoginPrompt

Create

47.1.5.3 TDispatchConnection Methods

The methods of the TDispatchConnection class are listed here.

Protected Methods

	Name	Description
	DoDisconnect (see page 4798)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.
	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4800)	Sets the Connected (see page 4802) property.

Public Methods

	Name	Description
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

47.1.5.3.1 TDispatchConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected (see page 4802) property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect

BeforeDisconnect

Connected (see page 4802)

AppServer

47.1.5.3.2 TDispatchConnection.GetConnected Method

Returns the value of the Connected (see page 4802) property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected implementation of the Connected (see page 4802) property. It uses the AppServer property (set by the DoConnect method of a TDispatchConnection (see page 4796) descendant) to determine whether a connection is established.

If a connection is established, GetConnected returns true. Otherwise, GetConnected returns false.

See Also

Connected (see page 4802)

DoConnect (see page 4786)

47.1.5.3.3 TDispatchConnection.GetServer Method

Returns the IAppServer (see page 5222) interface of the application server.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Client datasets call GetServer to set the value of their AppServer property. This allows them to access providers on the remote application server.

GetServer ensures that there is a connection and then returns an IAppServer (see page 5222) interface that can be used to communicate with providers on the application server. To use other methods of the application server's interface, use the AppServer property instead.

See Also

Connected (see page 4802)

AppServer

AppServer

47.1.5.3.4 TDispatchConnection.GetServerCLSID Method

Returns the GUID for the application server.

Pascal

```
function GetServerCLSID: TGUID;
```

C++

```
__fastcall TGUID GetServerCLSID();
```

Description

GetServerCLSID is used internally to obtain the GUID for the application server.

In most cases, GetServerCLSID returns the value of the ServerGUID (see page 4807) property. However, if the application server was specified using the ServerName (see page 4807) property, and the application server was not registered when the

ServerName (see page 4807) property was set, ServerGUID (see page 4807) will not represent the application server's GUID. GetServerCLSID can return a GUID that only becomes available when a connection is opened.

If neither the ServerName (see page 4807) nor the ServerGUID (see page 4807) property is set, GetServerCLSID raises an exception.

See Also

ServerGUID (see page 4807)

ServerName (see page 4807)

47.1.5.3.5 TDispatchConnection.GetServerList Method

Returns a list of remote data modules to which the component can connect.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Connection components use GetServerList internally to fill the drop down list in the Object Inspector for the ServerName (see page 4807) property. GetServerList returns a variant array that lists all application servers that are on the local machine, registered in the system registry, or on the remote machine identified by the connection component.

See Also

ServerName (see page 4807)

47.1.5.3.6 TDispatchConnection.Notification Method

Responds when other objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically so objects can make internal adjustments when components are created or destroyed. TDispatchConnection (see page 4796) overrides the inherited method to set the ObjectBroker (see page 4806) property to nil (Delphi) or NULL (C++) when it receives notification that that object is about to be destroyed.

See Also

ObjectBroker (see page 4806)

47.1.5.3.7 TDispatchConnection.SetConnected Method

Sets the Connected (see page 4802) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 4802) property. It establishes a connection to the Application server if Value is true, and disconnects from the application server if Value is false.

If Value is false, SetConnected generates a BeforeDisconnect (see page 4809) event, closes the connection, and generates an AfterDisconnect (see page 4808) event.

If Value is true, SetConnected performs the following actions:

1. If LoginPrompt (see page 4802) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 4810) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
2. It generates a BeforeConnect (see page 4809) event.
3. It opens the connection.
4. It generates an AfterConnect (see page 4808) event.
5. If LoginPrompt (see page 4802) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 4810) event.

AfterConnect

BeforeDisconnect

AfterDisconnect

LoginPrompt

OnGetUserName

OnLogin

47.1.5.4 TDispatchConnection Properties

The properties of the TDispatchConnection class are listed here.

Protected Properties

	Name	Description
	ObjectBroker (see page 4806)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Published Properties

	Name	Description
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.

47.1.5.4.1 TDispatchConnection.Connected Property

Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.

Pascal

```
property Connected;
```

C++

```
__property Connected;
```

Description

Set Connected to true to establish a connection to the application server. Set Connected to false to terminate the connection.

When changing the value of Connected, TDispatchConnection (see page 4796) generates a BeforeConnect (see page 4809) and an AfterConnect (see page 4808) event, or a BeforeDisconnect (see page 4809) and an AfterDisconnect (see page 4808) event. In addition, when setting Connected to true, TDispatchConnection (see page 4796) may display a login dialog, depending on the value of LoginPrompt (see page 4802).

The Connected property uses the protected DoConnect and DoDisconnect (see page 4798) methods to connect to or disconnect from an application server. Descendants of TDispatchConnection (see page 4796) override DoConnect and DoDisconnect (see page 4798) to change the way the connection is formed or terminated.

See Also

DoDisconnect (see page 4798)

LoginPrompt

AfterConnect

AfterDisconnect

BeforeConnect

BeforeDisconnect

DoConnect (see page 4786)

47.1.5.4.2 TDispatchConnection.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt;
```

C++

```
__property LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the

connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

C++ Examples:

```
//
//This example demostrates the use of ADO for database conectivity.
//Example assumes that a TDBGrid is placed on the form.
//
void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Login details */
    String UserName = "db_user_name";
    String PassWord = "db_pass_word";
    String Server = "my.db.server";

    /* Connection String */
    String ConnString =
        "Provider=SQLOLEDB.1;Persist Security Info=False;";
    ConnString +=
        "User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;";
    ConnString +=
        "Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;";
    ConnString +=
        "Tag with column collation when possible=False";

    /* SQL Query */
    String SQLStr = "SELECT * FROM customer WHERE customer_id = :AnId;";

    /* All ADO variables */
    TADOConnection* ADOConn;
    TADOQuery* ADOQuery;
    TDataSource* DataSrc;
    TParameter* Param;

    /* Create an ADO connection */
    ADOConn = new TADOConnection(this);
```

```
    /* Setup the connection string */
    ADOConn->ConnectionString = Format(ConnString,
        ARRAYOFCONST((UserName, PassWord, Server)));

    /* Disable login prompt */
    ADOConn->LoginPrompt = False;

    try
    {
        ADOConn->Connected = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                    TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the query */
    ADOQuery = new TADOQuery(this);
    ADOQuery->Connection = ADOConn;
    ADOQuery->SQL->Add(SQLStr);

    /* Update the parameter that was parsed from the SQL query: AnId */
    Param = ADOQuery->Parameters->ParamByName("AnId");
    Param->DataType = ftInteger;
    Param->Value = 1;

    /* Set the query to Prepared - will improve performance */
    ADOQuery->Prepared = true;

    try
    {
        ADOQuery->Active = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                    TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the data source */
    DataSrc = new TDataSource(this);
    DataSrc->DataSet = ADOQuery;
    DataSrc->Enabled = true;

    /* Finally initilalize the grid */
    DBGrid1->DataSource = DataSrc;
}
```

Delphi Examples:

```
{
This example demostrates the use of ADO for database conectivity.
Example assumes that a TDBGrid is placed on the form.
}
procedure TForm2.FormCreate(Sender: TObject);
const
  { Connection string }
  ConnString =
  'Provider=SQLOLEDB.1;Persist Security Info=False;' +
  'User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;' +
  'Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;'+
  'Tag with column collation when possible=False';
```

```
    { SQL Query }
    SQLStr = 'SELECT * FROM customer WHERE customer_id = :AnId;';

    { User access }
    UserName = 'db_user_name';
    PassWord = 'db_pass_word';
    Server = 'my.db.server';

  var
    ADOConn  : TADOConnection;
    ADOQuery : TADOQuery;
    DataSrc  : TDataSource;
    Param    : TParameter;

  begin
    { Create an ADO connection }
    ADOConn := TADOConnection.Create(Self);
    { Setup the provider engine }

    { Setup the connection string }
    ADOConn.ConnectionString := Format(ConnString,
      [UserName, PassWord, Server]);

    { Disable login prompt }
    ADOConn.LoginPrompt := False;

    try
      ADOConn.Connected := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while connecting', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the query }
    ADOQuery := TADOQuery.Create(Self);
    ADOQuery.Connection := ADOConn;
    ADOQuery.SQL.Add(SQLStr);

    { Update the parameter that was parsed from the SQL query: AnId }
    Param := ADOQuery.Parameters.ParamByName('AnId');
    Param.DataType := ftInteger;
    Param.Value := 1;

    { Set the query to Prepared - will improve performance }
    ADOQuery.Prepared := true;

    try
      ADOQuery.Active := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while doing query', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the data source }
    DataSrc := TDataSource.Create(Self);
    DataSrc.DataSet := ADOQuery;
```

```
    DataSrc.Enabled := true;

    { Finally initilalize the grid }
    DBGrid1.DataSource := DataSrc;
  end;
```

Controlling Server Login

47.1.5.4.3 TDispatchConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName (see page 4807) or ServerGUID (see page 4807). When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection (see page 4796) define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker (see page 4787).

Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

47.1.5.4.4 TDispatchConnection.ServerGUID Property

Specifies the GUID of the application server with which to connect.

Pascal

```
property ServerGUID: string;
```

C++

```
__property UnicodeString ServerGUID;
```

Description

Use ServerGUID to specify the application server to which the client application should connect by its GUID (global unique identifier). If the value specifies a valid GUID for a registered application server, setting ServerGUID changes the value of ServerName (see page 4807) to the class name of the corresponding COM object.

Using ServerGUID rather than ServerName (see page 4807) to identify the application server is more robust because it does not require the application server to be registered on the client system.

Note: Either ServerName (see page 4807) or ServerGUID must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object.

ServerName (see page 4807)

Connecting to the Application Server

Connecting to the Application Server using DataSnap Components

47.1.5.4.5 TDispatchConnection.ServerName Property

Specifies the name of the application server with which to connect.

Pascal

```
property ServerName: string;
```

C++

```
__property UnicodeString ServerName;
```

Description

Use ServerName to specify the name of the application server to which the client application should connect. At design time, the Object Inspector provides a drop-down list of all available servers if one of the following conditions is met:

For DCOM and OLEnterprise connections, the servers must be registered in the system Registry (see page 6599).

For Socket connections, ScktSrvr.exe must be running on the server machine.

For Web connections, the connection component must have an URL for locating httpsrvr.dll.

If ServerName specifies a valid name for a registered application server, setting ServerName sets the ServerGUID (see page 4807) property to the GUID that corresponds to the named application server.

Note: Either ServerName or ServerGUID (see page 4807) must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object. Using ServerGUID (see page 4807) rather than ServerName to identify the application server is more robust because it does not require the application server to be registered on the client system when using a COM-based connection.

47.1.5.5 TDispatchConnection Events

The events of the TDispatchConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

47.1.5.5.1 TDispatchConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

Connected

Disconnecting from a Database Server

47.1.5.5.3 TDispatchConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect;
```

C++

```
__property BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect

Connected

Connecting to a Database Server

47.1.5.5.4 TDispatchConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

Disconnecting from a Database Server

47.1.5.5.5 TDispatchConnection.OnGetUsername Event

Pascal

```
property OnGetUsername;
```

C++

```
__property OnGetUsername;
```

Description

This is OnGetUsername, a member of class TDispatchConnection.

47.1.5.5.6 TDispatchConnection.OnLogin Event

Occurs when a communication channel opens to the server.

Pascal

```
property OnLogin;
```

C++

```
__property OnLogin;
```

Description

OnLogin occurs when connections are opened if the LoginPrompt property is true.

For DataSnap SOAP connection components, the following sequence of events occurs when opening a connection to an application server:

1. An OnGetUsername event occurs, where the application can supply an initial user name for the login dialog.
2. The login dialog appears, where the user can supply a user name and password.
3. A BeforeConnect event occurs, the connection is opened, and an AfterConnect event occurs.
4. The OnLogin event occurs, where you can write code to log in to the application server using the username and password that were provided in the remote login dialog.

   Note: Do not use the OnLogin event if the connection component provides a different scheme for logging in. For example, TWebConnection uses the Username and Password properties instead.

   For ADO connection components, the following sequence of events occurs when opening a connection to an application server:

1. A BeforeConnect event occurs.

2. An OnWillConnect event occurs, where the application can supply an initial user name and password for the login dialog, as well as the connection options and status.

3. The login dialog appears, where the user can supply a user name and password.

4. The OnLogin event occurs, where you can write code to respond to the user-supplied values. (For example, you could convert an application-specific user name and password to database user name and password).

5. The connection is opened, and an AfterConnect event occurs.

Note: Some

C connection components that do not connect to an application server in a multitiered database application replace the OnLogin

event defined in TCustomConnection with a different event that occurs before a connection is established.

47.1.6 TOLEnterpriseConnection Class

TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.

Class Hierarchy

Pascal

```
TOLEnterpriseConnection = class(TCOMConnection);
```

C++

```
class TOLEnterpriseConnection : public TCOMConnection;
```

File

MConnect

Description

TOLEnterpriseConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server using OLEnterprise. This component is provided for backward compatibility.

TOLEnterpriseConnection establishes the initial connection between the client application and a remote application server using OLEnterprise. Once the connection is established, the client registers any or all of its client datasets with the remote server, and these client datasets use the IAppServer (see page 5222) interface from the OLEnterprise connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection (see page 4790) component instead. To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection. To connect client applications to remote application servers using HTTP, use TWebConnection. To connect to remote application servers using SOAP, use TSOAPConnection.

47.1.6.1 TOLEnterpriseConnection Members

The following tables list the members exposed by TOLEnterpriseConnection.

Protected Methods

	Name	Description
	DoConnect (see page 4813)	Establishes a connection to the application server.
	DoDisconnect (see page 4798)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.
	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4786)	Sets the Connected (see page 4802) property.
	SetConnected (see page 4800)	Sets the Connected (see page 4802) property.

Protected Properties

	Name	Description
	ObjectBroker (see page 4806)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 4797)	Creates an instance of a dispatch connection component.
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	BrokerName (see page 4813)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 4814)	Specifies the name of the machine on which the application server is located.
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.

47.1.6.2 TOLEnterpriseConnection Methods

The methods of the TOLEnterpriseConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 4813)	Establishes a connection to the application server.

47.1.6.2.1 TOLEnterpriseConnection.DoConnect Method

Establishes a connection to the application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 4802) property is set to true. DoConnect obtains the interface of the remote data module on the application server using OLEnterprise runtime. This interface can then be used to obtain interfaces for the providers on the application server or to make interface calls to the remote data module.

BeforeConnect

Connected

AppServer

47.1.6.3 TOLEnterpriseConnection Properties

The properties of the TOLEnterpriseConnection class are listed here.

Published Properties

	Name	Description
	BrokerName (see page 4813)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 4814)	Specifies the name of the machine on which the application server is located.

47.1.6.3.1 TOLEnterpriseConnection.BrokerName Property

Specifies the name of the Business Object Broker that locates the application server.

Pascal

```
property BrokerName: string;
```

C++

```
__property UnicodeString BrokerName;
```

Description

Use BrokerName to specify the OLEnterprise Business Object Broker with which the application server is registered. The Business Object Broker locates an available application server with the name specified by the ServerName (see page 4807) property.

If you are not using the Business Object Broker, use the ComputerName (see page 4814) property instead. You must specify a value for either BrokerName or ComputerName (see page 4814):

Note: Setting the value of BrokerName changes the ComputerName (see page 4814) property to blank, and vice versa.

See Also

ServerName (see page 4807)

ComputerName (see page 4814)

47.1.6.3.2 TOLEnterpriseConnection.ComputerName Property

Specifies the name of the machine on which the application server is located.

Pascal

```
property ComputerName: string;
```

C++

```
__property UnicodeString ComputerName;
```

Description

Use ComputerName to specify the machine where the application server resides if you are not using the Business Object Broker. If you are not using the Business Object Broker and ComputerName is blank (the default), TOLEnterpriseConnection (see page 4811) assumes the application server can be found on the user's machine or that the computer name can be derived from the system registry based on the DCOM configuration. If ComputerName is not blank, it overrides any system registry entries.

If you are using the Business Object Broker, use the BrokerName (see page 4813) property instead. BrokerName (see page 4813) and ComputerName are mutually exclusive: Setting the value of ComputerName changes the BrokerName (see page 4813) property to blank, and vice versa.

See Also

ServerName (see page 4807)

BrokerName (see page 4813)

47.1.7 TSharedConnection Class

TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Class Hierarchy

Pascal

```
TSharedConnection = class(TCustomRemoteServer);
```

C++

```
class TSharedConnection : public TCustomRemoteServer;
```

File

MConnect

Description

TSharedConnection manages a connection to a "child" remote data module that is managed by a single main remote data module on an application server. The client application does not connect directly to the "child" remote data module. Rather, it uses a single connection to the main remote data module on the server machine, and that main remote data module dispatches calls to the IAppServer (see page 5222) interface of other "child" data modules. This allows the client application to use a single connection rather than one connection for each remote data module on the application server.

On the server-side, the interface for the child remote data module is surfaced as a property of the main remote data module's interface. The TSharedConnection component uses this property name to indicate which child remote data module is the actual target of its connection.

TSharedConnection uses a TDispatchConnection (see page 4796) descendant (TDCOMConnection (see page 4790), TWebConnection, or TSocketConnection) to form the connection to the main remote data module on the application server. When you use TSharedConnection to open a connection, it causes the associated dispatch connection to connect to the main remote data module if it has not already done so. When you close the connection maintained by TSharedConnection, however, it severs only the connection to the child remote data module, leaving the connection to the main remote data module open in case other components on the client application are still using it.

Connecting to an Application Server That Uses Multiple Data Modules

47.1.7.1 TSharedConnection Members

The following tables list the members exposed by TSharedConnection.

Protected Methods

	Name	Description
	ConnectEvent (see page 4817)	This is ConnectEvent, a member of class TSharedConnection.
V	DoConnect (see page 4817)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 4818)	Provides the interface for a method that terminates the connection.
V	GetConnected (see page 4818)	Returns the value of the Connected property.
V	Notification (see page 4819)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
V	Destroy (see page 4816)	Destroys the TSharedConnection (see page 4814) instance.
V	GetServer (see page 4818)	Returns the IAppServer (see page 5222) interface of the child remote data module.

Published Events

	Name	Description
	AfterConnect (see page 4820)	Occurs after a connection is established.
	AfterDisconnect (see page 4821)	Occurs after the connection closes.
	BeforeConnect (see page 4821)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4822)	Occurs immediately before the connection closes.

Published Methods

	Name	Description
	Create (see page 4816)	Creates an instance of a remote server component.

Published Properties

	Name	Description
	ChildName (see page 4819)	Identifies the child remote data module on the application server with which you want to communicate.
	ParentConnection (see page 4820)	Specifies the connection component that establishes a connection to the main remote data module on the application server.

47.1.7.2 TSharedConnection.Create Constructor

Creates an instance of a remote server component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSharedConnection(TComponent * AOwner);
```

Description

Create instantiates an instance of a remote server component and initializes its properties.

AOwner is the component that is responsible for freeing the TCustomRemoteServer instance. It becomes the value of the Owner property.

See Also

Create

Owner

47.1.7.3 TSharedConnection.Destroy Destructor

Destroys the TSharedConnection (see page 4814) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSharedConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the reference to the shared connection component is not nil before calling Destroy

See Also

System::TObject::Free

47.1.7.4 TSharedConnection Methods

The methods of the TSharedConnection class are listed here.

Protected Methods

	Name	Description
	ConnectEvent (see page 4817)	This is ConnectEvent, a member of class TSharedConnection.
V	DoConnect (see page 4817)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 4818)	Provides the interface for a method that terminates the connection.
V	GetConnected (see page 4818)	Returns the value of the Connected property.
V	Notification (see page 4819)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
V	GetServer (see page 4818)	Returns the IAppServer (see page 5222) interface of the child remote data module.

47.1.7.4.1 TSharedConnection.ConnectEvent Method

Pascal

```
procedure ConnectEvent(Sender: TObject; Connecting: Boolean);
```

C++

```
__fastcall ConnectEvent(TObject * Sender, Boolean Connecting);
```

Description

This is ConnectEvent, a member of class TSharedConnection.

47.1.7.4.2 TSharedConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected

DoDisconnect

47.1.7.4.3 TSharedConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected

DoConnect

47.1.7.4.4 TSharedConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected

SetConnected

47.1.7.4.5 TSharedConnection.GetServer Method

Returns the IAppServer (see page 5222) interface of the child remote data module.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Call GetServer to obtain the interface of the remote data module on the application server. GetServer returns the IAppServer (see page 5222) interface of the same remote data module as the one whose interface is the value of the AppServer property. Client applications can communicate directly with the child remote data module through this interface.

See Also

AppServer

47.1.7.4.6 TSharedConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

RemoveComponent

Owner

47.1.7.5 TSharedConnection Properties

The properties of the TSharedConnection class are listed here.

Published Properties

	Name	Description
	ChildName (see page 4819)	Identifies the child remote data module on the application server with which you want to communicate.
	ParentConnection (see page 4820)	Specifies the connection component that establishes a connection to the main remote data module on the application server.

47.1.7.5.1 TSharedConnection.ChildName Property

Identifies the child remote data module on the application server with which you want to communicate.

Pascal

```
property ChildName: String;
```

C++

```
__property UnicodeString ChildName;
```

Description

Set ChildName to the name of the property on the application server's main remote data module that exposes the interface for the desired child remote data module. TSharedConnection (see page 4814) uses this property to obtain the interface for the child remote data module, which it sets as the value of the AppServer property.

See Also

AppServer

ParentConnection (see page 4820)

47.1.7.5.2 TSharedConnection.ParentConnection Property

Specifies the connection component that establishes a connection to the main remote data module on the application server.

Pascal

```
property ParentConnection: TDispatchConnection;
```

C++

```
__property TDispatchConnection ParentConnection;
```

Description

Set ParentConnection to a connection component that connects to the main remote data module on the application server. TSharedConnection (see page 4814) uses this component's connection for communicating to the child remote data module.

The main remote data module with which ParentConnection communicates must expose the interface for the child remote data module as a property on its IAppServer (see page 5222) interface.

47.1.7.6 TSharedConnection Events

The events of the TSharedConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 4820)	Occurs after a connection is established.
	AfterDisconnect (see page 4821)	Occurs after the connection closes.
	BeforeConnect (see page 4821)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4822)	Occurs immediately before the connection closes.

47.1.7.6.1 TSharedConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect

Connected

Connecting to a Database Server

47.1.7.6.2 TSharedConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect;
```

C++

```
__property AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

Connected

Connecting to a Database Server

47.1.7.6.4 TSharedConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;

47.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetMIDASAppServerList (see page 4823)	This is function MConnect.GetMIDASAppServerList.

47.2.1 MConnect.GetMIDASAppServerList Function

Pascal

```
procedure GetMIDASAppServerList(List: TStringList; const RegCheck: string);
```

C++

```
GetMIDASAppServerList(TStringList List, const UnicodeString RegCheck);
```

File

MConnect

Description

This is function MConnect.GetMIDASAppServerList.

48 Menus Namespace

This is namespace Menus.

Topics

Name	Description
Classes (see page 4827)	The following table lists classes in this documentation.
Functions (see page 4951)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4965)	The following table lists structs, records, enums in this documentation.
Types (see page 4970)	The following table lists types in this documentation.
Variables (see page 4975)	The following table lists variables in this documentation.
Constants (see page 4977)	The following table lists constants in this documentation.

Classes

	Name	Description
	EMenuError (see page 4827)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 4828)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 4837)	TMenu is the base type for menu components such as TMainMenu (see page 4828) and TPopupMenu (see page 4935).
	TMenuActionLink (see page 4858)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 4869)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 4929)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 4931)	This is class Menus.TMenuItemStack.
	TPopupList (see page 4932)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 4935)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Constants

Name	Description
cDialogSuffix (see page 4977)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 4977)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 4977)	This is constant Menus.cLineCaption.

Functions

	Name	Description
	AnsiSameCaption (see page 4951)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

	DrawMenuItem (see page 4952)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 4952)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 4952)	This is function Menus.IsAltGRPressed.
	NewItem (see page 4953)	Creates and initializes a menu item.
	NewLine (see page 4954)	Creates a menu item for a separator.
	NewMenu (see page 4955)	Creates and initializes a main menu.
	NewPopupMenu (see page 4956)	Creates and initializes a popup menu.
	NewSubMenu (see page 4957)	Creates and initializes a menu item that represents a submenu.
	SameCaption (see page 4958)	This is function Menus.SameCaption.
	ShortCut (see page 4958)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 4959)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 4960)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 4961)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 4962)	This is function Menus.StripHotkey.
	TextToShortCut (see page 4963)	Creates a menu shortcut from a text string.

Structs, Records, Enums

	Name	Description
	TFindItemKind (see page 4965)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 4966)	TMenuAnimation (see page 4971) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 4966)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 4967)	TMenuItemAutoFlag and TMenuAutoFlag (see page 4972) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 4968)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 4968)	TTrackButton specifies which mouse button activates a tool button menu.

Types

Name	Description
PMenuItem (see page 4970)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 4970)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 4971)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 4971)	TMenuAnimation and TMenuAnimations (see page 4966) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 4972)	TMenuItemAutoFlag (see page 4967) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 4972)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 4973)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuHandle (see page 4973)	This is type Menus.TMenuHandle.
TMenuMeasureItemEvent (see page 4973)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Variables

Name	Description
PopupList (see page 4975)	This is variable Menus.PopupList.
ShortCutItems (see page 4975)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 4975)	This is variable Menus.ValidMenuHotkeys.

48.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMenuError (see page 4827)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 4828)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 4837)	TMenu is the base type for menu components such as TMainMenu (see page 4828) and TPopupMenu (see page 4935).
	TMenuActionLink (see page 4858)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 4869)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 4929)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 4931)	This is class Menus.TMenuItemStack.
	TPopupList (see page 4932)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 4935)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

48.1.1 EMenuError Class

EMenuError is the exception class for errors involving menu items.

Class Hierarchy

Pascal

```
EMenuError = class(Exception);
```

C++

```
class EMenuError : public Exception;
```

File

Menus

Description

EMenuError is raised if an error occurs while an application is working with menu items. For example, an EMenuError exception occurs if

An application tries to delete an item from an empty menu

A menu item attempts to insert itself into it's own list of items

An application attempts to reference a menu that does not exist

An application specifies an invalid GroupIndex for a menu item

See Also

TMenuItem (see page 4869)

TMenu (see page 4837)

48.1.2 TMainMenu Class

TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.

Class Hierarchy

Pascal

```
TMainMenu = class(TMenu);
```

C++

```
class TMainMenu : public TMenu;
```

File

Menus

Description

Use TMainMenu to provide the main menu for a form. To begin designing a menu, add a main menu to a form, and double-click the component.

TMainMenu introduces properties and methods for merging the drop-down menus of the main menu with the main menu of another form.

TMainMenu introduces properties and methods for assisting in the menu negotiation process of an OLE container.

Tip: To create a menu that users can configure at runtime, use the TActionMainMenuBar component with an action manager instead.

See Also

TMenuItem (see page 4869)

TPopupMenu (see page 4935)

TActionMainMenuBar

TActionManager

48.1.2.1 TMainMenu Members

The following tables list the members exposed by TMainMenu.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 4841)	Applies the BiDiMode (see page 4850) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 4842)	Updates the menu when the BiDiMode (see page 4850) property changes.
	DoChange (see page 4842)	Generates an OnChange (see page 4858) event.
	DoGetMenuString (see page 4843)	Returns the caption for an item in the menu.
	GetHandle (see page 4830)	Returns the value of the Handle property.
	IsOwnerDraw (see page 4845)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 4846)	Calls the DoChange (see page 4842) method when the menu is first loaded into memory.
	MenuChanged (see page 4831)	Responds when the menu changes.

	Notification (see page 4847)	Responds when components are added or deleted.
	SetChildOrder (see page 4848)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 4849)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	Create (see page 4839)	Creates an instance of TMenu (see page 4837).
	CreateMenuItem (see page 4841)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 4840)	Destroys the menu component.
	DispatchCommand (see page 4841)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 4842)	Dispatches a pop-up menu command.
	FindItem (see page 4843)	Locates and returns a menu item.
	GetChildren (see page 4844)	Executes a callback for child menu items.
	GetHelpContext (see page 4844)	Returns the help context ID associated with a menu item.
	GetOle2AcceleratorTable (see page 4830)	Returns the main menu's accelerator table.
	IsRightToLeft (see page 4845)	Indicates whether menu items read from right to left.
	IsShortCut (see page 4845)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	Merge (see page 4831)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	ParentBiDiModeChanged (see page 4847)	This is the overview for the ParentBiDiModeChanged method overload.
	PopulateOle2Menu (see page 4832)	Populates an OLE menu with items from the main menu.
	ProcessMenuChar (see page 4848)	Responds to keyboard input for the menu.
	SetOle2MenuHandle (see page 4832)	Associates the handle for an OLE menu with the main menu.
	Unmerge (see page 4832)	Reverses the merging of two menus in a non-MDI application.

Public Properties

	Name	Description
	Handle (see page 4851)	Provides access to the Windows menu handle for the menu.
	WindowHandle (see page 4857)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 4837)	Occurs when the menu changes.

Published Properties

	Name	Description
	AutoHotkeys (see page 4833)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4834)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoMerge (see page 4834)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 4835)	Determines the layout of the menu in Middle East locales.
	Images (see page 4835)	Lists the images that can appear beside individual menu items.
	Items (see page 4852)	Describes the elements of the menu.
	OwnerDraw (see page 4836)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 4836)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.

48.1.2.2 TMainMenu Methods

The methods of the TMainMenu class are listed here.

Protected Methods

	Name	Description
	GetHandle (see page 4830)	Returns the value of the Handle property.
	MenuChanged (see page 4831)	Responds when the menu changes.

Public Methods

	Name	Description
	GetOle2AcceleratorTable (see page 4830)	Returns the main menu's accelerator table.
	Merge (see page 4831)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	PopulateOle2Menu (see page 4832)	Populates an OLE menu with items from the main menu.
	SetOle2MenuHandle (see page 4832)	Associates the handle for an OLE menu with the main menu.
	Unmerge (see page 4832)	Reverses the merging of two menus in a non-MDI application.

48.1.2.2.1 TMainMenu.GetHandle Method

Returns the value of the Handle property.

Pascal

```
function GetHandle: HMENU; override;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle property. Override this method to change the implementation of the handle property. For example, TMainMenu overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 4851)

48.1.2.2.2 TMainMenu.GetOle2AcceleratorTable Method

Returns the main menu's accelerator table.

Pascal

```
procedure GetOle2AcceleratorTable(var AccelTable: HAccel; var AccelCount: Integer; const
Groups: array of Integer);
```

C++

```
__fastcall GetOle2AcceleratorTable(HAccel AccelTable, int AccelCount, const array of Integer
Groups);
```

Description

Call GetOle2AcceleratorTable to obtain a handle to an accelerator table for all menu items with a GroupIndex value that appears in the Groups parameter. The AccelTable parameter is set to the accelerator table handle, and the AccelCount is set to the number of entries in the table. GetOle2AcceleratorTable is used by OLE containers when merging menus.

See Also

GroupIndex (see page 4914)

ShortCut (see page 4920)

48.1.2.2.3 TMainMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); override;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange method, which generates an OnChange event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems method instead of MenuChanged. For example, when the Images property changes, UpdateItems is called rather than MenuChanged.

See Also

Items (see page 4852)

UpdateItems (see page 4849)

DoChange (see page 4842)

48.1.2.2.4 TMainMenu.Merge Method

Combines the main menu of one form with the main menu of another in non-MDI applications.

Pascal

```
procedure Merge(Menu: TMainMenu);
```

C++

```
__fastcall Merge(TMainMenu Menu);
```

Description

Call Merge to merge another main menu with this one. Specify the menu you want merged with this menu as the Menu parameter.

For example, to use the main menu of the first form in an application as the main menu for the application, call Merge to merge the main menu of any additional forms in the application with the main menu of the first form.

Depending on the value of the GroupIndex property of menu items on the main menu, the merged menu items can replace menu items on the menu bar, or insert menu items into the menu bar. See GroupIndex for information on how to do these things.

To merge and unmerge main menus automatically when other forms are displayed, change the value of the AutoMerge (see page 4834) property to true on all forms whose menus should be merged in.

See Also

AutoMerge (see page 4834)

GroupIndex (see page 4914)

Unmerge (see page 4832)

48.1.2.2.5 TMainMenu.PopulateOle2Menu Method

Populates an OLE menu with items from the main menu.

Pascal

```
procedure PopulateOle2Menu(SharedMenu: HMenu; const Groups: array of Integer; var Widths:
array of Longint);
```

C++

```
__fastcall PopulateOle2Menu(HMenu SharedMenu, const array of Integer Groups, array of Longint
Widths);
```

Description

Call PopulateOle2Menu to merge the menu items with GroupIndex values specified by the Groups parameter into the menu that uses the SharedMenu handle. PopulateOle2Menu appends all menu items in the specified groups to the menu, and increments the corresponding entries in the Widths array for every menu item appended. PopulateOle2Menu is used by OLE containers when merging menus.

Note: PopulateOle2Menu populates the menu specified by the SharedMenu parameter but does not set this as the OLE menu associated with the menu.

See Also

GetOle2AcceleratorTable (see page 4830)

SetOle2MenuHandle (see page 4832)

GroupIndex (see page 4914)

48.1.2.2.6 TMainMenu.SetOle2MenuHandle Method

Associates the handle for an OLE menu with the main menu.

Pascal

```
procedure SetOle2MenuHandle(Handle: HMENU);
```

C++

```
__fastcall SetOle2MenuHandle(HMENU Handle);
```

Description

Call SetOle2MenuHandle to temporarily replace the menu of a form with the menu represented by the Handle (see page 4851) parameter. To restore the original menu, call SetOle2MenuHandle with the Handle (see page 4851) parameter set to 0. SetOle2MenuHandle allows an OLE container to use menu items provided by an OLE server.

See Also

GetOle2AcceleratorTable (see page 4830)

PopulateOle2Menu (see page 4832)

48.1.2.2.7 TMainMenu.Unmerge Method

Reverses the merging of two menus in a non-MDI application.

Pascal

```
procedure Unmerge(Menu: TMainMenu);
```

C++

```
__fastcall Unmerge(TMainMenu Menu);
```

Description

Call Unmerge to remove items from another main menu that were added using the Merge (see page 4831) method. The Menu parameter is the merged menu whose items should be removed from the main menu.

See Also

AutoMerge (see page 4834)

Merge (see page 4831)

48.1.2.3 TMainMenu Properties

The properties of the TMainMenu class are listed here.

Published Properties

	Name	Description
	AutoHotkeys (see page 4833)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4834)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoMerge (see page 4834)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 4835)	Determines the layout of the menu in Middle East locales.
	Images (see page 4835)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 4836)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 4836)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.

48.1.2.3.1 TMainMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its

Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 4900)

Items (see page 4852)

RethinkHotkeys (see page 4894)

48.1.2.3.2 TMainMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 4900)

Items (see page 4852)

RethinkLines (see page 4894)

48.1.2.3.3 TMainMenu.AutoMerge Property

Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.

Pascal

```
property AutoMerge: Boolean;
```

C++

```
__property Boolean AutoMerge;
```

Description

To merge a form's menus with the main menu in the main form, set the AutoMerge property of each main menu you want merged to true. Make sure that the AutoMerge property of the main menu of the main form (the one other menus are merged

into) remains false. How menus merge depends on the value of the GroupIndex property for each menu item.

If the application is an MDI application (the FormStyle properties are set so the main form is a parent form and subsequent forms are child forms), menu merging occurs automatically without using the AutoMerge property.

See Also

FormStyle (see page 2162)

GroupIndex (see page 4914)

Merge (see page 4831)

48.1.2.3.4 TMainMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 4857)

IsRightToLeft (see page 4845)

48.1.2.3.5 TMainMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 4916)

Images

Items (see page 4852)

48.1.2.3.6 TMainMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 4929)

OnDrawItem (see page 4928)

Images (see page 4851)

48.1.2.3.7 TMainMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 4850)

48.1.2.4 TMainMenu Events

The events of the TMainMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 4837)	Occurs when the menu changes.

48.1.2.4.1 TMainMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 4852)

48.1.3 TMenu Class

TMenu is the base type for menu components such as TMainMenu (see page 4828) and TPopupMenu (see page 4935).

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TMenu = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TMenu : public TComponent;
```

File

Menus

Description

Use TMenu as a base class when defining a component that represents a collection of menu items. TMenu introduces properties and methods to create a Windows menu that represents a set of menu items, dispatch commands associated with those menu items, and locate the help context id for any of those menu items.

Using the Menu Designer Context Menu

Viewing the Menu

48.1.3.1 TMenu Members

The following tables list the members exposed by TMenu.

Protected Events

	Name	Description
	OnChange (see page 4858)	Occurs when the menu changes.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 4841)	Applies the BiDiMode (see page 4850) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 4842)	Updates the menu when the BiDiMode (see page 4850) property changes.
	DoChange (see page 4842)	Generates an OnChange (see page 4858) event.
	DoGetMenuString (see page 4843)	Returns the caption for an item in the menu.
	GetHandle (see page 4844)	Returns the value of the Handle (see page 4851) property.
	IsOwnerDraw (see page 4845)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 4846)	Calls the DoChange (see page 4842) method when the menu is first loaded into memory.
	MenuChanged (see page 4846)	Responds when the menu changes.
	Notification (see page 4847)	Responds when components are added or deleted.
	SetChildOrder (see page 4848)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 4849)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	Create (see page 4839)	Creates an instance of TMenu (see page 4837).
	CreateMenuItem (see page 4841)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 4840)	Destroys the menu component.
	DispatchCommand (see page 4841)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 4842)	Dispatches a pop-up menu command.
	FindItem (see page 4843)	Locates and returns a menu item.
	GetChildren (see page 4844)	Executes a callback for child menu items.
	GetHelpContext (see page 4844)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 4845)	Indicates whether menu items read from right to left.
	IsShortCut (see page 4845)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 4847)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 4848)	Responds to keyboard input for the menu.

Public Properties

	Name	Description
	AutoHotkeys (see page 4849)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4850)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 4850)	Determines the layout of the menu in Middle East locales.
	Handle (see page 4851)	Provides access to the Windows menu handle for the menu.
	Images (see page 4851)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 4856)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 4857)	Indicates whether the BiDiMode (see page 4850) property is inherited from the control that uses the menu.
	WindowHandle (see page 4857)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
	Items (see page 4852)	Describes the elements of the menu.

48.1.3.2 TMenu.Create Constructor

Creates an instance of TMenu (see page 4837).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenu(TComponent * AOwner);
```

Description

Call Create to create a menu at runtime. Menus (see page 4825) placed on forms at design time are created automatically. Create calls the inherited Create method, then sets the initial values for the menu component, including creating an Items (see page 4852) property.

The AOwner parameter indicates the component (usually a form) that is responsible for managing the memory associated with the menu.

See Also

Items (see page 4852)

48.1.3.3 TMenu.Destroy Destructor

Destroys the menu component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenu (see page 4837) reference is not nil, and only then calls Destroy. Destroy frees the Items (see page 4852) property, and then calls the inherited Destroy method.

See Also

System::TObject::Free

Items (see page 4852)

48.1.3.4 TMenu Methods

The methods of the TMenu class are listed here.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 4841)	Applies the BiDiMode (see page 4850) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 4842)	Updates the menu when the BiDiMode (see page 4850) property changes.
	DoChange (see page 4842)	Generates an OnChange (see page 4858) event.
	DoGetMenuString (see page 4843)	Returns the caption for an item in the menu.
	GetHandle (see page 4844)	Returns the value of the Handle (see page 4851) property.
	IsOwnerDraw (see page 4845)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 4846)	Calls the DoChange (see page 4842) method when the menu is first loaded into memory.
	MenuChanged (see page 4846)	Responds when the menu changes.
	Notification (see page 4847)	Responds when components are added or deleted.
	SetChildOrder (see page 4848)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 4849)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	CreateMenuItem (see page 4841)	This is CreateMenuItem, a member of class TMenu.
	DispatchCommand (see page 4841)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 4842)	Dispatches a pop-up menu command.
	FindItem (see page 4843)	Locates and returns a menu item.
	GetChildren (see page 4844)	Executes a callback for child menu items.
	GetHelpContext (see page 4844)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 4845)	Indicates whether menu items read from right to left.
	IsShortCut (see page 4845)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 4847)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 4848)	Responds to keyboard input for the menu.

48.1.3.4.1 TMenu.AdjustBiDiBehavior Method

Applies the BiDiMode (see page 4850) property to the menu when the Windows control is created.

Pascal

```
procedure AdjustBiDiBehavior;
```

C++

```
__fastcall AdjustBiDiBehavior();
```

Description

AdjustBiDiBehavior is called automatically when the Windows control for the menu is created. It ensures that the BiDiMode (see page 4850) property is properly reflected in the menu if the application is running in a Middle Eastern locale.

See Also

BiDiMode (see page 4850)

48.1.3.4.2 TMenu.CreateMenuItem Method

Pascal

```
function CreateMenuItem: TMenuItem; dynamic;
```

C++

```
__fastcall TMenuItem CreateMenuItem();
```

Description

This is CreateMenuItem, a member of class TMenu.

48.1.3.4.3 TMenu.DispatchCommand Method

Calls the Click method of the menu item with the specified value as its Command property.

Pascal

```
function DispatchCommand(ACommand: Word): Boolean;
```

C++

```
__fastcall Boolean DispatchCommand(Word ACommand);
```

Description

Call DispatchCommand to simulate a click on the menu item associated with a command ID. If DispatchCommand locates a menu item that matches the command ID, it calls the Click method for that menu item and returns true. If there is no such item, DispatchCommand returns false.

See Also

DispatchPopup (see page 4842)

IsShortCut (see page 4845)

Items (see page 4852)

Click (see page 4881)

Command (see page 4907)

48.1.3.4.4 TMenu.DispatchPopup Method

Dispatches a pop-up menu command.

Pascal

```
function DispatchPopup(AHandle: HMENU): Boolean;
```

C++

```
__fastcall Boolean DispatchPopup(HMENU AHandle);
```

Description

Call DispatchPopup to simulate a click on the menu item associated with the pop-up menu handle. If DispatchPopup locates a menu item that matches the pop-up menu handle, it calls the Click method for that menu item and returns true. If there is no such item, DispatchPopup returns false.

See Also

DispatchCommand (see page 4841)

IsShortCut (see page 4845)

Items (see page 4852)

Click (see page 4881)

48.1.3.4.5 TMenu.DoBiDiModeChanged Method

Updates the menu when the BiDiMode (see page 4850) property changes.

Pascal

```
procedure DoBiDiModeChanged;
```

C++

```
__fastcall DoBiDiModeChanged();
```

Description

Do not call DoBiDiModeChanged. It is called automatically when the menu's BiDiMode (see page 4850) property changes to update the menu to reflect the current setting.

See Also

BiDiMode (see page 4850)

48.1.3.4.6 TMenu.DoChange Method

Generates an OnChange (see page 4858) event.

Pascal

```
procedure DoChange(Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall DoChange(TMenuItem Source, Boolean Rebuild);
```

Description

DoChange is called automatically when the properties of any menu items change. The Source parameter specifies the menu item (if any) that changed. The Rebuild parameter indicates whether the change requires the menu to regenerate its items.

See Also

OnChange (see page 4858)

MenuChanged (see page 4846)

48.1.3.4.7 TMenu.DoGetMenuString Method

Returns the caption for an item in the menu.

Pascal

```
function DoGetMenuString(Menu: HMENU; ItemID: UINT; Str: PChar; MaxCount: Integer; Flag:
UINT): Integer;
```

C++

```
__fastcall int DoGetMenuString(HMENU Menu, UINT ItemID, const char * Str, int MaxCount, UINT
Flag);
```

Description

DoGetMenuString is used internally to obtain menu item captions, given the Windows menu handle. The Menu parameter indicates the menu's handle. The ItemID parameter specifies the menu item whose caption is desired. If the Flag parameter is MF_BYCOMMAND, ItemID is the Command property of the menu item. If Flag is MF_BYPOSITION, ItemID is the 0-based index of the menu item. The caption is returned in a buffer pointed to by the Str parameter. MaxCount indicates the size of that buffer.

Unlike the Windows API function GetMenuString, DoGetMenuString returns the correct caption for owner-draw menu items.

See Also

Caption (see page 4902)

Command (see page 4907)

48.1.3.4.8 TMenu.FindItem Method

Locates and returns a menu item.

Pascal

```
function FindItem(Value: Integer; Kind: TFindItemKind): TMenuItem;
```

C++

```
__fastcall TMenuItem FindItem(int Value, TFindItemKind Kind);
```

Description

Call FindItem to locate a menu item in the menu or one of its submenus. The menu item is identified by either a pop-up menu handle, command ID, or menu shortcut value. The Kind parameter specifies how the menu item is to be identified.

See Also

TMenuItem (see page 4869)

Command (see page 4907)

Handle (see page 4915)

ShortCut (see page 4920)

48.1.3.4.9 TMenu.GetChildren Method

Executes a callback for child menu items.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called automatically by the streaming system so that child menu items are saved and read with their parent menu.

See Also

GetParentComponent

SetChildOrder

48.1.3.4.10 TMenu.GetHandle Method

Returns the value of the Handle (see page 4851) property.

Pascal

```
function GetHandle: HMENU; virtual;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle (see page 4851) property. Override this method to change the implementation of the handle property. For example, TMainMenu (see page 4828) overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 4851)

48.1.3.4.11 TMenu.GetHelpContext Method

Returns the help context ID associated with a menu item.

Pascal

```
function GetHelpContext(Value: Integer; ByCommand: Boolean): THelpContext;
```

C++

```
__fastcall THelpContext GetHelpContext(int Value, Boolean ByCommand);
```

Description

Call GetHelpContext to obtain the ID for context-sensitive help on a particular menu item. Identify the menu item as the item that matches the Value property. If ByCommand is true, Value is the Command property of the TMenuItem (see page 4869). If ByCommand is false, Value is the Handle (see page 4851) property.

See Also

FindItem (see page 4843)

Command (see page 4907)

Handle (see page 4915)

HelpContext (see page 4915)

HelpContext

48.1.3.4.12 TMenu.IsOwnerDraw Method

Indicates whether menu items can contain more than simple captions.

Pascal

```
function IsOwnerDraw: Boolean;
```

C++

```
__fastcall Boolean IsOwnerDraw();
```

Description

IsOwnerDraw returns true when the OwnerDraw (see page 4856) property is true or the Images (see page 4851) property is not nil (Delphi) or NULL (C++). This is used internally to determine how the menu should be painted.

See Also

OwnerDraw (see page 4856)

Images (see page 4851)

48.1.3.4.13 TMenu.IsRightToLeft Method

Indicates whether menu items read from right to left.

Pascal

```
function IsRightToLeft: Boolean;
```

C++

```
__fastcall Boolean IsRightToLeft();
```

Description

Call IsRightToLeft to determine the layout of main menu items. IsRightToLeft returns true if the application is running on a system with a Middle Eastern locale and the BiDiMode (see page 4850) property is not bdLeftToRight.

See Also

BiDiMode (see page 4850)

48.1.3.4.14 TMenu.IsShortCut Method

Dispatches a key message if it represents a shortcut key for an item in the menu.

Pascal

```
function IsShortCut(var Message: TWMKey): Boolean; dynamic;
```

C++

```
__fastcall Boolean IsShortCut(TWMKey Message);
```

Description

Call IsShortCut when processing a KeyDown message to identify shortcut keys and trigger the appropriate menu action. IsShortCut decodes the key message passed in the Message parameter. It then encodes the state of the Shift, Control, and Alt keys with the value of the character that was typed to obtain the ShortCut (see page 4958) property of a menu item. If IsShortCut locates a menu item associated with the shortcut key combination, it calls the item's Click method and returns true. If no item in the menu has a shortcut corresponding to the message, IsShortCut returns false.

See Also

DispatchCommand (see page 4841)

DispatchPopup (see page 4842)

FindItem (see page 4843)

Click (see page 4881)

48.1.3.4.15 TMenu.Loaded Method

Calls the DoChange (see page 4842) method when the menu is first loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically immediately after the menu is loaded into memory. It calls the DoChange (see page 4842) method to allow any necessary fixup.

See Also

DoChange (see page 4842)

48.1.3.4.16 TMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange (see page 4842) method, which generates an OnChange (see page 4858) event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems (see page 4849) method instead of MenuChanged. For example, when the Images (see page 4851) property changes, UpdateItems (see page 4849) is called rather than MenuChanged.

See Also

Items (see page 4852)

UpdateItems (see page 4849)

DoChange (see page 4842)

48.1.3.4.17 TMenu.Notification Method

Responds when components are added or deleted.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

TMenu (see page 4837) overrides the inherited method to set the Images (see page 4851) property to nil (Delphi) or NULL (C++) if the ImageList is deleted.

See Also

Notification

Images (see page 4851)

48.1.3.4.18 ParentBiDiModeChanged Method

This is the overview for the ParentBiDiModeChanged method overload.

Overload List

	Name	Description
	TMenu.ParentBiDiModeChanged () (see page 4847)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 4850) and ParentBiDiMode (see page 4857) properties.
	TMenu.ParentBiDiModeChanged (TObject) (see page 4847)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 4850) and ParentBiDiMode (see page 4857) properties.

48.1.3.4.18.1 TMenu.ParentBiDiModeChanged Method ()

Ensures that the menu's layout follows the current settings of the BiDiMode (see page 4850) and ParentBiDiMode (see page 4857) properties.

Pascal

```
procedure ParentBiDiModeChanged; overload;
procedure ParentBiDiModeChanged(AControl: TObject); overload;
```

C++

```
__fastcall ParentBiDiModeChanged();
__fastcall ParentBiDiModeChanged(TObject * AControl);
```

Description

ParentBiDiMode (see page 4857) changed is called when the menu's BiDiMode (see page 4850) property must be updated to reflect the bi-directional mode of its associated control.

See Also

BiDiMode (see page 4850)

ParentBiDiMode (see page 4857)

DoBiDiModeChanged (see page 4842)

48.1.3.4.19 TMenu.ProcessMenuChar Method

Responds to keyboard input for the menu.

Pascal

```
procedure ProcessMenuChar(var Message: TWMMenuChar);
```

C++

```
__fastcall ProcessMenuChar(TWMMenuChar Message);
```

Description

ProcessMenuChar handles keyboard messages from Windows. It checks whether the character typed is an accelerator character from one of the menu's items. If so, ProcessMenuChar executes the menu item (or, if the item is disabled, selects it). If the key is not an accelerator, ProcessMenuChar checks for captions that begin with the character. If there is only one, it is treated like an accelerator. Otherwise, the first item beginning with that character is selected.

When calling ProcessMenuChar programmatically, the User, MenuFlag, and Menu fields of Message parameter must be supplied.

See Also

Caption (see page 4902)

48.1.3.4.20 TMenu.SetChildOrder Method

Ensures that the menu item indexes reflect the order in which they are loaded and saved.

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

SetChildOrder is called automatically when menus are loaded into memory. The Child parameter specifies the child object that was just loaded. The Order parameter specifies the order in which it was loaded. SetChildOrder assigns the MenuIndex for each child to match the order in which the items are loaded.

See Also

MenuIndex (see page 4919)

48.1.3.4.21 TMenu.UpdateItems Method

Causes all menu items to update themselves.

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

UpdateItems is called automatically when changes occur that must be reflected by individual menu items. Changes that affect the menu as a whole trigger the MenuChanged (see page 4846) method instead.

See Also

MenuChanged (see page 4846)

48.1.3.5 TMenu Properties

The properties of the TMenu class are listed here.

Public Properties

	Name	Description
	AutoHotkeys (see page 4849)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4850)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 4850)	Determines the layout of the menu in Middle East locales.
R	Handle (see page 4851)	Provides access to the Windows menu handle for the menu.
	Images (see page 4851)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 4856)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 4857)	Indicates whether the BiDiMode (see page 4850) property is inherited from the control that uses the menu.
	WindowHandle (see page 4857)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
R	Items (see page 4852)	Describes the elements of the menu.

48.1.3.5.1 TMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu (see page 4837)

tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items (see page 4852) property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items (see page 4852) property. Setting one sets the other.

See Also

AutoHotkeys (see page 4900)

Items (see page 4852)

RethinkHotkeys (see page 4894)

48.1.3.5.2 TMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items (see page 4852) property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items (see page 4852) property. Setting one sets the other.

See Also

AutoLineReduction (see page 4900)

Items (see page 4852)

RethinkLines (see page 4894)

48.1.3.5.3 TMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 4857)

IsRightToLeft (see page 4845)

48.1.3.5.4 TMenu.Handle Property

Provides access to the Windows menu handle for the menu.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle to call a Windows API function that requires a menu handle. Handle is the handle for the menu that contains only the items described by the Items (see page 4852) property. If no other menus have been merged with this menu, this is the same as the WindowHandle (see page 4857) property.

See Also

WindowHandle (see page 4857)

48.1.3.5.5 TMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 4916)

Images

Items (see page 4852)

48.1.3.5.6 TMenu.Items Property

Describes the elements of the menu.

Pascal

```
property Items: TMenuItem;
```

C++

```
__property TMenuItem Items;
```

Description

Use Items to access information about the elements in the menu. Items is a single TMenuItem (see page 4869) object that describes the elements of the menu in its own Items property.

Note: Because Items is the default property of TMenuItem (see page 4869), the Items property of TMenu (see page 4837) can be treated as an indexed array of menu items that describe the individual items in the menu. That is, instead of writing

Note: FirstItem := Menu1.Items.Items[0];

Note: you can use

Note: FirstItem := Menu1.Items[0];

Set the Items property at design time by clicking on the Items property in the Property Inspector. The Menu Designer automatically inserts a menu item. As each menu item is entered, outlined regions appear at the possible locations of additional menu items. Click in those regions to specify additional menu items. At runtime, create a TMenuItem (see page 4869) that describes the elements of the menu programmatically, and set the Items property of the menu.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/

48.1.3.5.7 TMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images (see page 4851) and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 4929)

OnDrawItem (see page 4928)

Images (see page 4851)

48.1.3.5.8 TMenu.ParentBiDiMode Property

Indicates whether the BiDiMode (see page 4850) property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode (see page 4850) setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode (see page 4850) setting and control the menu's layout independently.

See Also

BiDiMode (see page 4850)

48.1.3.5.9 TMenu.WindowHandle Property

Provides access to the handle of the window that uses the menu.

Pascal

```
property WindowHandle: HWND;
```

C++

```
__property HWND WindowHandle;
```

Description

Read WindowHandle to get the window handle of the control that receives WM_COMMAND (see page 5148) messages when the user clicks on an item in the menu. When menu items are selected, use this handle in an OnClick event handler to send messages to the control that uses the menu or to make Windows API calls that affect the control.

Set WindowHandle to associate the menu with a control.

See Also

DispatchCommand (see page 4841)

Command (see page 4907)

OnClick (see page 4922)

48.1.3.6 TMenu Events

The events of the TMenu class are listed here.

Protected Events

	Name	Description
	OnChange (see page 4858)	Occurs when the menu changes.

48.1.3.6.1 TMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 4852)

48.1.4 TMenuActionLink Class

TMenuActionLink links menu item clients to the corresponding menu action.

Class Hierarchy

Pascal

```
TMenuActionLink = class(TActionLink);
```

C++

```
class TMenuActionLink : public TActionLink;
```

File

Menus

Description

TMenuActionLink is designed to link actions to menu item clients. TMenuActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of and events of menu item clients.

TMenuActionLink overrides methods to support linking the following properties and events with menu item client properties or events, most of which have the same name:

Caption

Checked

Enabled

HelpContext

Hint

ImageIndex

ShortCut (see page 4958)

Visible

OnExecute

48.1.4.1 TMenuActionLink Members

The following tables list the members exposed by TMenuActionLink.

Protected Fields

	Name	Description
	FClient (see page 4860)	This is FClient, a member of class TMenuActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 4860)	Assigns a client menu item that is linked to the associated action.
	IsAutoCheckLinked (see page 4861)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 4861)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 4862)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 4862)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 4862)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 4863)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHintLinked (see page 4863)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 4864)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 4864)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 4864)	Indicates whether the ShortCut (see page 4958) property for the action and the client are linked.
	IsVisibleLinked (see page 4865)	Indicates whether the visible state for the action and the client are linked.
	SetAutoCheck (see page 4865)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 4866)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 4866)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 4866)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetHelpContext (see page 4867)	Sets the Help context of a menu item that is the client of this action link.
	SetHint (see page 4867)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 4867)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 4868)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 4868)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 4869)	Sets the visible state of a menu item if the client is linked to the action for this property.

48.1.4.2 TMenuActionLink Fields

The fields of the TMenuActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 4860)	This is FClient, a member of class TMenuActionLink.

48.1.4.2.1 TMenuActionLink.FClient Field

Pascal

```
FClient: TMenuItem;
```

C++

```
TMenuItem FClient;
```

Description

This is FClient, a member of class TMenuActionLink.

48.1.4.3 TMenuActionLink Methods

The methods of the TMenuActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 4860)	Assigns a client menu item that is linked to the associated action.
	IsAutoCheckLinked (see page 4861)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 4861)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 4862)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 4862)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 4862)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 4863)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHintLinked (see page 4863)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 4864)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 4864)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 4864)	Indicates whether the ShortCut (see page 4958) property for the action and the client are linked.
	IsVisibleLinked (see page 4865)	Indicates whether the visible state for the action and the client are linked.
	SetAutoCheck (see page 4865)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 4866)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 4866)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 4866)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetHelpContext (see page 4867)	Sets the Help context of a menu item that is the client of this action link.
	SetHint (see page 4867)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 4867)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 4868)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 4868)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 4869)	Sets the visible state of a menu item if the client is linked to the action for this property.

48.1.4.3.1 TMenuActionLink.AssignClient Method

Assigns a client menu item that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TMenuActionLink (see page 4858) overrides AssignClient to ensure that the client for the link is a menu item.

See Also

Action (see page 4899)

Create

48.1.4.3.2 TMenuActionLink.IsAutoCheckLinked Method

Indicates whether the AutoCheck state for the action and the client are linked.

Pascal

```
function IsAutoCheckLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsAutoCheckLinked();
```

Description

IsAutoCheckLinked indicates whether the AutoCheck property is linked to the appropriate client property. IsAutoCheckLinked returns true if the client requests that the action control this property, false otherwise.

See Also

AutoCheck

AutoCheck (see page 4899)

SetAutoCheck (see page 4865)

48.1.4.3.3 TMenuActionLink.IsCaptionLinked Method

Indicates whether the caption for the action and the client are linked.

Pascal

```
function IsCaptionLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCaptionLinked();
```

Description

IsCaptionLinked indicates whether the Caption property is linked to the appropriate client property. IsCaptionLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Caption

Caption (see page 4902)

SetCaption (see page 4866)

48.1.4.3.4 TMenuActionLink.IsCheckedLinked Method

Indicates whether the checked state for the action and the client are linked.

Pascal

```
function IsCheckedLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

IsCheckedLinked indicates whether the Checked property is linked to the appropriate client property. IsCheckedLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Checked

Checked (see page 4906)

SetChecked (see page 4866)

48.1.4.3.5 TMenuActionLink.IsEnabledLinked Method

Indicates whether the enabled state for the action and the client are linked.

Pascal

```
function IsEnabledLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsEnabledLinked();
```

Description

IsEnabledLinked indicates whether the Enabled property is linked to the appropriate client property. IsEnabledLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Enabled

Enabled (see page 4912)

SetEnabled (see page 4866)

48.1.4.3.6 TMenuActionLink.IsGroupIndexLinked Method

Indicates whether the GroupIndex property for the action controls client behavior.

Pascal

```
function IsGroupIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsGroupIndexLinked();
```

Description

TActionLink descendants can call IsGroupIndexLinked to determine whether they need to propagate changes to the GroupIndex property of the action so that they are reflected by the client object. When IsGroupIndexLinked returns true, the action controls

the GroupIndex property: Changes to the GroupIndex property of the action are reflected in the client object. When IsGroupIndexLinked returns false, the client object is not influenced by the GroupIndex property of its action.

As implemented in TActionLink, IsGroupIndexLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

GroupIndex

SetGroupIndex

Action

48.1.4.3.7 TMenuActionLink.IsHelpContextLinked Method

Indicates whether the HelpContext properties for the action and client controls are linked.

Pascal

```
function IsHelpContextLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHelpContextLinked();
```

Description

TActionLink descendants can call IsHelpContextLinked to determine whether they need to propagate changes to the HelpContext property of the action so that they are reflected by the client object. When IsHelpContextLinked returns true, the action controls the HelpContext property: Changes to the HelpContext property of the action are reflected in the client object. When IsHelpContextLinked returns false, the client object is not influenced by the HelpContext property of its action.

As implemented in TActionLink, IsHelpContextLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

HelpContext

SetHelpContext

Action

IsHelpLinked

48.1.4.3.8 TMenuActionLink.IsHintLinked Method

Indicates whether the Hint property for the action and the client are linked.

Pascal

```
function IsHintLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHintLinked();
```

Description

IsHintLinked indicates whether the Hint property is linked to the appropriate client property. IsHintLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Hint

Hint (see page 4916)

SetHint (see page 4867)

48.1.4.3.9 TMenuActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

IsImageIndexLinked indicates whether the ImageIndex property is linked to the appropriate client property. IsImageIndexLinked returns true if the client requests that the action control this property, false otherwise.

See Also

ImageIndex

ImageIndex (see page 4916)

SetImageIndex (see page 4867)

48.1.4.3.10 TMenuActionLink.IsOnExecuteLinked Method

Indicates whether the OnExecute event handler for the action and the client are linked.

Pascal

```
function IsOnExecuteLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsOnExecuteLinked();
```

Description

IsOnExecuteLinked indicates whether the OnExecute event handler is linked to the appropriate client event. IsOnExecuteLinked returns true if the client requests that the action control this event, false otherwise.

See Also

OnExecute

OnClick (see page 4922)

SetOnExecute (see page 4868)

48.1.4.3.11 TMenuActionLink.IsShortCutLinked Method

Indicates whether the ShortCut (see page 4958) property for the action and the client are linked.

Pascal

```
function IsShortCutLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsShortCutLinked();
```

Description

IsShortCutLinked indicates whether the ShortCut (see page 4958) property is linked to the appropriate client property. IsVisibleLinked (see page 4865) returns true if the client requests that the action control this property, false otherwise.

See Also

ShortCut

ShortCut (see page 4920)

SetShortCut (see page 4868)

48.1.4.3.12 TMenuActionLink.IsVisibleLinked Method

Indicates whether the visible state for the action and the client are linked.

Pascal

```
function IsVisibleLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVisibleLinked();
```

Description

IsVisibleLinked indicates whether the Visible property is linked to the appropriate client property. IsVisibleLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Visible

Visible (see page 4921)

SetVisible (see page 4869)

48.1.4.3.13 TMenuActionLink.SetAutoCheck Method

Sets the AutoCheck property of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetAutoCheck(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoCheck(Boolean Value);
```

Description

SetAutoCheck sets the AutoCheck property of a menu item, and is called only if the client is linked for this event. Value specifies the AutoCheck new value of AutoCheck.

See Also

AutoCheck

AutoCheck (see page 4899)

IsAutoCheckLinked (see page 4861)

48.1.4.3.14 TMenuActionLink.SetCaption Method

Sets the caption of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString Value);
```

Description

SetCaption sets the caption of a menu item, and is called only if the client is linked for this event. Value is the string to which the caption should be set.

See Also

Caption

Caption (see page 4902)

IsCaptionLinked (see page 4861)

48.1.4.3.15 TMenuActionLink.SetChecked Method

Sets the checked state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked sets the checked state of a menu item, and is called only if the client is linked for this event. Value specifies whether the checked state should be set.

See Also

Checked

Checked (see page 4906)

IsCheckedLinked (see page 4862)

48.1.4.3.16 TMenuActionLink.SetEnabled Method

Sets the enabled state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled sets the enabled state of a menu item, and is called only if the client is linked for this event. Value specifies whether the enabled state should be set.

See Also

Enabled

Enabled (see page 4912)

IsEnabledLinked (see page 4862)

48.1.4.3.17 TMenuActionLink.SetHelpContext Method

Sets the Help context of a menu item that is the client of this action link.

Pascal

```
procedure SetHelpContext(Value: THelpContext); override;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

SetHelpContext sets the help context of a client menu item, and is called only if the client is linked for this property. Value specifies what the help context should be.

See Also

HelpContext

HelpContext (see page 4915)

IsHelpLinked

48.1.4.3.18 TMenuActionLink.SetHint Method

Sets the hint of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetHint(const Value: string); override;
```

C++

```
virtual __fastcall SetHint(const UnicodeString Value);
```

Description

SetHint sets the hint of a menu item, and is called only if the client is linked for this event. Value is the string that to which the hint should be set.

See Also

Hint

Hint (see page 4916)

IsHintLinked (see page 4863)

48.1.4.3.19 TMenuActionLink.SetImageIndex Method

Sets the image index of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

SetImageIndex sets the image index of a menu item, and is called only if the client is linked for this event. Value specifies what the image index should be.

See Also

ImageIndex

ImageIndex (see page 4916)

IsImageIndexLinked (see page 4864)

48.1.4.3.20 TMenuActionLink.SetOnExecute Method

Sets the execution event handler for a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetOnExecute(Value: TNotifyEvent); override;
```

C++

```
virtual __fastcall SetOnExecute(TNotifyEvent Value);
```

Description

SetOnExecute sets the appropriate execution event handler of a menu item, and is called only if the client is linked for this event. Value specifies the procedure that should be used for this event.

See Also

OnExecute

OnClick (see page 4922)

IsOnExecuteLinked (see page 4864)

48.1.4.3.21 TMenuActionLink.SetShortCut Method

Sets the shortcut of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetShortCut(Value: TShortCut); override;
```

C++

```
virtual __fastcall SetShortCut(TShortCut Value);
```

Description

SetShortCut sets the shortcut of a menu item, and is called only if the client is linked for this event. Value specifies what the shortcut should be.

See Also

ShortCut

ShortCut (see page 4920)

IsShortCutLinked (see page 4864)

48.1.4.3.22 TMenuActionLink.SetVisible Method

Sets the visible state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetVisible(Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

SetVisible sets the visible state of a menu item, and is called only if the client is linked for this event. Value specifies whether the visible state should be set.

See Also

Visible

Visible (see page 4921)

IsVisibleLinked (see page 4865)

48.1.5 TMenuItem Class

TMenuItem describes the properties of an item in a menu.

Class Hierarchy

Pascal

```
TMenuItem = class(TComponent);
```

C++

```
class TMenuItem : public TComponent;
```

File

Menus

Description

Use TMenuItem to specify the appearance and behavior of an item in a menu. Each TMainMenu (see page 4828) or TPopupMenu (see page 4935) component can contain multiple menu items. When a menu is defined at design time, the Menu Designer automatically creates menu item objects for each command on the menu.

See Also

TMainMenu (see page 4828)

TPopupMenu (see page 4935)

NewItem (see page 4953)

NewLine (see page 4954)

NewSubMenu (see page 4957)

48.1.5.1 TMenuItem Members

The following tables list the members exposed by TMenuItem.

Protected Methods

	Name	Description
	ActionChange (see page 4875)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 4880)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 4880)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 4881)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 4882)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 4883)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 4883)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 4884)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 4884)	This is GetAutoLineReduction, a member of class TMenuItem.
	GetCount (see page 4884)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 4885)	This is GetHandle, a member of class TMenuItem.
	GetItem (see page 4886)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 4886)	This is GetMenuIndex, a member of class TMenuItem.
	InsertNewLine (see page 4889)	This is InsertNewLine, a member of class TMenuItem.
V	Loaded (see page 4891)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 4891)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 4892)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 4893)	Forwards notification messages to all owned components.
	SetBreak (see page 4895)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 4895)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 4895)	This is SetChecked, a member of class TMenuItem.
V	SetChildOrder (see page 4896)	This is SetChildOrder, a member of class TMenuItem.
	SetDefault (see page 4896)	This is SetDefault, a member of class TMenuItem.
	SetEnabled (see page 4896)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 4896)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 4897)	This is SetImageIndex, a member of class TMenuItem.
	SetMenuIndex (see page 4897)	This is SetMenuIndex, a member of class TMenuItem.
	SetRadioItem (see page 4897)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 4897)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 4898)	This is SetVisible, a member of class TMenuItem.
	UpdateItems (see page 4898)	This is UpdateItems, a member of class TMenuItem.

Protected Properties

	Name	Description
	ActionLink (see page 4899)	This is ActionLink, a member of class TMenuItem.

Public Methods

	Name	Description
	Add (see page 4875)	This is the overview for the Add method overload.
	Clear (see page 4881)	Removes and frees all menu items listed in the Items (see page 4917) property.
V	Click (see page 4881)	Simulates a mouse click.
V	Create (see page 4872)	Creates an instance of TMenuItem (see page 4869).
	Delete (see page 4882)	Removes a menu item from the Items (see page 4917) property array.
V	Destroy (see page 4873)	Destroys an instance of TMenuItem (see page 4869).
	Find (see page 4883)	Locates a menu item in the Items (see page 4917) property array given its caption.

	GetChildren (see page 4884)	This is GetChildren, a member of class TMenuItem.
	GetEnumerator (see page 4884)	Returns a TComponent enumerator.
	GetImageList (see page 4885)	Returns the Image list that supplies an image for the menu item.
	GetParentComponent (see page 4886)	Returns the parent component of the menu item.
	GetParentMenu (see page 4886)	Returns the main menu of which the menu item is part.
	HasParent (see page 4887)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 4887)	Returns the position of a menu item within the Items (see page 4917) array.
	InitiateAction (see page 4887)	Calls the action link's Update method if the menu item is associated with an action link.
	Insert (see page 4888)	Inserts a menu item into a specified position in the Items (see page 4917) array.
	InsertNewLineAfter (see page 4889)	Inserts a separator bar after a specified item from the Items (see page 4917) property array.
	InsertNewLineBefore (see page 4890)	Inserts a separator bar before a specified item from the Items (see page 4917) property array.
	IsLine (see page 4890)	Indicates whether the menu item represents a separator bar.
	NewBottomLine (see page 4892)	Inserts a separator bar at the end of the Items (see page 4917) property array.
	NewTopLine (see page 4892)	Inserts a separator bar at the beginning of the Items (see page 4917) property array.
	Remove (see page 4893)	Removes a menu item from the Items (see page 4917) property array
	RethinkHotkeys (see page 4894)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 4894)	Removes superfluous separator lines from the Items (see page 4917) property array.
	SetParentComponent (see page 4897)	This is SetParentComponent, a member of class TMenuItem.

Public Properties

	Name	Description
	Command (see page 4907)	Specifies the Windows Command ID associated with the menu item.
	Count (see page 4907)	Indicates the number of subitems of the menu item.
	Handle (see page 4915)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
	Items (see page 4917)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 4919)	Indicates the index of the menu item within its parent menu.
	Parent (see page 4919)	Identifies the parent menu item of this menu item.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 4922)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 4922)	Occurs when the user clicks menu item.
	OnDrawItem (see page 4928)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 4929)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Published Properties

	Name	Description
	Action (see page 4899)	Designates the action associated with the menu item.
	AutoCheck (see page 4899)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 4900)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 4900)	Determines whether redundant separator bars are automatically removed from the submenu.
	Bitmap (see page 4901)	Designates a bitmap that is drawn for the menu item.
	Break (see page 4901)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 4902)	Specifies the text of the menu item.
	Checked (see page 4906)	Specifies whether a check mark should appear beside the Caption (see page 4902).

	Default (see page 4912)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 4912)	Specifies whether the menu item is enabled.
	GroupIndex (see page 4914)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 4915)	Specifies the help context ID associated with the menu item.
	Hint (see page 4916)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 4916)	Indicates which image maintained by the parent menu appears next to the menu item.
	RadioItem (see page 4920)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 4920)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 4921)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Visible (see page 4921)	Specifies whether the menu item appears in the menu.

48.1.5.2 TMenuItem.Create Constructor

Creates an instance of TMenuItem (see page 4869).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenuItem(TComponent * AOwner);
```

Description

Use Create to create a menu item at runtime. Menu items defined at design time using the Menu designer are created automatically.

AOwner is the component that is responsible for freeing the menu item. It becomes the value of the Owner property.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
```

See Also

Owner

NewItem (see page 4953)

48.1.5.3 TMenuItem.Destroy Destructor

Destroys an instance of TMenuItem (see page 4869).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenuItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenuItem (see page 4869) reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

48.1.5.4 TMenuItem Methods

The methods of the TMenuItem class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 4875)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 4880)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 4880)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 4881)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 4882)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 4883)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 4883)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 4884)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 4884)	This is GetAutoLineReduction, a member of class TMenuItem.
	GetCount (see page 4884)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 4885)	This is GetHandle, a member of class TMenuItem.
	GetItem (see page 4886)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 4886)	This is GetMenuIndex, a member of class TMenuItem.
	InsertNewLine (see page 4889)	This is InsertNewLine, a member of class TMenuItem.
V	Loaded (see page 4891)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 4891)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 4892)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 4893)	Forwards notification messages to all owned components.
	SetBreak (see page 4895)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 4895)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 4895)	This is SetChecked, a member of class TMenuItem.
V	SetChildOrder (see page 4896)	This is SetChildOrder, a member of class TMenuItem.
	SetDefault (see page 4896)	This is SetDefault, a member of class TMenuItem.
	SetEnabled (see page 4896)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 4896)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 4897)	This is SetImageIndex, a member of class TMenuItem.
	SetMenuIndex (see page 4897)	This is SetMenuIndex, a member of class TMenuItem.
	SetRadioItem (see page 4897)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 4897)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 4898)	This is SetVisible, a member of class TMenuItem.
	UpdateItems (see page 4898)	This is UpdateItems, a member of class TMenuItem.

Public Methods

	Name	Description
	Add (see page 4875)	This is the overview for the Add method overload.
	Clear (see page 4881)	Removes and frees all menu items listed in the Items (see page 4917) property.
V	Click (see page 4881)	Simulates a mouse click.
	Delete (see page 4882)	Removes a menu item from the Items (see page 4917) property array.
	Find (see page 4883)	Locates a menu item in the Items (see page 4917) property array given its caption.
V	GetChildren (see page 4884)	This is GetChildren, a member of class TMenuItem.
	GetEnumerator (see page 4884)	Returns a TComponent enumerator.
	GetImageList (see page 4885)	Returns the Image list that supplies an image for the menu item.
V	GetParentComponent (see page 4886)	Returns the parent component of the menu item.
	GetParentMenu (see page 4886)	Returns the main menu of which the menu item is part.

	HasParent (see page 4887)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 4887)	Returns the position of a menu item within the Items (see page 4917) array.
	InitiateAction (see page 4887)	Calls the action link's Update method if the menu item is associated with an action link.
	Insert (see page 4888)	Inserts a menu item into a specified position in the Items (see page 4917) array.
	InsertNewLineAfter (see page 4889)	Inserts a separator bar after a specified item from the Items (see page 4917) property array.
	InsertNewLineBefore (see page 4890)	Inserts a separator bar before a specified item from the Items (see page 4917) property array.
	IsLine (see page 4890)	Indicates whether the menu item represents a separator bar.
	NewBottomLine (see page 4892)	Inserts a separator bar at the end of the Items (see page 4917) property array.
	NewTopLine (see page 4892)	Inserts a separator bar at the beginning of the Items (see page 4917) property array.
	Remove (see page 4893)	Removes a menu item from the Items (see page 4917) property array
	RethinkHotkeys (see page 4894)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 4894)	Removes superfluous separator lines from the Items (see page 4917) property array.
	SetParentComponent (see page 4897)	This is SetParentComponent, a member of class TMenuItem.

48.1.5.4.1 TMenuItem.ActionChange Method

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); dynamic;
```

C++

```
__fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

This is ActionChange, a member of class TMenuItem.

48.1.5.4.2 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TMenuItem.Add (array of TMenuItem) (see page 4875)	Adds one or more menu items to the end of the Items (see page 4917) property array.
	TMenuItem.Add (TMenuItem) (see page 4875)	Adds one or more menu items to the end of the Items (see page 4917) property array.

48.1.5.4.2.1 TMenuItem.Add Method (TMenuItem)

Adds one or more menu items to the end of the Items (see page 4917) property array.

Pascal

```
procedure Add(Item: TMenuItem); overload;
procedure Add(const AItems: array of TMenuItem); overload;
```

C++

```
__fastcall Add(TMenuItem Item);
__fastcall Add(const array of TMenuItem AItems);
```

Description

Use Add to add new menu items to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 4917) property of a main menu or pop-up menu, Add adds the items to the end of the menu.

Specify a single new menu item to add as the value of the Item parameter, or an array of new menu items as the value of the AItems parameter. AItems_Size is the index of the last item in the AItems array (one less than the number of items).

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
```

```
  var
    NewItem: TMenuItem;
    I : integer;
  begin
    { first create the separator }
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Name:= 'Separator';
    NewItem.Caption := '-';
    { add the new item to the Windows menu }
    MainMenu1.Items[1].Add(NewItem);
    { now create and add a menu item for each form }
    for  I := 0 to Screen.FormCount-1 do
    begin
      NewItem := TMenuItem.Create(MainMenu1.Items[1]);
      NewItem.Caption := Screen.Forms[I].Name + 'Item';
      NewItem.Name := Screen.Forms[I].Name;
      MainMenu1.Items[1].Add(NewItem);
     end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I : Integer;
  begin
    // Count down, not up!
    for  I := MainMenu1.Items[1].Count - 1 downto 0 do
    begin
      MainMenu1.Items[1].Items[I].Free;
    end;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)
      AddButton: TButton;
      EditButton: TButton;
      DestroyButton: TButton;
      PopupMenu1: TPopupMenu;
      procedure AddButtonClick(Sender: TObject);
      procedure EditButtonClick(Sender: TObject);
      procedure DestroyButtonClick(Sender: TObject);
      procedure FormCreate(Sender: TObject);
    private
      { Private declarations }
    public
      procedure PopupMenuItemsClick(Sender: TObject);

    end;

  var
    Form1: TForm1;

  implementation

  {$R *.dfm}
```

```
procedure TForm1.AddButtonClick(Sender: TObject);
var
  index: Integer;
  NewItem: TMenuItem;
begin
    // The owner (PopupMenu1) will cleanup this menu item.
  NewItem := TMenuItem.Create(PopupMenu1); // create the new item
  index := PopupMenu1.Items.Count;
  PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
  NewItem.Caption := 'Menu Item ' + IntToStr(index);
  NewItem.Tag := index;
  NewItem.OnClick :=
    PopupMenuItemsClick; // assign it an event handler
end;

procedure TForm1.PopupMenuItemsClick(Sender: TObject);
begin
  with Sender as TMenuItem do
  begin
    case Tag of
      0:  ShowMessage('first item clicked');
      1:  ShowMessage('second item clicked');
      2:  ShowMessage('third item clicked');
      3:  ShowMessage('fourth item clicked');
    end;
  end;
end;

{
To edit or destroy an item, grab its pointer via the Items
property.
}
procedure TForm1.EditButtonClick(Sender: TObject);
var
  ItemToEdit: TMenuItem;
begin
  ItemToEdit := PopupMenu.Items[1];
  ItemToEdit.Caption := 'Changed Caption';
end;

procedure TForm1.DestroyButtonClick(Sender: TObject);
var
  ItemToDelete: TMenuItem;
begin
  ItemToDelete := PopupMenu.Items[2];
  ItemToDelete.Free;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  index: Integer;
  NewItem: TMenuItem;
begin
  for index := 0 to 3 do
  begin
      // The owner (PopupMenu1) will cleanup this menu item.
    NewItem := TMenuItem.Create(PopupMenu1); // create the new item
    PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
    NewItem.Caption := 'Menu Item ' + IntToStr(index);
    NewItem.Tag := index;
    NewItem.OnClick :=
      PopupMenuItemsClick; // assign it an event handler
  end;
end;
```

48.1.5.4.3 TMenuItem.AdvancedDrawItem Method

Pascal

```
procedure AdvancedDrawItem(ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState; TopLevel:
Boolean); virtual;
```

C++

```
virtual __fastcall AdvancedDrawItem(TCanvas ACanvas, TRect ARect, TOwnerDrawState State,
Boolean TopLevel);
```

Description

This is AdvancedDrawItem, a member of class TMenuItem.

48.1.5.4.4 TMenuItem.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

48.1.5.4.5 TMenuItem.Clear Method

Removes and frees all menu items listed in the Items (see page 4917) property.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use Clear to free all the items listed in the Items (see page 4917) property array.

See Also

Items (see page 4917)

Delete (see page 4882)

48.1.5.4.6 TMenuItem.Click Method

Simulates a mouse click.

Pascal

```
procedure Click; virtual;
```

C++

```
virtual __fastcall Click();
```

Description

Click generates an OnClick (see page 4922) event, as if the user had clicked the menu item. Unlike a real mouse click, Click does not generate a WM_COMMAND (see page 5148) message to the window associated with the menu.

Component writers can override click to provide a different response when the user selects the menu item.

See Also

Command (see page 4907)

OnClick (see page 4922)

48.1.5.4.7 TMenuItem.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor

DefineBinaryProperty

DefineProperties

DefineProperty

48.1.5.4.8 TMenuItem.Delete Method

Removes a menu item from the Items (see page 4917) property array.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Call Delete to remove a menu item and all its submenus from a menu. The Index parameter is the index of the item to be deleted, where 0 specifies the first item in the menu, 1 specifies the second item, and so on.

Delete does not free the removed item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 4921) property.

See Also

Add (see page 4875)

Insert (see page 4888)

Items (see page 4917)

Remove (see page 4893)

48.1.5.4.9 TMenuItem.DoDrawText Method

Pascal

```
procedure DoDrawText(ACanvas: TCanvas; const ACaption: string; var Rect: TRect; Selected:
Boolean; Flags: Longint);
```

C++

```
__fastcall DoDrawText(TCanvas ACanvas, const UnicodeString ACaption, TRect Rect, Boolean
Selected, Longint Flags);
```

Description

This is DoDrawText, a member of class TMenuItem.

48.1.5.4.10 TMenuItem.DrawItem Method

Pascal

```
procedure DrawItem(ACanvas: TCanvas; ARect: TRect; Selected: Boolean); virtual;
```

C++

```
virtual __fastcall DrawItem(TCanvas ACanvas, TRect ARect, Boolean Selected);
```

Description

This is DrawItem, a member of class TMenuItem.

48.1.5.4.11 TMenuItem.Find Method

Locates a menu item in the Items (see page 4917) property array given its caption.

Pascal

```
function Find(ACaption: string): TMenuItem;
```

C++

```
__fastcall TMenuItem Find(UnicodeString ACaption);
```

Description

Use Find to locate the menu item in the Items (see page 4917) property array with the caption specified by the ACaption parameter. Find ignores accelerator characters when comparing item captions to the ACaption parameter.

Find returns the first menu item in the Items (see page 4917) property array with the specified caption. If no item is found, Find returns nil (Delphi) or NULL (C++).

See Also

Items (see page 4917)

Caption (see page 4902)

48.1.5.4.12 TMenuItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TMenuActionLinkClass; dynamic;
```

C++

```
__fastcall TMenuActionLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TMenuItem.

48.1.5.4.13 TMenuItem.GetAutoHotkeys Method

Pascal

```
function GetAutoHotkeys: Boolean;
```

C++

```
__fastcall Boolean GetAutoHotkeys();
```

Description

This is GetAutoHotkeys, a member of class TMenuItem.

48.1.5.4.14 TMenuItem.GetAutoLineReduction Method

Pascal

```
function GetAutoLineReduction: Boolean;
```

C++

```
__fastcall Boolean GetAutoLineReduction();
```

Description

This is GetAutoLineReduction, a member of class TMenuItem.

48.1.5.4.15 TMenuItem.GetChildren Method

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

This is GetChildren, a member of class TMenuItem.

48.1.5.4.16 TMenuItem.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TMenuItem.

48.1.5.4.17 TMenuItem.GetEnumerator Method

Returns a TComponent enumerator.

Pascal

```
function GetEnumerator: TMenuItemEnumerator;
```

C++

```
__fastcall TMenuItemEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TComponentEnumerator reference, which enumerates the components contained within a specified containing component.

To process all these sub components, call the TComponentEnumerator GetCurrent method within a While MoveNext do loop.

See Also

TComponentEnumerator

48.1.5.4.18 TMenuItem.GetHandle Method

Pascal

```
function GetHandle: HMENU;
```

C++

```
__fastcall HMENU GetHandle();
```

Description

This is GetHandle, a member of class TMenuItem.

48.1.5.4.19 TMenuItem.GetImageList Method

Returns the Image list that supplies an image for the menu item.

Pascal

```
function GetImageList: TCustomImageList;
```

C++

```
__fastcall TCustomImageList GetImageList();
```

Description

Use GetImageList to access the list of images that contains the image for this menu item. The ImageIndex (see page 4916) property identifies a specific image from the list that GetImageList returns.

GetImageList first checks the Parent (see page 4919) of this menu item for a SubMenuImages (see page 4921) property. If the parent menu item does not maintain a list of images, it checks that menu item's parent, and so on until reaching a top-level menu item (a menu item where Parent (see page 4919) is not set). If none of the parent menu items has a SubMenuImages (see page 4921) property, GetImageList checks the top-level menu for an Images property.

GetImageList returns the first image list it finds. If it doesn't find an image list, GetImageList returns nil (Delphi) or NULL (C++).

See Also

ImageIndex (see page 4916)

SubMenuImages (see page 4921)

Images (see page 4851)

Parent (see page 4919)

48.1.5.4.20 TMenuItem.GetItem Method

Pascal

```
function GetItem(Index: Integer): TMenuItem;
```

C++

```
__fastcall TMenuItem GetItem(int Index);
```

Description

This is GetItem, a member of class TMenuItem.

48.1.5.4.21 TMenuItem.GetMenuIndex Method

Pascal

```
function GetMenuIndex: Integer;
```

C++

```
__fastcall int GetMenuIndex();
```

Description

This is GetMenuIndex, a member of class TMenuItem.

48.1.5.4.22 TMenuItem.GetParentComponent Method

Returns the parent component of the menu item.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

GetParentComponent is called by the streaming system that loads and saves components. It ensures that objects are loaded and saved with their parent objects. GetParentComponent is overridden in descendant classes to return the appropriate parent for their particular type of component. TMenuItem (see page 4869) overrides it to identify its associated menu, if it has one, as its parent.

48.1.5.4.23 TMenuItem.GetParentMenu Method

Returns the main menu of which the menu item is part.

Pascal

```
function GetParentMenu: TMenu;
```

C++

```
__fastcall TMenu GetParentMenu();
```

Description

GetParentMenu returns the menu that contains the menu item.

See Also

System::TObject::Free

48.1.5.4.24 TMenuItem.HasParent Method

Indicates that the menu item has a parent that is responsible for loading and saving its data.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TMenuItem (see page 4869) overrides HasParent to return true, indicating that menu items have a parent. Applications seldom call the HasParent method. It is used by the streaming system that loads and saves forms to determine when another object is responsible for writing a component to a stream.

See Also

Parent (see page 4919)

HasParent

48.1.5.4.25 TMenuItem.IndexOf Method

Returns the position of a menu item within the Items (see page 4917) array.

Pascal

```
function IndexOf(Item: TMenuItem): Integer;
```

C++

```
__fastcall int IndexOf(TMenuItem Item);
```

Description

Call IndexOf to locate a menu item in the submenu headed by this menu item. IndexOf returns 0 for the first menu item, 1 for the second menu item, and so on. If the menu item is not in the submenu, IndexOf returns -1.

Note: IndexOf may not correspond to the position of the item in the menu the user sees if the menu includes some items that are not visible.

See Also

Items (see page 4917)

MenuIndex (see page 4919)

Visible (see page 4921)

48.1.5.4.26 TMenuItem.InitiateAction Method

Calls the action link's Update method if the menu item is associated with an action link.

Pascal

```
procedure InitiateAction; virtual;
```

C++

```
virtual __fastcall InitiateAction();
```

Description

InitiateAction calls the action link, if there is one for the menu item, to update the association between the action and the menu item.

See Also

Items (see page 4917)

MenuIndex (see page 4919)

Visible (see page 4921)

48.1.5.4.27 TMenuItem.Insert Method

Inserts a menu item into a specified position in the Items (see page 4917) array.

Pascal

```
procedure Insert(Index: Integer; Item: TMenuItem);
```

C++

```
__fastcall Insert(int Index, TMenuItem Item);
```

Description

Use Insert to insert a new menu item to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 4917) property of a main menu or pop-up menu, Insert inserts an item into that menu. Specify the new menu item to add as the value of the Item parameter, and the position in the Items (see page 4917) array as the value of the Index parameter.

C++ Examples:

```
/*
This code inserts a menu item after the first item in a menu
named FileMenu:
*/
void __fastcall TForm1::InsertMenuItemClick(TObject *Sender)
{
  TMenuItem *NewItem = new TMenuItem(FileMenu);
  try
  {
    NewItem->Caption = "Form1";
    FileMenu->Insert(1, NewItem);
  }
  catch (Exception &e)
  {
    delete NewItem;
    throw;
  }
}
```

Delphi Examples:

```
{
This code inserts a menu item after the first item in a menu
named FileMenu:
}
procedure TForm1.InsertMenuItemClick(Sender: TObject);
var
  NewItem: TMenuItem;
begin
  NewItem := TMenuItem.Create(FileMenu);
```

```
    try
      NewItem.Caption := 'Do this';
      FileMenu.Insert(1, NewItem);
    except
      NewItem.Free; // Throw away the menu item if there is an error.
      raise; // reraise the exception
    end;
    // Don't free the menu item on success.  Need it for the menu!
  end;

  // Free all the menu items that we have created dynamically.
  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I : Integer;
  begin
    for I := FileMenu.Count - 1 downto 0 do  // Index backwards because Count changes as you
  remove items.
      if FileMenu.Items[I].Name = '' then  // Items created dynamically have not name.
        FileMenu.Items[I].Free;
  end;
```

48.1.5.4.28 TMenuItem.InsertNewLine Method

Pascal

```
function InsertNewLine(ABefore: Boolean; AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLine(Boolean ABefore, TMenuItem AItem);
```

Description

This is InsertNewLine, a member of class TMenuItem.

48.1.5.4.29 TMenuItem.InsertNewLineAfter Method

Inserts a separator bar after a specified item from the Items (see page 4917) property array.

Pascal

```
function InsertNewLineAfter(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineAfter(TMenuItem AItem);
```

Description

Use InsertNewLineAfter to insert a separator bar after the menu item specified by AItem. If AItem is not an item in the Items (see page 4917) property array, InsertNewLineAfter raises an exception.

InsertNewLineAfter returns the index of the newly inserted separator item in the Items (see page 4917) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 4900) to true so that

superfluous separators can be automatically removed.

See Also

Insert (see page 4888)

InsertNewLineBefore (see page 4890)

Items (see page 4917)

NewBottomLine (see page 4892)

NewTopLine (see page 4892)

AutoLineReduction (see page 4900)

48.1.5.4.30 TMenuItem.InsertNewLineBefore Method

Inserts a separator bar before a specified item from the Items (see page 4917) property array.

Pascal

```
function InsertNewLineBefore(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineBefore(TMenuItem AItem);
```

Description

Use InsertNewLineBefore to insert a separator bar before the menu item specified by AItem. If AItem is not an item in the Items (see page 4917) property array, InsertNewLineBefore raises an exception.

InsertNewLineBefore returns the index of the newly inserted separator item in the Items (see page 4917) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 4900) to true so that superfluous separators can be automatically removed.

See Also

Insert (see page 4888)

InsertNewLineAfter (see page 4889)

Items (see page 4917)

NewBottomLine (see page 4892)

NewTopLine (see page 4892)

AutoLineReduction (see page 4900)

48.1.5.4.31 TMenuItem.IsLine Method

Indicates whether the menu item represents a separator bar.

Pascal

```
function IsLine: Boolean;
```

C++

```
__fastcall Boolean IsLine();
```

Description

Call IsLine to determine whether the menu item is a separator bar. IsLine checks the Caption (see page 4902) of the menu

item and returns true if the value of Caption (see page 4902) is '-'. Menu items with this Caption (see page 4902) appear as separator bars.

See Also

Caption (see page 4902)

48.1.5.4.32 TMenuItem.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

48.1.5.4.33 TMenuItem.MeasureItem Method

Pascal

```
procedure MeasureItem(ACanvas: TCanvas; var Width: Integer; var Height: Integer); virtual;
```

C++

```
virtual __fastcall MeasureItem(TCanvas ACanvas, int Width, int Height);
```

Description

This is MeasureItem, a member of class TMenuItem.

48.1.5.4.34 TMenuItem.MenuChanged Method

Pascal

```
procedure MenuChanged(Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(Boolean Rebuild);
```

Description

This is MenuChanged, a member of class TMenuItem.

48.1.5.4.35 TMenuItem.NewBottomLine Method

Inserts a separator bar at the end of the Items (see page 4917) property array.

Pascal

```
function NewBottomLine: Integer;
```

C++

```
__fastcall int NewBottomLine();
```

Description

Use NewBottomLine to insert a separator bar at the end of the items property array. This is useful when building up submenus dynamically at runtime.

NewBottomLine returns the index of the newly inserted separator item in the Items (see page 4917) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 4900) to true so that superfluous separators can be automatically removed.

Items (see page 4917)

InsertNewLineAfter (see page 4889)

NewTopLine (see page 4892)

AutoLineReduction (see page 4900)

48.1.5.4.36 TMenuItem.NewTopLine Method

Inserts a separator bar at the beginning of the Items (see page 4917) property array.

Pascal

```
function NewTopLine: Integer;
```

C++

```
__fastcall int NewTopLine();
```

Description

Use NewTopLine to insert a separator bar at the beginning of the items property array. This is useful when building up submenus dynamically at runtime.

NewTopLine returns the index of the newly inserted separator item in the Items (see page 4917) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 4900) to true so that superfluous separators can be automatically removed.

See Also

Add (see page 4875)

InsertNewLineBefore (see page 4890)

Items (see page 4917)

InsertNewLineAfter (see page 4889)

NewBottomLine (see page 4892)

AutoLineReduction (see page 4900)

48.1.5.4.37 TMenuItem.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

48.1.5.4.38 TMenuItem.Remove Method

Removes a menu item from the Items (see page 4917) property array

Pascal

```
procedure Remove(Item: TMenuItem);
```

C++

```
__fastcall Remove(TMenuItem Item);
```

Description

Call Remove to remove a menu item and all its submenus from a menu. The Item parameter is the item to be removed. If Item is not a menu item in the Items (see page 4917) array, Remove raises an exception.

Remove does not free the item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 4921) property.

See Also

Add (see page 4875)

Delete (see page 4882)

EMenuError (see page 4827)

Insert (see page 4888)

Items (see page 4917)

Visible (see page 4921)

48.1.5.4.39 TMenuItem.RethinkHotkeys Method

Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.

Pascal

```
function RethinkHotkeys: Boolean;
```

C++

```
__fastcall Boolean RethinkHotkeys();
```

Description

Call RethinkHotkeys to adjust the accelerator keys for the items in the Items (see page 4917) property and in any submenu of those items. RethinkHotkeys checks for items that do not have an accelerator key or that have duplicate accelerator keys. It then replaces any duplicate accelerators with unique characters and adds accelerator keys to items that don't have them. RethinkHotkeys gives first priority to existing accelerator key mappings, but may change them if necessary to ensure uniqueness.

RethinkHotkeys lets a menu adjust the accelerator keys when the AutoHotkeys (see page 4900) property is false. For any menu or submenu that has AutoHotkeys (see page 4900) set to true, this adjustment occurs automatically.

RethinkHotkeys returns true if RethinkHotkeys changed the Caption (see page 4902) property of any menu items, false otherwise.

See Also

AutoHotkeys (see page 4900)

AutoHotkeys (see page 4849)

Caption (see page 4902)

Items (see page 4917)

48.1.5.4.40 TMenuItem.RethinkLines Method

Removes superfluous separator lines from the Items (see page 4917) property array.

Pascal

```
function RethinkLines: Boolean;
```

C++

```
__fastcall Boolean RethinkLines();
```

Description

Call RethinkLines to remove superfluous separators from the items in the Items (see page 4917) property and in any submenu of those items. RethinkLines removes separators that appear at the very beginning or end of a submenu and separators that immediately follow another separator.

RethinkLines lets a menu remove superfluous separators when the AutoLineReduction (see page 4900) property is false. For any menu or submenu that has AutoLineReduction (see page 4900) set to true, this adjustment occurs automatically.

RethinkLines returns true if RethinkLines removed any menu items, false otherwise.

See Also

AutoLineReduction (see page 4900)

AutoLineReduction (see page 4850)

IsLine (see page 4890)

48.1.5.4.41 TMenuItem.SetBreak Method

Pascal

```
procedure SetBreak(Value: TMenuBreak);
```

C++

```
__fastcall SetBreak(TMenuBreak Value);
```

Description

This is SetBreak, a member of class TMenuItem.

48.1.5.4.42 TMenuItem.SetCaption Method

Pascal

```
procedure SetCaption(const Value: string);
```

C++

```
__fastcall SetCaption(const UnicodeString Value);
```

Description

This is SetCaption, a member of class TMenuItem.

48.1.5.4.43 TMenuItem.SetChecked Method

Pascal

```
procedure SetChecked(Value: Boolean);
```

C++

```
__fastcall SetChecked(Boolean Value);
```

Description

This is SetChecked, a member of class TMenuItem.

48.1.5.4.44 TMenuItem.SetChildOrder Method

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

This is SetChildOrder, a member of class TMenuItem.

48.1.5.4.45 TMenuItem.SetDefault Method

Pascal

```
procedure SetDefault(Value: Boolean);
```

C++

```
__fastcall SetDefault(Boolean Value);
```

Description

This is SetDefault, a member of class TMenuItem.

48.1.5.4.46 TMenuItem.SetEnabled Method

Pascal

```
procedure SetEnabled(Value: Boolean);
```

C++

```
__fastcall SetEnabled(Boolean Value);
```

Description

This is SetEnabled, a member of class TMenuItem.

48.1.5.4.47 TMenuItem.SetGroupIndex Method

Pascal

```
procedure SetGroupIndex(Value: Byte);
```

C++

```
__fastcall SetGroupIndex(Byte Value);
```

Description

This is SetGroupIndex, a member of class TMenuItem.

48.1.5.4.48 TMenuItem.SetImageIndex Method

Pascal

```
procedure SetImageIndex(Value: TImageIndex);
```

C++

```
__fastcall SetImageIndex(TImageIndex Value);
```

Description

This is SetImageIndex, a member of class TMenuItem.

48.1.5.4.49 TMenuItem.SetMenuIndex Method

Pascal

```
procedure SetMenuIndex(Value: Integer);
```

C++

```
__fastcall SetMenuIndex(int Value);
```

Description

This is SetMenuIndex, a member of class TMenuItem.

48.1.5.4.50 TMenuItem.SetParentComponent Method

Pascal

```
procedure SetParentComponent(Value: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * Value);
```

Description

This is SetParentComponent, a member of class TMenuItem.

48.1.5.4.51 TMenuItem.SetRadioItem Method

Pascal

```
procedure SetRadioItem(Value: Boolean);
```

C++

```
__fastcall SetRadioItem(Boolean Value);
```

Description

This is SetRadioItem, a member of class TMenuItem.

48.1.5.4.52 TMenuItem.SetShortCut Method

Pascal

```
procedure SetShortCut(Value: TShortCut);
```

C++

```
__fastcall SetShortCut(TShortCut Value);
```

Description

This is SetShortCut, a member of class TMenuItem.

48.1.5.4.53 TMenuItem.SetVisible Method

Pascal

```
procedure SetVisible(Value: Boolean);
```

C++

```
__fastcall SetVisible(Boolean Value);
```

Description

This is SetVisible, a member of class TMenuItem.

48.1.5.4.54 TMenuItem.UpdateItems Method

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

This is UpdateItems, a member of class TMenuItem.

48.1.5.5 TMenuItem Properties

The properties of the TMenuItem class are listed here.

Protected Properties

	Name	Description
	ActionLink (see page 4899)	This is ActionLink, a member of class TMenuItem.

Public Properties

	Name	Description
R	Command (see page 4907)	Specifies the Windows Command ID associated with the menu item.
R	Count (see page 4907)	Indicates the number of subitems of the menu item.
R	Handle (see page 4915)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
R	Items (see page 4917)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 4919)	Indicates the index of the menu item within its parent menu.
R	Parent (see page 4919)	Identifies the parent menu item of this menu item.

Published Properties

	Name	Description
	Action (see page 4899)	Designates the action associated with the menu item.
	AutoCheck (see page 4899)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 4900)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 4900)	Determines whether redundant separator bars are automatically removed from the submenu.

	Bitmap (see page 4901)	Designates a bitmap that is drawn for the menu item.
	Break (see page 4901)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 4902)	Specifies the text of the menu item.
	Checked (see page 4906)	Specifies whether a check mark should appear beside the Caption (see page 4902).
	Default (see page 4912)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 4912)	Specifies whether the menu item is enabled.
	GroupIndex (see page 4914)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 4915)	Specifies the help context ID associated with the menu item.
	Hint (see page 4916)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 4916)	Indicates which image maintained by the parent menu appears next to the menu item.
	RadioItem (see page 4920)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 4920)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 4921)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Visible (see page 4921)	Specifies whether the menu item appears in the menu.

48.1.5.5.1 TMenuItem.Action Property

Designates the action associated with the menu item.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action designates the action object that is associated with the menu item. Actions can be associated with a menu item by using the action list editor at design-time. Actions are a way of centralizing user responses to commands.

48.1.5.5.2 TMenuItem.ActionLink Property

Pascal

```
property ActionLink: TMenuActionLink;
```

C++

```
__property TMenuActionLink ActionLink;
```

Description

This is ActionLink, a member of class TMenuItem.

48.1.5.5.3 TMenuItem.AutoCheck Property

Indicates whether the menu item's checked state toggles automatically when the item is clicked.

Pascal

```
property AutoCheck: Boolean;
```

C++

```
__property Boolean AutoCheck;
```

Description

When AutoCheck is true, then every time the menu item is clicked, the value of the Checked (see page 4906) property toggles automatically before the OnClick (see page 4922) event occurs. When AutoCheck is false, the application must explicitly set the value of the Checked (see page 4906) property (for example, in an OnClick (see page 4922) event handler).

See Also

Checked (see page 4906)

OnClick (see page 4922)

48.1.5.5.4 TMenuItem.AutoHotkeys Property

Determines whether the accelerator keys for submenu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the accelerator keys for the items in the Items (see page 4917) property can be reset if necessary to ensure that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenuItem (see page 4869) tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, it checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic or if AutoHotkeys is maParent and the parent menu item adjusts accelerator key mappings. Otherwise, the menu does not alter the items listed in the Items (see page 4917) property, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

Note: When AutoHotkeys disallows automatic adjustment of accelerator keys, an application can still adjust the menu items by calling the RethinkHotkeys (see page 4894) method. AutoHotkeys merely controls whether this adjustment occurs automatically.

See Also

AutoHotkeys (see page 4849)

Items (see page 4917)

RethinkHotkeys (see page 4894)

48.1.5.5.5 TMenuItem.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the submenu.

Pascal

```
property AutoLineReduction: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu item should automatically ensure that the submenu defined by its Items (see page 4917) property does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, the menu item removes superfluous separator bars if AutoLineReduction is maAutomatic or AutoLineReduction is maParent and the parent menu item removes superfluous separator bars. Otherwise, the menu item does not remove separators from the Items (see page 4917) property, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

Note: When AutoLineReduction disallows automatic removal of separator bars, an application can still remove superfluous separators by calling the RethinkLines (see page 4894) method. AutoLineReduction merely controls whether this adjustment occurs automatically.

See Also

AutoLineReduction (see page 4850)

Items (see page 4917)

RethinkLines (see page 4894)

48.1.5.5.6 TMenuItem.Bitmap Property

Designates a bitmap that is drawn for the menu item.

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Use Bitmap to provide a custom image that appears next to the caption in the menu item. On owner-draw menus, Bitmap can be used from an OnDrawItem (see page 4928) event handler to represent the entire menu item or a portion of the menu item.

Note: If the ImageIndex (see page 4916) property is set and the parent menu has a non-nil (Delphi) or NULL (C++) Images property, the image identified by ImageIndex (see page 4916) is used instead of Bitmap.

See Also

ImageIndex (see page 4916)

Images (see page 4851)

Caption (see page 4902)

OwnerDraw (see page 4856)

OnDrawItem (see page 4928)

48.1.5.5.7 TMenuItem.Break Property

Determines whether the menu item starts a new column in the menu.

Pascal

```
property Break: TMenuBreak;
```

C++

```
__property TMenuBreak Break;
```

Description

Set Break to break a long menu into columns at the item described by this menu item. The value of Break indicates whether the menu is broken into columns, and if so, whether a bar appears between the columns of the parent menu.

The default is mbNone (no breaking into columns).

See Also

Caption (see page 4902)

Parent (see page 4919)

48.1.5.5.8 TMenuItem.Caption Property

Specifies the text of the menu item.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Set Caption to the string the user sees for this item in the menu. To underline a character in a string, include an ampersand (&) before the character. This type of character is called an accelerator character. If Caption includes an accelerator character, the user can select the menu item by pressing Alt while typing the underlined character.

Tip: To automatically assign or adjust the accelerator characters in menu item captions, use the RethinkHotkeys (see page 4894) method.

Use the Caption property to identify the menu item as a line that separates the menu into parts. Specify a hyphen character (-) as the value of Caption for the menu item to indicate that the menu item is a separator. To separate the menu into multiple columns, use the Break (see page 4901) property instead.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";   // The owner will cleanup these menu items.
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items->Items[1]->Add(NewItem);
  // now create and add a menu item for each form
```

```
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this); // The owner will cleanup these menu items.
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items->Items[1]->Add(NewItem);
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
```

```
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
```

```
  end;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

Checked (see page 4906)

Caption

RethinkHotkeys (see page 4894)

48.1.5.5.9 TMenuItem.Checked Property

Specifies whether a check mark should appear beside the Caption (see page 4902).

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to allow a menu item to work like a check box. If Checked is true, the menu item appears checked. If Checked is false, the menu item remains unchecked.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Caption (see page 4902)

RadioItem (see page 4920)

Checked

AutoCheck (see page 4899)

48.1.5.5.10 TMenuItem.Command Property

Specifies the Windows Command ID associated with the menu item.

Pascal

```
property Command: Word;
```

C++

```
__property Word Command;
```

Description

Use Command in an application that directly handles WM_COMMAND (see page 5148) messages. When the user selects the menu item, Windows sends a WM_COMMAND (see page 5148) to the window associated with the menu. The ItemID of the message contains the value of the Command property of the menu item that was selected.

See Also

OnClick (see page 4922)

DispatchCommand (see page 4841)

WindowHandle (see page 4857)

48.1.5.5.11 TMenuItem.Count Property

Indicates the number of subitems of the menu item.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of subitems listed in the Items (see page 4917) property array. When the user clicks on a menu item that has subitems, a dropdown menu appears which displays those subitems. Each subitem can, in turn, contain additional subitems. The Count property counts only the immediate subitems of the menu item.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
  {
    File1->Items[i]->Enabled = false;
```

```
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}

void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
```

```
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;
```

```
procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

Items (see page 4917)

MenuIndex (see page 4919)

48.1.5.5.12 TMenuItem.Default Property

Specifies whether the menu item is invoked when the parent item is double clicked.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Set Default to specify whether a menu item is the default item in a submenu. Default menu items are executed when the parent item is double-clicked, allowing users to avoid navigating the submenus that contain them.

The default item appears in boldface. A submenu can have only one default item. If the Items (see page 4917) list of the parent menu item already contains a default menu item, setting the Default property to true sets the Default property of the previous default item to false.

See Also

Click (see page 4881)

Parent (see page 4919)

48.1.5.5.13 TMenuItem.Enabled Property

Specifies whether the menu item is enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to enable or disable a menu item. If Enabled is true, the Click (see page 4881) method is called when the user selects the item with the mouse. If Enabled is false, the menu item appears dimmed and the user cannot select it. However, calling the Click (see page 4881) method works even when Enabled is false.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
```

```
  {
    File1->Items[i]->Enabled = false;
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}

void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
```

```
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

48.1.5.5.14 TMenuItem.GroupIndex Property

Identifies the logical group to which the menu item belongs.

Pascal

```
property GroupIndex: Byte;
```

C++

```
__property Byte GroupIndex;
```

Description

Use GroupIndex to control how menus are merged. In applications that contain multiple forms, items from the menus of secondary forms can be merged into the application's main menu as those forms become active. MDI applications always merge the menus of child windows with the main menu of the parent window.

By default, all menu items in a menu bar (main menu) have the same GroupIndex value. To use GroupIndex to merge menus, set the GroupIndex value of each successive menu item to a value equal to or greater than that of the previous menu item.

When a menu item in a menu bar that is merged into the application's main menu has the same GroupIndex value as a menu item in the main menu, the menu item in the application's main menu is replaced by the corresponding menu item. If multiple menu items in the application's main menu have the same GroupIndex value, they can be replaced only by separate menu items from the other form's menu that also have repeated GroupIndex values. Thus, the first main menu item with a given value is replaced by the first item in the second form with that value, the second item in the main form is replaced by the second item in the second form, and so on.

When a menu item in a menu bar that is merged into the application's main menu has a GroupIndex that falls between the GroupIndex values of two adjacent items on the application's main menu, that menu item is inserted between the two adjacent items. If the item's GroupIndex value is greater than all other GroupIndex values in the application's main menu, the item appears at the end of the main menu. If the GroupIndex value is less than all other GroupIndex values in the application's main menu, the menu item appears at the beginning of the main menu bar.

When an object created by an OLE 2.0 server application is activated, the server can try to merge its menus with the menus of the container application. The GroupIndex property is used to replace up to three main menu items with items from the server, in the manner described above. The server application uses the following predefined GroupIndex values to locate menu items to replace:

Group	Index	Description
Edit	1	Server menu items for editing the active OLE object
View	3	Server menu items for modifying the view of the OLE object.
Help	5	Server menu items for accessing the server's online Help.

Note: See the documentation for the OLE server for information about whether it attempts menu merge during in-place activation.

GroupIndex can also be used to define groups of menu items that act like radio buttons. To allow menu items to behave like radio buttons, set the RadioItem (see page 4920) property to all menu items in the group to true, and assign each menu item the same value of GroupIndex. Checking any menu item in the group will then uncheck the others.

See Also

MenuIndex (see page 4919)

RadioItem (see page 4920)

AutoMerge (see page 4834)

Merge (see page 4831)

PopulateOle2Menu (see page 4832)

48.1.5.5.15 TMenuItem.Handle Property

Indicates the Windows menu handle of the drop-down menu associated with the menu item.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle when calling a Windows API function that requires a menu handle. Handle is only valid if the Count (see page 4907) property is greater than 0.

See Also

Count (see page 4907)

Items (see page 4917)

48.1.5.5.16 TMenuItem.HelpContext Property

Specifies the help context ID associated with the menu item.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate the menu item with a screen in the Help system of the application. Each screen in the Help system

should have a unique context ID. When a menu item is selected using the keyboard, pressing F1 displays a Help screen. Which Help screen appears depends on the value of the HelpContext property.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

HelpFile (see page 1974)

HelpContext

HelpContext

48.1.5.5.17 TMenuItem.Hint Property

Specifies the text string that can appear when the user moves the mouse pointer over a menu item.

Pascal

```
property Hint: string;
```

C++

```
__property UnicodeString Hint;
```

Description

Set Hint to a string that provides more information about the meaning of the menu item than the Caption (see page 4902). The hint text appears in the **Status Bar** when the user pauses with the mouse over the menu item if Help Hints are enabled (that is, if the Form's and the Application's Show Hint properties are true). It is also available for the code in the application's On Hint event handler.

The value of Hint can specify both a short value for the Help Hint window and a longer string to be used by the OnHint event handler. To provide both a short and a long hint, set Hint to the short string, followed by a vertical bar (|), followed by the long string.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

48.1.5.5.18 TMenuItem.ImageIndex Property

Indicates which image maintained by the parent menu appears next to the menu item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to designate an image that should appear next to the caption when the menu item is drawn. On top-level menu items, ImageIndex specifies a zero-offset index into the Images property of the parent menu (TMenu (see page 4837) or TPopupMenu (see page 4935)). On submenu items, ImageIndex is the zero-offset index into the parent item's SubMenuImages (see page 4921) property.

If the parent menu or item does not maintain a list of images, use the Bitmap (see page 4901) property to provide an image for a single menu item. However, any image specified by ImageIndex takes precedence over the Bitmap (see page 4901) property. Bitmap (see page 4901) is only used when ImageIndex has a negative value or the parent's Images or SubMenuImages (see page 4921) property is nil (Delphi) or NULL (C++).

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Images (see page 4851)

Bitmap (see page 4901)

ImageIndex

SubMenuImages (see page 4921)

48.1.5.5.19 TMenuItem.Items Property

Lists the menu items in the submenu of the menu item.

Pascal

```
property Items [Index: Integer]: TMenuItem;
```

C++

```
__property TMenuItem Items[int Index];
```

Description

Use Items to access to a subitem by its position in the list of subitems. The value of Index is the position of the subitem within the Items array. For example, if an application has a File drop-down menu that contains the menu items New, Open, and Save, in that order, the expression

```
FileMenu.Items[2]
FileMenu->Items[2]
```

refers to the Save command.

Note: In Delphi, Items is the default property for TMenuItem (see page 4869). This means you can leave off the property name. Thus, instead of writing FileMenu.Items[2], you can write FileMenu[2].

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

C++ Examples:

```
/*
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
*/
void __fastcall TForm1::DisableSubItemsClick(TObject *Sender)
{
  for (int i = 0; i < File1->Count; i++)
  {
    File1->Items[i]->Enabled = false;
  }
}

void __fastcall TForm1::Edit1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Edit command");
}

void __fastcall TForm1::File1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the File command");
}
```

```
void __fastcall TForm1::FileSub11Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub1 command");
}

void __fastcall TForm1::FileSub21Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub2 command");
}

void __fastcall TForm1::FileSub31Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the FileSub3 command");
}

void __fastcall TForm1::Options1Click(TObject *Sender)
{
  ListBox1->Items->Add("This is the Options command");
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

Count (see page 4907)

MenuIndex (see page 4919)

Parent (see page 4919)

operator_[]

48.1.5.5.20 TMenuItem.MenuIndex Property

Indicates the index of the menu item within its parent menu.

Pascal

```
property MenuIndex: Integer;
```

C++

```
__property int MenuIndex;
```

Description

Use MenuIndex to locate the menu item in the Items (see page 4917) property of its parent menu item. Changing this value moves the menu item within its menu.

Note: MenuIndex may not correspond to the position of the item in the menu the user sees. The menu can include items that are not visible.

See Also

Count (see page 4907)

GroupIndex (see page 4914)

Items (see page 4917)

Visible (see page 4921)

48.1.5.5.21 TMenuItem.Parent Property

Identifies the parent menu item of this menu item.

Pascal

```
property Parent: TMenuItem;
```

C++

```
__property TMenuItem Parent;
```

Description

Read Parent to determine the menu item that represents the dropdown menu that contains this menu item. If the menu item is a top level menu item in a main menu or pop-up menu, Parent is the value of that menu's Items (see page 4917) property.

See Also

Items (see page 4917)

MenuIndex (see page 4919)

Items (see page 4852)

48.1.5.5.22 TMenuItem.RadioItem Property

Specifies whether the menu item is mutually exclusive with other menu items in its group.

Pascal

```
property RadioItem: Boolean;
```

C++

```
__property Boolean RadioItem;
```

Description

Use RadioItem to make the menu item behave like a radio button with a group of other menu items. The group of menu items is the set of all menu items in a pop-up or drop-down menu that have the same value of GroupIndex (see page 4914). When RadioItem is true, only one menu item in the group that contains the menu item can be checked at a time. The single selected menu item in the group is indicated by a round dot next to the Caption (see page 4902).

Note: RadioItem does not automatically select the item when the user clicks it at runtime: you must still explicitly set the Checked (see page 4906) property to true in response to the OnClick (see page 4922) event. RadioItem simply changes the appearance of the Checked (see page 4906) state (from a check mark to a round dot) and automatically unchecks other menu items in the same group when you set the Checked (see page 4906) property to true.

RadioItem does not work for the top-level items in a main menu.

Note: Under Windows NT 3.51, the round dot indicator only appears if the "new shell" has been installed.

See Also

Caption (see page 4902)

Checked (see page 4906)

GroupIndex (see page 4914)

TMainMenu (see page 4828)

OnClick (see page 4922)

48.1.5.5.23 TMenuItem.ShortCut Property

Specifies the key combination users can type to quickly access the menu item.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

Use ShortCut to allow the user to type a key combination instead of selecting the item using the menu. This key combination appears to the right of the menu item in the menu.

When setting menu shortcuts at design time, the Object Inspector provides a long list of key combinations to choose from. To create menu shortcuts at runtime, use the global ShortCut or TextToShortCut (see page 4963) function. For example, the following line creates a shortcut, Ctrl+C and assigns it to a menu item named CloseCommand.

```
CloseCommand.ShortCut := ShortCut(Word('C'), [ssCtrl]);
CloseCommand->ShortCut = ShortCut(Word('C'), TShiftState() << ssCtrl);
```

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

ShortCut (see page 4958)

ShortCutToKey (see page 4960)

ShortCutToText (see page 4961)

TextToShortCut (see page 4963)

IsShortCut (see page 4845)

ShortCut

48.1.5.5.24 TMenuItem.SubMenuImages Property

Lists the images that can appear beside individual items in a submenu of this menu item.

Pascal

```
property SubMenuImages: TCustomImageList;
```

C++

```
__property TCustomImageList SubMenuImages;
```

Description

Use SubMenuImages to supply a set of images that can appear beside items listed in the Items (see page 4917) property. Individual menu items set their ImageIndex (see page 4916) property to indicate which image in the list appears to the left of the menu item caption.

Tip: If the application uses action lists, this property can be the value of the command list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 4916)

Images

Items (see page 4917)

48.1.5.5.25 TMenuItem.Visible Property

Specifies whether the menu item appears in the menu.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use Visible to prevent the user from seeing an item in the menu. For example, remove menu items that do not apply to the current component of a pop-up menu in an OnPopup event handler.

If Visible is true, the menu item appears. If Visible is false, the menu item is hidden.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Enabled (see page 4912)

OnPopup (see page 4949)

PopupComponent (see page 4946)

Visible

48.1.5.6 TMenuItem Events

The events of the TMenuItem class are listed here.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 4922)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 4922)	Occurs when the user clicks menu item.
	OnDrawItem (see page 4928)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 4929)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

48.1.5.6.1 TMenuItem.OnAdvancedDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnAdvancedDrawItem: TAdvancedMenuDrawItemEvent;
```

C++

```
__property TAdvancedMenuDrawItemEvent OnAdvancedDrawItem;
```

Description

Write an OnAdvancedDrawItem event handler to render the image of a menu item in an owner-draw menu.

In the event handler, use the Bitmap (see page 4901) property or the ImageIndex (see page 4916) property to access a bitmap that represents the menu item.

Note: OnAdvancedDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

See Also

OnMeasureItem (see page 4929)

Bitmap (see page 4901)

ImageIndex (see page 4916)

Images (see page 4851)

OwnerDraw (see page 4856)

OnDrawItem (see page 4928)

48.1.5.6.2 TMenuItem.OnClick Event

Occurs when the user clicks menu item.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Write an OnClick event handler to implement the desired behavior for when the user selects the menu item. An advantage of using the OnClick event handler over directly handling WM_COMMAND (see page 5148) messages sent when the user selects the menu item, is that only the OnClick event occurs when the Click (see page 4881) method is called.

Note: This event handler is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
```

```
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      // The owner (PopupMenu1) will cleanup this menu item.
      TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
      int index = PopupMenu1->Items->Count;
      PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
      NewItem->Caption = "Menu Item " + IntToStr(index);
      NewItem->Tag = index;
      NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
      TNotifyEvent();
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
```

```
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.

OnExecute

48.1.5.6.3 TMenuItem.OnDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnDrawItem: TMenuDrawItemEvent;
```

C++

```
__property TMenuDrawItemEvent OnDrawItem;
```

Description

Write an OnDrawItem event handler to render the image of a menu item in an owner-draw menu. In the event handler, use the Bitmap (see page 4901) property or the ImageIndex (see page 4916) property to access a bitmap that represents the menu item.

Note: OnDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

Tip: For more precise information about the menu item's state, use the OnAdvancedDrawItem (see page 4922) event instead.

See Also

OnMeasureItem (see page 4929)

Bitmap (see page 4901)

ImageIndex (see page 4916)

Images (see page 4851)

OwnerDraw (see page 4856)

OnAdvancedDrawItem (see page 4922)

48.1.5.6.4 TMenuItem.OnMeasureItem Event

Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Pascal

```
property OnMeasureItem: TMenuMeasureItemEvent;
```

C++

```
__property TMenuMeasureItemEvent OnMeasureItem;
```

Description

Write an OnMeasureItem event handler to indicate the size of owner-draw menu items. If the menu item is using a bitmap image, the event handler can use the Bitmap (see page 4901) property or the ImageIndex (see page 4916) property to access the bitmap to determine its size.

Note: OnMeasureItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

48.1.6 TMenuItemEnumerator Class

Class Hierarchy

Pascal

```
TMenuItemEnumerator = class;
```

C++

```
class TMenuItemEnumerator;
```

File

Menus

Description

This is class Menus.TMenuItemEnumerator.

48.1.6.1 TMenuItemEnumerator Members

The following tables list the members exposed by TMenuItemEnumerator.

Public Methods

	Name	Description
	Create (see page 4930)	This is Create, a member of class TMenuItemEnumerator.
	GetCurrent (see page 4930)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 4930)	This is MoveNext, a member of class TMenuItemEnumerator.

Public Properties

	Name	Description
	Current (see page 4931)	This is Current, a member of class TMenuItemEnumerator.

48.1.6.2 TMenuItemEnumerator.Create Constructor

Pascal

```
constructor Create(AMenuItem: TMenuItem);
```

C++

```
__fastcall TMenuItemEnumerator(TMenuItem AMenuItem);
```

Description

This is Create, a member of class TMenuItemEnumerator.

48.1.6.3 TMenuItemEnumerator Methods

The methods of the TMenuItemEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 4930)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 4930)	This is MoveNext, a member of class TMenuItemEnumerator.

48.1.6.3.1 TMenuItemEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TMenuItem;
```

C++

```
__fastcall TMenuItem GetCurrent();
```

Description

This is GetCurrent, a member of class TMenuItemEnumerator.

48.1.6.3.2 TMenuItemEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TMenuItemEnumerator.

48.1.6.4 TMenuItemEnumerator Properties

The properties of the TMenuItemEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 4931)	This is Current, a member of class TMenuItemEnumerator.

48.1.6.4.1 TMenuItemEnumerator.Current Property

Pascal

```
property Current: TMenuItem;
```

C++

```
__property TMenuItem Current;
```

Description

This is Current, a member of class TMenuItemEnumerator.

48.1.7 TMenuItemStack Class

Class Hierarchy

Pascal

```
TMenuItemStack = class(TStack);
```

C++

```
class TMenuItemStack : public TStack;
```

File

Menus

Description

This is class Menus.TMenuItemStack.

48.1.7.1 TMenuItemStack Members

The following tables list the members exposed by TMenuItemStack.

Public Methods

	Name	Description
	ClearItem (see page 4932)	This is ClearItem, a member of class TMenuItemStack.

48.1.7.2 TMenuItemStack Methods

The methods of the TMenuItemStack class are listed here.

Public Methods

	Name	Description
	ClearItem (see page 4932)	This is ClearItem, a member of class TMenuItemStack.

48.1.7.2.1 TMenuItemStack.ClearItem Method

Pascal

```
procedure ClearItem(AItem: TMenuItem);
```

C++

```
__fastcall ClearItem(TMenuItem AItem);
```

Description

This is ClearItem, a member of class TMenuItemStack.

48.1.8 TPopupList Class

TPopupList manages the window that handles popup menu messages.

Class Hierarchy

Pascal

```
TPopupList = class(TList);
```

C++

```
class TPopupList : public TList;
```

File

Menus

Description

TPopupList is the type of the global PopupList (see page 4975) variable, which provides centralized message handling for all popup menus in an application.

See Also

TPopupMenu (see page 4935)

PopupList (see page 4975)

48.1.8.1 TPopupList Members

The following tables list the members exposed by TPopupList.

Protected Fields

	Name	Description
	FWindow (see page 4933)	This is FWindow, a member of class TPopupList.

Protected Methods

	Name	Description
	MainWndProc (see page 4934)	Wraps the WndProc (see page 4935) method with an exception-handling layer.
V	WndProc (see page 4935)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 4934)	Inserts a new popup menu at the end of the list.
	Remove (see page 4934)	Removes a popup menu from the list.

Public Properties

	Name	Description
R	Window (see page 4935)	Provides access to the Window handle of the hidden window that processes popup menu messages.

48.1.8.2 TPopupList Fields

The fields of the TPopupList class are listed here.

Protected Fields

	Name	Description
	FWindow (see page 4933)	This is FWindow, a member of class TPopupList.

48.1.8.2.1 TPopupList.FWindow Field

Pascal

```
FWindow: HWND;
```

C++

```
HWND FWindow;
```

Description

This is FWindow, a member of class TPopupList.

48.1.8.3 TPopupList Methods

The methods of the TPopupList class are listed here.

Protected Methods

	Name	Description
	MainWndProc (see page 4934)	Wraps the WndProc (see page 4935) method with an exception-handling layer.
V	WndProc (see page 4935)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 4934)	Inserts a new popup menu at the end of the list.
	Remove (see page 4934)	Removes a popup menu from the list.

48.1.8.3.1 TPopupList.Add Method

Inserts a new popup menu at the end of the list.

Pascal

```
procedure Add(Popup: TPopupMenu);
```

C++

```
__fastcall Add(TPopupMenu Popup);
```

Description

Do not call the Add method. Popup menus automatically add themselves to the list when they are created.

Add increments Count and, if necessary, allocates memory by increasing the value of Capacity. When the first popup menu is added to the list, Add creates the hidden window whose handle is available as the Window (see page 4935) property.

See Also

Remove (see page 4934)

Window (see page 4935)

48.1.8.3.2 TPopupList.MainWndProc Method

Wraps the WndProc (see page 4935) method with an exception-handling layer.

Pascal

```
procedure MainWndProc(var Message: TMessage);
```

C++

```
__fastcall MainWndProc(TMessage Message);
```

Description

Do not use the protected MainWndProc method. It is used internally when creating the hidden window that responds to popup menu messages. To subclass the window procedure that handles messages sent to popup menus, override the WndProc (see page 4935) method instead.

See Also

WndProc (see page 4935)

48.1.8.3.3 TPopupList.Remove Method

Removes a popup menu from the list.

Pascal

```
procedure Remove(Popup: TPopupMenu);
```

C++

```
__fastcall Remove(TPopupMenu Popup);
```

Description

Do not call the Remove method. It is called automatically by popup menus from their destructors, to remove themselves from the list.

See Also

Add (see page 4934)

48.1.8.3.4 TPopupList.WndProc Method

Provides centralized message handling for all popup menus in the application.

Pascal

```
procedure WndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to subclass the window procedure that handles messages directed at the popup menus in an application. WndProc handles messages by dispatching commands, displaying help, painting menu item, and so on.

48.1.8.4 TPopupList Properties

The properties of the TPopupList class are listed here.

Public Properties

	Name	Description
	Window (see page 4935)	Provides access to the Window handle of the hidden window that processes popup menu messages.

48.1.8.4.1 TPopupList.Window Property

Provides access to the Window handle of the hidden window that processes popup menu messages.

Pascal

```
property Window: HWND;
```

C++

```
__property HWND Window;
```

Description

Use Window for Windows API calls that require a window handle. The hidden window that processes messages for the popup menus in an application is not created until the first popup menu is added to the list. If the list contains no popup menus (that is, if no popup menus are created by the application), Window is 0.

48.1.9 TPopupMenu Class

TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Class Hierarchy

Pascal

```
TPopupMenu = class(TMenu);
```

C++

```
class TPopupMenu : public TMenu;
```

File

Menus

Description

Use TPopupMenu to define the pop-up menu that appears when the user clicks on a control with the right mouse button. To make a pop-up menu available, assign the TPopupMenu object to the control's PopupMenu property.

Tip: To create a popup menu that users can configure at runtime, use the TStandardMenuPopup component with an action manager instead.

Note: If the popup menu's ParentBiDiMode (see page 4946) is true, the popup menu's BiDiMode (see page 4943) is set to the BiDiMode (see page 4943) of the control that activates it. If a control cannot be found, the BiDiMode (see page 4943) is set to the value of the Application object's BiDiMode (see page 4943). The popup menu's BiDiMode (see page 4943) affects all of its menu items.

See Also

TMainMenu (see page 4828)

TMenuItem (see page 4869)

NewPopupMenu (see page 4956)

TActionManager

Providing a Pop-up Menu

Setting Up Action Bands

48.1.9.1 TPopupMenu Members

The following tables list the members exposed by TPopupMenu.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 4841)	Applies the BiDiMode (see page 4850) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 4842)	Updates the menu when the BiDiMode (see page 4850) property changes.
V	DoChange (see page 4842)	Generates an OnChange (see page 4858) event.
	DoGetMenuString (see page 4843)	Returns the caption for an item in the menu.
V	DoPopup (see page 4939)	Generates an OnPopup (see page 4949) event.
V	GetHandle (see page 4844)	Returns the value of the Handle (see page 4851) property.
	IsOwnerDraw (see page 4845)	Indicates whether menu items can contain more than simple captions.

	Loaded (see page 4846)	Calls the DoChange (see page 4842) method when the menu is first loaded into memory.
	MenuChanged (see page 4846)	Responds when the menu changes.
	Notification (see page 4847)	Responds when components are added or deleted.
	SetChildOrder (see page 4848)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetPopupPoint (see page 4940)	This is SetPopupPoint, a member of class TPopupMenu.
	UpdateItems (see page 4849)	Causes all menu items to update themselves.
	UseRightToLeftAlignment (see page 4940)	Specifies whether the control's alignment is in a right-to-left mode.

Public Methods

	Name	Description
	Create (see page 4938)	Creates an instance of TPopupMenu (see page 4935).
	CreateMenuItem (see page 4841)	This is CreateMenuItem, a member of class TMenu.
	Destroy (see page 4938)	Destroys an instance of TPopupMenu (see page 4935).
	DispatchCommand (see page 4841)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 4842)	Dispatches a pop-up menu command.
	FindItem (see page 4843)	Locates and returns a menu item.
	GetChildren (see page 4844)	Executes a callback for child menu items.
	GetHelpContext (see page 4844)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 4845)	Indicates whether menu items read from right to left.
	IsShortCut (see page 4845)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 4847)	This is the overview for the ParentBiDiModeChanged method overload.
	Popup (see page 4939)	Displays the pop-up menu onscreen.
	ProcessMenuChar (see page 4848)	Responds to keyboard input for the menu.

Public Properties

	Name	Description
	Handle (see page 4851)	Provides access to the Windows menu handle for the menu.
	PopupComponent (see page 4946)	Indicates the component that last displayed the popup menu in response to a right mouse click.
	PopupPoint (see page 4948)	Indicates the location where the pop-up menu appears.
	WindowHandle (see page 4857)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 4949)	Occurs when the menu changes.
	OnPopup (see page 4949)	Occurs just before the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 4941)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 4941)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4942)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 4942)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 4943)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 4944)	Specifies a context ID for the entire pop-up menu.
	Images (see page 4944)	Lists the images that can appear beside individual menu items.
	Items (see page 4852)	Describes the elements of the menu.
	MenuAnimation (see page 4945)	Specifies how the menu appears when it is first displayed.
	OwnerDraw (see page 4945)	Specifies whether the menu items are drawn by the application.

	ParentBiDiMode (see page 4946)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	TrackButton (see page 4948)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

48.1.9.2 TPopupMenu.Create Constructor

Creates an instance of TPopupMenu (see page 4935).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPopupMenu(TComponent * AOwner);
```

Description

Call Create to create to create a pop-up menu at runtime. Pop-up menus placed in forms or data modules at design time are created automatically.

See Also

Create (see page 4839)

48.1.9.3 TPopupMenu.Destroy Destructor

Destroys an instance of TPopupMenu (see page 4935).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TPopupMenu (see page 4935) reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

48.1.9.4 TPopupMenu Methods

The methods of the TPopupMenu class are listed here.

Protected Methods

	Name	Description
	DoPopup (see page 4939)	Generates an OnPopup (see page 4949) event.
	SetPopupPoint (see page 4940)	This is SetPopupPoint, a member of class TPopupMenu.
	UseRightToLeftAlignment (see page 4940)	Specifies whether the control's alignment is in a right-to-left mode.

Public Methods

	Name	Description
	Popup (see page 4939)	Displays the pop-up menu onscreen.

48.1.9.4.1 TPopupMenu.DoPopup Method

Generates an OnPopup (see page 4949) event.

Pascal

```
procedure DoPopup(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DoPopup(TObject * Sender);
```

Description

DoPopup is called automatically just before the pop-up menu appears to generate an OnPopup (see page 4949) event. Override DoPopup in a descendant class to change the event.

See Also

OnPopup (see page 4949)

Popup (see page 4939)

48.1.9.4.2 TPopupMenu.Popup Method

Displays the pop-up menu onscreen.

Pascal

```
procedure Popup(X: Integer; Y: Integer); virtual;
```

C++

```
virtual __fastcall Popup(int X, int Y);
```

Description

Call Popup to bring up the pop-up menu. The menu appears at the screen coordinates indicated by the values (in pixels) of X and Y.

C++ Examples:

```
/*
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = false;
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(Left + X, Top + Y);
}
```

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
```

```
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Alignment (see page 4941)

AutoPopup (see page 4942)

OnPopup (see page 4949)

48.1.9.4.3 TPopupMenu.SetPopupPoint Method

Pascal

```
procedure SetPopupPoint(APopupPoint: TPoint);
```

C++

```
__fastcall SetPopupPoint(TPoint APopupPoint);
```

Description

This is SetPopupPoint, a member of class TPopupMenu.

48.1.9.4.4 TPopupMenu.UseRightToLeftAlignment Method

Specifies whether the control's alignment is in a right-to-left mode.

Pascal

```
function UseRightToLeftAlignment: Boolean;
```

C++

```
__fastcall Boolean UseRightToLeftAlignment();
```

Description

Call UseRightToLeftAlignment to determine whether the control's alignment is in a right-to-left mode. This information can be used when painting the control or when responding to mouse events.

UseRightToLeftAlignment returns the setting from the control that activated the popup. If the popup was not activated by a control, UseRightToLeftAlignment returns the setting used in the global Application object.

48.1.9.5 TPopupMenu Properties

The properties of the TPopupMenu class are listed here.

Public Properties

	Name	Description
	PopupComponent (see page 4946)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 4948)	Indicates the location where the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 4941)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 4941)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 4942)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 4942)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 4943)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 4944)	Specifies a context ID for the entire pop-up menu.
	Images (see page 4944)	Lists the images that can appear beside individual menu items.
	MenuAnimation (see page 4945)	Specifies how the menu appears when it is first displayed.
	OwnerDraw (see page 4945)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 4946)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	TrackButton (see page 4948)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

48.1.9.5.1 TPopupMenu.Alignment Property

Determines where the pop-up menu appears when the user clicks the right mouse button.

Pascal

```
property Alignment: TPopupAlignment;
```

C++

```
__property TPopupAlignment Alignment;
```

Description

Set Alignment to control the placement of the popup menu. Alignment controls whether the menu appears to the left of the mouse, to the right of the mouse, or centered over the mouse.

By default, the menu appears with its top left corner under the mouse (paLeft).

See Also

AutoPopup (see page 4942)

OnPopup (see page 4949)

48.1.9.5.2 TPopupMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure

that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 4900)

Items (see page 4852)

RethinkHotkeys (see page 4894)

48.1.9.5.3 TPopupMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 4900)

Items (see page 4852)

RethinkLines (see page 4894)

48.1.9.5.4 TPopupMenu.AutoPopup Property

Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.

Pascal

```
property AutoPopup: Boolean;
```

C++

```
__property Boolean AutoPopup;
```

Description

Set AutoPopup to true to cause the pop-up menu to appear automatically when the user clicks the right mouse button on a control that has the pop-up menu specified as its PopupMenu property. The application key present on keyboards specifically designed for 32-bit Windows will also show this menu when pressed.

Set AutoPopup to false if the appearance of the pop-up menu should be controlled programmatically. To display a pop-up menu when AutoPopup is false, use the Popup (see page 4939) method.

C++ Examples:

```
/*
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = false;
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(Left + X, Top + Y);
}
```

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Popup (see page 4939)

OnPopup (see page 4949)

PopupMenu

48.1.9.5.5 TPopupMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 4857)

IsRightToLeft (see page 4845)

48.1.9.5.6 TPopupMenu.HelpContext Property

Specifies a context ID for the entire pop-up menu.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate a help screen with the entire pop-up menu. Each screen in the Help system should have a unique context ID. When a component is selected in the application, pressing F1 displays the Help screen associated with the value of HelpContext.

To associate a help screen with the individual items in the pop-up menu, use the HelpContext property of the associated TMenuItem (see page 4869) objects.

See Also

GetHelpContext (see page 4844)

HelpFile (see page 1974)

HelpContext (see page 4915)

48.1.9.5.7 TPopupMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu

items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 4916)

Images

Items (see page 4852)

48.1.9.5.8 TPopupMenu.MenuAnimation Property

Specifies how the menu appears when it is first displayed.

Pascal

```
property MenuAnimation: TMenuAnimation;
```

C++

```
__property TMenuAnimation MenuAnimation;
```

Description

Use MenuAnimation to specify how the popup menu appears on the screen. The menu can simply appear as a whole, or can slide into view like a window shade being drawn from any edge.

Note: MenuAnimation only has an effect when running on Windows 98, NT 5.0, or later.

See Also

Popup (see page 4939)

48.1.9.5.9 TPopupMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 4929)

OnDrawItem (see page 4928)

Images (see page 4851)

48.1.9.5.10 TPopupMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 4850)

48.1.9.5.11 TPopupMenu.PopupComponent Property

Indicates the component that last displayed the popup menu in response to a right mouse click.

Pascal

```
property PopupComponent: TComponent;
```

C++

```
__property TComponent * PopupComponent;
```

Description

Read PopupComponent to determine which control is currently using the popup menu. In applications where multiple controls share the same pop-up menu, use PopupComponent to determine which of them displayed the menu.

Set PopupComponent to associate a control with the menu before calling the Popup (see page 4939) method programmatically to bring up the pop-up menu.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
```

```
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
```

```
    if PopupMenu1.PopupComponent = Edit1 then
     Edit1.CopyToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CopyToClipboard
    else
      Beep;
  end;

  procedure TForm1.Cut1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
```

See Also

AutoPopup (see page 4942)

OnPopup (see page 4949)

Popup (see page 4939)

PopupMenu

48.1.9.5.12 TPopupMenu.PopupPoint Property

Indicates the location where the pop-up menu appears.

Pascal

```
property PopupPoint: TPoint;
```

C++

```
__property TPoint PopupPoint;
```

Description

This public property is used internally to locate the popup menu. Its value is set by the Popup (see page 4939) method.

See Also

Popup (see page 4939)

48.1.9.5.13 TPopupMenu.TrackButton Property

Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

Pascal

```
property TrackButton: TTrackButton;
```

C++

```
__property TTrackButton TrackButton;
```

Description

Use TrackButton to specify which mouse button activates the popup menu when it is associated with a toolbar button.

48.1.9.6 TPopupMenu Events

The events of the TPopupMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 4949)	Occurs when the menu changes.
	OnPopup (see page 4949)	Occurs just before the pop-up menu appears.

48.1.9.6.1 TPopupMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 4852)

48.1.9.6.2 TPopupMenu.OnPopup Event

Occurs just before the pop-up menu appears.

Pascal

```
property OnPopup: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPopup;
```

Description

Write an OnPopup event handler to take specific action just before the pop-up menu appears. For example, use an OnPopup event handler to set the Checked, Enabled, or Visible property of individual items in the menu so that they are appropriate to the PopupComponent (see page 4946).

C++ Examples:

```
/*
The following code enables the Copy item from the pop-up
menu if the edit control has a nonempty selection.
Note: A portion of the edit control text must be highlighted.
*/
```

```
void __fastcall TForm1::PopupMenu1Popup(TObject *Sender)
{
  Copy1->Enabled = (Edit1->SelLength > 0);
}

void __fastcall TForm1::Copy1Click(TObject *Sender)
{
    ListBox1->Items->Add("'Copy' menu");
}

void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
          int X, int Y)
{
  PopupMenu1->Popup(X, Y);
}
```

Delphi Examples:

```
{
The following code enables the Copy item from the pop-up
menu if the edit control has a nonempty selection.
Note: A portion of the edit control text must be highlighted.
}
procedure TForm1.PopupMenu1Popup(Sender: TObject);
begin
  Copy1.Enabled := Edit1.SelLength > 0;
end;

procedure TForm1.Copy1Click(Sender: TObject);
begin
    ListBox1.Items.Add('"Copy" menu');
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

PopupComponent (see page 4946)

PopupMenu

48.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnsiSameCaption (see page 4951)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.
	DrawMenuItem (see page 4952)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 4952)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 4952)	This is function Menus.IsAltGRPressed.
	NewItem (see page 4953)	Creates and initializes a menu item.
	NewLine (see page 4954)	Creates a menu item for a separator.
	NewMenu (see page 4955)	Creates and initializes a main menu.
	NewPopupMenu (see page 4956)	Creates and initializes a popup menu.
	NewSubMenu (see page 4957)	Creates and initializes a menu item that represents a submenu.
	SameCaption (see page 4958)	This is function Menus.SameCaption.
	ShortCut (see page 4958)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 4959)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 4960)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 4961)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 4962)	This is function Menus.StripHotkey.
	TextToShortCut (see page 4963)	Creates a menu shortcut from a text string.

48.2.1 Menus.AnsiSameCaption Function

Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

Pascal

```
function AnsiSameCaption(const Text1: string; const Text2: string): Boolean;
```

C++

```
Boolean AnsiSameCaption(const UnicodeString Text1, const UnicodeString Text2);
```

File

Menus

Description

AnsiSameCaption compares Text1 to Text2, without case sensitivity and ignoring any ampersands (&) that are included to create accelerator characters. The compare operation is controlled by the current locale. The return value is true if the two strings have the same value, false otherwise.

See Also

StringReplace

IsAccel

AnsiSameText

WideSameCaption

48.2.2 Menus.DrawMenuItem Function

Pascal

```
procedure DrawMenuItem(MenuItem: TMenuItem; ACanvas: TCanvas; ARect: TRect; State:
TOwnerDrawState);
```

C++

```
DrawMenuItem(TMenuItem MenuItem, TCanvas ACanvas, TRect ARect, TOwnerDrawState State);
```

File

Menus

Description

This is function Menus.DrawMenuItem.

48.2.3 Menus.GetHotkey Function

Returns the last character in a string marked with an ampersand (&).

Pascal

```
function GetHotkey(const Text: string): string;
```

C++

```
UnicodeString GetHotkey(const UnicodeString Text);
```

File

Menus

Description

GetHotKey searches Text, starting at the end, for a character that is identified as an accelerator key by a preceding ampersand (&). If it locates a character marked with an ampersand, GetHotKey returns that character. Otherwise, it returns an empty string.

See Also

AnsiSameCaption (see page 4951)

StripHotKey

IsAccel

48.2.4 Menus.IsAltGRPressed Function

Pascal

```
function IsAltGRPressed: boolean;
```

C++

```
boolean IsAltGRPressed();
```

File

Menus

Description

This is function Menus.IsAltGRPressed.

48.2.5 Menus.NewItem Function

Creates and initializes a menu item.

Pascal

```
function NewItem(const ACaption: string; AShortCut: TShortCut; AChecked: Boolean; AEnabled:
Boolean; AOnClick: TNotifyEvent; hCtx: THelpContext; const AName: string): TMenuItem;
```

C++

```
TMenuItem NewItem(const UnicodeString ACaption, TShortCut AShortCut, Boolean AChecked, Boolean
AEnabled, TNotifyEvent AOnClick, THelpContext hCtx, const UnicodeString AName);
```

File

Menus

Description

Call NewItem to create and initialize a menu item when constructing a menu programmatically.

The ACaption parameter specifies the string that should appear for the menu item.

The AShortCut parameter specifies any associated shortcut.

The AChecked parameter indicates whether the menu item appears with a check mark.

The AEnabled parameter specifies whether the menu item is enabled or grayed.

The AOnClick parameter specifies an event handler that executes when the user clicks the menu item.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The menu item returned by NewItem can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 4955), NewPopupMenu (see page 4956), or NewSubMenu (see page 4957) function.

Warning: The item returned by NewItem does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 4869) do not free memory.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
```

```
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewMenu (see page 4955)

NewPopupMenu (see page 4956)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

48.2.6 Menus.NewLine Function

Creates a menu item for a separator.

Pascal

```
function NewLine: TMenuItem;
```

C++

```
TMenuItem NewLine();
```

File

Menus

Description

Call NewLine to create a separator that divides the items in a menu into logical groups. Once the menu item for the separator has been created using NewLine, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (

see page 4955), NewPopupMenu (see page 4956), or NewSubMenu (see page 4957) function.

Warning: The item returned by NewLine does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 4869) do not free memory.

See Also

NewItem (see page 4953)

NewPopupMenu (see page 4956)

NewSubMenu (see page 4957)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

48.2.7 Menus.NewMenu Function

Creates and initializes a main menu.

Pascal

```
function NewMenu(Owner: TComponent; const AName: string; const Items: array of TMenuItem):
TMainMenu;
```

C++

```
TMainMenu NewMenu(TComponent * Owner, const UnicodeString AName, const array of TMenuItem
Items);
```

File

Menus

Description

Call NewMenu to create and initialize a main menu programmatically. NewMenu returns the TMainMenu (see page 4828) component that represents the menu.

The Owner parameter specifies the component that is responsible for freeing the menu (typically the form).

The AName parameter specifies the name of the menu, which is used to refer to it in code.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 4953) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
```

```
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewPopupMenu (see page 4956)

NewSubMenu (see page 4957)

NewItem (see page 4953)

48.2.8 Menus.NewPopupMenu Function

Creates and initializes a popup menu.

Pascal

```
function NewPopupMenu(Owner: TComponent; const AName: string; Alignment: TPopupAlignment;
AutoPopup: Boolean; const Items: array of TMenuItem): TPopupMenu;
```

C++

```
TPopupMenu NewPopupMenu(TComponent * Owner, const UnicodeString AName, TPopupAlignment
Alignment, Boolean AutoPopup, const array of TMenuItem Items);
```

File

Menus

Description

Call NewPopupMenu to create and initialize a popup menu programmatically. NewPopupMenu returns the TPopupMenu (see page 4935) component that represents the popup menu, but does not associate that popup menu with any control.

The Owner parameter specifies the component that is responsible for freeing the menu.

The AName parameter specifies the name of the popup menu, which is used to refer to it in code.

The Alignment parameter determines where the menu appears relative to the mouse when the user right clicks on the control that uses the menu.

The AutoPopup parameter specifies whether the menu should appear automatically when the user right clicks the associated control.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 4953) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

See Also

NewMenu (see page 4955)

NewSubMenu (see page 4957)

NewItem (see page 4953)

48.2.9 Menus.NewSubMenu Function

Creates and initializes a menu item that represents a submenu.

Pascal

```
function NewSubMenu(const ACaption: string; hCtx: THelpContext; const AName: string; const
Items: array of TMenuItem; AEnabled: Boolean = True): TMenuItem;
```

C++

```
TMenuItem NewSubMenu(const UnicodeString ACaption, THelpContext hCtx, const UnicodeString
AName, const array of TMenuItem Items, Boolean AEnabled = True);
```

File

Menus

Description

Call NewSubMenu to create a menu item that represents a submenu when constructing a menu programmatically at runtime.

The ACaption parameter indicates the string that appears in the parent menu for the submenu.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The Items parameter specifies an array of menu items that make up the submenu and that appear when the user clicks the submenu item in the parent menu.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

The AEnabled parameter specifies whether the menu item that appears in the parent menu is enabled.

Once a submenu has been created using NewSubMenu, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 4955), NewPopupMenu (see page 4956), or NewSubMenu function.

Warning: The item returned by NewSubMenu does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 4869) do not free memory.

See Also

NewItem (see page 4953)

TMenuItem (see page 4869)

NewLine (see page 4954)

NewMenu (see page 4955)

NewPopupMenu (see page 4956)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

TMenuItem (see page 4869)

48.2.10 Menus.SameCaption Function

Pascal

```
function SameCaption(const Text1: string; const Text2: string): Boolean;
```

C++

```
Boolean SameCaption(const UnicodeString Text1, const UnicodeString Text2);
```

File

Menus

Description

This is function Menus.SameCaption.

48.2.11 Menus.ShortCut Function

Creates a menu shortcut for a specified key combination.

Pascal

```
function ShortCut(Key: Word; Shift: TShiftState): TShortCut;
```

C++

```
TShortCut ShortCut(Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCut to create a menu shortcut at runtime.

Specify a Key value using a virtual key code (Menus (see page 4825) version) or Qt key code (QMenus version).

Specify the values for the Shift, Control, and Alt keys by using a set of type TShiftState. For example, to specify the Shift key, use the set [ssShift]. To specify a Shift and Ctrl key combination, use the set [ssShift, ssCtrl].

Assign the value returned by ShortCut as the value of the ShortCut property of a menu item.

Note: TextToShortCut (see page 4963) can also create a shortcut. TextToShortCut (see page 4963) converts a string to a shortcut, so it can be used to let the user specify the shortcut. However, TextToShortCut (see page 4963) executes much more slowly than ShortCut. Use ShortCut whenever possible.

C++ Examples:

```
/*
This example creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
*/
void __fastcall TForm1::OpenCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Open command has been selected.",
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenCommand->ShortCut =
    ShortCut(Word('O'), TShiftState() << ssCtrl);
}
```

Delphi Examples:

```
{
This example creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCutToKey (see page 4960)

ShortCutToText (see page 4961)

TextToShortCut (see page 4963)

TMenuItem (see page 4869)

48.2.12 Menus.ShortCutFromMessage Function

Pascal

```
function ShortCutFromMessage(Message: TWMKey): TShortCut;
```

C++

```
TShortCut ShortCutFromMessage(TWMKey Message);
```

File

Menus

Description

This is function Menus.ShortCutFromMessage.

48.2.13 Menus.ShortCutToKey Function

Returns the key code and shift state of a menu shortcut.

Pascal

```
procedure ShortCutToKey(ShortCut: TShortCut; var Key: Word; var Shift: TShiftState);
```

C++

```
ShortCutToKey(TShortCut ShortCut, Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCutToKey to parse a menu shortcut into its virtual key code and shift state parts.

ShortCut (see page 4958) is the value of the menu shortcut.

Key returns the virtual key code (Menus (see page 4825) version) or Qt key code (QMenus version) for the key.

Shirt returns the associated combination of Shift, Ctrl, and Alt keys.

C++ Examples:

```
/*
The following code redefines the ShortCut of CloseCommand if
the original short cut used the [ssCtrl] shift state.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Word TheKey;

  TShiftState TheShiftState;

  ShortCutToKey(CloseCommand->ShortCut, TheKey, TheShiftState);
  if (TheShiftState.Contains(ssCtrl))
    CloseCommand->ShortCut = ShortCut(Word('C'), TShiftState() << ssShift);}

void __fastcall TForm1::CloseCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Close command has been selected.",
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CloseCommand->ShortCut =
    ShortCut(Word('C'), TShiftState() << ssCtrl);
}
```

Delphi Examples:

```
{
The following code redefines the ShortCut of CloseCommand if
```

```
the original short cut used the [ssCtrl] shift state.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  TheKey: Word;
  TheShiftState: TShiftState;
begin
  Menus.ShortCutToKey(CloseCommand.ShortCut, TheKey, TheShiftState);
  if TheShiftState = [ssCtrl] then
   CloseCommand.ShortCut := ShortCut(Word('C'), [ssShift]);
end;

procedure TForm1.CloseCommandClick(Sender: TObject);
begin
  MessageDlg('The Close command has been selected.', mtInformation, [mbOk], 0);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  CloseCommand.ShortCut := Menus.ShortCut(Word('C'), [ssCtrl]);
end;
```

See Also

ShortCut (see page 4958)

ShortCutToText (see page 4961)

TextToShortCut (see page 4963)

TMenuItem (see page 4869)

48.2.14 Menus.ShortCutToText Function

Converts a menu shortcut into a string that describes the shortcut.

Pascal

```
function ShortCutToText(ShortCut: TShortCut): string;
```

C++

```
UnicodeString ShortCutToText(TShortCut ShortCut);
```

File

Menus

Description

Call ShortCutToText to obtain a text description of the shortcut associated with a menu item. Use this function when the application needs to display a description of a shortcut to the user.

C++ Examples:

```
/*
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->Text = ShortCutToText(OpenCommand->ShortCut);}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  OpenCommand->ShortCut =
    ShortCut(Word('O'), TShiftState() << ssCtrl);
}

void __fastcall TForm1::OpenCommandClick(TObject *Sender)
{
  MessageDlg(
    "The Open command has been selected.",
    mtInformation,
    TMsgDlgButtons() << mbOK,
    0);
}
```

Delphi Examples:

```
{
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.Text := Menus.ShortCutToText(OpenCommand.ShortCut);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCut (see page 4958)

ShortCutToKey (see page 4960)

TextToShortCut (see page 4963)

48.2.15 Menus.StripHotkey Function

Pascal

```
function StripHotkey(const Text: string): string;
```

C++

```
UnicodeString StripHotkey(const UnicodeString Text);
```

File

Menus

Description

This is function Menus.StripHotkey.

48.2.16 Menus.TextToShortCut Function

Creates a menu shortcut from a text string.

Pascal

```
function TextToShortCut(Text: string): TShortCut;
```

C++

```
TShortCut TextToShortCut(UnicodeString Text);
```

File

Menus

Description

Call TextToShortCut to create a menu shortcut from a descriptive string. For example, an application can allow users to specify the value of a shortcut in an edit box control, and then call TextToShortCut to create a menu shortcut for the value entered by the user.

Note: TextToShortCut executes slowly. When possible, use the ShortCut (see page 4958) function to create a menu shortcut instead.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.  Click on the menu item
or type "Ctrl+N" to execute MyOnExecute.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
```

```
end;
```

ShortCut (see page 4958)

ShortCutToText (see page 4961)

TMenuItem (see page 4869)

48.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFindItemKind (see page 4965)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 4966)	TMenuAnimation (see page 4971) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 4966)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 4967)	TMenuItemAutoFlag and TMenuAutoFlag (see page 4972) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 4968)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 4968)	TTrackButton specifies which mouse button activates a tool button menu.

48.3.1 Menus.TFindItemKind Enumeration

TFindItemKind indicates the criterion to use when locating menu items.

Pascal

```
TFindItemKind = (
  fkCommand,
  fkHandle,
  fkShortCut
);
```

C++

```
enum TFindItemKind {
  fkCommand,
  fkHandle,
  fkShortCut
};
```

File

Menus

Description

TFindItemKind values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
fkID	Identify the item by its Windows command ID (parameter to WM_COMMAND (see page 5148) message).
fkHandle	Identify the item by its pop-up menu handle.
fkShortCut	Identify the item by its menu shortcut key code.

48.3.2 Menus.TMenuAnimations Enumeration

TMenuAnimation (see page 4971) and TMenuAnimations indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimations = (
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
);
```

C++

```
enum TMenuAnimations {
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
};
```

File

Menus

Description

TMenuAnimations indicates the direction in which a menu can "slide" into view. TMenuAnimation (see page 4971) is a set of TMenuAnimations values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.
maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

48.3.3 Menus.TMenuBreak Enumeration

TMenuBreak indicates the criterion to use when locating menu items.

Pascal

```
TMenuBreak = (
  mbNone,
  mbBreak,
  mbBarBreak
```

```
);
```

C++

```
enum TMenuBreak {
  mbNone,
  mbBreak,
  mbBarBreak
};
```

File

Menus

Description

TMenuBreak values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
mbNone	No menu breaking occurs.
mbBarBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. A bar separates the new and the old columns.
mbBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. Only space separates the new and the old columns.

48.3.4 Menus.TMenuItemAutoFlag Enumeration

TMenuItemAutoFlag and TMenuAutoFlag (see page 4972) Indicate when menu items are automatically maintained.

Pascal

```
TMenuItemAutoFlag = (
  maAutomatic,
  maManual,
  maParent
);
```

C++

```
enum TMenuItemAutoFlag {
  maAutomatic,
  maManual,
  maParent
};
```

File

Menus

Description

TMenuItemAutoFlag indicates when a submenu is checked for problems and updated. TMenuAutoFlag (see page 4972) provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.

maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

48.3.5 Menus.TPopupAlignment Enumeration

TPopupAlignment represents the position of a popup menu relative to the mouse.

Pascal

```
TPopupAlignment = (
  paLeft,
  paRight,
  paCenter
);
```

C++

```
enum TPopupAlignment {
  paLeft,
  paRight,
  paCenter
};
```

File

Menus

Description

These are the possible values:

Value	Meaning
paLeft	The pop-up menu appears with its top left corner under the mouse.
paCenter	The pop-up menu appears with the top center of the menu under the mouse.
paRight	The pop-up menu appears with its top right corner under the mouse.

48.3.6 Menus.TTrackButton Enumeration

TTrackButton specifies which mouse button activates a tool button menu.

Pascal

```
TTrackButton = (
  tbRightButton,
  tbLeftButton
);
```

C++

```
enum TTrackButton {
```

```
    tbRightButton,
    tbLeftButton
};
```

File

Menus

Description

TTrackButton can have one of the following values:

Value	Meaning
tbRightButton	The right mouse button activates the tool button menu.
tbLeftButton	The left mouse button activates the tool button menu.

48.4 Types

The following table lists types in this documentation.

Types

Name	Description
PMenuItem (see page 4970)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 4970)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 4971)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 4971)	TMenuAnimation and TMenuAnimations (see page 4966) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 4972)	TMenuItemAutoFlag (see page 4967) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 4972)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 4973)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuHandle (see page 4973)	This is type Menus.TMenuHandle.
TMenuMeasureItemEvent (see page 4973)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

48.4.1 Menus.PMenuItem Type

Pascal

```
PMenuItem = ^TMenuItem;
```

C++

```
^TMenuItem PMenuItem;
```

File

Menus

Description

This is type Menus.PMenuItem.

48.4.2 Menus.TAdvancedMenuDrawItemEvent Type

TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TAdvancedMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect;
State: TOwnerDrawState) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState) (
TAdvancedMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 4869) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

State is a set indicating various aspects of the menu items state such as whether it is selected, checked, grayed, and so on.

48.4.3 Menus.TMenuActionLinkClass Type

Pascal

```
TMenuActionLinkClass = class of TMenuActionLink;
```

C++

```
TMenuActionLink TMenuActionLinkClass;
```

File

Menus

Description

This is type Menus.TMenuActionLinkClass.

48.4.4 Menus.TMenuAnimation Type

TMenuAnimation and TMenuAnimations (see page 4966) indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimation = set of TMenuAnimations;
```

C++

```
TMenuAnimations TMenuAnimation;
```

File

Menus

Description

TMenuAnimations (see page 4966) indicates the direction in which a menu can "slide" into view. TMenuAnimation is a set of TMenuAnimations (see page 4966) values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations (see page 4966) values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.

maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

See Also

TPopupMenu

48.4.5 Menus.TMenuAutoFlag Type

TMenuItemAutoFlag (see page 4967) and TMenuAutoFlag Indicate when menu items are automatically maintained.

Pascal

```
TMenuAutoFlag = maAutomatic..maManual;
```

C++

```
maAutomatic..maManual TMenuAutoFlag;
```

File

Menus

Description

TMenuItemAutoFlag (see page 4967) indicates when a submenu is checked for problems and updated. TMenuAutoFlag provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.
maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

AutoHotkeys

AutoLineReduction

48.4.6 Menus.TMenuChangeEvent Type

Pascal

```
TMenuChangeEvent = procedure (Sender: TObject; Source: TMenuItem; Rebuild: Boolean) of object;
```

C++

```
(Sender: TObject; Source: TMenuItem; Rebuild: Boolean) ( TMenuChangeEvent)();
```

File

Menus

Description

This is type Menus.TMenuChangeEvent.

48.4.7 Menus.TMenuDrawItemEvent Type

TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected:
Boolean) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected: Boolean) ( TMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 4869) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

Selected indicates whether the menu item is selected (that is, if it will be clicked if the user presses return)

48.4.8 Menus.TMenuHandle Type

Pascal

```
TMenuHandle = HMENU;
```

C++

```
HMENU TMenuHandle;
```

File

Menus

Description

This is type Menus.TMenuHandle.

48.4.9 Menus.TMenuMeasureItemEvent Type

TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Pascal

```
TMenuMeasureItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; var Width, Height:
Integer) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; var Width, Height: Integer) ( TMenuMeasureItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 4869) instance that represents the menu item to be measured.

ACanvas represents the canvas where the menu item will be drawn. Use its methods, if necessary, to determine the size of the menu item.

Width and Height return the dimensions, in pixels, that should be used to draw the menu item.

48.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
PopupList (see page 4975)	This is variable Menus.PopupList.
ShortCutItems (see page 4975)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 4975)	This is variable Menus.ValidMenuHotkeys.

48.5.1 Menus.PopupList Variable

Pascal

```
PopupList: TPopupList;
```

C++

```
TPopupList PopupList;
```

File

Menus

Description

This is variable Menus.PopupList.

48.5.2 Menus.ShortCutItems Variable

Pascal

```
ShortCutItems: TMenuItemStack;
```

C++

```
TMenuItemStack ShortCutItems;
```

File

Menus

Description

This is variable Menus.ShortCutItems.

48.5.3 Menus.ValidMenuHotkeys Variable

Pascal

```
ValidMenuHotkeys: string = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

C++

```
UnicodeString ValidMenuHotkeys = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

File

Menus

Description

This is variable Menus.ValidMenuHotkeys.

48.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cDialogSuffix (see page 4977)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 4977)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 4977)	This is constant Menus.cLineCaption.

48.6.1 Menus.cDialogSuffix Constant

Pascal

```
cDialogSuffix = '...';
```

C++

```
cDialogSuffix = '...';
```

File

Menus

Description

This is constant Menus.cDialogSuffix.

48.6.2 Menus.cHotkeyPrefix Constant

Pascal

```
cHotkeyPrefix = '&';
```

C++

```
cHotkeyPrefix = '&';
```

File

Menus

Description

This is constant Menus.cHotkeyPrefix.

48.6.3 Menus.cLineCaption Constant

Pascal

```
cLineCaption = '-';
```

C++

```
cLineCaption = '-';
```

File

Menus

Description

This is constant Menus.cLineCaption.

49 Messages Namespace

This is namespace Messages.

EM_LINELENGTH (see page 5114)	This is constant Messages.EM_LINELENGTH.
EM_LINESCROLL (see page 5114)	This is constant Messages.EM_LINESCROLL.
EM_POSFROMCHAR (see page 5114)	This is constant Messages.EM_POSFROMCHAR.
EM_REPLACESEL (see page 5115)	This is constant Messages.EM_REPLACESEL.
EM_SCROLL (see page 5115)	This is constant Messages.EM_SCROLL.
EM_SCROLLCARET (see page 5115)	This is constant Messages.EM_SCROLLCARET.
EM_SETHANDLE (see page 5116)	This is constant Messages.EM_SETHANDLE.
EM_SETIMESTATUS (see page 5116)	This is constant Messages.EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 5116)	This is constant Messages.EM_SETLIMITTEXT.
EM_SETMARGINS (see page 5117)	This is constant Messages.EM_SETMARGINS.
EM_SETMODIFY (see page 5117)	This is constant Messages.EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 5117)	This is constant Messages.EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 5118)	This is constant Messages.EM_SETREADONLY.
EM_SETRECT (see page 5118)	This is constant Messages.EM_SETRECT.
EM_SETRECTNP (see page 5118)	This is constant Messages.EM_SETRECTNP.
EM_SETSEL (see page 5119)	This is constant Messages.EM_SETSEL.
EM_SETTABSTOPS (see page 5119)	This is constant Messages.EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 5119)	This is constant Messages.EM_SETWORDBREAKPROC.
EM_UNDO (see page 5120)	This is constant Messages.EM_UNDO.
EN_CHANGE (see page 5120)	This is constant Messages.EN_CHANGE.
EN_ERRSPACE (see page 5120)	This is constant Messages.EN_ERRSPACE.
EN_HSCROLL (see page 5121)	This is constant Messages.EN_HSCROLL.
EN_KILLFOCUS (see page 5121)	This is constant Messages.EN_KILLFOCUS.
EN_MAXTEXT (see page 5121)	This is constant Messages.EN_MAXTEXT.
EN_SETFOCUS (see page 5122)	This is constant Messages.EN_SETFOCUS.
EN_UPDATE (see page 5122)	This is constant Messages.EN_UPDATE.
EN_VSCROLL (see page 5122)	This is constant Messages.EN_VSCROLL.
LB_ADDFILE (see page 5123)	This is constant Messages.LB_ADDFILE.
LB_ADDSTRING (see page 5123)	This is constant Messages.LB_ADDSTRING.
LB_DELETESTRING (see page 5123)	This is constant Messages.LB_DELETESTRING.
LB_DIR (see page 5124)	This is constant Messages.LB_DIR.
LB_FINDSTRING (see page 5124)	This is constant Messages.LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 5124)	This is constant Messages.LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 5125)	This is constant Messages.LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 5125)	This is constant Messages.LB_GETCARETINDEX.
LB_GETCOUNT (see page 5125)	This is constant Messages.LB_GETCOUNT.
LB_GETCURSEL (see page 5126)	This is constant Messages.LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 5126)	This is constant Messages.LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 5126)	This is constant Messages.LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 5127)	This is constant Messages.LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 5127)	This is constant Messages.LB_GETITEMRECT.
LB_GETLOCALE (see page 5127)	This is constant Messages.LB_GETLOCALE.
LB_GETSEL (see page 5128)	This is constant Messages.LB_GETSEL.
LB_GETSELCOUNT (see page 5128)	This is constant Messages.LB_GETSELCOUNT.

LB_GETSELITEMS (see page 5128)	This is constant Messages.LB_GETSELITEMS.
LB_GETTEXT (see page 5129)	This is constant Messages.LB_GETTEXT.
LB_GETTEXTLEN (see page 5129)	This is constant Messages.LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 5129)	This is constant Messages.LB_GETTOPINDEX.
LB_INITSTORAGE (see page 5130)	This is constant Messages.LB_INITSTORAGE.
LB_INSERTSTRING (see page 5130)	This is constant Messages.LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 5130)	This is constant Messages.LB_ITEMFROMPOINT.

LBN_DBLCLK (see page 5136)	This is constant Messages.LBN_DBLCLK.
LBN_ERRSPACE (see page 5137)	This is constant Messages.LBN_ERRSPACE.
LBN_KILLFOCUS (see page 5137)	This is constant Messages.LBN_KILLFOCUS.
LBN_SELCANCEL (see page 5137)	This is constant Messages.LBN_SELCANCEL.
LBN_SELCHANGE (see page 5138)	This is constant Messages.LBN_SELCHANGE.
LBN_SETFOCUS (see page 5138)	This is constant Messages.LBN_SETFOCUS.
PSM_PAGEINFO (see page 5138)	This is constant Messages.PSM_PAGEINFO.
PSM_SHEETINFO (see page 5139)	This is constant Messages.PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 5139)	This is constant Messages.SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 5139)	This is constant Messages.SBM_GETPOS.
SBM_GETRANGE (see page 5140)	This is constant Messages.SBM_GETRANGE.
SBM_GETSCROLLBARINFO (see page 5140)	This is constant Messages.SBM_GETSCROLLBARINFO.
SBM_GETSCROLLINFO (see page 5140)	This is constant Messages.SBM_GETSCROLLINFO.
SBM_SETPOS (see page 5141)	This is constant Messages.SBM_SETPOS.
SBM_SETRANGE (see page 5141)	This is constant Messages.SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 5141)	This is constant Messages.SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 5142)	This is constant Messages.SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 5142)	This is constant Messages.WM_ACTIVATE.
WM_ACTIVATEAPP (see page 5142)	This is constant Messages.WM_ACTIVATEAPP.
WM_APP (see page 5143)	This is constant Messages.WM_APP.
WM_APPCOMMAND (see page 5143)	This is constant Messages.WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 5143)	This is constant Messages.WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 5144)	This is constant Messages.WM_CANCELJOURNAL.
WM_CANCELMODE (see page 5144)	This is constant Messages.WM_CANCELMODE.
WM_CAPTURECHANGED (see page 5144)	This is constant Messages.WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 5145)	This is constant Messages.WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 5145)	This is constant Messages.WM_CHANGEUISTATE.
WM_CHAR (see page 5145)	This is constant Messages.WM_CHAR.
WM_CHARTOITEM (see page 5146)	This is constant Messages.WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 5146)	This is constant Messages.WM_CHILDACTIVATE.

WM_CLEAR (see page 5146)	This is constant Messages.WM_CLEAR.
WM_CLOSE (see page 5147)	This is constant Messages.WM_CLOSE.
WM_COALESCE_FIRST (see page 5147)	This is constant Messages.WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 5147)	This is constant Messages.WM_COALESCE_LAST.
WM_COMMAND (see page 5148)	This is constant Messages.WM_COMMAND.
WM_COMMNOTIFY (see page 5148)	This is constant Messages.WM_COMMNOTIFY.
WM_COMPACTING (see page 5148)	This is constant Messages.WM_COMPACTING.
WM_COMPAREITEM (see page 5149)	This is constant Messages.WM_COMPAREITEM.
WM_CONTEXTMENU (see page 5149)	This is constant Messages.WM_CONTEXTMENU.
WM_COPY (see page 5149)	This is constant Messages.WM_COPY.
WM_COPYDATA (see page 5150)	This is constant Messages.WM_COPYDATA.
WM_CREATE (see page 5150)	This is constant Messages.WM_CREATE.
WM_CTLCOLOR (see page 5150)	This is constant Messages.WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 5151)	This is constant Messages.WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 5151)	This is constant Messages.WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 5151)	This is constant Messages.WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 5152)	This is constant Messages.WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 5152)	This is constant Messages.WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 5152)	This is constant Messages.WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 5153)	This is constant Messages.WM_CTLCOLORSTATIC.
WM_CUT (see page 5153)	This is constant Messages.WM_CUT.
WM_DDE_ACK (see page 5153)	This is constant Messages.WM_DDE_ACK.
WM_DDE_ADVISE (see page 5154)	This is constant Messages.WM_DDE_ADVISE.
WM_DDE_DATA (see page 5154)	This is constant Messages.WM_DDE_DATA.
WM_DDE_EXECUTE (see page 5154)	This is constant Messages.WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 5155)	This is constant Messages.WM_DDE_FIRST.
WM_DDE_INITIATE (see page 5155)	This is constant Messages.WM_DDE_INITIATE.
WM_DDE_LAST (see page 5155)	This is constant Messages.WM_DDE_LAST.
WM_DDE_POKE (see page 5156)	This is constant Messages.WM_DDE_POKE.
WM_DDE_REQUEST (see page 5156)	This is constant Messages.WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 5156)	This is constant Messages.WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 5157)	This is constant Messages.WM_DDE_UNADVISE.
WM_DEADCHAR (see page 5157)	This is constant Messages.WM_DEADCHAR.
WM_DELETEITEM (see page 5157)	This is constant Messages.WM_DELETEITEM.
WM_DESTROY (see page 5158)	This is constant Messages.WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 5158)	This is constant Messages.WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 5158)	This is constant Messages.WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 5159)	This is constant Messages.WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 5159)	This is constant Messages.WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 5159)	This is constant Messages.WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 5160)	This is constant Messages.WM_DRAWITEM.
WM_DROPFILES (see page 5160)	This is constant Messages.WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 5160)	This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 5161)	This is constant Messages.WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 5161)	This is constant Messages.WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 5161)	This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 5162)	This is constant Messages.WM_ENABLE.
WM_ENDSESSION (see page 5162)	This is constant Messages.WM_ENDSESSION.
WM_ENTERIDLE (see page 5162)	This is constant Messages.WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 5163)	This is constant Messages.WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 5163)	This is constant Messages.WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 5163)	This is constant Messages.WM_ERASEBKGND.
WM_EXITMENULOOP (see page 5164)	This is constant Messages.WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 5164)	This is constant Messages.WM_EXITSIZEMOVE.

WM_FONTCHANGE (see page 5164)	This is constant Messages.WM_FONTCHANGE.
WM_GETDLGCODE (see page 5165)	This is constant Messages.WM_GETDLGCODE.
WM_GETFONT (see page 5165)	This is constant Messages.WM_GETFONT.
WM_GETHOTKEY (see page 5165)	This is constant Messages.WM_GETHOTKEY.
WM_GETICON (see page 5166)	This is constant Messages.WM_GETICON.
WM_GETMINMAXINFO (see page 5166)	This is constant Messages.WM_GETMINMAXINFO.
WM_GETOBJECT (see page 5166)	This is constant Messages.WM_GETOBJECT.
WM_GETTEXT (see page 5167)	This is constant Messages.WM_GETTEXT.
WM_GETTEXTLENGTH (see page 5167)	This is constant Messages.WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 5167)	This is constant Messages.WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 5168)	This is constant Messages.WM_HANDHELDLAST.
WM_HELP (see page 5168)	This is constant Messages.WM_HELP.
WM_HOTKEY (see page 5168)	This is constant Messages.WM_HOTKEY.
WM_HSCROLL (see page 5169)	This is constant Messages.WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 5169)	This is constant Messages.WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 5169)	This is constant Messages.WM_ICONERASEBKGND.
WM_IME_CHAR (see page 5170)	This is constant Messages.WM_IME_CHAR.
WM_IME_COMPOSITION (see page 5170)	This is constant Messages.WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 5170)	This is constant Messages.WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 5171)	This is constant Messages.WM_IME_CONTROL.
WM_IME_ENDCOMPOSITION (see page 5171)	This is constant Messages.WM_IME_ENDCOMPOSITION.
WM_IME_KEYDOWN (see page 5171)	This is constant Messages.WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 5172)	This is constant Messages.WM_IME_KEYLAST.
WM_IME_KEYUP (see page 5172)	This is constant Messages.WM_IME_KEYUP.
WM_IME_NOTIFY (see page 5172)	This is constant Messages.WM_IME_NOTIFY.
WM_IME_REQUEST (see page 5173)	This is constant Messages.WM_IME_REQUEST.
WM_IME_SELECT (see page 5173)	This is constant Messages.WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 5173)	This is constant Messages.WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 5174)	This is constant Messages.WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 5174)	This is constant Messages.WM_INITDIALOG.
WM_INITMENU (see page 5174)	This is constant Messages.WM_INITMENU.
WM_INITMENUPOPUP (see page 5175)	This is constant Messages.WM_INITMENUPOPUP.
WM_INPUT (see page 5175)	This is constant Messages.WM_INPUT.
WM_INPUTLANGCHANGE (see page 5175)	This is constant Messages.WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 5176)	This is constant Messages.WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 5176)	This is constant Messages.WM_KEYDOWN.
WM_KEYFIRST (see page 5176)	This is constant Messages.WM_KEYFIRST.
WM_KEYLAST (see page 5177)	This is constant Messages.WM_KEYLAST.
WM_KEYUP (see page 5177)	This is constant Messages.WM_KEYUP.
WM_KILLFOCUS (see page 5177)	This is constant Messages.WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 5178)	This is constant Messages.WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 5178)	This is constant Messages.WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 5178)	This is constant Messages.WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 5179)	This is constant Messages.WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 5179)	This is constant Messages.WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 5179)	This is constant Messages.WM_MBUTTONUP.
WM_MDIACTIVATE (see page 5180)	This is constant Messages.WM_MDIACTIVATE.
WM_MDICASCADE (see page 5180)	This is constant Messages.WM_MDICASCADE.
WM_MDICREATE (see page 5180)	This is constant Messages.WM_MDICREATE.
WM_MDIDESTROY (see page 5181)	This is constant Messages.WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 5181)	This is constant Messages.WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 5181)	This is constant Messages.WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 5182)	This is constant Messages.WM_MDIMAXIMIZE.
WM_MDINEXT (see page 5182)	This is constant Messages.WM_MDINEXT.

WM_MDIREFRESHMENU (see page 5182)	This is constant Messages.WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 5183)	This is constant Messages.WM_MDIRESTORE.
WM_MDISETMENU (see page 5183)	This is constant Messages.WM_MDISETMENU.
WM_MDITILE (see page 5183)	This is constant Messages.WM_MDITILE.
WM_MEASUREITEM (see page 5184)	This is constant Messages.WM_MEASUREITEM.
WM_MENUCHAR (see page 5184)	This is constant Messages.WM_MENUCHAR.
WM_MENUCOMMAND (see page 5184)	This is constant Messages.WM_MENUCOMMAND.
WM_MENUDRAG (see page 5185)	This is constant Messages.WM_MENUDRAG.
WM_MENUGETOBJECT (see page 5185)	This is constant Messages.WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 5185)	This is constant Messages.WM_MENURBUTTONUP.
WM_MENUSELECT (see page 5186)	This is constant Messages.WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 5186)	This is constant Messages.WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 5186)	This is constant Messages.WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 5187)	This is constant Messages.WM_MOUSEHOVER.
WM_MOUSELAST (see page 5187)	This is constant Messages.WM_MOUSELAST.
WM_MOUSELEAVE (see page 5187)	This is constant Messages.WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 5188)	This is constant Messages.WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 5188)	This is constant Messages.WM_MOUSEWHEEL.
WM_MOVE (see page 5188)	This is constant Messages.WM_MOVE.
WM_MOVING (see page 5189)	This is constant Messages.WM_MOVING.
WM_NCACTIVATE (see page 5189)	This is constant Messages.WM_NCACTIVATE.
WM_NCCALCSIZE (see page 5189)	This is constant Messages.WM_NCCALCSIZE.
WM_NCCREATE (see page 5190)	This is constant Messages.WM_NCCREATE.
WM_NCDESTROY (see page 5190)	This is constant Messages.WM_NCDESTROY.
WM_NCHITTEST (see page 5190)	This is constant Messages.WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 5191)	This is constant Messages.WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 5191)	This is constant Messages.WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 5191)	This is constant Messages.WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 5192)	This is constant Messages.WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 5192)	This is constant Messages.WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 5192)	This is constant Messages.WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 5193)	This is constant Messages.WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 5193)	This is constant Messages.WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 5193)	This is constant Messages.WM_NCMOUSEMOVE.
WM_NCPAINT (see page 5194)	This is constant Messages.WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 5194)	This is constant Messages.WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 5194)	This is constant Messages.WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 5195)	This is constant Messages.WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 5195)	This is constant Messages.WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 5195)	This is constant Messages.WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 5196)	This is constant Messages.WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 5196)	This is constant Messages.WM_NEXTDLGCTL.
WM_NEXTMENU (see page 5196)	This is constant Messages.WM_NEXTMENU.
WM_NOTIFY (see page 5197)	This is constant Messages.WM_NOTIFY.
WM_NOTIFYFORMAT (see page 5197)	This is constant Messages.WM_NOTIFYFORMAT.
WM_NULL (see page 5197)	This is constant Messages.WM_NULL.
WM_PAINT (see page 5198)	This is constant Messages.WM_PAINT.
WM_PAINTCLIPBOARD (see page 5198)	This is constant Messages.WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 5198)	This is constant Messages.WM_PAINTICON.
WM_PALETTECHANGED (see page 5199)	This is constant Messages.WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 5199)	This is constant Messages.WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 5199)	This is constant Messages.WM_PARENTNOTIFY.
WM_PASTE (see page 5200)	This is constant Messages.WM_PASTE.
WM_PENWINFIRST (see page 5200)	This is constant Messages.WM_PENWINFIRST.

WM_PENWINLAST (see page 5200)	This is constant Messages.WM_PENWINLAST.
WM_POWER (see page 5201)	This is constant Messages.WM_POWER.
WM_POWERBROADCAST (see page 5201)	This is constant Messages.WM_POWERBROADCAST.
WM_PRINT (see page 5201)	This is constant Messages.WM_PRINT.
WM_PRINTCLIENT (see page 5202)	This is constant Messages.WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 5202)	This is constant Messages.WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 5202)	This is constant Messages.WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 5203)	This is constant Messages.WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 5203)	This is constant Messages.WM_QUERYOPEN.
WM_QUERYUISTATE (see page 5203)	This is constant Messages.WM_QUERYUISTATE.
WM_QUEUESYNC (see page 5204)	This is constant Messages.WM_QUEUESYNC.
WM_QUIT (see page 5204)	This is constant Messages.WM_QUIT.
WM_RBUTTONDBLCLK (see page 5204)	This is constant Messages.WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 5205)	This is constant Messages.WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 5205)	This is constant Messages.WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 5205)	This is constant Messages.WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 5206)	This is constant Messages.WM_RENDERFORMAT.
WM_SETCURSOR (see page 5206)	This is constant Messages.WM_SETCURSOR.
WM_SETFOCUS (see page 5206)	This is constant Messages.WM_SETFOCUS.
WM_SETFONT (see page 5207)	This is constant Messages.WM_SETFONT.
WM_SETHOTKEY (see page 5207)	This is constant Messages.WM_SETHOTKEY.
WM_SETICON (see page 5207)	This is constant Messages.WM_SETICON.
WM_SETREDRAW (see page 5208)	This is constant Messages.WM_SETREDRAW.
WM_SETTEXT (see page 5208)	This is constant Messages.WM_SETTEXT.
WM_SETTINGCHANGE (see page 5208)	This is constant Messages.WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 5209)	This is constant Messages.WM_SHOWWINDOW.
WM_SIZE (see page 5209)	This is constant Messages.WM_SIZE.
WM_SIZECLIPBOARD (see page 5209)	This is constant Messages.WM_SIZECLIPBOARD.
WM_SIZING (see page 5210)	This is constant Messages.WM_SIZING.
WM_SPOOLERSTATUS (see page 5210)	This is constant Messages.WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 5210)	This is constant Messages.WM_STYLECHANGED.
WM_STYLECHANGING (see page 5211)	This is constant Messages.WM_STYLECHANGING.
WM_SYSCHAR (see page 5211)	This is constant Messages.WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 5211)	This is constant Messages.WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 5212)	This is constant Messages.WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 5212)	This is constant Messages.WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 5212)	This is constant Messages.WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 5213)	This is constant Messages.WM_SYSKEYUP.
WM_SYSTEMERROR (see page 5213)	This is constant Messages.WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 5213)	This is constant Messages.WM_TABLET_FIRST.
WM_TABLET_LAST (see page 5214)	This is constant Messages.WM_TABLET_LAST.
WM_TCARD (see page 5214)	This is constant Messages.WM_TCARD.
WM_THEMECHANGED (see page 5214)	This is constant Messages.WM_THEMECHANGED.
WM_TIMECHANGE (see page 5215)	This is constant Messages.WM_TIMECHANGE.
WM_TIMER (see page 5215)	This is constant Messages.WM_TIMER.
WM_UNDO (see page 5215)	This is constant Messages.WM_UNDO.
WM_UNICHAR (see page 5216)	This is constant Messages.WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 5216)	This is constant Messages.WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 5216)	This is constant Messages.WM_UPDATEUISTATE.
WM_USER (see page 5217)	This is constant Messages.WM_USER.
WM_USERCHANGED (see page 5217)	This is constant Messages.WM_USERCHANGED.
WM_VKEYTOITEM (see page 5217)	This is constant Messages.WM_VKEYTOITEM.
WM_VSCROLL (see page 5218)	This is constant Messages.WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 5218)	This is constant Messages.WM_VSCROLLCLIPBOARD.

WM_WINDOWPOSCHANGED (see page 5218)	This is constant Messages.WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 5219)	This is constant Messages.WM_WINDOWPOSCHANGING.
WM_WININICHANGE (see page 5219)	This is constant Messages.WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 5219)	This is constant Messages.WM_WTSSESSION_CHANGE.

Functions

	Name	Description
	SendGetIntMessage (see page 4991)	Send Windows message, sending and receiving integer values.
	SendGetStructMessage (see page 4992)	Send Windows message, sending and receiving data structure.
	SendStructMessage (see page 4992)	Send Windows message, sending data structure.
	SendTextMessage (see page 4993)	Send Windows message, sending text.

Structs, Records, Enums

	Name	Description
	TMessage (see page 4997)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 4998)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 4998)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 4999)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 4999)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 5000)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 5000)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 5001)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 5001)	This is record Messages.TWMCommand.
	TWMCompacting (see page 5002)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 5002)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 5003)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 5003)	This is record Messages.TWMCopyData.
	TWMCreate (see page 5004)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 5004)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 5005)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 5005)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 5006)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 5006)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 5007)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 5007)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 5008)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 5008)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 5009)	This is record Messages.TWMDDE_Unadvise.
	TWMDeleteItem (see page 5009)	This is record Messages.TWMDeleteItem.
	TWMDevModeChange (see page 5010)	This is record Messages.TWMDevModeChange.
	TWMDisplayChange (see page 5010)	This is record Messages.TWMDisplayChange.
	TWMDrawItem (see page 5011)	This is record Messages.TWMDrawItem.
	TWMDropFiles (see page 5011)	This is record Messages.TWMDropFiles.
	TWMEnable (see page 5012)	This is record Messages.TWMEnable.
	TWMEndSession (see page 5012)	This is record Messages.TWMEndSession.
	TWMEnterIdle (see page 5013)	This is record Messages.TWMEnterIdle.
	TWMEnterMenuLoop (see page 5013)	This is record Messages.TWMEnterMenuLoop.
	TWMEraseBkgnd (see page 5014)	This is record Messages.TWMEraseBkgnd.
	TWMGetIcon (see page 5014)	This is record Messages.TWMGetIcon.
	TWMGetMinMaxInfo (see page 5015)	This is record Messages.TWMGetMinMaxInfo.
	TWMGetText (see page 5015)	This is record Messages.TWMGetText.
	TWMHelp (see page 5016)	This is record Messages.TWMHelp.
	TWMHotKey (see page 5016)	This is record Messages.TWMHotKey.
	TWMHScrollClipboard (see page 5017)	This is record Messages.TWMHScrollClipboard.
	TWMInitDialog (see page 5017)	This is record Messages.TWMInitDialog.

	TWMInitMenu (see page 5018)	This is record Messages.TWMInitMenu.
	TWMInitMenuPopup (see page 5018)	This is record Messages.TWMInitMenuPopup.
	TWMKey (see page 5019)	This is record Messages.TWMKey.
	TWMKillFocus (see page 5019)	This is record Messages.TWMKillFocus.
	TWMMDIActivate (see page 5020)	This is record Messages.TWMMDIActivate.
	TWMMDICascade (see page 5020)	This is record Messages.TWMMDICascade.
	TWMMDICreate (see page 5021)	This is record Messages.TWMMDICreate.
	TWMMDIDestroy (see page 5021)	This is record Messages.TWMMDIDestroy.
	TWMMDIMaximize (see page 5022)	This is record Messages.TWMMDIMaximize.
	TWMMDINext (see page 5022)	This is record Messages.TWMMDINext.
	TWMMDIRestore (see page 5023)	This is record Messages.TWMMDIRestore.
	TWMMDISetMenu (see page 5023)	This is record Messages.TWMMDISetMenu.
	TWMMDITile (see page 5024)	This is record Messages.TWMMDITile.
	TWMMeasureItem (see page 5024)	This is record Messages.TWMMeasureItem.
	TWMMenuChar (see page 5025)	This is record Messages.TWMMenuChar.
	TWMMenuSelect (see page 5025)	This is record Messages.TWMMenuSelect.
	TWMMouse (see page 5026)	This is record Messages.TWMMouse.
	TWMMouseActivate (see page 5026)	This is record Messages.TWMMouseActivate.
	TWMMouseWheel (see page 5027)	This is record Messages.TWMMouseWheel.
	TWMMove (see page 5027)	This is record Messages.TWMMove.
	TWMMoving (see page 5028)	This is record Messages.TWMMoving.
	TWMNCActivate (see page 5028)	This is record Messages.TWMNCActivate.
	TWMNCCalcSize (see page 5029)	This is record Messages.TWMNCCalcSize.
	TWMNCCreate (see page 5029)	This is record Messages.TWMNCCreate.
	TWMNCHitMessage (see page 5030)	This is record Messages.TWMNCHitMessage.
	TWMNCHitTest (see page 5030)	This is record Messages.TWMNCHitTest.
	TWMNCPaint (see page 5031)	This is record Messages.TWMNCPaint.
	TWMNextDlgCtl (see page 5031)	This is record Messages.TWMNextDlgCtl.
	TWMNoParams (see page 5032)	This is record Messages.TWMNoParams.
	TWMNotify (see page 5032)	This is record Messages.TWMNotify.
	TWMNotifyFormat (see page 5033)	This is record Messages.TWMNotifyFormat.
	TWMPaint (see page 5033)	This is record Messages.TWMPaint.
	TWMPaintClipboard (see page 5034)	This is record Messages.TWMPaintClipboard.
	TWMPaletteChanged (see page 5034)	This is record Messages.TWMPaletteChanged.
	TWMPaletteIsChanging (see page 5035)	This is record Messages.TWMPaletteIsChanging.
	TWMParentNotify (see page 5035)	This is record Messages.TWMParentNotify.
	TWMPower (see page 5036)	This is record Messages.TWMPower.
	TWMPrint (see page 5036)	This is record Messages.TWMPrint.
	TWMQueryEndSession (see page 5037)	This is record Messages.TWMQueryEndSession.
	TWMQuit (see page 5037)	This is record Messages.TWMQuit.
	TWMRenderFormat (see page 5038)	This is record Messages.TWMRenderFormat.
	TWMScroll (see page 5038)	This is record Messages.TWMScroll.
	TWMSetCursor (see page 5039)	This is record Messages.TWMSetCursor.
	TWMSetFocus (see page 5039)	This is record Messages.TWMSetFocus.
	TWMSetFont (see page 5040)	This is record Messages.TWMSetFont.
	TWMSetHotKey (see page 5040)	This is record Messages.TWMSetHotKey.
	TWMSetIcon (see page 5041)	This is record Messages.TWMSetIcon.
	TWMSetRedraw (see page 5041)	This is record Messages.TWMSetRedraw.
	TWMSetText (see page 5042)	This is record Messages.TWMSetText.
	TWMSettingChange (see page 5042)	This is record Messages.TWMSettingChange.
	TWMShowWindow (see page 5043)	This is record Messages.TWMShowWindow.
	TWMSize (see page 5043)	This is record Messages.TWMSize.
	TWMSizeClipboard (see page 5044)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 5044)	This is record Messages.TWMSpoolerStatus.

	TWMStyleChange (see page 5045)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 5045)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 5046)	This is record Messages.TWMSysDeadChar.
	TWMSystemError (see page 5046)	This is record Messages.TWMSystemError.
	TWMTimer (see page 5047)	This is record Messages.TWMTimer.
	TWMUIState (see page 5047)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 5048)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 5048)	This is record Messages.TWMWindowPosMsg.
	TWMWinIniChange (see page 5049)	This is record Messages.TWMWinIniChange.

Types

Name	Description
PMessage (see page 5051)	This is type Messages.PMessage.
TWMCancelMode (see page 5052)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 5052)	This is type Messages.TWMChangeUIState.
TWMChar (see page 5052)	This is type Messages.TWMChar.
TWMChildActivate (see page 5053)	This is type Messages.TWMChildActivate.
TWMClear (see page 5053)	This is type Messages.TWMClear.
TWMClose (see page 5053)	This is type Messages.TWMClose.
TWMCopy (see page 5054)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 5054)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 5054)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 5055)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 5055)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 5055)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 5056)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 5056)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 5056)	This is type Messages.TWMCut.
TWMDeadChar (see page 5057)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 5057)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 5057)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 5058)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 5058)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 5058)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 5059)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 5059)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 5059)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 5060)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 5060)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 5060)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 5061)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 5061)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 5061)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 5062)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 5062)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 5062)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 5063)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 5063)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 5063)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 5064)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 5064)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 5064)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 5065)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 5065)	This is type Messages.TWMNCLButtonDblClk.

TWMNCLButtonDown (see page 5065)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 5066)	This is type Messages.TWMNCLButtonUp.
TWMNCMButtonDblClk (see page 5066)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 5066)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 5067)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 5067)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 5067)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 5068)	This is type Messages.TWMNCRButtonDown.
TWMNCRButtonUp (see page 5068)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 5068)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 5069)	This is type Messages.TWMPaste.
TWMPrintClient (see page 5069)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 5069)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 5070)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 5070)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 5070)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 5071)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 5071)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 5071)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 5072)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 5072)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 5072)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 5073)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 5073)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 5073)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 5074)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 5074)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 5074)	This is type Messages.TWMTimeChange.
TWMUndo (see page 5075)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 5075)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 5075)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 5076)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 5076)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 5076)	This is type Messages.TWMWindowPosChanging.

49.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	SendGetIntMessage (see page 4991)	Send Windows message, sending and receiving integer values.
	SendGetStructMessage (see page 4992)	Send Windows message, sending and receiving data structure.
	SendStructMessage (see page 4992)	Send Windows message, sending data structure.
	SendTextMessage (see page 4993)	Send Windows message, sending text.

49.1.1 Messages.SendGetIntMessage Function

Send Windows message, sending and receiving integer values.

Pascal

```
function SendGetIntMessage(Handle: HWND; Msg: UINT; var WParam: Integer; var LParam: Integer):
LRESULT;
```

C++

```
LRESULT SendGetIntMessage(HWND Handle, UINT Msg, int WParam, int LParam);
```

File

Messages

Description

SendGetIntMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. A value may be sent and returned.

LParam is an integer **LPARAM** for the message, depending on **Msg**. A value may be sent and returned.

Various records have been defined in the **Messages (see page 4979)** unit to represent Windows messages. For instance, **TWMCopy (see page 5054)** represents the message **WM_COPY (see page 5149)**, **TWMKeyDown (see page 5061)** represents **WM_KEYDOWN (see page 5176)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

Messages unit

49.1.2 Messages.SendGetStructMessage Function

Send Windows message, sending and receiving data structure.

Pascal

```
function SendGetStructMessage(Handle: HWND; Msg: UINT; WParam: WPARAM; var LParam; Unused:
Boolean = False): LRESULT;
```

C++

```
LRESULT SendGetStructMessage(HWND Handle, UINT Msg, WPARAM WParam,  LParam, Boolean Unused =
False);
```

File

Messages

Description

SendGetStructMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. The value is sent.

LParam is a data structure **LPARAM** for the message, depending on **Msg**. A value may be sent and returned.

Unused is not used and is optional.

Various records have been defined in the **Messages (see page 4979)** unit to represent Windows messages. For instance, **TWMCopy (see page 5054)** represents the message **WM_COPY (see page 5149)**, **TWMKeyDown (see page 5061)** represents **WM_KEYDOWN (see page 5176)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

49.1.3 Messages.SendStructMessage Function

Send Windows message, sending data structure.

Pascal

```
function SendStructMessage(Handle: HWND; Msg: UINT; WParam: WPARAM; const LParam): LRESULT;
```

C++

```
LRESULT SendStructMessage(HWND Handle, UINT Msg, WPARAM WParam, const  LParam);
```

File

Messages

Description

SendStructMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. The value is sent.

LParam is a data structure **LPARAM** for the message, depending on **Msg**. The value is sent.

Various records have been defined in the **Messages (see page 4979)** unit to represent Windows messages. For instance, **TWMCopy (see page 5054)** represents the message **WM_COPY (see page 5149)**, **TWMKeyDown (see page 5061)** represents **WM_KEYDOWN (see page 5176)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

49.1.4 Messages.SendTextMessage Function

Send Windows message, sending text.

Pascal

```
function SendTextMessage(Handle: HWND; Msg: UINT; WParam: WPARAM; LParam: UnicodeString):
LRESULT; overload;
```

C++

```
LRESULT SendTextMessage(HWND Handle, UINT Msg, WPARAM WParam, UnicodeString LParam);
```

File

Messages

Description

SendTextMessage calls the Windows **SendMessage** function and returns an **LRESULT**.

Handle is an **HWND** window handle.

Msg is the Windows message ID. This constant is exactly the same as the Windows message ID described in the Microsoft Windows SDK.

WParam is a **WPARAM** for the message, depending on **Msg**. The value is sent.

LParam is a **string LPARAM** for the message, depending on **Msg**. The value is sent.

Various records have been defined in the **Messages (see page 4979)** unit to represent Windows messages. For instance, **TWMCopy (see page 5054)** represents the message **WM_COPY (see page 5149)**, **TWMKeyDown (see page 5061)** represents **WM_KEYDOWN (see page 5176)**, and so on.

See the Microsoft Windows SDK documentation for information on the Windows messages and their associated **WPARAM** and **LPARAM**.

49.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TMessage (see page 4997)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 4998)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 4998)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 4999)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 4999)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 5000)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 5000)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 5001)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 5001)	This is record Messages.TWMCommand.
	TWMCompacting (see page 5002)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 5002)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 5003)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 5003)	This is record Messages.TWMCopyData.
	TWMCreate (see page 5004)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 5004)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 5005)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 5005)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 5006)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 5006)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 5007)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 5007)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 5008)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 5008)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 5009)	This is record Messages.TWMDDE_Unadvise.
	TWMDeleteItem (see page 5009)	This is record Messages.TWMDeleteItem.
	TWMDevModeChange (see page 5010)	This is record Messages.TWMDevModeChange.
	TWMDisplayChange (see page 5010)	This is record Messages.TWMDisplayChange.
	TWMDrawItem (see page 5011)	This is record Messages.TWMDrawItem.
	TWMDropFiles (see page 5011)	This is record Messages.TWMDropFiles.
	TWMEnable (see page 5012)	This is record Messages.TWMEnable.
	TWMEndSession (see page 5012)	This is record Messages.TWMEndSession.
	TWMEnterIdle (see page 5013)	This is record Messages.TWMEnterIdle.
	TWMEnterMenuLoop (see page 5013)	This is record Messages.TWMEnterMenuLoop.
	TWMEraseBkgnd (see page 5014)	This is record Messages.TWMEraseBkgnd.
	TWMGetIcon (see page 5014)	This is record Messages.TWMGetIcon.
	TWMGetMinMaxInfo (see page 5015)	This is record Messages.TWMGetMinMaxInfo.
	TWMGetText (see page 5015)	This is record Messages.TWMGetText.
	TWMHelp (see page 5016)	This is record Messages.TWMHelp.
	TWMHotKey (see page 5016)	This is record Messages.TWMHotKey.
	TWMHScrollClipboard (see page 5017)	This is record Messages.TWMHScrollClipboard.
	TWMInitDialog (see page 5017)	This is record Messages.TWMInitDialog.
	TWMInitMenu (see page 5018)	This is record Messages.TWMInitMenu.
	TWMInitMenuPopup (see page 5018)	This is record Messages.TWMInitMenuPopup.
	TWMKey (see page 5019)	This is record Messages.TWMKey.

	TWMKillFocus (see page 5019)	This is record Messages.TWMKillFocus.
	TWMMDIActivate (see page 5020)	This is record Messages.TWMMDIActivate.
	TWMMDICascade (see page 5020)	This is record Messages.TWMMDICascade.
	TWMMDICreate (see page 5021)	This is record Messages.TWMMDICreate.
	TWMMDIDestroy (see page 5021)	This is record Messages.TWMMDIDestroy.
	TWMMDIMaximize (see page 5022)	This is record Messages.TWMMDIMaximize.
	TWMMDINext (see page 5022)	This is record Messages.TWMMDINext.
	TWMMDIRestore (see page 5023)	This is record Messages.TWMMDIRestore.
	TWMMDISetMenu (see page 5023)	This is record Messages.TWMMDISetMenu.
	TWMMDITile (see page 5024)	This is record Messages.TWMMDITile.
	TWMMeasureItem (see page 5024)	This is record Messages.TWMMeasureItem.
	TWMMenuChar (see page 5025)	This is record Messages.TWMMenuChar.
	TWMMenuSelect (see page 5025)	This is record Messages.TWMMenuSelect.
	TWMMouse (see page 5026)	This is record Messages.TWMMouse.
	TWMMouseActivate (see page 5026)	This is record Messages.TWMMouseActivate.
	TWMMouseWheel (see page 5027)	This is record Messages.TWMMouseWheel.
	TWMMove (see page 5027)	This is record Messages.TWMMove.
	TWMMoving (see page 5028)	This is record Messages.TWMMoving.
	TWMNCActivate (see page 5028)	This is record Messages.TWMNCActivate.
	TWMNCCalcSize (see page 5029)	This is record Messages.TWMNCCalcSize.
	TWMNCCreate (see page 5029)	This is record Messages.TWMNCCreate.
	TWMNCHitMessage (see page 5030)	This is record Messages.TWMNCHitMessage.
	TWMNCHitTest (see page 5030)	This is record Messages.TWMNCHitTest.
	TWMNCPaint (see page 5031)	This is record Messages.TWMNCPaint.
	TWMNextDlgCtl (see page 5031)	This is record Messages.TWMNextDlgCtl.
	TWMNoParams (see page 5032)	This is record Messages.TWMNoParams.
	TWMNotify (see page 5032)	This is record Messages.TWMNotify.
	TWMNotifyFormat (see page 5033)	This is record Messages.TWMNotifyFormat.
	TWMPaint (see page 5033)	This is record Messages.TWMPaint.
	TWMPaintClipboard (see page 5034)	This is record Messages.TWMPaintClipboard.
	TWMPaletteChanged (see page 5034)	This is record Messages.TWMPaletteChanged.
	TWMPaletteIsChanging (see page 5035)	This is record Messages.TWMPaletteIsChanging.
	TWMParentNotify (see page 5035)	This is record Messages.TWMParentNotify.
	TWMPower (see page 5036)	This is record Messages.TWMPower.
	TWMPrint (see page 5036)	This is record Messages.TWMPrint.
	TWMQueryEndSession (see page 5037)	This is record Messages.TWMQueryEndSession.
	TWMQuit (see page 5037)	This is record Messages.TWMQuit.
	TWMRenderFormat (see page 5038)	This is record Messages.TWMRenderFormat.
	TWMScroll (see page 5038)	This is record Messages.TWMScroll.
	TWMSetCursor (see page 5039)	This is record Messages.TWMSetCursor.
	TWMSetFocus (see page 5039)	This is record Messages.TWMSetFocus.
	TWMSetFont (see page 5040)	This is record Messages.TWMSetFont.
	TWMSetHotKey (see page 5040)	This is record Messages.TWMSetHotKey.
	TWMSetIcon (see page 5041)	This is record Messages.TWMSetIcon.
	TWMSetRedraw (see page 5041)	This is record Messages.TWMSetRedraw.
	TWMSetText (see page 5042)	This is record Messages.TWMSetText.
	TWMSettingChange (see page 5042)	This is record Messages.TWMSettingChange.
	TWMShowWindow (see page 5043)	This is record Messages.TWMShowWindow.
	TWMSize (see page 5043)	This is record Messages.TWMSize.
	TWMSizeClipboard (see page 5044)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 5044)	This is record Messages.TWMSpoolerStatus.
	TWMStyleChange (see page 5045)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 5045)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 5046)	This is record Messages.TWMSysDeadChar.

	TWMSystemError (see page 5046)	This is record Messages.TWMSystemError.
	TWMTimer (see page 5047)	This is record Messages.TWMTimer.
	TWMUIState (see page 5047)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 5048)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 5048)	This is record Messages.TWMWindowPosMsg.
	TWMWinIniChange (see page 5049)	This is record Messages.TWMWinIniChange.

49.2.1 Messages.TMessage Record

TMessage represents a Windows message.

Pascal

```
TMessage = packed record
  Msg: Cardinal;
  case Integer of
    0: (WParam: WPARAM;
        LParam: LPARAM;
        Result: LRESULT;);
    1: (WParamLo: Word;
        WParamHi: Word;
        LParamLo: Word;
        LParamHi: Word;
        ResultLo: Word;
        ResultHi: Word;);
end;
```

C++

```
struct TMessage {
  unsigned Msg;
  WPARAM WParam;
  LPARAM LParam;
  LRESULT Result;
  Word WParamLo;
  Word WParamHi;
  Word LParamLo;
  Word LParamHi;
  Word ResultLo;
  Word ResultHi;
};
```

File

Messages

Description

The TMessage type represents a Windows message in WndProc and other methods.

The Msg field represents the Windows Message code.

The WParam field represents the WParam of the message. To access the low and high words of this field, use the WParamLo and WParamHi fields instead.

The LParam field represents the LParam of the message. To access the low and high words of this field, use the LParamLo and LParamHi fields instead.

The Result field holds the return value. To access the low and high words of this field, use the ResultLo and ResultHi fields instead.

49.2.2 Messages.TMSHMouseWheel Record

Pascal

```
TMSHMouseWheel = packed record
  Msg: Cardinal;
  WheelDelta: Integer;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TMSHMouseWheel {
  unsigned Msg;
  int WheelDelta;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TMSHMouseWheel.

49.2.3 Messages.TWMActivate Record

Pascal

```
TWMActivate = packed record
  Msg: Cardinal;
  Active: Word;
  Minimized: WordBool;
  ActiveWindow: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMActivate {
  unsigned Msg;
  Word Active;
  WordBool Minimized;
  HWND ActiveWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivate.

49.2.4 Messages.TWMActivateApp Record

Pascal

```
TWMActivateApp = packed record
  Msg: Cardinal;
  Active: BOOL;
  ThreadId: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMActivateApp {
  unsigned Msg;
  BOOL Active;
  Longint ThreadId;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivateApp.

49.2.5 Messages.TWMAskCBFormatName Record

Pascal

```
TWMAskCBFormatName = packed record
  Msg: Cardinal;
  NameLen: Word;
  Unused: Word;
  FormatName: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMAskCBFormatName {
```

```
  unsigned Msg;
  Word NameLen;
  Word Unused;
  const char * FormatName;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMAskCBFormatName.

49.2.6 Messages.TWMChangeCBChain Record

Pascal

```
TWMChangeCBChain = packed record
  Msg: Cardinal;
  Remove: HWND;
  Next: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMChangeCBChain {
  unsigned Msg;
  HWND Remove;
  HWND Next;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMChangeCBChain.

49.2.7 Messages.TWMCharToItem Record

Pascal

```
TWMCharToItem = packed record
  Msg: Cardinal;
  Key: Word;
  CaretPos: Word;
  ListBox: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCharToItem {
  unsigned Msg;
  Word Key;
  Word CaretPos;
  HWND ListBox;
```

```
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCharToItem.

49.2.8 Messages.TWMChooseFont_GetLogFont Record

Pascal

```
TWMChooseFont_GetLogFont = packed record
  Msg: Cardinal;
  Unused: Longint;
  LogFont: PLogFont;
  Result: Longint;
end;
```

C++

```
struct TWMChooseFont_GetLogFont {
  unsigned Msg;
  Longint Unused;
  PLogFont LogFont;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMChooseFont_GetLogFont.

49.2.9 Messages.TWMCommand Record

Pascal

```
TWMCommand = packed record
  Msg: Cardinal;
  ItemID: Word;
  NotifyCode: Word;
  Ctl: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCommand {
  unsigned Msg;
  Word ItemID;
  Word NotifyCode;
  HWND Ctl;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCommand.

49.2.10 Messages.TWMCompacting Record

Pascal

```
TWMCompacting = packed record
  Msg: Cardinal;
  CompactRatio: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMCompacting {
  unsigned Msg;
  Longint CompactRatio;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompacting.

49.2.11 Messages.TWMCompareItem Record

Pascal

```
TWMCompareItem = packed record
  Msg: Cardinal;
  Ctl: HWnd;
  CompareItemStruct: PCompareItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCompareItem {
  unsigned Msg;
  HWnd Ctl;
  PCompareItemStruct CompareItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompareItem.

49.2.12 Messages.TWMContextMenu Record

Pascal

```
TWMContextMenu = packed record
  Msg: Cardinal;
  hWnd: HWND;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMContextMenu {
  unsigned Msg;
  HWND hWnd;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMContextMenu.

49.2.13 Messages.TWMCopyData Record

Pascal

```
TWMCopyData = packed record
  Msg: Cardinal;
  From: HWND;
  CopyDataStruct: PCopyDataStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCopyData {
  unsigned Msg;
  HWND From;
  PCopyDataStruct CopyDataStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCopyData.

49.2.14 Messages.TWMCreate Record

Pascal

```
TWMCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCreate.

49.2.15 Messages.TWMCtlColor Record

Pascal

```
TWMCtlColor = packed record
  Msg: Cardinal;
  ChildDC: HDC;
  ChildWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCtlColor {
  unsigned Msg;
  HDC ChildDC;
  HWND ChildWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCtlColor.

49.2.16 Messages.TWMDDE_Ack Record

Pascal

```
TWMDDE_Ack = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  case Word of
    WM_DDE_EXECUTE: (PackedVal: Longint;);
    WM_DDE_INITIATE: (App: Word;
                      Topic: Word;
                      Result: Longint;);
end;
```

C++

```
struct TWMDDE_Ack {
  unsigned Msg;
  HWND PostingApp;
  Word App;
  Word Topic;
  Longint Result;
  Longint PackedVal;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Ack.

49.2.17 Messages.TWMDDE_Advise Record

Pascal

```
TWMDDE_Advise = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Advise {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Advise.

49.2.18 Messages.TWMDDE_Data Record

Pascal

```
TWMDDE_Data = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Data {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Data.

49.2.19 Messages.TWMDDE_Execute Record

Pascal

```
TWMDDE_Execute = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Commands: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Execute {
  unsigned Msg;
  HWND PostingApp;
  THandle Commands;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Execute.

49.2.20 Messages.TWMDDE_Initiate Record

Pascal

```
TWMDDE_Initiate = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  App: Word;
  Topic: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Initiate {
  unsigned Msg;
  HWND PostingApp;
  Word App;
  Word Topic;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Initiate.

49.2.21 Messages.TWMDDE_Poke Record

Pascal

```
TWMDDE_Poke = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Poke {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Poke.

49.2.22 Messages.TWMDDE_Request Record

Pascal

```
TWMDDE_Request = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Format: Word;
  Item: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Request {
  unsigned Msg;
  HWND PostingApp;
  Word Format;
  Word Item;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Request.

49.2.23 Messages.TWMDDE_Terminate Record

Pascal

```
TWMDDE_Terminate = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Terminate {
  unsigned Msg;
  HWND PostingApp;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Terminate.

49.2.24 Messages.TWMDDE_Unadvise Record

Pascal

```
TWMDDE_Unadvise = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Format: Word;
  Item: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Unadvise {
  unsigned Msg;
  HWND PostingApp;
  Word Format;
  Word Item;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Unadvise.

49.2.25 Messages.TWMDeleteItem Record

Pascal

```
TWMDeleteItem = packed record
  Msg: Cardinal;
  Ctl: HWND;
  DeleteItemStruct: PDeleteItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMDeleteItem {
  unsigned Msg;
  HWND Ctl;
  PDeleteItemStruct DeleteItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDeleteItem.

49.2.26 Messages.TWMDevModeChange Record

Pascal

```
TWMDevModeChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Device: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMDevModeChange {
  unsigned Msg;
  int Unused;
  const char * Device;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDevModeChange.

49.2.27 Messages.TWMDisplayChange Record

Pascal

```
TWMDisplayChange = packed record
  Msg: Cardinal;
  BitsPerPixel: Integer;
  Width: Word;
  Height: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDisplayChange {
  unsigned Msg;
  int BitsPerPixel;
  Word Width;
  Word Height;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDisplayChange.

49.2.28 Messages.TWMDrawItem Record

Pascal

```
TWMDrawItem = packed record
  Msg: Cardinal;
  Ctl: HWND;
  DrawItemStruct: PDrawItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMDrawItem {
  unsigned Msg;
  HWND Ctl;
  PDrawItemStruct DrawItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDrawItem.

49.2.29 Messages.TWMDropFiles Record

Pascal

```
TWMDropFiles = packed record
  Msg: Cardinal;
  Drop: THANDLE;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDropFiles {
  unsigned Msg;
  THANDLE Drop;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDropFiles.

49.2.30 Messages.TWMEnable Record

Pascal

```
TWMEnable = packed record
  Msg: Cardinal;
  Enabled: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnable {
  unsigned Msg;
  LongBool Enabled;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnable.

49.2.31 Messages.TWMEndSession Record

Pascal

```
TWMEndSession = packed record
  Msg: Cardinal;
  EndSession: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEndSession {
  unsigned Msg;
  LongBool EndSession;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEndSession.

49.2.32 Messages.TWMEnterIdle Record

Pascal

```
TWMEnterIdle = packed record
  Msg: Cardinal;
  Source: Longint;
  IdleWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMEnterIdle {
  unsigned Msg;
  Longint Source;
  HWND IdleWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterIdle.

49.2.33 Messages.TWMEnterMenuLoop Record

Pascal

```
TWMEnterMenuLoop = packed record
  Msg: Cardinal;
  IsTrackPopupMenu: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnterMenuLoop {
  unsigned Msg;
  LongBool IsTrackPopupMenu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterMenuLoop.

49.2.34 Messages.TWMEraseBkgnd Record

Pascal

```
TWMEraseBkgnd = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEraseBkgnd {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEraseBkgnd.

49.2.35 Messages.TWMGetIcon Record

Pascal

```
TWMGetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMGetIcon {
  unsigned Msg;
  Longbool BigIcon;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetIcon.

49.2.36 Messages.TWMGetMinMaxInfo Record

Pascal

```
TWMGetMinMaxInfo = packed record
  Msg: Cardinal;
  Unused: Integer;
  MinMaxInfo: PMinMaxInfo;
  Result: Longint;
end;
```

C++

```
struct TWMGetMinMaxInfo {
  unsigned Msg;
  int Unused;
  PMinMaxInfo MinMaxInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetMinMaxInfo.

49.2.37 Messages.TWMGetText Record

Pascal

```
TWMGetText = packed record
  Msg: Cardinal;
  TextMax: Integer;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMGetText {
  unsigned Msg;
  int TextMax;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetText.

49.2.38 Messages.TWMHelp Record

Pascal

```
TWMHelp = packed record
  Msg: Cardinal;
  Unused: Integer;
  HelpInfo: PHelpInfo;
  Result: Longint;
end;
```

C++

```
struct TWMHelp {
  unsigned Msg;
  int Unused;
  PHelpInfo HelpInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHelp.

49.2.39 Messages.TWMHotKey Record

Pascal

```
TWMHotKey = packed record
  Msg: Cardinal;
  HotKey: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMHotKey {
  unsigned Msg;
  Longint HotKey;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHotKey.

49.2.40 Messages.TWMHScrollClipboard Record

Pascal

```
TWMHScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScrollCode: Word;
  Pos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMHScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScrollCode;
  Word Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHScrollClipboard.

49.2.41 Messages.TWMInitDialog Record

Pascal

```
TWMInitDialog = packed record
  Msg: Cardinal;
  Focus: HWND;
  InitParam: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitDialog {
  unsigned Msg;
  HWND Focus;
  Longint InitParam;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitDialog.

49.2.42 Messages.TWMInitMenu Record

Pascal

```
TWMInitMenu = packed record
  Msg: Cardinal;
  Menu: HMENU;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenu {
  unsigned Msg;
  HMENU Menu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenu.

49.2.43 Messages.TWMInitMenuPopup Record

Pascal

```
TWMInitMenuPopup = packed record
  Msg: Cardinal;
  MenuPopup: HMENU;
  Pos: Smallint;
  SystemMenu: WordBool;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenuPopup {
  unsigned Msg;
  HMENU MenuPopup;
  Smallint Pos;
  WordBool SystemMenu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenuPopup.

49.2.44 Messages.TWMKey Record

Pascal

```
TWMKey = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMKey {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMKey.

49.2.45 Messages.TWMKillFocus Record

Pascal

```
TWMKillFocus = packed record
  Msg: Cardinal;
  FocusedWnd: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMKillFocus {
  unsigned Msg;
  HWND FocusedWnd;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMKillFocus.

49.2.46 Messages.TWMMDIActivate Record

Pascal

```
TWMMDIActivate = packed record
  Msg: Cardinal;
  case Integer of
    0: (ChildWnd: HWND;);
    1: (DeactiveWnd: HWND;
        ActiveWnd: HWND;
        Result: Longint;);
end;
```

C++

```
struct TWMMDIActivate {
  unsigned Msg;
  HWND ChildWnd;
  HWND DeactiveWnd;
  HWND ActiveWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIActivate.

49.2.47 Messages.TWMMDICascade Record

Pascal

```
TWMMDICascade = packed record
  Msg: Cardinal;
  Cascade: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDICascade {
  unsigned Msg;
  Longint Cascade;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDICascade.

49.2.48 Messages.TWMMDICreate Record

Pascal

```
TWMMDICreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  MDICreateStruct: PMDICreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMMDICreate {
  unsigned Msg;
  int Unused;
  PMDICreateStruct MDICreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDICreate.

49.2.49 Messages.TWMMDIDestroy Record

Pascal

```
TWMMDIDestroy = packed record
  Msg: Cardinal;
  Child: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIDestroy {
  unsigned Msg;
  HWND Child;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIDestroy.

49.2.50 Messages.TWMMDIMaximize Record

Pascal

```
TWMMDIMaximize = packed record
  Msg: Cardinal;
  Maximize: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIMaximize {
  unsigned Msg;
  HWND Maximize;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIMaximize.

49.2.51 Messages.TWMMDINext Record

Pascal

```
TWMMDINext = packed record
  Msg: Cardinal;
  Child: HWND;
  Next: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDINext {
  unsigned Msg;
  HWND Child;
  Longint Next;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDINext.

49.2.52 Messages.TWMMDIRestore Record

Pascal

```
TWMMDIRestore = packed record
  Msg: Cardinal;
  IDChild: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIRestore {
  unsigned Msg;
  HWND IDChild;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIRestore.

49.2.53 Messages.TWMMDISetMenu Record

Pascal

```
TWMMDISetMenu = packed record
  Msg: Cardinal;
  MenuFrame: HMENU;
  MenuWindow: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMDISetMenu {
  unsigned Msg;
  HMENU MenuFrame;
  HMENU MenuWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDISetMenu.

49.2.54 Messages.TWMMDITile Record

Pascal

```
TWMMDITile = packed record
  Msg: Cardinal;
  Tile: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDITile {
  unsigned Msg;
  Longint Tile;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDITile.

49.2.55 Messages.TWMMeasureItem Record

Pascal

```
TWMMeasureItem = packed record
  Msg: Cardinal;
  IDCtl: HWnd;
  MeasureItemStruct: PMeasureItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMMeasureItem {
  unsigned Msg;
  HWnd IDCtl;
  PMeasureItemStruct MeasureItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMeasureItem.

49.2.56 Messages.TWMMenuChar Record

Pascal

```
TWMMenuChar = packed record
  Msg: Cardinal;
  User: Char;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuChar {
  unsigned Msg;
  Char User;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMenuChar.

49.2.57 Messages.TWMMenuSelect Record

Pascal

```
TWMMenuSelect = packed record
  Msg: Cardinal;
  IDItem: Word;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuSelect {
  unsigned Msg;
  Word IDItem;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMenuSelect.

49.2.58 Messages.TWMMouse Record

Pascal

```
TWMMouse = packed record
  Msg: Cardinal;
  Keys: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMouse {
  unsigned Msg;
  Longint Keys;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouse.

49.2.59 Messages.TWMMouseActivate Record

Pascal

```
TWMMouseActivate = packed record
  Msg: Cardinal;
  TopLevel: HWND;
  HitTestCode: Word;
  MouseMsg: Word;
  Result: Longint;
end;
```

C++

```
struct TWMMouseActivate {
  unsigned Msg;
  HWND TopLevel;
  Word HitTestCode;
  Word MouseMsg;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouseActivate.

49.2.60 Messages.TWMMouseWheel Record

Pascal

```
TWMMouseWheel = packed record
  Msg: Cardinal;
  Keys: SmallInt;
  WheelDelta: SmallInt;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMouseWheel {
  unsigned Msg;
  SmallInt Keys;
  SmallInt WheelDelta;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouseWheel.

49.2.61 Messages.TWMMove Record

Pascal

```
TWMMove = packed record
  Msg: Cardinal;
  Unused: Integer;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMove {
  unsigned Msg;
  int Unused;
  Smallint XPos;
  Smallint YPos;
```

```
    TSmallPoint Pos;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMMove.

49.2.62 Messages.TWMMoving Record

Pascal

```
  TWMMoving = packed record
    Msg: Cardinal;
    Edge: Integer;
    DragRect: PRect;
  end;
```

C++

```
  struct TWMMoving {
    unsigned Msg;
    int Edge;
    PRect DragRect;
  };
```

File

Messages

Description

This is record Messages.TWMMoving.

49.2.63 Messages.TWMNCActivate Record

Pascal

```
  TWMNCActivate = packed record
    Msg: Cardinal;
    Active: BOOL;
    Unused: Longint;
    Result: Longint;
  end;
```

C++

```
  struct TWMNCActivate {
    unsigned Msg;
    BOOL Active;
    Longint Unused;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMNCActivate.

49.2.64 Messages.TWMNCCalcSize Record

Pascal

```
TWMNCCalcSize = packed record
  Msg: Cardinal;
  CalcValidRects: BOOL;
  CalcSize_Params: PNCCalcSizeParams;
  Result: Longint;
end;
```

C++

```
struct TWMNCCalcSize {
  unsigned Msg;
  BOOL CalcValidRects;
  PNCCalcSizeParams CalcSize_Params;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCalcSize.

49.2.65 Messages.TWMNCCreate Record

Pascal

```
TWMNCCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMNCCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCreate.

49.2.66 Messages.TWMNCHitMessage Record

Pascal

```
TWMNCHitMessage = packed record
  Msg: Cardinal;
  HitTest: Longint;
  XCursor: Smallint;
  YCursor: Smallint;
  Result: Longint;
end;
```

C++

```
struct TWMNCHitMessage {
  unsigned Msg;
  Longint HitTest;
  Smallint XCursor;
  Smallint YCursor;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitMessage.

49.2.67 Messages.TWMNCHitTest Record

Pascal

```
TWMNCHitTest = packed record
  Msg: Cardinal;
  Unused: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMNCHitTest {
  unsigned Msg;
  Longint Unused;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitTest.

49.2.68 Messages.TWMNCPaint Record

Pascal

```
TWMNCPaint = packed record
  Msg: Cardinal;
  RGN: HRGN;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNCPaint {
  unsigned Msg;
  HRGN RGN;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCPaint.

49.2.69 Messages.TWMNextDlgCtl Record

Pascal

```
TWMNextDlgCtl = packed record
  Msg: Cardinal;
  CtlFocus: Longint;
  Handle: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMNextDlgCtl {
  unsigned Msg;
  Longint CtlFocus;
  WordBool Handle;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNextDlgCtl.

49.2.70 Messages.TWMNoParams Record

Pascal

```
TWMNoParams = packed record
  Msg: Cardinal;
  Unused: array[0..3] of Word;
  Result: Longint;
end;
```

C++

```
struct TWMNoParams {
  unsigned Msg;
  array[0..3] of Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNoParams.

49.2.71 Messages.TWMNotify Record

Pascal

```
TWMNotify = packed record
  Msg: Cardinal;
  IDCtrl: Longint;
  NMHdr: PNMHdr;
  Result: Longint;
end;
```

C++

```
struct TWMNotify {
  unsigned Msg;
  Longint IDCtrl;
  PNMHdr NMHdr;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNotify.

49.2.72 Messages.TWMNotifyFormat Record

Pascal

```
TWMNotifyFormat = packed record
  Msg: Cardinal;
  From: HWND;
  Command: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNotifyFormat {
  unsigned Msg;
  HWND From;
  Longint Command;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNotifyFormat.

49.2.73 Messages.TWMPaint Record

Pascal

```
TWMPaint = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaint {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaint.

49.2.74 Messages.TWMPaintClipboard Record

Pascal

```
TWMPaintClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  PaintStruct: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMPaintClipboard {
  unsigned Msg;
  HWND Viewer;
  THandle PaintStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaintClipboard.

49.2.75 Messages.TWMPaletteChanged Record

Pascal

```
TWMPaletteChanged = packed record
  Msg: Cardinal;
  PalChg: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaletteChanged {
  unsigned Msg;
  HWND PalChg;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaletteChanged.

49.2.76 Messages.TWMPaletteIsChanging Record

Pascal

```
TWMPaletteIsChanging = packed record
  Msg: Cardinal;
  Realize: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaletteIsChanging {
  unsigned Msg;
  HWND Realize;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaletteIsChanging.

49.2.77 Messages.TWMParentNotify Record

Pascal

```
TWMParentNotify = packed record
  Msg: Cardinal;
  Event: Word;
  case Word of
    0: (Value1: Word;
        Value2: Longint;
        Result: Longint;);
    WM_DESTROY: (ChildID: Word;
                 ChildWnd: HWnd;);
    WM_RBUTTONDOWN: (Value: Word;
                     XPos: Smallint;
                     YPos: Smallint;);
end;
```

C++

```
struct TWMParentNotify {
  unsigned Msg;
  Word Event;
  Word ChildID;
  HWnd ChildWnd;
  Word Value;
  Smallint XPos;
  Smallint YPos;
  Word Value1;
  Longint Value2;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMParentNotify.

49.2.78 Messages.TWMPower Record

Pascal

```
TWMPower = packed record
  Msg: Cardinal;
  PowerEvt: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPower {
  unsigned Msg;
  Longint PowerEvt;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPower.

49.2.79 Messages.TWMPrint Record

Pascal

```
TWMPrint = packed record
  Msg: Cardinal;
  DC: HDC;
  Flags: Cardinal;
  Result: Integer;
end;
```

C++

```
struct TWMPrint {
  unsigned Msg;
  HDC DC;
  unsigned Flags;
  int Result;
};
```

File

Messages

Description

This is record Messages.TWMPrint.

49.2.80 Messages.TWMQueryEndSession Record

Pascal

```
TWMQueryEndSession = packed record
  Msg: Cardinal;
  Source: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQueryEndSession {
  unsigned Msg;
  Longint Source;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQueryEndSession.

49.2.81 Messages.TWMQuit Record

Pascal

```
TWMQuit = packed record
  Msg: Cardinal;
  ExitCode: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQuit {
  unsigned Msg;
  Longint ExitCode;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQuit.

49.2.82 Messages.TWMRenderFormat Record

Pascal

```
TWMRenderFormat = packed record
  Msg: Cardinal;
  Format: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMRenderFormat {
  unsigned Msg;
  Longint Format;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMRenderFormat.

49.2.83 Messages.TWMScroll Record

Pascal

```
TWMScroll = packed record
  Msg: Cardinal;
  ScrollCode: Smallint;
  Pos: Smallint;
  ScrollBar: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMScroll {
  unsigned Msg;
  Smallint ScrollCode;
  Smallint Pos;
  HWND ScrollBar;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMScroll.

49.2.84 Messages.TWMSetCursor Record

Pascal

```
TWMSetCursor = packed record
  Msg: Cardinal;
  CursorWnd: HWND;
  HitTest: SmallInt;
  MouseMsg: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetCursor {
  unsigned Msg;
  HWND CursorWnd;
  SmallInt HitTest;
  Word MouseMsg;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetCursor.

49.2.85 Messages.TWMSetFocus Record

Pascal

```
TWMSetFocus = packed record
  Msg: Cardinal;
  FocusedWnd: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetFocus {
  unsigned Msg;
  HWND FocusedWnd;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFocus.

49.2.86 Messages.TWMSetFont Record

Pascal

```
TWMSetFont = packed record
  Msg: Cardinal;
  Font: HFONT;
  Redraw: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetFont {
  unsigned Msg;
  HFONT Font;
  WordBool Redraw;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFont.

49.2.87 Messages.TWMSetHotKey Record

Pascal

```
TWMSetHotKey = packed record
  Msg: Cardinal;
  Key: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetHotKey {
  unsigned Msg;
  Longint Key;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetHotKey.

49.2.88 Messages.TWMSetIcon Record

Pascal

```
TWMSetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Icon: HICON;
  Result: Longint;
end;
```

C++

```
struct TWMSetIcon {
  unsigned Msg;
  Longbool BigIcon;
  HICON Icon;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetIcon.

49.2.89 Messages.TWMSetRedraw Record

Pascal

```
TWMSetRedraw = packed record
  Msg: Cardinal;
  Redraw: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetRedraw {
  unsigned Msg;
  Longint Redraw;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetRedraw.

49.2.90 Messages.TWMSetText Record

Pascal

```
TWMSetText = packed record
  Msg: Cardinal;
  Unused: Longint;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSetText {
  unsigned Msg;
  Longint Unused;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetText.

49.2.91 Messages.TWMSettingChange Record

Pascal

```
TWMSettingChange = packed record
  Msg: Cardinal;
  Flag: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSettingChange {
  unsigned Msg;
  int Flag;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSettingChange.

49.2.92 Messages.TWMShowWindow Record

Pascal

```
TWMShowWindow = packed record
  Msg: Cardinal;
  Show: BOOL;
  Status: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMShowWindow {
  unsigned Msg;
  BOOL Show;
  Longint Status;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMShowWindow.

49.2.93 Messages.TWMSize Record

Pascal

```
TWMSize = packed record
  Msg: Cardinal;
  SizeType: Longint;
  Width: Word;
  Height: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSize {
  unsigned Msg;
  Longint SizeType;
  Word Width;
  Word Height;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSize.

49.2.94 Messages.TWMSizeClipboard Record

Pascal

```
TWMSizeClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  RC: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMSizeClipboard {
  unsigned Msg;
  HWND Viewer;
  THandle RC;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSizeClipboard.

49.2.95 Messages.TWMSpoolerStatus Record

Pascal

```
TWMSpoolerStatus = packed record
  Msg: Cardinal;
  JobStatus: Longint;
  JobsLeft: Word;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSpoolerStatus {
  unsigned Msg;
  Longint JobStatus;
  Word JobsLeft;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSpoolerStatus.

49.2.96 Messages.TWMStyleChange Record

Pascal

```
TWMStyleChange = packed record
  Msg: Cardinal;
  StyleType: Longint;
  StyleStruct: PStyleStruct;
  Result: Longint;
end;
```

C++

```
struct TWMStyleChange {
  unsigned Msg;
  Longint StyleType;
  PStyleStruct StyleStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMStyleChange.

49.2.97 Messages.TWMSysCommand Record

Pascal

```
TWMSysCommand = packed record
  Msg: Cardinal;
  CmdType: Longint;
  case Longint of
    SC_HOTKEY: (ActivateWnd: HWND;);
    SC_KEYMENU: (Key: Word;);
    SC_VSCROLL: (XPos: Smallint;
                 YPos: Smallint;
                 Result: Longint;);
end;
```

C++

```
struct TWMSysCommand {
  unsigned Msg;
  Longint CmdType;
  HWND ActivateWnd;
  Word Key;
  Smallint XPos;
  Smallint YPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysCommand.

49.2.98 Messages.TWMSysDeadChar Record

Pascal

```
TWMSysDeadChar = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSysDeadChar {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysDeadChar.

49.2.99 Messages.TWMSystemError Record

Pascal

```
TWMSystemError = packed record
  Msg: Cardinal;
  ErrSpec: Word;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSystemError {
  unsigned Msg;
  Word ErrSpec;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSystemError.

49.2.100 Messages.TWMTimer Record

Pascal

```
TWMTimer = packed record
  Msg: Cardinal;
  TimerID: Longint;
  TimerProc: TFarProc;
  Result: Longint;
end;
```

C++

```
struct TWMTimer {
  unsigned Msg;
  Longint TimerID;
  TFarProc TimerProc;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMTimer.

49.2.101 Messages.TWMUIState Record

Pascal

```
TWMUIState = packed record
  Msg: Cardinal;
  Action: Word;
  Flags: Word;
  Unused: Longint;
end;
```

C++

```
struct TWMUIState {
  unsigned Msg;
  Word Action;
  Word Flags;
  Longint Unused;
};
```

File

Messages

Description

This is record Messages.TWMUIState.

49.2.102 Messages.TWMVScrollClipboard Record

Pascal

```
TWMVScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScollCode: Word;
  ThumbPos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMVScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScollCode;
  Word ThumbPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMVScrollClipboard.

49.2.103 Messages.TWMWindowPosMsg Record

Pascal

```
TWMWindowPosMsg = packed record
  Msg: Cardinal;
  Unused: Integer;
  WindowPos: PWindowPos;
  Result: Longint;
end;
```

C++

```
struct TWMWindowPosMsg {
  unsigned Msg;
  int Unused;
  PWindowPos WindowPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWindowPosMsg.

49.2.104 Messages.TWMWinIniChange Record

Pascal

```
TWMWinIniChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMWinIniChange {
  unsigned Msg;
  int Unused;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWinIniChange.

49.3 Types

The following table lists types in this documentation.

Types

Name	Description
PMessage (see page 5051)	This is type Messages.PMessage.
TWMCancelMode (see page 5052)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 5052)	This is type Messages.TWMChangeUIState.
TWMChar (see page 5052)	This is type Messages.TWMChar.
TWMChildActivate (see page 5053)	This is type Messages.TWMChildActivate.
TWMClear (see page 5053)	This is type Messages.TWMClear.
TWMClose (see page 5053)	This is type Messages.TWMClose.
TWMCopy (see page 5054)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 5054)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 5054)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 5055)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 5055)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 5055)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 5056)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 5056)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 5056)	This is type Messages.TWMCut.
TWMDeadChar (see page 5057)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 5057)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 5057)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 5058)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 5058)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 5058)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 5059)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 5059)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 5059)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 5060)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 5060)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 5060)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 5061)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 5061)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 5061)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 5062)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 5062)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 5062)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 5063)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 5063)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 5063)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 5064)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 5064)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 5064)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 5065)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 5065)	This is type Messages.TWMNCLButtonDblClk.
TWMNCLButtonDown (see page 5065)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 5066)	This is type Messages.TWMNCLButtonUp.

TWMNCMButtonDblClk (see page 5066)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 5066)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 5067)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 5067)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 5067)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 5068)	This is type Messages.TWMNCRButtonDown.
TWMNCRButtonUp (see page 5068)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 5068)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 5069)	This is type Messages.TWMPaste.
TWMPrintClient (see page 5069)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 5069)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 5070)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 5070)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 5070)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 5071)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 5071)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 5071)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 5072)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 5072)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 5072)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 5073)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 5073)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 5073)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 5074)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 5074)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 5074)	This is type Messages.TWMTimeChange.
TWMUndo (see page 5075)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 5075)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 5075)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 5076)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 5076)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 5076)	This is type Messages.TWMWindowPosChanging.

49.3.1 Messages.PMessage Type

Pascal

```
PMessage = ^TMessage;
```

C++

```
^TMessage PMessage;
```

File

Messages

Description

This is type Messages.PMessage.

49.3.2 Messages.TWMCancelMode Type

Pascal

```
TWMCancelMode = TWMNoParams;
```

C++

```
TWMNoParams TWMCancelMode;
```

File

Messages

Description

This is type Messages.TWMCancelMode.

49.3.3 Messages.TWMChangeUIState Type

Pascal

```
TWMChangeUIState = TWMUIState;
```

C++

```
TWMUIState TWMChangeUIState;
```

File

Messages

Description

This is type Messages.TWMChangeUIState.

49.3.4 Messages.TWMChar Type

Pascal

```
TWMChar = TWMKey;
```

C++

```
TWMKey TWMChar;
```

File

Messages

Description

This is type Messages.TWMChar.

49.3.5 Messages.TWMChildActivate Type

Pascal

```
TWMChildActivate = TWMNoParams;
```

C++

```
TWMNoParams TWMChildActivate;
```

File

Messages

Description

This is type Messages.TWMChildActivate.

49.3.6 Messages.TWMClear Type

Pascal

```
TWMClear = TWMNoParams;
```

C++

```
TWMNoParams TWMClear;
```

File

Messages

Description

This is type Messages.TWMClear.

49.3.7 Messages.TWMClose Type

Pascal

```
TWMClose = TWMNoParams;
```

C++

```
TWMNoParams TWMClose;
```

File

Messages

Description

This is type Messages.TWMClose.

49.3.8 Messages.TWMCopy Type

Pascal

```
TWMCopy = TWMNoParams;
```

C++

```
TWMNoParams TWMCopy;
```

File

Messages

Description

This is type Messages.TWMCopy.

49.3.9 Messages.TWMCtlColorBtn Type

Pascal

```
TWMCtlColorBtn = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorBtn;
```

File

Messages

Description

This is type Messages.TWMCtlColorBtn.

49.3.10 Messages.TWMCtlColorDlg Type

Pascal

```
TWMCtlColorDlg = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorDlg;
```

File

Messages

Description

This is type Messages.TWMCtlColorDlg.

49.3.11 Messages.TWMCtlColorEdit Type

Pascal

```
TWMCtlColorEdit = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorEdit;
```

File

Messages

Description

This is type Messages.TWMCtlColorEdit.

49.3.12 Messages.TWMCtlColorListbox Type

Pascal

```
TWMCtlColorListbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorListbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorListbox.

49.3.13 Messages.TWMCtlColorMsgbox Type

Pascal

```
TWMCtlColorMsgbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorMsgbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorMsgbox.

49.3.14 Messages.TWMCtlColorScrollbar Type

Pascal

```
TWMCtlColorScrollbar = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorScrollbar;
```

File

Messages

Description

This is type Messages.TWMCtlColorScrollbar.

49.3.15 Messages.TWMCtlColorStatic Type

Pascal

```
TWMCtlColorStatic = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorStatic;
```

File

Messages

Description

This is type Messages.TWMCtlColorStatic.

49.3.16 Messages.TWMCut Type

Pascal

```
TWMCut = TWMNoParams;
```

C++

```
TWMNoParams TWMCut;
```

File

Messages

Description

This is type Messages.TWMCut.

49.3.17 Messages.TWMDeadChar Type

Pascal

```
TWMDeadChar = TWMChar;
```

C++

```
TWMChar TWMDeadChar;
```

File

Messages

Description

This is type Messages.TWMDeadChar.

49.3.18 Messages.TWMDestroy Type

Pascal

```
TWMDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroy;
```

File

Messages

Description

This is type Messages.TWMDestroy.

49.3.19 Messages.TWMDestroyClipboard Type

Pascal

```
TWMDestroyClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroyClipboard;
```

File

Messages

Description

This is type Messages.TWMDestroyClipboard.

49.3.20 Messages.TWMDrawClipboard Type

Pascal

```
TWMDrawClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDrawClipboard;
```

File

Messages

Description

This is type Messages.TWMDrawClipboard.

49.3.21 Messages.TWMExitMenuLoop Type

Pascal

```
TWMExitMenuLoop = TWMEnterMenuLoop;
```

C++

```
TWMEnterMenuLoop TWMExitMenuLoop;
```

File

Messages

Description

This is type Messages.TWMExitMenuLoop.

49.3.22 Messages.TWMFontChange Type

Pascal

```
TWMFontChange = TWMNoParams;
```

C++

```
TWMNoParams TWMFontChange;
```

File

Messages

Description

This is type Messages.TWMFontChange.

49.3.23 Messages.TWMGetDlgCode Type

Pascal

```
TWMGetDlgCode = TWMNoParams;
```

C++

```
TWMNoParams TWMGetDlgCode;
```

File

Messages

Description

This is type Messages.TWMGetDlgCode.

49.3.24 Messages.TWMGetFont Type

Pascal

```
TWMGetFont = TWMNoParams;
```

C++

```
TWMNoParams TWMGetFont;
```

File

Messages

Description

This is type Messages.TWMGetFont.

49.3.25 Messages.TWMGetHotKey Type

Pascal

```
TWMGetHotKey = TWMNoParams;
```

C++

```
TWMNoParams TWMGetHotKey;
```

File

Messages

Description

This is type Messages.TWMGetHotKey.

49.3.26 Messages.TWMGetTextLength Type

Pascal

```
TWMGetTextLength = TWMNoParams;
```

C++

```
TWMNoParams TWMGetTextLength;
```

File

Messages

Description

This is type Messages.TWMGetTextLength.

49.3.27 Messages.TWMHScroll Type

Pascal

```
TWMHScroll = TWMScroll;
```

C++

```
TWMScroll TWMHScroll;
```

File

Messages

Description

This is type Messages.TWMHScroll.

49.3.28 Messages.TWMIconEraseBkgnd Type

Pascal

```
TWMIconEraseBkgnd = TWMEraseBkgnd;
```

C++

```
TWMEraseBkgnd TWMIconEraseBkgnd;
```

File

Messages

Description

This is type Messages.TWMIconEraseBkgnd.

49.3.29 Messages.TWMKeyDown Type

Pascal

```
TWMKeyDown = TWMKey;
```

C++

```
TWMKey TWMKeyDown;
```

File

Messages

Description

This is type Messages.TWMKeyDown.

49.3.30 Messages.TWMKeyUp Type

Pascal

```
TWMKeyUp = TWMKey;
```

C++

```
TWMKey TWMKeyUp;
```

File

Messages

Description

This is type Messages.TWMKeyUp.

49.3.31 Messages.TWMLButtonDblClk Type

Pascal

```
TWMLButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMLButtonDblClk.

49.3.32 Messages.TWMLButtonDown Type

TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.

Pascal

```
TWMLButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDown;
```

File

Messages

Description

TWMLButtonDown is the data structure that CLX uses for Windows messages informing an application that the user just clicked the left mouse button. It is the same as all mouse messages.

49.3.33 Messages.TWMLButtonUp Type

Pascal

```
TWMLButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMLButtonUp;
```

File

Messages

Description

This is type Messages.TWMLButtonUp.

49.3.34 Messages.TWMMButtonDblClk Type

Pascal

```
TWMMButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMMButtonDblClk.

49.3.35 Messages.TWMMButtonDown Type

Pascal

```
TWMMButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDown;
```

File

Messages

Description

This is type Messages.TWMMButtonDown.

49.3.36 Messages.TWMMButtonUp Type

Pascal

```
TWMMButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMMButtonUp;
```

File

Messages

Description

This is type Messages.TWMMButtonUp.

49.3.37 Messages.TWMMDIGetActive Type

Pascal

```
TWMMDIGetActive = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIGetActive;
```

File

Messages

Description

This is type Messages.TWMMDIGetActive.

49.3.38 Messages.TWMMDIIconArrange Type

Pascal

```
TWMMDIIconArrange = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIIconArrange;
```

File

Messages

Description

This is type Messages.TWMMDIIconArrange.

49.3.39 Messages.TWMMDIRefreshMenu Type

Pascal

```
TWMMDIRefreshMenu = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIRefreshMenu;
```

File

Messages

Description

This is type Messages.TWMMDIRefreshMenu.

49.3.40 Messages.TWMMouseMove Type

Pascal

```
TWMMouseMove = TWMMouse;
```

C++

```
TWMMouse TWMMouseMove;
```

File

Messages

Description

This is type Messages.TWMMouseMove.

49.3.41 Messages.TWMNCDestroy Type

Pascal

```
TWMNCDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMNCDestroy;
```

File

Messages

Description

This is type Messages.TWMNCDestroy.

49.3.42 Messages.TWMNCLButtonDblClk Type

Pascal

```
TWMNCLButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDblClk.

49.3.43 Messages.TWMNCLButtonDown Type

Pascal

```
TWMNCLButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDown.

49.3.44 Messages.TWMNCLButtonUp Type

Pascal

```
TWMNCLButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCLButtonUp.

49.3.45 Messages.TWMNCMButtonDblClk Type

Pascal

```
TWMNCMButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDblClk.

49.3.46 Messages.TWMNCMButtonDown Type

Pascal

```
TWMNCMButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDown.

49.3.47 Messages.TWMNCMButtonUp Type

Pascal

```
TWMNCMButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCMButtonUp.

49.3.48 Messages.TWMNCMouseMove Type

Pascal

```
TWMNCMouseMove = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMouseMove;
```

File

Messages

Description

This is type Messages.TWMNCMouseMove.

49.3.49 Messages.TWMNCRButtonDblClk Type

Pascal

```
TWMNCRButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDblClk.

49.3.50 Messages.TWMNCRButtonDown Type

Pascal

```
TWMNCRButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDown.

49.3.51 Messages.TWMNCRButtonUp Type

Pascal

```
TWMNCRButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCRButtonUp.

49.3.52 Messages.TWMPaintIcon Type

Pascal

```
TWMPaintIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMPaintIcon;
```

File

Messages

Description

This is type Messages.TWMPaintIcon.

49.3.53 Messages.TWMPaste Type

Pascal

```
TWMPaste = TWMNoParams;
```

C++

```
TWMNoParams TWMPaste;
```

File

Messages

Description

This is type Messages.TWMPaste.

49.3.54 Messages.TWMPrintClient Type

Pascal

```
TWMPrintClient = TWMPrint;
```

C++

```
TWMPrint TWMPrintClient;
```

File

Messages

Description

This is type Messages.TWMPrintClient.

49.3.55 Messages.TWMQueryDragIcon Type

Pascal

```
TWMQueryDragIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryDragIcon;
```

File

Messages

Description

This is type Messages.TWMQueryDragIcon.

49.3.56 Messages.TWMQueryNewPalette Type

Pascal

```
TWMQueryNewPalette = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryNewPalette;
```

File

Messages

Description

This is type Messages.TWMQueryNewPalette.

49.3.57 Messages.TWMQueryOpen Type

Pascal

```
TWMQueryOpen = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryOpen;
```

File

Messages

Description

This is type Messages.TWMQueryOpen.

49.3.58 Messages.TWMQueryUIState Type

Pascal

```
TWMQueryUIState = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryUIState;
```

File

Messages

Description

This is type Messages.TWMQueryUIState.

49.3.59 Messages.TWMQueueSync Type

Pascal

```
TWMQueueSync = TWMNoParams;
```

C++

```
TWMNoParams TWMQueueSync;
```

File

Messages

Description

This is type Messages.TWMQueueSync.

49.3.60 Messages.TWMRButtonDblClk Type

Pascal

```
TWMRButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMRButtonDblClk.

49.3.61 Messages.TWMRButtonDown Type

Pascal

```
TWMRButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDown;
```

File

Messages

Description

This is type Messages.TWMRButtonDown.

49.3.62 Messages.TWMRButtonUp Type

Pascal

```
TWMRButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMRButtonUp;
```

File

Messages

Description

This is type Messages.TWMRButtonUp.

49.3.63 Messages.TWMRenderAllFormats Type

Pascal

```
TWMRenderAllFormats = TWMNoParams;
```

C++

```
TWMNoParams TWMRenderAllFormats;
```

File

Messages

Description

This is type Messages.TWMRenderAllFormats.

49.3.64 Messages.TWMStyleChanged Type

Pascal

```
TWMStyleChanged = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanged;
```

File

Messages

Description

This is type Messages.TWMStyleChanged.

49.3.65 Messages.TWMStyleChanging Type

Pascal

```
TWMStyleChanging = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanging;
```

File

Messages

Description

This is type Messages.TWMStyleChanging.

49.3.66 Messages.TWMSysChar Type

Pascal

```
TWMSysChar = TWMKey;
```

C++

```
TWMKey TWMSysChar;
```

File

Messages

Description

This is type Messages.TWMSysChar.

49.3.67 Messages.TWMSysColorChange Type

Pascal

```
TWMSysColorChange = TWMNoParams;
```

C++

```
TWMNoParams TWMSysColorChange;
```

File

Messages

Description

This is type Messages.TWMSysColorChange.

49.3.68 Messages.TWMSysKeyDown Type

Pascal

```
TWMSysKeyDown = TWMKey;
```

C++

```
TWMKey TWMSysKeyDown;
```

File

Messages

Description

This is type Messages.TWMSysKeyDown.

49.3.69 Messages.TWMSysKeyUp Type

Pascal

```
TWMSysKeyUp = TWMKey;
```

C++

```
TWMKey TWMSysKeyUp;
```

File

Messages

Description

This is type Messages.TWMSysKeyUp.

49.3.70 Messages.TWMTimeChange Type

Pascal

```
TWMTimeChange = TWMNoParams;
```

C++

```
TWMNoParams TWMTimeChange;
```

File

Messages

Description

This is type Messages.TWMTimeChange.

49.3.71 Messages.TWMUndo Type

Pascal

```
TWMUndo = TWMNoParams;
```

C++

```
TWMNoParams TWMUndo;
```

File

Messages

Description

This is type Messages.TWMUndo.

49.3.72 Messages.TWMUpdateUIState Type

Pascal

```
TWMUpdateUIState = TWMUIState;
```

C++

```
TWMUIState TWMUpdateUIState;
```

File

Messages

Description

This is type Messages.TWMUpdateUIState.

49.3.73 Messages.TWMVKeyToItem Type

Pascal

```
TWMVKeyToItem = TWMCharToItem;
```

C++

```
TWMCharToItem TWMVKeyToItem;
```

File

Messages

Description

This is type Messages.TWMVKeyToItem.

49.3.74 Messages.TWMVScroll Type

Pascal

```
TWMVScroll = TWMScroll;
```

C++

```
TWMScroll TWMVScroll;
```

File

Messages

Description

This is type Messages.TWMVScroll.

49.3.75 Messages.TWMWindowPosChanged Type

Pascal

```
TWMWindowPosChanged = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanged;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanged.

49.3.76 Messages.TWMWindowPosChanging Type

Pascal

```
TWMWindowPosChanging = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanging;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanging.

49.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BM_CLICK (see page 5084)	This is constant Messages.BM_CLICK.
BM_GETCHECK (see page 5085)	This is constant Messages.BM_GETCHECK.
BM_GETIMAGE (see page 5085)	This is constant Messages.BM_GETIMAGE.
BM_GETSTATE (see page 5085)	This is constant Messages.BM_GETSTATE.
BM_SETCHECK (see page 5086)	This is constant Messages.BM_SETCHECK.
BM_SETIMAGE (see page 5086)	This is constant Messages.BM_SETIMAGE.
BM_SETSTATE (see page 5086)	This is constant Messages.BM_SETSTATE.
BM_SETSTYLE (see page 5087)	This is constant Messages.BM_SETSTYLE.
BN_CLICKED (see page 5087)	This is constant Messages.BN_CLICKED.
BN_DBLCLK (see page 5087)	This is constant Messages.BN_DBLCLK.
BN_DISABLE (see page 5088)	This is constant Messages.BN_DISABLE.
BN_DOUBLECLICKED (see page 5088)	This is constant Messages.BN_DOUBLECLICKED.
BN_HILITE (see page 5088)	This is constant Messages.BN_HILITE.
BN_KILLFOCUS (see page 5089)	This is constant Messages.BN_KILLFOCUS.
BN_PAINT (see page 5089)	This is constant Messages.BN_PAINT.
BN_PUSHED (see page 5089)	This is constant Messages.BN_PUSHED.
BN_SETFOCUS (see page 5090)	This is constant Messages.BN_SETFOCUS.
BN_UNHILITE (see page 5090)	This is constant Messages.BN_UNHILITE.
BN_UNPUSHED (see page 5090)	This is constant Messages.BN_UNPUSHED.
CB_ADDSTRING (see page 5091)	This is constant Messages.CB_ADDSTRING.
CB_DELETESTRING (see page 5091)	This is constant Messages.CB_DELETESTRING.
CB_DIR (see page 5091)	This is constant Messages.CB_DIR.
CB_FINDSTRING (see page 5092)	This is constant Messages.CB_FINDSTRING.
CB_FINDSTRINGEXACT (see page 5092)	This is constant Messages.CB_FINDSTRINGEXACT.
CB_GETCOUNT (see page 5092)	This is constant Messages.CB_GETCOUNT.
CB_GETCURSEL (see page 5093)	This is constant Messages.CB_GETCURSEL.
CB_GETDROPPEDCONTROLRECT (see page 5093)	This is constant Messages.CB_GETDROPPEDCONTROLRECT.
CB_GETDROPPEDSTATE (see page 5093)	This is constant Messages.CB_GETDROPPEDSTATE.
CB_GETDROPPEDWIDTH (see page 5094)	This is constant Messages.CB_GETDROPPEDWIDTH.
CB_GETEDITSEL (see page 5094)	This is constant Messages.CB_GETEDITSEL.
CB_GETEXTENDEDUI (see page 5094)	This is constant Messages.CB_GETEXTENDEDUI.
CB_GETHORIZONTALEXTENT (see page 5095)	This is constant Messages.CB_GETHORIZONTALEXTENT.
CB_GETITEMDATA (see page 5095)	This is constant Messages.CB_GETITEMDATA.
CB_GETITEMHEIGHT (see page 5095)	This is constant Messages.CB_GETITEMHEIGHT.
CB_GETLBTEXT (see page 5096)	This is constant Messages.CB_GETLBTEXT.
CB_GETLBTEXTLEN (see page 5096)	This is constant Messages.CB_GETLBTEXTLEN.
CB_GETLOCALE (see page 5096)	This is constant Messages.CB_GETLOCALE.
CB_GETTOPINDEX (see page 5097)	This is constant Messages.CB_GETTOPINDEX.
CB_INITSTORAGE (see page 5097)	This is constant Messages.CB_INITSTORAGE.
CB_INSERTSTRING (see page 5097)	This is constant Messages.CB_INSERTSTRING.
CB_LIMITTEXT (see page 5098)	This is constant Messages.CB_LIMITTEXT.
CB_MSGMAX (see page 5098)	This is constant Messages.CB_MSGMAX.
CB_RESETCONTENT (see page 5098)	This is constant Messages.CB_RESETCONTENT.
CB_SELECTSTRING (see page 5099)	This is constant Messages.CB_SELECTSTRING.

CB_SETCURSEL (see page 5099)	This is constant Messages.CB_SETCURSEL.
CB_SETDROPPEDWIDTH (see page 5099)	This is constant Messages.CB_SETDROPPEDWIDTH.
CB_SETEDITSEL (see page 5100)	This is constant Messages.CB_SETEDITSEL.
CB_SETEXTENDEDUI (see page 5100)	This is constant Messages.CB_SETEXTENDEDUI.
CB_SETHORIZONTALEXTENT (see page 5100)	This is constant Messages.CB_SETHORIZONTALEXTENT.
CB_SETITEMDATA (see page 5101)	This is constant Messages.CB_SETITEMDATA.
CB_SETITEMHEIGHT (see page 5101)	This is constant Messages.CB_SETITEMHEIGHT.
CB_SETLOCALE (see page 5101)	This is constant Messages.CB_SETLOCALE.
CB_SETTOPINDEX (see page 5102)	This is constant Messages.CB_SETTOPINDEX.
CB_SHOWDROPDOWN (see page 5102)	This is constant Messages.CB_SHOWDROPDOWN.
CBN_CLOSEUP (see page 5102)	This is constant Messages.CBN_CLOSEUP.
CBN_DBLCLK (see page 5103)	This is constant Messages.CBN_DBLCLK.
CBN_DROPDOWN (see page 5103)	This is constant Messages.CBN_DROPDOWN.
CBN_EDITCHANGE (see page 5103)	This is constant Messages.CBN_EDITCHANGE.
CBN_EDITUPDATE (see page 5104)	This is constant Messages.CBN_EDITUPDATE.
CBN_ERRSPACE (see page 5104)	This is constant Messages.CBN_ERRSPACE.
CBN_KILLFOCUS (see page 5104)	This is constant Messages.CBN_KILLFOCUS.
CBN_SELCHANGE (see page 5105)	This is constant Messages.CBN_SELCHANGE.
CBN_SELENDCANCEL (see page 5105)	This is constant Messages.CBN_SELENDCANCEL.
CBN_SELENDOK (see page 5105)	This is constant Messages.CBN_SELENDOK.
CBN_SETFOCUS (see page 5106)	This is constant Messages.CBN_SETFOCUS.
DM_GETDEFID (see page 5106)	This is constant Messages.DM_GETDEFID.
DM_REPOSITION (see page 5106)	This is constant Messages.DM_REPOSITION.
DM_SETDEFID (see page 5107)	This is constant Messages.DM_SETDEFID.
EM_CANUNDO (see page 5107)	This is constant Messages.EM_CANUNDO.
EM_CHARFROMPOS (see page 5107)	This is constant Messages.EM_CHARFROMPOS.
EM_EMPTYUNDOBUFFER (see page 5108)	This is constant Messages.EM_EMPTYUNDOBUFFER.
EM_FMTLINES (see page 5108)	This is constant Messages.EM_FMTLINES.
EM_GETFIRSTVISIBLELINE (see page 5108)	This is constant Messages.EM_GETFIRSTVISIBLELINE.
EM_GETHANDLE (see page 5109)	This is constant Messages.EM_GETHANDLE.
EM_GETIMESTATUS (see page 5109)	This is constant Messages.EM_GETIMESTATUS.
EM_GETLIMITTEXT (see page 5109)	This is constant Messages.EM_GETLIMITTEXT.
EM_GETLINE (see page 5110)	This is constant Messages.EM_GETLINE.
EM_GETLINECOUNT (see page 5110)	This is constant Messages.EM_GETLINECOUNT.
EM_GETMARGINS (see page 5110)	This is constant Messages.EM_GETMARGINS.
EM_GETMODIFY (see page 5111)	This is constant Messages.EM_GETMODIFY.
EM_GETPASSWORDCHAR (see page 5111)	This is constant Messages.EM_GETPASSWORDCHAR.
EM_GETRECT (see page 5111)	This is constant Messages.EM_GETRECT.
EM_GETSEL (see page 5112)	This is constant Messages.EM_GETSEL.
EM_GETTHUMB (see page 5112)	This is constant Messages.EM_GETTHUMB.
EM_GETWORDBREAKPROC (see page 5112)	This is constant Messages.EM_GETWORDBREAKPROC.
EM_LIMITTEXT (see page 5113)	This is constant Messages.EM_LIMITTEXT.
EM_LINEFROMCHAR (see page 5113)	This is constant Messages.EM_LINEFROMCHAR.
EM_LINEINDEX (see page 5113)	This is constant Messages.EM_LINEINDEX.
EM_LINELENGTH (see page 5114)	This is constant Messages.EM_LINELENGTH.
EM_LINESCROLL (see page 5114)	This is constant Messages.EM_LINESCROLL.
EM_POSFROMCHAR (see page 5114)	This is constant Messages.EM_POSFROMCHAR.
EM_REPLACESEL (see page 5115)	This is constant Messages.EM_REPLACESEL.
EM_SCROLL (see page 5115)	This is constant Messages.EM_SCROLL.
EM_SCROLLCARET (see page 5115)	This is constant Messages.EM_SCROLLCARET.
EM_SETHANDLE (see page 5116)	This is constant Messages.EM_SETHANDLE.
EM_SETIMESTATUS (see page 5116)	This is constant Messages.EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 5116)	This is constant Messages.EM_SETLIMITTEXT.
EM_SETMARGINS (see page 5117)	This is constant Messages.EM_SETMARGINS.

EM_SETMODIFY (see page 5117)	This is constant Messages.EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 5117)	This is constant Messages.EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 5118)	This is constant Messages.EM_SETREADONLY.
EM_SETRECT (see page 5118)	This is constant Messages.EM_SETRECT.
EM_SETRECTNP (see page 5118)	This is constant Messages.EM_SETRECTNP.
EM_SETSEL (see page 5119)	This is constant Messages.EM_SETSEL.
EM_SETTABSTOPS (see page 5119)	This is constant Messages.EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 5119)	This is constant Messages.EM_SETWORDBREAKPROC.
EM_UNDO (see page 5120)	This is constant Messages.EM_UNDO.
EN_CHANGE (see page 5120)	This is constant Messages.EN_CHANGE.
EN_ERRSPACE (see page 5120)	This is constant Messages.EN_ERRSPACE.
EN_HSCROLL (see page 5121)	This is constant Messages.EN_HSCROLL.
EN_KILLFOCUS (see page 5121)	This is constant Messages.EN_KILLFOCUS.
EN_MAXTEXT (see page 5121)	This is constant Messages.EN_MAXTEXT.
EN_SETFOCUS (see page 5122)	This is constant Messages.EN_SETFOCUS.
EN_UPDATE (see page 5122)	This is constant Messages.EN_UPDATE.
EN_VSCROLL (see page 5122)	This is constant Messages.EN_VSCROLL.
LB_ADDFILE (see page 5123)	This is constant Messages.LB_ADDFILE.
LB_ADDSTRING (see page 5123)	This is constant Messages.LB_ADDSTRING.
LB_DELETESTRING (see page 5123)	This is constant Messages.LB_DELETESTRING.
LB_DIR (see page 5124)	This is constant Messages.LB_DIR.
LB_FINDSTRING (see page 5124)	This is constant Messages.LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 5124)	This is constant Messages.LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 5125)	This is constant Messages.LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 5125)	This is constant Messages.LB_GETCARETINDEX.
LB_GETCOUNT (see page 5125)	This is constant Messages.LB_GETCOUNT.
LB_GETCURSEL (see page 5126)	This is constant Messages.LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 5126)	This is constant Messages.LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 5126)	This is constant Messages.LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 5127)	This is constant Messages.LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 5127)	This is constant Messages.LB_GETITEMRECT.
LB_GETLOCALE (see page 5127)	This is constant Messages.LB_GETLOCALE.
LB_GETSEL (see page 5128)	This is constant Messages.LB_GETSEL.
LB_GETSELCOUNT (see page 5128)	This is constant Messages.LB_GETSELCOUNT.
LB_GETSELITEMS (see page 5128)	This is constant Messages.LB_GETSELITEMS.
LB_GETTEXT (see page 5129)	This is constant Messages.LB_GETTEXT.
LB_GETTEXTLEN (see page 5129)	This is constant Messages.LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 5129)	This is constant Messages.LB_GETTOPINDEX.
LB_INITSTORAGE (see page 5130)	This is constant Messages.LB_INITSTORAGE.
LB_INSERTSTRING (see page 5130)	This is constant Messages.LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 5130)	This is constant Messages.LB_ITEMFROMPOINT.
LB_MSGMAX (see page 5131)	This is constant Messages.LB_MSGMAX.
LB_RESETCONTENT (see page 5131)	This is constant Messages.LB_RESETCONTENT.
LB_SELECTSTRING (see page 5131)	This is constant Messages.LB_SELECTSTRING.
LB_SELITEMRANGE (see page 5132)	This is constant Messages.LB_SELITEMRANGE.
LB_SELITEMRANGEEX (see page 5132)	This is constant Messages.LB_SELITEMRANGEEX.
LB_SETANCHORINDEX (see page 5132)	This is constant Messages.LB_SETANCHORINDEX.
LB_SETCARETINDEX (see page 5133)	This is constant Messages.LB_SETCARETINDEX.
LB_SETCOLUMNWIDTH (see page 5133)	This is constant Messages.LB_SETCOLUMNWIDTH.
LB_SETCOUNT (see page 5133)	This is constant Messages.LB_SETCOUNT.
LB_SETCURSEL (see page 5134)	This is constant Messages.LB_SETCURSEL.
LB_SETHORIZONTALEXTENT (see page 5134)	This is constant Messages.LB_SETHORIZONTALEXTENT.
LB_SETITEMDATA (see page 5134)	This is constant Messages.LB_SETITEMDATA.
LB_SETITEMHEIGHT (see page 5135)	This is constant Messages.LB_SETITEMHEIGHT.

LB_SETLOCALE (see page 5135)	This is constant Messages.LB_SETLOCALE.
LB_SETSEL (see page 5135)	This is constant Messages.LB_SETSEL.
LB_SETTABSTOPS (see page 5136)	This is constant Messages.LB_SETTABSTOPS.
LB_SETTOPINDEX (see page 5136)	This is constant Messages.LB_SETTOPINDEX.
LBN_DBLCLK (see page 5136)	This is constant Messages.LBN_DBLCLK.
LBN_ERRSPACE (see page 5137)	This is constant Messages.LBN_ERRSPACE.
LBN_KILLFOCUS (see page 5137)	This is constant Messages.LBN_KILLFOCUS.
LBN_SELCANCEL (see page 5137)	This is constant Messages.LBN_SELCANCEL.
LBN_SELCHANGE (see page 5138)	This is constant Messages.LBN_SELCHANGE.
LBN_SETFOCUS (see page 5138)	This is constant Messages.LBN_SETFOCUS.
PSM_PAGEINFO (see page 5138)	This is constant Messages.PSM_PAGEINFO.
PSM_SHEETINFO (see page 5139)	This is constant Messages.PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 5139)	This is constant Messages.SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 5139)	This is constant Messages.SBM_GETPOS.
SBM_GETRANGE (see page 5140)	This is constant Messages.SBM_GETRANGE.
SBM_GETSCROLLBARINFO (see page 5140)	This is constant Messages.SBM_GETSCROLLBARINFO.
SBM_GETSCROLLINFO (see page 5140)	This is constant Messages.SBM_GETSCROLLINFO.
SBM_SETPOS (see page 5141)	This is constant Messages.SBM_SETPOS.
SBM_SETRANGE (see page 5141)	This is constant Messages.SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 5141)	This is constant Messages.SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 5142)	This is constant Messages.SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 5142)	This is constant Messages.WM_ACTIVATE.
WM_ACTIVATEAPP (see page 5142)	This is constant Messages.WM_ACTIVATEAPP.
WM_APP (see page 5143)	This is constant Messages.WM_APP.
WM_APPCOMMAND (see page 5143)	This is constant Messages.WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 5143)	This is constant Messages.WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 5144)	This is constant Messages.WM_CANCELJOURNAL.
WM_CANCELMODE (see page 5144)	This is constant Messages.WM_CANCELMODE.
WM_CAPTURECHANGED (see page 5144)	This is constant Messages.WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 5145)	This is constant Messages.WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 5145)	This is constant Messages.WM_CHANGEUISTATE.
WM_CHAR (see page 5145)	This is constant Messages.WM_CHAR.
WM_CHARTOITEM (see page 5146)	This is constant Messages.WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 5146)	This is constant Messages.WM_CHILDACTIVATE.
WM_CLEAR (see page 5146)	This is constant Messages.WM_CLEAR.
WM_CLOSE (see page 5147)	This is constant Messages.WM_CLOSE.
WM_COALESCE_FIRST (see page 5147)	This is constant Messages.WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 5147)	This is constant Messages.WM_COALESCE_LAST.
WM_COMMAND (see page 5148)	This is constant Messages.WM_COMMAND.
WM_COMMNOTIFY (see page 5148)	This is constant Messages.WM_COMMNOTIFY.
WM_COMPACTING (see page 5148)	This is constant Messages.WM_COMPACTING.
WM_COMPAREITEM (see page 5149)	This is constant Messages.WM_COMPAREITEM.
WM_CONTEXTMENU (see page 5149)	This is constant Messages.WM_CONTEXTMENU.
WM_COPY (see page 5149)	This is constant Messages.WM_COPY.
WM_COPYDATA (see page 5150)	This is constant Messages.WM_COPYDATA.
WM_CREATE (see page 5150)	This is constant Messages.WM_CREATE.
WM_CTLCOLOR (see page 5150)	This is constant Messages.WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 5151)	This is constant Messages.WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 5151)	This is constant Messages.WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 5151)	This is constant Messages.WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 5152)	This is constant Messages.WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 5152)	This is constant Messages.WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 5152)	This is constant Messages.WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 5153)	This is constant Messages.WM_CTLCOLORSTATIC.

WM_CUT (see page 5153)	This is constant Messages.WM_CUT.
WM_DDE_ACK (see page 5153)	This is constant Messages.WM_DDE_ACK.
WM_DDE_ADVISE (see page 5154)	This is constant Messages.WM_DDE_ADVISE.
WM_DDE_DATA (see page 5154)	This is constant Messages.WM_DDE_DATA.
WM_DDE_EXECUTE (see page 5154)	This is constant Messages.WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 5155)	This is constant Messages.WM_DDE_FIRST.
WM_DDE_INITIATE (see page 5155)	This is constant Messages.WM_DDE_INITIATE.
WM_DDE_LAST (see page 5155)	This is constant Messages.WM_DDE_LAST.
WM_DDE_POKE (see page 5156)	This is constant Messages.WM_DDE_POKE.
WM_DDE_REQUEST (see page 5156)	This is constant Messages.WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 5156)	This is constant Messages.WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 5157)	This is constant Messages.WM_DDE_UNADVISE.
WM_DEADCHAR (see page 5157)	This is constant Messages.WM_DEADCHAR.
WM_DELETEITEM (see page 5157)	This is constant Messages.WM_DELETEITEM.
WM_DESTROY (see page 5158)	This is constant Messages.WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 5158)	This is constant Messages.WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 5158)	This is constant Messages.WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 5159)	This is constant Messages.WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 5159)	This is constant Messages.WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 5159)	This is constant Messages.WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 5160)	This is constant Messages.WM_DRAWITEM.
WM_DROPFILES (see page 5160)	This is constant Messages.WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 5160)	This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 5161)	This is constant Messages.WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 5161)	This is constant Messages.WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 5161)	This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 5162)	This is constant Messages.WM_ENABLE.
WM_ENDSESSION (see page 5162)	This is constant Messages.WM_ENDSESSION.
WM_ENTERIDLE (see page 5162)	This is constant Messages.WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 5163)	This is constant Messages.WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 5163)	This is constant Messages.WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 5163)	This is constant Messages.WM_ERASEBKGND.
WM_EXITMENULOOP (see page 5164)	This is constant Messages.WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 5164)	This is constant Messages.WM_EXITSIZEMOVE.
WM_FONTCHANGE (see page 5164)	This is constant Messages.WM_FONTCHANGE.
WM_GETDLGCODE (see page 5165)	This is constant Messages.WM_GETDLGCODE.
WM_GETFONT (see page 5165)	This is constant Messages.WM_GETFONT.
WM_GETHOTKEY (see page 5165)	This is constant Messages.WM_GETHOTKEY.
WM_GETICON (see page 5166)	This is constant Messages.WM_GETICON.
WM_GETMINMAXINFO (see page 5166)	This is constant Messages.WM_GETMINMAXINFO.
WM_GETOBJECT (see page 5166)	This is constant Messages.WM_GETOBJECT.
WM_GETTEXT (see page 5167)	This is constant Messages.WM_GETTEXT.
WM_GETTEXTLENGTH (see page 5167)	This is constant Messages.WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 5167)	This is constant Messages.WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 5168)	This is constant Messages.WM_HANDHELDLAST.
WM_HELP (see page 5168)	This is constant Messages.WM_HELP.
WM_HOTKEY (see page 5168)	This is constant Messages.WM_HOTKEY.
WM_HSCROLL (see page 5169)	This is constant Messages.WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 5169)	This is constant Messages.WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 5169)	This is constant Messages.WM_ICONERASEBKGND.
WM_IME_CHAR (see page 5170)	This is constant Messages.WM_IME_CHAR.
WM_IME_COMPOSITION (see page 5170)	This is constant Messages.WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 5170)	This is constant Messages.WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 5171)	This is constant Messages.WM_IME_CONTROL.

WM_IME_ENDCOMPOSITION (see page 5171)	This is constant Messages.WM_IME_ENDCOMPOSITION.
WM_IME_KEYDOWN (see page 5171)	This is constant Messages.WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 5172)	This is constant Messages.WM_IME_KEYLAST.
WM_IME_KEYUP (see page 5172)	This is constant Messages.WM_IME_KEYUP.
WM_IME_NOTIFY (see page 5172)	This is constant Messages.WM_IME_NOTIFY.
WM_IME_REQUEST (see page 5173)	This is constant Messages.WM_IME_REQUEST.
WM_IME_SELECT (see page 5173)	This is constant Messages.WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 5173)	This is constant Messages.WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 5174)	This is constant Messages.WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 5174)	This is constant Messages.WM_INITDIALOG.
WM_INITMENU (see page 5174)	This is constant Messages.WM_INITMENU.
WM_INITMENUPOPUP (see page 5175)	This is constant Messages.WM_INITMENUPOPUP.
WM_INPUT (see page 5175)	This is constant Messages.WM_INPUT.
WM_INPUTLANGCHANGE (see page 5175)	This is constant Messages.WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 5176)	This is constant Messages.WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 5176)	This is constant Messages.WM_KEYDOWN.
WM_KEYFIRST (see page 5176)	This is constant Messages.WM_KEYFIRST.
WM_KEYLAST (see page 5177)	This is constant Messages.WM_KEYLAST.
WM_KEYUP (see page 5177)	This is constant Messages.WM_KEYUP.
WM_KILLFOCUS (see page 5177)	This is constant Messages.WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 5178)	This is constant Messages.WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 5178)	This is constant Messages.WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 5178)	This is constant Messages.WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 5179)	This is constant Messages.WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 5179)	This is constant Messages.WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 5179)	This is constant Messages.WM_MBUTTONUP.
WM_MDIACTIVATE (see page 5180)	This is constant Messages.WM_MDIACTIVATE.
WM_MDICASCADE (see page 5180)	This is constant Messages.WM_MDICASCADE.
WM_MDICREATE (see page 5180)	This is constant Messages.WM_MDICREATE.
WM_MDIDESTROY (see page 5181)	This is constant Messages.WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 5181)	This is constant Messages.WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 5181)	This is constant Messages.WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 5182)	This is constant Messages.WM_MDIMAXIMIZE.
WM_MDINEXT (see page 5182)	This is constant Messages.WM_MDINEXT.
WM_MDIREFRESHMENU (see page 5182)	This is constant Messages.WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 5183)	This is constant Messages.WM_MDIRESTORE.
WM_MDISETMENU (see page 5183)	This is constant Messages.WM_MDISETMENU.
WM_MDITILE (see page 5183)	This is constant Messages.WM_MDITILE.
WM_MEASUREITEM (see page 5184)	This is constant Messages.WM_MEASUREITEM.
WM_MENUCHAR (see page 5184)	This is constant Messages.WM_MENUCHAR.
WM_MENUCOMMAND (see page 5184)	This is constant Messages.WM_MENUCOMMAND.
WM_MENUDRAG (see page 5185)	This is constant Messages.WM_MENUDRAG.
WM_MENUGETOBJECT (see page 5185)	This is constant Messages.WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 5185)	This is constant Messages.WM_MENURBUTTONUP.
WM_MENUSELECT (see page 5186)	This is constant Messages.WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 5186)	This is constant Messages.WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 5186)	This is constant Messages.WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 5187)	This is constant Messages.WM_MOUSEHOVER.
WM_MOUSELAST (see page 5187)	This is constant Messages.WM_MOUSELAST.
WM_MOUSELEAVE (see page 5187)	This is constant Messages.WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 5188)	This is constant Messages.WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 5188)	This is constant Messages.WM_MOUSEWHEEL.
WM_MOVE (see page 5188)	This is constant Messages.WM_MOVE.
WM_MOVING (see page 5189)	This is constant Messages.WM_MOVING.

WM_NCACTIVATE (see page 5189)	This is constant Messages.WM_NCACTIVATE.
WM_NCCALCSIZE (see page 5189)	This is constant Messages.WM_NCCALCSIZE.
WM_NCCREATE (see page 5190)	This is constant Messages.WM_NCCREATE.
WM_NCDESTROY (see page 5190)	This is constant Messages.WM_NCDESTROY.
WM_NCHITTEST (see page 5190)	This is constant Messages.WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 5191)	This is constant Messages.WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 5191)	This is constant Messages.WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 5191)	This is constant Messages.WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 5192)	This is constant Messages.WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 5192)	This is constant Messages.WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 5192)	This is constant Messages.WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 5193)	This is constant Messages.WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 5193)	This is constant Messages.WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 5193)	This is constant Messages.WM_NCMOUSEMOVE.
WM_NCPAINT (see page 5194)	This is constant Messages.WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 5194)	This is constant Messages.WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 5194)	This is constant Messages.WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 5195)	This is constant Messages.WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 5195)	This is constant Messages.WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 5195)	This is constant Messages.WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 5196)	This is constant Messages.WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 5196)	This is constant Messages.WM_NEXTDLGCTL.
WM_NEXTMENU (see page 5196)	This is constant Messages.WM_NEXTMENU.
WM_NOTIFY (see page 5197)	This is constant Messages.WM_NOTIFY.
WM_NOTIFYFORMAT (see page 5197)	This is constant Messages.WM_NOTIFYFORMAT.
WM_NULL (see page 5197)	This is constant Messages.WM_NULL.
WM_PAINT (see page 5198)	This is constant Messages.WM_PAINT.
WM_PAINTCLIPBOARD (see page 5198)	This is constant Messages.WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 5198)	This is constant Messages.WM_PAINTICON.
WM_PALETTECHANGED (see page 5199)	This is constant Messages.WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 5199)	This is constant Messages.WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 5199)	This is constant Messages.WM_PARENTNOTIFY.
WM_PASTE (see page 5200)	This is constant Messages.WM_PASTE.
WM_PENWINFIRST (see page 5200)	This is constant Messages.WM_PENWINFIRST.
WM_PENWINLAST (see page 5200)	This is constant Messages.WM_PENWINLAST.
WM_POWER (see page 5201)	This is constant Messages.WM_POWER.
WM_POWERBROADCAST (see page 5201)	This is constant Messages.WM_POWERBROADCAST.
WM_PRINT (see page 5201)	This is constant Messages.WM_PRINT.
WM_PRINTCLIENT (see page 5202)	This is constant Messages.WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 5202)	This is constant Messages.WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 5202)	This is constant Messages.WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 5203)	This is constant Messages.WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 5203)	This is constant Messages.WM_QUERYOPEN.
WM_QUERYUISTATE (see page 5203)	This is constant Messages.WM_QUERYUISTATE.
WM_QUEUESYNC (see page 5204)	This is constant Messages.WM_QUEUESYNC.
WM_QUIT (see page 5204)	This is constant Messages.WM_QUIT.
WM_RBUTTONDBLCLK (see page 5204)	This is constant Messages.WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 5205)	This is constant Messages.WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 5205)	This is constant Messages.WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 5205)	This is constant Messages.WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 5206)	This is constant Messages.WM_RENDERFORMAT.
WM_SETCURSOR (see page 5206)	This is constant Messages.WM_SETCURSOR.
WM_SETFOCUS (see page 5206)	This is constant Messages.WM_SETFOCUS.
WM_SETFONT (see page 5207)	This is constant Messages.WM_SETFONT.

WM_SETHOTKEY (see page 5207)	This is constant Messages.WM_SETHOTKEY.
WM_SETICON (see page 5207)	This is constant Messages.WM_SETICON.
WM_SETREDRAW (see page 5208)	This is constant Messages.WM_SETREDRAW.
WM_SETTEXT (see page 5208)	This is constant Messages.WM_SETTEXT.
WM_SETTINGCHANGE (see page 5208)	This is constant Messages.WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 5209)	This is constant Messages.WM_SHOWWINDOW.
WM_SIZE (see page 5209)	This is constant Messages.WM_SIZE.
WM_SIZECLIPBOARD (see page 5209)	This is constant Messages.WM_SIZECLIPBOARD.
WM_SIZING (see page 5210)	This is constant Messages.WM_SIZING.
WM_SPOOLERSTATUS (see page 5210)	This is constant Messages.WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 5210)	This is constant Messages.WM_STYLECHANGED.
WM_STYLECHANGING (see page 5211)	This is constant Messages.WM_STYLECHANGING.
WM_SYSCHAR (see page 5211)	This is constant Messages.WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 5211)	This is constant Messages.WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 5212)	This is constant Messages.WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 5212)	This is constant Messages.WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 5212)	This is constant Messages.WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 5213)	This is constant Messages.WM_SYSKEYUP.
WM_SYSTEMERROR (see page 5213)	This is constant Messages.WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 5213)	This is constant Messages.WM_TABLET_FIRST.
WM_TABLET_LAST (see page 5214)	This is constant Messages.WM_TABLET_LAST.
WM_TCARD (see page 5214)	This is constant Messages.WM_TCARD.
WM_THEMECHANGED (see page 5214)	This is constant Messages.WM_THEMECHANGED.
WM_TIMECHANGE (see page 5215)	This is constant Messages.WM_TIMECHANGE.
WM_TIMER (see page 5215)	This is constant Messages.WM_TIMER.
WM_UNDO (see page 5215)	This is constant Messages.WM_UNDO.
WM_UNICHAR (see page 5216)	This is constant Messages.WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 5216)	This is constant Messages.WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 5216)	This is constant Messages.WM_UPDATEUISTATE.
WM_USER (see page 5217)	This is constant Messages.WM_USER.
WM_USERCHANGED (see page 5217)	This is constant Messages.WM_USERCHANGED.
WM_VKEYTOITEM (see page 5217)	This is constant Messages.WM_VKEYTOITEM.
WM_VSCROLL (see page 5218)	This is constant Messages.WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 5218)	This is constant Messages.WM_VSCROLLCLIPBOARD.
WM_WINDOWPOSCHANGED (see page 5218)	This is constant Messages.WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 5219)	This is constant Messages.WM_WINDOWPOSCHANGING.
WM_WININICHANGE (see page 5219)	This is constant Messages.WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 5219)	This is constant Messages.WM_WTSSESSION_CHANGE.

49.4.1 Messages.BM_CLICK Constant

Pascal

```
BM_CLICK = $00F5;
```

C++

```
BM_CLICK = 0x00F5;
```

File

Messages

Description

This is constant Messages.BM_CLICK.

49.4.2 Messages.BM_GETCHECK Constant

Pascal

```
BM_GETCHECK = $00F0;
```

C++

```
BM_GETCHECK = 0x00F0;
```

File

Messages

Description

This is constant Messages.BM_GETCHECK.

49.4.3 Messages.BM_GETIMAGE Constant

Pascal

```
BM_GETIMAGE = $00F6;
```

C++

```
BM_GETIMAGE = 0x00F6;
```

File

Messages

Description

This is constant Messages.BM_GETIMAGE.

49.4.4 Messages.BM_GETSTATE Constant

Pascal

```
BM_GETSTATE = $00F2;
```

C++

```
BM_GETSTATE = 0x00F2;
```

File

Messages

Description

This is constant Messages.BM_GETSTATE.

49.4.5 Messages.BM_SETCHECK Constant

Pascal

```
BM_SETCHECK = $00F1;
```

C++

```
BM_SETCHECK = 0x00F1;
```

File

Messages

Description

This is constant Messages.BM_SETCHECK.

49.4.6 Messages.BM_SETIMAGE Constant

Pascal

```
BM_SETIMAGE = $00F7;
```

C++

```
BM_SETIMAGE = 0x00F7;
```

File

Messages

Description

This is constant Messages.BM_SETIMAGE.

49.4.7 Messages.BM_SETSTATE Constant

Pascal

```
BM_SETSTATE = $00F3;
```

C++

```
BM_SETSTATE = 0x00F3;
```

File

Messages

Description

This is constant Messages.BM_SETSTATE.

49.4.8 Messages.BM_SETSTYLE Constant

Pascal

```
BM_SETSTYLE = $00F4;
```

C++

```
BM_SETSTYLE = 0x00F4;
```

File

Messages

Description

This is constant Messages.BM_SETSTYLE.

49.4.9 Messages.BN_CLICKED Constant

Pascal

```
BN_CLICKED = 0;
```

C++

```
BN_CLICKED = 0;
```

File

Messages

Description

This is constant Messages.BN_CLICKED.

49.4.10 Messages.BN_DBLCLK Constant

Pascal

```
BN_DBLCLK = BN_DOUBLECLICKED;
```

C++

```
BN_DBLCLK = BN_DOUBLECLICKED;
```

File

Messages

Description

This is constant Messages.BN_DBLCLK.

49.4.11 Messages.BN_DISABLE Constant

Pascal

```
BN_DISABLE = 4;
```

C++

```
BN_DISABLE = 4;
```

File

Messages

Description

This is constant Messages.BN_DISABLE.

49.4.12 Messages.BN_DOUBLECLICKED Constant

Pascal

```
BN_DOUBLECLICKED = 5;
```

C++

```
BN_DOUBLECLICKED = 5;
```

File

Messages

Description

This is constant Messages.BN_DOUBLECLICKED.

49.4.13 Messages.BN_HILITE Constant

Pascal

```
BN_HILITE = 2;
```

C++

```
BN_HILITE = 2;
```

File

Messages

Description

This is constant Messages.BN_HILITE.

49.4.14 Messages.BN_KILLFOCUS Constant

Pascal

```
BN_KILLFOCUS = 7;
```

C++

```
BN_KILLFOCUS = 7;
```

File

Messages

Description

This is constant Messages.BN_KILLFOCUS.

49.4.15 Messages.BN_PAINT Constant

Pascal

```
BN_PAINT = 1;
```

C++

```
BN_PAINT = 1;
```

File

Messages

Description

This is constant Messages.BN_PAINT.

49.4.16 Messages.BN_PUSHED Constant

Pascal

```
BN_PUSHED = BN_HILITE;
```

C++

```
BN_PUSHED = BN_HILITE;
```

File

Messages

Description

This is constant Messages.BN_PUSHED.

49.4.17 Messages.BN_SETFOCUS Constant

Pascal

```
BN_SETFOCUS = 6;
```

C++

```
BN_SETFOCUS = 6;
```

File

Messages

Description

This is constant Messages.BN_SETFOCUS.

49.4.18 Messages.BN_UNHILITE Constant

Pascal

```
BN_UNHILITE = 3;
```

C++

```
BN_UNHILITE = 3;
```

File

Messages

Description

This is constant Messages.BN_UNHILITE.

49.4.19 Messages.BN_UNPUSHED Constant

Pascal

```
BN_UNPUSHED = BN_UNHILITE;
```

C++

```
BN_UNPUSHED = BN_UNHILITE;
```

File

Messages

Description

This is constant Messages.BN_UNPUSHED.

49.4.20 Messages.CB_ADDSTRING Constant

Pascal

```
CB_ADDSTRING = $0143;
```

C++

```
CB_ADDSTRING = 0x0143;
```

File

Messages

Description

This is constant Messages.CB_ADDSTRING.

49.4.21 Messages.CB_DELETESTRING Constant

Pascal

```
CB_DELETESTRING = $0144;
```

C++

```
CB_DELETESTRING = 0x0144;
```

File

Messages

Description

This is constant Messages.CB_DELETESTRING.

49.4.22 Messages.CB_DIR Constant

Pascal

```
CB_DIR = $0145;
```

C++

```
CB_DIR = 0x0145;
```

File

Messages

Description

This is constant Messages.CB_DIR.

49.4.23 Messages.CB_FINDSTRING Constant

Pascal

```
CB_FINDSTRING = $014C;
```

C++

```
CB_FINDSTRING = 0x014C;
```

File

Messages

Description

This is constant Messages.CB_FINDSTRING.

49.4.24 Messages.CB_FINDSTRINGEXACT Constant

Pascal

```
CB_FINDSTRINGEXACT = $0158;
```

C++

```
CB_FINDSTRINGEXACT = 0x0158;
```

File

Messages

Description

This is constant Messages.CB_FINDSTRINGEXACT.

49.4.25 Messages.CB_GETCOUNT Constant

Pascal

```
CB_GETCOUNT = $0146;
```

C++

```
CB_GETCOUNT = 0x0146;
```

File

Messages

Description

This is constant Messages.CB_GETCOUNT.

49.4.26 Messages.CB_GETCURSEL Constant

Pascal

```
CB_GETCURSEL = $0147;
```

C++

```
CB_GETCURSEL = 0x0147;
```

File

Messages

Description

This is constant Messages.CB_GETCURSEL.

49.4.27 Messages.CB_GETDROPPEDCONTROLRECT Constant

Pascal

```
CB_GETDROPPEDCONTROLRECT = $0152;
```

C++

```
CB_GETDROPPEDCONTROLRECT = 0x0152;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDCONTROLRECT.

49.4.28 Messages.CB_GETDROPPEDSTATE Constant

Pascal

```
CB_GETDROPPEDSTATE = $0157;
```

C++

```
CB_GETDROPPEDSTATE = 0x0157;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDSTATE.

49.4.29 Messages.CB_GETDROPPEDWIDTH Constant

Pascal

```
CB_GETDROPPEDWIDTH = 351;
```

C++

```
CB_GETDROPPEDWIDTH = 351;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDWIDTH.

49.4.30 Messages.CB_GETEDITSEL Constant

Pascal

```
CB_GETEDITSEL = $0140;
```

C++

```
CB_GETEDITSEL = 0x0140;
```

File

Messages

Description

This is constant Messages.CB_GETEDITSEL.

49.4.31 Messages.CB_GETEXTENDEDUI Constant

Pascal

```
CB_GETEXTENDEDUI = $0156;
```

C++

```
CB_GETEXTENDEDUI = 0x0156;
```

File

Messages

Description

This is constant Messages.CB_GETEXTENDEDUI.

49.4.32 Messages.CB_GETHORIZONTALEXTENT Constant

Pascal

```
CB_GETHORIZONTALEXTENT = 349;
```

C++

```
CB_GETHORIZONTALEXTENT = 349;
```

File

Messages

Description

This is constant Messages.CB_GETHORIZONTALEXTENT.

49.4.33 Messages.CB_GETITEMDATA Constant

Pascal

```
CB_GETITEMDATA = $0150;
```

C++

```
CB_GETITEMDATA = 0x0150;
```

File

Messages

Description

This is constant Messages.CB_GETITEMDATA.

49.4.34 Messages.CB_GETITEMHEIGHT Constant

Pascal

```
CB_GETITEMHEIGHT = $0154;
```

C++

```
CB_GETITEMHEIGHT = 0x0154;
```

File

Messages

Description

This is constant Messages.CB_GETITEMHEIGHT.

49.4.35 Messages.CB_GETLBTEXT Constant

Pascal

```
CB_GETLBTEXT = $0148;
```

C++

```
CB_GETLBTEXT = 0x0148;
```

File

Messages

Description

This is constant Messages.CB_GETLBTEXT.

49.4.36 Messages.CB_GETLBTEXTLEN Constant

Pascal

```
CB_GETLBTEXTLEN = $0149;
```

C++

```
CB_GETLBTEXTLEN = 0x0149;
```

File

Messages

Description

This is constant Messages.CB_GETLBTEXTLEN.

49.4.37 Messages.CB_GETLOCALE Constant

Pascal

```
CB_GETLOCALE = 346;
```

C++

```
CB_GETLOCALE = 346;
```

File

Messages

Description

This is constant Messages.CB_GETLOCALE.

49.4.38 Messages.CB_GETTOPINDEX Constant

Pascal

```
CB_GETTOPINDEX = 347;
```

C++

```
CB_GETTOPINDEX = 347;
```

File

Messages

Description

This is constant Messages.CB_GETTOPINDEX.

49.4.39 Messages.CB_INITSTORAGE Constant

Pascal

```
CB_INITSTORAGE = 353;
```

C++

```
CB_INITSTORAGE = 353;
```

File

Messages

Description

This is constant Messages.CB_INITSTORAGE.

49.4.40 Messages.CB_INSERTSTRING Constant

Pascal

```
CB_INSERTSTRING = $014A;
```

C++

```
CB_INSERTSTRING = 0x014A;
```

File

Messages

Description

This is constant Messages.CB_INSERTSTRING.

49.4.41 Messages.CB_LIMITTEXT Constant

Pascal

```
CB_LIMITTEXT = $0141;
```

C++

```
CB_LIMITTEXT = 0x0141;
```

File

Messages

Description

This is constant Messages.CB_LIMITTEXT.

49.4.42 Messages.CB_MSGMAX Constant

Pascal

```
CB_MSGMAX = 354;
```

C++

```
CB_MSGMAX = 354;
```

File

Messages

Description

This is constant Messages.CB_MSGMAX.

49.4.43 Messages.CB_RESETCONTENT Constant

Pascal

```
CB_RESETCONTENT = $014B;
```

C++

```
CB_RESETCONTENT = 0x014B;
```

File

Messages

Description

This is constant Messages.CB_RESETCONTENT.

49.4.44 Messages.CB_SELECTSTRING Constant

Pascal

```
CB_SELECTSTRING = $014D;
```

C++

```
CB_SELECTSTRING = 0x014D;
```

File

Messages

Description

This is constant Messages.CB_SELECTSTRING.

49.4.45 Messages.CB_SETCURSEL Constant

Pascal

```
CB_SETCURSEL = $014E;
```

C++

```
CB_SETCURSEL = 0x014E;
```

File

Messages

Description

This is constant Messages.CB_SETCURSEL.

49.4.46 Messages.CB_SETDROPPEDWIDTH Constant

Pascal

```
CB_SETDROPPEDWIDTH = 352;
```

C++

```
CB_SETDROPPEDWIDTH = 352;
```

File

Messages

Description

This is constant Messages.CB_SETDROPPEDWIDTH.

49.4.47 Messages.CB_SETEDITSEL Constant

Pascal

```
CB_SETEDITSEL = $0142;
```

C++

```
CB_SETEDITSEL = 0x0142;
```

File

Messages

Description

This is constant Messages.CB_SETEDITSEL.

49.4.48 Messages.CB_SETEXTENDEDUI Constant

Pascal

```
CB_SETEXTENDEDUI = $0155;
```

C++

```
CB_SETEXTENDEDUI = 0x0155;
```

File

Messages

Description

This is constant Messages.CB_SETEXTENDEDUI.

49.4.49 Messages.CB_SETHORIZONTALEXTENT Constant

Pascal

```
CB_SETHORIZONTALEXTENT = 350;
```

C++

```
CB_SETHORIZONTALEXTENT = 350;
```

File

Messages

Description

This is constant Messages.CB_SETHORIZONTALEXTENT.

49.4.50 Messages.CB_SETITEMDATA Constant

Pascal

```
CB_SETITEMDATA = $0151;
```

C++

```
CB_SETITEMDATA = 0x0151;
```

File

Messages

Description

This is constant Messages.CB_SETITEMDATA.

49.4.51 Messages.CB_SETITEMHEIGHT Constant

Pascal

```
CB_SETITEMHEIGHT = $0153;
```

C++

```
CB_SETITEMHEIGHT = 0x0153;
```

File

Messages

Description

This is constant Messages.CB_SETITEMHEIGHT.

49.4.52 Messages.CB_SETLOCALE Constant

Pascal

```
CB_SETLOCALE = 345;
```

C++

```
CB_SETLOCALE = 345;
```

File

Messages

Description

This is constant Messages.CB_SETLOCALE.

49.4.53 Messages.CB_SETTOPINDEX Constant

Pascal

```
CB_SETTOPINDEX = 348;
```

C++

```
CB_SETTOPINDEX = 348;
```

File

Messages

Description

This is constant Messages.CB_SETTOPINDEX.

49.4.54 Messages.CB_SHOWDROPDOWN Constant

Pascal

```
CB_SHOWDROPDOWN = $014F;
```

C++

```
CB_SHOWDROPDOWN = 0x014F;
```

File

Messages

Description

This is constant Messages.CB_SHOWDROPDOWN.

49.4.55 Messages.CBN_CLOSEUP Constant

Pascal

```
CBN_CLOSEUP = 8;
```

C++

```
CBN_CLOSEUP = 8;
```

File

Messages

Description

This is constant Messages.CBN_CLOSEUP.

49.4.56 Messages.CBN_DBLCLK Constant

Pascal

```
CBN_DBLCLK = 2;
```

C++

```
CBN_DBLCLK = 2;
```

File

Messages

Description

This is constant Messages.CBN_DBLCLK.

49.4.57 Messages.CBN_DROPDOWN Constant

Pascal

```
CBN_DROPDOWN = 7;
```

C++

```
CBN_DROPDOWN = 7;
```

File

Messages

Description

This is constant Messages.CBN_DROPDOWN.

49.4.58 Messages.CBN_EDITCHANGE Constant

Pascal

```
CBN_EDITCHANGE = 5;
```

C++

```
CBN_EDITCHANGE = 5;
```

File

Messages

Description

This is constant Messages.CBN_EDITCHANGE.

49.4.59 Messages.CBN_EDITUPDATE Constant

Pascal

```
CBN_EDITUPDATE = 6;
```

C++

```
CBN_EDITUPDATE = 6;
```

File

Messages

Description

This is constant Messages.CBN_EDITUPDATE.

49.4.60 Messages.CBN_ERRSPACE Constant

Pascal

```
CBN_ERRSPACE = (-1);
```

C++

```
CBN_ERRSPACE = (-1);
```

File

Messages

Description

This is constant Messages.CBN_ERRSPACE.

49.4.61 Messages.CBN_KILLFOCUS Constant

Pascal

```
CBN_KILLFOCUS = 4;
```

C++

```
CBN_KILLFOCUS = 4;
```

File

Messages

Description

This is constant Messages.CBN_KILLFOCUS.

49.4.62 Messages.CBN_SELCHANGE Constant

Pascal

```
CBN_SELCHANGE = 1;
```

C++

```
CBN_SELCHANGE = 1;
```

File

Messages

Description

This is constant Messages.CBN_SELCHANGE.

49.4.63 Messages.CBN_SELENDCANCEL Constant

Pascal

```
CBN_SELENDCANCEL = 10;
```

C++

```
CBN_SELENDCANCEL = 10;
```

File

Messages

Description

This is constant Messages.CBN_SELENDCANCEL.

49.4.64 Messages.CBN_SELENDOK Constant

Pascal

```
CBN_SELENDOK = 9;
```

C++

```
CBN_SELENDOK = 9;
```

File

Messages

Description

This is constant Messages.CBN_SELENDOK.

49.4.65 Messages.CBN_SETFOCUS Constant

Pascal

```
CBN_SETFOCUS = 3;
```

C++

```
CBN_SETFOCUS = 3;
```

File

Messages

Description

This is constant Messages.CBN_SETFOCUS.

49.4.66 Messages.DM_GETDEFID Constant

Pascal

```
DM_GETDEFID = (WM_USER+0);
```

C++

```
DM_GETDEFID = (WM_USER+0);
```

File

Messages

Description

This is constant Messages.DM_GETDEFID.

49.4.67 Messages.DM_REPOSITION Constant

Pascal

```
DM_REPOSITION = (WM_USER+2);
```

C++

```
DM_REPOSITION = (WM_USER+2);
```

File

Messages

Description

This is constant Messages.DM_REPOSITION.

49.4.68 Messages.DM_SETDEFID Constant

Pascal

```
DM_SETDEFID = (WM_USER+1);
```

C++

```
DM_SETDEFID = (WM_USER+1);
```

File

Messages

Description

This is constant Messages.DM_SETDEFID.

49.4.69 Messages.EM_CANUNDO Constant

Pascal

```
EM_CANUNDO = $00C6;
```

C++

```
EM_CANUNDO = 0x00C6;
```

File

Messages

Description

This is constant Messages.EM_CANUNDO.

49.4.70 Messages.EM_CHARFROMPOS Constant

Pascal

```
EM_CHARFROMPOS = 215;
```

C++

```
EM_CHARFROMPOS = 215;
```

File

Messages

Description

This is constant Messages.EM_CHARFROMPOS.

49.4.71 Messages.EM_EMPTYUNDOBUFFER Constant

Pascal

```
EM_EMPTYUNDOBUFFER = $00CD;
```

C++

```
EM_EMPTYUNDOBUFFER = 0x00CD;
```

File

Messages

Description

This is constant Messages.EM_EMPTYUNDOBUFFER.

49.4.72 Messages.EM_FMTLINES Constant

Pascal

```
EM_FMTLINES = $00C8;
```

C++

```
EM_FMTLINES = 0x00C8;
```

File

Messages

Description

This is constant Messages.EM_FMTLINES.

49.4.73 Messages.EM_GETFIRSTVISIBLELINE Constant

Pascal

```
EM_GETFIRSTVISIBLELINE = $00CE;
```

C++

```
EM_GETFIRSTVISIBLELINE = 0x00CE;
```

File

Messages

Description

This is constant Messages.EM_GETFIRSTVISIBLELINE.

49.4.74 Messages.EM_GETHANDLE Constant

Pascal

```
EM_GETHANDLE = $00BD;
```

C++

```
EM_GETHANDLE = 0x00BD;
```

File

Messages

Description

This is constant Messages.EM_GETHANDLE.

49.4.75 Messages.EM_GETIMESTATUS Constant

Pascal

```
EM_GETIMESTATUS = 217;
```

C++

```
EM_GETIMESTATUS = 217;
```

File

Messages

Description

This is constant Messages.EM_GETIMESTATUS.

49.4.76 Messages.EM_GETLIMITTEXT Constant

Pascal

```
EM_GETLIMITTEXT = 213;
```

C++

```
EM_GETLIMITTEXT = 213;
```

File

Messages

Description

This is constant Messages.EM_GETLIMITTEXT.

49.4.77 Messages.EM_GETLINE Constant

Pascal

```
EM_GETLINE = $00C4;
```

C++

```
EM_GETLINE = 0x00C4;
```

File

Messages

Description

This is constant Messages.EM_GETLINE.

49.4.78 Messages.EM_GETLINECOUNT Constant

Pascal

```
EM_GETLINECOUNT = $00BA;
```

C++

```
EM_GETLINECOUNT = 0x00BA;
```

File

Messages

Description

This is constant Messages.EM_GETLINECOUNT.

49.4.79 Messages.EM_GETMARGINS Constant

Pascal

```
EM_GETMARGINS = 212;
```

C++

```
EM_GETMARGINS = 212;
```

File

Messages

Description

This is constant Messages.EM_GETMARGINS.

49.4.80 Messages.EM_GETMODIFY Constant

Pascal

```
EM_GETMODIFY = $00B8;
```

C++

```
EM_GETMODIFY = 0x00B8;
```

File

Messages

Description

This is constant Messages.EM_GETMODIFY.

49.4.81 Messages.EM_GETPASSWORDCHAR Constant

Pascal

```
EM_GETPASSWORDCHAR = $00D2;
```

C++

```
EM_GETPASSWORDCHAR = 0x00D2;
```

File

Messages

Description

This is constant Messages.EM_GETPASSWORDCHAR.

49.4.82 Messages.EM_GETRECT Constant

Pascal

```
EM_GETRECT = $00B2;
```

C++

```
EM_GETRECT = 0x00B2;
```

File

Messages

Description

This is constant Messages.EM_GETRECT.

49.4.83 Messages.EM_GETSEL Constant

Pascal

```
EM_GETSEL = $00B0;
```

C++

```
EM_GETSEL = 0x00B0;
```

File

Messages

Description

This is constant Messages.EM_GETSEL.

49.4.84 Messages.EM_GETTHUMB Constant

Pascal

```
EM_GETTHUMB = $00BE;
```

C++

```
EM_GETTHUMB = 0x00BE;
```

File

Messages

Description

This is constant Messages.EM_GETTHUMB.

49.4.85 Messages.EM_GETWORDBREAKPROC Constant

Pascal

```
EM_GETWORDBREAKPROC = $00D1;
```

C++

```
EM_GETWORDBREAKPROC = 0x00D1;
```

File

Messages

Description

This is constant Messages.EM_GETWORDBREAKPROC.

49.4.86 Messages.EM_LIMITTEXT Constant

Pascal

```
EM_LIMITTEXT = $00C5;
```

C++

```
EM_LIMITTEXT = 0x00C5;
```

File

Messages

Description

This is constant Messages.EM_LIMITTEXT.

49.4.87 Messages.EM_LINEFROMCHAR Constant

Pascal

```
EM_LINEFROMCHAR = $00C9;
```

C++

```
EM_LINEFROMCHAR = 0x00C9;
```

File

Messages

Description

This is constant Messages.EM_LINEFROMCHAR.

49.4.88 Messages.EM_LINEINDEX Constant

Pascal

```
EM_LINEINDEX = $00BB;
```

C++

```
EM_LINEINDEX = 0x00BB;
```

File

Messages

Description

This is constant Messages.EM_LINEINDEX.

49.4.89 Messages.EM_LINELENGTH Constant

Pascal

```
EM_LINELENGTH = $00C1;
```

C++

```
EM_LINELENGTH = 0x00C1;
```

File

Messages

Description

This is constant Messages.EM_LINELENGTH.

49.4.90 Messages.EM_LINESCROLL Constant

Pascal

```
EM_LINESCROLL = $00B6;
```

C++

```
EM_LINESCROLL = 0x00B6;
```

File

Messages

Description

This is constant Messages.EM_LINESCROLL.

49.4.91 Messages.EM_POSFROMCHAR Constant

Pascal

```
EM_POSFROMCHAR = 214;
```

C++

```
EM_POSFROMCHAR = 214;
```

File

Messages

Description

This is constant Messages.EM_POSFROMCHAR.

49.4.92 Messages.EM_REPLACESEL Constant

Pascal

```
EM_REPLACESEL = $00C2;
```

C++

```
EM_REPLACESEL = 0x00C2;
```

File

Messages

Description

This is constant Messages.EM_REPLACESEL.

49.4.93 Messages.EM_SCROLL Constant

Pascal

```
EM_SCROLL = $00B5;
```

C++

```
EM_SCROLL = 0x00B5;
```

File

Messages

Description

This is constant Messages.EM_SCROLL.

49.4.94 Messages.EM_SCROLLCARET Constant

Pascal

```
EM_SCROLLCARET = $00B7;
```

C++

```
EM_SCROLLCARET = 0x00B7;
```

File

Messages

Description

This is constant Messages.EM_SCROLLCARET.

49.4.95 Messages.EM_SETHANDLE Constant

Pascal

```
EM_SETHANDLE = $00BC;
```

C++

```
EM_SETHANDLE = 0x00BC;
```

File

Messages

Description

This is constant Messages.EM_SETHANDLE.

49.4.96 Messages.EM_SETIMESTATUS Constant

Pascal

```
EM_SETIMESTATUS = 216;
```

C++

```
EM_SETIMESTATUS = 216;
```

File

Messages

Description

This is constant Messages.EM_SETIMESTATUS.

49.4.97 Messages.EM_SETLIMITTEXT Constant

Pascal

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

C++

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

File

Messages

Description

This is constant Messages.EM_SETLIMITTEXT.

49.4.98 Messages.EM_SETMARGINS Constant

Pascal

```
EM_SETMARGINS = 211;
```

C++

```
EM_SETMARGINS = 211;
```

File

Messages

Description

This is constant Messages.EM_SETMARGINS.

49.4.99 Messages.EM_SETMODIFY Constant

Pascal

```
EM_SETMODIFY = $00B9;
```

C++

```
EM_SETMODIFY = 0x00B9;
```

File

Messages

Description

This is constant Messages.EM_SETMODIFY.

49.4.100 Messages.EM_SETPASSWORDCHAR Constant

Pascal

```
EM_SETPASSWORDCHAR = $00CC;
```

C++

```
EM_SETPASSWORDCHAR = 0x00CC;
```

File

Messages

Description

This is constant Messages.EM_SETPASSWORDCHAR.

49.4.101 Messages.EM_SETREADONLY Constant

Pascal

```
EM_SETREADONLY = $00CF;
```

C++

```
EM_SETREADONLY = 0x00CF;
```

File

Messages

Description

This is constant Messages.EM_SETREADONLY.

49.4.102 Messages.EM_SETRECT Constant

Pascal

```
EM_SETRECT = $00B3;
```

C++

```
EM_SETRECT = 0x00B3;
```

File

Messages

Description

This is constant Messages.EM_SETRECT.

49.4.103 Messages.EM_SETRECTNP Constant

Pascal

```
EM_SETRECTNP = $00B4;
```

C++

```
EM_SETRECTNP = 0x00B4;
```

File

Messages

Description

This is constant Messages.EM_SETRECTNP.

49.4.104 Messages.EM_SETSEL Constant

Pascal

```
EM_SETSEL = $00B1;
```

C++

```
EM_SETSEL = 0x00B1;
```

File

Messages

Description

This is constant Messages.EM_SETSEL.

49.4.105 Messages.EM_SETTABSTOPS Constant

Pascal

```
EM_SETTABSTOPS = $00CB;
```

C++

```
EM_SETTABSTOPS = 0x00CB;
```

File

Messages

Description

This is constant Messages.EM_SETTABSTOPS.

49.4.106 Messages.EM_SETWORDBREAKPROC Constant

Pascal

```
EM_SETWORDBREAKPROC = $00D0;
```

C++

```
EM_SETWORDBREAKPROC = 0x00D0;
```

File

Messages

Description

This is constant Messages.EM_SETWORDBREAKPROC.

49.4.107 Messages.EM_UNDO Constant

Pascal

```
EM_UNDO = $00C7;
```

C++

```
EM_UNDO = 0x00C7;
```

File

Messages

Description

This is constant Messages.EM_UNDO.

49.4.108 Messages.EN_CHANGE Constant

Pascal

```
EN_CHANGE = $0300;
```

C++

```
EN_CHANGE = 0x0300;
```

File

Messages

Description

This is constant Messages.EN_CHANGE.

49.4.109 Messages.EN_ERRSPACE Constant

Pascal

```
EN_ERRSPACE = $0500;
```

C++

```
EN_ERRSPACE = 0x0500;
```

File

Messages

Description

This is constant Messages.EN_ERRSPACE.

49.4.110 Messages.EN_HSCROLL Constant

Pascal

```
EN_HSCROLL = $0601;
```

C++

```
EN_HSCROLL = 0x0601;
```

File

Messages

Description

This is constant Messages.EN_HSCROLL.

49.4.111 Messages.EN_KILLFOCUS Constant

Pascal

```
EN_KILLFOCUS = $0200;
```

C++

```
EN_KILLFOCUS = 0x0200;
```

File

Messages

Description

This is constant Messages.EN_KILLFOCUS.

49.4.112 Messages.EN_MAXTEXT Constant

Pascal

```
EN_MAXTEXT = $0501;
```

C++

```
EN_MAXTEXT = 0x0501;
```

File

Messages

Description

This is constant Messages.EN_MAXTEXT.

49.4.113 Messages.EN_SETFOCUS Constant

Pascal

```
EN_SETFOCUS = $0100;
```

C++

```
EN_SETFOCUS = 0x0100;
```

File

Messages

Description

This is constant Messages.EN_SETFOCUS.

49.4.114 Messages.EN_UPDATE Constant

Pascal

```
EN_UPDATE = $0400;
```

C++

```
EN_UPDATE = 0x0400;
```

File

Messages

Description

This is constant Messages.EN_UPDATE.

49.4.115 Messages.EN_VSCROLL Constant

Pascal

```
EN_VSCROLL = $0602;
```

C++

```
EN_VSCROLL = 0x0602;
```

File

Messages

Description

This is constant Messages.EN_VSCROLL.

49.4.116 Messages.LB_ADDFILE Constant

Pascal

```
LB_ADDFILE = $0196;
```

C++

```
LB_ADDFILE = 0x0196;
```

File

Messages

Description

This is constant Messages.LB_ADDFILE.

49.4.117 Messages.LB_ADDSTRING Constant

Pascal

```
LB_ADDSTRING = $0180;
```

C++

```
LB_ADDSTRING = 0x0180;
```

File

Messages

Description

This is constant Messages.LB_ADDSTRING.

49.4.118 Messages.LB_DELETESTRING Constant

Pascal

```
LB_DELETESTRING = $0182;
```

C++

```
LB_DELETESTRING = 0x0182;
```

File

Messages

Description

This is constant Messages.LB_DELETESTRING.

49.4.119 Messages.LB_DIR Constant

Pascal

```
LB_DIR = $018D;
```

C++

```
LB_DIR = 0x018D;
```

File

Messages

Description

This is constant Messages.LB_DIR.

49.4.120 Messages.LB_FINDSTRING Constant

Pascal

```
LB_FINDSTRING = $018F;
```

C++

```
LB_FINDSTRING = 0x018F;
```

File

Messages

Description

This is constant Messages.LB_FINDSTRING.

49.4.121 Messages.LB_FINDSTRINGEXACT Constant

Pascal

```
LB_FINDSTRINGEXACT = $01A2;
```

C++

```
LB_FINDSTRINGEXACT = 0x01A2;
```

File

Messages

Description

This is constant Messages.LB_FINDSTRINGEXACT.

49.4.122 Messages.LB_GETANCHORINDEX Constant

Pascal

```
LB_GETANCHORINDEX = $019D;
```

C++

```
LB_GETANCHORINDEX = 0x019D;
```

File

Messages

Description

This is constant Messages.LB_GETANCHORINDEX.

49.4.123 Messages.LB_GETCARETINDEX Constant

Pascal

```
LB_GETCARETINDEX = $019F;
```

C++

```
LB_GETCARETINDEX = 0x019F;
```

File

Messages

Description

This is constant Messages.LB_GETCARETINDEX.

49.4.124 Messages.LB_GETCOUNT Constant

Pascal

```
LB_GETCOUNT = $018B;
```

C++

```
LB_GETCOUNT = 0x018B;
```

File

Messages

Description

This is constant Messages.LB_GETCOUNT.

49.4.125 Messages.LB_GETCURSEL Constant

Pascal

```
LB_GETCURSEL = $0188;
```

C++

```
LB_GETCURSEL = 0x0188;
```

File

Messages

Description

This is constant Messages.LB_GETCURSEL.

49.4.126 Messages.LB_GETHORIZONTALEXTENT Constant

Pascal

```
LB_GETHORIZONTALEXTENT = $0193;
```

C++

```
LB_GETHORIZONTALEXTENT = 0x0193;
```

File

Messages

Description

This is constant Messages.LB_GETHORIZONTALEXTENT.

49.4.127 Messages.LB_GETITEMDATA Constant

Pascal

```
LB_GETITEMDATA = $0199;
```

C++

```
LB_GETITEMDATA = 0x0199;
```

File

Messages

Description

This is constant Messages.LB_GETITEMDATA.

49.4.128 Messages.LB_GETITEMHEIGHT Constant

Pascal

```
LB_GETITEMHEIGHT = $01A1;
```

C++

```
LB_GETITEMHEIGHT = 0x01A1;
```

File

Messages

Description

This is constant Messages.LB_GETITEMHEIGHT.

49.4.129 Messages.LB_GETITEMRECT Constant

Pascal

```
LB_GETITEMRECT = $0198;
```

C++

```
LB_GETITEMRECT = 0x0198;
```

File

Messages

Description

This is constant Messages.LB_GETITEMRECT.

49.4.130 Messages.LB_GETLOCALE Constant

Pascal

```
LB_GETLOCALE = $01A6;
```

C++

```
LB_GETLOCALE = 0x01A6;
```

File

Messages

Description

This is constant Messages.LB_GETLOCALE.

49.4.131 Messages.LB_GETSEL Constant

Pascal

```
LB_GETSEL = $0187;
```

C++

```
LB_GETSEL = 0x0187;
```

File

Messages

Description

This is constant Messages.LB_GETSEL.

49.4.132 Messages.LB_GETSELCOUNT Constant

Pascal

```
LB_GETSELCOUNT = $0190;
```

C++

```
LB_GETSELCOUNT = 0x0190;
```

File

Messages

Description

This is constant Messages.LB_GETSELCOUNT.

49.4.133 Messages.LB_GETSELITEMS Constant

Pascal

```
LB_GETSELITEMS = $0191;
```

C++

```
LB_GETSELITEMS = 0x0191;
```

File

Messages

Description

This is constant Messages.LB_GETSELITEMS.

49.4.134 Messages.LB_GETTEXT Constant

Pascal

```
LB_GETTEXT = $0189;
```

C++

```
LB_GETTEXT = 0x0189;
```

File

Messages

Description

This is constant Messages.LB_GETTEXT.

49.4.135 Messages.LB_GETTEXTLEN Constant

Pascal

```
LB_GETTEXTLEN = $018A;
```

C++

```
LB_GETTEXTLEN = 0x018A;
```

File

Messages

Description

This is constant Messages.LB_GETTEXTLEN.

49.4.136 Messages.LB_GETTOPINDEX Constant

Pascal

```
LB_GETTOPINDEX = $018E;
```

C++

```
LB_GETTOPINDEX = 0x018E;
```

File

Messages

Description

This is constant Messages.LB_GETTOPINDEX.

49.4.137 Messages.LB_INITSTORAGE Constant

Pascal

```
LB_INITSTORAGE = $01A8;
```

C++

```
LB_INITSTORAGE = 0x01A8;
```

File

Messages

Description

This is constant Messages.LB_INITSTORAGE.

49.4.138 Messages.LB_INSERTSTRING Constant

Pascal

```
LB_INSERTSTRING = $0181;
```

C++

```
LB_INSERTSTRING = 0x0181;
```

File

Messages

Description

This is constant Messages.LB_INSERTSTRING.

49.4.139 Messages.LB_ITEMFROMPOINT Constant

Pascal

```
LB_ITEMFROMPOINT = $01A9;
```

C++

```
LB_ITEMFROMPOINT = 0x01A9;
```

File

Messages

Description

This is constant Messages.LB_ITEMFROMPOINT.

49.4.140 Messages.LB_MSGMAX Constant

Pascal

```
LB_MSGMAX = 432;
```

C++

```
LB_MSGMAX = 432;
```

File

Messages

Description

This is constant Messages.LB_MSGMAX.

49.4.141 Messages.LB_RESETCONTENT Constant

Pascal

```
LB_RESETCONTENT = $0184;
```

C++

```
LB_RESETCONTENT = 0x0184;
```

File

Messages

Description

This is constant Messages.LB_RESETCONTENT.

49.4.142 Messages.LB_SELECTSTRING Constant

Pascal

```
LB_SELECTSTRING = $018C;
```

C++

```
LB_SELECTSTRING = 0x018C;
```

File

Messages

Description

This is constant Messages.LB_SELECTSTRING.

49.4.143 Messages.LB_SELITEMRANGE Constant

Pascal

```
LB_SELITEMRANGE = $019B;
```

C++

```
LB_SELITEMRANGE = 0x019B;
```

File

Messages

Description

This is constant Messages.LB_SELITEMRANGE.

49.4.144 Messages.LB_SELITEMRANGEEX Constant

Pascal

```
LB_SELITEMRANGEEX = $0183;
```

C++

```
LB_SELITEMRANGEEX = 0x0183;
```

File

Messages

Description

This is constant Messages.LB_SELITEMRANGEEX.

49.4.145 Messages.LB_SETANCHORINDEX Constant

Pascal

```
LB_SETANCHORINDEX = $019C;
```

C++

```
LB_SETANCHORINDEX = 0x019C;
```

File

Messages

Description

This is constant Messages.LB_SETANCHORINDEX.

49.4.146 Messages.LB_SETCARETINDEX Constant

Pascal

```
LB_SETCARETINDEX = $019E;
```

C++

```
LB_SETCARETINDEX = 0x019E;
```

File

Messages

Description

This is constant Messages.LB_SETCARETINDEX.

49.4.147 Messages.LB_SETCOLUMNWIDTH Constant

Pascal

```
LB_SETCOLUMNWIDTH = $0195;
```

C++

```
LB_SETCOLUMNWIDTH = 0x0195;
```

File

Messages

Description

This is constant Messages.LB_SETCOLUMNWIDTH.

49.4.148 Messages.LB_SETCOUNT Constant

Pascal

```
LB_SETCOUNT = $01A7;
```

C++

```
LB_SETCOUNT = 0x01A7;
```

File

Messages

Description

This is constant Messages.LB_SETCOUNT.

49.4.149 Messages.LB_SETCURSEL Constant

Pascal

```
LB_SETCURSEL = $0186;
```

C++

```
LB_SETCURSEL = 0x0186;
```

File

Messages

Description

This is constant Messages.LB_SETCURSEL.

49.4.150 Messages.LB_SETHORIZONTALEXTENT Constant

Pascal

```
LB_SETHORIZONTALEXTENT = $0194;
```

C++

```
LB_SETHORIZONTALEXTENT = 0x0194;
```

File

Messages

Description

This is constant Messages.LB_SETHORIZONTALEXTENT.

49.4.151 Messages.LB_SETITEMDATA Constant

Pascal

```
LB_SETITEMDATA = $019A;
```

C++

```
LB_SETITEMDATA = 0x019A;
```

File

Messages

Description

This is constant Messages.LB_SETITEMDATA.

49.4.152 Messages.LB_SETITEMHEIGHT Constant

Pascal

```
LB_SETITEMHEIGHT = $01A0;
```

C++

```
LB_SETITEMHEIGHT = 0x01A0;
```

File

Messages

Description

This is constant Messages.LB_SETITEMHEIGHT.

49.4.153 Messages.LB_SETLOCALE Constant

Pascal

```
LB_SETLOCALE = $01A5;
```

C++

```
LB_SETLOCALE = 0x01A5;
```

File

Messages

Description

This is constant Messages.LB_SETLOCALE.

49.4.154 Messages.LB_SETSEL Constant

Pascal

```
LB_SETSEL = $0185;
```

C++

```
LB_SETSEL = 0x0185;
```

File

Messages

Description

This is constant Messages.LB_SETSEL.

49.4.155 Messages.LB_SETTABSTOPS Constant

Pascal

```
LB_SETTABSTOPS = $0192;
```

C++

```
LB_SETTABSTOPS = 0x0192;
```

File

Messages

Description

This is constant Messages.LB_SETTABSTOPS.

49.4.156 Messages.LB_SETTOPINDEX Constant

Pascal

```
LB_SETTOPINDEX = $0197;
```

C++

```
LB_SETTOPINDEX = 0x0197;
```

File

Messages

Description

This is constant Messages.LB_SETTOPINDEX.

49.4.157 Messages.LBN_DBLCLK Constant

Pascal

```
LBN_DBLCLK = 2;
```

C++

```
LBN_DBLCLK = 2;
```

File

Messages

Description

This is constant Messages.LBN_DBLCLK.

49.4.158 Messages.LBN_ERRSPACE Constant

Pascal

```
LBN_ERRSPACE = (-2);
```

C++

```
LBN_ERRSPACE = (-2);
```

File

Messages

Description

This is constant Messages.LBN_ERRSPACE.

49.4.159 Messages.LBN_KILLFOCUS Constant

Pascal

```
LBN_KILLFOCUS = 5;
```

C++

```
LBN_KILLFOCUS = 5;
```

File

Messages

Description

This is constant Messages.LBN_KILLFOCUS.

49.4.160 Messages.LBN_SELCANCEL Constant

Pascal

```
LBN_SELCANCEL = 3;
```

C++

```
LBN_SELCANCEL = 3;
```

File

Messages

Description

This is constant Messages.LBN_SELCANCEL.

49.4.161 Messages.LBN_SELCHANGE Constant

Pascal

```
LBN_SELCHANGE = 1;
```

C++

```
LBN_SELCHANGE = 1;
```

File

Messages

Description

This is constant Messages.LBN_SELCHANGE.

49.4.162 Messages.LBN_SETFOCUS Constant

Pascal

```
LBN_SETFOCUS = 4;
```

C++

```
LBN_SETFOCUS = 4;
```

File

Messages

Description

This is constant Messages.LBN_SETFOCUS.

49.4.163 Messages.PSM_PAGEINFO Constant

Pascal

```
PSM_PAGEINFO = (WM_USER+100);
```

C++

```
PSM_PAGEINFO = (WM_USER+100);
```

File

Messages

Description

This is constant Messages.PSM_PAGEINFO.

49.4.164 Messages.PSM_SHEETINFO Constant

Pascal

```
PSM_SHEETINFO = (WM_USER+101);
```

C++

```
PSM_SHEETINFO = (WM_USER+101);
```

File

Messages

Description

This is constant Messages.PSM_SHEETINFO.

49.4.165 Messages.SBM_ENABLE_ARROWS Constant

Pascal

```
SBM_ENABLE_ARROWS = 228;
```

C++

```
SBM_ENABLE_ARROWS = 228;
```

File

Messages

Description

This is constant Messages.SBM_ENABLE_ARROWS.

49.4.166 Messages.SBM_GETPOS Constant

Pascal

```
SBM_GETPOS = 225;
```

C++

```
SBM_GETPOS = 225;
```

File

Messages

Description

This is constant Messages.SBM_GETPOS.

49.4.167 Messages.SBM_GETRANGE Constant

Pascal

```
SBM_GETRANGE = 227;
```

C++

```
SBM_GETRANGE = 227;
```

File

Messages

Description

This is constant Messages.SBM_GETRANGE.

49.4.168 Messages.SBM_GETSCROLLBARINFO Constant

Pascal

```
SBM_GETSCROLLBARINFO = 235;
```

C++

```
SBM_GETSCROLLBARINFO = 235;
```

File

Messages

Description

This is constant Messages.SBM_GETSCROLLBARINFO.

49.4.169 Messages.SBM_GETSCROLLINFO Constant

Pascal

```
SBM_GETSCROLLINFO = 234;
```

C++

```
SBM_GETSCROLLINFO = 234;
```

File

Messages

Description

This is constant Messages.SBM_GETSCROLLINFO.

49.4.170 Messages.SBM_SETPOS Constant

Pascal

```
SBM_SETPOS = 224;
```

C++

```
SBM_SETPOS = 224;
```

File

Messages

Description

This is constant Messages.SBM_SETPOS.

49.4.171 Messages.SBM_SETRANGE Constant

Pascal

```
SBM_SETRANGE = 226;
```

C++

```
SBM_SETRANGE = 226;
```

File

Messages

Description

This is constant Messages.SBM_SETRANGE.

49.4.172 Messages.SBM_SETRANGEREDRAW Constant

Pascal

```
SBM_SETRANGEREDRAW = 230;
```

C++

```
SBM_SETRANGEREDRAW = 230;
```

File

Messages

Description

This is constant Messages.SBM_SETRANGEREDRAW.

49.4.173 Messages.SBM_SETSCROLLINFO Constant

Pascal

```
SBM_SETSCROLLINFO = 233;
```

C++

```
SBM_SETSCROLLINFO = 233;
```

File

Messages

Description

This is constant Messages.SBM_SETSCROLLINFO.

49.4.174 Messages.WM_ACTIVATE Constant

Pascal

```
WM_ACTIVATE = $0006;
```

C++

```
WM_ACTIVATE = 0x0006;
```

File

Messages

Description

This is constant Messages.WM_ACTIVATE.

49.4.175 Messages.WM_ACTIVATEAPP Constant

Pascal

```
WM_ACTIVATEAPP = $001C;
```

C++

```
WM_ACTIVATEAPP = 0x001C;
```

File

Messages

Description

This is constant Messages.WM_ACTIVATEAPP.

49.4.176 Messages.WM_APP Constant

Pascal

```
WM_APP = $8000;
```

C++

```
WM_APP = 0x8000;
```

File

Messages

Description

This is constant Messages.WM_APP.

49.4.177 Messages.WM_APPCOMMAND Constant

Pascal

```
WM_APPCOMMAND = $0319;
```

C++

```
WM_APPCOMMAND = 0x0319;
```

File

Messages

Description

This is constant Messages.WM_APPCOMMAND.

49.4.178 Messages.WM_ASKCBFORMATNAME Constant

Pascal

```
WM_ASKCBFORMATNAME = $030C;
```

C++

```
WM_ASKCBFORMATNAME = 0x030C;
```

File

Messages

Description

This is constant Messages.WM_ASKCBFORMATNAME.

49.4.179 Messages.WM_CANCELJOURNAL Constant

Pascal

```
WM_CANCELJOURNAL = $004B;
```

C++

```
WM_CANCELJOURNAL = 0x004B;
```

File

Messages

Description

This is constant Messages.WM_CANCELJOURNAL.

49.4.180 Messages.WM_CANCELMODE Constant

Pascal

```
WM_CANCELMODE = $001F;
```

C++

```
WM_CANCELMODE = 0x001F;
```

File

Messages

Description

This is constant Messages.WM_CANCELMODE.

49.4.181 Messages.WM_CAPTURECHANGED Constant

Pascal

```
WM_CAPTURECHANGED = 533;
```

C++

```
WM_CAPTURECHANGED = 533;
```

File

Messages

Description

This is constant Messages.WM_CAPTURECHANGED.

49.4.182 Messages.WM_CHANGECBCHAIN Constant

Pascal

```
WM_CHANGECBCHAIN = $030D;
```

C++

```
WM_CHANGECBCHAIN = 0x030D;
```

File

Messages

Description

This is constant Messages.WM_CHANGECBCHAIN.

49.4.183 Messages.WM_CHANGEUISTATE Constant

Pascal

```
WM_CHANGEUISTATE = $0127;
```

C++

```
WM_CHANGEUISTATE = 0x0127;
```

File

Messages

Description

This is constant Messages.WM_CHANGEUISTATE.

49.4.184 Messages.WM_CHAR Constant

Pascal

```
WM_CHAR = $0102;
```

C++

```
WM_CHAR = 0x0102;
```

File

Messages

Description

This is constant Messages.WM_CHAR.

49.4.185 Messages.WM_CHARTOITEM Constant

Pascal

```
WM_CHARTOITEM = $002F;
```

C++

```
WM_CHARTOITEM = 0x002F;
```

File

Messages

Description

This is constant Messages.WM_CHARTOITEM.

49.4.186 Messages.WM_CHILDACTIVATE Constant

Pascal

```
WM_CHILDACTIVATE = $0022;
```

C++

```
WM_CHILDACTIVATE = 0x0022;
```

File

Messages

Description

This is constant Messages.WM_CHILDACTIVATE.

49.4.187 Messages.WM_CLEAR Constant

Pascal

```
WM_CLEAR = $0303;
```

C++

```
WM_CLEAR = 0x0303;
```

File

Messages

Description

This is constant Messages.WM_CLEAR.

49.4.188 Messages.WM_CLOSE Constant

Pascal

```
WM_CLOSE = $0010;
```

C++

```
WM_CLOSE = 0x0010;
```

File

Messages

Description

This is constant Messages.WM_CLOSE.

49.4.189 Messages.WM_COALESCE_FIRST Constant

Pascal

```
WM_COALESCE_FIRST = $0390;
```

C++

```
WM_COALESCE_FIRST = 0x0390;
```

File

Messages

Description

This is constant Messages.WM_COALESCE_FIRST.

49.4.190 Messages.WM_COALESCE_LAST Constant

Pascal

```
WM_COALESCE_LAST = $039F;
```

C++

```
WM_COALESCE_LAST = 0x039F;
```

File

Messages

Description

This is constant Messages.WM_COALESCE_LAST.

49.4.191 Messages.WM_COMMAND Constant

Pascal

```
WM_COMMAND = $0111;
```

C++

```
WM_COMMAND = 0x0111;
```

File

Messages

Description

This is constant Messages.WM_COMMAND.

49.4.192 Messages.WM_COMMNOTIFY Constant

Pascal

```
WM_COMMNOTIFY = $0044;
```

C++

```
WM_COMMNOTIFY = 0x0044;
```

File

Messages

Description

This is constant Messages.WM_COMMNOTIFY.

49.4.193 Messages.WM_COMPACTING Constant

Pascal

```
WM_COMPACTING = $0041;
```

C++

```
WM_COMPACTING = 0x0041;
```

File

Messages

Description

This is constant Messages.WM_COMPACTING.

49.4.194 Messages.WM_COMPAREITEM Constant

Pascal

```
WM_COMPAREITEM = $0039;
```

C++

```
WM_COMPAREITEM = 0x0039;
```

File

Messages

Description

This is constant Messages.WM_COMPAREITEM.

49.4.195 Messages.WM_CONTEXTMENU Constant

Pascal

```
WM_CONTEXTMENU = $007B;
```

C++

```
WM_CONTEXTMENU = 0x007B;
```

File

Messages

Description

This is constant Messages.WM_CONTEXTMENU.

49.4.196 Messages.WM_COPY Constant

Pascal

```
WM_COPY = $0301;
```

C++

```
WM_COPY = 0x0301;
```

File

Messages

Description

This is constant Messages.WM_COPY.

49.4.197 Messages.WM_COPYDATA Constant

Pascal

```
WM_COPYDATA = $004A;
```

C++

```
WM_COPYDATA = 0x004A;
```

File

Messages

Description

This is constant Messages.WM_COPYDATA.

49.4.198 Messages.WM_CREATE Constant

Pascal

```
WM_CREATE = $0001;
```

C++

```
WM_CREATE = 0x0001;
```

File

Messages

Description

This is constant Messages.WM_CREATE.

49.4.199 Messages.WM_CTLCOLOR Constant

Pascal

```
WM_CTLCOLOR = $0019;
```

C++

```
WM_CTLCOLOR = 0x0019;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLOR.

49.4.200 Messages.WM_CTLCOLORBTN Constant

Pascal

```
WM_CTLCOLORBTN = $0135;
```

C++

```
WM_CTLCOLORBTN = 0x0135;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORBTN.

49.4.201 Messages.WM_CTLCOLORDLG Constant

Pascal

```
WM_CTLCOLORDLG = $0136;
```

C++

```
WM_CTLCOLORDLG = 0x0136;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORDLG.

49.4.202 Messages.WM_CTLCOLOREDIT Constant

Pascal

```
WM_CTLCOLOREDIT = $0133;
```

C++

```
WM_CTLCOLOREDIT = 0x0133;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLOREDIT.

49.4.203 Messages.WM_CTLCOLORLISTBOX Constant

Pascal

```
WM_CTLCOLORLISTBOX = $0134;
```

C++

```
WM_CTLCOLORLISTBOX = 0x0134;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORLISTBOX.

49.4.204 Messages.WM_CTLCOLORMSGBOX Constant

Pascal

```
WM_CTLCOLORMSGBOX = $0132;
```

C++

```
WM_CTLCOLORMSGBOX = 0x0132;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORMSGBOX.

49.4.205 Messages.WM_CTLCOLORSCROLLBAR Constant

Pascal

```
WM_CTLCOLORSCROLLBAR = $0137;
```

C++

```
WM_CTLCOLORSCROLLBAR = 0x0137;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORSCROLLBAR.

49.4.206 Messages.WM_CTLCOLORSTATIC Constant

Pascal

```
WM_CTLCOLORSTATIC = $0138;
```

C++

```
WM_CTLCOLORSTATIC = 0x0138;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORSTATIC.

49.4.207 Messages.WM_CUT Constant

Pascal

```
WM_CUT = $0300;
```

C++

```
WM_CUT = 0x0300;
```

File

Messages

Description

This is constant Messages.WM_CUT.

49.4.208 Messages.WM_DDE_ACK Constant

Pascal

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

C++

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

File

Messages

Description

This is constant Messages.WM_DDE_ACK.

49.4.209 Messages.WM_DDE_ADVISE Constant

Pascal

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

C++

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

File

Messages

Description

This is constant Messages.WM_DDE_ADVISE.

49.4.210 Messages.WM_DDE_DATA Constant

Pascal

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

C++

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

File

Messages

Description

This is constant Messages.WM_DDE_DATA.

49.4.211 Messages.WM_DDE_EXECUTE Constant

Pascal

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

File

Messages

Description

This is constant Messages.WM_DDE_EXECUTE.

49.4.212 Messages.WM_DDE_FIRST Constant

Pascal

```
WM_DDE_FIRST = $03E0;
```

C++

```
WM_DDE_FIRST = 0x03E0;
```

File

Messages

Description

This is constant Messages.WM_DDE_FIRST.

49.4.213 Messages.WM_DDE_INITIATE Constant

Pascal

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

C++

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

File

Messages

Description

This is constant Messages.WM_DDE_INITIATE.

49.4.214 Messages.WM_DDE_LAST Constant

Pascal

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

File

Messages

Description

This is constant Messages.WM_DDE_LAST.

49.4.215 Messages.WM_DDE_POKE Constant

Pascal

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

C++

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

File

Messages

Description

This is constant Messages.WM_DDE_POKE.

49.4.216 Messages.WM_DDE_REQUEST Constant

Pascal

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

C++

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

File

Messages

Description

This is constant Messages.WM_DDE_REQUEST.

49.4.217 Messages.WM_DDE_TERMINATE Constant

Pascal

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

C++

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

File

Messages

Description

This is constant Messages.WM_DDE_TERMINATE.

49.4.218 Messages.WM_DDE_UNADVISE Constant

Pascal

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

C++

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

File

Messages

Description

This is constant Messages.WM_DDE_UNADVISE.

49.4.219 Messages.WM_DEADCHAR Constant

Pascal

```
WM_DEADCHAR = $0103;
```

C++

```
WM_DEADCHAR = 0x0103;
```

File

Messages

Description

This is constant Messages.WM_DEADCHAR.

49.4.220 Messages.WM_DELETEITEM Constant

Pascal

```
WM_DELETEITEM = $002D;
```

C++

```
WM_DELETEITEM = 0x002D;
```

File

Messages

Description

This is constant Messages.WM_DELETEITEM.

49.4.221 Messages.WM_DESTROY Constant

Pascal

```
WM_DESTROY = $0002;
```

C++

```
WM_DESTROY = 0x0002;
```

File

Messages

Description

This is constant Messages.WM_DESTROY.

49.4.222 Messages.WM_DESTROYCLIPBOARD Constant

Pascal

```
WM_DESTROYCLIPBOARD = $0307;
```

C++

```
WM_DESTROYCLIPBOARD = 0x0307;
```

File

Messages

Description

This is constant Messages.WM_DESTROYCLIPBOARD.

49.4.223 Messages.WM_DEVICECHANGE Constant

Pascal

```
WM_DEVICECHANGE = 537;
```

C++

```
WM_DEVICECHANGE = 537;
```

File

Messages

Description

This is constant Messages.WM_DEVICECHANGE.

49.4.224 Messages.WM_DEVMODECHANGE Constant

Pascal

```
WM_DEVMODECHANGE = $001B;
```

C++

```
WM_DEVMODECHANGE = 0x001B;
```

File

Messages

Description

This is constant Messages.WM_DEVMODECHANGE.

49.4.225 Messages.WM_DISPLAYCHANGE Constant

Pascal

```
WM_DISPLAYCHANGE = $007E;
```

C++

```
WM_DISPLAYCHANGE = 0x007E;
```

File

Messages

Description

This is constant Messages.WM_DISPLAYCHANGE.

49.4.226 Messages.WM_DRAWCLIPBOARD Constant

Pascal

```
WM_DRAWCLIPBOARD = $0308;
```

C++

```
WM_DRAWCLIPBOARD = 0x0308;
```

File

Messages

Description

This is constant Messages.WM_DRAWCLIPBOARD.

49.4.227 Messages.WM_DRAWITEM Constant

Pascal

```
WM_DRAWITEM = $002B;
```

C++

```
WM_DRAWITEM = 0x002B;
```

File

Messages

Description

This is constant Messages.WM_DRAWITEM.

49.4.228 Messages.WM_DROPFILES Constant

Pascal

```
WM_DROPFILES = $0233;
```

C++

```
WM_DROPFILES = 0x0233;
```

File

Messages

Description

This is constant Messages.WM_DROPFILES.

49.4.229 Messages.WM_DWMCOLORIZATIONCOLORCHANGED Constant

Pascal

```
WM_DWMCOLORIZATIONCOLORCHANGED = $0320;
```

C++

```
WM_DWMCOLORIZATIONCOLORCHANGED = 0x0320;
```

File

Messages

Description

This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.

49.4.230 Messages.WM_DWMCOMPOSITIONCHANGED Constant

Pascal

```
WM_DWMCOMPOSITIONCHANGED = $031E;
```

C++

```
WM_DWMCOMPOSITIONCHANGED = 0x031E;
```

File

Messages

Description

This is constant Messages.WM_DWMCOMPOSITIONCHANGED.

49.4.231 Messages.WM_DWMNCRENDERINGCHANGED Constant

Pascal

```
WM_DWMNCRENDERINGCHANGED = $031F;
```

C++

```
WM_DWMNCRENDERINGCHANGED = 0x031F;
```

File

Messages

Description

This is constant Messages.WM_DWMNCRENDERINGCHANGED.

49.4.232 Messages.WM_DWMWINDOWMAXIMIZEDCHANGE Constant

Pascal

```
WM_DWMWINDOWMAXIMIZEDCHANGE = $0321;
```

C++

```
WM_DWMWINDOWMAXIMIZEDCHANGE = 0x0321;
```

File

Messages

Description

This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.

49.4.233 Messages.WM_ENABLE Constant

Pascal

```
WM_ENABLE = $000A;
```

C++

```
WM_ENABLE = 0x000A;
```

File

Messages

Description

This is constant Messages.WM_ENABLE.

49.4.234 Messages.WM_ENDSESSION Constant

Pascal

```
WM_ENDSESSION = $0016;
```

C++

```
WM_ENDSESSION = 0x0016;
```

File

Messages

Description

This is constant Messages.WM_ENDSESSION.

49.4.235 Messages.WM_ENTERIDLE Constant

Pascal

```
WM_ENTERIDLE = $0121;
```

C++

```
WM_ENTERIDLE = 0x0121;
```

File

Messages

Description

This is constant Messages.WM_ENTERIDLE.

49.4.236 Messages.WM_ENTERMENULOOP Constant

Pascal

```
WM_ENTERMENULOOP = $0211;
```

C++

```
WM_ENTERMENULOOP = 0x0211;
```

File

Messages

Description

This is constant Messages.WM_ENTERMENULOOP.

49.4.237 Messages.WM_ENTERSIZEMOVE Constant

Pascal

```
WM_ENTERSIZEMOVE = $0231;
```

C++

```
WM_ENTERSIZEMOVE = 0x0231;
```

File

Messages

Description

This is constant Messages.WM_ENTERSIZEMOVE.

49.4.238 Messages.WM_ERASEBKGND Constant

Pascal

```
WM_ERASEBKGND = $0014;
```

C++

```
WM_ERASEBKGND = 0x0014;
```

File

Messages

Description

This is constant Messages.WM_ERASEBKGND.

49.4.239 Messages.WM_EXITMENULOOP Constant

Pascal

```
WM_EXITMENULOOP = $0212;
```

C++

```
WM_EXITMENULOOP = 0x0212;
```

File

Messages

Description

This is constant Messages.WM_EXITMENULOOP.

49.4.240 Messages.WM_EXITSIZEMOVE Constant

Pascal

```
WM_EXITSIZEMOVE = $0232;
```

C++

```
WM_EXITSIZEMOVE = 0x0232;
```

File

Messages

Description

This is constant Messages.WM_EXITSIZEMOVE.

49.4.241 Messages.WM_FONTCHANGE Constant

Pascal

```
WM_FONTCHANGE = $001D;
```

C++

```
WM_FONTCHANGE = 0x001D;
```

File

Messages

Description

This is constant Messages.WM_FONTCHANGE.

49.4.242 Messages.WM_GETDLGCODE Constant

Pascal

```
WM_GETDLGCODE = $0087;
```

C++

```
WM_GETDLGCODE = 0x0087;
```

File

Messages

Description

This is constant Messages.WM_GETDLGCODE.

49.4.243 Messages.WM_GETFONT Constant

Pascal

```
WM_GETFONT = $0031;
```

C++

```
WM_GETFONT = 0x0031;
```

File

Messages

Description

This is constant Messages.WM_GETFONT.

49.4.244 Messages.WM_GETHOTKEY Constant

Pascal

```
WM_GETHOTKEY = $0033;
```

C++

```
WM_GETHOTKEY = 0x0033;
```

File

Messages

Description

This is constant Messages.WM_GETHOTKEY.

49.4.245 Messages.WM_GETICON Constant

Pascal

```
WM_GETICON = $007F;
```

C++

```
WM_GETICON = 0x007F;
```

File

Messages

Description

This is constant Messages.WM_GETICON.

49.4.246 Messages.WM_GETMINMAXINFO Constant

Pascal

```
WM_GETMINMAXINFO = $0024;
```

C++

```
WM_GETMINMAXINFO = 0x0024;
```

File

Messages

Description

This is constant Messages.WM_GETMINMAXINFO.

49.4.247 Messages.WM_GETOBJECT Constant

Pascal

```
WM_GETOBJECT = $003D;
```

C++

```
WM_GETOBJECT = 0x003D;
```

File

Messages

Description

This is constant Messages.WM_GETOBJECT.

49.4.248 Messages.WM_GETTEXT Constant

Pascal

```
WM_GETTEXT = $000D;
```

C++

```
WM_GETTEXT = 0x000D;
```

File

Messages

Description

This is constant Messages.WM_GETTEXT.

49.4.249 Messages.WM_GETTEXTLENGTH Constant

Pascal

```
WM_GETTEXTLENGTH = $000E;
```

C++

```
WM_GETTEXTLENGTH = 0x000E;
```

File

Messages

Description

This is constant Messages.WM_GETTEXTLENGTH.

49.4.250 Messages.WM_HANDHELDFIRST Constant

Pascal

```
WM_HANDHELDFIRST = 856;
```

C++

```
WM_HANDHELDFIRST = 856;
```

File

Messages

Description

This is constant Messages.WM_HANDHELDFIRST.

49.4.251 Messages.WM_HANDHELDLAST Constant

Pascal

```
WM_HANDHELDLAST = 863;
```

C++

```
WM_HANDHELDLAST = 863;
```

File

Messages

Description

This is constant Messages.WM_HANDHELDLAST.

49.4.252 Messages.WM_HELP Constant

Pascal

```
WM_HELP = $0053;
```

C++

```
WM_HELP = 0x0053;
```

File

Messages

Description

This is constant Messages.WM_HELP.

49.4.253 Messages.WM_HOTKEY Constant

Pascal

```
WM_HOTKEY = $0312;
```

C++

```
WM_HOTKEY = 0x0312;
```

File

Messages

Description

This is constant Messages.WM_HOTKEY.

49.4.254 Messages.WM_HSCROLL Constant

Pascal

```
WM_HSCROLL = $0114;
```

C++

```
WM_HSCROLL = 0x0114;
```

File

Messages

Description

This is constant Messages.WM_HSCROLL.

49.4.255 Messages.WM_HSCROLLCLIPBOARD Constant

Pascal

```
WM_HSCROLLCLIPBOARD = $030E;
```

C++

```
WM_HSCROLLCLIPBOARD = 0x030E;
```

File

Messages

Description

This is constant Messages.WM_HSCROLLCLIPBOARD.

49.4.256 Messages.WM_ICONERASEBKGND Constant

Pascal

```
WM_ICONERASEBKGND = $0027;
```

C++

```
WM_ICONERASEBKGND = 0x0027;
```

File

Messages

Description

This is constant Messages.WM_ICONERASEBKGND.

49.4.257 Messages.WM_IME_CHAR Constant

Pascal

```
WM_IME_CHAR = $0286;
```

C++

```
WM_IME_CHAR = 0x0286;
```

File

Messages

Description

This is constant Messages.WM_IME_CHAR.

49.4.258 Messages.WM_IME_COMPOSITION Constant

Pascal

```
WM_IME_COMPOSITION = $010F;
```

C++

```
WM_IME_COMPOSITION = 0x010F;
```

File

Messages

Description

This is constant Messages.WM_IME_COMPOSITION.

49.4.259 Messages.WM_IME_COMPOSITIONFULL Constant

Pascal

```
WM_IME_COMPOSITIONFULL = $0284;
```

C++

```
WM_IME_COMPOSITIONFULL = 0x0284;
```

File

Messages

Description

This is constant Messages.WM_IME_COMPOSITIONFULL.

49.4.260 Messages.WM_IME_CONTROL Constant

Pascal

```
WM_IME_CONTROL = $0283;
```

C++

```
WM_IME_CONTROL = 0x0283;
```

File

Messages

Description

This is constant Messages.WM_IME_CONTROL.

49.4.261 Messages.WM_IME_ENDCOMPOSITION Constant

Pascal

```
WM_IME_ENDCOMPOSITION = $010E;
```

C++

```
WM_IME_ENDCOMPOSITION = 0x010E;
```

File

Messages

Description

This is constant Messages.WM_IME_ENDCOMPOSITION.

49.4.262 Messages.WM_IME_KEYDOWN Constant

Pascal

```
WM_IME_KEYDOWN = $0290;
```

C++

```
WM_IME_KEYDOWN = 0x0290;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYDOWN.

49.4.263 Messages.WM_IME_KEYLAST Constant

Pascal

```
WM_IME_KEYLAST = $010F;
```

C++

```
WM_IME_KEYLAST = 0x010F;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYLAST.

49.4.264 Messages.WM_IME_KEYUP Constant

Pascal

```
WM_IME_KEYUP = $0291;
```

C++

```
WM_IME_KEYUP = 0x0291;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYUP.

49.4.265 Messages.WM_IME_NOTIFY Constant

Pascal

```
WM_IME_NOTIFY = $0282;
```

C++

```
WM_IME_NOTIFY = 0x0282;
```

File

Messages

Description

This is constant Messages.WM_IME_NOTIFY.

49.4.266 Messages.WM_IME_REQUEST Constant

Pascal

```
WM_IME_REQUEST = $0288;
```

C++

```
WM_IME_REQUEST = 0x0288;
```

File

Messages

Description

This is constant Messages.WM_IME_REQUEST.

49.4.267 Messages.WM_IME_SELECT Constant

Pascal

```
WM_IME_SELECT = $0285;
```

C++

```
WM_IME_SELECT = 0x0285;
```

File

Messages

Description

This is constant Messages.WM_IME_SELECT.

49.4.268 Messages.WM_IME_SETCONTEXT Constant

Pascal

```
WM_IME_SETCONTEXT = $0281;
```

C++

```
WM_IME_SETCONTEXT = 0x0281;
```

File

Messages

Description

This is constant Messages.WM_IME_SETCONTEXT.

49.4.269 Messages.WM_IME_STARTCOMPOSITION Constant

Pascal

```
WM_IME_STARTCOMPOSITION = $010D;
```

C++

```
WM_IME_STARTCOMPOSITION = 0x010D;
```

File

Messages

Description

This is constant Messages.WM_IME_STARTCOMPOSITION.

49.4.270 Messages.WM_INITDIALOG Constant

Pascal

```
WM_INITDIALOG = $0110;
```

C++

```
WM_INITDIALOG = 0x0110;
```

File

Messages

Description

This is constant Messages.WM_INITDIALOG.

49.4.271 Messages.WM_INITMENU Constant

Pascal

```
WM_INITMENU = $0116;
```

C++

```
WM_INITMENU = 0x0116;
```

File

Messages

Description

This is constant Messages.WM_INITMENU.

49.4.272 Messages.WM_INITMENUPOPUP Constant

Pascal

```
WM_INITMENUPOPUP = $0117;
```

C++

```
WM_INITMENUPOPUP = 0x0117;
```

File

Messages

Description

This is constant Messages.WM_INITMENUPOPUP.

49.4.273 Messages.WM_INPUT Constant

Pascal

```
WM_INPUT = $00FF;
```

C++

```
WM_INPUT = 0x00FF;
```

File

Messages

Description

This is constant Messages.WM_INPUT.

49.4.274 Messages.WM_INPUTLANGCHANGE Constant

Pascal

```
WM_INPUTLANGCHANGE = $0051;
```

C++

```
WM_INPUTLANGCHANGE = 0x0051;
```

File

Messages

Description

This is constant Messages.WM_INPUTLANGCHANGE.

49.4.275 Messages.WM_INPUTLANGCHANGEREQUEST Constant

Pascal

```
WM_INPUTLANGCHANGEREQUEST = $0050;
```

C++

```
WM_INPUTLANGCHANGEREQUEST = 0x0050;
```

File

Messages

Description

This is constant Messages.WM_INPUTLANGCHANGEREQUEST.

49.4.276 Messages.WM_KEYDOWN Constant

Pascal

```
WM_KEYDOWN = $0100;
```

C++

```
WM_KEYDOWN = 0x0100;
```

File

Messages

Description

This is constant Messages.WM_KEYDOWN.

49.4.277 Messages.WM_KEYFIRST Constant

Pascal

```
WM_KEYFIRST = $0100;
```

C++

```
WM_KEYFIRST = 0x0100;
```

File

Messages

Description

This is constant Messages.WM_KEYFIRST.

49.4.278 Messages.WM_KEYLAST Constant

Pascal

```
WM_KEYLAST = $0109;
```

C++

```
WM_KEYLAST = 0x0109;
```

File

Messages

Description

This is constant Messages.WM_KEYLAST.

49.4.279 Messages.WM_KEYUP Constant

Pascal

```
WM_KEYUP = $0101;
```

C++

```
WM_KEYUP = 0x0101;
```

File

Messages

Description

This is constant Messages.WM_KEYUP.

49.4.280 Messages.WM_KILLFOCUS Constant

Pascal

```
WM_KILLFOCUS = $0008;
```

C++

```
WM_KILLFOCUS = 0x0008;
```

File

Messages

Description

This is constant Messages.WM_KILLFOCUS.

49.4.281 Messages.WM_LBUTTONDBLCLK Constant

Pascal

```
WM_LBUTTONDBLCLK = $0203;
```

C++

```
WM_LBUTTONDBLCLK = 0x0203;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONDBLCLK.

49.4.282 Messages.WM_LBUTTONDOWN Constant

Pascal

```
WM_LBUTTONDOWN = $0201;
```

C++

```
WM_LBUTTONDOWN = 0x0201;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONDOWN.

49.4.283 Messages.WM_LBUTTONUP Constant

Pascal

```
WM_LBUTTONUP = $0202;
```

C++

```
WM_LBUTTONUP = 0x0202;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONUP.

49.4.284 Messages.WM_MBUTTONDBLCLK Constant

Pascal

```
WM_MBUTTONDBLCLK = $0209;
```

C++

```
WM_MBUTTONDBLCLK = 0x0209;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONDBLCLK.

49.4.285 Messages.WM_MBUTTONDOWN Constant

Pascal

```
WM_MBUTTONDOWN = $0207;
```

C++

```
WM_MBUTTONDOWN = 0x0207;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONDOWN.

49.4.286 Messages.WM_MBUTTONUP Constant

Pascal

```
WM_MBUTTONUP = $0208;
```

C++

```
WM_MBUTTONUP = 0x0208;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONUP.

49.4.287 Messages.WM_MDIACTIVATE Constant

Pascal

```
WM_MDIACTIVATE = $0222;
```

C++

```
WM_MDIACTIVATE = 0x0222;
```

File

Messages

Description

This is constant Messages.WM_MDIACTIVATE.

49.4.288 Messages.WM_MDICASCADE Constant

Pascal

```
WM_MDICASCADE = $0227;
```

C++

```
WM_MDICASCADE = 0x0227;
```

File

Messages

Description

This is constant Messages.WM_MDICASCADE.

49.4.289 Messages.WM_MDICREATE Constant

Pascal

```
WM_MDICREATE = $0220;
```

C++

```
WM_MDICREATE = 0x0220;
```

File

Messages

Description

This is constant Messages.WM_MDICREATE.

49.4.290 Messages.WM_MDIDESTROY Constant

Pascal

```
WM_MDIDESTROY = $0221;
```

C++

```
WM_MDIDESTROY = 0x0221;
```

File

Messages

Description

This is constant Messages.WM_MDIDESTROY.

49.4.291 Messages.WM_MDIGETACTIVE Constant

Pascal

```
WM_MDIGETACTIVE = $0229;
```

C++

```
WM_MDIGETACTIVE = 0x0229;
```

File

Messages

Description

This is constant Messages.WM_MDIGETACTIVE.

49.4.292 Messages.WM_MDIICONARRANGE Constant

Pascal

```
WM_MDIICONARRANGE = $0228;
```

C++

```
WM_MDIICONARRANGE = 0x0228;
```

File

Messages

Description

This is constant Messages.WM_MDIICONARRANGE.

49.4.293 Messages.WM_MDIMAXIMIZE Constant

Pascal

```
WM_MDIMAXIMIZE = $0225;
```

C++

```
WM_MDIMAXIMIZE = 0x0225;
```

File

Messages

Description

This is constant Messages.WM_MDIMAXIMIZE.

49.4.294 Messages.WM_MDINEXT Constant

Pascal

```
WM_MDINEXT = $0224;
```

C++

```
WM_MDINEXT = 0x0224;
```

File

Messages

Description

This is constant Messages.WM_MDINEXT.

49.4.295 Messages.WM_MDIREFRESHMENU Constant

Pascal

```
WM_MDIREFRESHMENU = $0234;
```

C++

```
WM_MDIREFRESHMENU = 0x0234;
```

File

Messages

Description

This is constant Messages.WM_MDIREFRESHMENU.

49.4.296 Messages.WM_MDIRESTORE Constant

Pascal

```
WM_MDIRESTORE = $0223;
```

C++

```
WM_MDIRESTORE = 0x0223;
```

File

Messages

Description

This is constant Messages.WM_MDIRESTORE.

49.4.297 Messages.WM_MDISETMENU Constant

Pascal

```
WM_MDISETMENU = $0230;
```

C++

```
WM_MDISETMENU = 0x0230;
```

File

Messages

Description

This is constant Messages.WM_MDISETMENU.

49.4.298 Messages.WM_MDITILE Constant

Pascal

```
WM_MDITILE = $0226;
```

C++

```
WM_MDITILE = 0x0226;
```

File

Messages

Description

This is constant Messages.WM_MDITILE.

49.4.299 Messages.WM_MEASUREITEM Constant

Pascal

```
WM_MEASUREITEM = $002C;
```

C++

```
WM_MEASUREITEM = 0x002C;
```

File

Messages

Description

This is constant Messages.WM_MEASUREITEM.

49.4.300 Messages.WM_MENUCHAR Constant

Pascal

```
WM_MENUCHAR = $0120;
```

C++

```
WM_MENUCHAR = 0x0120;
```

File

Messages

Description

This is constant Messages.WM_MENUCHAR.

49.4.301 Messages.WM_MENUCOMMAND Constant

Pascal

```
WM_MENUCOMMAND = $0126;
```

C++

```
WM_MENUCOMMAND = 0x0126;
```

File

Messages

Description

This is constant Messages.WM_MENUCOMMAND.

49.4.302 Messages.WM_MENUDRAG Constant

Pascal

```
WM_MENUDRAG = $0123;
```

C++

```
WM_MENUDRAG = 0x0123;
```

File

Messages

Description

This is constant Messages.WM_MENUDRAG.

49.4.303 Messages.WM_MENUGETOBJECT Constant

Pascal

```
WM_MENUGETOBJECT = $0124;
```

C++

```
WM_MENUGETOBJECT = 0x0124;
```

File

Messages

Description

This is constant Messages.WM_MENUGETOBJECT.

49.4.304 Messages.WM_MENURBUTTONUP Constant

Pascal

```
WM_MENURBUTTONUP = $0122;
```

C++

```
WM_MENURBUTTONUP = 0x0122;
```

File

Messages

Description

This is constant Messages.WM_MENURBUTTONUP.

49.4.305 Messages.WM_MENUSELECT Constant

Pascal

```
WM_MENUSELECT = $011F;
```

C++

```
WM_MENUSELECT = 0x011F;
```

File

Messages

Description

This is constant Messages.WM_MENUSELECT.

49.4.306 Messages.WM_MOUSEACTIVATE Constant

Pascal

```
WM_MOUSEACTIVATE = $0021;
```

C++

```
WM_MOUSEACTIVATE = 0x0021;
```

File

Messages

Description

This is constant Messages.WM_MOUSEACTIVATE.

49.4.307 Messages.WM_MOUSEFIRST Constant

Pascal

```
WM_MOUSEFIRST = $0200;
```

C++

```
WM_MOUSEFIRST = 0x0200;
```

File

Messages

Description

This is constant Messages.WM_MOUSEFIRST.

49.4.308 Messages.WM_MOUSEHOVER Constant

Pascal

```
WM_MOUSEHOVER = $02A1;
```

C++

```
WM_MOUSEHOVER = 0x02A1;
```

File

Messages

Description

This is constant Messages.WM_MOUSEHOVER.

49.4.309 Messages.WM_MOUSELAST Constant

Pascal

```
WM_MOUSELAST = $020A;
```

C++

```
WM_MOUSELAST = 0x020A;
```

File

Messages

Description

This is constant Messages.WM_MOUSELAST.

49.4.310 Messages.WM_MOUSELEAVE Constant

Pascal

```
WM_MOUSELEAVE = $02A3;
```

C++

```
WM_MOUSELEAVE = 0x02A3;
```

File

Messages

Description

This is constant Messages.WM_MOUSELEAVE.

49.4.311 Messages.WM_MOUSEMOVE Constant

Pascal

```
WM_MOUSEMOVE = $0200;
```

C++

```
WM_MOUSEMOVE = 0x0200;
```

File

Messages

Description

This is constant Messages.WM_MOUSEMOVE.

49.4.312 Messages.WM_MOUSEWHEEL Constant

Pascal

```
WM_MOUSEWHEEL = $020A;
```

C++

```
WM_MOUSEWHEEL = 0x020A;
```

File

Messages

Description

This is constant Messages.WM_MOUSEWHEEL.

49.4.313 Messages.WM_MOVE Constant

Pascal

```
WM_MOVE = $0003;
```

C++

```
WM_MOVE = 0x0003;
```

File

Messages

Description

This is constant Messages.WM_MOVE.

49.4.314 Messages.WM_MOVING Constant

Pascal

```
WM_MOVING = 534;
```

C++

```
WM_MOVING = 534;
```

File

Messages

Description

This is constant Messages.WM_MOVING.

49.4.315 Messages.WM_NCACTIVATE Constant

Pascal

```
WM_NCACTIVATE = $0086;
```

C++

```
WM_NCACTIVATE = 0x0086;
```

File

Messages

Description

This is constant Messages.WM_NCACTIVATE.

49.4.316 Messages.WM_NCCALCSIZE Constant

Pascal

```
WM_NCCALCSIZE = $0083;
```

C++

```
WM_NCCALCSIZE = 0x0083;
```

File

Messages

Description

This is constant Messages.WM_NCCALCSIZE.

49.4.317 Messages.WM_NCCREATE Constant

Pascal

```
WM_NCCREATE = $0081;
```

C++

```
WM_NCCREATE = 0x0081;
```

File

Messages

Description

This is constant Messages.WM_NCCREATE.

49.4.318 Messages.WM_NCDESTROY Constant

Pascal

```
WM_NCDESTROY = $0082;
```

C++

```
WM_NCDESTROY = 0x0082;
```

File

Messages

Description

This is constant Messages.WM_NCDESTROY.

49.4.319 Messages.WM_NCHITTEST Constant

Pascal

```
WM_NCHITTEST = $0084;
```

C++

```
WM_NCHITTEST = 0x0084;
```

File

Messages

Description

This is constant Messages.WM_NCHITTEST.

49.4.320 Messages.WM_NCLBUTTONDBLCLK Constant

Pascal

```
WM_NCLBUTTONDBLCLK = $00A3;
```

C++

```
WM_NCLBUTTONDBLCLK = 0x00A3;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONDBLCLK.

49.4.321 Messages.WM_NCLBUTTONDOWN Constant

Pascal

```
WM_NCLBUTTONDOWN = $00A1;
```

C++

```
WM_NCLBUTTONDOWN = 0x00A1;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONDOWN.

49.4.322 Messages.WM_NCLBUTTONUP Constant

Pascal

```
WM_NCLBUTTONUP = $00A2;
```

C++

```
WM_NCLBUTTONUP = 0x00A2;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONUP.

49.4.323 Messages.WM_NCMBUTTONDBLCLK Constant

Pascal

```
WM_NCMBUTTONDBLCLK = $00A9;
```

C++

```
WM_NCMBUTTONDBLCLK = 0x00A9;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONDBLCLK.

49.4.324 Messages.WM_NCMBUTTONDOWN Constant

Pascal

```
WM_NCMBUTTONDOWN = $00A7;
```

C++

```
WM_NCMBUTTONDOWN = 0x00A7;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONDOWN.

49.4.325 Messages.WM_NCMBUTTONUP Constant

Pascal

```
WM_NCMBUTTONUP = $00A8;
```

C++

```
WM_NCMBUTTONUP = 0x00A8;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONUP.

49.4.326 Messages.WM_NCMOUSEHOVER Constant

Pascal

```
WM_NCMOUSEHOVER = $02A0;
```

C++

```
WM_NCMOUSEHOVER = 0x02A0;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSEHOVER.

49.4.327 Messages.WM_NCMOUSELEAVE Constant

Pascal

```
WM_NCMOUSELEAVE = $02A2;
```

C++

```
WM_NCMOUSELEAVE = 0x02A2;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSELEAVE.

49.4.328 Messages.WM_NCMOUSEMOVE Constant

Pascal

```
WM_NCMOUSEMOVE = $00A0;
```

C++

```
WM_NCMOUSEMOVE = 0x00A0;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSEMOVE.

49.4.329 Messages.WM_NCPAINT Constant

Pascal

```
WM_NCPAINT = $0085;
```

C++

```
WM_NCPAINT = 0x0085;
```

File

Messages

Description

This is constant Messages.WM_NCPAINT.

49.4.330 Messages.WM_NCRBUTTONDBLCLK Constant

Pascal

```
WM_NCRBUTTONDBLCLK = $00A6;
```

C++

```
WM_NCRBUTTONDBLCLK = 0x00A6;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONDBLCLK.

49.4.331 Messages.WM_NCRBUTTONDOWN Constant

Pascal

```
WM_NCRBUTTONDOWN = $00A4;
```

C++

```
WM_NCRBUTTONDOWN = 0x00A4;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONDOWN.

49.4.332 Messages.WM_NCRBUTTONUP Constant

Pascal

```
WM_NCRBUTTONUP = $00A5;
```

C++

```
WM_NCRBUTTONUP = 0x00A5;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONUP.

49.4.333 Messages.WM_NCXBUTTONDBLCLK Constant

Pascal

```
WM_NCXBUTTONDBLCLK = $00AD;
```

C++

```
WM_NCXBUTTONDBLCLK = 0x00AD;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONDBLCLK.

49.4.334 Messages.WM_NCXBUTTONDOWN Constant

Pascal

```
WM_NCXBUTTONDOWN = $00AB;
```

C++

```
WM_NCXBUTTONDOWN = 0x00AB;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONDOWN.

49.4.335 Messages.WM_NCXBUTTONUP Constant

Pascal

```
WM_NCXBUTTONUP = $00AC;
```

C++

```
WM_NCXBUTTONUP = 0x00AC;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONUP.

49.4.336 Messages.WM_NEXTDLGCTL Constant

Pascal

```
WM_NEXTDLGCTL = $0028;
```

C++

```
WM_NEXTDLGCTL = 0x0028;
```

File

Messages

Description

This is constant Messages.WM_NEXTDLGCTL.

49.4.337 Messages.WM_NEXTMENU Constant

Pascal

```
WM_NEXTMENU = $0213;
```

C++

```
WM_NEXTMENU = 0x0213;
```

File

Messages

Description

This is constant Messages.WM_NEXTMENU.

49.4.338 Messages.WM_NOTIFY Constant

Pascal

```
WM_NOTIFY = $004E;
```

C++

```
WM_NOTIFY = 0x004E;
```

File

Messages

Description

This is constant Messages.WM_NOTIFY.

49.4.339 Messages.WM_NOTIFYFORMAT Constant

Pascal

```
WM_NOTIFYFORMAT = $0055;
```

C++

```
WM_NOTIFYFORMAT = 0x0055;
```

File

Messages

Description

This is constant Messages.WM_NOTIFYFORMAT.

49.4.340 Messages.WM_NULL Constant

Pascal

```
WM_NULL = $0000;
```

C++

```
WM_NULL = 0x0000;
```

File

Messages

Description

This is constant Messages.WM_NULL.

49.4.341 Messages.WM_PAINT Constant

Pascal

```
WM_PAINT = $000F;
```

C++

```
WM_PAINT = 0x000F;
```

File

Messages

Description

This is constant Messages.WM_PAINT.

49.4.342 Messages.WM_PAINTCLIPBOARD Constant

Pascal

```
WM_PAINTCLIPBOARD = $0309;
```

C++

```
WM_PAINTCLIPBOARD = 0x0309;
```

File

Messages

Description

This is constant Messages.WM_PAINTCLIPBOARD.

49.4.343 Messages.WM_PAINTICON Constant

Pascal

```
WM_PAINTICON = $0026;
```

C++

```
WM_PAINTICON = 0x0026;
```

File

Messages

Description

This is constant Messages.WM_PAINTICON.

49.4.344 Messages.WM_PALETTECHANGED Constant

Pascal

```
WM_PALETTECHANGED = $0311;
```

C++

```
WM_PALETTECHANGED = 0x0311;
```

File

Messages

Description

This is constant Messages.WM_PALETTECHANGED.

49.4.345 Messages.WM_PALETTEISCHANGING Constant

Pascal

```
WM_PALETTEISCHANGING = $0310;
```

C++

```
WM_PALETTEISCHANGING = 0x0310;
```

File

Messages

Description

This is constant Messages.WM_PALETTEISCHANGING.

49.4.346 Messages.WM_PARENTNOTIFY Constant

Pascal

```
WM_PARENTNOTIFY = $0210;
```

C++

```
WM_PARENTNOTIFY = 0x0210;
```

File

Messages

Description

This is constant Messages.WM_PARENTNOTIFY.

49.4.347 Messages.WM_PASTE Constant

Pascal

```
WM_PASTE = $0302;
```

C++

```
WM_PASTE = 0x0302;
```

File

Messages

Description

This is constant Messages.WM_PASTE.

49.4.348 Messages.WM_PENWINFIRST Constant

Pascal

```
WM_PENWINFIRST = $0380;
```

C++

```
WM_PENWINFIRST = 0x0380;
```

File

Messages

Description

This is constant Messages.WM_PENWINFIRST.

49.4.349 Messages.WM_PENWINLAST Constant

Pascal

```
WM_PENWINLAST = $038F;
```

C++

```
WM_PENWINLAST = 0x038F;
```

File

Messages

Description

This is constant Messages.WM_PENWINLAST.

49.4.350 Messages.WM_POWER Constant

Pascal

```
WM_POWER = $0048;
```

C++

```
WM_POWER = 0x0048;
```

File

Messages

Description

This is constant Messages.WM_POWER.

49.4.351 Messages.WM_POWERBROADCAST Constant

Pascal

```
WM_POWERBROADCAST = 536;
```

C++

```
WM_POWERBROADCAST = 536;
```

File

Messages

Description

This is constant Messages.WM_POWERBROADCAST.

49.4.352 Messages.WM_PRINT Constant

Pascal

```
WM_PRINT = 791;
```

C++

```
WM_PRINT = 791;
```

File

Messages

Description

This is constant Messages.WM_PRINT.

49.4.353 Messages.WM_PRINTCLIENT Constant

Pascal

```
WM_PRINTCLIENT = 792;
```

C++

```
WM_PRINTCLIENT = 792;
```

File

Messages

Description

This is constant Messages.WM_PRINTCLIENT.

49.4.354 Messages.WM_QUERYDRAGICON Constant

Pascal

```
WM_QUERYDRAGICON = $0037;
```

C++

```
WM_QUERYDRAGICON = 0x0037;
```

File

Messages

Description

This is constant Messages.WM_QUERYDRAGICON.

49.4.355 Messages.WM_QUERYENDSESSION Constant

Pascal

```
WM_QUERYENDSESSION = $0011;
```

C++

```
WM_QUERYENDSESSION = 0x0011;
```

File

Messages

Description

This is constant Messages.WM_QUERYENDSESSION.

49.4.356 Messages.WM_QUERYNEWPALETTE Constant

Pascal

```
WM_QUERYNEWPALETTE = $030F;
```

C++

```
WM_QUERYNEWPALETTE = 0x030F;
```

File

Messages

Description

This is constant Messages.WM_QUERYNEWPALETTE.

49.4.357 Messages.WM_QUERYOPEN Constant

Pascal

```
WM_QUERYOPEN = $0013;
```

C++

```
WM_QUERYOPEN = 0x0013;
```

File

Messages

Description

This is constant Messages.WM_QUERYOPEN.

49.4.358 Messages.WM_QUERYUISTATE Constant

Pascal

```
WM_QUERYUISTATE = $0129;
```

C++

```
WM_QUERYUISTATE = 0x0129;
```

File

Messages

Description

This is constant Messages.WM_QUERYUISTATE.

49.4.359 Messages.WM_QUEUESYNC Constant

Pascal

```
WM_QUEUESYNC = $0023;
```

C++

```
WM_QUEUESYNC = 0x0023;
```

File

Messages

Description

This is constant Messages.WM_QUEUESYNC.

49.4.360 Messages.WM_QUIT Constant

Pascal

```
WM_QUIT = $0012;
```

C++

```
WM_QUIT = 0x0012;
```

File

Messages

Description

This is constant Messages.WM_QUIT.

49.4.361 Messages.WM_RBUTTONDBLCLK Constant

Pascal

```
WM_RBUTTONDBLCLK = $0206;
```

C++

```
WM_RBUTTONDBLCLK = 0x0206;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONDBLCLK.

49.4.362 Messages.WM_RBUTTONDOWN Constant

Pascal

```
WM_RBUTTONDOWN = $0204;
```

C++

```
WM_RBUTTONDOWN = 0x0204;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONDOWN.

49.4.363 Messages.WM_RBUTTONUP Constant

Pascal

```
WM_RBUTTONUP = $0205;
```

C++

```
WM_RBUTTONUP = 0x0205;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONUP.

49.4.364 Messages.WM_RENDERALLFORMATS Constant

Pascal

```
WM_RENDERALLFORMATS = $0306;
```

C++

```
WM_RENDERALLFORMATS = 0x0306;
```

File

Messages

Description

This is constant Messages.WM_RENDERALLFORMATS.

49.4.365 Messages.WM_RENDERFORMAT Constant

Pascal

```
WM_RENDERFORMAT = $0305;
```

C++

```
WM_RENDERFORMAT = 0x0305;
```

File

Messages

Description

This is constant Messages.WM_RENDERFORMAT.

49.4.366 Messages.WM_SETCURSOR Constant

Pascal

```
WM_SETCURSOR = $0020;
```

C++

```
WM_SETCURSOR = 0x0020;
```

File

Messages

Description

This is constant Messages.WM_SETCURSOR.

49.4.367 Messages.WM_SETFOCUS Constant

Pascal

```
WM_SETFOCUS = $0007;
```

C++

```
WM_SETFOCUS = 0x0007;
```

File

Messages

Description

This is constant Messages.WM_SETFOCUS.

49.4.368 Messages.WM_SETFONT Constant

Pascal

```
WM_SETFONT = $0030;
```

C++

```
WM_SETFONT = 0x0030;
```

File

Messages

Description

This is constant Messages.WM_SETFONT.

49.4.369 Messages.WM_SETHOTKEY Constant

Pascal

```
WM_SETHOTKEY = $0032;
```

C++

```
WM_SETHOTKEY = 0x0032;
```

File

Messages

Description

This is constant Messages.WM_SETHOTKEY.

49.4.370 Messages.WM_SETICON Constant

Pascal

```
WM_SETICON = $0080;
```

C++

```
WM_SETICON = 0x0080;
```

File

Messages

Description

This is constant Messages.WM_SETICON.

49.4.371 Messages.WM_SETREDRAW Constant

Pascal

```
WM_SETREDRAW = $000B;
```

C++

```
WM_SETREDRAW = 0x000B;
```

File

Messages

Description

This is constant Messages.WM_SETREDRAW.

49.4.372 Messages.WM_SETTEXT Constant

Pascal

```
WM_SETTEXT = $000C;
```

C++

```
WM_SETTEXT = 0x000C;
```

File

Messages

Description

This is constant Messages.WM_SETTEXT.

49.4.373 Messages.WM_SETTINGCHANGE Constant

Pascal

```
WM_SETTINGCHANGE = WM_WININICHANGE;
```

C++

```
WM_SETTINGCHANGE = WM_WININICHANGE;
```

File

Messages

Description

This is constant Messages.WM_SETTINGCHANGE.

49.4.374 Messages.WM_SHOWWINDOW Constant

Pascal

```
WM_SHOWWINDOW = $0018;
```

C++

```
WM_SHOWWINDOW = 0x0018;
```

File

Messages

Description

This is constant Messages.WM_SHOWWINDOW.

49.4.375 Messages.WM_SIZE Constant

Pascal

```
WM_SIZE = $0005;
```

C++

```
WM_SIZE = 0x0005;
```

File

Messages

Description

This is constant Messages.WM_SIZE.

49.4.376 Messages.WM_SIZECLIPBOARD Constant

Pascal

```
WM_SIZECLIPBOARD = $030B;
```

C++

```
WM_SIZECLIPBOARD = 0x030B;
```

File

Messages

Description

This is constant Messages.WM_SIZECLIPBOARD.

49.4.377 Messages.WM_SIZING Constant

Pascal

```
WM_SIZING = 532;
```

C++

```
WM_SIZING = 532;
```

File

Messages

Description

This is constant Messages.WM_SIZING.

49.4.378 Messages.WM_SPOOLERSTATUS Constant

Pascal

```
WM_SPOOLERSTATUS = $002A;
```

C++

```
WM_SPOOLERSTATUS = 0x002A;
```

File

Messages

Description

This is constant Messages.WM_SPOOLERSTATUS.

49.4.379 Messages.WM_STYLECHANGED Constant

Pascal

```
WM_STYLECHANGED = $007D;
```

C++

```
WM_STYLECHANGED = 0x007D;
```

File

Messages

Description

This is constant Messages.WM_STYLECHANGED.

49.4.380 Messages.WM_STYLECHANGING Constant

Pascal

```
WM_STYLECHANGING = $007C;
```

C++

```
WM_STYLECHANGING = 0x007C;
```

File

Messages

Description

This is constant Messages.WM_STYLECHANGING.

49.4.381 Messages.WM_SYSCHAR Constant

Pascal

```
WM_SYSCHAR = $0106;
```

C++

```
WM_SYSCHAR = 0x0106;
```

File

Messages

Description

This is constant Messages.WM_SYSCHAR.

49.4.382 Messages.WM_SYSCOLORCHANGE Constant

Pascal

```
WM_SYSCOLORCHANGE = $0015;
```

C++

```
WM_SYSCOLORCHANGE = 0x0015;
```

File

Messages

Description

This is constant Messages.WM_SYSCOLORCHANGE.

49.4.383 Messages.WM_SYSCOMMAND Constant

Pascal

```
WM_SYSCOMMAND = $0112;
```

C++

```
WM_SYSCOMMAND = 0x0112;
```

File

Messages

Description

This is constant Messages.WM_SYSCOMMAND.

49.4.384 Messages.WM_SYSDEADCHAR Constant

Pascal

```
WM_SYSDEADCHAR = $0107;
```

C++

```
WM_SYSDEADCHAR = 0x0107;
```

File

Messages

Description

This is constant Messages.WM_SYSDEADCHAR.

49.4.385 Messages.WM_SYSKEYDOWN Constant

Pascal

```
WM_SYSKEYDOWN = $0104;
```

C++

```
WM_SYSKEYDOWN = 0x0104;
```

File

Messages

Description

This is constant Messages.WM_SYSKEYDOWN.

49.4.386 Messages.WM_SYSKEYUP Constant

Pascal

```
WM_SYSKEYUP = $0105;
```

C++

```
WM_SYSKEYUP = 0x0105;
```

File

Messages

Description

This is constant Messages.WM_SYSKEYUP.

49.4.387 Messages.WM_SYSTEMERROR Constant

Pascal

```
WM_SYSTEMERROR = $0017;
```

C++

```
WM_SYSTEMERROR = 0x0017;
```

File

Messages

Description

This is constant Messages.WM_SYSTEMERROR.

49.4.388 Messages.WM_TABLET_FIRST Constant

Pascal

```
WM_TABLET_FIRST = $02C0;
```

C++

```
WM_TABLET_FIRST = 0x02C0;
```

File

Messages

Description

This is constant Messages.WM_TABLET_FIRST.

49.4.389 Messages.WM_TABLET_LAST Constant

Pascal

```
WM_TABLET_LAST = $02DF;
```

C++

```
WM_TABLET_LAST = 0x02DF;
```

File

Messages

Description

This is constant Messages.WM_TABLET_LAST.

49.4.390 Messages.WM_TCARD Constant

Pascal

```
WM_TCARD = $0052;
```

C++

```
WM_TCARD = 0x0052;
```

File

Messages

Description

This is constant Messages.WM_TCARD.

49.4.391 Messages.WM_THEMECHANGED Constant

Pascal

```
WM_THEMECHANGED = $031A;
```

C++

```
WM_THEMECHANGED = 0x031A;
```

File

Messages

Description

This is constant Messages.WM_THEMECHANGED.

49.4.392 Messages.WM_TIMECHANGE Constant

Pascal

```
WM_TIMECHANGE = $001E;
```

C++

```
WM_TIMECHANGE = 0x001E;
```

File

Messages

Description

This is constant Messages.WM_TIMECHANGE.

49.4.393 Messages.WM_TIMER Constant

Pascal

```
WM_TIMER = $0113;
```

C++

```
WM_TIMER = 0x0113;
```

File

Messages

Description

This is constant Messages.WM_TIMER.

49.4.394 Messages.WM_UNDO Constant

Pascal

```
WM_UNDO = $0304;
```

C++

```
WM_UNDO = 0x0304;
```

File

Messages

Description

This is constant Messages.WM_UNDO.

49.4.395 Messages.WM_UNICHAR Constant

Pascal

```
WM_UNICHAR = $0109;
```

C++

```
WM_UNICHAR = 0x0109;
```

File

Messages

Description

This is constant Messages.WM_UNICHAR.

49.4.396 Messages.WM_UNINITMENUPOPUP Constant

Pascal

```
WM_UNINITMENUPOPUP = $0125;
```

C++

```
WM_UNINITMENUPOPUP = 0x0125;
```

File

Messages

Description

This is constant Messages.WM_UNINITMENUPOPUP.

49.4.397 Messages.WM_UPDATEUISTATE Constant

Pascal

```
WM_UPDATEUISTATE = $0128;
```

C++

```
WM_UPDATEUISTATE = 0x0128;
```

File

Messages

Description

This is constant Messages.WM_UPDATEUISTATE.

49.4.398 Messages.WM_USER Constant

Pascal

```
WM_USER = $0400;
```

C++

```
WM_USER = 0x0400;
```

File

Messages

Description

This is constant Messages.WM_USER.

49.4.399 Messages.WM_USERCHANGED Constant

Pascal

```
WM_USERCHANGED = $0054;
```

C++

```
WM_USERCHANGED = 0x0054;
```

File

Messages

Description

This is constant Messages.WM_USERCHANGED.

49.4.400 Messages.WM_VKEYTOITEM Constant

Pascal

```
WM_VKEYTOITEM = $002E;
```

C++

```
WM_VKEYTOITEM = 0x002E;
```

File

Messages

Description

This is constant Messages.WM_VKEYTOITEM.

49.4.401 Messages.WM_VSCROLL Constant

Pascal

```
WM_VSCROLL = $0115;
```

C++

```
WM_VSCROLL = 0x0115;
```

File

Messages

Description

This is constant Messages.WM_VSCROLL.

49.4.402 Messages.WM_VSCROLLCLIPBOARD Constant

Pascal

```
WM_VSCROLLCLIPBOARD = $030A;
```

C++

```
WM_VSCROLLCLIPBOARD = 0x030A;
```

File

Messages

Description

This is constant Messages.WM_VSCROLLCLIPBOARD.

49.4.403 Messages.WM_WINDOWPOSCHANGED Constant

Pascal

```
WM_WINDOWPOSCHANGED = $0047;
```

C++

```
WM_WINDOWPOSCHANGED = 0x0047;
```

File

Messages

Description

This is constant Messages.WM_WINDOWPOSCHANGED.

49.4.404 Messages.WM_WINDOWPOSCHANGING Constant

Pascal

```
WM_WINDOWPOSCHANGING = $0046;
```

C++

```
WM_WINDOWPOSCHANGING = 0x0046;
```

File

Messages

Description

This is constant Messages.WM_WINDOWPOSCHANGING.

49.4.405 Messages.WM_WININICHANGE Constant

Pascal

```
WM_WININICHANGE = $001A;
```

C++

```
WM_WININICHANGE = 0x001A;
```

File

Messages

Description

This is constant Messages.WM_WININICHANGE.

49.4.406 Messages.WM_WTSSESSION_CHANGE Constant

Pascal

```
WM_WTSSESSION_CHANGE = $02B1;
```

C++

```
WM_WTSSESSION_CHANGE = 0x02B1;
```

File

Messages

Description

This is constant Messages.WM_WTSSESSION_CHANGE.

50 Midas Namespace

This is namespace Midas.

Topics

Name	Description
Interfaces (see page 5222)	The following table lists interfaces in this documentation.
Constants (see page 5232)	The following table lists constants in this documentation.

Constants

Name	Description
IID_IAppServer (see page 5232)	This is constant Midas.IID_IAppServer.
LIBID_Midas (see page 5232)	This is constant Midas.LIBID_Midas.

Interfaces

	Name	Description
	IAppServer (see page 5222)	IAppServer is the interface that client datasets use to communicate with a dataset provider.
	IAppServerDisp (see page 5229)	This is class Midas.IAppServerDisp.

50.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAppServer (see page 5222)	IAppServer is the interface that client datasets use to communicate with a dataset provider.
	IAppServerDisp (see page 5229)	This is class Midas.IAppServerDisp.

50.1.1 IAppServer Interface

IAppServer is the interface that client datasets use to communicate with a dataset provider.

Class Hierarchy

Pascal

```
IAppServer = interface(IDispatch);
```

C++

```
__interface IAppServer : public IDispatch;
```

File

Midas

Description

Client datasets use an IAppServer interface to implement many of their properties and methods. This interface provides the basis of communication between the client dataset and a provider component from which it receives data and to which it applies updates.

If the provider is in the same application as the client dataset, the IAppServer interface is implemented by a hidden object that is created to manage the communication between the client dataset and the provider. In multi-tiered applications, client datasets obtain an IAppServer instance from a connection component that resides in the client application.

When client datasets use IAppServer to talk to a provider component, they pass the name of the desired provider to all method calls. By default, the interface is stateless, meaning that each method call functions independently, with no reliance on previous method calls. Because of this, IAppServer has no properties, which would represent persistent state information. However, there are cases where the client dataset relies on state information, such as the current database cursor position when performing incremental fetching using the AS_GetRecords (see page 5227) method. This state information is preserved only if multiple clients do not share an application server that implements IAppServer.

Note: Component Method declarations that use IAppServer use the _di_IAppServer type instead. This type is a DelphiInterface wrapper around the IAppServer interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IAppServer >  _di_IAppServer;
```

50.1.1.1 IAppServer Members

The following tables list the members exposed by IAppServer.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 5223)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 5224)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 5224)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 5225)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 5226)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 5227)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 5228)	Returns information from a specified record of the provider's dataset.

50.1.1.2 IAppServer Methods

The methods of the IAppServer class are listed here.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 5223)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 5224)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 5224)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 5225)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 5226)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 5227)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 5228)	Returns information from a specified record of the provider's dataset.

50.1.1.2.1 IAppServer.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before stopping the update operation.

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates (Delphi) or AS_ApplyUpdates_result parameter (C++) returns a Variant that is a data packet containing all records that could not be applied to the database.

AS_ApplyUpdates

as_applyupdates

Communicating with the Client Dataset

50.1.1.2.2 IAppServer.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value (Delphi) or the AS_DataRequest_result parameter (C++), which is returned to the caller.

See Also

OnDataRequest (see page 6490)

DataRequest

Communicating with the Client Dataset

50.1.1.2.3 IAppServer.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's AS_Execute method generates a BeforeAS_Execute event, passes the command on to its associated dataset, and generates an AfterAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams routine. To decode Params into a TParams object, use the Unpackparams routine.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

PackageParams

UnpackParams

Communicating with the Client Dataset

50.1.1.2.4 IAppServer.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

The ProviderName parameter specifies the name of the provider component whose dataset has the parameters.

The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns the parameters, encoded as a Variant array, where each element is a 2-element Variant array containing a parameter name and a parameter value. These parameters can be converted to a TParams object using the UnpackParams procedure. If the dataset has no parameters, or if the provider does not support parameter fetching, AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns a Null Variant.

Note: AS_AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, retrieve parameter values using the AS_Execute (see page 5224) method instead.

Communicating with the Client Dataset

50.1.1.2.5 IAppServer.AS_GetProviderNames Method

Returns a list of all the available providers on a remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all providers available from a remote data module. These values indicate the possible values for the ProviderName property of a client dataset that uses the IAppServer (see page 5222) interface of an application server. When calling any other IAppServer (see page 5222) method, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

See Also

providers

ProviderName

Providers

Communicating with the Client Dataset

50.1.1.2.6 IAppServer.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of a query, or the name of a table or stored procedure that replaces the provider's table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters. You can convert between the Variant format for parameters used by this argument and a TParams object using the global PackageParams and UnpackParams routines.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variantparameter, AS_GetRecords_result (C++).

Communicating with the Client Dataset

50.1.1.2.7 IAppServer.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet in AS_RowRequest_result (C++).

50.1.2 IAppServerDisp Interface

Class Hierarchy

Pascal

```
IAppServerDisp = dispinterface;
```

C++

```
class IAppServerDisp;
```

File

Midas

Description

This is class Midas.IAppServerDisp.

50.1.2.1 IAppServerDisp Members

The following tables list the members exposed by IAppServerDisp.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 5230)	This is AS_ApplyUpdates, a member of class IAppServerDisp.
	AS_DataRequest (see page 5230)	This is AS_DataRequest, a member of class IAppServerDisp.
	AS_Execute (see page 5230)	This is AS_Execute, a member of class IAppServerDisp.
	AS_GetParams (see page 5230)	This is AS_GetParams, a member of class IAppServerDisp.
	AS_GetProviderNames (see page 5231)	This is AS_GetProviderNames, a member of class IAppServerDisp.
	AS_GetRecords (see page 5231)	This is AS_GetRecords, a member of class IAppServerDisp.
	AS_RowRequest (see page 5231)	This is AS_RowRequest, a member of class IAppServerDisp.

50.1.2.2 IAppServerDisp Methods

The methods of the IAppServerDisp class are listed here.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 5230)	This is AS_ApplyUpdates, a member of class IAppServerDisp.
	AS_DataRequest (see page 5230)	This is AS_DataRequest, a member of class IAppServerDisp.
	AS_Execute (see page 5230)	This is AS_Execute, a member of class IAppServerDisp.
	AS_GetParams (see page 5230)	This is AS_GetParams, a member of class IAppServerDisp.
	AS_GetProviderNames (see page 5231)	This is AS_GetProviderNames, a member of class IAppServerDisp.
	AS_GetRecords (see page 5231)	This is AS_GetRecords, a member of class IAppServerDisp.
	AS_RowRequest (see page 5231)	This is AS_RowRequest, a member of class IAppServerDisp.

50.1.2.2.1 IAppServerDisp.AS_ApplyUpdates Method

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

This is AS_ApplyUpdates, a member of class IAppServerDisp.

50.1.2.2.2 IAppServerDisp.AS_DataRequest Method

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

This is AS_DataRequest, a member of class IAppServerDisp.

50.1.2.2.3 IAppServerDisp.AS_Execute Method

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant);
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

This is AS_Execute, a member of class IAppServerDisp.

50.1.2.2.4 IAppServerDisp.AS_GetParams Method

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

This is AS_GetParams, a member of class IAppServerDisp.

50.1.2.2.5 IAppServerDisp.AS_GetProviderNames Method

Pascal

```
function AS_GetProviderNames: OleVariant;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

This is AS_GetProviderNames, a member of class IAppServerDisp.

50.1.2.2.6 IAppServerDisp.AS_GetRecords Method

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is AS_GetRecords, a member of class IAppServerDisp.

50.1.2.2.7 IAppServerDisp.AS_RowRequest Method

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

This is AS_RowRequest, a member of class IAppServerDisp.

50.2 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IID_IAppServer (see page 5232)	This is constant Midas.IID_IAppServer.
LIBID_Midas (see page 5232)	This is constant Midas.LIBID_Midas.

50.2.1 Midas.IID_IAppServer Constant

Pascal

```
IID_IAppServer: TGUID = '{1AEFCC20-7A24-11D2-98B0-C69BEB4B5B6D}';
```

C++

```
TGUID IID_IAppServer = '{1AEFCC20-7A24-11D2-98B0-C69BEB4B5B6D}';
```

File

Midas

Description

This is constant Midas.IID_IAppServer.

50.2.2 Midas.LIBID_Midas Constant

Pascal

```
LIBID_Midas: TGUID = '{83F57D68-CA9A-11D2-9088-00C04FA35CFA}';
```

C++

```
TGUID LIBID_Midas = '{83F57D68-CA9A-11D2-9088-00C04FA35CFA}';
```

File

Midas

Description

This is constant Midas.LIBID_Midas.

51 MidasCon Namespace

This is namespace MidasCon.

Topics

Name	Description
Classes (see page 5234)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 5241)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 5234)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 5239)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Structs, Records, Enums

	Name	Description
	TConnectType (see page 5241)	This is record MidasCon.TConnectType.

51.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 5234)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 5239)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

51.1.1 TMidasConnection Class

TMidasConnection handles a server connection for the client of a multi-tiered application.

Class Hierarchy

Pascal

```
TMidasConnection = class(TDCOMConnection);
```

C++

```
class TMidasConnection : public TDCOMConnection;
```

File

MidasCon

Description

TMidasConnection is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection (see page 4790) instead. When writing client applications that connect to application servers using sockets, use TSocketConnection instead. When writing client applications that connect to application servers using HTTP, use TWebConnection instead.

See Also

TClientDataSet

TDCOMConnection (see page 4790)

TSocketConnection

TWebConnection

51.1.1.1 TMidasConnection Members

The following tables list the members exposed by TMidasConnection.

Protected Methods

	Name	Description
	DoConnect (see page 5236)	Connects to an application server.
	DoDisconnect (see page 5237)	Drops a connection to an application server.
	GetConnected (see page 4798)	Returns the value of the Connected (see page 4802) property.
	GetServerCLSID (see page 4799)	Returns the GUID for the application server.
	Notification (see page 4800)	Responds when other objects are created or destroyed.
	SetConnected (see page 4786)	Sets the Connected (see page 4802) property.
	SetConnected (see page 4800)	Sets the Connected (see page 4802) property.
	SetConnectType (see page 5237)	This is SetConnectType, a member of class TMidasConnection.
	SetUseBroker (see page 5237)	This is SetUseBroker, a member of class TMidasConnection.

Protected Properties

	Name	Description
	ObjectBroker (see page 4806)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Public Methods

	Name	Description
	Create (see page 5235)	Creates and initializes an instance of TMidasConnection (see page 5234).
	GetServer (see page 4799)	Returns the IAppServer (see page 5222) interface of the application server.
	GetServerList (see page 4800)	Returns a list of remote data modules to which the component can connect.

Published Events

	Name	Description
	AfterConnect (see page 4808)	Occurs after a connection is established.
	AfterDisconnect (see page 4808)	Occurs after the connection closes.
	BeforeConnect (see page 4809)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 4809)	Occurs immediately before the connection closes.
	OnGetUsername (see page 4810)	This is OnGetUsername, a member of class TDispatchConnection.
	OnLogin (see page 4810)	Occurs when a communication channel opens to the server.

Published Properties

	Name	Description
	ComputerName (see page 4793)	This is ComputerName, a member of class TDCOMConnection.
	Connected (see page 4802)	Indicates whether the TDispatchConnection (see page 4796) object is connected to an application server.
	ConnectType (see page 5238)	Specifies the protocol to use to establish the connection to the application server.
	LoginPrompt (see page 4802)	Specifies whether a login dialog appears immediately before opening a new connection.
	ObjectBroker (see page 4794)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	ServerGUID (see page 4807)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 4807)	Specifies the name of the application server with which to connect.
	ServerPort (see page 5238)	Specifies the port used by the listening socket on the server machine.
	UseBroker (see page 5239)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

51.1.1.2 TMidasConnection.Create Constructor

Creates and initializes an instance of TMidasConnection (see page 5234).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMidasConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TMidasConnection (see page 5234) component at runtime. TMidasConnection (see page 5234) components placed in forms or data modules at design time are created automatically.

Create initializes the value of the ServerPort (see page 5238) property to 211. This is also the default port number for ScktSrvr.exe and ScktSrvc.exe.

See Also

ServerPort (see page 5238)

Create (see page 4797)

Port

51.1.1.3 TMidasConnection Methods

The methods of the TMidasConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 5236)	Connects to an application server.
	DoDisconnect (see page 5237)	Drops a connection to an application server.
	SetConnectType (see page 5237)	This is SetConnectType, a member of class TMidasConnection.
	SetUseBroker (see page 5237)	This is SetUseBroker, a member of class TMidasConnection.

51.1.1.3.1 TMidasConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName property. If the ObjectBroker property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

See Also

AfterConnect

BeforeConnect

Connected

AppServer

computername (see page 4793)

ObjectBroker (see page 4806)

51.1.1.3.2 TMidasConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect

BeforeDisconnect

Connected (see page 4802)

AppServer

51.1.1.3.3 TMidasConnection.SetConnectType Method

Pascal

```
procedure SetConnectType(Value: TConnectType); virtual;
```

C++

```
virtual __fastcall SetConnectType(TConnectType Value);
```

Description

This is SetConnectType, a member of class TMidasConnection.

51.1.1.3.4 TMidasConnection.SetUseBroker Method

Pascal

```
procedure SetUseBroker(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetUseBroker(Boolean Value);
```

Description

This is SetUseBroker, a member of class TMidasConnection.

51.1.1.4 TMidasConnection Properties

The properties of the TMidasConnection class are listed here.

Published Properties

	Name	Description
	ConnectType (see page 5238)	Specifies the protocol to use to establish the connection to the application server.
	ServerPort (see page 5238)	Specifies the port used by the listening socket on the server machine.
	UseBroker (see page 5239)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

51.1.1.4.1 TMidasConnection.ConnectType Property

Specifies the protocol to use to establish the connection to the application server.

Pascal

```
property ConnectType: TConnectType;
```

C++

```
__property TConnectType ConnectType;
```

Description

Use ConnectType to specify the desired protocol for connecting with the application server.

See Also

ServerPort (see page 5238)

computername (see page 4793)

UseBroker (see page 5239)

ServerName (see page 4807)

51.1.1.4.2 TMidasConnection.ServerPort Property

Specifies the port used by the listening socket on the server machine.

Pascal

```
property ServerPort: Integer;
```

C++

```
__property int ServerPort;
```

Description

When establishing connections to the application server using TCP/IP sockets, the application server must have a socket dispatcher listening on a predefined port for requests from client applications. If the value of ConnectType (see page 5238) is ctSockets, set ServerPort to the port number used by Scktsrvr.exe or SckTSrvc.exe on the server system. TMidasConnection (see page 5234) attempts to connect to the application server by sending a message to the system specified by the ComputerName property at the port specified by ServerPort.

Note: ServerPort has no effect if ConnectType (see page 5238) is not ctSockets.

See Also

ConnectType (see page 5238)

computername (see page 4793)

Port

51.1.1.4.3 TMidasConnection.UseBroker Property

Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

Pascal

```
property UseBroker: Boolean;
```

C++

```
__property Boolean UseBroker;
```

Description

When establishing connections to the application server using OLEnterprise, UseBroker specifies whether the connection should use the Business Object Broker. If UseBroker is true, TMidasConnection (see page 5234) uses the Business Object Broker, and the ComputerName property specifies the name of the Business Object Broker. If UseBroker is false, TMidasConnection (see page 5234) uses OLEnterprise, but does not go through the Business Object Broker. When UseBroker is false, ComputerName specifies the name of the OLEnterprise server.

For more information about using OLEnterprise, see the OLEnterprise documentation.

Note: The value of UseBroker has no effect unless ConnectType (see page 5238) is ctOLEnterprise.

See Also

ConnectType (see page 5238)

computername (see page 4793)

51.1.2 TRemoteServer Class

TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Class Hierarchy

Pascal

```
TRemoteServer = class(TDCOMConnection);
```

C++

```
class TRemoteServer : public TDCOMConnection;
```

File

MidasCon

Description

TRemoteServer is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection (see page 4790) instead.

See Also

TClientDataSet

TDCOMConnection (see page 4790)

TSocketConnection

TWebConnection

TDatasetprovider

51.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectType (see page 5241)	This is record MidasCon.TConnectType.

51.2.1 MidasCon.TConnectType Enumeration

Pascal

```
TConnectType = (
  ctDCOM,
  ctSockets,
  ctOLEnterprise
);
```

C++

```
enum TConnectType {
  ctDCOM,
  ctSockets,
  ctOLEnterprise
};
```

File

MidasCon

Description

This is record MidasCon.TConnectType.

52 MidItems Namespace

This is namespace MidItems.

Interfaces (see page 5644)	The following table lists interfaces in this documentation.
Functions (see page 5676)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 5681)	The following table lists structs, records, enums in this documentation.
Types (see page 5684)	The following table lists types in this documentation.
Constants (see page 5686)	The following table lists constants in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 5250)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 5256)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 5260)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 5263)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 5271)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.
	TCustomFieldGroup (see page 5276)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 5282)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 5288)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.
	TCustomQueryForm (see page 5293)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 5298)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 5302)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 5307)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.
	TDataSetButton (see page 5311)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

	TDeleteButton (see page 5318)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 5320)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 5326)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 5335)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 5344)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 5349)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 5355)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 5363)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 5365)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 5373)	TGridAttributes describes the options the TDataGrid (see page 5302) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 5379)	TGridRowAttributes describes the options the TDataGrid (see page 5302) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 5385)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 5387)	TLastButton generates an HTML control that moves to the last record in an XML data packet.
	TLayoutGroup (see page 5389)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 5392)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 5394)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 5396)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 5399)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 5401)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 5403)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 5412)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.
	TQueryFieldGroup (see page 5415)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 5421)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 5425)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 5437)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 5449)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 5458)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 5469)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 5472)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 5481)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 5486)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 5488)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

	TTextColumn (see page 5495)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 5502)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 5504)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 5510)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 5519)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 5532)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 5540)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 5544)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 5548)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 5558)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 5567)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 5573)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 5578)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 5583)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.
	TWebTextInput (see page 5589)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 5595)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 5601)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 5605)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 5608)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 5616)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 5620)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 5632)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 5635)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 5640)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

Constants

Name	Description
FormMethodNames (see page 5686)	This is constant MidItems.FormMethodNames.
HTMLAlignValues (see page 5687)	This is constant MidItems.HTMLAlignValues.
HTMLVAlignValues (see page 5687)	This is constant MidItems.HTMLVAlignValues.
sActionAttr (see page 5687)	This is constant MidItems.sActionAttr.
sAlignAttr (see page 5688)	This is constant MidItems.sAlignAttr.
sBgColorAttr (see page 5688)	This is constant MidItems.sBgColorAttr.
sBorderAttr (see page 5688)	This is constant MidItems.sBorderAttr.
sCellPaddingAttr (see page 5689)	This is constant MidItems.sCellPaddingAttr.
sCellSpacingAttr (see page 5689)	This is constant MidItems.sCellSpacingAttr.
sCheckedAttr (see page 5689)	This is constant MidItems.sCheckedAttr.
sClassAttr (see page 5690)	This is constant MidItems.sClassAttr.
sColsAttr (see page 5690)	This is constant MidItems.sColsAttr.
sColSpanAttr (see page 5690)	This is constant MidItems.sColSpanAttr.
sEncTypeAttr (see page 5691)	This is constant MidItems.sEncTypeAttr.
sImageHeightAttr (see page 5691)	This is constant MidItems.sImageHeightAttr.

sImageWidthAttr (see page 5691)	This is constant MidItems.sImageWidthAttr.
sMaxLengthAttr (see page 5692)	This is constant MidItems.sMaxLengthAttr.
sMethodAttr (see page 5692)	This is constant MidItems.sMethodAttr.
sMultipleAttr (see page 5692)	This is constant MidItems.sMultipleAttr.
sNameAttr (see page 5693)	This is constant MidItems.sNameAttr.
sOnClickAttr (see page 5693)	This is constant MidItems.sOnClickAttr.
sReadOnlyAttr (see page 5693)	This is constant MidItems.sReadOnlyAttr.
sRowsAttr (see page 5694)	This is constant MidItems.sRowsAttr.
sSelectedAttr (see page 5694)	This is constant MidItems.sSelectedAttr.
sSizeAttr (see page 5694)	This is constant MidItems.sSizeAttr.
sStyleAttr (see page 5695)	This is constant MidItems.sStyleAttr.
sTabIndexAttr (see page 5695)	This is constant MidItems.sTabIndexAttr.
sTypeAttr (see page 5695)	This is constant MidItems.sTypeAttr.
sVAlignAttr (see page 5696)	This is constant MidItems.sVAlignAttr.
sValueAttr (see page 5696)	This is constant MidItems.sValueAttr.
sWidthAttr (see page 5696)	This is constant MidItems.sWidthAttr.
sWrapAttr (see page 5697)	This is constant MidItems.sWrapAttr.
TextAreaWrap (see page 5697)	This is constant MidItems.TextAreaWrap.

Functions

	Name	Description
	AddBoolAttrib (see page 5676)	This is function MidItems.AddBoolAttrib.
	AddCustomAttrib (see page 5676)	This is function MidItems.AddCustomAttrib.
	AddIntAttrib (see page 5677)	This is function MidItems.AddIntAttrib.
	AddQuotedAttrib (see page 5677)	This is function MidItems.AddQuotedAttrib.
	AddStringAttrib (see page 5677)	This is function MidItems.AddStringAttrib.
	CanAddClassHelper (see page 5678)	This is function MidItems.CanAddClassHelper.
	CreateDefaultButtonClasses (see page 5678)	This is function MidItems.CreateDefaultButtonClasses.
	DeclareSubmitForm (see page 5678)	This is function MidItems.DeclareSubmitForm.
	FindDispatcher (see page 5679)	This is function MidItems.FindDispatcher.
	FindProducer (see page 5679)	This is function MidItems.FindProducer.
	FormatColumnData (see page 5679)	This is function MidItems.FormatColumnData.
	FormatColumnHeading (see page 5680)	This is function MidItems.FormatColumnHeading.
	GetItemValuesFromDataSet (see page 5680)	This is function MidItems.GetItemValuesFromDataSet.

Interfaces

	Name	Description
	IDataSetComponent (see page 5644)	IDataSetComponent defines the methods that bind a Web item to an XML broker.
	IDataSetField (see page 5648)	This is class MidItems.IDataSetField.
	IDataSetFields (see page 5650)	This is class MidItems.IDataSetFields.
	IFormatColumn (see page 5652)	This is class MidItems.IFormatColumn.
	IHTMLField (see page 5653)	IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.
	IHTMLForm (see page 5655)	IHTMLForm is an interface that must be implemented by Web items that generate forms.
	IInetXWebDataSet (see page 5657)	IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.
	IQueryField (see page 5661)	This is class MidItems.IQueryField.
	IQueryFields (see page 5664)	This is class MidItems.IQueryFields.
	IQueryForm (see page 5665)	This is class MidItems.IQueryForm.
	IRestoreDefaults (see page 5665)	This is class MidItems.IRestoreDefaults.
	IStatusField (see page 5666)	This is class MidItems.IStatusField.
	IValidateField (see page 5667)	This is class MidItems.IValidateField.
	IValidateFields (see page 5668)	This is class MidItems.IValidateFields.
	IWebDisplay (see page 5670)	

	IWebDisplayReference (see page 5671)	
	IXMLDisplay (see page 5673)	This is class MidItems.IXMLDisplay.

Structs, Records, Enums

	Name	Description
	TCaptionPosition (see page 5681)	TCaptionPosition indicates the relative position of a label to the HTML control it labels.
	TFormMethod (see page 5682)	TFormMethod represents the method attribute on the <form> tag of an HTML form.
	TLayoutState (see page 5682)	This is record MidItems.TLayoutState.
	TTextAreaWrap (see page 5683)	TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

Types

Name	Description
IMidasWebDataSet (see page 5684)	This is type MidItems.IMidasWebDataSet.
TWebButtonClass (see page 5684)	This is type MidItems.TWebButtonClass.
TWebDataDisplayClass (see page 5685)	This is type MidItems.TWebDataDisplayClass.
TWebDataInputClass (see page 5685)	This is type MidItems.TWebDataInputClass.
TWebStatusClass (see page 5685)	This is type MidItems.TWebStatusClass.

52.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 5250)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 5256)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 5260)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 5263)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 5271)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.
	TCustomFieldGroup (see page 5276)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 5282)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 5288)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.
	TCustomQueryForm (see page 5293)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 5298)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 5302)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 5307)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.
	TDataSetButton (see page 5311)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.
	TDeleteButton (see page 5318)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 5320)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 5326)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 5335)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 5344)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 5349)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 5355)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 5363)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 5365)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 5373)	TGridAttributes describes the options the TDataGrid (see page 5302) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 5379)	TGridRowAttributes describes the options the TDataGrid (see page 5302) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 5385)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 5387)	TLastButton generates an HTML control that moves to the last record in an XML data packet.

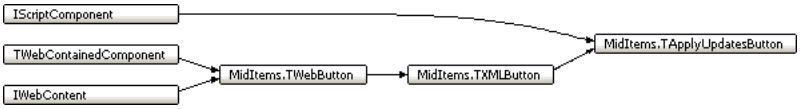
	TLayoutGroup (see page 5389)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 5392)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 5394)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 5396)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 5399)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 5401)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 5403)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 5412)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.
	TQueryFieldGroup (see page 5415)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 5421)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 5425)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 5437)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 5449)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 5458)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 5469)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 5472)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 5481)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 5486)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 5488)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.
	TTextColumn (see page 5495)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 5502)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 5504)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 5510)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 5519)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 5532)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 5540)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 5544)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 5548)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 5558)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 5567)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 5573)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 5578)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 5583)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.

	TWebTextInput (see page 5589)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 5595)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 5601)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 5605)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 5608)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 5616)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 5620)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 5632)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 5635)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 5640)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

52.1.1 TApplyUpdatesButton Class

TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.

Class Hierarchy



Pascal

```
TApplyUpdatesButton = class(TXMLButton, IScriptComponent);
```

C++

```
class TApplyUpdatesButton : public TXMLButton, public IScriptComponent;
```

File

MidItems

Description

Add TApplyUpdatesButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to submit changes made by end users. The resulting HTML button's action generates an HTTP message that forwards all changes to a specific XML data packet back to the XML broker on the InternetExpress application.

Use the properties of TApplyUpdatesButton to customize the appearance of the button and associate it with an XML broker. The associated XML broker adds the XML data packet to the HTML document and responds to update messages generated by the apply updates button on the HTML form.

TXMLBroker

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

Using the Web Page Editor

52.1.1.1 TApplyUpdatesButton Members

The following tables list the members exposed by TApplyUpdatesButton.

Protected Methods

	Name	Description
	AddElements (see page 5252)	This is AddElements, a member of class TApplyUpdatesButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
V	GetCaption (see page 5597)	Returns the value of the Caption property.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetSubComponents (see page 5252)	This is GetSubComponents, a member of class TApplyUpdatesButton.
	GetXMLBroker (see page 5598)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 5598)	This is GetXMLUseParent, a member of class TXMLButton.
V	ImplAddElements (see page 5252)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 5252)	Provides the underlying implementation for the Content method.
V	Notification (see page 5598)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetXMLBroker (see page 5599)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 5599)	This is SetXMLUseParent, a member of class TXMLButton.

Protected Properties

	Name	Description
	DefaultCaption (see page 5599)	This is DefaultCaption, a member of class TXMLButton.
R	XMLData (see page 5600)	This is XMLData, a member of class TXMLButton.

Public Methods

	Name	Description
V	Create (see page 5251)	Creates and initializes an instance of TApplyUpdatesButton (see page 5250).
V	Destroy (see page 5597)	Frees an instance of TXMLButton (see page 5595).

Published Properties

	Name	Description
	Caption (see page 5253)	Specifies the caption that appears on the button.
	Custom (see page 5254)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5254)	Adds style attributes to the generated button control.
	StyleRule (see page 5254)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 5255)	Associates the XML button with an XML broker.
	XMLUseParent (see page 5255)	Specifies whether the XML button is associated with its parent's XML broker.

52.1.1.2 TApplyUpdatesButton.Create Constructor

Creates and initializes an instance of TApplyUpdatesButton (see page 5250).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TApplyUpdatesButton(TComponent * AOwner);
```

Description

Call Create to instantiate TApplyUpdatesButton (see page 5250) at runtime. Buttons added at design time using the Web

Page editor are instantiated automatically.

52.1.1.3 TApplyUpdatesButton Methods

The methods of the TApplyUpdatesButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 5252)	This is AddElements, a member of class TApplyUpdatesButton.
	GetSubComponents (see page 5252)	This is GetSubComponents, a member of class TApplyUpdatesButton.
V	ImplAddElements (see page 5252)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 5252)	Provides the underlying implementation for the Content method.

52.1.1.3.1 TApplyUpdatesButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TApplyUpdatesButton.

52.1.1.3.2 TApplyUpdatesButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TApplyUpdatesButton.

52.1.1.3.3 TApplyUpdatesButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TApplyUpdatesButton.

52.1.1.3.4 TApplyUpdatesButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 5506)

ILayoutWebContent

52.1.1.4 TApplyUpdatesButton Properties

The properties of the TApplyUpdatesButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 5253)	Specifies the caption that appears on the button.
	Custom (see page 5254)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5254)	Adds style attributes to the generated button control.
	StyleRule (see page 5254)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 5255)	Associates the XML button with an XML broker.
	XMLUseParent (see page 5255)	Specifies whether the XML button is associated with its parent's XML broker.

52.1.1.4.1 TApplyUpdatesButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 5509)

GetCaption (see page 5507)

SetCaption (see page 5508)

52.1.1.4.2 TApplyUpdatesButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 5508)

Style (see page 5509)

52.1.1.4.3 TApplyUpdatesButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 5509)

StyleRule (see page 5510)

52.1.1.4.4 TApplyUpdatesButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 5509)

Styles (see page 5716)

StylesFile (see page 5717)

Styles

StylesFile

52.1.1.4.5 TApplyUpdatesButton.XMLBroker Property

Associates the XML button with an XML broker.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Set XMLBroker to specify the XML broker whose data packets the XML button manipulates.

When XML buttons are used by TDataNavigator, the data navigator already establishes a connection (indirectly) to an XML broker. If the XML button uses this same XML broker, you do not need to set the XMLBroker property. Instead, setting the XMLUseParent property to true (the default) automatically associates the XML button with the same broker as the one associated with the navigator.

See Also

XMLUseParent (see page 5600)

52.1.1.4.6 TApplyUpdatesButton.XMLUseParent Property

Specifies whether the XML button is associated with its parent's XML broker.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the XML button determines the XML broker whose data packets it manipulates. When XMLUseParent is false, the XMLBroker property must be set to indicate the XML broker. When XMLUseParent is true, the XML broker associated with the XML button's parent determines the associated XML broker.

The XML button's parent is the Web item (typically TDataNavigator) that uses the XML button to assemble its own HTML content. The parent's associated broker may be defined through an indirect association. For example, the data navigator acts on another component, such as a field group, which has an associated broker.

If the parent does not have an associated XML broker, setting XMLUseParent to true sets the XMLBroker property to nil (Delphi) or NULL (C++).

See Also

XMLBroker (see page 5599)

52.1.2 TCaptionAttributes Class

TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.

Class Hierarchy

Pascal

```
TCaptionAttributes = class(TPersistent);
```

C++

```
class TCaptionAttributes : public TPersistent;
```

File

MidItems

Description

TCaptionAttributes is the type of the CaptionAttributes property of Web items that generate display controls. It defines several properties that customize the appearance of the label generated by the Web item.

See Also

CaptionAttributes

52.1.2.1 TCaptionAttributes Members

The following tables list the members exposed by TCaptionAttributes.

Public Methods

	Name	Description
	Create (see page 5257)	Creates an instance of TCaptionAttributes (see page 5256).

Public Properties

	Name	Description
R	Parent (see page 5258)	Indicates the Web item that uses TCaptionAttributes (see page 5256) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 5257)	Represents the Align option of an HTML tag.
	Custom (see page 5258)	Represents a tag option and its value.

	Style (see page 5258)	Adds style attributes to the generated caption.
	StyleRule (see page 5259)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 5259)	Represents the VAlign option of an HTML tag.

52.1.2.2 TCaptionAttributes.Create Constructor

Creates an instance of TCaptionAttributes (see page 5256).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TCaptionAttributes(TComponent * AParent);
```

Description

Do not create instances of TCaptionAttributes (see page 5256). This object is instantiated by the Web item that uses it to implement its CaptionAttributes property.

The AParent parameter specifies the Web item that creates a TCaptionAttributes (see page 5256) instance for its CaptionAttributes property. This becomes the value of the Parent (see page 5258) property.

See Also

CaptionAttributes (see page 5530)

Parent (see page 5258)

52.1.2.3 TCaptionAttributes Properties

The properties of the TCaptionAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 5258)	Indicates the Web item that uses TCaptionAttributes (see page 5256) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 5257)	Represents the Align option of an HTML tag.
	Custom (see page 5258)	Represents a tag option and its value.
	Style (see page 5258)	Adds style attributes to the generated caption.
	StyleRule (see page 5259)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 5259)	Represents the VAlign option of an HTML tag.

52.1.2.3.1 TCaptionAttributes.Align Property

Represents the Align option of an HTML tag.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Use Align to add an Align option to the tag that surrounds the caption. The Align option influences the horizontal alignment of the caption text.

The Web item that generates the caption inserts the specified Align option into the HTML tag when it generates its content.

See Also

VAlign (see page 5259)

52.1.2.3.2 TCaptionAttributes.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the caption. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces.

The Web item that generates the caption inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 5258)

StyleRule (see page 5259)

52.1.2.3.3 TCaptionAttributes.Parent Property

Indicates the Web item that uses TCaptionAttributes (see page 5256) to customize the appearance of its generated caption.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Use Parent to access the Web item that uses the TCaptionAttributes (see page 5256) object.

See Also

Create (see page 5257)

52.1.2.3.4 TCaptionAttributes.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated caption. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the caption as the value of a STYLE option.

See Also

Custom (see page 5258)

StyleRule (see page 5259)

52.1.2.3.5 TCaptionAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated caption.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated caption. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 5258) property instead.

See Also

Style (see page 5258)

Styles (see page 5716)

Styles

StylesFile (see page 5717)

StylesFile

52.1.2.3.6 TCaptionAttributes.VAlign Property

Represents the VAlign option of an HTML tag.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Use VAlign to add an VAlign option to the tag that surrounds the caption. The VAlign option influences the vertical alignment of the caption text.

The Web item that generates the caption inserts the specified VAlign option into the HTML tag when it generates its content.

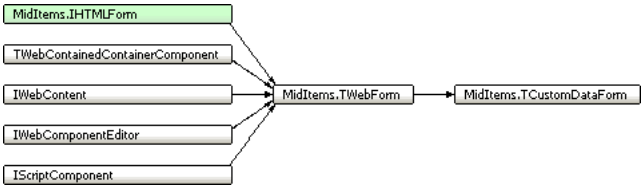
See Also

Align (see page 5257)

52.1.3 TCustomDataForm Class

TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.

Class Hierarchy



Pascal

```
TCustomDataForm = class(TWebForm);
```

C++

```
class TCustomDataForm : public TWebForm;
```

File

MidItems

Description

TCustomDataForm is the base class for components that generate HTML forms to display database information that users can view and edit. Such forms can be added to the items of an InternetExpress page producer (InetXPageProducer).

TCustomDataForm implements the ability to generate an HTML form that contains controls for displaying information from an XML data packet. Buttons on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TCustomDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that generate data displays (TDataGrid (see page 5302) or TFieldGroup (see page 5320)), components that contain buttons which operate on those displays (TDataNavigator (see page 5307)), and components that manage the layout of HTML controls (TLayoutGroup (see page 5389)). At design time, you can add these Web items to the form using the Web page editor.

See Also

IWebContent

TInetXPageProducer (see page 5730)

52.1.3.1 TCustomDataForm Members

The following tables list the members exposed by TCustomDataForm.

Protected Methods

	Name	Description
	AddElements (see page 5550)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 5551)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 5558) property list.
	Content (see page 5551)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 5552)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 5552)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 5262)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 5553)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 5553)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 5553)	Returns the value of the WebComponents (see page 5558) property.
	GetVisibleFields (see page 5554)	Returns the value of the VisibleFields (see page 5557) property.
V	ImplAddElements (see page 5554)	Provides the underlying implementation for the AddElements (see page 5550) method.
V	ImplCanAddClass (see page 5262)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5262)	Provides the underlying implementation for the Content method.
V	SetDefaultWebComponents (see page 5555)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 5557)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
V	Create (see page 5549)	Creates and initializes an instance of TWebForm (see page 5548).
V	Destroy (see page 5550)	Frees an instance of TWebForm (see page 5548).
	GetHTMLFormName (see page 5656)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 5656)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	Custom (see page 5556)	Represents a tag option and its value in the generated FORM tag.
R	HTMLFormName (see page 5657)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 5657)	Indicates the name of the javascript variable that represents the HTML form.
	Style (see page 5556)	Adds style attributes to the generated form.
	StyleRule (see page 5557)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 5558)	Maintains a list of components that generate HTML content for the TWebForm (see page 5548) descendant.

52.1.3.2 TCustomDataForm Methods

The methods of the TCustomDataForm class are listed here.

Protected Methods

	Name	Description
V	GetHTMLFormTag (see page 5262)	This is GetHTMLFormTag, a member of class TCustomDataForm.
V	ImplCanAddClass (see page 5262)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5262)	Provides the underlying implementation for the Content method.

52.1.3.2.1 TCustomDataForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomDataForm.

52.1.3.2.2 TCustomDataForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 5551)

WebComponents (see page 5558)

52.1.3.2.3 TCustomDataForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

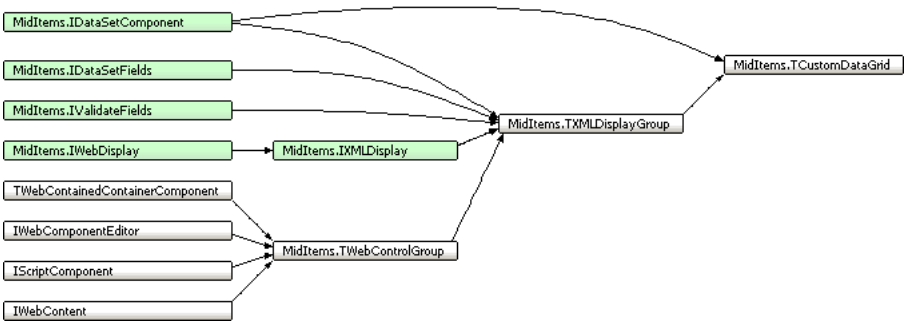
Content (see page 5551)

AddElements (see page 5550)

52.1.4 TCustomDataGrid Class

TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.

Class Hierarchy



Pascal

```
TCustomDataGrid = class(TXMLDisplayGroup, IDataSetComponent);
```

C++

```
class TCustomDataGrid : public TXMLDisplayGroup, public IDataSetComponent;
```

File

MidItems

Description

Use TCustomDataGrid as a base class for Web items that generate an HTML table to display multiple records from a dataset as a set of rows and columns. Each TCustomDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 5495), TSelectOptionColumn, TTextAreaColumn (see page 5488), and TStatusColumn (see page 5481).

You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

TCustomDataGrid introduces a number of properties that affect the appearance of the generated table.

In order to let other Web items use the HTML table that the data grid generates, TCustomDataGrid inherits the IWebContent interface from TWebControlGroup (see page 5510).

Do not create instances of TCustomDataGrid. Instead, use a descendant of TCustomDataGrid such as TDataGrid (see page 5302).

See Also

TDataGrid (see page 5302)

IWebContent

TSelectOptionsColumn (see page 5472)

TStatusColumn (see page 5481)

TTextAreaColumn (see page 5488)

TTextColumn (see page 5495)

52.1.4.1 TCustomDataGrid Members

The following tables list the members exposed by TCustomDataGrid.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 5623)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 5623)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 5266)	This is FormatTable, a member of class TCustomDataGrid.
	GetDataSet (see page 5624)	Returns the value of the DataSet property.
	GetDataSetField (see page 5624)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
	GetEnableValidateFields (see page 5624)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 5624)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 5625)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetVisibleFields (see page 5625)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 5625)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 5625)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 5626)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 5626)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 5626)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 5267)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5267)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5267)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	ImplGetSubComponents (see page 5627)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 5268)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	IsFieldInUse (see page 5627)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 5628)	Forwards notification messages to all owned components.
	SetDataSetField (see page 5628)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	SetEnableValidateFields (see page 5628)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 5268)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 5268)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 5269)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetXMLBroker (see page 5629)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 5629)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 5629)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 5629)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
	EnableValidateFields (see page 5630)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 5631)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 5266)	Creates and initializes an instance of TCustomDataGrid (see page 5263).
V	Destroy (see page 5266)	Frees an instance of TCustomDataGrid (see page 5263).
	GetDataSet (see page 5645)	Returns the value of the DataSet (see page 5646) property.
	GetEnableValidateFields (see page 5669)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 5651)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 5670)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 5673)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 5651)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 5645)	Returns the value of the XMLBroker (see page 5647) property.
	GetXMLDataSet (see page 5646)	Returns the value of the XMLDataSet (see page 5647) property.
	GetXMLDisplayName (see page 5674)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 5674)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 5651)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 5651)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 5669)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 5651)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 5669)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	DataSet (see page 5646)	Provides access to an interface for working with the associated dataset.
	DisplayRows (see page 5269)	Limits the number of rows in the HTML table.
	EnableValidateFields (see page 5669)	This is EnableValidateFields, a member of class IValidateFields.
	HeadingAttributes (see page 5269)	Determines the display characteristics of the table's header.
R	IsMultipleRecordView (see page 5671)	
R	IsMultipleRecordView (see page 5674)	
	RowAttributes (see page 5270)	Determines the display characteristics of the table's body.
	TableAttributes (see page 5270)	Determines the basic display characteristics of the table.
R	VisibleFields (see page 5652)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 5630)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 5647)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 5647)	Indicates the TXMLDataSet (see page 5608) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 5675)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 5675)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	XMLBroker (see page 5631)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 5631)	Binds the XML display group to a nested dataset from the XML data packet.

52.1.4.2 TCustomDataGrid.Create Constructor

Creates and initializes an instance of TCustomDataGrid (see page 5263).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataGrid(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomDataGrid (see page 5263) at runtime. TCustomDataGrid (see page 5263) components added at design time using the Web Page editor are instantiated automatically.

52.1.4.3 TCustomDataGrid.Destroy Destructor

Frees an instance of TCustomDataGrid (see page 5263).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataGrid();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is nil before calling Destroy.

See Also

System::TObject::Free

52.1.4.4 TCustomDataGrid Methods

The methods of the TCustomDataGrid class are listed here.

Protected Methods

	Name	Description
	FormatTable (see page 5266)	This is FormatTable, a member of class TCustomDataGrid.
V	ImplAddElements (see page 5267)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5267)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5267)	Provides the underlying implementation for the Content method.
V	ImplIsMultipleRecordView (see page 5268)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	SetHeadingAttributes (see page 5268)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 5268)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 5269)	This is SetTableAttributes, a member of class TCustomDataGrid.

52.1.4.4.1 TCustomDataGrid.FormatTable Method

Pascal

```
function FormatTable(Layout: TLayoutWebContent; Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatTable(TLayoutWebContent Layout, TWebContentOptions Options);
```

Description

This is FormatTable, a member of class TCustomDataGrid.

52.1.4.4.2 TCustomDataGrid.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 5513)

52.1.4.4.3 TCustomDataGrid.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.4.4.4 TCustomDataGrid.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.4.4.5 TCustomDataGrid.ImplIsMultipleRecordView Method

Pascal

```
function ImplIsMultipleRecordView: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsMultipleRecordView();
```

Description

This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.

52.1.4.4.6 TCustomDataGrid.SetHeadingAttributes Method

Pascal

```
procedure SetHeadingAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetHeadingAttributes(const TGridRowAttributes Value);
```

Description

This is SetHeadingAttributes, a member of class TCustomDataGrid.

52.1.4.4.7 TCustomDataGrid.SetRowAttributes Method

Pascal

```
procedure SetRowAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetRowAttributes(const TGridRowAttributes Value);
```

Description

This is SetRowAttributes, a member of class TCustomDataGrid.

52.1.4.4.8 TCustomDataGrid.SetTableAttributes Method

Pascal

```
procedure SetTableAttributes(const Value: TGridAttributes);
```

C++

```
__fastcall SetTableAttributes(const TGridAttributes Value);
```

Description

This is SetTableAttributes, a member of class TCustomDataGrid.

52.1.4.5 TCustomDataGrid Properties

The properties of the TCustomDataGrid class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 5269)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 5269)	Determines the display characteristics of the table's header.
	RowAttributes (see page 5270)	Determines the display characteristics of the table's body.
	TableAttributes (see page 5270)	Determines the basic display characteristics of the table.

52.1.4.5.1 TCustomDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton (see page 5394) or TPriorPageButton (see page 5401) lets end users scroll through the records in the data packet.

See Also

MaxRecords

TNextPageButton (see page 5394)

TPriorPageButton (see page 5401)

52.1.4.5.2 TCustomDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes (see page 5270) or RowAttributes (see page 5270) property instead.

See Also

TableAttributes (see page 5270)

RowAttributes (see page 5270)

52.1.4.5.3 TCustomDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes (see page 5270) or HeadingAttributes (see page 5269) property instead.

See Also

TableAttributes (see page 5270)

HeadingAttributes (see page 5269)

52.1.4.5.4 TCustomDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any

custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes (see page 5269) property instead.

See Also

RowAttributes (see page 5270)

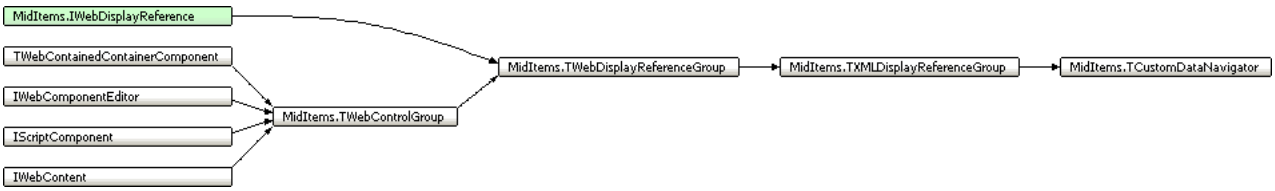
DisplayRows (see page 5269)

HeadingAttributes (see page 5269)

52.1.5 TCustomDataNavigator Class

TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.

Class Hierarchy



Pascal

```
TCustomDataNavigator = class(TXMLDisplayReferenceGroup);
```

C++

```
class TCustomDataNavigator : public TXMLDisplayReferenceGroup;
```

File

MidItems

Description

Use TCustomDataNavigator as a base class for Web items that generate the HTML to arrange a collection of button controls in a data form. Each TCustomDataNavigator object has an associated Web item that generates display controls in the form. The buttons arranged by the data navigator component manipulate the information these display controls show.

TCustomDataNavigator introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomDataNavigator. TCustomDataNavigator is intended to act as a base class. Instead, instantiate a descendant class such as TDataNavigator (see page 5307).

See Also

TDataForm (see page 5298)

TFieldGroup (see page 5320)

TDataGrid (see page 5302)

IWebContent

52.1.5.1 TCustomDataNavigator Members

The following tables list the members exposed by TCustomDataNavigator.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 5273)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetWebDisplayComponent (see page 5546)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplAddElements (see page 5642)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5273)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5273)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 5274)	Provides the underlying implementation for the GetSubComponents method.
V	Notification (see page 5546)	Forwards notification messages to all owned components.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
V	SetWebDisplayComponent (see page 5547)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	VisibleButtons (see page 5274)	This is VisibleButtons, a member of class TCustomDataNavigator.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
R	WebDisplay (see page 5547)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 5547)	

Public Methods

	Name	Description
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Create (see page 5545)	Creates an instance of TWebDisplayReferenceGroup (see page 5544).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5546)	Frees an instance of TWebDisplayReferenceGroup (see page 5544).
	GetWebDisplayComponent (see page 5672)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
	Custom (see page 5275)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5275)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5276)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebDisplayComponent (see page 5672)	
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
	XMLComponent (see page 5643)	Associates the group with a component that generates HTML display controls.

52.1.5.2 TCustomDataNavigator Methods

The methods of the TCustomDataNavigator class are listed here.

Protected Methods

	Name	Description
	GetDefaultButtons (see page 5273)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
	ImplCanAddClass (see page 5273)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 5273)	Provides the underlying implementation for the Content method.
	ImplGetSubComponents (see page 5274)	Provides the underlying implementation for the GetSubComponents method.
	VisibleButtons (see page 5274)	This is VisibleButtons, a member of class TCustomDataNavigator.

52.1.5.2.1 TCustomDataNavigator.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomDataNavigator.

52.1.5.2.2 TCustomDataNavigator.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.5.2.3 TCustomDataNavigator.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.5.2.4 TCustomDataNavigator.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents method.

Pascal

```
function ImplGetSubComponents: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents method calls ImplGetSubComponents to retrieve the value of WebFieldControls as a TObject. TWebControlGroup descendants override this method if the list is not simply the value of WebFieldControls. For example, some TWebControlGroup descendants supply a default value (DefaultWebComponents) when the WebFieldControls property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 5516)

DefaultWebComponents (see page 5518)

WebFieldControls (see page 5519)

52.1.5.2.5 TCustomDataNavigator.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomDataNavigator.

52.1.5.3 TCustomDataNavigator Properties

The properties of the TCustomDataNavigator class are listed here.

Public Properties

	Name	Description
	Custom (see page 5275)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5275)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5276)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.5.3.1 TCustomDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomDataNavigator (see page 5271) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5275)

StyleRule (see page 5276)

WebFieldControls (see page 5519)

52.1.5.3.2 TCustomDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomDataNavigator (see page 5271) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5275)

StyleRule (see page 5276)

WebFieldControls (see page 5519)

52.1.5.3.3 TCustomDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomDataNavigator (see page 5271) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 5275) property.

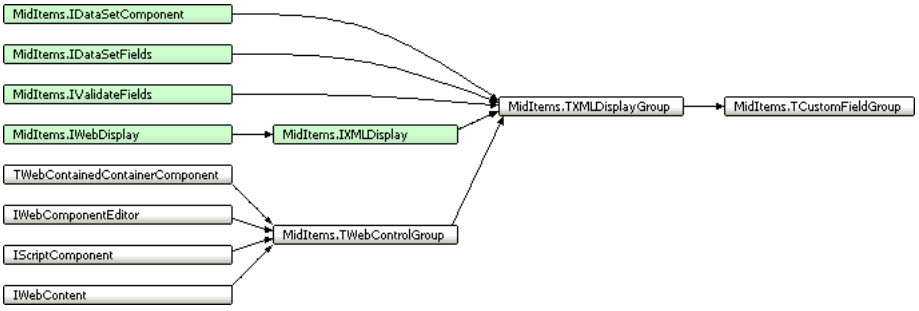
52.1.6 TCustomFieldGroup Class

TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TCustomFieldGroup = class(TXMLDisplayGroup);
```

C++

```
class TCustomFieldGroup : public TXMLDisplayGroup;
```

File

MidItems

Description

Use TCustomFieldGroup as a base class for Web items that display information in labeled fields on an HTML form. Each TCustomFieldGroup object maintains a list of Web items that generate the individual display fields. These Web items are restricted to classes that are appropriate for the specific TCustomFieldGroup descendant.

If the controls generated for TCustomFieldGroup by its Web items represent database information, you can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can use that binding to determine the source of the data they display.

TCustomFieldGroup introduces a number of properties that affect the appearance of the generated set of fields.

In order to let other Web items use the HTML that the TCustomFieldGroup object generates, TCustomFieldGroup inherits the IWebContent interface from TWebControlGroup (see page 5510).

Do not create instances of TCustomFieldGroup. Instead, use a descendant of TCustomFieldGroup such as TFieldGroup (see page 5320) or TQueryFieldGroup (see page 5415).

See Also

TFieldGroup (see page 5320)

IWebContent

TQueryFieldGroup (see page 5415)

52.1.6.1 TCustomFieldGroup Members

The following tables list the members exposed by TCustomFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 5623)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 5623)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 5624)	Returns the value of the DataSet property.
	GetDataSetField (see page 5624)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
	GetEnableValidateFields (see page 5624)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 5624)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 5625)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 5280)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetVisibleFields (see page 5625)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 5625)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 5625)	Returns the value of the XMLDataSet property.

	GetXMLDisplayName (see page 5626)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 5626)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 5626)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplAddElements (see page 5626)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5280)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	ImplGetSubComponents (see page 5627)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 5627)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 5627)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 5628)	Forwards notification messages to all owned components.
	SetDataSetField (see page 5628)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	SetEnableValidateFields (see page 5628)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 5629)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 5629)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 5629)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 5629)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
	EnableValidateFields (see page 5630)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 5631)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 5279)	Creates and initializes an instance of TCustomFieldGroup (see page 5276).
V	Destroy (see page 5279)	Frees an instance of TCustomFieldGroup (see page 5276).
	GetDataSet (see page 5645)	Returns the value of the DataSet (see page 5646) property.
	GetEnableValidateFields (see page 5669)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 5651)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 5670)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 5673)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 5651)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 5645)	Returns the value of the XMLBroker (see page 5647) property.
	GetXMLDataSet (see page 5646)	Returns the value of the XMLDataSet (see page 5647) property.
	GetXMLDisplayName (see page 5674)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 5674)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 5651)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 5651)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 5669)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 5651)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 5669)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	Custom (see page 5281)	Represents a tag option and its value in the generated TABLE tag.
R	DataSet (see page 5646)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 5669)	This is EnableValidateFields, a member of class IValidateFields.

	IsMultipleRecordView (see page 5671)	
	IsMultipleRecordView (see page 5674)	
	Style (see page 5281)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5282)	Applies a style in the page producer's style sheet to the table.
	VisibleFields (see page 5652)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 5630)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 5647)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 5647)	Indicates the TXMLDataSet (see page 5608) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 5675)	This is XMLDisplayName, a member of class IXMLDisplay.
	XMLRowSetName (see page 5675)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	XMLBroker (see page 5631)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 5631)	Binds the XML display group to a nested dataset from the XML data packet.

52.1.6.2 TCustomFieldGroup.Create Constructor

Creates and initializes an instance of TCustomFieldGroup (see page 5276).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFieldGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomFieldGroup (see page 5276) at runtime. TCustomFieldGroup (see page 5276) components added at design time using the Web Page editor are instantiated automatically.

52.1.6.3 TCustomFieldGroup.Destroy Destructor

Frees an instance of TCustomFieldGroup (see page 5276).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomFieldGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is not nil before calling Destroy.

See Also

System::TObject::Free

52.1.6.4 TCustomFieldGroup Methods

The methods of the TCustomFieldGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 5280)	Returns an object that specifies how the generated group of controls should look.
	ImplContent (see page 5280)	Provides the underlying implementation for the Content method.

52.1.6.4.1 TCustomFieldGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 5514)

52.1.6.4.2 TCustomFieldGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.6.5 TCustomFieldGroup Properties

The properties of the TCustomFieldGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 5281)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5281)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5282)	Applies a style in the page producer's style sheet to the table.

52.1.6.5.1 TCustomFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup (see page 5276) generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5281)

StyleRule (see page 5282)

52.1.6.5.2 TCustomFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup (see page 5276) generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5281)

StyleRule (see page 5282)

52.1.6.5.3 TCustomFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 5281) property.

See Also

Style (see page 5281)

Styles (see page 5716)

StylesFile (see page 5717)

52.1.7 TCustomLayoutGroup Class

TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.

Class Hierarchy

Pascal

```
TCustomLayoutGroup = class(TWebControlGroup);
```

C++

```
class TCustomLayoutGroup : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomLayoutGroup as a base class for Web items that are used purely for layout. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated

by other Web items.

TCustomLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to let the parent component use the HTML that TCustomLayoutGroup generates, TCustomLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 5510).

Do not create instances of TCustomLayoutGroup. Instead, use a descendant of TCustomLayoutGroup such as TLayoutGroup (see page 5389).

See Also

TLayoutGroup (see page 5389)

IWebContent

52.1.7.1 TCustomLayoutGroup Members

The following tables list the members exposed by TCustomLayoutGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5284)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplCanAddClass (see page 5285)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5285)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 5284)	Creates and initializes an instance of TCustomLayoutGroup (see page 5282).
V	Destroy (see page 5284)	Frees an instance of TCustomLayoutGroup (see page 5282).

Public Properties

	Name	Description
	Custom (see page 5286)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 5286)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 5287)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5287)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

52.1.7.2 TCustomLayoutGroup.Create Constructor

Creates and initializes an instance of TCustomLayoutGroup (see page 5282).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TCustomLayoutGroup(TComponent * AComponent);
```

Description

Call Create to instantiate TCustomLayoutGroup (see page 5282) at runtime. TCustomLayoutGroup (see page 5282) components added at design time using the Web Page editor are instantiated automatically.

52.1.7.3 TCustomLayoutGroup.Destroy Destructor

Frees an instance of TCustomLayoutGroup (see page 5282).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomLayoutGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the layout group is nil before calling Destroy.

See Also

System::TObject::Free

52.1.7.4 TCustomLayoutGroup Methods

The methods of the TCustomLayoutGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 5284)	Returns an object that specifies how the generated group of controls should look.
	ImplCanAddClass (see page 5285)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 5285)	Provides the underlying implementation for the Content method.

52.1.7.4.1 TCustomLayoutGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 5514)

52.1.7.4.2 TCustomLayoutGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.7.4.3 TCustomLayoutGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.7.5 TCustomLayoutGroup Properties

The properties of the TCustomLayoutGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 5286)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 5286)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 5287)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5287)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.7.5.1 TCustomLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomLayoutGroup (see page 5282) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 5519) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5287)

StyleRule (see page 5287)

WebFieldControls (see page 5519)

DisplayColumns (see page 5286)

52.1.7.5.2 TCustomLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup (see page 5282) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 5519) property. It adds the HTML generated by each Web item listed in WebFieldControls (see page 5519) to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 5519)

52.1.7.5.3 TCustomLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomLayoutGroup (see page 5282) generates an HTML table to lay out the controls generated by the Web items in WebFieldControls (see page 5519). Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5286)

StyleRule (see page 5287)

WebFieldControls (see page 5519)

52.1.7.5.4 TCustomLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomLayoutGroup (see page 5282) generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 5287) property.

See Also

Style (see page 5287)

Styles

StylesFile

WebFieldControls (see page 5519)

52.1.8 TCustomQueryButtons Class

TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.

Class Hierarchy

Pascal

```
TCustomQueryButtons = class(TWebControlGroup);
```

C++

```
class TCustomQueryButtons : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomQueryButtons as a base class for Web items that generate the HTML to arrange a collection of button controls in a query form. The buttons arranged by the query buttons component manipulate information shown by display controls in the parent Query form.

TCustomQueryButtons introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomQueryButtons. TCustomQueryButtons is intended to act as a base class. Instead, instantiate a descendant class such as TQueryButtons (see page 5412).

See Also

TQueryForm (see page 5421)

TQueryFieldGroup (see page 5415)

IWebContent

52.1.8.1 TCustomQueryButtons Members

The following tables list the members exposed by TCustomQueryButtons.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 5289)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5290)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5290)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5290)	Provides the underlying implementation for the Content method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	VisibleButtons (see page 5291)	This is VisibleButtons, a member of class TCustomQueryButtons.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).

Public Properties

	Name	Description
	Custom (see page 5291)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5292)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5292)	Applies a style in the page producer's style sheet to the group of buttons.
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

52.1.8.2 TCustomQueryButtons Methods

The methods of the TCustomQueryButtons class are listed here.

Protected Methods

	Name	Description
V	GetDefaultButtons (see page 5289)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	ImplAddElements (see page 5290)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5290)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5290)	Provides the underlying implementation for the Content method.
	VisibleButtons (see page 5291)	This is VisibleButtons, a member of class TCustomQueryButtons.

52.1.8.2.1 TCustomQueryButtons.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomQueryButtons.

52.1.8.2.2 TCustomQueryButtons.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 5513)

52.1.8.2.3 TCustomQueryButtons.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.8.2.4 TCustomQueryButtons.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.8.2.5 TCustomQueryButtons.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomQueryButtons.

52.1.8.3 TCustomQueryButtons Properties

The properties of the TCustomQueryButtons class are listed here.

Public Properties

	Name	Description
	Custom (see page 5291)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5292)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5292)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.8.3.1 TCustomQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomQueryButtons (see page 5288) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5292)

StyleRule (see page 5292)

WebFieldControls (see page 5519)

52.1.8.3.2 TCustomQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomQueryButtons (see page 5288) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5291)

StyleRule (see page 5292)

WebFieldControls (see page 5519)

52.1.8.3.3 TCustomQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomQueryButtons (see page 5288) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 5519) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the

generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 5292) property.

See Also

Style (see page 5292)

Styles (see page 5716)

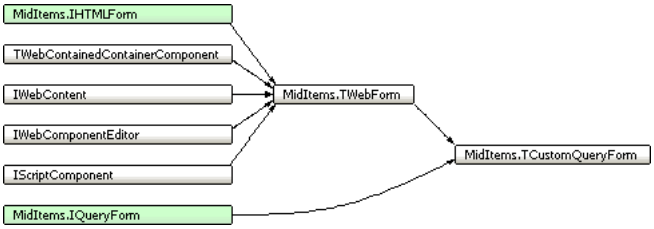
StylesFile (see page 5717)

WebFieldControls (see page 5519)

52.1.9 TCustomQueryForm Class

TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.

Class Hierarchy



Pascal

```
TCustomQueryForm = class(TWebForm, IQueryForm);
```

C++

```
class TCustomQueryForm : public TWebForm, public IQueryForm;
```

File

MidItems

Description

Use TCustomQueryForm as a base class for components that generate an HTML form that displays application-defined values and submits them to an InternetExpress application. TCustomQueryForm introduces properties for specifying the method and target URL of messages submitted by the form.

When building an HTML form, TCustomQueryForm makes use of content generated by the components listed in its WebComponents (see page 5558) property. These components can include Web items that display application-defined values (TQueryFieldGroup (see page 5415)) or that generate buttons to operate on those values (TQueryButtons (see page 5412)). They can also include components that manage the layout of other HTML controls (TLayoutGroup (see page 5389)).

In order to let an InternetExpress page producer use the generated HTML query form, TCustomQueryForm inherits support for the IWebContent interface from TWebForm (see page 5548).

Do not create instances of TCustomQueryForm. Instead, create descendants of TCustomQueryForm, such as TQueryForm (see page 5421).

See Also

TQueryForm (see page 5421)

IWebContent

TInetXPageProducer (see page 5730)

52.1.9.1 TCustomQueryForm Members

The following tables list the members exposed by TCustomQueryForm.

Protected Methods

	Name	Description
	AddElements (see page 5550)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 5295)	This is AssignStringsCallback, a member of class TCustomQueryForm.
	CanAddClass (see page 5551)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 5558) property list.
	Content (see page 5551)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 5552)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 5552)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 5296)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 5553)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 5553)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 5553)	Returns the value of the WebComponents (see page 5558) property.
	GetVisibleFields (see page 5554)	Returns the value of the VisibleFields (see page 5557) property.
V	ImplAddElements (see page 5296)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5296)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5297)	Provides the underlying implementation for the Content method.
	MethodString (see page 5297)	This is MethodString, a member of class TCustomQueryForm.
V	SetDefaultWebComponents (see page 5555)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 5557)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
	AssignStrings (see page 5295)	This is AssignStrings, a member of class TCustomQueryForm.
V	Create (see page 5295)	Creates and initializes an instance of TCustomQueryForm (see page 5293).
V	Destroy (see page 5550)	Frees an instance of TWebForm (see page 5548).
	GetHTMLFormName (see page 5656)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 5656)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	Action (see page 5298)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 5556)	Represents a tag option and its value in the generated FORM tag.
R	HTMLFormName (see page 5657)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 5657)	Indicates the name of the javascript variable that represents the HTML form.
	Method (see page 5298)	This is Method, a member of class TCustomQueryForm.
	Style (see page 5556)	Adds style attributes to the generated form.
	StyleRule (see page 5557)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 5558)	Maintains a list of components that generate HTML content for the TWebForm (see page 5548) descendant.

52.1.9.2 TCustomQueryForm.Create Constructor

Creates and initializes an instance of TCustomQueryForm (see page 5293).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomQueryForm(TComponent * AOwner);
```

Description

Call Create to instantiate a query form at runtime. Query forms added at design time using the Web Page editor are instantiated automatically.

52.1.9.3 TCustomQueryForm Methods

The methods of the TCustomQueryForm class are listed here.

Protected Methods

	Name	Description
	AssignStringsCallback (see page 5295)	This is AssignStringsCallback, a member of class TCustomQueryForm.
V	GetHTMLFormTag (see page 5296)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
V	ImplAddElements (see page 5296)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5296)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5297)	Provides the underlying implementation for the Content method.
	MethodString (see page 5297)	This is MethodString, a member of class TCustomQueryForm.

Public Methods

	Name	Description
	AssignStrings (see page 5295)	This is AssignStrings, a member of class TCustomQueryForm.

52.1.9.3.1 TCustomQueryForm.AssignStrings Method

Pascal

```
procedure AssignStrings(Value: TStrings);
```

C++

```
__fastcall AssignStrings(TStrings Value);
```

Description

This is AssignStrings, a member of class TCustomQueryForm.

52.1.9.3.2 TCustomQueryForm.AssignStringsCallback Method

Pascal

```
procedure AssignStringsCallback(AComponent: TComponent);
```

C++

```
__fastcall AssignStringsCallback(TComponent * AComponent);
```

Description

This is AssignStringsCallback, a member of class TCustomQueryForm.

52.1.9.3.3 TCustomQueryForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomQueryForm.

52.1.9.3.4 TCustomQueryForm.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any javascript declarations by calling the AddIntf interface. These declarations allow the generated display control to call javascript methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebForm, ImplAddElements does nothing. TWebForm descendants can override ImplAddElements to add any required declarations.

See Also

AddElements (see page 5550)

52.1.9.3.5 TCustomQueryForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 5551)

WebComponents (see page 5558)

52.1.9.3.6 TCustomQueryForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

Content (see page 5551)

AddElements (see page 5550)

52.1.9.3.7 TCustomQueryForm.MethodString Method

Pascal

```
function MethodString: string;
```

C++

```
__fastcall UnicodeString MethodString();
```

Description

This is MethodString, a member of class TCustomQueryForm.

52.1.9.4 TCustomQueryForm Properties

The properties of the TCustomQueryForm class are listed here.

Public Properties

	Name	Description
	Action (see page 5298)	Specifies the path info portion of the URL to which the query submits request messages.
	Method (see page 5298)	This is Method, a member of class TCustomQueryForm.

52.1.9.4.1 TCustomQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property UnicodeString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 5293)

PathInfo (see page 3382)

PathInfo (see page 3341)

52.1.9.4.2 TCustomQueryForm.Method Property

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

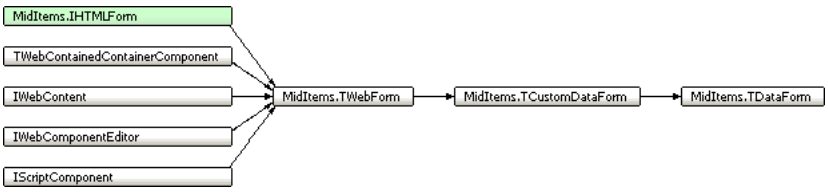
Description

This is Method, a member of class TCustomQueryForm.

52.1.10 TDataForm Class

TDataForm generates an HTML form that displays database information and lets users apply updates.

Class Hierarchy



Pascal

```
TDataForm = class(TCustomDataForm);
```

C++

```
class TDataForm : public TCustomDataForm;
```

File

MidItems

Description

Add TDataForm to the Web items of an Internet Express page producer (TInetXPageProducer (see page 5730)) to add an HTML form that displays database information that users can view and edit.

Data forms generate an HTML form that contains controls which display information from an XML data packet. Buttons on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that generate data displays (TDataGrid (see page 5302) or TFieldGroup (see page 5320)), components that contain buttons which operate on those displays (TDataNavigator (see page 5307)), and components that manage the layout of HTML controls (TLayoutGroup (see page 5389)). At design time, you can add these Web items to the form using the Web page editor.

TApplyUpdatesButton (see page 5250)

Using the Web Page Editor

52.1.10.1 TDataForm Members

The following tables list the members exposed by TDataForm.

Protected Methods

	Name	Description
	AddElements (see page 5550)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 5551)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 5558) property list.
	Content (see page 5551)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 5552)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 5552)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 5262)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 5553)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 5553)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 5553)	Returns the value of the WebComponents (see page 5558) property.
	GetVisibleFields (see page 5554)	Returns the value of the VisibleFields (see page 5557) property.
V	ImplAddElements (see page 5554)	Provides the underlying implementation for the AddElements (see page 5550) method.
V	ImplCanAddClass (see page 5262)	Provides the underlying implementation for the CanAddClass method.
A	ImplCanAddClass (see page 5554)	Provides the underlying implementation for the CanAddClass (see page 5551) method.
V	ImplContent (see page 5262)	Provides the underlying implementation for the Content method.

	ImplContent (see page 5555)	Provides the underlying implementation for the Content (see page 5551) method.
	SetDefaultWebComponents (see page 5555)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
	VisibleFields (see page 5557)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
	Create (see page 5549)	Creates and initializes an instance of TWebForm (see page 5548).
	Destroy (see page 5550)	Frees an instance of TWebForm (see page 5548).
	GetHTMLFormName (see page 5656)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 5656)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
	HTMLFormName (see page 5657)	Indicates the name of the generated HTML form.
	HTMLFormVarName (see page 5657)	Indicates the name of the javascript variable that represents the HTML form.
	WebComponents (see page 5558)	Maintains a list of components that generate HTML content for the TWebForm (see page 5548) descendant.

Published Properties

	Name	Description
	Custom (see page 5300)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 5301)	Adds style attributes to the generated form.
	StyleRule (see page 5301)	Applies a style in the page producer's style sheet to the button.

52.1.10.2 TDataForm Properties

The properties of the TDataForm class are listed here.

Published Properties

	Name	Description
	Custom (see page 5300)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 5301)	Adds style attributes to the generated form.
	StyleRule (see page 5301)	Applies a style in the page producer's style sheet to the button.

52.1.10.2.1 TDataForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the

text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 5556)

52.1.10.2.2 TDataForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 5556)

StyleRule (see page 5557)

52.1.10.2.3 TDataForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 5556)

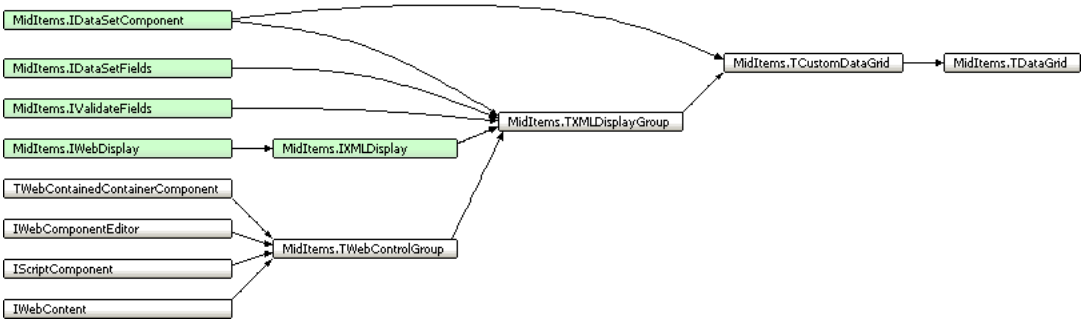
Styles (see page 5716)

StylesFile (see page 5717)

52.1.11 TDataGrid Class

TDataGrid generates an HTML table to display a dataset in an XML data packet.

Class Hierarchy



Pascal

```
TDataGrid = class(TCustomDataGrid);
```

C++

```
class TDataGrid : public TCustomDataGrid;
```

File

MidItems

Description

Add TDataGrid to the Web items of a TDataForm (see page 5298) component (or a layout group that is a child of a TDataForm (see page 5298) component.) TDataGrid generates an HTML table that displays multiple records from a dataset as a set of rows and columns.

Each TDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 5495), TSelectOptionColumn, TTextAreaColumn (see page 5488), and TStatusColumn (see page 5481). You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TDataGrid to affect the appearance of the generated table.

See Also

TSelectOptionsColumn (see page 5472)

TStatusColumn (see page 5481)

TTextAreaColumn (see page 5488)

TTextColumn (see page 5495)

TDataForm (see page 5298)

TLayoutGroup (see page 5389)

TWebDataDisplay (see page 5519)

Using the Web Page Editor

52.1.11.1 TDataGrid Members

The following tables list the members exposed by TDataGrid.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 5623)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 5623)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 5266)	This is FormatTable, a member of class TCustomDataGrid.
	GetDataSet (see page 5624)	Returns the value of the DataSet property.
	GetDataSetField (see page 5624)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
	GetEnableValidateFields (see page 5624)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 5624)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 5625)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetVisibleFields (see page 5625)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 5625)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 5625)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 5626)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 5626)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 5626)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 5267)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplAddElements (see page 5626)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5267)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5267)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	ImplGetSubComponents (see page 5627)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 5268)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
V	ImplIsMultipleRecordView (see page 5627)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 5627)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 5628)	Forwards notification messages to all owned components.
	SetDataSetField (see page 5628)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	SetEnableValidateFields (see page 5628)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 5268)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 5268)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 5269)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetXMLBroker (see page 5629)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 5629)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 5629)	This is ValidateFields, a member of class TXMLDisplayGroup.

	XMLDataChange (see page 5629)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
	EnableValidateFields (see page 5630)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
	XMLDataSet (see page 5631)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	Create (see page 5266)	Creates and initializes an instance of TCustomDataGrid (see page 5263).
	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
	Create (see page 5622)	Creates and initializes an instance of TXMLDisplayGroup (see page 5620).
	Destroy (see page 5266)	Frees an instance of TCustomDataGrid (see page 5263).
	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).
	Destroy (see page 5622)	Frees an instance of TXMLDisplayGroup (see page 5620).
	GetDataSet (see page 5645)	Returns the value of the DataSet (see page 5646) property.
	GetEnableValidateFields (see page 5669)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 5651)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 5670)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 5673)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 5651)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 5645)	Returns the value of the XMLBroker (see page 5647) property.
	GetXMLDataSet (see page 5646)	Returns the value of the XMLDataSet (see page 5647) property.
	GetXMLDisplayName (see page 5674)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 5674)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 5651)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 5651)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 5669)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 5651)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 5669)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	DataSet (see page 5646)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 5669)	This is EnableValidateFields, a member of class IValidateFields.
	IsMultipleRecordView (see page 5671)	
	IsMultipleRecordView (see page 5674)	
	VisibleFields (see page 5652)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 5630)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 5647)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 5647)	Indicates the TXMLDataSet (see page 5608) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 5675)	This is XMLDisplayName, a member of class IXMLDisplay.
	XMLRowSetName (see page 5675)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	DisplayRows (see page 5305)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 5305)	Determines the display characteristics of the table's header.
	RowAttributes (see page 5306)	Determines the display characteristics of the table's body.

	TableAttributes (see page 5306)	Determines the basic display characteristics of the table.
	XMLBroker (see page 5631)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 5631)	Binds the XML display group to a nested dataset from the XML data packet.

52.1.11.2 TDataGrid Properties

The properties of the TDataGrid class are listed here.

Published Properties

	Name	Description
	DisplayRows (see page 5305)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 5305)	Determines the display characteristics of the table's header.
	RowAttributes (see page 5306)	Determines the display characteristics of the table's body.
	TableAttributes (see page 5306)	Determines the basic display characteristics of the table.

52.1.11.2.1 TDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton or TPriorPageButton lets end users scroll through the records in the data packet.

See Also

MaxRecords

TNextPageButton (see page 5394)

TPriorPageButton (see page 5401)

52.1.11.2.2 TDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes or RowAttributes property instead.

See Also

TableAttributes (see page 5270)

RowAttributes (see page 5270)

52.1.11.2.3 TDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes or HeadingAttributes property instead.

See Also

TableAttributes (see page 5270)

HeadingAttributes (see page 5269)

52.1.11.2.4 TDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes property instead.

See Also

RowAttributes (see page 5270)

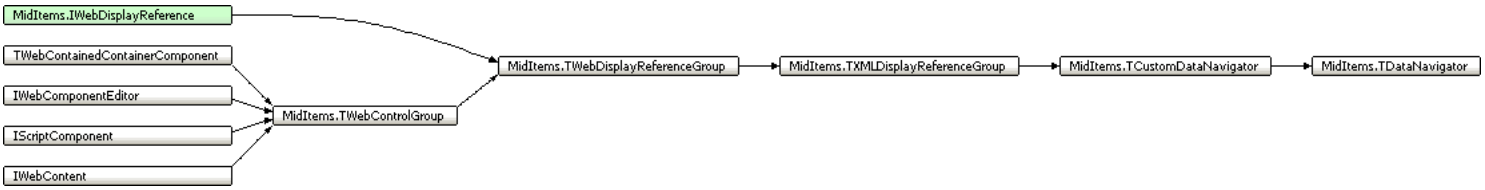
DisplayRows (see page 5269)

HeadingAttributes (see page 5269)

52.1.12 TDataNavigator Class

TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 5311) and TXMLButton (see page 5595) descendants.

Class Hierarchy



Pascal

```
TDataNavigator = class(TCustomDataNavigator);
```

C++

```
class TDataNavigator : public TCustomDataNavigator;
```

File

MidItems

Description

Add TDataNavigator as the child of a TDataForm (see page 5298) component (or a layout group that is a child of a TDataForm (see page 5298) component) to enable the generated HTML form to navigate the displayed data and apply updates that end users make to the data. TDataNavigator can be associated with the Web item that displays the data, such as TDataGrid (see page 5302) or TFieldGroup (see page 5320).

TDataNavigator generates HTML containing the controls generated by its children. These children must be descendants of TDataSetButton (see page 5311) or TXMLButton (see page 5595), such as TInsertButton (see page 5385) and TApplyUpdatesButton (see page 5250).

Use the properties of TDataNavigator to customize the appearance of the group of buttons.

See Also

TDataForm (see page 5298)

TFieldGroup (see page 5320)

TDataGrid (see page 5302)

Using the Web Page Editor

52.1.12.1 TDataNavigator Members

The following tables list the members exposed by TDataNavigator.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.

	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 5273)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetWebDisplayComponent (see page 5546)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplAddElements (see page 5642)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5273)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5273)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5274)	Provides the underlying implementation for the GetSubComponents method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	Notification (see page 5546)	Forwards notification messages to all owned components.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
V	SetWebDisplayComponent (see page 5547)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	VisibleButtons (see page 5274)	This is VisibleButtons, a member of class TCustomDataNavigator.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
R	WebDisplay (see page 5547)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 5547)	

Public Methods

	Name	Description
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Create (see page 5545)	Creates an instance of TWebDisplayReferenceGroup (see page 5544).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5546)	Frees an instance of TWebDisplayReferenceGroup (see page 5544).
	GetWebDisplayComponent (see page 5672)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 5672)	
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 5309)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5309)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5310)	Applies a style in the page producer's style sheet to the group of buttons.
	XMLComponent (see page 5310)	Associates the group with a component that generates HTML display controls.

52.1.12.2 TDataNavigator Properties

The properties of the TDataNavigator class are listed here.

Published Properties

	Name	Description
	Custom (see page 5309)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5309)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5310)	Applies a style in the page producer's style sheet to the group of buttons.
	XMLComponent (see page 5310)	Associates the group with a component that generates HTML display controls.

52.1.12.2.1 TDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5275)

StyleRule (see page 5276)

WebFieldControls (see page 5519)

52.1.12.2.2 TDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5275)

StyleRule (see page 5276)

WebFieldControls (see page 5519)

52.1.12.2.3 TDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 5275)

Styles (see page 5716)

StylesFile (see page 5717)

WebFieldControls (see page 5519)

52.1.12.2.4 TDataNavigator.XMLComponent Property

Associates the group with a component that generates HTML display controls.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Use XMLComponent to associate the group of buttons with a Web item that generates the display controls those buttons influence. Typical values of XMLComponent are TFieldGroup or TDataGrid.

If all the buttons arranged by the TXMLDisplayReferenceGroup object operate on the same set of display controls, it is most efficient to specify the Web item generating these controls as the value of XMLComponent. Then, each button uses this value to determine its associated display controls when its XMLUseParent property is true. Any buttons that do not operate on the display controls generated by XMLComponent can set their own XMLComponent property to another Web item.

See Also

XMLComponent (see page 5639)

XMLUseParent (see page 5640)

TFieldGroup (see page 5320)

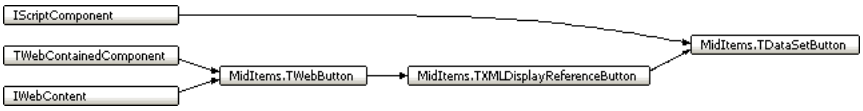
TDataGrid (see page 5302)

TQueryFieldGroup (see page 5415)

52.1.13 TDataSetButton Class

TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

Class Hierarchy



Pascal

```
TDataSetButton = class(TXMLDisplayReferenceButton, IScriptComponent);
```

C++

```
class TDataSetButton : public TXMLDisplayReferenceButton, public IScriptComponent;
```

File

MidItems

Description

Use TDataSetButton as a base class for components that generate the HTML statements defining a specialized button control for working with the data displayed by another Web item. TDataSetButton objects are used by TDataNavigator (see page 5307), which organizes the generated buttons.

TDataSetButton defines properties and methods for

Generating the HTML code to define the button control.

Associating the button with another Web item that generates HTML for displaying the data that the button manipulates.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TDataSetButton inherits support for the IWebContent interface from TWebButton (see page 5504).

Do not create instances of TDataSetButton. TDataSetButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TDataSetButton, such as TNextButton (see page 5392), TPostButton (see page 5396), TInsertButton (see page 5385), and so on.

See Also

TFirstButton (see page 5363)

TNextButton (see page 5392)

TPriorButton (see page 5399)

TLastButton (see page 5387)

TNextPageButton (see page 5394)

TPriorPageButton (see page 5401)

TInsertButton (see page 5385)

TDeleteButton (see page 5318)

TUndoButton (see page 5502)

TPostButton (see page 5396)

IWebContent

TDataNavigator (see page 5307)

52.1.13.1 TDataSetButton Members

The following tables list the members exposed by TDataSetButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5506)	Creates and initializes an instance of TWebButton (see page 5504).
V	Create (see page 5637)	Creates and initializes an instance of TXMLDisplayReferenceButton (see page 5635).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.

	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.13.2 TDataSetButton Fields

The fields of the TDataSetButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

52.1.13.2.1 TDataSetButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
UnicodeString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TDataSetButton.

52.1.13.2.2 TDataSetButton.XMLMethodName Field

Pascal

```
XMLMethodName: string;
```

C++

```
UnicodeString XMLMethodName;
```

Description

This is XMLMethodName, a member of class TDataSetButton.

52.1.13.3 TDataSetButton Methods

The methods of the TDataSetButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	GetCaption (see page 5314)	Returns the value of the Caption property.
	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.

52.1.13.3.1 TDataSetButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TDataSetButton.

52.1.13.3.2 TDataSetButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 5508)

SetCaption (see page 5508)

52.1.13.3.3 TDataSetButton.GetMethodName Method

Pascal

```
function GetMethodName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetMethodName();
```

Description

This is GetMethodName, a member of class TDataSetButton.

52.1.13.3.4 TDataSetButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TDataSetButton.

52.1.13.3.5 TDataSetButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TDataSetButton.

52.1.13.3.6 TDataSetButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 5506)

ILayoutWebContent

52.1.13.4 TDataSetButton Properties

The properties of the TDataSetButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.13.4.1 TDataSetButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 5509)

52.1.13.4.2 TDataSetButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 5508)

Style (see page 5509)

52.1.13.4.3 TDataSetButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or

more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 5509)

StyleRule (see page 5510)

52.1.13.4.4 TDataSetButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 5509)

Styles (see page 5716)

StylesFile (see page 5717)

Styles

StylesFile

52.1.13.4.5 TDataSetButton.XMLComponent Property

Associates the button with the component that generates the display control it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates a display control that the button influences.

Note: Typically, descendants of TXMLDisplayReferenceButton are used by a descendant of TXMLDisplayReferenceGroup, which has its own XMLComponent property. If the button influences this same component, you need not set the XMLComponent property. Instead, setting the XMLUseParent property to true (the default) sets XMLComponent to the value of the parent's XMLComponent property.

See Also

XMLUseParent (see page 5640)

52.1.13.4.6 TDataSetButton.XMLUseParent Property

Specifies whether the button is associated with its parent's display object.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the dataset button determines the component that it influences. When XMLUseParent is false, the XMLComponent property must be set to indicate the display component. When XMLUseParent is true, the button influences the component specified by its parent's XMLComponent property.

The button's parent is the Web item that uses the button to assemble its own HTML content (typically a TDataNavigator or TQueryButtons object). If the parent does not have an associated display component, setting XMLUseParent to true sets the XMLComponent property to nil (Delphi) or NULL (C++).

See Also

XMLComponent (see page 5639)

XMLComponent (see page 5643)

52.1.14 TDeleteButton Class

TDeleteButton generates an HTML control that deletes a record from an XML data packet.

Class Hierarchy

Pascal

```
TDeleteButton = class(TDataSetButton);
```

C++

```
class TDeleteButton : public TDataSetButton;
```

File

MidItems

Description

Add TDeleteButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to delete records. The resulting HTML button's action adds the record deletion to the emerging delta packet, which can then be submitted using an apply updates button.

Use the properties of TDeleteButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the delete button can delete.

See Also

TXMLBroker

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

TApplyUpdatesButton (see page 5250)

52.1.14.1 TDeleteButton Members

The following tables list the members exposed by TDeleteButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5320)	Creates and initializes an instance of TDeleteButton (see page 5318).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.

	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.14.2 TDeleteButton.Create Constructor

Creates and initializes an instance of TDeleteButton (see page 5318).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDeleteButton(TComponent * AOwner);
```

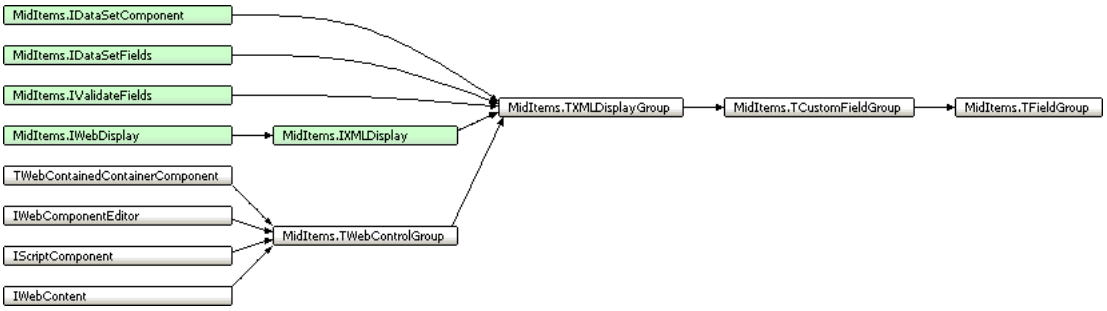
Description

Call Create to instantiate TDeleteButton (see page 5318) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.15 TFieldGroup Class

TFieldGroup arranges database information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TFieldGroup = class(TCustomFieldGroup);
```

C++

```
class TFieldGroup : public TCustomFieldGroup;
```

File

MidItems

Description

Add TFieldGroup to a data form component (TDataForm (see page 5298)) or a layout group (TLayoutGroup (see page 5389)) that is a child for a data form. TFieldGroup generates the HTML to display information from an XML data packet in labeled fields.

TFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the following classes: TFieldText (see page 5349), TFieldTextArea (see page 5355), TFieldSelectOptions (see page 5335), TFieldRadioGroup (see page 5326), and TFieldStatus (see page 5344). You can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TFieldGroup to affect the overall appearance of the set of fields.

See Also

TDataForm (see page 5298)

TLayoutGroup (see page 5389)

TFieldRadioGroup (see page 5326)

TFieldStatus (see page 5344)

TFieldSelectOptions (see page 5335)

TFieldText (see page 5349)

TFieldTextArea (see page 5355)

Using the Web Page Editor

52.1.15.1 TFieldGroup Members

The following tables list the members exposed by TFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 5623)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 5623)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 5624)	Returns the value of the DataSet property.
	GetDataSetField (see page 5624)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
	GetEnableValidateFields (see page 5624)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 5624)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 5625)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 5280)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.

	GetVisibleFields (see page 5625)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 5625)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 5625)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 5626)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 5626)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 5626)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 5323)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5324)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 5280)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	ImplGetSubComponents (see page 5627)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 5627)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 5627)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Notification (see page 5628)	Forwards notification messages to all owned components.
	SetDataSetField (see page 5628)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	SetEnableValidateFields (see page 5628)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 5629)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 5629)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 5629)	This is ValidateFields, a member of class TXMLDisplayGroup.
V	XMLDataChange (see page 5629)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
	EnableValidateFields (see page 5630)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 5631)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
V	Create (see page 5279)	Creates and initializes an instance of TCustomFieldGroup (see page 5276).
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Create (see page 5622)	Creates and initializes an instance of TXMLDisplayGroup (see page 5620).
V	Destroy (see page 5279)	Frees an instance of TCustomFieldGroup (see page 5276).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5622)	Frees an instance of TXMLDisplayGroup (see page 5620).
	GetDataSet (see page 5645)	Returns the value of the DataSet (see page 5646) property.
	GetEnableValidateFields (see page 5669)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 5651)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 5670)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 5673)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 5651)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 5645)	Returns the value of the XMLBroker (see page 5647) property.
	GetXMLDataSet (see page 5646)	Returns the value of the XMLDataSet (see page 5647) property.
	GetXMLDisplayName (see page 5674)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 5674)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 5651)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 5651)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 5669)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 5651)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 5669)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	DataSet (see page 5646)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 5669)	This is EnableValidateFields, a member of class IValidateFields.
	IsMultipleRecordView (see page 5671)	
	IsMultipleRecordView (see page 5674)	
	VisibleFields (see page 5652)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 5630)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 5647)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 5647)	Indicates the TXMLDataSet (see page 5608) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 5675)	This is XMLDisplayName, a member of class IXMLDisplay.
	XMLRowSetName (see page 5675)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 5324)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5325)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5325)	Applies a style in the page producer's style sheet to the table.
	XMLBroker (see page 5631)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 5631)	Binds the XML display group to a nested dataset from the XML data packet.

52.1.15.2 TFieldGroup Methods

The methods of the TFieldGroup class are listed here.

Protected Methods

	Name	Description
	ImplAddElements (see page 5323)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 5324)	Provides the underlying implementation for the CanAddClass method.

52.1.15.2.1 TFieldGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 5513)

52.1.15.2.2 TFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.15.3 TFieldGroup Properties

The properties of the TFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 5324)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5325)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5325)	Applies a style in the page producer's style sheet to the table.

52.1.15.3.1 TFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5281)

StyleRule (see page 5282)

52.1.15.3.2 TFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5281)

StyleRule (see page 5282)

52.1.15.3.3 TFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 5281)

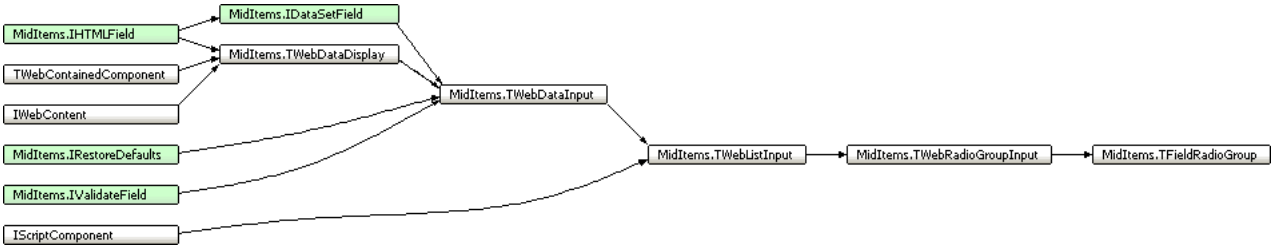
Styles (see page 5716)

StylesFile (see page 5717)

52.1.16 TFieldRadioGroup Class

TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldRadioGroup = class(TWebRadioGroupInput);
```

C++

```
class TFieldRadioGroup : public TWebRadioGroupInput;
```

File

MidItems

Description

Add TFieldRadioGroup as the child of a TFieldGroup (see page 5320) component to add a radio group control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldRadioGroup to

Specify the field whose value the radio group displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 5320)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.16.1 TFieldRadioGroup Members

The following tables list the members exposed by TFieldRadioGroup.

Protected Methods

	Name	Description
	AddAttributes (see page 5570)	This is AddAttributes, a member of class TWebRadioGroupInput.

	AddElements (see page 5562)	This is AddElements, a member of class TWebListInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5562)	This is ControlContent, a member of class TWebListInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5571)	This is EventContent, a member of class TWebRadioGroupInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 5562)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 5571)	This is FormatInputs, a member of class TWebRadioGroupInput.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetCheckIndex (see page 5571)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 5563)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 5563)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 5571)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	Notification (see page 5563)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5571)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetDataSet (see page 5564)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 5564)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 5564)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
	Create (see page 5561)	Creates and initializes an instance of TWebListInput (see page 5558).
	Create (see page 5570)	Creates and initializes an instance of TWebRadioGroupInput (see page 5567).
	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	Destroy (see page 5561)	Frees an instance of TWebListInput (see page 5558).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5329)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5329)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5330)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5330)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5330)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 5331)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 5331)	Specifies the width of the radio group, in characters.
	FieldName (see page 5332)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5332)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5333)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ReadOnly (see page 5333)	Indicates whether end users can use the generated control to set values.
	Style (see page 5333)	Adds style attributes to the generated display control.
	StyleRule (see page 5334)	This is StyleRule, a member of class TFieldRadioGroup.
	TabIndex (see page 5334)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5334)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5335)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.16.2 TFieldRadioGroup Properties

The properties of the TFieldRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 5329)	Specifies the text of a label that indicates what information the generated control displays.

	CaptionAttributes (see page 5329)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5330)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5330)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5330)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 5331)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 5331)	Specifies the width of the radio group, in characters.
	FieldName (see page 5332)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5332)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5333)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ReadOnly (see page 5333)	Indicates whether end users can use the generated control to set values.
	Style (see page 5333)	Adds style attributes to the generated display control.
	StyleRule (see page 5334)	This is StyleRule, a member of class TFieldRadioGroup.
	TabIndex (see page 5334)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5334)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5335)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.16.2.1 TFieldRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.16.2.2 TFieldRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.16.2.3 TFieldRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.16.2.4 TFieldRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.16.2.5 TFieldRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 5565)

ValuesField (see page 5566)

Items (see page 5565)

Values (see page 5566)

52.1.16.2.6 TFieldRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 5565)

Items (see page 5565)

DisplayWidth (see page 5572)

52.1.16.2.7 TFieldRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 5572)

Custom (see page 5530)

52.1.16.2.8 TFieldRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.16.2.9 TFieldRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.16.2.10 TFieldRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.16.2.11 TFieldRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 5572)

Custom (see page 5530)

52.1.16.2.12 TFieldRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.16.2.13 TFieldRadioGroup.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TFieldRadioGroup.

52.1.16.2.14 TFieldRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.16.2.15 TFieldRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 5565)

ItemsField (see page 5565)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.16.2.16 TFieldRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

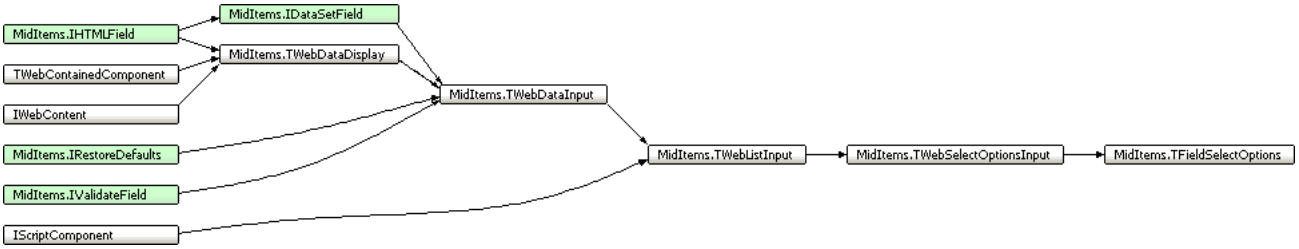
DataSet (see page 5564)

ItemsField (see page 5565)

52.1.17 TFieldSelectOptions Class

TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldSelectOptions = class(TWebSelectOptionsInput);
```

C++

```
class TFieldSelectOptions : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TFieldSelectOptions as the child of a TFieldGroup (see page 5320) component to add a list control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldSelectOptions to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 5320)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.17.1 TFieldSelectOptions Members

The following tables list the members exposed by TFieldSelectOptions.

Protected Methods

	Name	Description
	AddAttributes (see page 5576)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 5562)	This is AddElements, a member of class TWebListInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5562)	This is ControlContent, a member of class TWebListInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.

	EventContent (see page 5577)	This is EventContent, a member of class TWebSelectOptionsInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 5562)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 5577)	This is FormatInputs, a member of class TWebSelectOptionsInput.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSelectIndex (see page 5577)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 5563)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 5563)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	Notification (see page 5563)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetDataSet (see page 5564)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 5564)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 5564)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
	Create (see page 5561)	Creates and initializes an instance of TWebListInput (see page 5558).
	Create (see page 5576)	Creates and initializes an instance of TWebSelectOptionsInput (see page 5573).

	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	Destroy (see page 5561)	Frees an instance of TWebListInput (see page 5558).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5339)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5339)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5339)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5340)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5340)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5341)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5341)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5342)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5342)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 5342)	Adds style attributes to the generated display control.
	StyleRule (see page 5343)	This is StyleRule, a member of class TFieldSelectOptions.
	TabIndex (see page 5343)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5343)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5344)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.17.2 TFieldSelectOptions Properties

The properties of the TFieldSelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 5339)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5339)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5339)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5340)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5340)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5341)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5341)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5342)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5342)	Indicates which field in DataSet supplies the possible selections for the generated control.

	Style (see page 5342)	Adds style attributes to the generated display control.
	StyleRule (see page 5343)	This is StyleRule, a member of class TFieldSelectOptions.
	TabIndex (see page 5343)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5343)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5344)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.17.2.1 TFieldSelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.17.2.2 TFieldSelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.17.2.3 TFieldSelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.17.2.4 TFieldSelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.17.2.5 TFieldSelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections

that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 5565)

ValuesField (see page 5566)

Items (see page 5565)

Values (see page 5566)

52.1.17.2.6 TFieldSelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 5565)

Items (see page 5565)

52.1.17.2.7 TFieldSelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.17.2.8 TFieldSelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.17.2.9 TFieldSelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.17.2.10 TFieldSelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.17.2.11 TFieldSelectOptions.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TFieldSelectOptions.

52.1.17.2.12 TFieldSelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.17.2.13 TFieldSelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 5565)

ItemsField (see page 5565)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.17.2.14 TFieldSelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

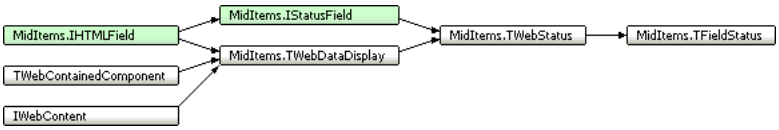
DataSet (see page 5564)

ItemsField (see page 5565)

52.1.18 TFieldStatus Class

TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.

Class Hierarchy



Pascal

```
TFieldStatus = class(TWebStatus);
```

C++

```
class TFieldStatus : public TWebStatus;
```

File

MidItems

Description

Add TFieldStatus as the child of a TFieldGroup (see page 5320) component to provide feedback about whether the current record has been modified. The generated control displays an M if the user has edited the record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TFieldStatus to

Specify a caption that labels the status control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 5320)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.18.1 TFieldStatus Members

The following tables list the members exposed by TFieldStatus.

Protected Methods

	Name	Description
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5580)	This is ControlContent, a member of class TWebStatus.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5581)	Returns the value of the Caption property.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.

	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5581)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5580)	Creates and initializes an instance of TWebStatus (see page 5578).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	Identifier (see page 5581)	Returns the name under which record status information is stored in the XML data packet.
V	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	DisplayWidth (see page 5583)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.
	TabIndex (see page 5532)	Determines the position of the generated control in the HTML form's tab order.

Published Properties

	Name	Description
	Caption (see page 5347)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5347)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5347)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5348)	Represents a tag option and its value in the tag for the display control.
	Style (see page 5348)	Adds style attributes to the generated display control.
	StyleRule (see page 5349)	This is StyleRule, a member of class TFieldStatus.

52.1.18.2 TFieldStatus Properties

The properties of the TFieldStatus class are listed here.

Published Properties

	Name	Description
	Caption (see page 5347)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5347)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5347)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5348)	Represents a tag option and its value in the tag for the display control.

	Style (see page 5348)	Adds style attributes to the generated display control.
	StyleRule (see page 5349)	This is StyleRule, a member of class TFieldStatus.

52.1.18.2.1 TFieldStatus.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.18.2.2 TFieldStatus.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.18.2.3 TFieldStatus.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.18.2.4 TFieldStatus.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.18.2.5 TFieldStatus.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.18.2.6 TFieldStatus.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

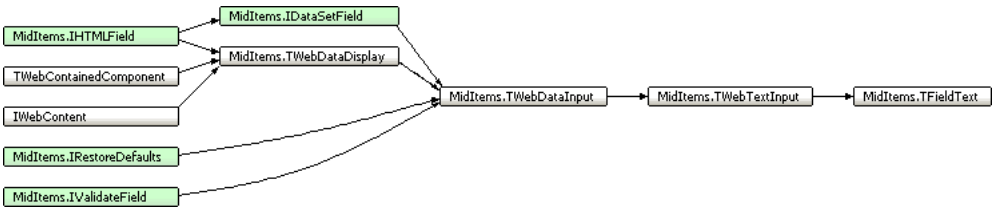
Description

This is StyleRule, a member of class TFieldStatus.

52.1.19 TFieldText Class

TFieldText creates a single-line HTML input control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldText = class(TWebTextInput);
```

C++

```
class TFieldText : public TWebTextInput;
```

File

MidItems

Description

Add TFieldText as the child of a TFieldGroup (see page 5320) component to add a single-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldText to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 5320)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.19.1 TFieldText Members

The following tables list the members exposed by TFieldText.

Protected Methods

	Name	Description
	AddAttributes (see page 5592)	This is AddAttributes, a member of class TWebTextInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5592)	This is ControlContent, a member of class TWebTextInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 5593)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5593)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
	Create (see page 5592)	Creates and initializes an instance of TWebTextInput (see page 5589).
	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5352)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5352)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5352)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5353)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5353)	Specifies the horizontal size of the generated control.
	FieldName (see page 5354)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5354)	Indicates whether end users can use the generated control to set values.
	Style (see page 5354)	Adds style attributes to the generated display control.
	StyleRule (see page 5355)	This is StyleRule, a member of class TFieldText.
	TabIndex (see page 5355)	Determines the position of the generated control in the HTML form's tab order.

52.1.19.2 TFieldText Properties

The properties of the TFieldText class are listed here.

Published Properties

	Name	Description
	Caption (see page 5352)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5352)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5352)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5353)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5353)	Specifies the horizontal size of the generated control.
	FieldName (see page 5354)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5354)	Indicates whether end users can use the generated control to set values.

	Style (see page 5354)	Adds style attributes to the generated display control.
	StyleRule (see page 5355)	This is StyleRule, a member of class TFieldText.
	TabIndex (see page 5355)	Determines the position of the generated control in the HTML form's tab order.

52.1.19.2.1 TFieldText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.19.2.2 TFieldText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.19.2.3 TFieldText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.19.2.4 TFieldText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.19.2.5 TFieldText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

52.1.19.2.6 TFieldText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.19.2.7 TFieldText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

52.1.19.2.8 TFieldText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.19.2.9 TFieldText.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TFieldText.

52.1.19.2.10 TFieldText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

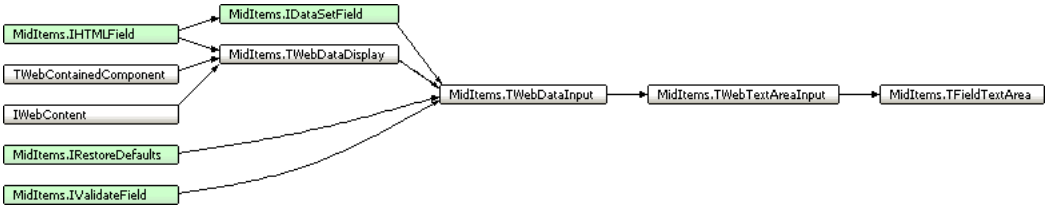
Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.20 TFieldTextArea Class

TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.

Class Hierarchy



Pascal

```
TFieldTextArea = class(TWebTextAreaInput);
```

C++

```
class TFieldTextArea : public TWebTextAreaInput;
```

File

MidItems

Description

Add TFieldTextArea as the child of a TFieldGroup (see page 5320) component to add a multi-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldTextArea to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent

TDataGrid (see page 5302)

TFieldGroup (see page 5320)

TQueryFieldGroup (see page 5415)

TQueryTextArea (see page 5458)

TTextAreaColumn (see page 5488)

52.1.20.1 TFieldTextArea Members

The following tables list the members exposed by TFieldTextArea.

Protected Methods

	Name	Description
	AddAttributes (see page 5586)	This is AddAttributes, a member of class TWebTextAreaInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5586)	This is ControlContent, a member of class TWebTextAreaInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5587)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.

	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 5587)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5587)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5586)	Creates and initializes an instance of TWebTextAreaInput (see page 5583).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5358)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5359)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5359)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5359)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5360)	Specifies the height of the generated control.
	DisplayWidth (see page 5360)	Specifies the horizontal size of the generated control.
	FieldName (see page 5360)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5361)	Indicates whether end users can use the generated control to set values.
	Style (see page 5361)	Adds style attributes to the generated display control.
	StyleRule (see page 5362)	This is StyleRule, a member of class TFieldTextArea.
	TabIndex (see page 5362)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5362)	Specifies how the generated control treats lines that are longer than the display width.

52.1.20.2 TFieldTextArea Properties

The properties of the TFieldTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 5358)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5359)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5359)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5359)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5360)	Specifies the height of the generated control.
	DisplayWidth (see page 5360)	Specifies the horizontal size of the generated control.
	FieldName (see page 5360)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5361)	Indicates whether end users can use the generated control to set values.
	Style (see page 5361)	Adds style attributes to the generated display control.
	StyleRule (see page 5362)	This is StyleRule, a member of class TFieldTextArea.
	TabIndex (see page 5362)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5362)	Specifies how the generated control treats lines that are longer than the display width.

52.1.20.2.1 TFieldTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.20.2.2 TFieldTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.20.2.3 TFieldTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.20.2.4 TFieldTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to

add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.20.2.5 TFieldTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 5588)

52.1.20.2.6 TFieldTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 5588)

52.1.20.2.7 TFieldTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.20.2.8 TFieldTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

52.1.20.2.9 TFieldTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.20.2.10 TFieldTextArea.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TFieldTextArea.

52.1.20.2.11 TFieldTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.20.2.12 TFieldTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 5588)

52.1.21 TFirstButton Class

TFirstButton generates an HTML control that moves to the first record in an XML data packet.

Class Hierarchy

Pascal

```
TFirstButton = class(TDataSetButton);
```

C++

```
class TFirstButton : public TDataSetButton;
```

File

MidItems

Description

Add TFirstButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to move quickly to the first record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the first record as current.

Use the properties of TFirstButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the first button navigates.

See Also

TXMLBroker

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

52.1.21.1 TFirstButton Members

The following tables list the members exposed by TFirstButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5365)	Creates and initializes an instance of TFirstButton (see page 5363).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.21.2 TFirstButton.Create Constructor

Creates and initializes an instance of TFirstButton (see page 5363).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFirstButton(TComponent * AOwner);
```

Description

Call Create to instantiate TFirstButton (see page 5363) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.22 TFormLayout Class

TFormLayout lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

Pascal

```
TFormLayout = class(TLayoutWebContent);
```

C++

```
class TFormLayout : public TLayoutWebContent;
```

File

MidItems

Description

TFormLayout is the default implementation of the ILayoutWebContent interface for InternetExpress applications. The Web items that belong to an InetXPageProducer object pass a TFormLayout instance to their child Web items as the ParentLayout parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure.

Use the TFormLayout properties to configure how the ILayoutWebContent methods convert HTML that child Web items generate into a final form.

TInetXPageProducer (see page 5730)

52.1.22.1 TFormLayout Members

The following tables list the members exposed by TFormLayout.

Protected Methods

	Name	Description
	EndButtons (see page 5367)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 5367)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 5368)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 5368)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 5368)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 5369)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 5369)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 5370)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 5370)	This is NextColumn, a member of class TFormLayout.
	StartButtons (see page 5370)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 5371)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 5371)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 5371)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
	Create (see page 5366)	Creates a new TFormLayout (see page 5365) object.
	EndLayout (see page 5367)	Returns the string of HTML to insert after laying out all child items.

Public Properties

	Name	Description
	BreakButtons (see page 5372)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
	ColumnCount (see page 5372)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
	TableHeader (see page 5372)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

52.1.22.2 TFormLayout.Create Constructor

Creates a new TFormLayout (see page 5365) object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TFormLayout(TLayout AParentLayout);
```

Description

Call Create to instantiate a TFormLayout (see page 5365) object to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout property.

ParentLayout

52.1.22.3 TFormLayout Methods

The methods of the TFormLayout class are listed here.

Protected Methods

	Name	Description
	EndButtons (see page 5367)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 5367)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 5368)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 5368)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 5368)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 5369)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 5369)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 5370)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 5370)	This is NextColumn, a member of class TFormLayout.
	StartButtons (see page 5370)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 5371)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 5371)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 5371)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
	EndLayout (see page 5367)	Returns the string of HTML to insert after laying out all child items.

52.1.22.3.1 TFormLayout.EndButtons Method

Pascal

```
function EndButtons: string;
```

C++

```
__fastcall UnicodeString EndButtons();
```

Description

This is EndButtons, a member of class TFormLayout.

52.1.22.3.2 TFormLayout.EndFields Method

Pascal

```
function EndFields: string;
```

C++

```
__fastcall UnicodeString EndFields();
```

Description

This is EndFields, a member of class TFormLayout.

52.1.22.3.3 TFormLayout.EndLayout Method

Returns the string of HTML to insert after laying out all child items.

Pascal

```
function EndLayout: string;
```

C++

```
__fastcall UnicodeString EndLayout();
```

Description

EndLayout generates the tags that must be inserted after all the content that child Web items generate. TFormLayout (see page 5365) keeps track of the ILayoutWebContent method calls that are made so that it can know what tags need to be closed.

See Also

ILayoutWebContent

52.1.22.3.4 TFormLayout.EndRow Method

Pascal

```
function EndRow: string;
```

C++

```
__fastcall UnicodeString EndRow();
```

Description

This is EndRow, a member of class TFormLayout.

52.1.22.3.5 TFormLayout.EndTable Method

Pascal

```
function EndTable: string;
```

C++

```
__fastcall UnicodeString EndTable();
```

Description

This is EndTable, a member of class TFormLayout.

52.1.22.3.6 TFormLayout.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutButton(const UnicodeString HTMLButton,
TLayoutAttributes Attributes);
```

Description

The LayoutButton method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton method.

See Also

LayoutButton

52.1.22.3.7 TFormLayout.ImplLayoutField Method

Provides the underlying implementation for the LayoutField method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutField(const UnicodeString HTMLField,
TLayoutAttributes Attributes);
```

Description

The LayoutField method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField method.

See Also

LayoutField

52.1.22.3.8 TFormLayout.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes);
```

Description

The LayoutLabelAndField method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField method.

See Also

LayoutLabelAndField

52.1.22.3.9 TFormLayout.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutTable(const UnicodeString HTMLTable,
TLayoutAttributes Attributes);
```

Description

The LayoutTable method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable method.

See Also

layouttable

52.1.22.3.10 TFormLayout.NextColumn Method

Pascal

```
function NextColumn(SubItemCount: Integer): string;
```

C++

```
__fastcall UnicodeString NextColumn(int SubItemCount);
```

Description

This is NextColumn, a member of class TFormLayout.

52.1.22.3.11 TFormLayout.StartButtons Method

Pascal

```
function StartButtons: string;
```

C++

```
__fastcall UnicodeString StartButtons();
```

Description

This is StartButtons, a member of class TFormLayout.

52.1.22.3.12 TFormLayout.StartFields Method

Pascal

```
function StartFields(ColCount: Integer): string;
```

C++

```
__fastcall UnicodeString StartFields(int ColCount);
```

Description

This is StartFields, a member of class TFormLayout.

52.1.22.3.13 TFormLayout.StartRow Method

Pascal

```
function StartRow: string;
```

C++

```
__fastcall UnicodeString StartRow();
```

Description

This is StartRow, a member of class TFormLayout.

52.1.22.3.14 TFormLayout.StartTable Method

Pascal

```
function StartTable: string;
```

C++

```
__fastcall UnicodeString StartTable();
```

Description

This is StartTable, a member of class TFormLayout.

52.1.22.4 TFormLayout Properties

The properties of the TFormLayout class are listed here.

Public Properties

	Name	Description
	BreakButtons (see page 5372)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
	ColumnCount (see page 5372)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
	TableHeader (see page 5372)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

52.1.22.4.1 TFormLayout.BreakButtons Property

Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.

Pascal

```
property BreakButtons: Boolean;
```

C++

```
__property Boolean BreakButtons;
```

Description

Set BreakButtons to true if the Web item that supplies this object to its child Web items uses an HTML table to position HTML buttons that those child Web items generate. Set BreakButtons to false if the Web item does not use an HTML table to position child buttons.

BreakButtons affects the whether the LayoutButton method on this object's ILayoutWebContent interface adds <TD> tags to the HTML that child Web items generate for HTML buttons.

See Also

layoutbutton

52.1.22.4.2 TFormLayout.ColumnCount Property

Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.

Pascal

```
property ColumnCount: Integer;
```

C++

```
__property int ColumnCount;
```

Description

Set ColumnCount to the number of child elements that appear in a single row when laying out child controls by rows.

ColumnCount affects where the LayoutField or LayoutButton method on this object's ILayoutWebContent interface adds <TR> and </TR> tags to the HTML that child Web items generate.

Note: ColumnCount only affects the LayoutButton method if the value of the BreakButtons (see page 5372) property is true.

See Also

layoutbutton

layoutfield

BreakButtons (see page 5372)

52.1.22.4.3 TFormLayout.TableHeader Property

Specifies the HTML to generate at the beginning of a table that lays out child elements.

Pascal

```
property TableHeader: string;
```

C++

```
__property UnicodeString TableHeader;
```

Description

Set TableHeader to the HTML tag that appears at the beginning of the HTML table used to control the layout of child elements. TableHeader is a string that includes the <table> tag, along with any attributes (such as alignment) that affect the layout of child items.

See Also

layoutbutton

layoutfield

BreakButtons (see page 5372)

52.1.23 TGridAttributes Class

TGridAttributes describes the options the TDataGrid (see page 5302) component adds to an HTML <TABLE> tag.

Class Hierarchy

Pascal

```
TGridAttributes = class(TPersistent);
```

C++

```
class TGridAttributes : public TPersistent;
```

File

MidItems

Description

TGridAttributes implements the TableAttributes property of a TDataGrid (see page 5302) or TAdapterGrid component. It describes display attributes that apply to an HTML table generated by TDataGrid (see page 5302) or TAdapterGrid. The properties of TGridAttributes specify the options added to the generated HTML <TABLE> tag, as well as any styles that should be applied.

See Also

TCustomDataGrid (see page 5263)

TCustomAdapterGrid

52.1.23.1 TGridAttributes Members

The following tables list the members exposed by TGridAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 5374)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	Create (see page 5374)	Creates an instance of TGridAttributes (see page 5373).

Public Properties

	Name	Description
	Parent (see page 5378)	Indicates the TDataGrid (see page 5302) object that uses this TGridAttributes (see page 5373) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 5375)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 5376)	Specifies the background color of the HTML table.
	Border (see page 5376)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 5377)	This is CellPadding, a member of class TGridAttributes.
	CellSpacing (see page 5377)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 5377)	Represents a tag option and its value in an HTML tag.
	Style (see page 5378)	Adds style attributes to the generated table.
	StyleRule (see page 5379)	This is StyleRule, a member of class TGridAttributes.

52.1.23.2 TGridAttributes.Create Constructor

Creates an instance of TGridAttributes (see page 5373).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridAttributes (see page 5373). TGridAttributes (see page 5373) is instantiated by the TDataGrid (see page 5302) component that uses it.

The AParent parameter is the TDataGrid (see page 5302) or TAdapterGrid component that uses the TGridAttributes (see page 5373) instance. This parameter becomes the value of the Parent (see page 5378) property.

See Also

Parent (see page 5378)

TDataGrid (see page 5302)

TAdapterGrid

52.1.23.3 TGridAttributes Methods

The methods of the TGridAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 5374)	Copies the properties of an object to a destination object.

52.1.23.3.1 TGridAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError

52.1.23.4 TGridAttributes Properties

The properties of the TGridAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 5378)	Indicates the TDataGrid (see page 5302) object that uses this TGridAttributes (see page 5373) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 5375)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 5376)	Specifies the background color of the HTML table.
	Border (see page 5376)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 5377)	This is CellPadding, a member of class TGridAttributes.
	CellSpacing (see page 5377)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 5377)	Represents a tag option and its value in an HTML tag.
	Style (see page 5378)	Adds style attributes to the generated table.
	StyleRule (see page 5379)	This is StyleRule, a member of class TGridAttributes.

52.1.23.4.1 TGridAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the table within the HTML document, or within the cell of a surrounding HTML table in a layout group. Align indicates the desired value of the Align option of the HTML table tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the HTML table where it wants.

See Also

cellpadding (see page 5377)

Border (see page 5376)

52.1.23.4.2 TGridAttributes.BgColor Property

Specifies the background color of the HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: The row or heading attributes can override this background color for a portion of the HTML table.

See Also

BgColor (see page 5382)

52.1.23.4.3 TGridAttributes.Border Property

Specifies the thickness of the border drawn around the HTML table.

Pascal

```
property Border: Integer;
```

C++

```
__property int Border;
```

Description

Set Border to specify whether a border should be drawn around the table, and if so, how thick it should be. The thickness specified by any particular value of border depends on the web browser that views the HTML table. For any browser, however, larger numbers indicate thicker borders. A value of -1 indicates that no border should be drawn around the table.

See Also

CellSpacing (see page 5377)

52.1.23.4.4 TGridAttributes.CellPadding Property

Pascal

```
property CellPadding: Integer;
```

C++

```
__property int CellPadding;
```

Description

This is CellPadding, a member of class TGridAttributes.

52.1.23.4.5 TGridAttributes.CellSpacing Property

Specifies the amount of space to leave between cells in the HTML table.

Pascal

```
property CellSpacing: Integer;
```

C++

```
__property int CellSpacing;
```

Description

Set CellSpacing to specify how many pixels of whitespace should appear between the cells in the table. A value of -1 indicates that the web browser should decide how to separate the cells of the HTML table.

Note: CellSpacing refers to the whitespace between cells in an HTML table, not the thickness of the lines drawn to separate rows and columns.

See Also

Border (see page 5376)

cellpadding (see page 5377)

52.1.23.4.6 TGridAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TABLE> tag. Each option and its value should have the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to hide the side borders and add row dividers, you can set Custom to

```
FRAME=HSIDES RULES=ROWS
```

See Also

Style (see page 5378)

stylerule (see page 5379)

52.1.23.4.7 TGridAttributes.Parent Property

Indicates the TDataGrid (see page 5302) object that uses this TGridAttributes (see page 5373) to describe its attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 5302) that uses this TGridAttributes (see page 5373) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 5302)

Create (see page 5374)

TAdapterGrid

52.1.23.4.8 TGridAttributes.Style Property

Adds style attributes to the generated table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the entire table. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the <TABLE> tag as the value of a STYLE option.

See Also

Custom (see page 5377)

stylerule (see page 5379)

52.1.23.4.9 TGridAttributes.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TGridAttributes.

52.1.24 TGridRowAttributes Class

TGridRowAttributes describes the options the TDataGrid (see page 5302) component adds to its HTML row tags (<TR>).

Class Hierarchy

Pascal

```
TGridRowAttributes = class(TPersistent);
```

C++

```
class TGridRowAttributes : public TPersistent;
```

File

MidItems

Description

TGridRowAttributes implements the RowAttributes and HeadingAttributes properties of a TDataGrid (see page 5302) or TAdapterGrid component. It describes display attributes that apply to the generated HTML table's rows. The properties of TGridRowAttributes specify the options added to the generated HTML <TR> tag, as well as any styles that should be applied to the header or body of the table.

52.1.24.1 TGridRowAttributes Members

The following tables list the members exposed by TGridRowAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 5381)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	Create (see page 5380)	Creates an instance of TGridRowAttributes (see page 5379).

Public Properties

	Name	Description
R	Parent (see page 5383)	Indicates the TDataGrid (see page 5302) or TAdapterGrid object that uses this TGridRowAttributes (see page 5379) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 5382)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 5382)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 5382)	Represents a tag option and its value in an HTML tag.
	Style (see page 5383)	Adds style attributes to the generated table body or header.
	StyleRule (see page 5384)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 5384)	Specifies the vertical alignment within the cells of the HTML table body or header.

52.1.24.2 TGridRowAttributes.Create Constructor

Creates an instance of TGridRowAttributes (see page 5379).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridRowAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridRowAttributes (see page 5379). TGridRowAttributes (see page 5379) is instantiated by the TDataGrid (see page 5302) or TAdapterGrid component that uses it.

The AParent parameter is the TDataGrid (see page 5302) or TAdapterGrid component that uses the TGridRowAttributes (see page 5379) instance. This parameter becomes the value of the Parent (see page 5383) property.

See Also

Parent (see page 5383)

TDataGrid (see page 5302)

TAdapterGrid

52.1.24.3 TGridRowAttributes Methods

The methods of the TGridRowAttributes class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 5381)	Copies the properties of an object to a destination object.

52.1.24.3.1 TGridRowAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

EConvertError

52.1.24.4 TGridRowAttributes Properties

The properties of the TGridRowAttributes class are listed here.

Public Properties

	Name	Description
	Parent (see page 5383)	Indicates the TDataGrid (see page 5302) or TAdapterGrid object that uses this TGridRowAttributes (see page 5379) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 5382)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 5382)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 5382)	Represents a tag option and its value in an HTML tag.
	Style (see page 5383)	Adds style attributes to the generated table body or header.
	StyleRule (see page 5384)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 5384)	Specifies the vertical alignment within the cells of the HTML table body or header.

52.1.24.4.1 TGridRowAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the contents of each cell in the table row or header. Align indicates the desired value of the Align option of the <TR> tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the cell contents wherever it wants horizontally.

See Also

VAlign (see page 5384)

52.1.24.4.2 TGridRowAttributes.BgColor Property

Specifies the background color of the rows or header of an HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the rows or heading of an HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: This property overrides the background color option of the HTML table itself.

See Also

BgColor (see page 5376)

52.1.24.4.3 TGridRowAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TR> tag. Each option and its value should have the form

`OPTIONNAME=Value`

To specify multiple options, separate the Name/value pairs with spaces.

See Also

Style (see page 5383)

StyleRule (see page 5384)

52.1.24.4.4 TGridRowAttributes.Parent Property

Indicates the TDataGrid (see page 5302) or TAdapterGrid object that uses this TGridRowAttributes (see page 5379) to describe its header or row attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 5302) or TAdapterGrid that uses this TGridRowAttributes (see page 5379) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 5302)

TAdapterGrid

Create (see page 5380)

52.1.24.4.5 TGridRowAttributes.Style Property

Adds style attributes to the generated table body or header.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the rows or header of the HTML table. The Style option consists of one or more attribute descriptions such as

`font-family: arial; font-weight: bold; font-size: 10px`

These attributes are added to the <TR> tag as the value of a STYLE option.

See Also

Custom (see page 5382)

StyleRule (see page 5384)

52.1.24.4.6 TGridRowAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated table body or header.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table body or header. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 5383) property instead.

See Also

Style (see page 5383)

Styles (see page 5716)

StylesFile (see page 5717)

Styles

StylesFile

52.1.24.4.7 TGridRowAttributes.VAlign Property

Specifies the vertical alignment within the cells of the HTML table body or header.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Set VAlign to indicate the desired vertical alignment of the contents of each cell. VAlign indicates the desired value of the VAlign option of the <TR> tag for the table rows or header.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document positions the contents of cells in the table element wherever it wishes vertically.

See Also

Align (see page 5382)

52.1.25 TInsertButton Class

TInsertButton generates an HTML control that inserts a new record in an XML data packet.

Class Hierarchy

Pascal

```
TInsertButton = class(TDataSetButton);
```

C++

```
class TInsertButton : public TDataSetButton;
```

File

MidItems

Description

Add TInsertButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to add records to an XML data packet. The resulting HTML button's action adds a new blank record to the emerging XML delta packet and causes the associated display control to display that new record.

Use the properties of TInsertButton to customize the appearance of the button and associate it with a Web item. The associated Web item generates the HTML control that displays the newly inserted record.

52.1.25.1 TInsertButton Members

The following tables list the members exposed by TInsertButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.

	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5386)	Creates and initializes an instance of TInsertButton (see page 5385).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.25.2 TInsertButton.Create Constructor

Creates and initializes an instance of TInsertButton (see page 5385).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInsertButton(TComponent * AOwner);
```

Description

Call Create to instantiate TInsertButton (see page 5385) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.26 TLastButton Class

TLastButton generates an HTML control that moves to the last record in an XML data packet.

Class Hierarchy

Pascal

```
TLastButton = class(TDataSetButton);
```

C++

```
class TLastButton : public TDataSetButton;
```

File

MidItems

Description

Add TLastButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to move quickly to the last record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the last record as current.

Use the properties of TLastButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the last button navigates.

See Also

TXMLBroker

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

52.1.26.1 TLastButton Members

The following tables list the members exposed by TLastButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.

	GetCaption (see page 5314)	Returns the value of the Caption property.
	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
	Notification (see page 5638)	Forwards notification messages to all owned components.
	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 5388)	Creates and initializes an instance of TLastButton (see page 5387).
	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.26.2 TLastButton.Create Constructor

Creates and initializes an instance of TLastButton (see page 5387).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLastButton(TComponent * AOwner);
```

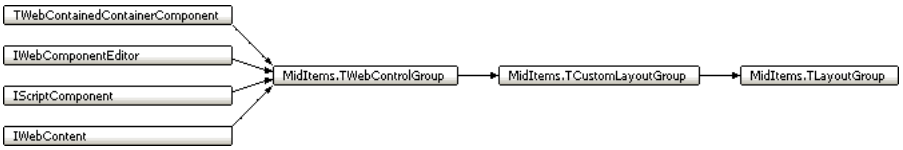
Description

Call Create to instantiate TLastButton (see page 5387) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.27 TLayoutGroup Class

TLayoutGroup generates the HTML to arrange content produced by other Web items.

Class Hierarchy



Pascal

```
TLayoutGroup = class(TCustomLayoutGroup);
```

C++

```
class TLayoutGroup : public TCustomLayoutGroup;
```

File

MidItems

Description

Use TLayoutGroup to adjust the layout of items in an HTML document. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated by other Web items.

TLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to let the parent component use the HTML that TLayoutGroup generates, TLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 5510).

See Also

IWebContent

Using the Web Page Editor

52.1.27.1 TLayoutGroup Members

The following tables list the members exposed by TLayoutGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.

	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5284)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplCanAddClass (see page 5285)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5285)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 5284)	Creates and initializes an instance of TCustomLayoutGroup (see page 5282).
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5284)	Frees an instance of TCustomLayoutGroup (see page 5282).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).

Public Properties

	Name	Description
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 5391)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 5391)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 5391)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5392)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.27.2 TLayoutGroup Properties

The properties of the TLayoutGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 5391)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 5391)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 5391)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5392)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.27.2.1 TLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5287)

StyleRule (see page 5287)

WebFieldControls (see page 5519)

DisplayColumns (see page 5286)

52.1.27.2.2 TLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. It adds the HTML generated by each Web item listed in WebFieldControls to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 5519)

52.1.27.2.3 TLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in WebFieldControls. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5286)

StyleRule (see page 5287)

WebFieldControls (see page 5519)

52.1.27.2.4 TLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

52.1.28 TNextButton Class

TNextButton generates an HTML control that moves to the next record in an XML data packet.

Class Hierarchy

Pascal

```
TNextButton = class(TDataSetButton);
```

C++

```
class TNextButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable an associated control to move to the next record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TNextButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the next button navigates.

See Also

TXMLBroker

TDataNavigator (see page 5307)

52.1.28.1 TNextButton Members

The following tables list the members exposed by TNextButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 5394)	Creates and initializes an instance of TNextButton (see page 5392).
	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.28.2 TNextButton.Create Constructor

Creates and initializes an instance of TNextButton (see page 5392).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextButton (see page 5392) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.29 TNextPageButton Class

TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.

Class Hierarchy

Pascal

```
TNextPageButton = class(TDataSetButton);
```

C++

```
class TNextPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextPageButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to display the next group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 5302)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 5320)), the current record changes to the next record in the data packet.

Use the properties of TNextPageButton to customize the appearance of the button and associate it with a display component.

TFieldGroup (see page 5320)

52.1.29.1 TNextPageButton Members

The following tables list the members exposed by TNextPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.

	Notification (see page 5638)	Forwards notification messages to all owned components.
	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 5396)	Creates and initializes an instance of TNextPageButton (see page 5394).
	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.29.2 TNextPageButton.Create Constructor

Creates and initializes an instance of TNextPageButton (see page 5394).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextPageButton (see page 5394) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.30 TPostButton Class

TPostButton generates an HTML control that posts changes to an XML delta packet.

Class Hierarchy

Pascal

```
TPostButton = class(TDataSetButton);
```

C++

```
class TPostButton : public TDataSetButton;
```

File

MidItems

Description

Add TPostButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to commit the edits on the current record of an associated display control. The resulting HTML button's action posts all edits to the current record to the emerging delta packet, which can then be submitted using an apply updates button.

Use the properties of TPostButton to customize the appearance of the button and associate it with a Web item that generates the display control.

52.1.30.1 TPostButton Members

The following tables list the members exposed by TPostButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.

	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
	Notification (see page 5638)	Forwards notification messages to all owned components.
	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 5398)	Creates and initializes an instance of TPostButton (see page 5396).
	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.30.2 TPostButton.Create Constructor

Creates and initializes an instance of TPostButton (see page 5396).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPostButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPostButton (see page 5396) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.31 TPriorButton Class

TPriorButton generates an HTML control that moves to the previous record in an XML data packet.

Class Hierarchy

Pascal

```
TPriorButton = class(TDataSetButton);
```

C++

```
class TPriorButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable an associated control to move to the previous record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TPriorButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the prior button navigates.

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

52.1.31.1 TPriorButton Members

The following tables list the members exposed by TPriorButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
	Notification (see page 5638)	Forwards notification messages to all owned components.
	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	Create (see page 5400)	Creates and initializes an instance of TPriorButton (see page 5399).
	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.31.2 TPriorButton.Create Constructor

Creates and initializes an instance of TPriorButton (see page 5399).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorButton (see page 5399) at runtime. Buttons added at design time using the Web Page editor

are instantiated automatically.

52.1.32 TPriorPageButton Class

TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.

Class Hierarchy

Pascal

```
TPriorPageButton = class(TDataSetButton);
```

C++

```
class TPriorPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorPageButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to display the previous group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 5302)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 5320)), the current record changes to the previous record in the data packet.

Use the properties of TNextPageButton (see page 5394) to customize the appearance of the button and associate it with a display component.

52.1.32.1 TPriorPageButton Members

The following tables list the members exposed by TPriorPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5403)	Creates and initializes an instance of TPriorPageButton (see page 5401).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.32.2 TPriorPageButton.Create Constructor

Creates and initializes an instance of TPriorPageButton (see page 5401).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorPageButton (see page 5401) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.33 TQueryButton Class

TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.

Class Hierarchy

Pascal

```
TQueryButton = class(TWebButton);
```

C++

```
class TQueryButton : public TWebButton;
```

File

MidItems

Description

Use TQueryButton as a base class in an InternetExpress application for components that generate the HTML statements defining a specialized button control for managing the application-defined input controls. TQueryButton objects are used by TQueryForm (see page 5421), which organizes the generated buttons and the input controls they manipulate.

TQueryButton defines properties and methods for

Generating the HTML code to define the button control.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Associating the button with a Query form whose controls it influences.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TQueryButton inherits support for the IWebContent interface from TWebButton (see page 5504).

Do not create instances of TQueryButton. TQueryButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TQueryButton, such as TResetQueryButton (see page 5469) or TSubmitQueryButton (see page 5486).

See Also

TResetQueryButton (see page 5469)

TSubmitQueryButton (see page 5486)

IWebContent

TQueryForm (see page 5421)

52.1.33.1 TQueryButton Members

The following tables list the members exposed by TQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5405)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 5405)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 5506)	Returns the HTML that defines the button control.
V	EventContent (see page 5406)	This is EventContent, a member of class TQueryButton.
V	GetCaption (see page 5406)	Returns the value of the Caption property.
V	GetHTMLControlName (see page 5406)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 5407)	This is GetHTMLForm, a member of class TQueryButton.
V	GetInputType (see page 5407)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 5407)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 5407)	Provides the underlying implementation for the Content method.
V	Notification (see page 5408)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 5408)	This is ParentXMLComponent, a member of class TQueryButton.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetXMLComponent (see page 5408)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 5409)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
V	Create (see page 5404)	Creates and initializes an instance of TQueryButton (see page 5403).

Published Properties

	Name	Description
	Caption (see page 5409)	Specifies the caption that appears on the button.
	Custom (see page 5409)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5410)	Adds style attributes to the generated button control.
	StyleRule (see page 5410)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5411)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 5411)	Specifies whether the button is associated with its parent's query form.

52.1.33.2 TQueryButton.Create Constructor

Creates and initializes an instance of TQueryButton (see page 5403).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset button at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

AOwner is the component that is responsible for freeing the query button. Typically, this is the Web module that contains the InterenetExpress page producer that uses the query button's generated HTML.

52.1.33.3 TQueryButton Fields

The fields of the TQueryButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 5405)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 5405)	This is InputType, a member of class TQueryButton.

52.1.33.3.1 TQueryButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
UnicodeString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TQueryButton.

52.1.33.3.2 TQueryButton.InputType Field

Pascal

```
InputType: string;
```

C++

```
UnicodeString InputType;
```

Description

This is InputType, a member of class TQueryButton.

52.1.33.4 TQueryButton Methods

The methods of the TQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 5406)	This is EventContent, a member of class TQueryButton.

	GetCaption (see page 5406)	Returns the value of the Caption property.
	GetHTMLControlName (see page 5406)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 5407)	This is GetHTMLForm, a member of class TQueryButton.
	GetInputType (see page 5407)	This is GetInputType, a member of class TQueryButton.
	GetXMLComponent (see page 5407)	This is GetXMLComponent, a member of class TQueryButton.
	ImplContent (see page 5407)	Provides the underlying implementation for the Content method.
	Notification (see page 5408)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 5408)	This is ParentXMLComponent, a member of class TQueryButton.
	SetXMLComponent (see page 5408)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 5409)	This is SetXMLUseParent, a member of class TQueryButton.

52.1.33.4.1 TQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TQueryButton.

52.1.33.4.2 TQueryButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 5508)

SetCaption (see page 5508)

52.1.33.4.3 TQueryButton.GetHTMLControlName Method

Pascal

```
function GetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetHTMLControlName();
```

Description

This is GetHTMLControlName, a member of class TQueryButton.

52.1.33.4.4 TQueryButton.GetHTMLForm Method

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

This is GetHTMLForm, a member of class TQueryButton.

52.1.33.4.5 TQueryButton.GetInputType Method

Pascal

```
function GetInputType: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetInputType();
```

Description

This is GetInputType, a member of class TQueryButton.

52.1.33.4.6 TQueryButton.GetXMLComponent Method

Pascal

```
function GetXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * GetXMLComponent();
```

Description

This is GetXMLComponent, a member of class TQueryButton.

52.1.33.4.7 TQueryButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 5506)

ILayoutWebContent

52.1.33.4.8 TQueryButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

52.1.33.4.9 TQueryButton.ParentXMLComponent Method

Pascal

```
function ParentXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * ParentXMLComponent();
```

Description

This is ParentXMLComponent, a member of class TQueryButton.

52.1.33.4.10 TQueryButton.SetXMLComponent Method

Pascal

```
procedure SetXMLComponent(const Value: TComponent);
```

C++

```
__fastcall SetXMLComponent(const TComponent * Value);
```

Description

This is SetXMLComponent, a member of class TQueryButton.

52.1.33.4.11 TQueryButton.SetXMLUseParent Method

Pascal

```
procedure SetXMLUseParent(const Value: Boolean);
```

C++

```
__fastcall SetXMLUseParent(const Boolean Value);
```

Description

This is SetXMLUseParent, a member of class TQueryButton.

52.1.33.5 TQueryButton Properties

The properties of the TQueryButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 5409)	Specifies the caption that appears on the button.
	Custom (see page 5409)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5410)	Adds style attributes to the generated button control.
	StyleRule (see page 5410)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5411)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 5411)	Specifies whether the button is associated with its parent's query form.

52.1.33.5.1 TQueryButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 5509)

52.1.33.5.2 TQueryButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 5508)

Style (see page 5509)

52.1.33.5.3 TQueryButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 5509)

StyleRule (see page 5510)

52.1.33.5.4 TQueryButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 5509)

Styles (see page 5716)

StylesFile (see page 5717)

Styles

StylesFile

52.1.33.5.5 TQueryButton.XMLComponent Property

Associates the button with the query form whose display controls it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates the form whose controls the query button influences. If this query form contains the TQueryButtons (see page 5412) object that formats the query button with its siblings, you need not set the XMLComponent property. Instead, setting the XMLUseParent (see page 5411) property to true (the default) sets XMLComponent to the Query form that contains the parent TQueryButtons (see page 5412) object.

See Also

XMLUseParent (see page 5411)

TQueryForm (see page 5421)

52.1.33.5.6 TQueryButton.XMLUseParent Property

Specifies whether the button is associated with its parent's query form.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the query button determines the form whose controls it influences. When XMLUseParent is false, the XMLComponent (see page 5411) property must be set to indicate the query form. When XMLUseParent is true, the button influences controls on the query form that contains its parent TQueryButtons (see page 5412) component.

See Also

XMLComponent (see page 5411)

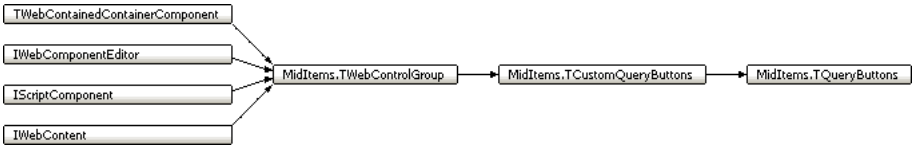
TQueryForm (see page 5421)

TQueryButtons (see page 5412)

52.1.34 TQueryButtons Class

TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 5403) descendants.

Class Hierarchy



Pascal

```
TQueryButtons = class(TCustomQueryButtons);
```

C++

```
class TQueryButtons : public TCustomQueryButtons;
```

File

MidItems

Description

Add TQueryButtons as the child of a TQueryForm (see page 5421) component (or a layout group that is a child of a TQueryForm (see page 5421) component) to enable the generated HTML form to undo or submit changes made by end users. TQueryButtons generates HTML containing the controls generated by its children. These children must be descendants of TQueryButton (see page 5403), such as TSubmitQueryButton (see page 5486) and TResetQueryButton (see page 5469).

In order to let other Web items to use the HTML that defines the organized collection of controls, TQueryButtons inherits the IWebContent interface from TWebControlGroup (see page 5510).

Use the properties of TQueryButtons to customize the appearance of the group of buttons.

TSubmitQueryButton (see page 5486)

IWebContent

TQueryFieldGroup (see page 5415)

Using the Web Page Editor

52.1.34.1 TQueryButtons Members

The following tables list the members exposed by TQueryButtons.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.

	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultButtons (see page 5289)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5290)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplCanAddClass (see page 5290)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5290)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	VisibleButtons (see page 5291)	This is VisibleButtons, a member of class TCustomQueryButtons.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Methods

	Name	Description
V	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
V	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).

Public Properties

	Name	Description
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 5413)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5414)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5414)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.34.2 TQueryButtons Properties

The properties of the TQueryButtons class are listed here.

Published Properties

	Name	Description
	Custom (see page 5413)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5414)	Adds style attributes to the generated HTML table.
	StyleRule (see page 5414)	Applies a style in the page producer's style sheet to the group of buttons.

52.1.34.2.1 TQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5292)

StyleRule (see page 5292)

WebFieldControls (see page 5519)

52.1.34.2.2 TQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5291)

StyleRule (see page 5292)

WebFieldControls (see page 5519)

52.1.34.2.3 TQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

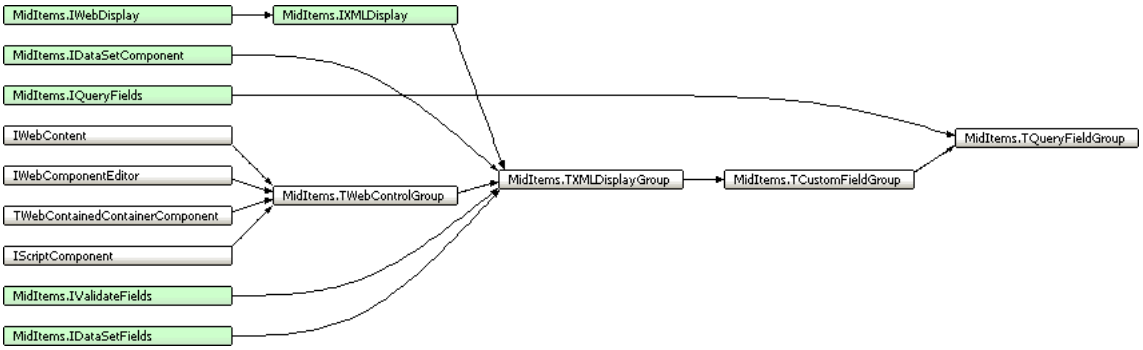
52.1.35 TQueryFieldGroup Class

TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.

Class Hierarchy



Pascal

```
TQueryFieldGroup = class(TCustomFieldGroup, IQueryFields);
```

C++

```
class TQueryFieldGroup : public TCustomFieldGroup, public IQueryFields;
```

File

MidItems

Description

Add TQueryFieldGroup to a query form component (TQueryForm (see page 5421)) or a layout group (TLayoutGroup (see page 5389)) that is a child for a query form. TQueryFieldGroup generates the HTML to display information in labeled fields. By default, TQueryFieldGroup displays information about the parameters for an XML broker, but it can be used to display any application-defined named values.

TQueryFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the following classes: TQueryText (see page 5449), TQueryTextArea (see page 5458), TQuerySelectOptions (see page 5437), and TQueryRadioGroup (see page 5425). If the query field group displays parameter values, you can bind the query field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to

determine the source of the parameters they display.

You can also use the properties of TQueryFieldGroup to affect the overall appearance of the set of fields.

52.1.35.1 TQueryFieldGroup Members

The following tables list the members exposed by TQueryFieldGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 5623)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 5623)	This is FindField, a member of class TXMLDisplayGroup.
	FindParam (see page 5418)	This is FindParam, a member of class TQueryFieldGroup.
	GetDataSet (see page 5624)	Returns the value of the DataSet property.
	GetDataSetField (see page 5624)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
	GetEnableValidateFields (see page 5624)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 5624)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 5625)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 5280)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetParamsList (see page 5418)	This is GetParamsList, a member of class TQueryFieldGroup.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
	GetVisibleFields (see page 5625)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 5625)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 5625)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 5626)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 5626)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 5626)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplAddElements (see page 5626)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 5419)	Provides the underlying implementation for the CanAddClass method.

	ImplContent (see page 5280)	Provides the underlying implementation for the Content method.
	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
	ImplGetSubComponents (see page 5627)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 5627)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 5627)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	IsParamInUse (see page 5419)	This is IsParamInUse, a member of class TQueryFieldGroup.
	Notification (see page 5628)	Forwards notification messages to all owned components.
	SetDataSetField (see page 5628)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.
	SetEnableValidateFields (see page 5628)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 5629)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 5629)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 5629)	This is ValidateFields, a member of class TXMLDisplayGroup.
	XMLDataChange (see page 5629)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.
	EnableValidateFields (see page 5630)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
	XMLDataSet (see page 5631)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	Create (see page 5279)	Creates and initializes an instance of TCustomFieldGroup (see page 5276).
	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
	Create (see page 5622)	Creates and initializes an instance of TXMLDisplayGroup (see page 5620).
	Destroy (see page 5279)	Frees an instance of TCustomFieldGroup (see page 5276).
	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).
	Destroy (see page 5622)	Frees an instance of TXMLDisplayGroup (see page 5620).
	GetDataSet (see page 5645)	Returns the value of the DataSet (see page 5646) property.
	GetEnableValidateFields (see page 5669)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetFieldsList (see page 5651)	This is GetFieldsList, a member of class IDataSetFields.
	GetIsMultipleRecordView (see page 5670)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 5673)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetVisibleFields (see page 5651)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 5645)	Returns the value of the XMLBroker (see page 5647) property.
	GetXMLDataSet (see page 5646)	Returns the value of the XMLDataSet (see page 5647) property.
	GetXMLDisplayName (see page 5674)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 5674)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasStatusField (see page 5651)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 5651)	This is IsFieldInUse, a member of class IDataSetFields.
	SetEnableValidateFields (see page 5669)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateDataSet (see page 5651)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateDataSet (see page 5665)	This is ValidateDataSet, a member of class IQueryFields.
	ValidateFields (see page 5669)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	DataSet (see page 5646)	Provides access to an interface for working with the associated dataset.
	EnableValidateFields (see page 5669)	This is EnableValidateFields, a member of class IValidateFields.
	IsMultipleRecordView (see page 5671)	

	IsMultipleRecordView (see page 5674)	
	VisibleFields (see page 5652)	This is VisibleFields, a member of class IDataSetFields.
	VisibleFields (see page 5630)	Indicates the controls displayed by the HTML that the XML display group generates.
	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.
	XMLBroker (see page 5647)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSet (see page 5647)	Indicates the TXMLDataSet (see page 5608) object that represents the dataset to which the Web item is bound.
	XMLDisplayName (see page 5675)	This is XMLDisplayName, a member of class IXMLDisplay.
	XMLRowSetName (see page 5675)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 5419)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5420)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5420)	Applies a style in the page producer's style sheet to the table.
	XMLBroker (see page 5631)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 5631)	Binds the XML display group to a nested dataset from the XML data packet.

52.1.35.2 TQueryFieldGroup Methods

The methods of the TQueryFieldGroup class are listed here.

Protected Methods

	Name	Description
	FindParam (see page 5418)	This is FindParam, a member of class TQueryFieldGroup.
	GetParamsList (see page 5418)	This is GetParamsList, a member of class TQueryFieldGroup.
	ImplCanAddClass (see page 5419)	Provides the underlying implementation for the CanAddClass method.
	IsParamInUse (see page 5419)	This is IsParamInUse, a member of class TQueryFieldGroup.

52.1.35.2.1 TQueryFieldGroup.FindParam Method

Pascal

```
function FindParam(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindParam(const UnicodeString AName);
```

Description

This is FindParam, a member of class TQueryFieldGroup.

52.1.35.2.2 TQueryFieldGroup.GetParamsList Method

Pascal

```
procedure GetParamsList(List: TStrings);
```

C++

```
__fastcall GetParamsList(TStrings List);
```

Description

This is GetParamsList, a member of class TQueryFieldGroup.

52.1.35.2.3 TQueryFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.35.2.4 TQueryFieldGroup.IsParamInUse Method

Pascal

```
function IsParamInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsParamInUse(UnicodeString AName);
```

Description

This is IsParamInUse, a member of class TQueryFieldGroup.

52.1.35.3 TQueryFieldGroup Properties

The properties of the TQueryFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 5419)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 5420)	Adds style attributes to the generated set of fields.
	StyleRule (see page 5420)	Applies a style in the page producer's style sheet to the table.

52.1.35.3.1 TQueryFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 5281)

StyleRule (see page 5282)

52.1.35.3.2 TQueryFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 5281)

StyleRule (see page 5282)

52.1.35.3.3 TQueryFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 5281)

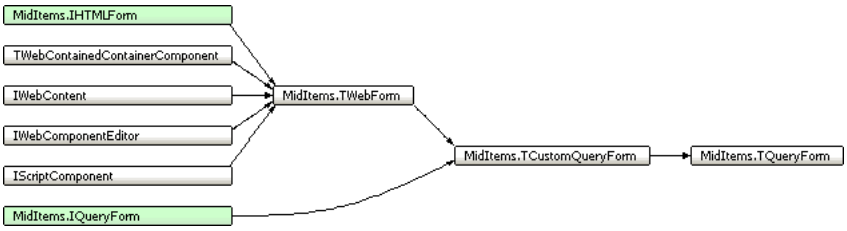
Styles (see page 5716)

StylesFile (see page 5717)

52.1.36 TQueryForm Class

TQueryForm generates HTML forms for letting users enter application-defined values.

Class Hierarchy



Pascal

```
TQueryForm = class(TCustomQueryForm);
```

C++

```
class TQueryForm : public TCustomQueryForm;
```

File

MidItems

Description

Add TQueryForm to the Web items of an InternetExpress page producer to add an HTML form that displays application-defined values that users can view and edit. Query forms submit these values to the InternetExpress application using a specified URL and method type.

TQueryForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that display application-defined values (TQueryFieldGroup (see page 5415)), components that contain buttons to operate on those displays (TQueryButtons (see page 5412)), and components that manage the layout of HTML controls (TLayoutGroup (see page 5389)). At design time, you can add these Web items to the form using the Web page editor.

See Also

TQueryButtons (see page 5412)

TInetXPageProducer (see page 5730)

TQueryFieldGroup (see page 5415)

TLayoutGroup (see page 5389)

Using the Web Page Editor

52.1.36.1 TQueryForm Members

The following tables list the members exposed by TQueryForm.

Protected Methods

	Name	Description
	AddElements (see page 5550)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 5295)	This is AssignStringsCallback, a member of class TCustomQueryForm.
	CanAddClass (see page 5551)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 5558) property list.
	Content (see page 5551)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 5552)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 5552)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 5296)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 5553)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 5553)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 5553)	Returns the value of the WebComponents (see page 5558) property.
	GetVisibleFields (see page 5554)	Returns the value of the VisibleFields (see page 5557) property.
V	ImplAddElements (see page 5296)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 5554)	Provides the underlying implementation for the AddElements (see page 5550) method.
V	ImplCanAddClass (see page 5296)	Provides the underlying implementation for the CanAddClass method.
A	ImplCanAddClass (see page 5554)	Provides the underlying implementation for the CanAddClass (see page 5551) method.
V	ImplContent (see page 5297)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5555)	Provides the underlying implementation for the Content (see page 5551) method.
	MethodString (see page 5297)	This is MethodString, a member of class TCustomQueryForm.
V	SetDefaultWebComponents (see page 5555)	Prevents an application from trying to assign a default set of Web items on the form.

Protected Properties

	Name	Description
R	VisibleFields (see page 5557)	Lists the Web items whose generated content appears in the HTML form.

Public Methods

	Name	Description
	AssignStrings (see page 5295)	This is AssignStrings, a member of class TCustomQueryForm.
V	Create (see page 5295)	Creates and initializes an instance of TCustomQueryForm (see page 5293).
V	Create (see page 5549)	Creates and initializes an instance of TWebForm (see page 5548).
V	Destroy (see page 5550)	Frees an instance of TWebForm (see page 5548).
	GetHTMLFormName (see page 5656)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 5656)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
R	HTMLFormName (see page 5657)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 5657)	Indicates the name of the javascript variable that represents the HTML form.
R	WebComponents (see page 5558)	Maintains a list of components that generate HTML content for the TWebForm (see page 5548) descendant.

Published Properties

	Name	Description
	Action (see page 5423)	Specifies the path info portion of the URL to which the query submits request messages.

	Custom (see page 5423)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 5424)	This is Method, a member of class TQueryForm.
	Style (see page 5424)	Adds style attributes to the generated form.
	StyleRule (see page 5424)	Applies a style in the page producer's style sheet to the button.

52.1.36.2 TQueryForm Properties

The properties of the TQueryForm class are listed here.

Published Properties

	Name	Description
	Action (see page 5423)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 5423)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 5424)	This is Method, a member of class TQueryForm.
	Style (see page 5424)	Adds style attributes to the generated form.
	StyleRule (see page 5424)	Applies a style in the page producer's style sheet to the button.

52.1.36.2.1 TQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property UnicodeString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 5293)

PathInfo (see page 3382)

PathInfo (see page 3341)

52.1.36.2.2 TQueryForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 5556)

52.1.36.2.3 TQueryForm.Method Property

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

Description

This is Method, a member of class TQueryForm.

52.1.36.2.4 TQueryForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 5556)

StyleRule (see page 5557)

52.1.36.2.5 TQueryForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of

StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 5556)

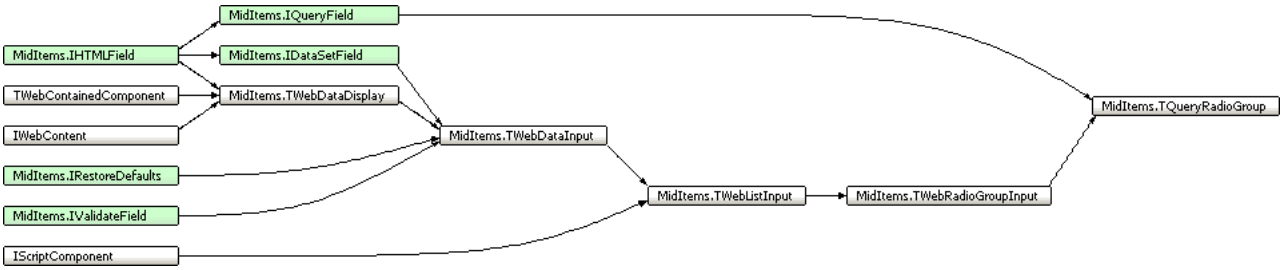
Styles (see page 5716)

StylesFile (see page 5717)

52.1.37 TQueryRadioGroup Class

TQueryRadioGroup creates an HTML radio group control to represent named parameter.

Class Hierarchy



Pascal

```
TQueryRadioGroup = class(TWebRadioGroupInput, IQueryField);
```

C++

```
class TQueryRadioGroup : public TWebRadioGroupInput, public IQueryField;
```

File

MidItems

Description

Add TQueryRadioGroup as the child of a TQueryFieldGroup (see page 5415) component to add a radio group control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 5415) represent the parameters of an XML broker. However, TQueryRadioGroup can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryRadioGroup to

Specify the field or parameter whose value the radio group displays.

Specify the possible values from which the user can choose.

Initialize the value of the radio group.

Specify a caption that describes the value of the radio group.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 5415)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

TXMLBroker

52.1.37.1 TQueryRadioGroup Members

The following tables list the members exposed by TQueryRadioGroup.

Protected Methods

	Name	Description
	AddAttributes (see page 5428)	This is AddAttributes, a member of class TQueryRadioGroup.
	AddElements (see page 5562)	This is AddElements, a member of class TWebListInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5562)	This is ControlContent, a member of class TWebListInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5571)	This is EventContent, a member of class TWebRadioGroupInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 5562)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 5571)	This is FormatInputs, a member of class TWebRadioGroupInput.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetCheckIndex (see page 5428)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 5563)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 5429)	This is GetText, a member of class TQueryRadioGroup.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 5563)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 5571)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.

	Notification (see page 5563)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5571)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetDataSet (see page 5564)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 5564)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 5429)	This is SetText, a member of class TQueryRadioGroup.
	SetValues (see page 5564)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
	Create (see page 5561)	Creates and initializes an instance of TWebListInput (see page 5558).
	Create (see page 5570)	Creates and initializes an instance of TWebRadioGroupInput (see page 5567).
	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	Destroy (see page 5561)	Frees an instance of TWebListInput (see page 5558).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 5662)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5429)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 5662)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5430)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5430)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5431)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5431)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5431)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 5432)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 5432)	Specifies the width of the radio group, in characters.
	FieldName (see page 5433)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5433)	Lists the possible selections that appear in the generated control.

	ItemsField (see page 5434)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 5434)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5435)	Indicates whether end users can use the generated control to set values.
	Style (see page 5435)	Adds style attributes to the generated display control.
	StyleRule (see page 5435)	This is StyleRule, a member of class TQueryRadioGroup.
	TabIndex (see page 5436)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5436)	Specifies the initial value of the radio group.
	Values (see page 5436)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5437)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.37.2 TQueryRadioGroup Methods

The methods of the TQueryRadioGroup class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 5428)	This is AddAttributes, a member of class TQueryRadioGroup.
	GetCheckIndex (see page 5428)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetText (see page 5429)	This is GetText, a member of class TQueryRadioGroup.
	SetText (see page 5429)	This is SetText, a member of class TQueryRadioGroup.

Public Methods

	Name	Description
	IsQueryField (see page 5429)	Indicates whether the component generates a control that can appear in a query form.

52.1.37.2.1 TQueryRadioGroup.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryRadioGroup.

52.1.37.2.2 TQueryRadioGroup.GetCheckIndex Method

Pascal

```
function GetCheckIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetCheckIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetCheckIndex, a member of class TQueryRadioGroup.

52.1.37.2.3 TQueryRadioGroup.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryRadioGroup.

52.1.37.2.4 TQueryRadioGroup.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 5421)). IsQueryField returns true, because TQueryRadioGroup (see page 5425) is designed specifically for use by TQueryFieldGroup (see page 5415).

See Also

IsColumn (see page 5527)

TQueryFieldGroup (see page 5415)

TQueryForm (see page 5421)

52.1.37.2.5 TQueryRadioGroup.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryRadioGroup.

52.1.37.3 TQueryRadioGroup Properties

The properties of the TQueryRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 5430)	Specifies the text of a label that indicates what information the generated control displays.

	CaptionAttributes (see page 5430)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5431)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5431)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5431)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 5432)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 5432)	Specifies the width of the radio group, in characters.
	FieldName (see page 5433)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5433)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5434)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 5434)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5435)	Indicates whether end users can use the generated control to set values.
	Style (see page 5435)	Adds style attributes to the generated display control.
	StyleRule (see page 5435)	This is StyleRule, a member of class TQueryRadioGroup.
	TabIndex (see page 5436)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5436)	Specifies the initial value of the radio group.
	Values (see page 5436)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5437)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.37.3.1 TQueryRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.37.3.2 TQueryRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.37.3.3 TQueryRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.37.3.4 TQueryRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.37.3.5 TQueryRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 5565)

ValuesField (see page 5566)

Items (see page 5565)

Values (see page 5566)

52.1.37.3.6 TQueryRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 5565)

Items (see page 5565)

DisplayWidth (see page 5572)

52.1.37.3.7 TQueryRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 5572)

Custom (see page 5530)

52.1.37.3.8 TQueryRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.37.3.9 TQueryRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.37.3.10 TQueryRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.37.3.11 TQueryRadioGroup.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 5539)

IsQueryField (see page 5528)

Params

xmlbroker (see page 5631)

Setting Web Item Properties

52.1.37.3.12 TQueryRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 5572)

Custom (see page 5530)

52.1.37.3.13 TQueryRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.37.3.14 TQueryRadioGroup.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TQueryRadioGroup.

52.1.37.3.15 TQueryRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.37.3.16 TQueryRadioGroup.Text Property

Specifies the initial value of the radio group.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value that appears in the generated radio group. This should be one of the values listed in the Items (see page 5433) property or in the field referenced by the ItemsField (see page 5434) property.

See Also

Items (see page 5565)

ItemsField (see page 5565)

52.1.37.3.17 TQueryRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the

DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 5565)

ItemsField (see page 5565)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.37.3.18 TQueryRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

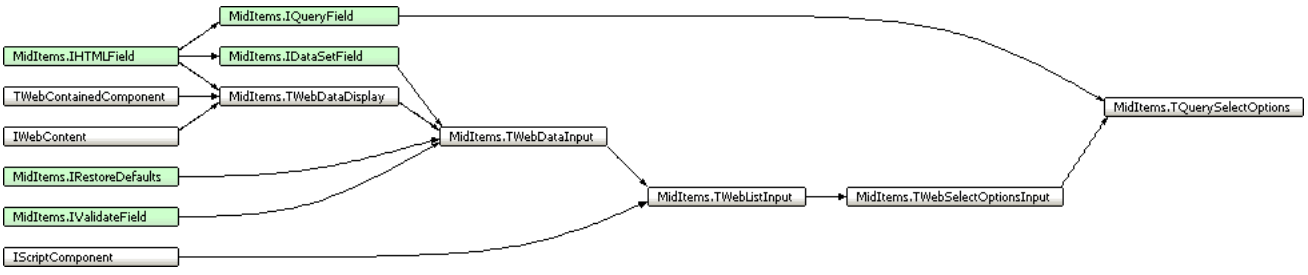
DataSet (see page 5564)

ItemsField (see page 5565)

52.1.38 TQuerySelectOptions Class

TQuerySelectOptions creates an HTML list control to represent a named parameter.

Class Hierarchy



Pascal

```
TQuerySelectOptions = class(TWebSelectOptionsInput, IQueryField);
```

C++

```
class TQuerySelectOptions : public TWebSelectOptionsInput, public IQueryField;
```

File

MidItems

Description

Add TQuerySelectOptions as the child of a TQueryFieldGroup (see page 5415) component to add a list control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 5415) represent the parameters of an XML broker. However, TQuerySelectOptions can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQuerySelectOptions to

Specify the field or parameter whose value the list box displays.

Specify the possible values from which the user can choose.

Assign an initial value to the list box.

Specify a caption that describes the value of the list box.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 5415)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

TXMLBroker

52.1.38.1 TQuerySelectOptions Members

The following tables list the members exposed by TQuerySelectOptions.

Protected Methods

	Name	Description
	AddAttributes (see page 5576)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 5562)	This is AddElements, a member of class TWebListInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5562)	This is ControlContent, a member of class TWebListInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5577)	This is EventContent, a member of class TWebSelectOptionsInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 5562)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 5577)	This is FormatInputs, a member of class TWebSelectOptionsInput.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.

	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 5441)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetSubComponents (see page 5563)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 5441)	This is GetText, a member of class TQuerySelectOptions.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 5563)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
V	Notification (see page 5563)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetDataSet (see page 5564)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 5564)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 5441)	This is SetText, a member of class TQuerySelectOptions.
	SetValues (see page 5564)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5561)	Creates and initializes an instance of TWebListInput (see page 5558).
V	Create (see page 5576)	Creates and initializes an instance of TWebSelectOptionsInput (see page 5573).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
V	Destroy (see page 5561)	Frees an instance of TWebListInput (see page 5558).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 5662)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.

	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5441)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 5662)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5442)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5442)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5443)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5443)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5444)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5444)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5445)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5445)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5446)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 5446)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 5447)	Adds style attributes to the generated display control.
	StyleRule (see page 5447)	This is StyleRule, a member of class TQuerySelectOptions.
	TabIndex (see page 5447)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5448)	Specifies the initial value selected in the list box.
	Values (see page 5448)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5448)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.38.2 TQuerySelectOptions Methods

The methods of the TQuerySelectOptions class are listed here.

Protected Methods

	Name	Description
	GetSelectIndex (see page 5441)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetText (see page 5441)	This is GetText, a member of class TQuerySelectOptions.
	SetText (see page 5441)	This is SetText, a member of class TQuerySelectOptions.

Public Methods

	Name	Description
	IsQueryField (see page 5441)	Indicates whether the component generates a control that can appear in a query form.

52.1.38.2.1 TQuerySelectOptions.GetSelectIndex Method

Pascal

```
function GetSelectIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetSelectIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetSelectIndex, a member of class TQuerySelectOptions.

52.1.38.2.2 TQuerySelectOptions.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQuerySelectOptions.

52.1.38.2.3 TQuerySelectOptions.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 5421)). IsQueryField returns true, because TQuerySelectOptions (see page 5437) is designed specifically for use by TQueryFieldGroup (see page 5415).

See Also

IsColumn (see page 5527)

TQueryFieldGroup (see page 5415)

TQueryForm (see page 5421)

52.1.38.2.4 TQuerySelectOptions.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQuerySelectOptions.

52.1.38.3 TQuerySelectOptions Properties

The properties of the TQuerySelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 5442)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5442)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5443)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5443)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5444)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5444)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5445)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5445)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5446)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 5446)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 5447)	Adds style attributes to the generated display control.
	StyleRule (see page 5447)	This is StyleRule, a member of class TQuerySelectOptions.
	TabIndex (see page 5447)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5448)	Specifies the initial value selected in the list box.
	Values (see page 5448)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5448)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.38.3.1 TQuerySelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.38.3.2 TQuerySelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.38.3.3 TQuerySelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.38.3.4 TQuerySelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.38.3.5 TQuerySelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 5565)

ValuesField (see page 5566)

Items (see page 5565)

Values (see page 5566)

52.1.38.3.6 TQuerySelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 5565)

Items (see page 5565)

52.1.38.3.7 TQuerySelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.38.3.8 TQuerySelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.38.3.9 TQuerySelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.38.3.10 TQuerySelectOptions.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 5539)

IsQueryField (see page 5528)

Params

xmlbroker (see page 5631)

Setting Web Item Properties

52.1.38.3.11 TQuerySelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.38.3.12 TQuerySelectOptions.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TQuerySelectOptions.

52.1.38.3.13 TQuerySelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.38.3.14 TQuerySelectOptions.Text Property

Specifies the initial value selected in the list box.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value of the generated list control. Text should specify one of the values listed in the Items (see page 5445) property or referenced by the ItemsField (see page 5446) property.

See Also

Items (see page 5565)

ItemsField (see page 5565)

52.1.38.3.15 TQuerySelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 5565)

ItemsField (see page 5565)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.38.3.16 TQuerySelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

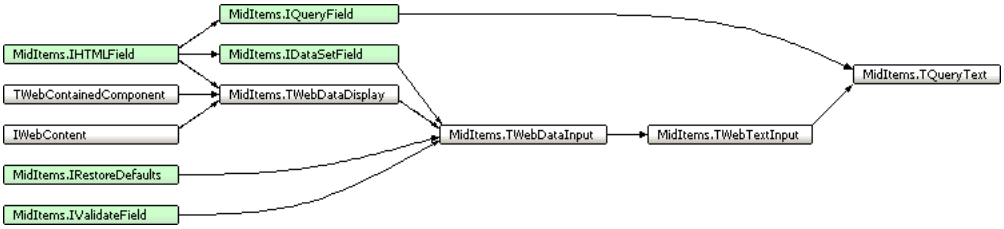
DataSet (see page 5564)

ItemsField (see page 5565)

52.1.39 TQueryText Class

TQueryText creates a single-line HTML input control to represent a named parameter.

Class Hierarchy



Pascal

```
TQueryText = class(TWebTextInput, IQueryField);
```

C++

```
class TQueryText : public TWebTextInput, public IQueryField;
```

File

MidItems

Description

Add TQueryText as the child of a TQueryFieldGroup (see page 5415) component to add an edit control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 5415) represent the parameters of an XML broker. However, TQueryText can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryText to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the input control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 5415)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

TXMLBroker

52.1.39.1 TQueryText Members

The following tables list the members exposed by TQueryText.

Protected Methods

	Name	Description
V	AddAttributes (see page 5452)	This is AddAttributes, a member of class TQueryText.
	Content (see page 5523)	Returns the HTML that defines the display control.
A	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 5592)	This is ControlContent, a member of class TWebTextInput.
V	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
V	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 5452)	This is GetText, a member of class TQueryText.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 5593)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5593)	This is RestoreFieldDefaults, a member of class TWebTextInput.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.

	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 5453)	This is SetText, a member of class TQueryText.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 5451)	Creates and initializes an instance of TQueryText (see page 5449).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 5662)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 5452)	Indicates whether the component generates a control that can appear in a query form.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 5662)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5453)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5454)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5454)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5455)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5455)	Specifies the horizontal size of the generated control.
	FieldName (see page 5455)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 5456)	Limits the length of text users can type into the control.
	ParamName (see page 5456)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5457)	Indicates whether end users can use the generated control to set values.
	Style (see page 5457)	Adds style attributes to the generated display control.
	StyleRule (see page 5458)	This is StyleRule, a member of class TQueryText.
	TabIndex (see page 5458)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5458)	Specifies the initial value of the generated control.

52.1.39.2 TQueryText.Create Constructor

Creates and initializes an instance of TQueryText (see page 5449).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryText(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryText (see page 5449) at runtime. TQueryText (see page 5449) components added at design time using the Web Page editor are instantiated automatically.

52.1.39.3 TQueryText Methods

The methods of the TQueryText class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 5452)	This is AddAttributes, a member of class TQueryText.
	GetText (see page 5452)	This is GetText, a member of class TQueryText.
	SetText (see page 5453)	This is SetText, a member of class TQueryText.

Public Methods

	Name	Description
	IsQueryField (see page 5452)	Indicates whether the component generates a control that can appear in a query form.

52.1.39.3.1 TQueryText.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryText.

52.1.39.3.2 TQueryText.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryText.

52.1.39.3.3 TQueryText.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 5421)). IsQueryField returns true, because TQueryText (see page 5449) is designed specifically for TQueryFieldGroup (see page 5415) to use.

See Also

IsColumn (see page 5527)

TQueryFieldGroup (see page 5415)

TQueryForm (see page 5421)

52.1.39.3.4 TQueryText.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryText.

52.1.39.4 TQueryText Properties

The properties of the TQueryText class are listed here.

Published Properties

	Name	Description
	Caption (see page 5453)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5454)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5454)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5455)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5455)	Specifies the horizontal size of the generated control.
	FieldName (see page 5455)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 5456)	Limits the length of text users can type into the control.
	ParamName (see page 5456)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5457)	Indicates whether end users can use the generated control to set values.
	Style (see page 5457)	Adds style attributes to the generated display control.
	StyleRule (see page 5458)	This is StyleRule, a member of class TQueryText.
	TabIndex (see page 5458)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 5458)	Specifies the initial value of the generated control.

52.1.39.4.1 TQueryText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.39.4.2 TQueryText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.39.4.3 TQueryText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.39.4.4 TQueryText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.39.4.5 TQueryText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

52.1.39.4.6 TQueryText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.39.4.7 TQueryText.MaxWidth Property

Limits the length of text users can type into the control.

Pascal

```
property MaxWidth: Integer;
```

C++

```
__property int MaxWidth;
```

Description

Use MaxWidth to limit the length of strings (in characters) that users can type into the generated control.

Note: MaxWidth has no effect on the size of the generated control. To limit the size of the control, use the DisplayWidth (see page 5455) property.

See Also

DisplayWidth (see page 5594)

52.1.39.4.8 TQueryText.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 5539)

IsQueryField (see page 5528)

Params

xmlbroker (see page 5631)

Setting Web Item Properties

52.1.39.4.9 TQueryText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

52.1.39.4.10 TQueryText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.39.4.11 TQueryText.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TQueryText.

52.1.39.4.12 TQueryText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.39.4.13 TQueryText.Text Property

Specifies the initial value of the generated control.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Use Text to initialize the value that appears in the generated display control.

See Also

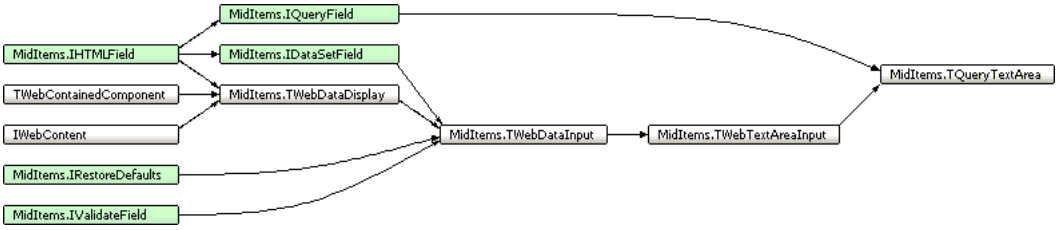
FieldName (see page 5539)

ParamName (see page 5540)

52.1.40 TQueryTextArea Class

TQueryTextArea creates a multi-line HTML input control to represent named parameter.

Class Hierarchy



Pascal

```
TQueryTextArea = class(TWebTextAreaInput, IQueryField);
```

C++

```
class TQueryTextArea : public TWebTextAreaInput, public IQueryField;
```

File

MidItems

Description

Add TQueryTextArea as the child of a TQueryFieldGroup (see page 5415) component to add a multi-line edit control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 5415) represent the parameters of an XML broker. However, TQueryTextArea can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryTextArea to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 5415)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

TXMLBroker

52.1.40.1 TQueryTextArea Members

The following tables list the members exposed by TQueryTextArea.

Protected Methods

	Name	Description
	AddAttributes (see page 5462)	This is AddAttributes, a member of class TQueryTextArea.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5462)	This is ControlContent, a member of class TQueryTextArea.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.

	EventContent (see page 5587)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 5462)	This is GetText, a member of class TQueryTextArea.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 5587)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5587)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetLines (see page 5463)	This is SetLines, a member of class TQueryTextArea.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetText (see page 5463)	This is SetText, a member of class TQueryTextArea.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
	Create (see page 5461)	Creates and initializes an instance of TQueryTextArea (see page 5458).
	Destroy (see page 5461)	Frees an instance of TQueryTextArea (see page 5458).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 5662)	This is GetParamName, a member of class IQueryField.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5463)	Indicates whether the component generates a control that can appear in a query form.

	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	SetParamName (see page 5662)	This is SetParamName, a member of class IQueryField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.
	Text (see page 5663)	This is Text, a member of class IQueryField.

Published Properties

	Name	Description
	Caption (see page 5464)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5464)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5465)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5465)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5466)	Specifies the height of the generated control.
	DisplayWidth (see page 5466)	Specifies the horizontal size of the generated control.
	FieldName (see page 5466)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 5467)	Specifies the initial value that appears in the multi-line edit control.
	ParamName (see page 5467)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5468)	Indicates whether end users can use the generated control to set values.
	Style (see page 5468)	Adds style attributes to the generated display control.
	StyleRule (see page 5468)	This is StyleRule, a member of class TQueryTextArea.
	TabIndex (see page 5469)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5469)	Specifies how the generated control treats lines that are longer than the display width.

52.1.40.2 TQueryTextArea.Create Constructor

Creates and initializes an instance of TQueryTextArea (see page 5458).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryTextArea(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryTextArea (see page 5458) at runtime. TQueryTextArea (see page 5458) components added at design time using the Web Page editor are instantiated automatically.

52.1.40.3 TQueryTextArea.Destroy Destructor

Frees an instance of TQueryTextArea (see page 5458).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQueryTextArea();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

52.1.40.4 TQueryTextArea Methods

The methods of the TQueryTextArea class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 5462)	This is AddAttributes, a member of class TQueryTextArea.
	ControlContent (see page 5462)	This is ControlContent, a member of class TQueryTextArea.
	GetText (see page 5462)	This is GetText, a member of class TQueryTextArea.
	SetLines (see page 5463)	This is SetLines, a member of class TQueryTextArea.
	SetText (see page 5463)	This is SetText, a member of class TQueryTextArea.

Public Methods

	Name	Description
	IsQueryField (see page 5463)	Indicates whether the component generates a control that can appear in a query form.

52.1.40.4.1 TQueryTextArea.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TQueryTextArea.

52.1.40.4.2 TQueryTextArea.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TQueryTextArea.

52.1.40.4.3 TQueryTextArea.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall UnicodeString GetText();
```

Description

This is GetText, a member of class TQueryTextArea.

52.1.40.4.4 TQueryTextArea.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 5421)). IsQueryField returns true, because TQueryTextArea (see page 5458) is designed specifically for TQueryFieldGroup (see page 5415) to use.

See Also

IsColumn (see page 5527)

TQueryFieldGroup (see page 5415)

TQueryForm (see page 5421)

52.1.40.4.5 TQueryTextArea.SetLines Method

Pascal

```
procedure SetLines(const Value: TStrings);
```

C++

```
__fastcall SetLines(const TStrings Value);
```

Description

This is SetLines, a member of class TQueryTextArea.

52.1.40.4.6 TQueryTextArea.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const UnicodeString Value);
```

Description

This is SetText, a member of class TQueryTextArea.

52.1.40.5 TQueryTextArea Properties

The properties of the TQueryTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 5464)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5464)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 5465)	Specifies where the label appears relative to the generated display control.
	Custom (see page 5465)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5466)	Specifies the height of the generated control.
	DisplayWidth (see page 5466)	Specifies the horizontal size of the generated control.
	FieldName (see page 5466)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 5467)	Specifies the initial value that appears in the multi-line edit control.
	ParamName (see page 5467)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 5468)	Indicates whether end users can use the generated control to set values.
	Style (see page 5468)	Adds style attributes to the generated display control.
	StyleRule (see page 5468)	This is StyleRule, a member of class TQueryTextArea.
	TabIndex (see page 5469)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5469)	Specifies how the generated control treats lines that are longer than the display width.

52.1.40.5.1 TQueryTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.40.5.2 TQueryTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are

added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.40.5.3 TQueryTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.40.5.4 TQueryTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.40.5.5 TQueryTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 5588)

52.1.40.5.6 TQueryTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 5588)

52.1.40.5.7 TQueryTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.40.5.8 TQueryTextArea.Lines Property

Specifies the initial value that appears in the multi-line edit control.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Use Lines to initialize the value that appears in the generated display control.

Each string in the TStrings object designates a line in the text value. This may affect the formatting, depending on the value of Wrap (see page 5469).

See Also

FieldName (see page 5539)

ParamName (see page 5540)

Wrap (see page 5588)

52.1.40.5.9 TQueryTextArea.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 5539)

IsQueryField (see page 5528)

Params

xmlbroker (see page 5631)

Setting Web Item Properties

52.1.40.5.10 TQueryTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

52.1.40.5.11 TQueryTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.40.5.12 TQueryTextArea.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TQueryTextArea.

52.1.40.5.13 TQueryTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.40.5.14 TQueryTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 5588)

52.1.41 TResetQueryButton Class

TResetQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TResetQueryButton = class(TQueryButton);
```

C++

```
class TResetQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TResetQueryButton as the child of a TQueryButtons (see page 5412) component (or a layout group that is a child of a TQueryButtons (see page 5412) component) to enable the generated HTML form to undo edits made in the query form's display fields. The resulting HTML button's action backs out all edits to the values displayed on the query form.

Use the properties of TResetQueryButton to customize the appearance of the button.

See Also

TXMLBroker

TQueryForm (see page 5421)

TQueryButtons (see page 5412)

TLayoutGroup (see page 5389)

52.1.41.1 TResetQueryButton Members

The following tables list the members exposed by TResetQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5405)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 5405)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 5506)	Returns the HTML that defines the button control.
V	EventContent (see page 5471)	This is EventContent, a member of class TResetQueryButton.
V	GetCaption (see page 5406)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
V	GetHTMLControlName (see page 5406)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 5407)	This is GetHTMLForm, a member of class TQueryButton.
V	GetInputType (see page 5407)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 5407)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 5407)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5408)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 5408)	This is ParentXMLComponent, a member of class TQueryButton.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetXMLComponent (see page 5408)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 5409)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
	Create (see page 5471)	Creates and initializes an instance of TResetQueryButton (see page 5469).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.

Published Properties

	Name	Description
	Caption (see page 5409)	Specifies the caption that appears on the button.
	Custom (see page 5409)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5410)	Adds style attributes to the generated button control.
	StyleRule (see page 5410)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5411)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 5411)	Specifies whether the button is associated with its parent's query form.

52.1.41.2 TResetQueryButton.Create Constructor

Creates and initializes an instance of TResetQueryButton (see page 5469).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TResetQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TResetQueryButton (see page 5469) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.41.3 TResetQueryButton Methods

The methods of the TResetQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 5471)	This is EventContent, a member of class TResetQueryButton.

52.1.41.3.1 TResetQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

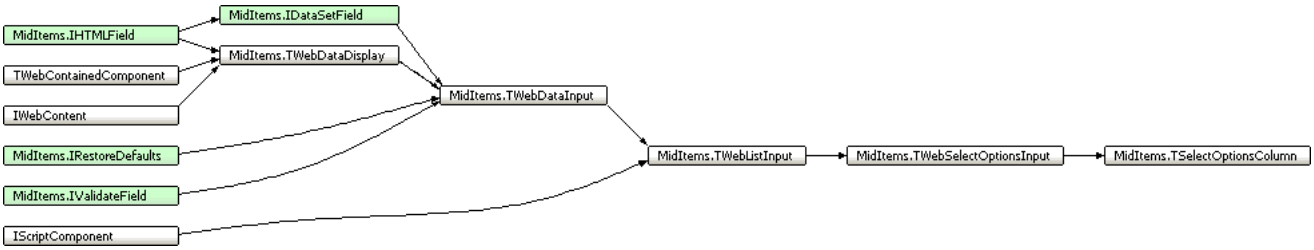
Description

This is EventContent, a member of class TResetQueryButton.

52.1.42 TSelectOptionsColumn Class

TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TSelectOptionsColumn = class(TWebSelectOptionsInput);
```

C++

```
class TSelectOptionsColumn : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TSelectOptionsColumn as the child of a TDataGrid (see page 5302) component to add a list control as the display control for a column. TSelectOptionsColumn represents the value of a field in the TDataGrid (see page 5302)'s associated dataset.

Use the properties and methods of TSelectOptionsColumn to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify the caption that appears at the top of the column.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TDataGrid (see page 5302)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.42.1 TSelectOptionsColumn Members

The following tables list the members exposed by TSelectOptionsColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 5576)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 5562)	This is AddElements, a member of class TWebListInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5562)	This is ControlContent, a member of class TWebListInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5577)	This is EventContent, a member of class TWebSelectOptionsInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 5562)	This is FormatInputs, a member of class TWebListInput.
	FormatInputs (see page 5577)	This is FormatInputs, a member of class TWebSelectOptionsInput.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSelectIndex (see page 5577)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 5563)	This is GetSubComponents, a member of class TWebListInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 5563)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	Notification (see page 5563)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetDataSet (see page 5564)	This is SetDataSet, a member of class TWebListInput.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetItems (see page 5564)	This is SetItems, a member of class TWebListInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	SetValues (see page 5564)	This is SetValues, a member of class TWebListInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5561)	Creates and initializes an instance of TWebListInput (see page 5558).
V	Create (see page 5576)	Creates and initializes an instance of TWebSelectOptionsInput (see page 5573).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
V	Destroy (see page 5561)	Frees an instance of TWebListInput (see page 5558).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 5475)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5475)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5476)	Customizes the appearance of the generated control's label.
	Custom (see page 5476)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5477)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5477)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5478)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5478)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5478)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 5479)	Adds style attributes to the generated display control.
	StyleRule (see page 5479)	This is StyleRule, a member of class TSelectOptionsColumn.
	TabIndex (see page 5480)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5480)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5480)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.42.2 TSelectOptionsColumn Methods

The methods of the TSelectOptionsColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 5475)	Indicates whether the component generates a control that can appear in the column of a data grid.

52.1.42.2.1 TSelectOptionsColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 5302)). IsColumn returns true, because TSelectOptionsColumn (see page 5472) is designed specifically for TDataGrid (see page 5302) to use.

See Also

IsColumn (see page 5527)

TDataGrid (see page 5302)

52.1.42.3 TSelectOptionsColumn Properties

The properties of the TSelectOptionsColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 5475)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5476)	Customizes the appearance of the generated control's label.
	Custom (see page 5476)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 5477)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 5477)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 5478)	Specifies the name of the field whose value the generated control represents.
	Items (see page 5478)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 5478)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 5479)	Adds style attributes to the generated display control.
	StyleRule (see page 5479)	This is StyleRule, a member of class TSelectOptionsColumn.
	TabIndex (see page 5480)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 5480)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 5480)	Indicates which field in DataSet supplies the possible values for the generated control.

52.1.42.3.1 TSelectOptionsColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.42.3.2 TSelectOptionsColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.42.3.3 TSelectOptionsColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.42.3.4 TSelectOptionsColumn.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 5565)

ValuesField (see page 5566)

Items (see page 5565)

Values (see page 5566)

52.1.42.3.5 TSelectOptionsColumn.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 5565)

Items (see page 5565)

52.1.42.3.6 TSelectOptionsColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.42.3.7 TSelectOptionsColumn.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.42.3.8 TSelectOptionsColumn.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property UnicodeString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.42.3.9 TSelectOptionsColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.42.3.10 TSelectOptionsColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TSelectOptionsColumn.

52.1.42.3.11 TSelectOptionsColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.42.3.12 TSelectOptionsColumn.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 5565)

ItemsField (see page 5565)

DataSet (see page 5564)

ValuesField (see page 5566)

52.1.42.3.13 TSelectOptionsColumn.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property UnicodeString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 5565)

Values (see page 5566)

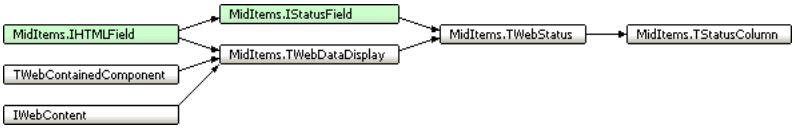
DataSet (see page 5564)

ItemsField (see page 5565)

52.1.43 TStatusColumn Class

TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.

Class Hierarchy



Pascal

```
TStatusColumn = class(TWebStatus);
```

C++

```
class TStatusColumn : public TWebStatus;
```

File

MidItems

Description

Add TStatusColumn as the child of a TDataGrid (see page 5302) component to provide feedback about whether records in the grid have been modified. The generated control displays an M if the user has edited a record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TStatusColumn to

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 5302)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.43.1 TStatusColumn Members

The following tables list the members exposed by TStatusColumn.

Protected Methods

	Name	Description
	Content (see page 5523)	Returns the HTML that defines the display control.
A	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 5580)	This is ControlContent, a member of class TWebStatus.
V	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
V	GetCaption (see page 5581)	Returns the value of the Caption property.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5581)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5580)	Creates and initializes an instance of TWebStatus (see page 5578).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	Identifier (see page 5581)	Returns the name under which record status information is stored in the XML data packet.
V	IsColumn (see page 5483)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	CaptionPosition (see page 5583)	Specifies where the label appears relative to the generated display control.
	DisplayWidth (see page 5583)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.
	TabIndex (see page 5532)	Determines the position of the generated control in the HTML form's tab order.

Published Properties

	Name	Description
	Caption (see page 5484)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5484)	Customizes the appearance of the generated control's label.
	Custom (see page 5484)	Represents a tag option and its value in the tag for the display control.
	Style (see page 5485)	Adds style attributes to the generated display control.
	StyleRule (see page 5485)	This is StyleRule, a member of class TStatusColumn.

52.1.43.2 TStatusColumn Methods

The methods of the TStatusColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 5483)	Indicates whether the component generates a control that can appear in the column of a data grid.

52.1.43.2.1 TStatusColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web item generates a control that represents a column in a data grid (TDataGrid (see page 5302)). IsColumn returns true, because TStatusColumn (see page 5481) is designed specifically for TDataGrid (see page 5302) to use.

See Also

IsColumn (see page 5527)

TDataGrid (see page 5302)

52.1.43.3 TStatusColumn Properties

The properties of the TStatusColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 5484)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5484)	Customizes the appearance of the generated control's label.
	Custom (see page 5484)	Represents a tag option and its value in the tag for the display control.
	Style (see page 5485)	Adds style attributes to the generated display control.
	StyleRule (see page 5485)	This is StyleRule, a member of class TStatusColumn.

52.1.43.3.1 TStatusColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.43.3.2 TStatusColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.43.3.3 TStatusColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator

key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.43.3.4 TStatusColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.43.3.5 TStatusColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TStatusColumn.

52.1.44 TSubmitQueryButton Class

TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TSubmitQueryButton = class(TQueryButton);
```

C++

```
class TSubmitQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TSubmitQueryButton as the child of a TQueryButtons (see page 5412) component (or a layout group that is a child of a TQueryButtons (see page 5412) component) to enable the generated HTML form to send the values entered in the query form back to the Web application. When the user presses the generated button, the values in the query form are sent to the Web application, using the path info specified by the query form's Action property.

Use the properties of TSubmitQueryButton to customize the appearance of the button.

See Also

TXMLBroker

TQueryForm (see page 5421)

TQueryButtons (see page 5412)

TLayoutGroup (see page 5389)

TCustomQueryForm (see page 5293)

52.1.44.1 TSubmitQueryButton Members

The following tables list the members exposed by TSubmitQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5405)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 5405)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	Content (see page 5506)	Returns the HTML that defines the button control.
V	EventContent (see page 5488)	This is EventContent, a member of class TSubmitQueryButton.
V	GetCaption (see page 5406)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
V	GetHTMLControlName (see page 5406)	This is GetHTMLControlName, a member of class TQueryButton.

	GetHTMLForm (see page 5407)	This is GetHTMLForm, a member of class TQueryButton.
V	GetInputType (see page 5407)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
	GetXMLComponent (see page 5407)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 5407)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5408)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 5408)	This is ParentXMLComponent, a member of class TQueryButton.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetXMLComponent (see page 5408)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 5409)	This is SetXMLUseParent, a member of class TQueryButton.

Public Methods

	Name	Description
V	Create (see page 5487)	Creates and initializes an instance of TSubmitQueryButton (see page 5486).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.

Published Properties

	Name	Description
	Caption (see page 5409)	Specifies the caption that appears on the button.
	Custom (see page 5409)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5410)	Adds style attributes to the generated button control.
	StyleRule (see page 5410)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5411)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 5411)	Specifies whether the button is associated with its parent's query form.

52.1.44.2 TSubmitQueryButton.Create Constructor

Creates and initializes an instance of TSubmitQueryButton (see page 5486).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSubmitQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TSubmitQueryButton (see page 5486) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.44.3 TSubmitQueryButton Methods

The methods of the TSubmitQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 5488)	This is EventContent, a member of class TSubmitQueryButton.

52.1.44.3.1 TSubmitQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

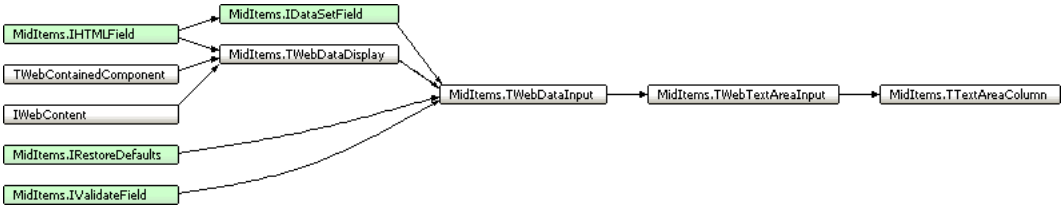
Description

This is EventContent, a member of class TSubmitQueryButton.

52.1.45 TTextAreaColumn Class

TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TTextAreaColumn = class(TWebTextAreaInput);
```

C++

```
class TTextAreaColumn : public TWebTextAreaInput;
```

File

MidItems

Description

Add TTextAreaColumn as the child of a TDataGrid (see page 5302) component to add a multi-line edit control as the display control for a column. TTextAreaColumn represents the value of a field in the TDataGrid (see page 5302)'s associated dataset.

Use the properties and methods of TTextAreaColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent

TDataGrid (see page 5302)

TFieldGroup (see page 5320)

TQueryFieldGroup (see page 5415)

TQueryTextArea (see page 5458)

52.1.45.1 TTextAreaColumn Members

The following tables list the members exposed by TTextAreaColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 5586)	This is AddAttributes, a member of class TWebTextAreaInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5586)	This is ControlContent, a member of class TWebTextAreaInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	EventContent (see page 5587)	This is EventContent, a member of class TWebTextAreaInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 5587)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 5587)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5586)	Creates and initializes an instance of TWebTextAreaInput (see page 5583).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 5491)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5491)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5492)	Customizes the appearance of the generated control's label.
	Custom (see page 5492)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5493)	Specifies the height of the generated control.
	DisplayWidth (see page 5493)	Specifies the horizontal size of the generated control.
	FieldName (see page 5493)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5494)	Indicates whether end users can use the generated control to set values.
	Style (see page 5494)	Adds style attributes to the generated display control.
	StyleRule (see page 5494)	This is StyleRule, a member of class TTextAreaColumn.
	TabIndex (see page 5495)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5495)	Specifies how the generated control treats lines that are longer than the display width.

52.1.45.2 TTextAreaColumn Methods

The methods of the TTextAreaColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 5491)	Indicates whether the component generates a control that can appear in the column of a data grid.

52.1.45.2.1 TTextAreaColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 5302)). IsColumn returns true, because TTextAreaColumn (see page 5488) is designed specifically for TDataGrid (see page 5302) to use.

See Also

IsColumn (see page 5527)

TDataGrid (see page 5302)

52.1.45.3 TTextAreaColumn Properties

The properties of the TTextAreaColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 5491)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5492)	Customizes the appearance of the generated control's label.
	Custom (see page 5492)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 5493)	Specifies the height of the generated control.
	DisplayWidth (see page 5493)	Specifies the horizontal size of the generated control.
	FieldName (see page 5493)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5494)	Indicates whether end users can use the generated control to set values.
	Style (see page 5494)	Adds style attributes to the generated display control.
	StyleRule (see page 5494)	This is StyleRule, a member of class TTextAreaColumn.
	TabIndex (see page 5495)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 5495)	Specifies how the generated control treats lines that are longer than the display width.

52.1.45.3.1 TTextAreaColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.45.3.2 TTextAreaColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.45.3.3 TTextAreaColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.45.3.4 TTextAreaColumn.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 5588)

52.1.45.3.5 TTextAreaColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 5588)

52.1.45.3.6 TTextAreaColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.45.3.7 TTextAreaColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

52.1.45.3.8 TTextAreaColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.45.3.9 TTextAreaColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TTextAreaColumn.

52.1.45.3.10 TTextAreaColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.45.3.11 TTextAreaColumn.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

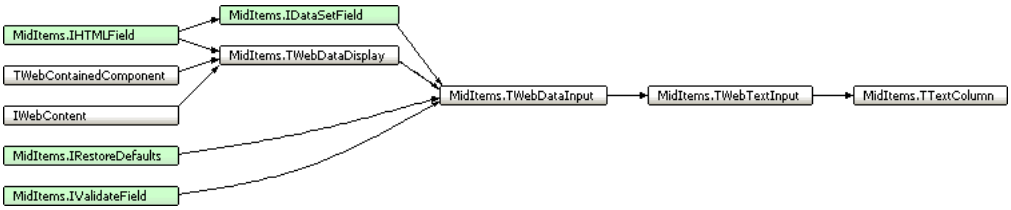
See Also

DisplayWidth (see page 5588)

52.1.46 TTextColumn Class

TTextColumn creates a single-line HTML input control to represent a field value in a data grid.

Class Hierarchy



Pascal

```
TTextColumn = class(TWebTextInput);
```

C++

```
class TTextColumn : public TWebTextInput;
```

File

MidItems

Description

Add TTextColumn as the child of a TDataGrid (see page 5302) component to add an edit control as the display control for a column. TTextColumn represents the value of a field in the TDataGrid (see page 5302)'s associated dataset.

Use the properties and methods of TTextColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 5302)

TXMLDisplayGroup (see page 5620)

TXMLDisplayGroup (see page 5620)

52.1.46.1 TTextColumn Members

The following tables list the members exposed by TTextColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 5592)	This is AddAttributes, a member of class TWebTextInput.
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 5592)	This is ControlContent, a member of class TWebTextInput.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetCaption (see page 5536)	Returns the value of the Caption property.

	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 5593)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5593)	This is RestoreFieldDefaults, a member of class TWebTextInput.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Create (see page 5592)	Creates and initializes an instance of TWebTextInput (see page 5589).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetFieldName (see page 5648)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 5649)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
V	IsColumn (see page 5498)	Indicates whether the component generates a control that can appear in the column of a data grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	RestoreDefaults (see page 5666)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SetFieldName (see page 5649)	This is SetFieldName, a member of class IDataSetField.
	ValidateField (see page 5667)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.

Published Properties

	Name	Description
	Caption (see page 5499)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5499)	Customizes the appearance of the generated control's label.
	Custom (see page 5500)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5500)	Specifies the horizontal size of the generated control.
	FieldName (see page 5500)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5501)	Indicates whether end users can use the generated control to set values.
	Style (see page 5501)	Adds style attributes to the generated display control.
	StyleRule (see page 5502)	This is StyleRule, a member of class TTextColumn.
	TabIndex (see page 5502)	Determines the position of the generated control in the HTML form's tab order.

52.1.46.2 TTextColumn Methods

The methods of the TTextColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 5498)	Indicates whether the component generates a control that can appear in the column of a data grid.

52.1.46.2.1 TTextColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 5302)). IsColumn returns true, because TTextColumn (see page 5495) is designed specifically for TDataGrid (see page 5302) to use.

See Also

IsColumn (see page 5527)

TDataGrid (see page 5302)

52.1.46.3 TTextColumn Properties

The properties of the TTextColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 5499)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5499)	Customizes the appearance of the generated control's label.
	Custom (see page 5500)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 5500)	Specifies the horizontal size of the generated control.
	FieldName (see page 5500)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 5501)	Indicates whether end users can use the generated control to set values.
	Style (see page 5501)	Adds style attributes to the generated display control.
	StyleRule (see page 5502)	This is StyleRule, a member of class TTextColumn.
	TabIndex (see page 5502)	Determines the position of the generated control in the HTML form's tab order.

52.1.46.3.1 TTextColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.46.3.2 TTextColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.46.3.3 TTextColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.46.3.4 TTextColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

52.1.46.3.5 TTextColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.46.3.6 TTextColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

52.1.46.3.7 TTextColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.46.3.8 TTextColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TTextColumn.

52.1.46.3.9 TTextColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

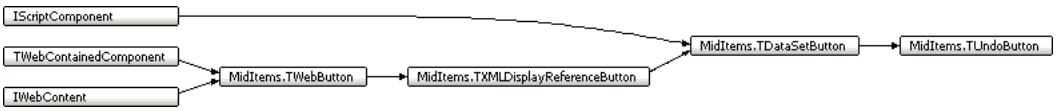
Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.47 TUndoButton Class

TUndoButton generates an HTML control that backs out changes to the current record.

Class Hierarchy



Pascal

```
TUndoButton = class(TDataSetButton);
```

C++

```
class TUndoButton : public TDataSetButton;
```

File

MidItems

Description

Add TUndoButton as the child of a TDataNavigator (see page 5307) component (or a layout group that is a child of a TDataNavigator (see page 5307) component) to enable the generated HTML form to undo edits made in an associated display control or controls. The resulting HTML button's action backs out all edits to the current record.

Use the properties of TUndoButton to customize the appearance of the button and associate it with a Web item that generates

the display controls.

See Also

TXMLBroker

TDataNavigator (see page 5307)

TLayoutGroup (see page 5389)

52.1.47.1 TUndoButton Members

The following tables list the members exposed by TUndoButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 5313)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 5313)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	AddElements (see page 5314)	This is AddElements, a member of class TDataSetButton.
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5314)	Returns the value of the Caption property.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
	GetDisplayComponent (see page 5637)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 5638)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 5314)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 5314)	This is GetSubComponents, a member of class TDataSetButton.
	GetXmlDisplayName (see page 5638)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 5315)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 5315)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	Notification (see page 5638)	Forwards notification messages to all owned components.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.
	SetDisplayComponent (see page 5639)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 5639)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

Protected Properties

	Name	Description
R	XMLDisplay (see page 5640)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
V	Create (see page 5504)	Creates and initializes an instance of TUndoButton (see page 5502).
V	Destroy (see page 5637)	Frees an instance of TXMLDisplayReferenceButton (see page 5635).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.

	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5639)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5640)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 5316)	Specifies the caption that appears on the button.
	Custom (see page 5316)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5316)	Adds style attributes to the generated button control.
	StyleRule (see page 5317)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 5317)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 5318)	Specifies whether the button is associated with its parent's display object.

52.1.47.2 TUndoButton.Create Constructor

Creates and initializes an instance of TUndoButton (see page 5502).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TUndoButton(TComponent * AOwner);
```

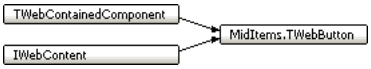
Description

Call Create to instantiate TUndoButton (see page 5502) at runtime. Buttons added at design time using the Web Page editor are instantiated automatically.

52.1.48 TWebButton Class

TWebButton is the base class for Web items that create HTML button controls.

Class Hierarchy



Pascal

```
TWebButton = class(TWebContainedComponent, IWebContent);
```

C++

```
class TWebButton : public TWebContainedComponent, public IWebContent;
```

File

MidItems

Description

Use TWebButton as a base class for components that generate the HTML statements defining a specialized button control in a WebSnap or InternetExpress application. TWebButton introduces the properties and methods for

Generating the HTML code to define the button control.

Defining a button caption.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

In order to allow other Web items to use the HTML generated by the button control, TWebButton implements the IWebContent interface.

Do not create instances of TWebButton. TWebButton relies on an abstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TWebButton that represent buttons with specific purposes.

TSubmitQueryButton (see page 5486)

TApplyUpdatesButton (see page 5250)

IWebContent

52.1.48.1 TWebButton Members

The following tables list the members exposed by TWebButton.

Protected Methods

	Name	Description
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.

Public Methods

	Name	Description
V	Create (see page 5506)	Creates and initializes an instance of TWebButton (see page 5504).

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.

	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.

52.1.48.2 TWebButton.Create Constructor

Creates and initializes an instance of TWebButton (see page 5504).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebButton(TComponent * AOwner);
```

Description

Call Create to instantiate a Web button at runtime. Web buttons added at design time using the Web Page editor are instantiated automatically.

52.1.48.3 TWebButton Methods

The methods of the TWebButton class are listed here.

Protected Methods

	Name	Description
	Content (see page 5506)	Returns the HTML that defines the button control.
V	GetCaption (see page 5507)	Returns the value of the Caption (see page 5508) property.
V	GetLayoutAttributes (see page 5507)	Returns the layout object that specifies how the generated control should look.
A	ImplContent (see page 5507)	Provides the underlying implementation for the Content (see page 5506) method.
V	SetCaption (see page 5508)	Sets the value of the Caption (see page 5508) property.

52.1.48.3.1 TWebButton.Content Method

Returns the HTML that defines the button control.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Content implements the IWebContent method of the same name. This method allows the Web button's parent to extract the HTML defining the button.

Content calls the virtual ImplContent (see page 5507) method to provide the content it returns. Each TWebButton (see page 5504) descendant overrides ImplContent (see page 5507) to generate the definition of its particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the button control.

See Also

ImplContent (see page 5507)

IWebContent

ILayoutWebContent

52.1.48.3.2 TWebButton.GetCaption Method

Returns the value of the Caption (see page 5508) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 5508) property.

See Also

Caption (see page 5508)

SetCaption (see page 5508)

52.1.48.3.3 TWebButton.GetLayoutAttributes Method

Returns the layout object that specifies how the generated control should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 5506) method) to take into account layout properties of the child component.

As implemented by TWebButton (see page 5504), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout of buttons does not make use of layout attributes.

See Also

Content (see page 5506)

52.1.48.3.4 TWebButton.ImplContent Method

Provides the underlying implementation for the Content (see page 5506) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout Layout) = 0;
```

Description

The Content (see page 5506) method calls ImplContent to generate the HTML that defines the button control. TWebButton (see page 5504) introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton (see page 5504) descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 5506)

ILayoutWebContent

52.1.48.3.5 TWebButton.SetCaption Method

Sets the value of the Caption (see page 5508) property.

Pascal

```
procedure SetCaption(const AValue: string); virtual;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString AValue);
```

Description

SetCaption is the protected write implementation for the Caption (see page 5508) property.

See Also

Caption (see page 5508)

GetCaption (see page 5507)

52.1.48.4 TWebButton Properties

The properties of the TWebButton class are listed here.

Public Properties

	Name	Description
	Caption (see page 5508)	Specifies the caption that appears on the button.
	Custom (see page 5509)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 5509)	Adds style attributes to the generated button control.
	StyleRule (see page 5510)	Applies a style in the page producer's style sheet to the button.

52.1.48.4.1 TWebButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 5509)

GetCaption (see page 5507)

SetCaption (see page 5508)

52.1.48.4.2 TWebButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 5508)

Style (see page 5509)

52.1.48.4.3 TWebButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 5509)

StyleRule (see page 5510)

52.1.48.4.4 TWebButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style (see page 5509) property.

See Also

Style (see page 5509)

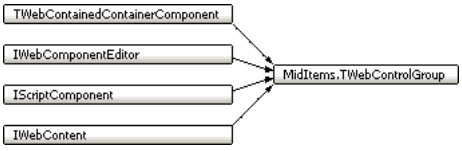
52.1.49 TWebControlGroup Class

TWebControlGroup is the base class for Web items that arrange HTML controls.

Class Hierarchy



Pascal

```
TWebControlGroup = class(TWebContainedContainerComponent, IWebComponentEditor,
IScriptComponent, IWebContent);
```

C++

```
class TWebControlGroup : public TWebContainedContainerComponent, public IWebComponentEditor,
public IScriptComponent, public IWebContent;
```

File

MidItems

Description

Use TWebControlGroup as a base class for components that generate organized portions of the HTML document containing one or more related HTML controls. TWebControlGroup introduces the properties and methods for managing a collection of Web items that generate the HTML controls that make up the group.

In order to let other Web items to use the HTML that defines the organized collection of controls, TWebControlGroup implements the IWebContent interface.

Do not create instances of TWebControlGroup. TWebControlGroup manages the Web items that generate HTML defining controls, but does not combine the generated content into any content of its own. Instead, use a descendant of TWebControlGroup for a set of specialized controls. These descendants are listed in the See also list.

52.1.49.1 TWebControlGroup Members

The following tables list the members exposed by TWebControlGroup.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Methods

	Name	Description
	Create (see page 5512)	Creates and initializes an instance of TWebControlGroup (see page 5510).
	Destroy (see page 5512)	Frees an instance of TWebControlGroup (see page 5510).

Public Properties

	Name	Description
	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

52.1.49.2 TWebControlGroup.Create Constructor

Creates and initializes an instance of TWebControlGroup (see page 5510).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebControlGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TWebControlGroup (see page 5510) at runtime. TWebControlGroup (see page 5510) descendants added at design time are instantiated automatically.

52.1.49.3 TWebControlGroup.Destroy Destructor

Frees an instance of TWebControlGroup (see page 5510).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebControlGroup();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

52.1.49.4 TWebControlGroup Methods

The methods of the TWebControlGroup class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 5513)	Used internally to generate any script declarations needed by the group of controls.

	CanAddClass (see page 5513)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.
	ChangeFieldControls (see page 5514)	Responds when the group of HTML controls changes.
	Content (see page 5514)	Returns the HTML that defines the group of HTML controls.
V	GetDefaultWebComponents (see page 5515)	Returns the value of the DefaultWebComponents (see page 5518) property.
V	GetLayoutAttributes (see page 5515)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 5516)	Returns the value of the WebFieldControls (see page 5519) property.
V	ImplAddElements (see page 5516)	Provides the underlying implementation for the AddElements (see page 5513) method.
V	ImplCanAddClass (see page 5516)	Provides the underlying implementation for the CanAddClass (see page 5513) method.
V	ImplContent (see page 5517)	Provides the underlying implementation for the Content (see page 5514) method.
V	ImplGetSubComponents (see page 5517)	Provides the underlying implementation for the GetSubComponents (see page 5516) method.
V	SetDefaultWebComponents (see page 5518)	Sets the value of the DefaultWebComponents (see page 5518) property.

52.1.49.4.1 TWebControlGroup.AddElements Method

Used internally to generate any script declarations needed by the group of controls.

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

The page producer calls AddElements when it generates the block of declarations for the script language it uses. This method allows the generated group of controls to use classes and methods in the scripting language of the page producer.

AddElements calls on the virtual ImplAddElements (see page 5516) method, which uses the provided interface to return its declarations. Each TWebControlGroup (see page 5510) descendant overrides ImplAddElements (see page 5516) to add any declarations it needs.

See Also

ImplAddElements (see page 5516)

TAdapterPageProducer

TInetXPageProducer (see page 5730)

52.1.49.4.2 TWebControlGroup.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 5519) property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the TWebControlGroup (see page 5510) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 5516) method to determine whether a class of Web item is valid.

AParent is the TWebControlGroup (see page 5510) descendant to whose WebFieldControls (see page 5519) property the Web item will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the TWebControlGroup (see page 5510) descendant can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 5516)

WebFieldControls (see page 5519)

52.1.49.4.3 TWebControlGroup.ChangeFieldControls Method

Responds when the group of HTML controls changes.

Pascal

```
procedure ChangeFieldControls(Sender: TObject);
```

C++

```
__fastcall ChangeFieldControls(TObject * Sender);
```

Description

ChangeFieldControls is called automatically when the list of Web items that generate HTML controls in this group changes. (It is assigned as the OnChange event handler to the TWebComponentList object that implements the WebFieldControls (see page 5519) property.)

ChangeFieldControls sets the DefaultWebComponents (see page 5518) property to nil (Delphi) or NULL (C++) when an application explicitly assigns child items to the WebFieldControls (see page 5519) property.

See Also

OnChange

WebFieldControls (see page 5519)

DefaultWebComponents (see page 5518)

DefaultWebComponents (see page 5518)

52.1.49.4.4 TWebControlGroup.Content Method

Returns the HTML that defines the group of HTML controls.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebControlGroup (see page 5510) object's parent to extract the HTML that defines and lays out a set of controls.

Content calls the virtual ImplContent (see page 5517) method to provide the HTML it returns. Each TWebControlGroup (see page 5510) descendant overrides ImplContent (see page 5517) to generate its particular group of controls. The generated HTML can make use of any script declarations supplied by the AddElements (see page 5513) method.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the group of controls.

See Also

ImplContent (see page 5517)

IWebContent

AddElements (see page 5513)

ILayoutWebContent

52.1.49.4.5 TWebControlGroup.GetDefaultWebComponents Method

Returns the value of the DefaultWebComponents (see page 5518) property.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents returns the value of DefaultWebComponents (see page 5518). When no Web items have explicitly been added to the control group, this is a list of controls that appear by default. Once an application explicitly assigns controls to the WebFieldControls (see page 5519) property, GetDefaultWebComponents returns nil (Delphi) or NULL (C++).

See Also

WebFieldControls (see page 5519)

DefaultWebComponents (see page 5518)

SetDefaultWebComponents (see page 5518)

52.1.49.4.6 TWebControlGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 5514) method) to take into account layout properties of the child component.

As implemented by TWebControlGroup (see page 5510), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup (see page 5510) descendants not make use of layout attributes.

See Also

Content (see page 5514)

52.1.49.4.7 TWebControlGroup.GetSubComponents Method

Returns the value of the WebFieldControls (see page 5519) property.

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

GetSubComponents returns the TWebControlGroup (see page 5510)'s list of Web items that it uses to generate HTML content. This method is part of the mechanism that fits TWebControlGroup (see page 5510) into a hierarchy of Web items, each of which generates part of a larger HTML document.

See Also

WebFieldControls (see page 5519)

ImplGetSubComponents (see page 5517)

52.1.49.4.8 TWebControlGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements (see page 5513) method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements (see page 5513) method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup (see page 5510), ImplAddElements does nothing. TWebControlGroup (see page 5510) descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 5513)

52.1.49.4.9 TWebControlGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 5513) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 5513) method calls ImpleCanAddClass to determine whether the TWebControlGroup (see page 5510) descendant can add a component of type AClass to its WebComponents property list. AParent is the

TWebControlGroup (see page 5510) instance to which the component will be added.

In TWebControlGroup (see page 5510), ImplCanAddClass always returns true. TWebControlGroup (see page 5510) descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 5513)

WebFieldControls (see page 5519)

52.1.49.4.10 TWebControlGroup.ImplContent Method

Provides the underlying implementation for the Content (see page 5514) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 5514) method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup (see page 5510), ImplContent returns an empty string. TWebControlGroup (see page 5510) descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup (see page 5510) should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 5514)

AddElements (see page 5513)

ILayoutWebContent

52.1.49.4.11 TWebControlGroup.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents (see page 5516) method.

Pascal

```
function ImplGetSubComponents: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents (see page 5516) method calls ImplGetSubComponents to retrieve the value of WebFieldControls (see page 5519) as a TObject. TWebControlGroup (see page 5510) descendants override this method if the list is not simply the value of WebFieldControls (see page 5519). For example, some TWebControlGroup (see page 5510) descendants supply a default value (DefaultWebComponents (see page 5518)) when the WebFieldControls (see page 5519) property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 5516)

DefaultWebComponents (see page 5518)

WebFieldControls (see page 5519)

52.1.49.4.12 TWebControlGroup.SetDefaultWebComponents Method

Sets the value of the DefaultWebComponents (see page 5518) property.

Pascal

```
procedure SetDefaultWebComponents(Value: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList Value);
```

Description

SetDefaultWebComponents assigns a list of Web items as the value of the DefaultWebComponents (see page 5518) property. This list specifies the controls that appear in the control group if the application does not explicitly assign any controls to the WebFieldControls (see page 5519) property.

See Also

DefaultWebComponents (see page 5518)

GetDefaultWebComponents (see page 5515)

WebFieldControls (see page 5519)

52.1.49.5 TWebControlGroup Properties

The properties of the TWebControlGroup class are listed here.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 5518)	Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Public Properties

	Name	Description
R	WebFieldControls (see page 5519)	Lists the components that generate HTML controls for the Web control group.

52.1.49.5.1 TWebControlGroup.DefaultWebComponents Property

Specifies the default value of the WebFieldControls (see page 5519) property when that property is not explicitly set.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Most TWebControlGroup (see page 5510) descendants have a default set of values for the WebFieldControls (see page

5519) property.

Note: For example, on Windows, TDataNavigator (see page 5307) has a default set of buttons and TFieldGroup (see page 5320) defaults to a control for each field in the associated data packet.

TWebControlGroup (see page 5510) descendants that supply default sets of Web items store these default sets as the value of the protected DefaultWebComponents property. Then, if the value of WebFieldControls (see page 5519) is not set, the TWebControlGroup (see page 5510) descendant uses DefaultWebComponents instead.

See Also

WebFieldControls (see page 5519)

52.1.49.5.2 TWebControlGroup.WebFieldControls Property

Lists the components that generate HTML controls for the Web control group.

Pascal

```
property WebFieldControls: TWebComponentList;
```

C++

```
__property TWebComponentList WebFieldControls;
```

Description

WebFieldControls lists the components that generate the related HTML controls that the Web control group assembles into a single unit. Each of these components supports the IWebContent interface, and some can contain their own list of Web items that help them generate their content.

The type of items that can be added to the WebFieldControls list are restricted by the CanAddClass (see page 5513) method. TWebControlGroup (see page 5510) does not restrict the items in the list at all, but descendant classes add restrictions to limit the list to related types of controls.

Note: For example, on Windows, TDataNavigator (see page 5307) limits the list to button generators that are descendants of TDataSetButton (see page 5311) or TXMLButton (see page 5595).

At design time, add components to the WebFieldControls property by bringing up the Web page editor for the containing page producer. Select the Web control group in the editor, and use the editor to add child controls.

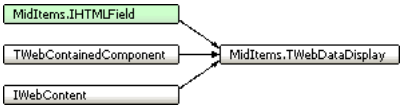
IWebContent

CanAddClass (see page 5513)

52.1.50 TWebDataDisplay Class

TWebDataDisplay is the base class for Web items that create HTML display controls.

Class Hierarchy



Pascal

```
TWebDataDisplay = class(TWebContainedComponent, IWebContent, IHTMLField);
```

C++

```
class TWebDataDisplay : public TWebContainedComponent, public IWebContent, public IHTMLField;
```

File

MidItems

Description

Use TWebDataDisplay as a base class for components that generate HTML controls which display information in a WebSnap or InternetExpress application. TWebDataDisplay descendants generate the individual controls that are organized by TAdapterGrid or TAdapterFieldGroup.

Note: On Windows, additional descendants, TDataGrid (see page 5302), TFieldGroup (see page 5320), or TQueryFieldGroup (see page 5415), can be used to generate the individual controls.

TWebDataDisplay introduces the properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataDisplay implements the IWebContent interface.

Do not create instances of TWebDataDisplay. TWebDataDisplay relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataDisplay that generates an HTML control of the desired type.

IWebContent

TAdapterGrid

TAdapterFieldGroup

TDataGrid (see page 5302)

TFieldGroup (see page 5320)

TQueryFieldGroup (see page 5415)

52.1.50.1 TWebDataDisplay Members

The following tables list the members exposed by TWebDataDisplay.

Protected Methods

	Name	Description
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.

	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
V	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
V	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	Caption (see page 5529)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5530)	Customizes the appearance of the generated control's label.
	Custom (see page 5530)	Represents a tag option and its value in the tag for the display control.
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.
	Style (see page 5531)	Adds style attributes to the generated display control.
	StyleRule (see page 5532)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 5532)	Determines the position of the generated control in the HTML form's tab order.

52.1.50.2 TWebDataDisplay.Create Constructor

Creates and initializes an instance of TWebDataDisplay (see page 5519).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebDataDisplay(TComponent * AOwner);
```

Description

Call Create to instantiate TWebDataDisplay (see page 5519) at runtime. TWebDataDisplay (see page 5519) descendants added at design time are instantiated automatically.

52.1.50.3 TWebDataDisplay.Destroy Destructor

Frees an instance of TWebDataDisplay (see page 5519).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDataDisplay();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component is not nil, and only then calls Destroy.

See Also

System::TObject::Free

52.1.50.4 TWebDataDisplay Methods

The methods of the TWebDataDisplay class are listed here.

Protected Methods

	Name	Description
	Content (see page 5523)	Returns the HTML that defines the display control.
	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
	EventContent (see page 5523)	This is EventContent, a member of class TWebDataDisplay.
	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 5524)	Returns the value of the Caption (see page 5529) property.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
	ImplGetHTMLControlName (see page 5527)	Returns the name that other components can use to refer to the generated display control.
	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	SetCaption (see page 5528)	Sets the value of the Caption (see page 5529) property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.

Public Methods

	Name	Description
	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

52.1.50.4.1 TWebDataDisplay.Content Method

Returns the HTML that defines the display control.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebDataDisplay (see page 5519) component's parent to extract the HTML defining the display control.

Content calls the virtual ImplContent (see page 5526) method to provide the HTML content that it returns. Each TWebDataDisplay (see page 5519) descendant overrides ImplContent (see page 5526) to generate the definition of its particular control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML control it generates. It supports the ILayoutWebContent interface.

Content returns a string of HTML defining the display control.

See Also

ImplContent (see page 5526)

IWebContent

ILayoutWebContent

52.1.50.4.2 TWebDataDisplay.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options) = 0;
```

Description

This is ControlContent, a member of class TWebDataDisplay.

52.1.50.4.3 TWebDataDisplay.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataDisplay.

52.1.50.4.4 TWebDataDisplay.FormatCaption Method

Pascal

```
function FormatCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString FormatCaption();
```

Description

This is FormatCaption, a member of class TWebDataDisplay.

52.1.50.4.5 TWebDataDisplay.GetCaption Method

Returns the value of the Caption (see page 5529) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 5529) property.

See Also

Caption (see page 5529)

52.1.50.4.6 TWebDataDisplay.GetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function GetHTMLControlName: string;
```

C++

```
__fastcall UnicodeString GetHTMLControlName();
```

Description

GetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

GetHTMLControlName returns the value supplied by the ImplGetHTMLControlName (see page 5527) method. Unlike GetHTMLControlName, ImplGetHTMLControlName (see page 5527) is a virtual method that descendants can override to supply a name in class-specific ways.

See Also

ImplGetHTMLControlName (see page 5527)

52.1.50.4.7 TWebDataDisplay.GetHTMLForm Method

Used internally to retrieve information about the form in which the display control is defined.

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

TWebDataDisplay (see page 5519) and its descendants use GetHTMLForm to obtain information about the form in which the generated display control appears. This information is used to generate code for calling form methods in response to user events.

GetHTMLForm walks up the hierarchy of Web items (using the GetParentComponent method) until it finds a component that can supply an interface for the HTML form.

See Also

GetParentComponent

52.1.50.4.8 TWebDataDisplay.GetLayoutAttributes Method

Returns the value of the LayoutAttributes (see page 5531) property.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 5523) method) to take into account layout properties of the child component.

GetLayoutAttributes returns the value of the LayoutAttributes (see page 5531) property.

See Also

Content (see page 5523)

LayoutAttributes (see page 5531)

52.1.50.4.9 TWebDataDisplay.GetXmlDisplayName Method

Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.

Pascal

```
function GetXmlDisplayName: string;
```

C++

```
__fastcall UnicodeString GetXmlDisplayName();
```

Description

GetXmlDisplayName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 5519) for descendant classes that are only accessible on Windows.

On Windows, GetXmlDisplayName returns the name of the javascript object that groups the set of display controls which includes this TWebDataDisplay (see page 5519) descendant's generated control. The javascript object is generated by a TDataGrid (see page 5302) or TFieldGroup (see page 5320) component, and provides the display component's link to its

XML data packet. Typically, the TDataGrid (see page 5302) or TFieldGroup (see page 5320) component is the parent of the TWebDataDisplay (see page 5519) component, but it may be higher in the parent hierarchy if the application uses layout groups.

See Also

TDataGrid (see page 5302)

TFieldGroup (see page 5320)

TQueryFieldGroup (see page 5415)

xmlbroker (see page 5631)

52.1.50.4.10 TWebDataDisplay.GetXmlRowSetName Method

Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.

Pascal

```
function GetXmlRowSetName: string;
```

C++

```
__fastcall UnicodeString GetXmlRowSetName();
```

Description

GetXmlRowSetName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 5519) for descendant classes that are only accessible on Windows.

On Windows, GetXmlRowSetName is used when generating HTML that accesses data from the XML data packet. It returns the name of the rowset that represents the data in the Web data display.

As implemented in TWebDataDisplay (see page 5519), GetXmlRowSetName walks up the parent hierarchy until it finds a Web item associated with a rowset, and then returns the name of that rowset.

See Also

GetXmlDisplayName (see page 5525)

52.1.50.4.11 TWebDataDisplay.ImplContent Method

Provides the underlying implementation for the Content (see page 5523) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 5523) method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent (see page 5523) method. ControlContent (see page 5523) is an abstract (pure virtual) method in TWebDataDisplay (see page 5519). TWebDataDisplay (see page 5519) descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay (see page 5519)

should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

See Also

Content (see page 5523)

Caption (see page 5529)

ILayoutWebContent

52.1.50.4.12 TWebDataDisplay.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay (see page 5519) descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name

52.1.50.4.13 TWebDataDisplay.IsColumn Method

Indicates whether the component generates the controls that appear in the column of a grid.

Pascal

```
class function IsColumn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a TWebDataDisplay (see page 5519) descendant generates the controls that appear in a single column of an adapter grid (TAdapterGrid) or data grid (TDataGrid (see page 5302)). As implemented in TWebDataDisplay (see page 5519), IsColumn returns false. Descendant classes that generate controls for the columns of a grid override this method to return true.

See Also

IsQueryField (see page 5528)

TDataGrid (see page 5302)

TAdapterGrid

52.1.50.4.14 TWebDataDisplay.IsQueryField Method

Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Pascal

```
class function IsQueryField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

IsQueryField is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 5519) for descendant classes that are only used on Windows.

On Windows, Call IsQueryField to determine whether a TWebDataDisplay (see page 5519) descendant generates the controls that represent a named value in a query form (TQueryForm (see page 5421)). As implemented in TWebDataDisplay (see page 5519), IsQueryField returns false. Descendant classes that generate controls for a TQueryFieldGroup (see page 5415) component override this method to return true.

See Also

IsColumn (see page 5527)

TQueryFieldGroup (see page 5415)

TQueryForm (see page 5421)

52.1.50.4.15 TWebDataDisplay.LabelContent Method

Pascal

```
function LabelContent: string; virtual;
```

C++

```
virtual __fastcall UnicodeString LabelContent();
```

Description

This is LabelContent, a member of class TWebDataDisplay.

52.1.50.4.16 TWebDataDisplay.SetCaption Method

Sets the value of the Caption (see page 5529) property.

Pascal

```
procedure SetCaption(Value: string); virtual;
```

C++

```
virtual __fastcall SetCaption(UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption (see page 5529) property.

See Also

Caption (see page 5529)

52.1.50.4.17 TWebDataDisplay.SetCaptionAttributes Method

Sets the value of the CaptionAttributes (see page 5530) property.

Pascal

```
procedure SetCaptionAttributes(const Value: TCaptionAttributes);
```

C++

```
__fastcall SetCaptionAttributes(const TCaptionAttributes Value);
```

Description

SetCaptionAttributes is the protected write implementation for the CaptionAttributes (see page 5530) property.

See Also

CaptionAttributes (see page 5530)

52.1.50.5 TWebDataDisplay Properties

The properties of the TWebDataDisplay class are listed here.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.

Public Properties

	Name	Description
	Caption (see page 5529)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 5530)	Customizes the appearance of the generated control's label.
	Custom (see page 5530)	Represents a tag option and its value in the tag for the display control.
	Style (see page 5531)	Adds style attributes to the generated display control.
	StyleRule (see page 5532)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 5532)	Determines the position of the generated control in the HTML form's tab order.

52.1.50.5.1 TWebDataDisplay.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 5530)

CaptionPosition (see page 5530)

52.1.50.5.2 TWebDataDisplay.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption (see page 5529) property.

See Also

Caption (see page 5529)

CaptionPosition (see page 5530)

HeadingAttributes (see page 5269)

52.1.50.5.3 TWebDataDisplay.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 5530)

Caption (see page 5529)

52.1.50.5.4 TWebDataDisplay.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

TWebDataDisplay (see page 5519) descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes (see page 5530) property instead.

See Also

Style (see page 5531)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

52.1.50.5.5 TWebDataDisplay.LayoutAttributes Property

Encodes attributes that describe how the generated control should look.

Pascal

```
property LayoutAttributes: TLayoutAttributes;
```

C++

```
__property TLayoutAttributes LayoutAttributes;
```

Description

LayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 5523) method) to take into account layout properties of the child component.

LayoutAttributes encodes the information in the CaptionPosition (see page 5530) and CaptionAttributes (see page 5530) properties. Some descendant classes add information from the Style (see page 5531) and StyleRule (see page 5532) properties as well.

See Also

GetLayoutAttributes (see page 5525)

CaptionPosition (see page 5530)

Content (see page 5523)

Style (see page 5531)

CaptionAttributes (see page 5530)

stylerule (see page 5532)

52.1.50.5.6 TWebDataDisplay.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes (see page 5530) property instead.

See Also

Custom (see page 5530)

stylerule (see page 5532)

CaptionAttributes (see page 5530)

Setting Web Item Properties

52.1.50.5.7 TWebDataDisplay.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

This is StyleRule, a member of class TWebDataDisplay.

52.1.50.5.8 TWebDataDisplay.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

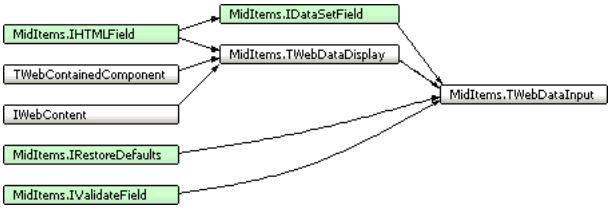
Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

52.1.51 TWebDataInput Class

TWebDataInput is the base class for Web items that create HTML display controls for entering information.

Class Hierarchy



Pascal

```
TWebDataInput = class(TWebDataDisplay, IRestoreDefaults, IDataSetField, IValidateField);
```

C++

```
class TWebDataInput : public TWebDataDisplay, public IRestoreDefaults, public IDataSetField,
public IValidateField;
```

File

MidItems

Description

Use TWebDataInput as a base class for components that generate HTML controls which display information in an InternetExpress application and into which users can enter values. TWebDataInput descendants generate controls that are organized by TDataGrid (see page 5302), TFieldGroup (see page 5320), or TQueryFieldGroup (see page 5415).

TWebDataInput defines or inherits properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Specifying a field or parameter whose value the control displays.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataInput inherits the IWebContent interface from TWebDataDisplay (see page 5519).

Do not create instances of TWebDataInput. TWebDataInput relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataInput that generates an HTML control of the desired type.

IWebContent

TDataGrid (see page 5302)

TFieldGroup (see page 5320)

TQueryFieldGroup (see page 5415)

52.1.51.1 TWebDataInput Members

The following tables list the members exposed by TWebDataInput.

Protected Methods

	Name	Description
	Content (see page 5523)	Returns the HTML that defines the display control.
A	ControlContent (see page 5523)	This is ControlContent, a member of class TWebDataDisplay.
V	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 5524)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 5524)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 5524)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 5525)	Returns the value of the LayoutAttributes (see page 5531) property.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetXmlDisplayName (see page 5525)	Returns the name of the javascript object that uses TWebDataDisplay (see page 5519) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 5526)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 5526)	Provides the underlying implementation for the Content (see page 5523) method.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
V	LabelContent (see page 5528)	This is LabelContent, a member of class TWebDataDisplay.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 5529)	Sets the value of the CaptionAttributes (see page 5530) property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

Protected Properties

	Name	Description
	CaptionPosition (see page 5530)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 5531)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Methods

	Name	Description
V	Create (see page 5521)	Creates and initializes an instance of TWebDataDisplay (see page 5519).
V	Destroy (see page 5522)	Frees an instance of TWebDataDisplay (see page 5519).
	GetHTMLControlName (see page 5654)	Returns the name of the generated HTML <INPUT> control.
V	IsColumn (see page 5527)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 5528)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Public Properties

	Name	Description
	Caption (see page 5529)	Specifies the text of a label that indicates what information the generated control displays.

	CaptionAttributes (see page 5530)	Customizes the appearance of the generated control's label.
	Custom (see page 5530)	Represents a tag option and its value in the tag for the display control.
	FieldName (see page 5539)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 5655)	Indicates the name of the generated HTML control.
	Style (see page 5531)	Adds style attributes to the generated display control.
	StyleRule (see page 5532)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 5532)	Determines the position of the generated control in the HTML form's tab order.

52.1.51.2 TWebDataInput Methods

The methods of the TWebDataInput class are listed here.

Protected Methods

	Name	Description
V	EventContent (see page 5535)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 5535)	This is FindAssociatedField, a member of class TWebDataInput.
V	GetCaption (see page 5536)	Returns the value of the Caption property.
	GetFieldName (see page 5536)	This is GetFieldName, a member of class TWebDataInput.
V	GetParamName (see page 5536)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 5536)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetFieldName (see page 5537)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 5537)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 5537)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 5537)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	RestoreDefaults (see page 5538)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 5538)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 5538)	Sets the value of the Caption property.
	SetFieldName (see page 5538)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 5539)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 5539)	This is ValidateField, a member of class TWebDataInput.

52.1.51.2.1 TWebDataInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataInput.

52.1.51.2.2 TWebDataInput.FindAssociatedField Method

Pascal

```
function FindAssociatedField(DataSet: IInetXWebDataSet): TField; virtual;
```

C++

```
virtual __fastcall TField FindAssociatedField(IInetXWebDataSet DataSet);
```

Description

This is FindAssociatedField, a member of class TWebDataInput.

52.1.51.2.3 TWebDataInput.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 5529)

52.1.51.2.4 TWebDataInput.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall UnicodeString GetFieldName();
```

Description

This is GetFieldName, a member of class TWebDataInput.

52.1.51.2.5 TWebDataInput.GetParamName Method

Pascal

```
function GetParamName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetParamName();
```

Description

This is GetParamName, a member of class TWebDataInput.

52.1.51.2.6 TWebDataInput.GetRowSetFieldAttributes Method

Pascal

```
function GetRowSetFieldAttributes(const FieldVarName: string): string;
```

C++

```
__fastcall UnicodeString GetRowSetFieldAttributes(const UnicodeString FieldVarName);
```

Description

This is GetRowSetFieldAttributes, a member of class TWebDataInput.

52.1.51.2.7 TWebDataInput.ImplGetFieldName Method

Pascal

```
function ImplGetFieldName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetFieldName();
```

Description

This is ImplGetFieldName, a member of class TWebDataInput.

52.1.51.2.8 TWebDataInput.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name

52.1.51.2.9 TWebDataInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetRowSetFieldAttributes(const UnicodeString
FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.

52.1.51.2.10 TWebDataInput.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TWebDataInput.

52.1.51.2.11 TWebDataInput.RestoreDefaults Method

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

This is RestoreDefaults, a member of class TWebDataInput.

52.1.51.2.12 TWebDataInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); virtual;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebDataInput.

52.1.51.2.13 TWebDataInput.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(Value: string); override;
```

C++

```
virtual __fastcall SetCaption(UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

See Also

Caption (see page 5529)

52.1.51.2.14 TWebDataInput.SetFieldName Method

Pascal

```
procedure SetFieldName(Value: string);
```

C++

```
__fastcall SetFieldName(UnicodeString Value);
```

Description

This is SetFieldName, a member of class TWebDataInput.

52.1.51.2.15 TWebDataInput.SetParamName Method

Pascal

```
procedure SetParamName(Value: string);
```

C++

```
__fastcall SetParamName(UnicodeString Value);
```

Description

This is SetParamName, a member of class TWebDataInput.

52.1.51.2.16 TWebDataInput.ValidateField Method

Pascal

```
function ValidateField(DataSet: IInetXWebDataSet; AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateField(IInetXWebDataSet DataSet, IAddScriptElements AddIntf);
```

Description

This is ValidateField, a member of class TWebDataInput.

52.1.51.3 TWebDataInput Properties

The properties of the TWebDataInput class are listed here.

Protected Properties

	Name	Description
	ParamName (see page 5540)	Specifies the name of the parameter whose value the generated control represents.

Public Properties

	Name	Description
	FieldName (see page 5539)	Specifies the name of the field whose value the generated control represents.

52.1.51.3.1 TWebDataInput.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 5631)

XMLDataSetField (see page 5631)

ParamName (see page 5540)

Setting Web Item Properties

52.1.51.3.2 TWebDataInput.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property UnicodeString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField (see page 5528) method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 5539)

IsQueryField (see page 5528)

Params

Setting Web Item Properties

52.1.52 TWebDisplay Class

Class Hierarchy

Pascal

```
TWebDisplay = class(TObject);
```

C++

```
class TWebDisplay : public TObject;
```

File

MidItems

Description

This is class MidItems.TWebDisplay.

52.1.52.1 TWebDisplay Members

The following tables list the members exposed by TWebDisplay.

Protected Methods

	Name	Description
	Changed (see page 5542)	This is Changed, a member of class TWebDisplay.
V	ChangedDisplayComponent (see page 5542)	This is ChangedDisplayComponent, a member of class TWebDisplay.
V	GetDisplayComponent (see page 5542)	This is GetDisplayComponent, a member of class TWebDisplay.
	SetDisplayComponent (see page 5542)	This is SetDisplayComponent, a member of class TWebDisplay.

Public Events

	Name	Description
	OnChange (see page 5543)	This is OnChange, a member of class TWebDisplay.

Public Methods

	Name	Description
	Create (see page 5541)	This is Create, a member of class TWebDisplay.
V	Notification (see page 5542)	This is Notification, a member of class TWebDisplay.

Public Properties

	Name	Description
	DisplayComponent (see page 5543)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 5543)	This is Parent, a member of class TWebDisplay.

52.1.52.2 TWebDisplay.Create Constructor

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TWebDisplay(TComponent * AParent);
```

Description

This is Create, a member of class TWebDisplay.
