    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

10.1.4.2.40 TDrawGrid.VisibleColCount Property

Indicates the number of scrollable columns visible in the grid.

Pascal

```
property VisibleColCount: Integer;
```

C++

```
__property int VisibleColCount;
```

Description

Use VisibleColCount to determine the number of scrollable columns fully visible in the grid. VisibleColCount does not include the fixed columns counted by the FixedCols property. It does not include any partially visible columns on the right edge of the grid.

See Also

ColCount (see page 3062)

FixedCols (see page 3067)

VisibleRowCount (see page 3082)

10.1.4.2.41 TDrawGrid.VisibleRowCount Property

Indicates the number of scrollable rows visible in the grid.

Pascal

```
property VisibleRowCount: Integer;
```

C++

```
__property int VisibleRowCount;
```

Description

Use VisibleRowCount to determine the number of scrollable rows fully visible in the grid. VisibleRowCount does not include the fixed rows counted by the FixedRows property. It does not include any partially visible rows on the bottom of the grid.

See Also

FixedRows (see page 3068)

RowCount (see page 3075)

VisibleColCount (see page 3082)

10.1.4.3 TDrawGrid Events

The events of the TDrawGrid class are listed here.

Published Events

	Name	Description
	OnClick (see page 3125)	Occurs when the user clicks the control.
	OnColumnMoved (see page 3127)	Occurs immediately after the position of a column changes.
	OnContextPopup (see page 3127)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3128)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3128)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3131)	Occurs when the user drags an object over a control.
	OnDrawCell (see page 3134)	Occurs when a cell in the grid needs to be drawn.
	OnEndDock (see page 3135)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3135)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3136)	Occurs when a control receives the input focus.

	OnExit (see page 3139)	Occurs when the input focus shifts away from one control to another.
	OnGetEditMask (see page 3142)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3142)	Occurs when the in-place editor requests the value of a cell.
	OnKeyDown (see page 3142)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3146)	Occurs when a key is pressed.
	OnKeyUp (see page 3147)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 3149)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3150)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3152)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3152)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3153)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3155)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheelDown (see page 3157)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 3157)	Occurs when the mouse wheel is rotated upward.
	OnRowMoved (see page 3158)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3158)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3159)	Occurs when the user edits the value of a cell.
	OnStartDock (see page 3159)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3160)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTopLeftChanged (see page 3160)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

10.1.4.3.1 TDrawGrid.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.

- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
```

```
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

10.1.4.3.2 TDrawGrid.OnColumnMoved Event

Occurs immediately after the position of a column changes.

Pascal

```
property OnColumnMoved: TMovedEvent;
```

C++

```
__property TMovedEvent OnColumnMoved;
```

Description

Use OnColumnMoved to perform special processing when the position of a grid column changes. Columns can be moved programmatically or by user manipulation. The FromIndex parameter is the old index of the column, and the ToIndex parameter is the new index. OnColumnMoved does not occur unless the Options (see page 3109) property includes goColMoving.

OnRowMoved (see page 3158)

Options (see page 3072)

10.1.4.3.3 TDrawGrid.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

10.1.4.3.4 TDrawGrid.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

10.1.4.3.5 TDrawGrid.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*

10.1.4.3.6 TDrawGrid.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*

10.1.4.3.7 TDrawGrid.OnDrawCell Event

Occurs when a cell in the grid needs to be drawn.

Pascal

```
property OnDrawCell: TDrawCellEvent;
```

C++

```
__property TDrawCellEvent OnDrawCell;
```

Description

Write an OnDrawCell event handler to draw the contents of all the cells in the grid. Draw on the cell using the methods of the Canvas (see page 3007) property.

If the OnDrawCell event handler is not assigned, all cells in the draw grid will appear empty. If the DefaultDrawing (see page 3100) property is true, the draw grid paints the background color of the cell before the OnDrawCell event, and draws a focus rectangle around the selected cell after the OnDrawCell event handler finishes drawing the contents of the cell. If the DefaultDrawing (see page 3100) property is false, the OnDrawCell event handler should paint the background of the cell and provide all visual indication of selection and focus.

DefaultDrawing (see page 3066)

10.1.4.3.8 TDrawGrid.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock;
```

C++

```
__property OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind

OnDragOver

OnDockDrop

10.1.4.3.9 TDrawGrid.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
```

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

10.1.4.3.10 TDrawGrid.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

10.1.4.3.11 TDrawGrid.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
```

```
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

begin
  // extract the net and host address from the IP
  IP := MaskEdit1.Text;
  net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
  net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
  host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
  host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));
```

```
    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows
  system color for a window.  These event handlers could also
  be shared.
  }
  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    Edit1.Color := clYellow;
  end;

  procedure TForm1.Edit1Exit(Sender: TObject);
  begin
    Edit1.Color := clWindow;
  end;

  procedure TForm1.Memo1Enter(Sender: TObject);
  begin
    Memo1.Color := clYellow;
  end;

  procedure TForm1.Memo1Exit(Sender: TObject);
  begin
    Memo1.Color := clWindow;
  end;
```

OnEnter

ActiveControl (see page 2145)

10.1.4.3.12 TDrawGrid.OnGetEditMask Event

Occurs when the in-place editor requests an edit mask.

Pascal

```
property OnGetEditMask: TGetEditEvent;
```

C++

```
__property TGetEditEvent OnGetEditMask;
```

Description

Write an OnGetEditMask event handler to provide the in-place editor with an edit mask that describes the valid input strings a user can type into a cell. Set the Value parameter to the string that describes the edit mask for the specified cell. If the cell does not have an edit mask, set the Value parameter to an empty string.

OnGetEditMask does not occur unless the Options (see page 3109) property includes goEditing.

See Also

Options (see page 3072)

EditMask (see page 4604)

10.1.4.3.13 TDrawGrid.OnGetEditText Event

Occurs when the in-place editor requests the value of a cell.

Pascal

```
property OnGetEditText: TGetEditEvent;
```

C++

```
__property TGetEditEvent OnGetEditText;
```

Description

Write an OnGetEditText event handler to provide the in-place editor with a string representing the contents of the cell. Set the Value parameter to the string for the specified cell. When the cell enters edit mode, the contents of the cell are drawn as the Value string returned by the OnGetEditText event handler. This image need not match the appearance of the cell when it is not in edit mode, which is drawn using the OnDrawCell (see page 3134) event handler.

OnGetEditText does not occur unless the Options (see page 3109) property includes goEditing.

See Also

OnDrawCell (see page 3134)

OnSetEditText (see page 3159)

10.1.4.3.14 TDrawGrid.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
```

```
}
/*

OnKeyPress

OnKeyUp

10.1.4.3.15 TDrawGrid.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
```

```
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyPress

10.1.4.3.17 TDrawGrid.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events.

This information is applicable to both VCL Win32 and VCL.NET.

10.1.4.3.18 TDrawGrid.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
```

```
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

10.1.4.3.19 TDrawGrid.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

10.1.4.3.20 TDrawGrid.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

10.1.4.3.21 TDrawGrid.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

10.1.4.3.23 TDrawGrid.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown;
```

C++

```
__property OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel

OnMouseWheelUp

10.1.4.3.24 TDrawGrid.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp;
```

C++

```
__property OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheelDown

OnMouseWheel

10.1.4.3.25 TDrawGrid.OnRowMoved Event

Occurs immediately after the position of a row changes.

Pascal

```
property OnRowMoved: TMovedEvent;
```

C++

```
__property TMovedEvent OnRowMoved;
```

Description

Write an OnRowMoved event handler to provide special processing whenever a row in the grid changes position. Rows can be moved programmatically or by user manipulation. The FromIndex parameter is the old index of the row, and the ToIndex parameter is the new index. OnRowMoved does not occur unless the Options (see page 3109) property includes goRowMoving.

OnColumnMoved (see page 3127)

Options (see page 3072)

10.1.4.3.26 TDrawGrid.OnSelectCell Event

Occurs before a cell in the grid is selected.

Pascal

```
property OnSelectCell: TSelectCellEvent;
```

C++

```
__property TSelectCellEvent OnSelectCell;
```

Description

Write an OnSelectCell event handler to specify whether any particular cell in the grid can be selected.

See Also

Col (see page 3060)

Row (see page 3074)

TabStops (see page 3079)

10.1.4.3.27 TDrawGrid.OnSetEditText Event

Occurs when the user edits the value of a cell.

Pascal

```
property OnSetEditText: TSetEditEvent;
```

C++

```
__property TSetEditEvent OnSetEditText;
```

Description

Write an OnSetEditText event handler to perform any special processing of the text edited by the user in an in-place editor. For example, use the OnSetEditText event to retrieve and store the value of a cell so that it can be displayed in an OnDrawCell (see page 3134) event handler. OnSetEditText occurs every time the user changes the text.

OnSetEditText does not occur unless the Options (see page 3109) property includes goEditing.

OnDrawCell (see page 3134)

OnGetEditText (see page 3142)

Options (see page 3072)

10.1.4.3.28 TDrawGrid.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

DragKind

OnDragOver

OnDockDrop

10.1.4.3.29 TDrawGrid.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

OnDragOver

OnDragDrop

10.1.4.3.30 TDrawGrid.OnTopLeftChanged Event

Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Pascal

```
property OnTopLeftChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTopLeftChanged;
```

Description

Use OnTopLeftChanged to perform special processing when the non-fixed cells in the grid are scrolled.

See Also

LeftCol (see page 3072)

TopRow (see page 3080)

10.1.5 TInplaceEdit Class

TInplaceEdit provides text editing capabilities for grid controls.

Class Hierarchy

Pascal

```
TInplaceEdit = class(TCustomMaskEdit);
```

C++

```
class TInplaceEdit : public TCustomMaskEdit;
```

File

Grids

Description

TInplaceEdit is a helper object tailored to work with grid controls. It provides a multiline editing window that appears in the appropriate cell of a grid control. TInplaceEdit provides services so that the grid can influence the response of the control to user actions, and can move or resize the editing window as cells are moved or resized.

The TInplaceEdit window has no border, so it does not stand out as a separate control. TInplaceEdit is not a data-aware control, but can work with a data-aware grid such as TDBGrid, allowing the grid to fetch or post the text, and allowing the grid to impose a mask to limit the text of the edit control to data that is valid.

See Also

TCustomGrid (see page 3027)

TDBEdit

TDBGrid

10.1.5.1 TInplaceEdit Members

The following tables list the members exposed by TInplaceEdit.

Protected Methods

	Name	Description
	BoundsChanged (see page 3163)	Indents the text area of the window slightly after the grid repositions the edit control.
	CheckCursor (see page 4595)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
	CreateParams (see page 3164)	Initializes a window-creation parameter record passed in the Params parameter.
	DblClick (see page 3164)	Informs the grid when the user double-clicks in the edit window.
	DoMouseWheel (see page 3165)	Delegates mouse wheel messages to the associated grid.
	EditCanModify (see page 3165)	Determines whether the user can edit the Text.
	GetFirstEditChar (see page 4596)	Returns the index in the EditMask (see page 4604) of the first nonliteral character.
	GetLastEditChar (see page 4597)	Returns the index in the EditMask (see page 4604) of the last nonliteral character.
	GetMaxChars (see page 4597)	Returns the length of the EditText (see page 4606).

	GetNextEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 4598)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 4599)	Returns the endpoints of the current selection in the EditText (see page 4606).
V	KeyDown (see page 3167)	Responds when the user presses a key.
V	KeyPress (see page 3167)	Responds when the user types a key.
V	KeyUp (see page 3168)	Responds when the user releases a key.
	ReformatText (see page 4601)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 4601)	Returns the EditText (see page 4606) to its value at the time when the edit control last lost focus.
	SetCursor (see page 4602)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 4602)	Selects character range.
V	UpdateContents (see page 3169)	Sets the EditMask and Text properties to values specified by the grid.
V	Validate (see page 4603)	Validates a specified string against the current mask.
V	ValidateError (see page 4603)	Beeps and raises an EDBEditError (see page 4592) exception.
V	WndProc (see page 3170)	Supplements the inherited method to add special processing to some Windows messages.

Protected Properties

	Name	Description
	EditMask (see page 4604)	Specifies the mask that represents what text is valid for the masked edit control.
R	Grid (see page 3171)	Specifies the grid object that owns and controls this TInplaceEdit (see page 3161).
	MaskState (see page 4607)	Indicates state information about how the mask is being applied.
	MaxLength (see page 4607)	Specifies the maximum number of characters that can appear in the edit control.

Public Methods

	Name	Description
V	Clear (see page 4595)	Sets the Text (see page 4608) property to an empty string.
V	Create (see page 3162)	Creates an instance of TInplaceEdit (see page 3161).
	Deselect (see page 3165)	Removes the selection from the edit window.
	GetTextLen (see page 4599)	Returns the length of the underlying text.
	Hide (see page 3166)	Hides the edit control window and moves input focus to the grid.
	Invalidate (see page 3166)	Invalidates the edit window and the corresponding portion of the grid window.
	Move (see page 3168)	Changes the position of the edit window and repaints the contents.
	PosEqual (see page 3168)	Indicates whether the edit window has the size and position indicated by Rect.
	SetFocus (see page 3169)	Gives the editor window input focus if it is visible.
	UpdateLoc (see page 3170)	Changes the position of the edit window but does not repaint the contents.
V	ValidateEdit (see page 4603)	Validates the EditText (see page 4606) against the current mask.
	Visible (see page 3170)	This is Visible, a member of class TInplaceEdit.

Public Properties

	Name	Description
	EditText (see page 4606)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 4606)	Indicates whether a mask exists for the edit control.
	Text (see page 4608)	Denotes the underlying text for the masked edit control before the mask has been applied.

10.1.5.2 TInplaceEdit.Create Constructor

Creates an instance of TInplaceEdit (see page 3161).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInplaceEdit(TComponent * AOwner);
```

Description

Do not create instances of TInplaceEdit (see page 3161). These are created automatically by the grid that uses the editor.

AOwner specifies the Owner for the editor. This is the component that is responsible for freeing the TInplaceEdit (see page 3161) instance.

Create overrides the default constructor to make sure that the control has no border to provide a visual indication that the control exists.

See Also

Hide (see page 3166)

BoundsChanged (see page 3163)

Owner

10.1.5.3 TInplaceEdit Methods

The methods of the TInplaceEdit class are listed here.

Protected Methods

	Name	Description
	BoundsChanged (see page 3163)	Indents the text area of the window slightly after the grid repositions the edit control.
	CreateParams (see page 3164)	Initializes a window-creation parameter record passed in the Params parameter.
	DblClick (see page 3164)	Informs the grid when the user double-clicks in the edit window.
	DoMouseWheel (see page 3165)	Delegates mouse wheel messages to the associated grid.
	EditCanModify (see page 3165)	Determines whether the user can edit the Text.
	KeyDown (see page 3167)	Responds when the user presses a key.
	KeyPress (see page 3167)	Responds when the user types a key.
	KeyUp (see page 3168)	Responds when the user releases a key.
	UpdateContents (see page 3169)	Sets the EditMask and Text properties to values specified by the grid.
	WndProc (see page 3170)	Supplements the inherited method to add special processing to some Windows messages.

Public Methods

	Name	Description
	Deselect (see page 3165)	Removes the selection from the edit window.
	Hide (see page 3166)	Hides the edit control window and moves input focus to the grid.
	Invalidate (see page 3166)	Invalidates the edit window and the corresponding portion of the grid window.
	Move (see page 3168)	Changes the position of the edit window and repaints the contents.
	PosEqual (see page 3168)	Indicates whether the edit window has the size and position indicated by Rect.
	SetFocus (see page 3169)	Gives the editor window input focus if it is visible.
	UpdateLoc (see page 3170)	Changes the position of the edit window but does not repaint the contents.
	Visible (see page 3170)	This is Visible, a member of class TInplaceEdit.

10.1.5.3.1 TInplaceEdit.BoundsChanged Method

Indents the text area of the window slightly after the grid repositions the edit control.

Pascal

```
procedure BoundsChanged; virtual;
```

C++

```
virtual __fastcall BoundsChanged();
```

Description

BoundsChanged reinitializes the editing window after the control has been moved or resized. It creates a slight indentation in the text formatting area so that the contents of the editor do not appear to crowd the edges of the cell.

BoundsChanged is exposed as a protected method so that derived objects can add further enhancements when the editing window changes size or location.

See Also

Move (see page 3168)

UpdateLoc (see page 3170)

PosEqual (see page 3168)

10.1.5.3.2 TInplaceEdit.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. TInplaceEdit (see page 3161) overrides the inherited method to specify a multiline edit control.

See Also

CreateWnd

CreateWindowHandle

10.1.5.3.3 TInplaceEdit.DblClick Method

Informs the grid when the user double-clicks in the edit window.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick is called when the user double-clicks in the edit window. DblClick simply passes the event on to the grid. The grid must interpret and respond to the double-click. If the edit window needs to respond to the double-click, the grid must trigger the response by calling a method or setting a property of the TInplaceEdit (see page 3161).

See Also

Grid (see page 3171)

10.1.5.3.4 TInplaceEdit.Deselect Method

Removes the selection from the edit window.

Pascal

```
procedure Deselect;
```

C++

```
__fastcall Deselect();
```

Description

Use Deselect to cause all text in the edit window to be unselected. Deselect simply changes the selection, it does not change the actual text.

See Also

ClearSelection

SelectAll

KeyPress (see page 3167)

10.1.5.3.5 TInplaceEdit.DoMouseWheel Method

Delegates mouse wheel messages to the associated grid.

Pascal

```
function DoMouseWheel(Shift: TShiftState; WheelDelta: Integer; MousePos: TPoint): Boolean;
override;
```

C++

```
virtual __fastcall Boolean DoMouseWheel(TShiftState Shift, int WheelDelta, TPoint MousePos);
```

Description

TInplaceEdit (see page 3161) overrides the inherited DoMouseWheel method so that it can pass any mouse wheel messages on to the grid specified by the Grid (see page 3171) property. This causes the grid's OnMouseWheel event handler to execute even though the inplace edit control has focus.

See Also

OnMouseWheel

Grid (see page 3171)

10.1.5.3.6 TInplaceEdit.EditCanModify Method

Determines whether the user can edit the Text.

Pascal

```
function EditCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean EditCanModify();
```

Description

EditCanModify is called automatically when the user tries to edit the value of Text. EditCanModify calls the CanEditModify method of the grid to determine whether the current cell of the grid should be edited. When EditCanModify returns true, the user is permitted to edit the text. When EditCanModify returns false, the user is prevented from editing the text.

See Also

Grid (see page 3171)

CanEditModify (see page 3037)

Text

10.1.5.3.7 TInplaceEdit.Hide Method

Hides the edit control window and moves input focus to the grid.

Pascal

```
procedure Hide;
```

C++

```
__fastcall Hide();
```

Description

Hide makes the edit control window invisible without destroying it. Hide also moves the input focus from the editor window to the grid, so that the invisible window does not swallow keyboard events.

The grid calls Hide to hide the edit window when changing out of edit mode. It also calls Hide when scrolling the cell that is being edited out of the grid window.

See Also

Grid (see page 3171)

10.1.5.3.8 TInplaceEdit.Invalidate Method

Invalidates the edit window and the corresponding portion of the grid window.

Pascal

```
procedure Invalidate; reintroduce;
```

C++

```
__fastcall Invalidate();
```

Description

Invalidate ensures that the portion of the grid window under the edit control is invalidated at the same time as the edit window. This is important when the edit window is hidden or destroyed so that the grid window can repaint the cell that was covered by the edit window.

See Also

Grid (see page 3171)

Hide (see page 3166)

10.1.5.3.9 TInplaceEdit.KeyDown Method

Responds when the user presses a key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When the user presses a key, KeyDown checks whether the edit control or grid should process the KeyDown event. The Enter key is always passed on to the grid. The F2 key calls Deselect (see page 3165) to remove the current selection. Navigation keystrokes are passed on to the grid when the movement cannot be accommodated within the text window. For example, if the user types Left when the cursor is already at the left edge of the edit window, the keystroke is passed to the grid which moves focus to the previous cell. If the cursor is in the middle of a line, the keystroke is processed by the edit window, which moves left a single character.

KeyDown calls the OnKeyDown event handler for the grid, if there is one, before calling the inherited KeyDown for the edit control.

See Also

Grid (see page 3171)

KeyPress (see page 3167)

KeyUp (see page 3168)

KeyDown (see page 4599)

10.1.5.3.10 TInplaceEdit.KeyPress Method

Responds when the user types a key.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress allows the grid to handle the keystroke, and only processes keystrokes that the grid does not fully handle. If the grid is not in edit mode after handling the keystroke, KeyPress throws away the keystroke. Keystroke processes the Return Key and calls the inherited method to handle all other unprocessed keystrokes.

Pressing the Return key causes KeyPress to select all the text, unless it is already selected, in which case it causes KeyPress to deselect all the text.

See Also

Grid (see page 3171)

SelectAll

Deselect (see page 3165)

KeyPress (see page 4600)

KeyDown (see page 3167)

KeyUp (see page 3168)

10.1.5.3.11 TInplaceEdit.KeyUp Method

Responds when the user releases a key.

Pascal

```
procedure KeyUp(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyUp(Word Key, TShiftState Shift);
```

Description

The inplace edit control does not process the KeyUp event at all. It simply passes this event on to the grid, which may or may not process the event.

See Also

Grid (see page 3171)

KeyDown (see page 3167)

KeyPress (see page 3167)

10.1.5.3.12 TInplaceEdit.Move Method

Changes the position of the edit window and repaints the contents.

Pascal

```
procedure Move(const Loc: TRect);
```

C++

```
__fastcall Move(const TRect Loc);
```

Description

The grid calls Move to move the edit window to the indicated rectangle when the corresponding cell moves or resizes. The position of Loc is relative to the grid's client area.

See Also

Grid (see page 3171)

UpdateLoc (see page 3170)

10.1.5.3.13 TInplaceEdit.PosEqual Method

Indicates whether the edit window has the size and position indicated by Rect.

Pascal

```
function PosEqual(const Rect: TRect): Boolean;
```

C++

```
__fastcall Boolean PosEqual(const TRect Rect);
```

Description

Use PosEqual to determine if the edit window occupies a particular rectangle, where Rect is given in global coordinates. PosEqual can be used to determine whether the inplace edit control represents a particular cell in the grid, by checking the bounding rectangle of the cell.

See Also

BoundsRect

TCustomGrid (see page 3027)

10.1.5.3.14 TInplaceEdit.SetFocus Method

Gives the editor window input focus if it is visible.

Pascal

```
procedure SetFocus; reintroduce;
```

C++

```
__fastcall SetFocus();
```

Description

Use SetFocus to cause keyboard events to go to the editor window. Focus will not move to the window if it is hidden by a call to the Hide (see page 3166) method.

See Also

KeyPress (see page 3167)

KeyDown (see page 3167)

KeyUp (see page 3168)

Hide (see page 3166)

10.1.5.3.15 TInplaceEdit.UpdateContents Method

Sets the EditMask and Text properties to values specified by the grid.

Pascal

```
procedure UpdateContents; virtual;
```

C++

```
virtual __fastcall UpdateContents();
```

Description

UpdateContents calls the GetEditMask and GetEditText methods of the grid, and sets the EditMask and Text properties accordingly. UpdateContents allows the grid to bring up the inplace edit control with the contents of a particular cell, and to impose a mask to restrict the editor to valid input for the particular cell.

See Also

Grid (see page 3171)

EditMask (see page 4604)

Text

GetEditMask (see page 3045)

GetEditText (see page 3046)

10.1.5.3.16 TInplaceEdit.UpdateLoc Method

Changes the position of the edit window but does not repaint the contents.

Pascal

```
procedure UpdateLoc(const Loc: TRect);
```

C++

```
__fastcall UpdateLoc(const TRect Loc);
```

Description

The grid calls UpdateLoc to move the edit window when the grid is moved. Unlike the Move (see page 3168) method, UpdateLoc does not invalidate the edit window to cause a repaint.

See Also

Grid (see page 3171)

Move (see page 3168)

Invalidate (see page 3166)

10.1.5.3.17 TInplaceEdit.Visible Method

Pascal

```
function Visible: Boolean;
```

C++

```
__fastcall Boolean Visible();
```

Description

This is Visible, a member of class TInplaceEdit.

10.1.5.3.18 TInplaceEdit.WndProc Method

Supplements the inherited method to add special processing to some Windows messages.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method of a control that receives Windows messages.

WndProc for TInplaceEdit (see page 3161) passes focus events on to the grid. It calls the inherited method for all other Windows messages. WndProc converts mouse clicks to double clicks when the grid receives the first click within the double-click time period.

See Also

Grid (see page 3171)

WndProc

10.1.5.4 TInplaceEdit Properties

The properties of the TInplaceEdit class are listed here.

Protected Properties

	Name	Description
	Grid (see page 3171)	Specifies the grid object that owns and controls this TInplaceEdit (see page 3161).

10.1.5.4.1 TInplaceEdit.Grid Property

Specifies the grid object that owns and controls this TInplaceEdit (see page 3161).

Pascal

```
property Grid: TCustomGrid;
```

C++

```
__property TCustomGrid Grid;
```

Description

Read Grid to obtain the grid object for which TInplaceEdit (see page 3161) provides editing services. TInplaceEdit (see page 3161) uses the Grid property so that it can receive information about the text to be edited and so that it can pass on relevant events.

See Also

UpdateContents (see page 3169)

UpdateLoc (see page 3170)

10.1.6 TInplaceEditList Class

Class Hierarchy

Pascal

```
TInplaceEditList = class(TInPlaceEdit);
```

C++

```
class TInplaceEditList : public TInPlaceEdit;
```

File

Grids

Description

This is class Grids.TInplaceEditList.

10.1.6.1 TInplaceEditList Members

The following tables list the members exposed by TInplaceEditList.

Protected Methods

	Name	Description
	BoundsChanged (see page 3173)	This is BoundsChanged, a member of class TInplaceEditList.
	ButtonRect (see page 3173)	This is ButtonRect, a member of class TInplaceEditList.
	CloseUp (see page 3174)	This is CloseUp, a member of class TInplaceEditList.
	DblClick (see page 3174)	This is DblClick, a member of class TInplaceEditList.
	DoDropDownKeys (see page 3174)	This is DoDropDownKeys, a member of class TInplaceEditList.
	DoEditButtonClick (see page 3174)	This is DoEditButtonClick, a member of class TInplaceEditList.
	DoGetPickListItems (see page 3174)	This is DoGetPickListItems, a member of class TInplaceEditList.
	DropDown (see page 3175)	This is DropDown, a member of class TInplaceEditList.
	KeyDown (see page 3175)	This is KeyDown, a member of class TInplaceEditList.
	ListMouseUp (see page 3175)	This is ListMouseUp, a member of class TInplaceEditList.
	MouseDown (see page 3175)	This is MouseDown, a member of class TInplaceEditList.
	MouseMove (see page 3176)	This is MouseMove, a member of class TInplaceEditList.
	MouseUp (see page 3176)	This is MouseUp, a member of class TInplaceEditList.
	OverButton (see page 3176)	This is OverButton, a member of class TInplaceEditList.
	PaintWindow (see page 3176)	This is PaintWindow, a member of class TInplaceEditList.
	StopTracking (see page 3177)	This is StopTracking, a member of class TInplaceEditList.
	TrackButton (see page 3177)	This is TrackButton, a member of class TInplaceEditList.
	UpdateContents (see page 3177)	This is UpdateContents, a member of class TInplaceEditList.
	WndProc (see page 3177)	This is WndProc, a member of class TInplaceEditList.

Public Events

	Name	Description
	OnEditButtonClick (see page 3180)	This is OnEditButtonClick, a member of class TInplaceEditList.
	OnGetPickListitems (see page 3180)	This is OnGetPickListitems, a member of class TInplaceEditList.

Public Methods

	Name	Description
	Create (see page 3172)	This is Create, a member of class TInplaceEditList.
	RestoreContents (see page 3176)	This is RestoreContents, a member of class TInplaceEditList.

Public Properties

	Name	Description
	ActiveList (see page 3178)	This is ActiveList, a member of class TInplaceEditList.
	ButtonWidth (see page 3178)	This is ButtonWidth, a member of class TInplaceEditList.
	DropDownRows (see page 3178)	This is DropDownRows, a member of class TInplaceEditList.
	EditStyle (see page 3178)	This is EditStyle, a member of class TInplaceEditList.
	ListVisible (see page 3179)	This is ListVisible, a member of class TInplaceEditList.
	PickList (see page 3179)	This is PickList, a member of class TInplaceEditList.
	PickListLoaded (see page 3179)	This is PickListLoaded, a member of class TInplaceEditList.
	Pressed (see page 3179)	This is Pressed, a member of class TInplaceEditList.

10.1.6.2 TInplaceEditList.Create Constructor

Pascal

```
constructor Create(Owner: TComponent); override;
```

C++

```
virtual __fastcall TInplaceEditList(TComponent * Owner);
```

Description

This is Create, a member of class TInplaceEditList.

10.1.6.3 TInplaceEditList Methods

The methods of the TInplaceEditList class are listed here.

Protected Methods

	Name	Description
	BoundsChanged (see page 3173)	This is BoundsChanged, a member of class TInplaceEditList.
	ButtonRect (see page 3173)	This is ButtonRect, a member of class TInplaceEditList.
	CloseUp (see page 3174)	This is CloseUp, a member of class TInplaceEditList.
	DblClick (see page 3174)	This is DblClick, a member of class TInplaceEditList.
	DoDropDownKeys (see page 3174)	This is DoDropDownKeys, a member of class TInplaceEditList.
	DoEditButtonClick (see page 3174)	This is DoEditButtonClick, a member of class TInplaceEditList.
	DoGetPickListItems (see page 3174)	This is DoGetPickListItems, a member of class TInplaceEditList.
	DropDown (see page 3175)	This is DropDown, a member of class TInplaceEditList.
	KeyDown (see page 3175)	This is KeyDown, a member of class TInplaceEditList.
	ListMouseUp (see page 3175)	This is ListMouseUp, a member of class TInplaceEditList.
	MouseDown (see page 3175)	This is MouseDown, a member of class TInplaceEditList.
	MouseMove (see page 3176)	This is MouseMove, a member of class TInplaceEditList.
	MouseUp (see page 3176)	This is MouseUp, a member of class TInplaceEditList.
	OverButton (see page 3176)	This is OverButton, a member of class TInplaceEditList.
	PaintWindow (see page 3176)	This is PaintWindow, a member of class TInplaceEditList.
	StopTracking (see page 3177)	This is StopTracking, a member of class TInplaceEditList.
	TrackButton (see page 3177)	This is TrackButton, a member of class TInplaceEditList.
	UpdateContents (see page 3177)	This is UpdateContents, a member of class TInplaceEditList.
	WndProc (see page 3177)	This is WndProc, a member of class TInplaceEditList.

Public Methods

	Name	Description
	RestoreContents (see page 3176)	This is RestoreContents, a member of class TInplaceEditList.

10.1.6.3.1 TInplaceEditList.BoundsChanged Method

Pascal

```
procedure BoundsChanged; override;
```

C++

```
virtual __fastcall BoundsChanged();
```

Description

This is BoundsChanged, a member of class TInplaceEditList.

10.1.6.3.2 TInplaceEditList.ButtonRect Method

Pascal

```
function ButtonRect: TRect;
```

C++

```
__fastcall TRect ButtonRect();
```

Description

This is ButtonRect, a member of class TInplaceEditList.

10.1.6.3.3 TInplaceEditList.CloseUp Method

Pascal

```
procedure CloseUp(Accept: Boolean); dynamic;
```

C++

```
__fastcall CloseUp(Boolean Accept);
```

Description

This is CloseUp, a member of class TInplaceEditList.

10.1.6.3.4 TInplaceEditList.DblClick Method

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

This is DblClick, a member of class TInplaceEditList.

10.1.6.3.5 TInplaceEditList.DoDropDownKeys Method

Pascal

```
procedure DoDropDownKeys(var Key: Word; Shift: TShiftState); virtual;
```

C++

```
virtual __fastcall DoDropDownKeys(Word Key, TShiftState Shift);
```

Description

This is DoDropDownKeys, a member of class TInplaceEditList.

10.1.6.3.6 TInplaceEditList.DoEditButtonClick Method

Pascal

```
procedure DoEditButtonClick; virtual;
```

C++

```
virtual __fastcall DoEditButtonClick();
```

Description

This is DoEditButtonClick, a member of class TInplaceEditList.

10.1.6.3.7 TInplaceEditList.DoGetPickListItems Method

Pascal

```
procedure DoGetPickListItems; dynamic;
```

C++

```
__fastcall DoGetPickListItems();
```

Description

This is DoGetPickListItems, a member of class TInplaceEditList.

10.1.6.3.8 TInplaceEditList.DropDown Method

Pascal

```
procedure DropDown; dynamic;
```

C++

```
__fastcall DropDown();
```

Description

This is DropDown, a member of class TInplaceEditList.

10.1.6.3.9 TInplaceEditList.KeyDown Method

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

This is KeyDown, a member of class TInplaceEditList.

10.1.6.3.10 TInplaceEditList.ListMouseUp Method

Pascal

```
procedure ListMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X: Integer;
Y: Integer);
```

C++

```
__fastcall ListMouseUp(TObject * Sender, TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is ListMouseUp, a member of class TInplaceEditList.

10.1.6.3.11 TInplaceEditList.MouseDown Method

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseDown, a member of class TInplaceEditList.

10.1.6.3.12 TInplaceEditList.MouseMove Method

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

This is MouseMove, a member of class TInplaceEditList.

10.1.6.3.13 TInplaceEditList.MouseUp Method

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseUp, a member of class TInplaceEditList.

10.1.6.3.14 TInplaceEditList.OverButton Method

Pascal

```
function OverButton(const P: TPoint): Boolean;
```

C++

```
__fastcall Boolean OverButton(const TPoint P);
```

Description

This is OverButton, a member of class TInplaceEditList.

10.1.6.3.15 TInplaceEditList.PaintWindow Method

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

This is PaintWindow, a member of class TInplaceEditList.

10.1.6.3.16 TInplaceEditList.RestoreContents Method

Pascal

```
procedure RestoreContents;
```

C++

```
__fastcall RestoreContents();
```

Description

This is RestoreContents, a member of class TInplaceEditList.

10.1.6.3.17 TInplaceEditList.StopTracking Method

Pascal

```
procedure StopTracking;
```

C++

```
__fastcall StopTracking();
```

Description

This is StopTracking, a member of class TInplaceEditList.

10.1.6.3.18 TInplaceEditList.TrackButton Method

Pascal

```
procedure TrackButton(X: Integer; Y: Integer);
```

C++

```
__fastcall TrackButton(int X, int Y);
```

Description

This is TrackButton, a member of class TInplaceEditList.

10.1.6.3.19 TInplaceEditList.UpdateContents Method

Pascal

```
procedure UpdateContents; override;
```

C++

```
virtual __fastcall UpdateContents();
```

Description

This is UpdateContents, a member of class TInplaceEditList.

10.1.6.3.20 TInplaceEditList.WndProc Method

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

This is WndProc, a member of class TInplaceEditList.

10.1.6.4 TInplaceEditList Properties

The properties of the TInplaceEditList class are listed here.

Public Properties

	Name	Description
	ActiveList (see page 3178)	This is ActiveList, a member of class TInplaceEditList.
	ButtonWidth (see page 3178)	This is ButtonWidth, a member of class TInplaceEditList.
	DropDownRows (see page 3178)	This is DropDownRows, a member of class TInplaceEditList.
R	EditStyle (see page 3178)	This is EditStyle, a member of class TInplaceEditList.
	ListVisible (see page 3179)	This is ListVisible, a member of class TInplaceEditList.
R	PickList (see page 3179)	This is PickList, a member of class TInplaceEditList.
	PickListLoaded (see page 3179)	This is PickListLoaded, a member of class TInplaceEditList.
R	Pressed (see page 3179)	This is Pressed, a member of class TInplaceEditList.

10.1.6.4.1 TInplaceEditList.ActiveList Property

Pascal

```
property ActiveList: TWinControl;
```

C++

```
__property TWinControl * ActiveList;
```

Description

This is ActiveList, a member of class TInplaceEditList.

10.1.6.4.2 TInplaceEditList.ButtonWidth Property

Pascal

```
property ButtonWidth: Integer;
```

C++

```
__property int ButtonWidth;
```

Description

This is ButtonWidth, a member of class TInplaceEditList.

10.1.6.4.3 TInplaceEditList.DropDownRows Property

Pascal

```
property DropDownRows: Integer;
```

C++

```
__property int DropDownRows;
```

Description

This is DropDownRows, a member of class TInplaceEditList.

10.1.6.4.4 TInplaceEditList.EditStyle Property

Pascal

```
property EditStyle: TEditStyle;
```

C++

```
__property TEditStyle EditStyle;
```

Description

This is EditStyle, a member of class TInplaceEditList.

10.1.6.4.5 TInplaceEditList.ListVisible Property

Pascal

```
property ListVisible: Boolean;
```

C++

```
__property Boolean ListVisible;
```

Description

This is ListVisible, a member of class TInplaceEditList.

10.1.6.4.6 TInplaceEditList.PickList Property

Pascal

```
property PickList: TCustomListbox;
```

C++

```
__property TCustomListbox PickList;
```

Description

This is PickList, a member of class TInplaceEditList.

10.1.6.4.7 TInplaceEditList.PickListLoaded Property

Pascal

```
property PickListLoaded: Boolean;
```

C++

```
__property Boolean PickListLoaded;
```

Description

This is PickListLoaded, a member of class TInplaceEditList.

10.1.6.4.8 TInplaceEditList.Pressed Property

Pascal

```
property Pressed: Boolean;
```

C++

```
__property Boolean Pressed;
```

Description

This is Pressed, a member of class TInplaceEditList.

10.1.6.5 TInplaceEditList Events

The events of the TInplaceEditList class are listed here.

Public Events

	Name	Description
	OnEditButtonClick (see page 3180)	This is OnEditButtonClick, a member of class TInplaceEditList.
	OnGetPickListitems (see page 3180)	This is OnGetPickListitems, a member of class TInplaceEditList.

10.1.6.5.1 TInplaceEditList.OnEditButtonClick Event

Pascal

```
property OnEditButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEditButtonClick;
```

Description

This is OnEditButtonClick, a member of class TInplaceEditList.

10.1.6.5.2 TInplaceEditList.OnGetPickListitems Event

Pascal

```
property OnGetPickListitems: TOnGetPickListItems;
```

C++

```
__property TOnGetPickListItems OnGetPickListitems;
```

Description

This is OnGetPickListitems, a member of class TInplaceEditList.

10.1.7 TStringGrid Class

TStringGrid represents a grid control designed to simplify the handling of strings and associated objects.

Class Hierarchy

Pascal

```
TStringGrid = class(TDrawGrid);
```

C++

```
class TStringGrid : public TDrawGrid;
```

File

Grids

Description

Add a TStringGrid object to a form to present textual data in a tabular format. TStringGrid provides many properties to control the appearance of the grid, as well as events and methods that take advantage of the tabular organization of the grid in responding to user actions.

TStringGrid introduces the ability to associate an object with each string in the grid. These objects can encapsulate any information or behavior represented by the strings that are presented to the user.

If the strings to be presented in a grid represent field values from the records in a dataset, use TDBGrid instead.

Grids

10.1.7.1 TStringGrid Members

The following tables list the members exposed by TStringGrid.

Protected Events

	Name	Description
	OnColumnMoved (see page 3019)	Occurs immediately after the position of a column changes.
	OnDrawCell (see page 3020)	Occurs when a cell in the grid needs to be drawn.
	OnGetEditMask (see page 3021)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3022)	Occurs when the in-place editor requests the value of a cell.
	OnRowMoved (see page 3023)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3025)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3026)	Occurs when the user edits the value of a cell.
	OnTopLeftChanged (see page 3027)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 3031)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FGridState (see page 3031)	This is FGridState, a member of class TCustomGrid.
	FSaveCellExtents (see page 3032)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 3032)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	AdjustSize (see page 3034)	Adds or deletes rows or columns from the grid.
	BeginColumnDrag (see page 3034)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 3034)	Starts the dragging of a row in the grid.
	BoxRect (see page 3035)	Returns the screen coordinates of a specified set of cells.
	CalcDrawInfo (see page 3035)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 3036)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 3036)	Determines the appearance of the mouse cursor during resizing.
	CanEditAcceptKey (see page 3036)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 3037)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 3037)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 3037)	Indicates whether the grid should respond to a given key combination.
	CellRect (see page 3038)	Returns the screen coordinates of a cell in the grid.
	ChangeGridOrientation (see page 3038)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	CheckColumnDrag (see page 3039)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 3039)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
V	ColumnMoved (see page 3186)	Generates an OnColumnMoved event.
	ColWidthsChanged (see page 3040)	Responds when the column widths change.

	CreateEditor (see page 3040)	Creates the inplace editor control.
	CreateParams (see page 3041)	Initializes the window-creation parameter record.
	DefineProperties (see page 3041)	Adds the ColWidths (see page 3063) and RowHeights (see page 3076) properties to the values saved with the grid.
	DeleteColumn (see page 3041)	Deletes a specified column from the grid.
	DeleteRow (see page 3042)	Deletes a specified from the grid.
	DoExit (see page 3042)	Hides the inplace editor when selection moves to another control in a form.
	DoMouseWheelDown (see page 3042)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 3043)	Performs tasks when the mouse wheel is rotated upward.
	DrawCell (see page 3187)	Generates an OnDrawCell event.
	EndColumnDrag (see page 3044)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 3044)	Ends the dragging of a row in the grid.
	FocusCell (see page 3044)	Changes the current cell to a specified cell.
	GetEditLimit (see page 3045)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 3004)	Generates an OnGetEditMask (see page 3021) event.
	GetEditMask (see page 3045)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 3046)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 3187)	Generates an OnGetEditText event.
	GetGridHeight (see page 3046)	Returns the value of the GridHeight (see page 3068) property.
	GetGridWidth (see page 3047)	Returns the value of the GridWidth (see page 3070) property.
	HideEdit (see page 3047)	Hides the inplace editor.
	HideEditor (see page 3048)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 3048)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 3048)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateEditor (see page 3049)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 3049)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 3050)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	KeyDown (see page 3050)	Provides special processing when the user presses a key.
	KeyPress (see page 3050)	Provides special processing when the user presses a key.
	MouseDown (see page 3051)	Provides special processing when the user presses a mouse button.
	MouseMove (see page 3052)	Provides special processing when the user moves the mouse.
	MouseUp (see page 3052)	Provides special processing when the user releases the mouse button.
	MoveColRow (see page 3053)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 3053)	Moves a column to a new position.
	MoveRow (see page 3053)	Moves a row to a new position.
	Paint (see page 3054)	Draws the image of the grid control on the screen.
	RowHeightsChanged (see page 3054)	Responds when the row heights change.
	RowMoved (see page 3187)	Generates an OnRowMoved event.
	ScrollData (see page 3055)	Scrolls the visual image of the cells in the grid.
	SelectCell (see page 3006)	Determines whether a particular cell in the grid can be selected.
	SelectCell (see page 3055)	Determines whether a particular cell in the grid can be selected.
	SetEditText (see page 3188)	Generates an OnSetEditText event.
	ShowEditor (see page 3056)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 3057)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 3057)	Responds to changes in the size of the grid.
	Sizing (see page 3057)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 3058)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 3007)	Generates an OnTopLeftChanged (see page 3027) event.
	TopLeftChanged (see page 3058)	Updates the position of the inplace editor when the grid scrolls.

	UpdateDesigner (see page 3059)	Notifies the designer when rows and columns of the grid are moved or resized.

Protected Properties

	Name	Description
	BorderStyle (see page 3060)	Determines whether a single line border is drawn around the grid.
	Col (see page 3060)	Specifies the index of the column that contains the selected cell.
	ColCount (see page 3062)	Specifies the number of columns in the grid.
	Color (see page 3063)	Specifies the background color of the control.
	ColWidths (see page 3063)	Indicates the width (in pixels) of all the columns in the grid.
	DefaultColWidth (see page 3064)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3066)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3066)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	EditorMode (see page 3066)	Determines whether the current cell can be edited.
	FixedColor (see page 3067)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3067)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3068)	Specifies the number of rows on the top of the grid that cannot be scrolled.
R	GridHeight (see page 3068)	Specifies the height of the grid in pixels.
	GridLineWidth (see page 3069)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
R	GridWidth (see page 3070)	Specifies the width of the grid in pixels.
R	HitTest (see page 3071)	Indicates the current position of the mouse cursor.
R	InplaceEditor (see page 3071)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	LeftCol (see page 3072)	Specifies the index of the first visible scrollable column in the grid.
	Options (see page 3072)	Specifies various display and behavioral properties of the grid.
	ParentColor (see page 3073)	Determines where a control looks for its color information.
	Row (see page 3074)	Specifies the index of the row that contains the selected cell.
	RowCount (see page 3075)	Specifies the number of rows in the grid.
	RowHeights (see page 3076)	Gives the height (in pixels) of all rows in the grid.
	ScrollBars (see page 3077)	Specifies whether the grid includes horizontal and vertical scroll bars.
	Selection (see page 3077)	Indicates the boundaries of the current selection.
	TabStops (see page 3079)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3080)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 3082)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 3082)	Indicates the number of scrollable rows visible in the grid.

Public Methods

	Name	Description
	CellRect (see page 3003)	Returns the screen coordinates of a cell in the grid.
V	Create (see page 3185)	Creates an instance of TStringGrid (see page 3180).
V	Destroy (see page 3186)	Destroys an instance of TStringGrid (see page 3180).
	MouseCoord (see page 3051)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseToCell (see page 3005)	Returns the column and row of the cell at the position with screen coordinates (X,Y).

Public Properties

	Name	Description
	Canvas (see page 3007)	Specifies the TCanvas object that presents a drawing surface for the control.
	Cells (see page 3188)	Lists the strings for each cell in the grid.
	Col (see page 3009)	Specifies the index of the column that contains the selected cell.
	Cols (see page 3189)	Lists strings with their associated objects for each column.
	ColWidths (see page 3011)	Indicates the width (in pixels) of all the columns in the grid.
	EditorMode (see page 3011)	Determines whether the current cell can be edited.
	GridHeight (see page 3012)	Specifies the height of the grid in pixels.
	GridWidth (see page 3012)	Specifies the width of the grid in pixels.

	LeftCol (see page 3012)	Specifies the index of the first visible scrollable column in the grid.
	Objects (see page 3190)	Lists the objects for each cell in the grid.
	Row (see page 3013)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 3014)	Gives the height (in pixels) of all rows in the grid.
	Rows (see page 3190)	Lists the strings and their associated objects for each row.
	Selection (see page 3015)	Indicates the boundaries of the current selection.
	TabStops (see page 3017)	Indicates whether the user can tab to specified columns in the grid.
	TopRow (see page 3017)	Specifies the index of the first visible scrollable row in the grid.

Published Events

	Name	Description
	OnClick (see page 3125)	Occurs when the user clicks the control.
	OnColumnMoved (see page 3127)	Occurs immediately after the position of a column changes.
	OnContextPopup (see page 3127)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3128)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3128)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3131)	Occurs when the user drags an object over a control.
	OnDrawCell (see page 3134)	Occurs when a cell in the grid needs to be drawn.
	OnEndDock (see page 3135)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3135)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 3136)	Occurs when a control receives the input focus.
	OnExit (see page 3139)	Occurs when the input focus shifts away from one control to another.
	OnGetEditMask (see page 3142)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 3142)	Occurs when the in-place editor requests the value of a cell.
	OnKeyDown (see page 3142)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3146)	Occurs when a key is pressed.
	OnKeyUp (see page 3147)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 3149)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3150)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3152)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3152)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3153)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3155)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheelDown (see page 3157)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 3157)	Occurs when the mouse wheel is rotated upward.
	OnRowMoved (see page 3158)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 3158)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 3159)	Occurs when the user edits the value of a cell.
	OnStartDock (see page 3159)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3160)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTopLeftChanged (see page 3160)	Occurs immediately after the TopRow (see page 3017) property or the LeftCol (see page 3012) property changes.

Published Properties

	Name	Description
	Align (see page 3088)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3092)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 3092)	Specifies which edges of the control are beveled.

	BevelInner (see page 3093)	Specifies the cut of the inner bevel.
	BevelKind (see page 3093)	Specifies the control's bevel style.
	BevelOuter (see page 3094)	Specifies the cut of the outer bevel.
	BevelWidth (see page 3094)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 3095)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 3095)	Determines whether a single line border is drawn around the grid.
	ColCount (see page 3095)	Specifies the number of columns in the grid.
	Color (see page 3096)	Specifies the background color of the control.
	Constraints (see page 3097)	Specifies the size constraints for the control.
	Ctl3D (see page 3098)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 3098)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 3100)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 3100)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DoubleBuffered (see page 3101)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 3102)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3103)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3103)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 3105)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedColor (see page 3105)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 3106)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 3106)	Specifies the number of rows on the top of the grid that cannot be scrolled.
	Font (see page 3107)	Controls the attributes of text written on or in the control.
	GridLineWidth (see page 3108)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	Options (see page 3109)	Specifies various display and behavioral properties of the grid.
	ParentBiDiMode (see page 3111)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 3111)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3112)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 3112)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 3112)	Determines where a control looks for its font information.
	ParentShowHint (see page 3113)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3113)	Identifies the pop-up menu associated with the control.
	RowCount (see page 3118)	Specifies the number of rows in the grid.
	ScrollBars (see page 3119)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 3120)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 3121)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3079)	Determines if the user can tab to a control.
	Visible (see page 3122)	Determines whether the component appears onscreen.
	VisibleColCount (see page 3123)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 3124)	Indicates the number of scrollable rows visible in the grid.

10.1.7.2 TStringGrid.Create Constructor

Creates an instance of TStringGrid (see page 3180).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TStringGrid(TComponent * AOwner);
```

Description

Call Create to create an instance of TStringGrid (see page 3180) at runtime. For string grids placed on forms at design time, Create is called automatically.

AOwner is another component, typically a form, that becomes the grid's Owner. The Owner is responsible for freeing the grid.

See Also

Create (see page 3030)

10.1.7.3 TStringGrid.Destroy Destructor

Destroys an instance of TStringGrid (see page 3180).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStringGrid();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the string grid is not nil, and only then calls Destroy.

Destroy frees the helper objects used to manage the array of strings and their associated objects.

See Also

System::TObject::Free

10.1.7.4 TStringGrid Methods

The methods of the TStringGrid class are listed here.

Protected Methods

	Name	Description
	ColumnMoved (see page 3186)	Generates an OnColumnMoved event.
	DrawCell (see page 3187)	Generates an OnDrawCell event.
	GetEditText (see page 3187)	Generates an OnGetEditText event.
	RowMoved (see page 3187)	Generates an OnRowMoved event.
	SetEditText (see page 3188)	Generates an OnSetEditText event.

10.1.7.4.1 TStringGrid.ColumnMoved Method

Generates an OnColumnMoved event.

Pascal

```
procedure ColumnMoved(FromIndex: Longint; ToIndex: Longint); override;
```

C++

```
virtual __fastcall ColumnMoved(Longint FromIndex, Longint ToIndex);
```

Description

ColumnMoved is called immediately after a column in the grid has moved. It overrides the inherited method to generate an

OnColumnMoved event. Descendants of TCustomDrawGrid can override this method to make internal adjustments or to block the OnColumnMoved event.

See Also

OnColumnMoved (see page 3019)

10.1.7.4.2 TStringGrid.DrawCell Method

Generates an OnDrawCell event.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically whenever a cell in the grid is drawn. If the DefaultDrawing property is true, the background of the cell is painted before DrawCell is called, and the 3D effects of the fixed cells or the focus rectangle around the focused cell are drawn after DrawCell. Descendants of TCustomDrawGrid can override this method to draw the contents of the cell or to block the OnDrawCell event.

See Also

DefaultDrawing (see page 3066)

FixedCols (see page 3067)

FixedRows (see page 3068)

OnDrawCell (see page 3020)

10.1.7.4.3 TStringGrid.GetEditText Method

Generates an OnGetEditText event.

Pascal

```
function GetEditText(ACol: Longint; ARow: Longint): string; override;
```

C++

```
virtual __fastcall UnicodeString GetEditText(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditText to obtain the text for the indicated cell. GetEditText returns the Value parameter set by the OnGetEditText event handler. If there is no OnGetEditText event handler, GetEditText returns an empty string.

See Also

OnGetEditText (see page 3022)

10.1.7.4.4 TStringGrid.RowMoved Method

Generates an OnRowMoved event.

Pascal

```
procedure RowMoved(FromIndex: Longint; ToIndex: Longint); override;
```

C++

```
virtual __fastcall RowMoved(Longint FromIndex, Longint ToIndex);
```

Description

RowMoved is called immediately after a row in the grid changes position. It overrides the inherited method to generate an OnRowMoved event. Descendants of TCustomDrawGrid can override this method to make internal adjustments or to block the OnRowMoved event.

See Also

OnRowMoved (see page 3023)

10.1.7.4.5 TStringGrid.SetEditText Method

Generates an OnSetEditText event.

Pascal

```
procedure SetEditText(ACol: Longint; ARow: Longint; const Value: string); override;
```

C++

```
virtual __fastcall SetEditText(Longint ACol, Longint ARow, const UnicodeString Value);
```

Description

SetEditText is called by the inplace editor so that the grid can store the new value for the current cell. SetEditText overrides the inherited parent class's method to generate an OnSetEditText event. Descendants of TCustomDrawGrid can override this method to update an internal representation of the cell's value, or to block the OnSetEditText event.

See Also

OnSetEditText (see page 3026)

10.1.7.5 TStringGrid Properties

The properties of the TStringGrid class are listed here.

Public Properties

	Name	Description
	Cells (see page 3188)	Lists the strings for each cell in the grid.
	Cols (see page 3189)	Lists strings with their associated objects for each column.
	Objects (see page 3190)	Lists the objects for each cell in the grid.
	Rows (see page 3190)	Lists the strings and their associated objects for each row.

10.1.7.5.1 TStringGrid.Cells Property

Lists the strings for each cell in the grid.

Pascal

```
property Cells [ACol, ARow: Integer]: string;
```

C++

```
__property UnicodeString Cells[int ACol, ARow];
```

Description

Use Cells to access the string within a particular cell. ACol is the column coordinate of the cell, and ARow is the row coordinate

of the cell. The first row is row zero, and the first column is column zero.

The ColCount (see page 3095) and RowCount (see page 3118) property values define the size of the array of strings.

To access the objects associated with the strings in the Cells array, use the Objects (see page 3190) property.

C++ Examples:

```
/*
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int I, J, K;

  K = 0;

  for (I = 0; I < StringGrid1->ColCount; I++)
    for (J = 0; J < StringGrid1->RowCount; J++)
      StringGrid1->Cells[I][J] = IntToStr(++K);
}
```

Delphi Examples:

```
{
This code fills each cell with a number. The numbers are
arranged in consecutive order by rows.  Notice that even
cells in the fixed rows and columns are altered.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I, J, K : Integer;
begin
  K := 0;
  with StringGrid1 do
    for I := 0 to ColCount - 1 do
      for J:= 0 to RowCount - 1 do
        begin
          K := K + 1;
          Cells[I,J] := IntToStr(K);
        end;
end;
```

See Also

ColCount (see page 3062)

Objects (see page 3190)

RowCount (see page 3075)

10.1.7.5.2 TStringGrid.Cols Property

Lists strings with their associated objects for each column.

Pascal

```
property Cols [Index: Integer]: TStrings;
```

C++

```
__property TStrings Cols[int Index];
```

Description

Use Cols to access all the strings for a single column, along with their associated objects. The number of strings and associated

objects is always equal to the value of the ColCount (see page 3095) property, the number of columns in the grid. The Index parameter is the number of the column, where the value of the first column in the grid is zero.

To get all the strings and objects for a row, rather than for a column, use the Rows (see page 3190) property.

See Also

ColCount (see page 3062)

Objects (see page 3190)

Rows (see page 3190)

10.1.7.5.3 TStringGrid.Objects Property

Lists the objects for each cell in the grid.

Pascal

```
property Objects [ACol, ARow: Integer]: TObject;
```

C++

```
__property TObject * Objects[int ACol, ARow];
```

Description

Use the Objects property to access the object associated with a particular cell. The ColCount (see page 3095) and RowCount (see page 3118) values define the size of the array of objects. ACol is the column coordinate of the cell, and ARow is the row coordinate of the cell, where the first column is column 0, and the first row is row 0.

Note: The string grid does not own the objects in the Objects array. Objects added to the Objects array still exist even if the string grid is destroyed. They must be explicitly destroyed by the application.

See Also

Cells (see page 3188)

ColCount (see page 3062)

RowCount (see page 3075)

10.1.7.5.4 TStringGrid.Rows Property

Lists the strings and their associated objects for each row.

Pascal

```
property Rows [Index: Integer]: TStrings;
```

C++

```
__property TStrings Rows[int Index];
```

Description

Use Rows to access all the strings for a single row, along with their associated objects. The number of strings and associated objects is always equal to the value of the RowCount (see page 3118) property, the number of rows in the grid. The Index parameter is the number of the row, where the value of the first row in the grid is zero.

To get all the strings and objects for a column, rather than for a row, use the Cols (see page 3189) property.

C++ Examples:

```
/*
This example displays a string grid, a list box, and a
```

```
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ListBox1->Items = StringGrid1->Rows[StringGrid1->Row];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{

  StringGrid1->Cells[1][0] = "Column 1";
  StringGrid1->Cells[2][0] = "Column 2";
  StringGrid1->Cells[3][0] = "Column 3";
  StringGrid1->Cells[4][0] = "Column 4";
  StringGrid1->Cells[0][1] = "Row 1";
  StringGrid1->Cells[1][1] = "Object";
  StringGrid1->Cells[2][1] = "Pascal";
  StringGrid1->Cells[3][1] = "is";
  StringGrid1->Cells[4][1] = "excellent";
  StringGrid1->Cells[0][2] = "Row 2";
  StringGrid1->Cells[1][2] = "Delphi";
  StringGrid1->Cells[2][2] = "is";
  StringGrid1->Cells[4][2] = "RAD";

}
```

Delphi Examples:

```
{
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
Note that when the grid contains an empty cell, the list box
has a corresponding empty string.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ListBox1.Items := StringGrid1.Rows[StringGrid1.Row];
end;
procedure TForm1.FormCreate(Sender: TObject);
begin
  with StringGrid1 do
  begin
    Cells[1,0] := 'Column 1';
    Cells[2,0] := 'Column 2';
    Cells[3,0] := 'Column 3';
    Cells[4,0] := 'Column 4';
    Cells[0,1] := 'Row 1';
    Cells[1,1] := 'Object';
    Cells[2,1] := 'Pascal';
    Cells[3,1] := 'is';
    Cells[4,1] := 'excellent';
    Cells[0,2] := 'Row 2';
    Cells[1,2] := 'Delphi';
    Cells[2,2] := 'is';
    Cells[4,2] := 'RAD';
  end;
end;
```

See Also

ColCount (see page 3062)

Cols (see page 3189)

Objects (see page 3190)

10.1.8 TStringGridStrings Class

TStringGridStrings maintains a list of the strings that appear in the cells of a string grid.

Class Hierarchy

Pascal

```
TStringGridStrings = class(TStrings);
```

C++

```
class TStringGridStrings : public TStrings;
```

File

Grids

Description

Do not use TStringGridStrings directly in an application. It is tailored to work with a TStringGrid (see page 3180) object, and is created by the string grid to represent the strings (and associated objects) in a row or column of the grid.

See Also

TStringGrid (see page 3180)

TStringList

10.1.8.1 TStringGridStrings Members

The following tables list the members exposed by TStringGridStrings.

Protected Methods

	Name	Description
	Get (see page 3195)	Returns a string given its index.
	GetCount (see page 3195)	Returns the number of strings in the list
	GetObject (see page 3196)	Returns the object associated with the string at a specified index.
	Put (see page 3197)	Changes the value of the string with a specified index.
	PutObject (see page 3197)	Changes the object associated with the string at a specified index.
	SetUpdateState (see page 3197)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 3193)	Replaces the first empty string with a specified string.
	Assign (see page 3194)	Copies the list of strings and objects from another TStrings object.
	Clear (see page 3194)	Replaces all strings in the list with empty strings.
	Create (see page 3193)	Creates an instance of TStringGridStrings (see page 3192).

	Delete (see page 3195)	Prevents strings from being deleted.
	Insert (see page 3196)	Prevents strings from being inserted.

10.1.8.2 TStringGridStrings.Create Constructor

Creates an instance of TStringGridStrings (see page 3192).

Pascal

```
constructor Create(AGrid: TStringGrid; AIndex: Longint);
```

C++

```
__fastcall TStringGridStrings(TStringGrid AGrid, Longint AIndex);
```

Description

Do not create instances of TStringGridStrings (see page 3192). String grids create TStringGridStrings (see page 3192) objects for every row and column, to allow quick access of the strings and objects associated with the cells in the grid.

The AGrid parameter specifies the string grid that will use the TStringGridStrings (see page 3192) object. The AIndex parameter specifies the index of the row or column associated with the TStringGridStrings (see page 3192) object. If AIndex is greater than 0, the TStringGridStrings (see page 3192) object represents the row indexed by AIndex. If AIndex is less than 0, the TStringGridStrings (see page 3192) object represents the column indexed by the absolute value of AIndex. If AIndex is 0, the TStringGridStrings (see page 3192) object represents an empty row or column.

See Also

TStringGrid (see page 3180)

10.1.8.3 TStringGridStrings Methods

The methods of the TStringGridStrings class are listed here.

Protected Methods

	Name	Description
	Get (see page 3195)	Returns a string given its index.
	GetCount (see page 3195)	Returns the number of strings in the list
	GetObject (see page 3196)	Returns the object associated with the string at a specified index.
	Put (see page 3197)	Changes the value of the string with a specified index.
	PutObject (see page 3197)	Changes the object associated with the string at a specified index.
	SetUpdateState (see page 3197)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 3193)	Replaces the first empty string with a specified string.
	Assign (see page 3194)	Copies the list of strings and objects from another TStrings object.
	Clear (see page 3194)	Replaces all strings in the list with empty strings.
	Delete (see page 3195)	Prevents strings from being deleted.
	Insert (see page 3196)	Prevents strings from being inserted.

10.1.8.3.1 TStringGridStrings.Add Method

Replaces the first empty string with a specified string.

Pascal

```
function Add(const S: string): Integer; override;
```

C++

```
virtual __fastcall int Add(const UnicodeString S);
```

Description

Call Add to add a string to the list. Add searches the list for an empty string and replaces it with S. It then returns the index where it added S to the list. If there are no empty strings in the list, Add does not add S to the list and returns –1.

See Also

AddStrings

Append

Count

IndexOf

Insert (see page 3196)

10.1.8.3.2 TStringGridStrings.Assign Method

Copies the list of strings and objects from another TStrings object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the strings and objects from a source object of type TStrings. If the source object has more strings than the number of cells in the row or column represented by the TStringGridStrings (see page 3192) object, Assign only copies the first Count strings and objects.

If the Source parameter is not a TStrings object, Assign calls the inherited method.

See Also

Count

Objects

Strings

10.1.8.3.3 TStringGridStrings.Clear Method

Replaces all strings in the list with empty strings.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call Clear to remove all strings from the list, including any references to associated objects. Clear replaces every string with an

empty string and every object reference with nil (Delphi) or NULL (C++).

Note that Clear does not free the objects that are associated with strings in the list.

See Also

Delete (see page 3195)

Objects

Strings

10.1.8.3.4 TStringGridStrings.Delete Method

Prevents strings from being deleted.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Because TStringGridStrings (see page 3192) objects represent the rows or columns of a string grid, the number of entries in the list must correspond exactly to the number of cells in the corresponding row or column. Rather than allow entries to be deleted, destroying this correspondence, Delete raises an EInvalidGridOperation (see page 2999) exception.

See Also

EInvalidGridOperation (see page 2999)

Clear (see page 3194)

10.1.8.3.5 TStringGridStrings.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString Get(int Index);
```

Description

Get is the protected read implementation of the Strings property.

In TStrings Get is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the string with the specified index.

See Also

Strings

10.1.8.3.6 TStringGridStrings.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TStrings GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the number of strings that have been added to the list.

See Also

Count

10.1.8.3.7 TStringGridStrings.GetObject Method

Returns the object associated with the string at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects property.

Index is the index of the string with which the object is associated.

In TStrings, GetObject always returns nil (Delphi) or NULL (C++). This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override GetObject to return the specified object.

See Also

Objects

10.1.8.3.8 TStringGridStrings.Insert Method

Prevents strings from being inserted.

Pascal

```
procedure Insert(Index: Integer; const S: string); override;
```

C++

```
virtual __fastcall Insert(int Index, const UnicodeString S);
```

Description

Because TStringGridStrings (see page 3192) objects represent the rows or columns of a string grid, the number of entries in the list must correspond exactly to the number of cells in the corresponding row or column. Rather than allow entries to be inserted, destroying this correspondence, Insert raises an EInvalidGridOperation (see page 2999) exception.

See Also

EInvalidGridOperation (see page 2999)

Add (see page 3193)

10.1.8.3.9 TStringGridStrings.Put Method

Changes the value of the string with a specified index.

Pascal

```
procedure Put(Index: Integer; const S: string); override;
```

C++

```
virtual __fastcall Put(int Index, const UnicodeString S);
```

Description

Put is the protected write implementation of the Strings property.

Put changes the value of the string with the index specified by Index to S. Put does not change the object at the specified position. That is, any object associated with the previous string becomes associated with the new string.

See Also

Strings

Objects

10.1.8.3.10 TStringGridStrings.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); override;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects property.

As implemented in TStrings, PutObject does nothing. This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override PutObject to change the specified object.

See Also

Objects

10.1.8.3.11 TStringGridStrings.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); override;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate method is first called and the

TStrings object is not already in the middle of an update, TStrings calls SetUpdateState internally, with Updating set to true. When the EndUpdate method is called and it cancels out the last unmatched call to BeginUpdate, TStrings calls SetUpdateState internally, with Updating set to false.

As implemented in TStrings, SetUpdateState does nothing. Descendant classes can override this method to optimize the response to updates.

10.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEditStyle (see page 3199)	TEditStyle indicates whether a cell in a grid contains a drop-down arrow or ellipsis button.
	TGridOption (see page 3201)	TGridOption and TGridOptions (see page 3207) customize the appearance and behavior of a grid control.
	TGridState (see page 3203)	TGridState indicates any user actions that are currently changing the layout of the grid.

Records

	Name	Description
	TGridAxisDrawInfo (see page 3200)	TGridAxisDrawInfo and TGridDrawInfo (see page 3201) represent information that is useful when rendering a grid.
	TGridCoord (see page 3200)	TGridCoord specifies a cell in a grid control.
	TGridDrawInfo (see page 3201)	This is record Grids.TGridDrawInfo.
	TGridRect (see page 3203)	TGridRect specifies a set of cells that occupy a rectangular region in a grid control.

10.2.1 Grids.TEditStyle Enumeration

TEditStyle indicates whether a cell in a grid contains a drop-down arrow or ellipsis button.

Pascal

```
TEditStyle = (
  esSimple,
  esEllipsis,
  esPickList
);
```

C++

```
enum TEditStyle {
  esSimple,
  esEllipsis,
  esPickList
};
```

File

Grids

Description

TEditStyle describes the buttons, if any, that can appear in the cell of a grid. It can be any of the following values:

Value	Meaning
esSimple	The cell acts as a simple edit control where users can type a new value.
esEllipsis	The cell contains an ellipsis button that users can click to launch a dialog.
esPickList	The cell contains a drop-down arrow button that users can click to display a pick list of possible values.

10.2.2 Grids.TGridAxisDrawInfo Record

TGridAxisDrawInfo and TGridDrawInfo (see page 3201) represent information that is useful when rendering a grid.

Pascal

```
TGridAxisDrawInfo = record
  EffectiveLineWidth: Integer;
  FixedBoundary: Integer;
  GridBoundary: Integer;
  GridExtent: Integer;
  LastFullVisibleCell: Longint;
  FullVisBoundary: Integer;
  FixedCellCount: Integer;
  FirstGridCell: Integer;
  GridCellCount: Integer;
  GetExtent: TGetExtentsFunc;
end;
```

C++

```
struct TGridAxisDrawInfo {
  int EffectiveLineWidth;
  int FixedBoundary;
  int GridBoundary;
  int GridExtent;
  Longint LastFullVisibleCell;
  int FullVisBoundary;
  int FixedCellCount;
  int FirstGridCell;
  int GridCellCount;
  TGetExtentsFunc GetExtent;
};
```

File

Grids

Description

TGridDrawInfo (see page 3201) encapsulates information that reflects the layout of the grid axes. Each axis is described by a TGridAxisDrawInfo value, which encodes information about the size of the axis and the type and number of cells along that axis.

10.2.3 Grids.TGridCoord Record

TGridCoord specifies a cell in a grid control.

Pascal

```
TGridCoord = record
  X: Longint;
  Y: Longint;
end;
```

C++

```
struct TGridCoord {
  Longint X;
  Longint Y;
};
```

File

Grids

Description

TGridCoord indicates a specific cell in a grid.

X indicates the column of the grid, where 0 specifies the first column, 1 specifies the second column, and so on.

Y indicates the row of the grid, where 0 specifies the first row, 1 specifies the second row, and so on.

10.2.4 Grids.TGridDrawInfo Record

Pascal

```
TGridDrawInfo = record
  Horz: TGridAxisDrawInfo;
  Vert: TGridAxisDrawInfo;
end;
```

C++

```
struct TGridDrawInfo {
  TGridAxisDrawInfo Horz;
  TGridAxisDrawInfo Vert;
};
```

File

Grids

Description

This is record Grids.TGridDrawInfo.

10.2.5 Grids.TGridOption Enumeration

TGridOption and TGridOptions (see page 3207) customize the appearance and behavior of a grid control.

Pascal

```
TGridOption = (
  goFixedVertLine,
  goFixedHorzLine,
  goVertLine,
  goHorzLine,
  goRangeSelect,
  goDrawFocusSelected,
  goRowSizing,
  goColSizing,
  goRowMoving,
  goColMoving,
  goEditing,
  goTabs,
  goRowSelect,
  goAlwaysShowEditor,
  goThumbTracking
);
```

C++

```
enum TGridOption {
  goFixedVertLine,
  goFixedHorzLine,
  goVertLine,
  goHorzLine,
  goRangeSelect,
  goDrawFocusSelected,
  goRowSizing,
  goColSizing,
  goRowMoving,
  goColMoving,
  goEditing,
  goTabs,
  goRowSelect,
  goAlwaysShowEditor,
  goThumbTracking
};
```

File

Grids

Description

TGridOptions (see page 3207) is a set of TGridOption values. The following table lists the possible TGridOption values:

Value	Meaning
goFixedVertLine	Vertical lines are drawn to separate the fixed (nonscrolling) columns in the grid.
goFixedHorzLine	Horizontal lines are drawn to separate the fixed (nonscrolling) rows in the grid.
goVertLine	Vertical lines are drawn to separate the scrollable columns in the grid.
goHorzLine	Horizontal lines are drawn to separate the scrollable rows in the grid.
goRangeSelect	Users can select ranges of cells at one time. goRangeSelect is ignored if Options includes goEditing.
goDrawFocusSelected	Cells with input focus are drawn with a special highlight color, just like selected cells without input focus. If goDrawFocusSelected is not included, the cell with input focus is distinguished by a focus rectangle, not by a special background color.
goRowSizing	Scrollable rows can be individually resized.
goColSizing	Scrollable columns can be individually resized.
goRowMoving	Scrollable rows can be moved using the mouse.
goColMoving	Scrollable columns can be moved using the mouse.
goEditing	Users can edit the contents of cells. When goEditing is included in Options, goRangeSelect has no effect.
goTabs	Users can navigate through the cells in the grid using Tab and Shift+Tab.
goRowSelect	Entire rows are selected rather than individual cells. If goRowSelect is included in Options, goAlwaysShowEditor has no effect.
goAlwaysShowEditor	The grid is locked into edit mode. The user does not need to use Enter or F2 to turn on EditorMode. If Options does not include goEditing, goAlwaysShowEditor has no effect. If Options includes goRowSelect, goAlwaysShowEditor has no effect.
goThumbTracking	The grid image updates while the user is dragging the thumb of the scroll bar. If goThumbTracking is not included, the image does not update until the user releases the thumb in a new position.

10.2.6 Grids.TGridRect Record

TGridRect specifies a set of cells that occupy a rectangular region in a grid control.

Pascal

```
TGridRect = record
  case Integer of
    0: (Bottom: Longint;
        Left: Longint;
        Right: Longint;
        Top: Longint;);
    1: (BottomRight: TGridCoord;
        TopLeft: TGridCoord;);
end;
```

C++

```
struct TGridRect {
  Longint Bottom;
  Longint Left;
  Longint Right;
  Longint Top;
  TGridCoord BottomRight;
  TGridCoord TopLeft;
};
```

File

Grids

Description

TGridRect indicates a rectangular set of cells from the grid in one of two ways:

Using the first method, TopLeft indicates the coordinates of the top-left cell in the set and BottomRight indicates the coordinates of the bottom-right cell.

Using the second method, Left indicates the first column in the set and Right the last column in the set, where 0 is the first column of the grid, 1 is the second column, and so on. Top indicates the first row in the set and Bottom the last row, where 0 is the first row of the grid, 1 the second column, and so on.

10.2.7 Grids.TGridState Enumeration

TGridState indicates any user actions that are currently changing the layout of the grid.

Pascal

```
TGridState = (
  gsNormal,
  gsSelecting,
  gsRowSizing,
  gsColSizing,
  gsRowMoving,
  gsColMoving
);
```

C++

```
enum TGridState {
```

```
    gsNormal,
    gsSelecting,
    gsRowSizing,
    gsColSizing,
    gsRowMoving,
    gsColMoving
  };
```

File

Grids

Description

TGridState represents state information about how the grid layout is changing. The following table lists the possible values:

Value	Meaning
gsNormal	The grid layout is not changing.
gsSelecting	The user is selecting a cell or row.
gsRowSizing	The user is changing the height of a row.
gsColSizing	The user is changing the width of a column.
gsRowMoving	The user is dragging a row to a new position.
gsColMoving	The user is dragging a column to a new position.

10.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDrawCellEvent (see page 3205)	Function type for OnDrawCell event.
TGetEditEvent (see page 3206)	TGetEditEvent is the type of the event handlers that provide strings for the inplace editor of a grid.
TGetExtentsFunc (see page 3206)	This is type Grids.TGetExtentsFunc.
TGridDrawState (see page 3206)	TGridDrawState represents information that is useful when rendering the cell of a grid.
TGridMovement (see page 3207)	This is type Grids.TGridMovement.
TGridOptions (see page 3207)	TGridOptions and TGridOption (see page 3201) customize the appearance and behavior of a grid control.
TGridScrollDirection (see page 3209)	TGridScrollDirection indicates the direction in which to scroll the cells of a grid control.
TMovedEvent (see page 3210)	This is type Grids.TMovedEvent.
TOnGetPickListItems (see page 3210)	This is type Grids.TOnGetPickListItems.
TSelectCellEvent (see page 3210)	This is type Grids.TSelectCellEvent.
TSetEditEvent (see page 3211)	TSetEditEvent is the type of the event handlers that assign strings to a cell in a grid.

10.3.1 Grids.TDrawCellEvent Type

Function type for OnDrawCell event.

Pascal

```
TDrawCellEvent = procedure (Sender: TObject; ACol, ARow: Longint; Rect: TRect; State:
TGridDrawState) of object;
```

C++

```
(Sender: TObject; ACol, ARow: Longint; Rect: TRect; State: TGridDrawState) ( TDrawCellEvent)();
```

File

Grids

Description

TDrawCellEvent is the function type for a OnDrawCell event. Its parameters are described in this table.

Parameter	Meaning
Sender	Grid in which cell is being drawn.
ACol, ARow	Column and row indexes of the cell being drawn.
Rect	Location of cell on canvas.
State	TGridDrawState (see page 3206) that indicates whether the cell has input focus, whether the cell is selected, and whether the cell is a fixed (nonscrolling) cell.

See Also

OnDrawCell (see page 3020)

TGridDrawState (see page 3206)

10.3.2 Grids.TGetEditEvent Type

TGetEditEvent is the type of the event handlers that provide strings for the inplace editor of a grid.

Pascal

```
TGetEditEvent = procedure (Sender: TObject; ACol, ARow: Longint; var Value: string) of object;
```

C++

```
(Sender: TObject; ACol, ARow: Longint; var Value: string) ( TGetEditEvent)();
```

File

Grids

Description

Sender is the grid whose cell is being edited.

ACol and ARow indicate the column and row indexes of the cell that is being edited.

Value is the string requested by the inplace editor for that cell. The event handler supplies this string.

10.3.3 Grids.TGetExtentsFunc Type

Pascal

```
TGetExtentsFunc = function (Index: Longint): Integer of object;
```

C++

```
(Index: Longint): Integer ( TGetExtentsFunc)();
```

File

Grids

Description

This is type Grids.TGetExtentsFunc.

10.3.4 Grids.TGridDrawState Type

TGridDrawState represents information that is useful when rendering the cell of a grid.

Pascal

```
TGridDrawState = set of (gdSelected, gdFocused, gdFixed);
```

C++

```
(gdSelected, gdFocused, gdFixed) TGridDrawState;
```

File

Grids

Description

TGridDrawState represents state information about the cell of a grid that is being rendered. It is a set that includes 0 or more of the following:

Value	Meaning
gdSelected	The cell is currently selected.
gdFocused	The cell has input focus.
gdFixed	The cell is in the fixed region of the grid.

10.3.5 Grids.TGridMovement Type

Pascal

```
TGridMovement = gsRowMoving..gsColMoving;
```

C++

```
gsRowMoving..gsColMoving TGridMovement;
```

File

Grids

Description

This is type Grids.TGridMovement.

10.3.6 Grids.TGridOptions Type

TGridOptions and TGridOption (see page 3201) customize the appearance and behavior of a grid control.

Pascal

```
TGridOptions = set of TGridOption;
```

C++

```
TGridOption TGridOptions;
```

File

Grids

Description

TGridOptions is a set of TGridOption (see page 3201) values. The following table lists the possible TGridOption (see page 3201) values:

Value	Meaning
goFixedVertLine	Vertical lines are drawn to separate the fixed (nonscrolling) columns in the grid.
goFixedHorzLine	Horizontal lines are drawn to separate the fixed (nonscrolling) rows in the grid.
goVertLine	Vertical lines are drawn to separate the scrollable columns in the grid.
goHorzLine	Horizontal lines are drawn to separate the scrollable rows in the grid.
goRangeSelect	Users can select ranges of cells at one time. goRangeSelect is ignored if Options includes goEditing.
goDrawFocusSelected	Cells with input focus are drawn with a special highlight color, just like selected cells without input focus. If goDrawFocusSelected is not included, the cell with input focus is distinguished by a focus rectangle, not by a special background color.
goRowSizing	Scrollable rows can be individually resized.
goColSizing	Scrollable columns can be individually resized.
goRowMoving	Scrollable rows can be moved using the mouse.
goColMoving	Scrollable columns can be moved using the mouse.
goEditing	Users can edit the contents of cells. When goEditing is included in Options, goRangeSelect has no effect.
goTabs	Users can navigate through the cells in the grid using Tab and Shift+Tab.
goRowSelect	Entire rows are selected rather than individual cells. If goRowSelect is included in Options, goAlwaysShowEditor has no effect.
goAlwaysShowEditor	The grid is locked into edit mode. The user does not need to use Enter or F2 to turn on EditorMode. If Options does not include goEditing, goAlwaysShowEditor has no effect. If Options includes goRowSelect, goAlwaysShowEditor has no effect.
goThumbTracking	The grid image updates while the user is dragging the thumb of the scroll bar. If goThumbTracking is not included, the image does not update until the user releases the thumb in a new position.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
```

```
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

10.3.7 Grids.TGridScrollDirection Type

TGridScrollDirection indicates the direction in which to scroll the cells of a grid control.

Pascal

```
TGridScrollDirection = set of (sdLeft, sdRight, sdUp, sdDown);
```

C++

```
(sdLeft, sdRight, sdUp, sdDown) TGridScrollDirection;
```

File

Grids

Description

TGridScrollDirection is a set of one or two values that indicate the direction in which to scroll a grid. The set contains at least one value and at most one horizontal and one vertical value. The following table lists the possible values:

Value	Meaning
sdLeft	Scroll cells horizontally to the left.
sdRight	Scroll cells horizontally to the right.
sdUp	Scroll cells vertically up.
sdDown	Scroll cells vertically down.

See Also

TCustomGrid

10.3.8 Grids.TMovedEvent Type

Pascal

```
TMovedEvent = procedure (Sender: TObject; FromIndex, ToIndex: Longint) of object;
```

C++

```
(Sender: TObject; FromIndex, ToIndex: Longint) ( TMovedEvent)();
```

File

Grids

Description

This is type Grids.TMovedEvent.

10.3.9 Grids.TOnGetPickListItems Type

Pascal

```
TOnGetPickListItems = procedure (ACol, ARow: Integer; Items: TStrings) of object;
```

C++

```
(ACol, ARow: Integer; Items: TStrings) ( TOnGetPickListItems)();
```

File

Grids

Description

This is type Grids.TOnGetPickListItems.

10.3.10 Grids.TSelectCellEvent Type

Pascal

```
TSelectCellEvent = procedure (Sender: TObject; ACol, ARow: Longint; var CanSelect: Boolean) of
object;
```

C++

```
(Sender: TObject; ACol, ARow: Longint; var CanSelect: Boolean) ( TSelectCellEvent)();
```

File

Grids

Description

This is type Grids.TSelectCellEvent.

10.3.11 Grids.TSetEditEvent Type

TSetEditEvent is the type of the event handlers that assign strings to a cell in a grid.

Pascal

```
TSetEditEvent = procedure (Sender: TObject; ACol, ARow: Longint; const Value: string) of object;
```

C++

```
(Sender: TObject; ACol, ARow: Longint; const Value: string) ( TSetEditEvent)();
```

File

Grids

Description

Sender is the grid whose cell was just edited.

ACol and ARow indicate the column and row indexes of the cell that was edited.

Value is the string to assign to the cell.

10.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MaxCustomExtents (see page 3212)	This is constant Grids.MaxCustomExtents.
MaxShortInt (see page 3212)	This is constant Grids.MaxShortInt.

10.4.1 Grids.MaxCustomExtents Constant

Pascal

```
MaxCustomExtents = MaxListSize;
```

C++

```
MaxCustomExtents = MaxListSize;
```

File

Grids

Description

This is constant Grids.MaxCustomExtents.

10.4.2 Grids.MaxShortInt Constant

Pascal

```
MaxShortInt = High(ShortInt);
```

C++

```
MaxShortInt = High(ShortInt);
```

File

Grids

Description

This is constant Grids.MaxShortInt.

11 HelpIntfs Namespace

This is namespace HelpIntfs.

Topics

Name	Description
Classes (see page 3214)	The following table lists classes in this documentation.
Interfaces (see page 3215)	The following table lists interfaces in this documentation.
Functions (see page 3242)	The following table lists functions in this documentation.

Classes

	Name	Description
	EHelpSystemException (see page 3214)	EHelpSystemException is the class for errors raised by the RTL Help System.

Functions

	Name	Description
	GetHelpSystem (see page 3242)	Returns Help System object.
	GetHelpSystem (see page 3242)	Returns Help System object.
	GetHelpSystem (see page 3242)	Returns Help System object.
	RegisterViewer (see page 3242)	Register Help Viewer to receive requests.

Interfaces

	Name	Description
	ICustomHelpViewer (see page 3215)	Help Viewer access for Help System..
	IExtendedHelpViewer (see page 3219)	Help Viewer with context help support.
	IExtendedHelpViewer2 (see page 3222)	Help Viewer with ability to open Index and Search panes, as well as open Topics with Anchors.
	IFilteredHelpViewer (see page 3224)	Help Viewer with ability to Set and Get help filters.
	IHelpManager (see page 3226)	IHelpManager provides access to the Help System for a Help Viewer.
	IHelpSelector (see page 3228)	Interface for Help Selector object.
	IHelpSelector2 (see page 3230)	This is class HelpIntfs.IHelpSelector2.
	IHelpSystem (see page 3231)	Application Help System that supports multiple Help Viewers.
	IHelpSystem2 (see page 3234)	Application Help System that supports multiple Help Viewers.
	IHelpSystem3 (see page 3235)	Application Help System that supports multiple Help Viewers.
	IHelpSystemFlags (see page 3238)	This is class HelpIntfs.IHelpSystemFlags.
	ISpecialWinHelpViewer (see page 3239)	Help Viewer that supports special Windows Help requests.

11.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EHelpSystemException (see page 3214)	EHelpSystemException is the class for errors raised by the RTL Help System.

11.1.1 EHelpSystemException Class

EHelpSystemException is the class for errors raised by the RTL Help System.

Class Hierarchy

Pascal

```
EHelpSystemException = class(Exception);
```

C++

```
class EHelpSystemException : public Exception;
```

File

HelpIntfs

Description

The Run-Time Library Help System raises EHelpSystemException when an error occurs while registering or invoking a help viewer.

11.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	ICustomHelpViewer (see page 3215)	Help Viewer access for Help System..
	IExtendedHelpViewer (see page 3219)	Help Viewer with context help support.
	IExtendedHelpViewer2 (see page 3222)	Help Viewer with ability to open Index and Search panes, as well as open Topics with Anchors.
	IFilteredHelpViewer (see page 3224)	Help Viewer with ability to Set and Get help filters.
	IHelpManager (see page 3226)	IHelpManager provides access to the Help System for a Help Viewer.
	IHelpSelector (see page 3228)	Interface for Help Selector object.
	IHelpSelector2 (see page 3230)	This is class HelpIntfs.IHelpSelector2.
	IHelpSystem (see page 3231)	Application Help System that supports multiple Help Viewers.
	IHelpSystem2 (see page 3234)	Application Help System that supports multiple Help Viewers.
	IHelpSystem3 (see page 3235)	Application Help System that supports multiple Help Viewers.
	IHelpSystemFlags (see page 3238)	This is class HelpIntfs.IHelpSystemFlags.
	ISpecialWinHelpViewer (see page 3239)	Help Viewer that supports special Windows Help requests.

11.2.1 ICustomHelpViewer Interface

Help Viewer access for Help System..

Class Hierarchy

Pascal

```
ICustomHelpViewer = interface(IInterface);
```

C++

```
__interface ICustomHelpViewer : public IInterface;
```

File

HelpIntfs

Description

A Help Viewer is an object which handles application Help requests passed to it by the Help System on behalf of an application. A Help Viewer is typically a wrapper for an external application, such as a help engine or web browser.

The Help Viewer class must implement the ICustomHelpViewer interface, or one of its descendant interfaces, IExtendedHelpViewer (see page 3219) and ISpecialWinHelpViewer (see page 3239). The Help System uses methods from these interfaces to pass Help requests to the Help Viewer.

To use a Help Viewer, an application must call the global RegisterViewer (see page 3242) function.

Note: ISpecialWinHelpViewer (see page 3239) is only provided with Windows products. Do not use this type in cross-platform applications.

Implementing ICustomHelpViewer

11.2.1.1 ICustomHelpViewer Members

The following tables list the members exposed by ICustomHelpViewer.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.

11.2.1.2 ICustomHelpViewer Methods

The methods of the ICustomHelpViewer class are listed here.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.

11.2.1.2.1 ICustomHelpViewer.CanShowTableOfContents Method

Query support for Table of Contents.

Pascal

```
function CanShowTableOfContents: Boolean;
```

C++

```
__fastcall Boolean CanShowTableOfContents();
```

Description

The Help System uses CanShowTableOfContents to determine which Help Viewers know how to display a Table of Contents.

CanShowTableOfContents should return true if the Viewer is ready for a subsequent call to ShowTableOfContents (see page 3218). The Help System should not call ShowTableOfContents (see page 3218) for a Viewer after CanShowTableOfContents returns false; if this occurs, the Viewer should raise an EHelpSystemException (see page 3214).

See Also

ShowTableOfContents (see page 3233)

ShowTableOfContents (see page 3218)

EHelpSystemException (see page 3214)

11.2.1.1.2.2 ICustomHelpViewer.GetHelpStrings Method

Return Help Strings that match a keyword.

Pascal

```
function GetHelpStrings(const HelpString: string): TStringList;
```

C++

```
__fastcall TStringList GetHelpStrings(const UnicodeString HelpString);
```

Description

The Help System calls GetHelpStrings to obtain a list of Help Strings for topics that match a keyword-based Help request. GetHelpStrings should expect the keyword in the parameter and return the Help Strings in a TStringList object.

A Help String is an identifying string associated with a specific topic. The Help System requires that each of the topics provided by a given Viewer have a different Help String. The Help System does not require that two Viewers never use the same Help String, but an application should still avoid doing this. One strategy is to include the Viewer Name in the Help String.

The Help System uses Help Strings to provide the Help Selector with a merged list of Help topics that match a request. Typically, Help Strings are human-readable topic descriptions, and the Help Selector simply displays them to the user so the user can choose which topic will be displayed.

See Also

ShowHelp (see page 3233)

UnderstandsKeyword (see page 3219)

ShowHelp (see page 3218)

GetViewerName (see page 3217)

11.2.1.1.2.3 ICustomHelpViewer.GetViewerName Method

Return string identifying Help Viewer.

Pascal

```
function GetViewerName: string;
```

C++

```
__fastcall UnicodeString GetViewerName();
```

Description

The Help System calls GetViewerName to obtain a string identifying the Help Viewer. Every Help Viewer within an application must return a unique Viewer Name.

11.2.1.2.4 ICustomHelpViewer.NotifyID Method

Save Viewer's numeric ID.

Pascal

```
procedure NotifyID(const ViewerID: Integer);
```

C++

```
__fastcall NotifyID(const int ViewerID);
```

Description

The Help System calls NotifyID to pass the application a unique numeric ID associated with a Viewer. The application uses this ID to identify a specific viewer in calls to Release (IHelpManager (see page 3226)).

See Also

Release (see page 3227)

11.2.1.2.5 ICustomHelpViewer.ShowHelp Method

Show a specific Help topic.

Pascal

```
procedure ShowHelp(const HelpString: string);
```

C++

```
__fastcall ShowHelp(const UnicodeString HelpString);
```

Description

The Help System calls ShowHelp when it needs the Help Viewer to display the Help Topic identified by HelpString. The HelpString parameter is a value previously provided by the Help Viewer in response to a GetHelpStrings (see page 3217) call.

11.2.1.2.6 ICustomHelpViewer.ShowTableOfContents Method

Show a Table of Contents.

Pascal

```
procedure ShowTableOfContents;
```

C++

```
__fastcall ShowTableOfContents();
```

Description

The Help System calls ShowTableOfContents when it needs the Help Viewer to display a Table of Contents. The Help System does not call ShowTableOfContents for a Viewer unless that Viewer has previously returned true for a call to CanShowTableOfContents (see page 3216).

See Also

CanShowTableOfContents (see page 3216)

11.2.1.2.7 ICustomHelpViewer.ShutDown Method

Permanent Viewer shut down.

Pascal

```
procedure ShutDown;
```

C++

```
__fastcall ShutDown();
```

Description

The Help System calls ShutDown when it is notified that the application is shutting down. A Viewer should respond to this call by terminating any external applications used to display Help topics. After a call to ShutDown, a Viewer can assume that no more Help requests will arrive.

11.2.1.2.8 ICustomHelpViewer.SoftShutDown Method

Temporary Viewer shut down.

Pascal

```
procedure SoftShutDown;
```

C++

```
__fastcall SoftShutDown();
```

Description

The Help System calls SoftShutDown when it is notified that the application want to close all open Help Topics. A Viewer should respond to this call by terminating any external applications used to display Help topics, but should be prepared to restart them as needed.

11.2.1.2.9 ICustomHelpViewer.UnderstandsKeyword Method

Would respond to a keyword-based Help request.

Pascal

```
function UnderstandsKeyword(const HelpString: string): Integer;
```

C++

```
__fastcall int UnderstandsKeyword(const UnicodeString HelpString);
```

Description

The Help System calls UnderstandsKeyword to determine to determine if the Help Viewer can provide topics for a keyword-based Help request based on HelpString. UnderstandsKeyword should return the number of Help topics that would match such a request.

11.2.2 IExtendedHelpViewer Interface

Help Viewer with context help support.

Class Hierarchy

Pascal

```
IExtendedHelpViewer = interface(ICustomHelpViewer);
```

C++

```
__interface IExtendedHelpViewer : public ICustomHelpViewer;
```

File

HelpIntfs

Description

IExtendedHelpViewer extends ICustomHelpViewer (see page 3215) by adding support for Topic IDs and Context IDs.

A topic ID is a short string that uniquely identifies each topic provided by a Help Viewer. A topic ID provides a simple way for an application to display a specific Help topic without searching for it.

A context ID is an integer value that uniquely identifies each Help topic. Context IDs support context-sensitive Help by providing a value that associates forms and controls with their help topics. A form or control can be associated a topic simply by setting its HelpContext property.

RegisterViewer (see page 3242)

Help System Interfaces

11.2.2.1 IExtendedHelpViewer Members

The following tables list the members exposed by IExtendedHelpViewer.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayTopic (see page 3221)	Use Topic ID to display topic.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.2.2 IExtendedHelpViewer Methods

The methods of the IExtendedHelpViewer class are listed here.

Public Methods

	Name	Description
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayTopic (see page 3221)	Use Topic ID to display topic.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.2.2.1 IExtendedHelpViewer.DisplayHelpByContext Method

Use Context ID to display topic.

Pascal

```
procedure DisplayHelpByContext(const ContextID: Integer; const HelpFileName: string);
```

C++

```
__fastcall DisplayHelpByContext(const int ContextID, const UnicodeString HelpFileName);
```

Description

The RTL Help System calls DisplayHelpByContext to have the Viewer handle a context-based Help request. ContextID is the topic's Context ID. HelpFileName is the name of the file containing the topic. Note that some Help engines require the file name to be fully qualified.

See Also

UnderstandsTopic (see page 3222)

11.2.2.2.2 IExtendedHelpViewer.DisplayTopic Method

Use Topic ID to display topic.

Pascal

```
procedure DisplayTopic(const Topic: string);
```

C++

```
__fastcall DisplayTopic(const UnicodeString Topic);
```

Description

The RTL Help System calls DisplayTopic to have the Viewer handle a topic-based Help request. Topic is the Topic ID, a short string that must be unique for all the topics maintained by a particular Viewer.

See Also

UnderstandsTopic (see page 3222)

11.2.2.2.3 IExtendedHelpViewer.UnderstandsContext Method

Queries the Help Viewer if it understands the given Context ID.

Pascal

```
function UnderstandsContext(const ContextID: Integer; const HelpFileName: string): Boolean;
```

C++

```
__fastcall Boolean UnderstandsContext(const int ContextID, const UnicodeString HelpFileName);
```

Description

UnderstandsContext should return true if the Viewer is able to display the topic identified by ContextID in the file HelpFileName. When the RTL Help System receives a Context-based Help request, it calls UnderstandsContext for each Viewer that implements it until the method returns true. (Viewers are polled in the order they were registered.) The Help System than calls that Viewer's DisplayHelpByContext (see page 3221) method.

See Also

DisplayHelpByContext (see page 3221)

11.2.2.2.4 IExtendedHelpViewer.UnderstandsTopic Method

Queries the Help Viewer if it understands the given Topic.

Pascal

```
function UnderstandsTopic(const Topic: string): Boolean;
```

C++

```
__fastcall Boolean UnderstandsTopic(const UnicodeString Topic);
```

Description

UnderstandsTopic should return true if the Viewer is able to display the topic identified by the Topic parameter. When the RTL Help System receives a Topic-based Help request, it calls UnderstandsTopic for each Viewer that implements it until the method returns true. (Viewers are polled in the order they were registered.) The Help System than calls that Viewer's DisplayTopic (see page 3221) method.

See Also

DisplayTopic (see page 3221)

11.2.3 IExtendedHelpViewer2 Interface

Help Viewer with ability to open Index and Search panes, as well as open Topics with Anchors.

Class Hierarchy

Pascal

```
IExtendedHelpViewer2 = interface(IExtendedHelpViewer);
```

C++

```
__interface IExtendedHelpViewer2 : public IExtendedHelpViewer;
```

File

HelpIntfs

Description

IExtendedHelpViewer2 extends IExtendedHelpViewer (see page 3219) by adding support for opening the Index and Search pane of the Help Viewer. It also allows you to specify an Anchor when opening up a specific topic.

See Also

RegisterViewer (see page 3242)

Help System Interfaces

11.2.3.1 IExtendedHelpViewer2 Members

The following tables list the members exposed by IExtendedHelpViewer2.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayIndex (see page 3223)	Opens Index pane of Help Viewer.
	DisplaySearch (see page 3223)	Opens Search pane of Help Viewer.
	DisplayTopic (see page 3224)	Use Topic ID to display topic, specifying page anchor.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.3.2 IExtendedHelpViewer2 Methods

The methods of the IExtendedHelpViewer2 class are listed here.

Public Methods

	Name	Description
	DisplayIndex (see page 3223)	Opens Index pane of Help Viewer.
	DisplaySearch (see page 3223)	Opens Search pane of Help Viewer.
	DisplayTopic (see page 3224)	Use Topic ID to display topic, specifying page anchor.

11.2.3.2.1 IExtendedHelpViewer2.DisplayIndex Method

Opens Index pane of Help Viewer.

Pascal

```
procedure DisplayIndex(const Topic: string);
```

C++

```
__fastcall DisplayIndex(const UnicodeString Topic);
```

Description

The RTL Help System calls DisplayIndex to have the Viewer open its Index Pane. If the Help Viewer has the ability to search for the given topic parameter, it executes the Index search; otherwise it is ignored.

See Also

DisplaySearch (see page 3223)

11.2.3.2.2 IExtendedHelpViewer2.DisplaySearch Method

Opens Search pane of Help Viewer.

Pascal

```
procedure DisplaySearch(const Topic: string);
```

C++

```
__fastcall DisplaySearch(const UnicodeString Topic);
```

Description

The RTL Help System calls DisplaySearch to have the Viewer open its Search Pane. If the Help Viewer has the ability to search for the given topic parameter, it executes the search; otherwise it is ignored.

See Also

DisplayIndex (see page 3223)

11.2.3.2.3 IExtendedHelpViewer2.DisplayTopic Method

Use Topic ID to display topic, specifying page anchor.

Pascal

```
procedure DisplayTopic(const Topic: string; const Anchor: string); overload;
```

C++

```
__fastcall DisplayTopic(const UnicodeString Topic, const UnicodeString Anchor);
```

Description

The RTL Help System calls DisplayTopic to have the Viewer handle a topic-based Help request and can specify a page anchor. If the page does not have the page anchor, the page is opened anyway.

Topic is the Topic ID, a short string that must be unique for all topics maintained by a particular Viewer.

Anchor is a tag that allows you to jump to a specific place in a page.

See Also

UnderstandsTopic (see page 3222)

11.2.4 IFilteredHelpViewer Interface

Help Viewer with ability to Set and Get help filters.

Class Hierarchy

Pascal

```
IFilteredHelpViewer = interface(IExtendedHelpViewer2);
```

C++

```
__interface IFilteredHelpViewer : public IExtendedHelpViewer2;
```

File

HelpIntfs

Description

IFilteredHelpViewer extends IExtendedHelpViewer2 (see page 3222) by adding support for getting and setting help filters.

See Also

RegisterViewer (see page 3242)

Help System Interfaces

11.2.4.1 IFilteredHelpViewer Members

The following tables list the members exposed by IFilteredHelpViewer.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayIndex (see page 3223)	Opens Index pane of Help Viewer.
	DisplaySearch (see page 3223)	Opens Search pane of Help Viewer.
	DisplayTopic (see page 3221)	Use Topic ID to display topic.
	DisplayTopic (see page 3224)	Use Topic ID to display topic, specifying page anchor.
	GetFilter (see page 3225)	Returns current help filter.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	SetFilter (see page 3226)	Sets current help filter.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.4.2 IFilteredHelpViewer Methods

The methods of the IFilteredHelpViewer class are listed here.

Public Methods

	Name	Description
	GetFilter (see page 3225)	Returns current help filter.
	SetFilter (see page 3226)	Sets current help filter.

11.2.4.2.1 IFilteredHelpViewer.GetFilter Method

Returns current help filter.

Pascal

```
function GetFilter: string;
```

C++

```
__fastcall UnicodeString GetFilter();
```

Description

GetFilter queries the Help Viewer for the currently applied Help Filter.

See Also

SetFilter (see page 3226)

11.2.4.2.2 IFilteredHelpViewer.SetFilter Method

Sets current help filter.

Pascal

```
procedure SetFilter(const Filter: string);
```

C++

```
__fastcall SetFilter(const UnicodeString Filter);
```

Description

SetFilter sets the given help filter. This is useful when trying to narrow down help searches.

See Also

GetFilter (see page 3225)

11.2.5 IHelpManager Interface

IHelpManager provides access to the Help System for a Help Viewer.

Class Hierarchy

HelpIntfs.IHelpManager

Pascal

```
IHelpManager = interface;
```

C++

```
__interface IHelpManager;
```

File

HelpIntfs

Description

IHelpManager defines methods that a Help Viewer uses to interact with the Help System. A Viewer accesses these methods using the object that the global RegisterViewer (see page 3242) function returns.

See Also

RegisterViewer (see page 3242)

Help System Interfaces

11.2.5.1 IHelpManager Members

The following tables list the members exposed by IHelpManager.

Public Methods

	Name	Description
	GetHandle (see page 3227)	Get application window handle.
	GetHelpFile (see page 3227)	Get Help File name.
	Release (see page 3227)	Notify Help System of Help Viewer shutdown.

11.2.5.2 IHelpManager Methods

The methods of the IHelpManager class are listed here.

Public Methods

	Name	Description
	GetHandle (see page 3227)	Get application window handle.
	GetHelpFile (see page 3227)	Get Help File name.
	Release (see page 3227)	Notify Help System of Help Viewer shutdown.

11.2.5.2.1 IHelpManager.GetHandle Method

Get application window handle.

Pascal

```
function GetHandle: LongInt;
```

C++

```
__fastcall LongInt GetHandle();
```

Description

GetHandle returns the main window handle of the application responsible for the current Help request.

11.2.5.2.2 IHelpManager.GetHelpFile Method

Get Help File name.

Pascal

```
function GetHelpFile: string;
```

C++

```
__fastcall UnicodeString GetHelpFile();
```

Description

GetHelpFile returns the name of the Help File associated with the current Help request.

11.2.5.2.3 IHelpManager.Release Method

Notify Help System of Help Viewer shutdown.

Pascal

```
procedure Release(const ViewerID: Integer);
```

C++

```
__fastcall Release(const int ViewerID);
```

Description

Release disconnects the Help Viewer from the RTL Help System. The ViewerID parameter is the value the Help System previously passed to the Viewer by calling NotifyID.

A Help Viewer should call Release when it is about to shut down, unless the Viewer is shutting down in response to a call to ShutDown.

See Also

NotifyID (see page 3218)

ShutDown (see page 3218)

11.2.6 IHelpSelector Interface

Interface for Help Selector object.

Class Hierarchy

Pascal

```
IHelpSelector = interface(IInterface);
```

C++

```
__interface IHelpSelector : public IInterface;
```

File

HelpIntfs

Description

When an application uses more than one Help Viewer, there may be multiple responses to a Help request. By default, the Help System polls the Viewers in the order they were registered, and gives the request to the first viewer that claims to be able to handle it.

An application can optionally provide a Help Selector, which determines the Viewer for keyword-based Help requests and for requests to display a Table of Contents. To define a Help Selector, create an object that implements IHelpSelector and pass it to the Help System, using AssignHelpSelector.

The Help Selector cannot affect context-based or topic-based Help requests, which always go to the first Viewer that claims to be able to handle the request.

See Also

RegisterViewer (see page 3242)

IHelpSystem (see page 3231)

Help System Interfaces

11.2.6.1 IHelpSelector Members

The following tables list the members exposed by IHelpSelector.

Public Methods

	Name	Description
	SelectKeyword (see page 3229)	Keyword-based Help support for multiple Viewers.
	TableOfContents (see page 3229)	Choose Viewer to display Table of Contents.

11.2.6.2 IHelpSelector Methods

The methods of the IHelpSelector class are listed here.

Public Methods

	Name	Description
	SelectKeyword (see page 3229)	Keyword-based Help support for multiple Viewers.
	TableOfContents (see page 3229)	Choose Viewer to display Table of Contents.

11.2.6.2.1 IHelpSelector.SelectKeyword Method

Keyword-based Help support for multiple Viewers.

Pascal

```
function SelectKeyword(Keywords: TStrings): Integer;
```

C++

```
__fastcall int SelectKeyword(TStrings Keywords);
```

Description

The Help System calls SelectKeyword when more than one Help Viewer has topics that match a keyword-based Help request. The Keywords parameter contains a merged list of Help Strings, obtained by calling GetHelpStrings for each Viewer. SelectKeyword indicates a specific topic by returning the index of a specific Help String. The Help System then passes this Help String to the ShowHelp method of the appropriate Viewer. If the return value is negative, the Help System assumes that the Help request has been aborted and does nothing.

Typically, SelectKeyword displays a dialog box so the user can choose one of the Help Strings, and returns the index of the user's choice, or a negative value if the user cancels the dialog. This duplicates a feature of most Viewers, but allows the user to see all matching topics in a single list.

Note: SelectKeyword must not modify or rearrange the Help Strings list.

See Also

UnderstandsKeyword (see page 3219)

GetHelpStrings (see page 3217)

ShowHelp (see page 3218)

11.2.6.2.2 IHelpSelector.TableOfContents Method

Choose Viewer to display Table of Contents.

Pascal

```
function TableOfContents(Contents: TStrings): Integer;
```

C++

```
__fastcall int TableOfContents(TStrings Contents);
```

Description

The Help System calls TableOfContents when more than one Help Viewer responds to a request to show a Help Table of Contents. The Help System passes a list of Viewer names in the Contents parameter. TableOfContents should return the index of the chosen Viewer's name.

Note: TableOfContents must not modify or rearrange the Viewer names list.

See Also

CanShowTableOfContents (see page 3216)

11.2.7 IHelpSelector2 Interface

Class Hierarchy

Pascal

```
IHelpSelector2 = interface(IHelpSelector);
```

C++

```
__interface IHelpSelector2 : public IHelpSelector;
```

File

HelpIntfs

Description

This is class HelpIntfs.IHelpSelector2.

11.2.7.1 IHelpSelector2 Members

The following tables list the members exposed by IHelpSelector2.

Public Methods

	Name	Description
	SelectContext (see page 3230)	This is SelectContext, a member of class IHelpSelector2.
	SelectKeyword (see page 3229)	Keyword-based Help support for multiple Viewers.
	TableOfContents (see page 3229)	Choose Viewer to display Table of Contents.

11.2.7.2 IHelpSelector2 Methods

The methods of the IHelpSelector2 class are listed here.

Public Methods

	Name	Description
	SelectContext (see page 3230)	This is SelectContext, a member of class IHelpSelector2.

11.2.7.2.1 IHelpSelector2.SelectContext Method

Pascal

```
function SelectContext(Viewers: TStrings): Integer;
```

C++

```
__fastcall int SelectContext(TStrings Viewers);
```

Description

This is SelectContext, a member of class IHelpSelector2.

11.2.8 IHelpSystem Interface

Application Help System that supports multiple Help Viewers.

Class Hierarchy

Pascal

```
IHelpSystem = interface(IInterface);
```

C++

```
__interface IHelpSystem : public IInterface;
```

File

HelpIntfs

Description

The Run-Time Library Help System allows an application to access one or more Help Viewers through a uniform interface, IHelpSystem. To obtain an object that implements IHelpSystem, use the HelpSystem property of the Application global variable, or call the global GetHelpSystem (see page 3242) function.

See Also

Help System Interfaces

11.2.8.1 IHelpSystem Members

The following tables list the members exposed by IHelpSystem.

Public Methods

	Name	Description
	AssignHelpSelector (see page 3232)	Assign a Help Selector object.
	Hook (see page 3232)	Do a WinHelp-style Help request.
	ShowContextHelp (see page 3232)	Do Context-based Help request.
	ShowHelp (see page 3233)	Do Keyword-based Help request.
	ShowTableOfContents (see page 3233)	Show Table of Contents.
	ShowTopicHelp (see page 3233)	Show Help topic.

11.2.8.2 IHelpSystem Methods

The methods of the IHelpSystem class are listed here.

Public Methods

	Name	Description
	AssignHelpSelector (see page 3232)	Assign a Help Selector object.
	Hook (see page 3232)	Do a WinHelp-style Help request.

	ShowContextHelp (see page 3232)	Do Context-based Help request.
	ShowHelp (see page 3233)	Do Keyword-based Help request.
	ShowTableOfContents (see page 3233)	Show Table of Contents.
	ShowTopicHelp (see page 3233)	Show Help topic.

11.2.8.2.1 IHelpSystem.AssignHelpSelector Method

Assign a Help Selector object.

Pascal

```
procedure AssignHelpSelector(const Selector: IHelpSelector);
```

C++

```
__fastcall AssignHelpSelector(const IHelpSelector Selector);
```

Description

Call AssignHelpSelector to provide a Help Selector object. Use of a Help Selector allows an application to define the way a Help Viewer is chosen to handle keyword-based Help requests and requests to display a Table of Contents.

11.2.8.2.2 IHelpSystem.Hook Method

Do a WinHelp-style Help request.

Pascal

```
function Hook(Handle: Longint; const HelpFile: string; Comand: Word; Data: Longint): Boolean;
```

C++

```
__fastcall Boolean Hook(Longint Handle, const UnicodeString HelpFile, Word Comand, Longint
Data);
```

Description

Hook accepts Help requests that uses the same conventions as the Microsoft Windows WinHelp API. Hook should only be called for requests that cannot be translated into calls to ShowContextHelp (see page 3232), ShowHelp (see page 3233), ShowTableOfContents (see page 3233), or ShowTopicHelp (see page 3233).

Note: If the Help System is unable to decipher the Help request, it looks for a Viewer that implements ISpecialWinHelpViewer (see page 3239). If the application has registered such a viewer, the request succeeds if the Viewer is able to handle it. Otherwise the request fails.

11.2.8.2.3 IHelpSystem.ShowContextHelp Method

Do Context-based Help request.

Pascal

```
procedure ShowContextHelp(const ContextID: Longint; const HelpFileName: string);
```

C++

```
__fastcall ShowContextHelp(const Longint ContextID, const UnicodeString HelpFileName);
```

Description

Call ShowContextHelp to display a single Help topic, identified by ContextID and HelpFileName. For context-based Help requests to work, the application must have previously registered at least one Help Viewer that implements IExtendedHelpViewer (see page 3219). If no such Viewer is found, an EHelpSystemException (see page 3214) is raised.

11.2.8.2.4 IHelpSystem.ShowHelp Method

Do Keyword-based Help request.

Pascal

```
procedure ShowHelp(const HelpKeyword: string; const HelpFileName: string);
```

C++

```
__fastcall ShowHelp(const UnicodeString HelpKeyword, const UnicodeString HelpFileName);
```

Description

Call ShowHelp to submit a keyword-based Help request. By default, the RTL Help System gives the request to the first Help Viewer that claims to be able to handle it. Typically, the Viewer passes the Help request to an external Help engine, which displays a list of matching topics (if more than one topic matches) or goes directly to a specific topic (if a single topic matches).

To support keyword-based Help requests using multiple Help Viewers, assign a Help Selector, using the AssignHelpSelector (see page 3232) method.

11.2.8.2.5 IHelpSystem.ShowTableOfContents Method

Show Table of Contents.

Pascal

```
procedure ShowTableOfContents;
```

C++

```
__fastcall ShowTableOfContents();
```

Description

Call ShowTableOfContents to request that the Help System display a Table of Contents.

Note: Tapplication.HelpShowTableOfContents is the preferred method of opening the Table of Contents.

11.2.8.2.6 IHelpSystem.ShowTopicHelp Method

Show Help topic.

Pascal

```
procedure ShowTopicHelp(const Topic: string; const HelpFileName: string);
```

C++

```
__fastcall ShowTopicHelp(const UnicodeString Topic, const UnicodeString HelpFileName);
```

Description

Call ShowTopicHelp to request that the Help System display a specific Help topic.

The Topic parameter is a short string identifying the specific topic.

The HelpFileName parameter is the name of the file containing the topic. If this parameter is a zero-length string, the HelpFile property of the global Application variable is used.

11.2.9 IHelpSystem2 Interface

Application Help System that supports multiple Help Viewers.

Class Hierarchy

Pascal

```
IHelpSystem2 = interface(IHelpSystem);
```

C++

```
__interface IHelpSystem2 : public IHelpSystem;
```

File

HelpIntfs

Description

The Run-Time Library Help System allows an application to access one or more Help Viewers through a uniform interface, IHelpSystem2. To obtain an object that implements IHelpSystem2, call the global function GetHelpSystem (see page 3242).

This interface extends IHelpSystem (see page 3231) with the ability to query the Help System if it understands a given keyword.

See Also

Help System Interfaces

GetHelpSystem (see page 3242)

11.2.9.1 IHelpSystem2 Members

The following tables list the members exposed by IHelpSystem2.

Public Methods

	Name	Description
	AssignHelpSelector (see page 3232)	Assign a Help Selector object.
	Hook (see page 3232)	Do a WinHelp-style Help request.
	ShowContextHelp (see page 3232)	Do Context-based Help request.
	ShowHelp (see page 3233)	Do Keyword-based Help request.
	ShowTableOfContents (see page 3233)	Show Table of Contents.
	ShowTopicHelp (see page 3233)	Show Help topic.
	UnderstandsKeyword (see page 3235)	Queries Help system for ability to understand keyword.

11.2.9.2 IHelpSystem2 Methods

The methods of the IHelpSystem2 class are listed here.

Public Methods

	Name	Description
	UnderstandsKeyword (see page 3235)	Queries Help system for ability to understand keyword.

11.2.9.2.1 IHelpSystem2.UnderstandsKeyword Method

Queries Help system for ability to understand keyword.

Pascal

```
function UnderstandsKeyword(const HelpKeyword: string; const HelpFileName: string): Boolean;
```

C++

```
__fastcall Boolean UnderstandsKeyword(const UnicodeString HelpKeyword, const UnicodeString
HelpFileName);
```

Description

The Help System calls UnderstandsKeyword to determine if the Help Viewer can provide topics for a keyword-based Help request based on the given keyword. UnderstandsKeyword should return true if any registered help viewer understands the given keyword.

11.2.10 IHelpSystem3 Interface

Application Help System that supports multiple Help Viewers.

Class Hierarchy

Pascal

```
IHelpSystem3 = interface(IHelpSystem2);
```

C++

```
__interface IHelpSystem3 : public IHelpSystem2;
```

File

HelpIntfs

Description

The Run-Time Library Help System allows an application to access one or more Help Viewers through a uniform interface, IHelpSystem3. To obtain an object that implements IHelpSystem3, call the global function GetHelpSystem (see page 3242).

This interface extends IHelpSystem2 (see page 3234) with the ability to show the index and search panes. It also allows you to utilize page anchors and get and set help filters.

See Also

Help System Interfaces

GetHelpSystem (see page 3242)

11.2.10.1 IHelpSystem3 Members

The following tables list the members exposed by IHelpSystem3.

Public Methods

	Name	Description
	AssignHelpSelector (see page 3232)	Assign a Help Selector object.
	GetFilter (see page 3236)	Returns current help filter.
	Hook (see page 3232)	Do a WinHelp-style Help request.
	SetFilter (see page 3236)	Sets current help filter.
	ShowContextHelp (see page 3232)	Do Context-based Help request.
	ShowHelp (see page 3233)	Do Keyword-based Help request.
	ShowIndex (see page 3237)	Opens Index pane of Help Viewer.
	ShowSearch (see page 3237)	Opens Search pane of Help Viewer.
	ShowTableOfContents (see page 3233)	Show Table of Contents.
	ShowTopicHelp (see page 3237)	Show Help topic.
	UnderstandsKeyword (see page 3235)	Queries Help system for ability to understand keyword.

11.2.10.2 IHelpSystem3 Methods

The methods of the IHelpSystem3 class are listed here.

Public Methods

	Name	Description
	GetFilter (see page 3236)	Returns current help filter.
	SetFilter (see page 3236)	Sets current help filter.
	ShowIndex (see page 3237)	Opens Index pane of Help Viewer.
	ShowSearch (see page 3237)	Opens Search pane of Help Viewer.
	ShowTopicHelp (see page 3237)	Show Help topic.

11.2.10.2.1 IHelpSystem3.GetFilter Method

Returns current help filter.

Pascal

```
function GetFilter: string;
```

C++

```
__fastcall UnicodeString GetFilter();
```

Description

The RTL Help System calls GetFilter to have the Viewer return its current help filter. This function returns the filter of the first Help Viewer that implements this interface (Help Viewers are found in the order that they are added).

See Also

SetFilter (see page 3236)

11.2.10.2.2 IHelpSystem3.SetFilter Method

Sets current help filter.

Pascal

```
procedure SetFilter(const Filter: string);
```

C++

```
__fastcall SetFilter(const UnicodeString Filter);
```

Description

The RTL Help System calls SetFilter to set the given filter for all Viewers that implement IHelpSystem3 (see page 3235).

See Also

GetFilter (see page 3236)

11.2.10.2.3 IHelpSystem3.ShowIndex Method

Opens Index pane of Help Viewer.

Pascal

```
procedure ShowIndex(const Topic: string; const HelpFileName: string);
```

C++

```
__fastcall ShowIndex(const UnicodeString Topic, const UnicodeString HelpFileName);
```

Description

The RTL Help System calls ShowIndex to have a Viewer open its Index Pane. If the Help Viewer has the ability to search for the given topic parameter, it executes the Index search; otherwise it is ignored. The **HelpFileName** parameter is only used in certain help systems (such as Microsoft HTML Help) and is used only if there is no help file name already known by the Help System.

The help system queries all registered Help Viewers. If only one viewer can display an Index pane, it is shown; otherwise the user is asked to decide which Viewer to display.

See Also

ShowSearch (see page 3237)

11.2.10.2.4 IHelpSystem3.ShowSearch Method

Opens Search pane of Help Viewer.

Pascal

```
procedure ShowSearch(const Topic: string; const HelpFileName: string);
```

C++

```
__fastcall ShowSearch(const UnicodeString Topic, const UnicodeString HelpFileName);
```

Description

The RTL Help System calls ShowSearch to have a Viewer open its Search Pane. If the Help Viewer has the ability to search for the given topic parameter, it executes the search; otherwise it is ignored. The **HelpFileName** parameter is only used in certain help systems (such as Microsoft HTML Help) and is only used if there is no help file name already known by the Help System.

The help system queries all registered Help Viewers. If only one viewer can display an Search pane then it is shown; otherwise the user is asked to decide which Viewer to display.

See Also

ShowIndex (see page 3237)

11.2.10.2.5 IHelpSystem3.ShowTopicHelp Method

Show Help topic.

Pascal

```
procedure ShowTopicHelp(const Topic: string; const Anchor: string; const HelpFileName:
string); overload;
```

C++

```
__fastcall ShowTopicHelp(const UnicodeString Topic, const UnicodeString Anchor, const
UnicodeString HelpFileName);
```

Description

Call ShowTopicHelp to request that the Help System display a specific Help topic.

The **Topic** parameter is a short string identifying the specific topic.

The **Anchor** parameter is a specific place in a page specified while creating the help page. The anchor is ignored if it does not exist in the page.

The **HelpFileName** parameter is the name of the file containing the topic. If this parameter is a zero-length string, the HelpFile property of the global variable Application is used.

HelpFile (see page 1974)

Application (see page 2612)

11.2.11 IHelpSystemFlags Interface

Class Hierarchy

Pascal

```
IHelpSystemFlags = interface(IExtendedHelpViewer);
```

C++

```
__interface IHelpSystemFlags : public IExtendedHelpViewer;
```

File

HelpIntfs

Description

This is class HelpIntfs.IHelpSystemFlags.

11.2.11.1 IHelpSystemFlags Members

The following tables list the members exposed by IHelpSystemFlags.

Public Methods

	Name	Description
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayTopic (see page 3221)	Use Topic ID to display topic.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.

	GetUseDefaultTopic (see page 3239)	This is GetUseDefaultTopic, a member of class IHelpSystemFlags.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	SetUseDefaultTopic (see page 3239)	This is SetUseDefaultTopic, a member of class IHelpSystemFlags.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.11.2 IHelpSystemFlags Methods

The methods of the IHelpSystemFlags class are listed here.

Public Methods

	Name	Description
	GetUseDefaultTopic (see page 3239)	This is GetUseDefaultTopic, a member of class IHelpSystemFlags.
	SetUseDefaultTopic (see page 3239)	This is SetUseDefaultTopic, a member of class IHelpSystemFlags.

11.2.11.2.1 IHelpSystemFlags.GetUseDefaultTopic Method

Pascal

```
function GetUseDefaultTopic: Boolean;
```

C++

```
__fastcall Boolean GetUseDefaultTopic();
```

Description

This is GetUseDefaultTopic, a member of class IHelpSystemFlags.

11.2.11.2.2 IHelpSystemFlags.SetUseDefaultTopic Method

Pascal

```
procedure SetUseDefaultTopic(AValue: Boolean);
```

C++

```
__fastcall SetUseDefaultTopic(Boolean AValue);
```

Description

This is SetUseDefaultTopic, a member of class IHelpSystemFlags.

11.2.12 ISpecialWinHelpViewer Interface

Help Viewer that supports special Windows Help requests.

Class Hierarchy

Pascal

```
ISpecialWinHelpViewer = interface(IExtendedHelpViewer);
```

C++

```
__interface ISpecialWinHelpViewer : public IExtendedHelpViewer;
```

File

HelpIntfs

Description

ISpecialWinHelpViewer supports Help requests that cannot be easily generalized, and should only be handled by the Microsoft Windows Help engine or a closely compatible application.

ISpecialWinHelpViewer consists of a single method, CallWinHelp (see page 3241), which should pass the Help request to the Help engine with as little manipulation as possible. An application needs to provide only one Viewer that implements ISpecialWinHelpViewer. If more than one Viewer is registered that implements ISpecialWinHelpViewer, only the first Viewer ever receives calls to CallWinHelp (see page 3241).

IhelpSystem

ISpecialWinHelpViewer

RegisterViewer (see page 3242)

Help System Interfaces

11.2.12.1 ISpecialWinHelpViewer Members

The following tables list the members exposed by ISpecialWinHelpViewer.

Public Methods

	Name	Description
	CallWinHelp (see page 3241)	Pass Help request directly to engine.
	CanShowTableOfContents (see page 3216)	Query support for Table of Contents.
	DisplayHelpByContext (see page 3221)	Use Context ID to display topic.
	DisplayTopic (see page 3221)	Use Topic ID to display topic.
	GetHelpStrings (see page 3217)	Return Help Strings that match a keyword.
	GetViewerName (see page 3217)	Return string identifying Help Viewer.
	NotifyID (see page 3218)	Save Viewer's numeric ID.
	ShowHelp (see page 3218)	Show a specific Help topic.
	ShowTableOfContents (see page 3218)	Show a Table of Contents.
	ShutDown (see page 3218)	Permanent Viewer shut down.
	SoftShutDown (see page 3219)	Temporary Viewer shut down.
	UnderstandsContext (see page 3221)	Queries the Help Viewer if it understands the given Context ID.
	UnderstandsKeyword (see page 3219)	Would respond to a keyword-based Help request.
	UnderstandsTopic (see page 3222)	Queries the Help Viewer if it understands the given Topic.

11.2.12.2 ISpecialWinHelpViewer Methods

The methods of the ISpecialWinHelpViewer class are listed here.

Public Methods

	Name	Description
	CallWinHelp (see page 3241)	Pass Help request directly to engine.

11.2.12.2.1 ISpecialWinHelpViewer.CallWinHelp Method

Pass Help request directly to engine.

Pascal

```
function CallWinHelp(Handle: LongInt; const HelpFile: string; Command: Word; Data: LongInt):
Boolean;
```

C++

```
__fastcall Boolean CallWinHelp(LongInt Handle, const UnicodeString HelpFile, Word Command,
LongInt Data);
```

Description

The RTL Help System calls CallWinHelp when it receives a Windows-style Help request that cannot be generalized as a Topic-based or Context-based request. CallWinHelp should pass the request directly to the Windows winhelp() API or to a functional equivalent.

CallWinHelp should return true if it was able to handle the request.

11.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetHelpSystem (see page 3242)	Returns Help System object.
	GetHelpSystem (see page 3242)	Returns Help System object.
	GetHelpSystem (see page 3242)	Returns Help System object.
	RegisterViewer (see page 3242)	Register Help Viewer to receive requests.

11.3.1 HelpIntfs.GetHelpSystem Function

Returns Help System object.

Pascal

```
function GetHelpSystem(out System: IHelpSystem): Boolean; overload;
function GetHelpSystem(out System: IHelpSystem2): Boolean; overload;
function GetHelpSystem(out System: IHelpSystem3): Boolean; overload;
```

C++

```
Boolean GetHelpSystem(IHelpSystem System);
Boolean GetHelpSystem(IHelpSystem2 System);
Boolean GetHelpSystem(IHelpSystem3 System);
```

File

HelpIntfs

Description

GetHelpSystem returns an object that implements IHelpSystem (see page 3231). An application calls IHelpSystem (see page 3231) methods to interact with the Help System.

GetHelpSystem returns 1 if the Help System object was successfully obtained, 0 otherwise.

See Also

TApplication

11.3.2 HelpIntfs.RegisterViewer Function

Register Help Viewer to receive requests.

Pascal

```
function RegisterViewer(const newViewer: ICustomHelpViewer; out Manager: IHelpManager):
Integer;
```

C++

```
int RegisterViewer(const ICustomHelpViewer newViewer, IHelpManager Manager);
```

File

HelpIntfs

Description

Call RegisterViewer to register a Help Viewer with the Help System. An application can register any number of Viewers. The order in which Help Viewers are registered is significant, because each Help request causes the RTL Help System to poll the Viewers in the order they were registered, and give the Help request to the first viewer that claims to be able to handle it. An application can override this behavior for keyword-based Help requests and for requests to display a Table of Contents by providing a Help Selector object.

Pass the Viewer object in the newViewer parameter.

RegisterViewer returns a Help Manager object in the Manager parameter; the Viewer uses this object to interact with the Help System.

The return value of RegisterViewer is 1 is the Viewer was successfully registered, 0 otherwise.

12 HTMLHelpViewer Namespace

This is namespace HTMLHelpViewer.

Topics

Name	Description
Interfaces (see page 3246)	The following table lists interfaces in this documentation.
Variables (see page 3249)	The following table lists variables in this documentation.

ViewerName (see page 3249)	This is variable HTMLHelpViewer.ViewerName.

12.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHtmlHelpTester (see page 3246)	This is class HTMLHelpViewer.IHtmlHelpTester.

12.1.1 IHtmlHelpTester Interface

Class Hierarchy

Pascal

```
IHtmlHelpTester = interface(IInterface);
```

C++

```
__interface IHtmlHelpTester : public IInterface;
```

File

HTMLHelpViewer

Description

This is class HTMLHelpViewer.IHtmlHelpTester.

12.1.1.1 IHtmlHelpTester Members

The following tables list the members exposed by IHtmlHelpTester.

Public Methods

	Name	Description
	CanShowALink (see page 3247)	This is CanShowALink, a member of class IHtmlHelpTester.
	CanShowContext (see page 3247)	This is CanShowContext, a member of class IHtmlHelpTester.
	CanShowTopic (see page 3247)	This is CanShowTopic, a member of class IHtmlHelpTester.
	ConvertWinHelp (see page 3247)	This is ConvertWinHelp, a member of class IHtmlHelpTester.
	GetDefaultHelpFile (see page 3248)	This is GetDefaultHelpFile, a member of class IHtmlHelpTester.
	GetHelpPath (see page 3248)	This is GetHelpPath, a member of class IHtmlHelpTester.
	GetHelpStrings (see page 3248)	This is GetHelpStrings, a member of class IHtmlHelpTester.

12.1.1.2 IHtmlHelpTester Methods

The methods of the IHtmlHelpTester class are listed here.

Public Methods

	Name	Description
	CanShowALink (see page 3247)	This is CanShowALink, a member of class IHtmlHelpTester.
	CanShowContext (see page 3247)	This is CanShowContext, a member of class IHtmlHelpTester.
	CanShowTopic (see page 3247)	This is CanShowTopic, a member of class IHtmlHelpTester.
	ConvertWinHelp (see page 3247)	This is ConvertWinHelp, a member of class IHtmlHelpTester.
	GetDefaultHelpFile (see page 3248)	This is GetDefaultHelpFile, a member of class IHtmlHelpTester.
	GetHelpPath (see page 3248)	This is GetHelpPath, a member of class IHtmlHelpTester.
	GetHelpStrings (see page 3248)	This is GetHelpStrings, a member of class IHtmlHelpTester.

12.1.1.2.1 IHtmlHelpTester.CanShowALink Method

Pascal

```
function CanShowALink(const ALink: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean CanShowALink(const UnicodeString ALink, const UnicodeString FileName);
```

Description

This is CanShowALink, a member of class IHtmlHelpTester.

12.1.1.2.2 IHtmlHelpTester.CanShowContext Method

Pascal

```
function CanShowContext(const Context: Integer; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean CanShowContext(const int Context, const UnicodeString FileName);
```

Description

This is CanShowContext, a member of class IHtmlHelpTester.

12.1.1.2.3 IHtmlHelpTester.CanShowTopic Method

Pascal

```
function CanShowTopic(const Topic: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean CanShowTopic(const UnicodeString Topic, const UnicodeString FileName);
```

Description

This is CanShowTopic, a member of class IHtmlHelpTester.

12.1.1.2.4 IHtmlHelpTester.ConvertWinHelp Method

Pascal

```
function ConvertWinHelp(var Command: Word; var Data: LongInt): Boolean;
```

C++

```
__fastcall Boolean ConvertWinHelp(Word Command, LongInt Data);
```

Description

This is ConvertWinHelp, a member of class IHtmlHelpTester.

12.1.1.2.5 IHtmlHelpTester.GetDefaultHelpFile Method

Pascal

```
function GetDefaultHelpFile: string;
```

C++

```
__fastcall UnicodeString GetDefaultHelpFile();
```

Description

This is GetDefaultHelpFile, a member of class IHtmlHelpTester.

12.1.1.2.6 IHtmlHelpTester.GetHelpPath Method

Pascal

```
function GetHelpPath: string;
```

C++

```
__fastcall UnicodeString GetHelpPath();
```

Description

This is GetHelpPath, a member of class IHtmlHelpTester.

12.1.1.2.7 IHtmlHelpTester.GetHelpStrings Method

Pascal

```
function GetHelpStrings(const ALink: string): TStringList;
```

C++

```
__fastcall TStringList GetHelpStrings(const UnicodeString ALink);
```

Description

This is GetHelpStrings, a member of class IHtmlHelpTester.

12.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
HtmlHelpTester (see page 3249)	This is variable HTMLHelpViewer.HtmlHelpTester.
ViewerName (see page 3249)	This is variable HTMLHelpViewer.ViewerName.

12.2.1 HTMLHelpViewer.HtmlHelpTester Variable

Pascal

```
HtmlHelpTester: IHtmlHelpTester;
```

C++

```
IHtmlHelpTester HtmlHelpTester;
```

File

HTMLHelpViewer

Description

This is variable HTMLHelpViewer.HtmlHelpTester.

12.2.2 HTMLHelpViewer.ViewerName Variable

Pascal

```
ViewerName: string;
```

C++

```
UnicodeString ViewerName;
```

File

HTMLHelpViewer

Description

This is variable HTMLHelpViewer.ViewerName.

13 HTTPApp Namespace

This is namespace HTTPApp.

Topics

Name	Description
Classes (see page 3254)	The following table lists classes in this documentation.
Interfaces (see page 3416)	The following table lists interfaces in this documentation.
Functions (see page 3436)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3444)	The following table lists structs, records, enums in this documentation.
Types (see page 3446)	The following table lists types in this documentation.
Constants (see page 3448)	The following table lists constants in this documentation.

Classes

	Name	Description
	EWebBrokerException (see page 3254)	EWebBrokerException is an exception raised by WebBroker objects.
	TAbstractContentParser (see page 3255)	TAbstractContentParser is the base class for objects that parse the content of an HTTP request.
	TAbstractWebModuleFactory (see page 3259)	TAbstractWebModuleFactory is the base class for all Web module factory objects.
	TAbstractWebModuleList (see page 3266)	TAbstractWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.
	TAbstractWebPageInfo (see page 3275)	TAbstractWebPageInfo represents the attributes of a Web page module.
	TAbstractWebPageModuleFactory (see page 3285)	TAbstractWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TAbstractWebRequestFile (see page 3288)	TAbstractWebRequestFile describes an uploaded file from an HTTP request.
	TAbstractWebRequestFiles (see page 3292)	TAbstractWebRequestFiles is a collection of TAbstractWebRequestFile (see page 3288) objects.
	TAbstractWebSession (see page 3295)	TAbstractWebSession is the base class for objects that represent a session in a WebSnap application.
	TContentParser (see page 3301)	TContentParser is the default parser for extracting named value strings and uploaded files from an HTTP request.
	TCookie (see page 3304)	TCookie represents a Cookie header in an HTTP response message.
	TCookieCollection (see page 3309)	TCookieCollection is a collection of TCookie (see page 3304) objects.
	TCustomContentProducer (see page 3313)	TCustomContentProducer is the base class for all objects that produce the string that is sent as the contents of an HTTP response message.
	TCustomWebDispatcher (see page 3318)	TCustomWebDispatcher is the abstract base class for Web dispatcher objects.
	TDefaultWebAppServices (see page 3330)	This is class HTTPApp.TDefaultWebAppServices.
	TWebActionItem (see page 3335)	TWebActionItem allows a Web server application to create and send responses to HTTP request messages.

	TWebActionItems (see page 3344)	TWebActionItems is a collection of TWebActionItem (see page 3335) objects.
	TWebDispatcher (see page 3349)	TWebDispatcher passes HTTP request messages on to the appropriate action items that assemble a response.
	TWebModule (see page 3354)	TWebModule is the automatically generated Web module for a Web server application.
	TWebRequest (see page 3358)	TWebRequest is the base class for all objects that represent client request information that is passed to a Web server application.
	TWebResponse (see page 3389)	TWebResponse is the base class for all objects that represent HTTP messages sent in response to an HTTP request message.

Constants

Name	Description
MAX_DATETIMES (see page 3448)	This is constant HTTPApp.MAX_DATETIMES.
MAX_INTEGERS (see page 3448)	This is constant HTTPApp.MAX_INTEGERS.
MAX_STRINGS (see page 3449)	This is constant HTTPApp.MAX_STRINGS.
sDateFormat (see page 3449)	This is constant HTTPApp.sDateFormat.

Functions

	Name	Description
	DayOfWeekStr (see page 3436)	Converts a TDateTime into a string representing the day of the week.
	DosPathToUnixPath (see page 3437)	Converts a DOS-compatible path specification to a Unix-compatible path specification.
	EncodingFromContentType (see page 3437)	This is function HTTPApp.EncodingFromContentType.
	EncodingGetBytes (see page 3437)	This is function HTTPApp.EncodingGetBytes.
	EncodingGetString (see page 3438)	This is function HTTPApp.EncodingGetString.
	ExtractHeaderFields (see page 3438)	Parses a multi-valued string into its constituent fields.
	ExtractHeaderFields (see page 3438)	Parses a multi-valued string into its constituent fields.
	ExtractHTTPFields (see page 3439)	Parses a multi-valued string into its constituent fields.
	ExtractHTTPFields (see page 3439)	Parses a multi-valued string into its constituent fields.
	HTMLDecode (see page 3439)	This is function HTTPApp.HTMLDecode.
	HTMLEncode (see page 3440)	This is function HTTPApp.HTMLEncode.
	HTTPDecode (see page 3440)	Decodes a string that includes HTTP escape characters.
	HTTPEncode (see page 3441)	Converts a string into a form that contains no values that are illegal in an HTTP message header.
	MonthStr (see page 3441)	Converts a TDateTime into a string representing the month.
	ParseDate (see page 3442)	Converts a date value from an HTTP message header into a TDateTime.
	RegisterContentParser (see page 3442)	This is function HTTPApp.RegisterContentParser.
	StatusString (see page 3442)	Returns the explanatory string associated with one of the predefined HTTP response status codes.
	UnixPathToDosPath (see page 3443)	Converts a Unix-compatible path specification to a Dos-compatible path specification.

Interfaces

	Name	Description
	IGetAppDispatcher (see page 3416)	This is class HTTPApp.IGetAppDispatcher.
	IGetWebAppServices (see page 3417)	This is class HTTPApp.IGetWebAppServices.
	IGetWebRequestHandler (see page 3418)	This is class HTTPApp.IGetWebRequestHandler.
	IMultiModuleSupport (see page 3419)	This is class HTTPApp.IMultiModuleSupport.
	IProduceContent (see page 3420)	IProduceContent is the interface for generating the content of a Web page.
	IProduceContentFrom (see page 3422)	This is class HTTPApp.IProduceContentFrom.
	ISetAppDispatcher (see page 3423)	This is class HTTPApp.ISetAppDispatcher.
	IWebAppServices (see page 3424)	IWebAppServices is the interface for setting up and finishing the processing of HTTP request messages.
	IWebDispatch (see page 3427)	
	IWebDispatchActions (see page 3430)	IWebDispatchActions is the interface for components that dispatch HTTP request messages using action items.
	IWebDispatcherAccess (see page 3431)	IWebDispatcherAccess provides access to the current HTTP request and response object.

	IWebExceptionHandler (see page 3433)	This is class HTTPApp.IWebExceptionHandler.
	IWebRequestHandler (see page 3434)	IWebRequestHandler is the interface for objects that dispatch HTTP request messages.

Structs, Records, Enums

	Name	Description
	TMethodType (see page 3444)	This is record HTTPApp.TMethodType.
	TWebModuleCacheMode (see page 3444)	This is record HTTPApp.TWebModuleCacheMode.
	TWebModuleCreateMode (see page 3445)	This is record HTTPApp.TWebModuleCreateMode.

Types

Name	Description
TContentParserClass (see page 3446)	This is type HTTPApp.TContentParserClass.
THTTPMethodEvent (see page 3446)	This is type HTTPApp.THTTPMethodEvent.
TModuleAddedProc (see page 3447)	This is type HTTPApp.TModuleAddedProc.
TWebExceptionEvent (see page 3447)	This is type HTTPApp.TWebExceptionEvent.
TWebModuleContext (see page 3447)	This is type HTTPApp.TWebModuleContext.

13.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWebBrokerException (see page 3254)	EWebBrokerException is an exception raised by WebBroker objects.
	TAbstractContentParser (see page 3255)	TAbstractContentParser is the base class for objects that parse the content of an HTTP request.
	TAbstractWebModuleFactory (see page 3259)	TAbstractWebModuleFactory is the base class for all Web module factory objects.
	TAbstractWebModuleList (see page 3266)	TAbstractWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.
	TAbstractWebPageInfo (see page 3275)	TAbstractWebPageInfo represents the attributes of a Web page module.
	TAbstractWebPageModuleFactory (see page 3285)	TAbstractWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TAbstractWebRequestFile (see page 3288)	TAbstractWebRequestFile describes an uploaded file from an HTTP request.
	TAbstractWebRequestFiles (see page 3292)	TAbstractWebRequestFiles is a collection of TAbstractWebRequestFile (see page 3288) objects.
	TAbstractWebSession (see page 3295)	TAbstractWebSession is the base class for objects that represent a session in a WebSnap application.
	TContentParser (see page 3301)	TContentParser is the default parser for extracting named value strings and uploaded files from an HTTP request.
	TCookie (see page 3304)	TCookie represents a Cookie header in an HTTP response message.
	TCookieCollection (see page 3309)	TCookieCollection is a collection of TCookie (see page 3304) objects.
	TCustomContentProducer (see page 3313)	TCustomContentProducer is the base class for all objects that produce the string that is sent as the contents of an HTTP response message.
	TCustomWebDispatcher (see page 3318)	TCustomWebDispatcher is the abstract base class for Web dispatcher objects.
	TDefaultWebAppServices (see page 3330)	This is class HTTPApp.TDefaultWebAppServices.
	TWebActionItem (see page 3335)	TWebActionItem allows a Web server application to create and send responses to HTTP request messages.
	TWebActionItems (see page 3344)	TWebActionItems is a collection of TWebActionItem (see page 3335) objects.
	TWebDispatcher (see page 3349)	TWebDispatcher passes HTTP request messages on to the appropriate action items that assemble a response.
	TWebModule (see page 3354)	TWebModule is the automatically generated Web module for a Web server application.
	TWebRequest (see page 3358)	TWebRequest is the base class for all objects that represent client request information that is passed to a Web server application.
	TWebResponse (see page 3389)	TWebResponse is the base class for all objects that represent HTTP messages sent in response to an HTTP request message.

13.1.1 EWebBrokerException Class

EWebBrokerException is an exception raised by WebBroker objects.

Class Hierarchy

Pascal

```
EWebBrokerException = class(Exception);
```

C++

```
class EWebBrokerException : public Exception;
```

File

HTTPApp

Description

EWebBrokerException is raised when a WebBroker object encounters a problem. It functions identically to its parent class, TException.

See Also

Exception

13.1.2 TAbstractContentParser Class

TAbstractContentParser is the base class for objects that parse the content of an HTTP request.

Class Hierarchy

Pascal

```
TAbstractContentParser = class(TObject);
```

C++

```
class TAbstractContentParser : public TObject;
```

File

HTTPApp

Description

Web request objects use a descendant of TAbstractContentParser to retrieve information about the named values in the content of the HTTP request they represent. TAbstractContentParser defines two protected methods, GetContentFields (see page 3257) and GetFiles (see page 3258), which the Web request uses to obtain values for its ContentFields and Files properties, respectively.

TAbstractContentParser should not be instantiated. The GetContentFields (see page 3257) and GetFiles (see page 3258) methods are abstract or, in C++ terminology, pure virtual, which means that TAbstractContentParser does not supply an implementation. Each TAbstractContentParser descendant overrides these methods to support its own method of extracting named value strings and uploaded files from an HTTP request. The TAbstractContentParser descendant also overrides the public CanParse (see page 3257) method to check whether the request message contains information encoded in a way that the content parser understands.

Each TAbstractContentParser descendant registers itself with the Web server application. Then, when a Web request object needs to parse its content to set the ContentFields and Files properties, it searches through the registered content parsers to locate the most recently registered parser that can parse the current content.

See Also

TWebRequest (see page 3358)

TWebRequest (see page 3358)

TWebRequest (see page 3358)

TContentParser (see page 3301)

TMultipartContentParser (see page 6706)

13.1.2.1 TAbstractContentParser Members

The following tables list the members exposed by TAbstractContentParser.

Protected Methods

	Name	Description
	GetContentFields (see page 3257)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 3258)	Returns a set of uploaded files that the parser extracts from the current Web request.

Protected Properties

	Name	Description
	WebRequest (see page 3258)	Indicates the Web request object that uses this parser to parse its content.

Public Methods

	Name	Description
	CanParse (see page 3257)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	Create (see page 3256)	Creates and initializes a new TAbstractContentParser (see page 3255) object.

13.1.2.2 TAbstractContentParser.Create Constructor

Creates and initializes a new TAbstractContentParser (see page 3255) object.

Pascal

```
constructor Create(AWebRequest: TWebRequest); virtual;
```

C++

```
virtual __fastcall TAbstractContentParser(TWebRequest AWebRequest);
```

Description

Do not create instances of TAbstractContentParser (see page 3255). This class and its descendants are intended only as helper objects to the Web request. The Web request creates its own instance of a TAbstractContentParser (see page 3255) descendant that can parse its content.

AWebRequest is the Web request object that creates this content parser to extract information from its content. This becomes the value of the WebRequest (see page 3258) property.

See Also

WebRequest (see page 3258)

13.1.2.3 TAbstractContentParser Methods

The methods of the TAbstractContentParser class are listed here.

Protected Methods

	Name	Description
	GetContentFields (see page 3257)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 3258)	Returns a set of uploaded files that the parser extracts from the current Web request.

Public Methods

	Name	Description
	CanParse (see page 3257)	Indicates whether a specified request message contains information encoded in a way that this parser understands.

13.1.2.3.1 TAbstractContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a class method (Delphi) or static method (C++), which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered TAbstractContentParser (see page 3255) descendant until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TAbstractContentParser (see page 3255), CanParse always returns false. Descendant classes that implement the GetContentFields (see page 3257) and GetFiles (see page 3258) methods override CanParse to indicate when a Web request has a format they can parse.

See Also

GetContentFields (see page 3257)

GetFiles (see page 3258)

13.1.2.3.2 TAbstractContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; virtual; abstract;
```

C++

```
virtual __fastcall TStrings GetContentFields() = 0;
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TAbstractContentParser (see page 3255), GetContentFields is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract name/value pairs from the current request and add them to the returned string list.

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields (see page 3375)

WebRequest (see page 3258)

ExtractContentFields (see page 3363)

13.1.2.3.3 TAbstractContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles() = 0;
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TAbstractContentParser (see page 3255), GetFiles is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract uploaded files from the current request and add them to the Web request files object.

Note: The content parser owns the list it returns. The caller should not free this list.

See Also

Files (see page 3379)

WebRequest (see page 3258)

TAbstractWebRequestFile (see page 3288)

13.1.2.4 TAbstractContentParser Properties

The properties of the TAbstractContentParser class are listed here.

Protected Properties

	Name	Description
	WebRequest (see page 3258)	Indicates the Web request object that uses this parser to parse its content.

13.1.2.4.1 TAbstractContentParser.WebRequest Property

Indicates the Web request object that uses this parser to parse its content.

Pascal

```
property WebRequest: TWebRequest;
```

C++

```
__property TWebRequest WebRequest;
```

Description

Content parsers use the protected WebRequest property internally to access the content they parse. The value of WebRequest is a Web request object whose properties represent the headers and content of the current HTTP request message.

See Also

Content (see page 3373)

13.1.3 TAbstractWebModuleFactory Class

TAbstractWebModuleFactory is the base class for all Web module factory objects.

Class Hierarchy

Pascal

```
TAbstractWebModuleFactory = class;
```

C++

```
class TAbstractWebModuleFactory;
```

File

HTTPApp

Description

All WebSnap modules are registered with the WebSnap application using a factory object. In Delphi, the factory object is typically created in the initialization section of the module source file. The factory object is responsible for creating Web module instance. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instance for reuse with subsequent request messages.

Do not create instances of TAbstractWebModuleFactory. Most of its methods are abstract or, in C++ terminology, pure virtual, meaning they have no implementation. Instead, create instances of a TAbstractWebModuleFactory descendant such as TWebDataModuleFactory, TWebAppDataModuleFactory, TWebPageModuleFactory, or TWebAppPageModuleFactory. Each of these classes includes an implementation of the abstract or pure virtual methods, and represents group of Web module factories. These groups are based on whether the Web module factory generates the single application Web module (which contains the components to dispatch HTTP request messages), and it generates a Web module that creates a Web page.

TWebAppDataModuleFactory

TWebPageModuleFactory

TWebRequestHandler

TWebDataModuleFactory

13.1.3.1 TAbstractWebModuleFactory Members

The following tables list the members exposed by TAbstractWebModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 3260)	Returns the value of the CacheMode (see page 3264) property.
	GetComponentClass (see page 3261)	Returns the value of the ComponentClass (see page 3264) property.
	GetCreateMode (see page 3261)	Returns the value of the CreateMode (see page 3265) property.
	GetIsAppModule (see page 3261)	Returns the value of the IsAppModule (see page 3265) property.
	GetModuleName (see page 3262)	Returns the value of the ModuleName (see page 3265) property.
	GetWebPageInfo (see page 3263)	Returns the value of the WebPageInfo (see page 3266) property.

Public Methods

	Name	Description
	GetModule (see page 3262)	Creates an instance of the associated Web module.
	PreventDestruction (see page 3263)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
	CacheMode (see page 3264)	Indicates whether the factory can cache Web modules for reuse.
	ComponentClass (see page 3264)	Specifies the class type of the Web module that this factory creates.
	CreateMode (see page 3265)	Indicates when the factory creates instances of its Web module.
	IsAppModule (see page 3265)	Indicates whether the corresponding Web module is the main Web application module.
	ModuleName (see page 3265)	Specifies the name of the Web module class that this factory instantiates.
	WebPageInfo (see page 3266)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

13.1.3.2 TAbstractWebModuleFactory Methods

The methods of the TAbstractWebModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetCacheMode (see page 3260)	Returns the value of the CacheMode (see page 3264) property.
	GetComponentClass (see page 3261)	Returns the value of the ComponentClass (see page 3264) property.
	GetCreateMode (see page 3261)	Returns the value of the CreateMode (see page 3265) property.
	GetIsAppModule (see page 3261)	Returns the value of the IsAppModule (see page 3265) property.
	GetModuleName (see page 3262)	Returns the value of the ModuleName (see page 3265) property.
	GetWebPageInfo (see page 3263)	Returns the value of the WebPageInfo (see page 3266) property.

Public Methods

	Name	Description
	GetModule (see page 3262)	Creates an instance of the associated Web module.
	PreventDestruction (see page 3263)	Prevents the WebSnap application from freeing the Web module instance.

13.1.3.2.1 TAbstractWebModuleFactory.GetCacheMode Method

Returns the value of the CacheMode (see page 3264) property.

Pascal

```
function GetCacheMode: TWebModuleCacheMode; virtual; abstract;
```

C++

```
virtual __fastcall TWebModuleCacheMode GetCacheMode() = 0;
```

Description

GetCacheMode is the protected read implementation of the CacheMode (see page 3264) property.

In TAbstractWebModuleFactory (see page 3259), GetCacheMode is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the CacheMode (see page 3264) property.

See Also

CacheMode (see page 3264)

13.1.3.2.2 TAbstractWebModuleFactory.GetComponentClass Method

Returns the value of the ComponentClass (see page 3264) property.

Pascal

```
function GetComponentClass: TComponentClass; virtual; abstract;
```

C++

```
virtual __fastcall TComponentClass GetComponentClass() = 0;
```

Description

GetComponentClass is the protected read implementation of the ComponentClass (see page 3264) property.

In TAbstractWebModuleFactory (see page 3259), GetComponentClass is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the ComponentClass (see page 3264) property.

See Also

ComponentClass (see page 3264)

13.1.3.2.3 TAbstractWebModuleFactory.GetCreateMode Method

Returns the value of the CreateMode (see page 3265) property.

Pascal

```
function GetCreateMode: TWebModuleCreateMode; virtual; abstract;
```

C++

```
virtual __fastcall TWebModuleCreateMode GetCreateMode() = 0;
```

Description

GetCreateMode is the protected read implementation of the CreateMode (see page 3265) property.

In TAbstractWebModuleFactory (see page 3259), GetCreateMode is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the CreateMode (see page 3265) property.

See Also

CreateMode (see page 3265)

13.1.3.2.4 TAbstractWebModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule (see page 3265) property.

Pascal

```
function GetIsAppModule: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean GetIsAppModule() = 0;
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule (see page 3265) property.

In TAbstractWebModuleFactory (see page 3259), GetIsAppModule is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the IsAppModule (see page 3265) property.

See Also

IsAppModule (see page 3265)

13.1.3.2.5 TAbstractWebModuleFactory.GetModule Method

Creates an instance of the associated Web module.

Pascal

```
function GetModule: TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * GetModule() = 0;
```

Description

Call GetModule to obtain a new instance of the Web module that the factory creates. This method should only be called once for each request message that requires the use of the Web module.

GetModule returns the Web module instance.

In TAbstractWebModuleFactory (see page 3259), GetModule is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation that creates a new Web module instance.

See Also

ComponentClass (see page 3264)

CreateMode (see page 3265)

CacheMode (see page 3264)

13.1.3.2.6 TAbstractWebModuleFactory.GetModuleName Method

Returns the value of the ModuleName (see page 3265) property.

Pascal

```
function GetModuleName: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetModuleName() = 0;
```

Description

GetModuleName is the protected read implementation of the ModuleName (see page 3265) property.

In TAbstractWebModuleFactory (see page 3259), GetModuleName is abstract pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the ModuleName (see page 3265) property.

See Also

ModuleName (see page 3265)

13.1.3.2.7 TAbstractWebModuleFactory.GetWebPageInfo Method

Returns the value of the WebPageInfo (see page 3266) property.

Pascal

```
function GetWebPageInfo: TAbstractWebPageInfo; virtual;
```

C++

```
virtual __fastcall TAbstractWebPageInfo GetWebPageInfo();
```

Description

GetWebPageInfo is the protected read implementation of the WebPageInfo (see page 3266) property.

In TAbstractWebModuleFactory (see page 3259), GetWebPageInfo always returns nil (Delphi) or NULL (C++). Descendant classes that represent the factories for Web page modules override this method to return the Web page information object that describes the module's Web page.

See Also

WebPageInfo (see page 3266)

13.1.3.2.8 TAbstractWebModuleFactory.PreventDestruction Method

Prevents the WebSnap application from freeing the Web module instance.

Pascal

```
procedure PreventDestruction; virtual; abstract;
```

C++

```
virtual __fastcall PreventDestruction() = 0;
```

Description

Call PreventDestruction if the WebSnap application should not free the Web module instance when the current HTTP request message has been fully processed. For example, if another Web module contains a reference to the Web module that this factory creates, you may not want to allow the WebSnap application to free the Web module that this factory creates while the other module exists.

In TAbstractWebModuleFactory (see page 3259), PreventDestruction is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation that prevents the Web module from being freed.

See Also

CacheMode (see page 3264)

13.1.3.3 TAbstractWebModuleFactory Properties

The properties of the TAbstractWebModuleFactory class are listed here.

Public Properties

	Name	Description
	CacheMode (see page 3264)	Indicates whether the factory can cache Web modules for reuse.
	ComponentClass (see page 3264)	Specifies the class type of the Web module that this factory creates.
	CreateMode (see page 3265)	Indicates when the factory creates instances of its Web module.
	IsAppModule (see page 3265)	Indicates whether the corresponding Web module is the main Web application module.
	ModuleName (see page 3265)	Specifies the name of the Web module class that this factory instantiates.
	WebPageInfo (see page 3266)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

13.1.3.3.1 TAbstractWebModuleFactory.CacheMode Property

Indicates whether the factory can cache Web modules for reuse.

Pascal

```
property CacheMode: TWebModuleCacheMode;
```

C++

```
__property TWebModuleCacheMode CacheMode;
```

Description

The Web module factory creates an instance of its Web module to handle a specific HTTP request message. After the WebSnap application has finished with that request, it can free the Web module instance, or cache it so that the next time it needs to create an instance of its Web module, it can simply reuse the cached instance.

When CacheMode is caCache, the WebSnap application caches Web module instances for reuse. This can improve performance.

When CacheMode is caDestroy, the WebSnap application frees Web module instances when they are no longer needed for the current request message. This is the safest approach if changes to the Web module or any of the components it contains that are made while processing a request message can interfere with the correct handling of subsequent request messages.

See Also

CreateMode (see page 3265)

PreventDestruction (see page 3263)

13.1.3.3.2 TAbstractWebModuleFactory.ComponentClass Property

Specifies the class type of the Web module that this factory creates.

Pascal

```
property ComponentClass: TComponentClass;
```

C++

```
__property TComponentClass ComponentClass;
```

Description

ComponentClass is the class type of the Web module that the factory object creates. This is a descendant of TWebDataModule, TWebAppDataModule, TWebPageModule, or TWebAppPageModule. The WebSnap application wizard or Web module wizard generates the class declaration for the specific Web module class associated with a Web module factory.

See Also

ModuleName (see page 3265)

WebPageInfo (see page 3266)

IsAppModule (see page 3265)

13.1.3.3.3 TAbstractWebModuleFactory.CreateMode Property

Indicates when the factory creates instances of its Web module.

Pascal

```
property CreateMode: TWebModuleCreateMode;
```

C++

```
__property TWebModuleCreateMode CreateMode;
```

Description

Read CreateMode to determine whether the factory creates its Web module for every request message (crAlways), or when the WebSnap application specifically needs the Web module for the current request (crOnDemand).

Note: When the Web module factory creates the Web application module, CreateMode is always crAlways. The Web application module is always required because it contains the components that dispatch HTTP messages. For Web module factories that create any other Web modules in the application, CreateMode reflects a flag passed to the constructor.

See Also

CacheMode (see page 3264)

IsAppModule (see page 3265)

13.1.3.3.4 TAbstractWebModuleFactory.IsAppModule Property

Indicates whether the corresponding Web module is the main Web application module.

Pascal

```
property IsAppModule: Boolean;
```

C++

```
__property Boolean IsAppModule;
```

Description

WebSnap applications read IsAppModule to determine whether a Web module factory creates the single application module. WebSnap applications include one and only one application module, which holds the components responsible for dispatching HTTP requests. The Web application module is an instance of TWebAppPageModule or TWebAppDataModule.

See Also

TWebAppPageModule

TWebAppDataModule

ComponentClass (see page 3264)

TPageDispatcher

13.1.3.3.5 TAbstractWebModuleFactory.ModuleName Property

Specifies the name of the Web module class that this factory instantiates.

Pascal

```
property ModuleName: string;
```

C++

```
__property UnicodeString ModuleName;
```

Description

ModuleName is the name of the Web module class that the factory object instantiates. That is, this is the name of the class for which the ComponentClass (see page 3264) property is a class reference.

See Also

ComponentClass (see page 3264)

WebPageInfo (see page 3266)

IsAppModule (see page 3265)

FindModuleName (see page 3270)

13.1.3.3.6 TAbstractWebModuleFactory.WebPageInfo Property

Describes the attributes of the Web page that the corresponding Web module generates, if any.

Pascal

```
property WebPageInfo: TAbstractWebPageInfo;
```

C++

```
__property TAbstractWebPageInfo WebPageInfo;
```

Description

When the Web module that the factory object creates can generate a Web page, WebPageInfo describes the attributes of the Web page, such as its name, title, access rights, and so on. This information is stored in the Web module factory so that it is available even when there is no current instance of the Web module.

When the Web module that the factory object creates does not generate a Web page, WebPageInfo is nil (Delphi) or NULL (C++).

See Also

ComponentClass (see page 3264)

13.1.4 TAbstractWebModuleList Class

TAbstractWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.

Class Hierarchy

Pascal

```
TAbstractWebModuleList = class(TObject);
```

C++

```
class TAbstractWebModuleList : public TObject;
```

File

HTTPApp

Description

TAbstractWebModuleList is the base class for TWebModuleList, which lists every Web module that has been instantiated to serve the current request. It introduces properties and methods for accessing the Web modules in the application, as well as for the Web module factory objects that create those Web module instances. All the methods in TAbstractWebModuleList are abstract or, in C++ terminology, pure virtual, meaning they have no implementation. TWebModuleList, a TAbstractWebModuleList descendant, overrides those abstract or pure virtual methods to provide a default implementation.

When a WebSnap application handles multiple requests concurrently, it includes multiple web modules lists, each on a separate thread and each associated with a different request.

The Web context, which can be accessed using the global WebContext function, provides access to the TAbstractWebModuleList object that is associated with the current request. Use the Web context's WebModules property to obtain a reference to the Web module list.

WebContext

TAbstractWebContext

13.1.4.1 TAbstractWebModuleList Members

The following tables list the members exposed by TAbstractWebModuleList.

Protected Methods

	Name	Description
	GetFactory (see page 3270)	This is GetFactory, a member of class TAbstractWebModuleList.
	GetFactoryCount (see page 3270)	
	GetItem (see page 3271)	This is GetItem, a member of class TAbstractWebModuleList.
	GetItemCount (see page 3271)	
	GetOnModuleAdded (see page 3271)	
	SetOnModuleAdded (see page 3271)	

Public Events

	Name	Description
	OnModuleAdded (see page 3274)	Occurs when a new Web module is added to the Items (see page 3273) property array.

Public Methods

	Name	Description
	AddModuleClass (see page 3268)	Creates a new Web module, given its class, and adds it to the Items (see page 3273) property array.
	AddModuleName (see page 3269)	Creates a new Web module, given its name, and adds it to the Items (see page 3273) property array.
	FindModuleClass (see page 3269)	Locates a Web module given its class reference.
	FindModuleName (see page 3270)	Locates a Web module given its name.

Public Properties

	Name	Description
R	Factory (see page 3272)	Lists the Web module factories for all the Web modules available in the application.
R	FactoryCount (see page 3272)	Indicates the number of Web module factories listed in the Factory (see page 3272) property array.
R	ItemCount (see page 3273)	Indicates the number of Web modules that have been instantiated in the current thread.
R	Items (see page 3273)	Lists the instantiated Web modules in the current thread.

13.1.4.2 TAbstractWebModuleList Methods

The methods of the TAbstractWebModuleList class are listed here.

Protected Methods

	Name	Description
A	GetFactory (see page 3270)	This is GetFactory, a member of class TAbstractWebModuleList.
A	GetFactoryCount (see page 3270)	
A	GetItem (see page 3271)	This is GetItem, a member of class TAbstractWebModuleList.
A	GetItemCount (see page 3271)	
A	GetOnModuleAdded (see page 3271)	
A	SetOnModuleAdded (see page 3271)	

Public Methods

	Name	Description
A	AddModuleClass (see page 3268)	Creates a new Web module, given its class, and adds it to the Items (see page 3273) property array.
A	AddModuleName (see page 3269)	Creates a new Web module, given its name, and adds it to the Items (see page 3273) property array.
A	FindModuleClass (see page 3269)	Locates a Web module given its class reference.
A	FindModuleName (see page 3270)	Locates a Web module given its name.

13.1.4.2.1 TAbstractWebModuleList.AddModuleClass Method

Creates a new Web module, given its class, and adds it to the Items (see page 3273) property array.

Pascal

```
function AddModuleClass(AClass: TComponentClass): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * AddModuleClass(TComponentClass AClass) = 0;
```

Description

AddModuleClass searches for a Web module factory that can create a Web module of the specified class. If it finds a match, it instantiates the Web module and adds it to the Items (see page 3273) property array.

AClass is a class reference to the Web module you want to instantiate. It should not match the class type of any Web module already listed in the Items (see page 3273) property array.

AddModuleClass returns the new Web module instance. If the Factory (see page 3272) property array does not include a Web module factory that can create a Web module of the specified class, AddModuleClass returns nil (Delphi) or NULL (C++).

Note: In TAbstractWebModuleList (see page 3266), AddModuleClass is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes override this method to provide an implementation.

See Also

AddModuleName (see page 3269)

Items (see page 3273)

Factory (see page 3272)

FindModuleClass (see page 3269)

13.1.4.2.2 TAbstractWebModuleList.AddModuleName Method

Creates a new Web module, given its name, and adds it to the Items (see page 3273) property array.

Pascal

```
function AddModuleName(const AClass: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * AddModuleName(const UnicodeString AClass) = 0;
```

Description

AddModuleName searches for a Web module factory that can create a Web module of the specified name. If it finds a match, it instantiates the Web module and adds it to the Items (see page 3273) property array.

AName is the name of the Web module you want to instantiate. It should not match the name of any Web module already listed in the Items (see page 3273) property array.

AddModuleClass (see page 3268) returns the new Web module instance. If the Factory (see page 3272) property array does not include a Web module factory that can create a Web module of the specified name, AddModuleClass (see page 3268) returns nil (Delphi) or NULL (C++).

Note: In TAbstractWebModuleList (see page 3266), AddModuleName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes override this method to provide an implementation.

See Also

AddModuleClass (see page 3268)

Items (see page 3273)

Factory (see page 3272)

FindModuleName (see page 3270)

13.1.4.2.3 TAbstractWebModuleList.FindModuleClass Method

Locates a Web module given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass) = 0;
```

Description

Call FindModuleClass to locate the Web module instance of a given class type. FindModuleClass searches the Items (see page 3273) property array for a Web module instance of the specified class.

AClass is a class reference to the class type of the desired Web module.

FindModuleClass returns the requested Web module instance if it exists. If there is no Web module of the specified class, FindModuleClass returns nil (Delphi) or NULL (C++).

Note: In TAbstractWebModuleList (see page 3266), FindModuleClass is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes override this method to provide an implementation.

See Also

FindModuleName (see page 3270)

Items (see page 3273)

13.1.4.2.4 TAbstractWebModuleList.FindModuleName Method

Locates a Web module given its name.

Pascal

```
function FindModuleName(const AClass: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const UnicodeString AClass) = 0;
```

Description

Call FindModuleName to locate the Web module instance of a given name. FindModuleClass (see page 3269) searches the Items (see page 3273) property array for a Web module instance of the specified name.

AName is the name of the desired Web module.

FindModuleName returns the requested Web module instance if it exists. If there is no Web module with the specified name, FindModuleClass (see page 3269) returns nil (Delphi) or NULL (C++).

Note: In TAbstractWebModuleList (see page 3266), FindModuleClass (see page 3269) is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes override this method to provide an implementation.

See Also

FindModuleClass (see page 3269)

Items (see page 3273)

13.1.4.2.5 TAbstractWebModuleList.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractWebModuleFactory; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebModuleFactory GetFactory(int I) = 0;
```

Description

This is GetFactory, a member of class TAbstractWebModuleList.

13.1.4.2.6 TAbstractWebModuleList.GetFactoryCount Method

Pascal

```
function GetFactoryCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetFactoryCount() = 0;
```

See Also

GetFactory (see page 3270)

FactoryCount (see page 3272)

13.1.4.2.7 TAbstractWebModuleList.GetItem Method

Pascal

```
function GetItem(I: Integer): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * GetItem(int I) = 0;
```

Description

This is GetItem, a member of class TAbstractWebModuleList.

13.1.4.2.8 TAbstractWebModuleList.GetItemCount Method

Pascal

```
function GetItemCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetItemCount() = 0;
```

See Also

GetItem (see page 3271)

ItemCount (see page 3273)

13.1.4.2.9 TAbstractWebModuleList.GetOnModuleAdded Method

Pascal

```
function GetOnModuleAdded: TModuleAddedProc; virtual; abstract;
```

C++

```
virtual __fastcall TModuleAddedProc GetOnModuleAdded() = 0;
```

See Also

OnModuleAdded (see page 3274)

SetOnModuleAdded (see page 3271)

13.1.4.2.10 TAbstractWebModuleList.SetOnModuleAdded Method

Pascal

```
procedure SetOnModuleAdded(AProc: TModuleAddedProc); virtual; abstract;
```

C++

```
virtual __fastcall SetOnModuleAdded(TModuleAddedProc AProc) = 0;
```

See Also

GetOnModuleAdded (see page 3271)

OnModuleAdded (see page 3274)

13.1.4.3 TAbstractWebModuleList Properties

The properties of the TAbstractWebModuleList class are listed here.

Public Properties

	Name	Description
	Factory (see page 3272)	Lists the Web module factories for all the Web modules available in the application.
	FactoryCount (see page 3272)	Indicates the number of Web module factories listed in the Factory (see page 3272) property array.
	ItemCount (see page 3273)	Indicates the number of Web modules that have been instantiated in the current thread.
	Items (see page 3273)	Lists the instantiated Web modules in the current thread.

13.1.4.3.1 TAbstractWebModuleList.Factory Property

Lists the Web module factories for all the Web modules available in the application.

Pascal

```
property Factory [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory Factory[int I];
```

Description

Read Factory to access the factory objects that instantiate Web modules for the WebSnap application. Each factory object includes methods to create or (if an instance exists) access the corresponding Web module, as well as properties that provide information about the Web module it creates.

Use the FactoryCount (see page 3272) property in conjunction with Factory to iterate over all the Web module factory objects in the WebSnap application.

I is the index of the factory object to read, where 0 identifies the first factory, 1 identifies the second factory, and so on, until FactoryCount (see page 3272) – 1 identifies the last factory.

See Also

FactoryCount (see page 3272)

Items (see page 3273)

13.1.4.3.2 TAbstractWebModuleList.FactoryCount Property

Indicates the number of Web module factories listed in the Factory (see page 3272) property array.

Pascal

```
property FactoryCount: Integer;
```

C++

```
__property int FactoryCount;
```

Description

Read FactoryCount to determine the number of Web module factory object (and hence the potential number of Web modules) in the WebSnap application. FactoryCount provides an upper bound to the index of the Factory (see page 3272) property array.

See Also

Factory (see page 3272)

ItemCount (see page 3273)

13.1.4.3.3 TAbstractWebModuleList.ItemCount Property

Indicates the number of Web modules that have been instantiated in the current thread.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

Read ItemCount to determine the number of instantiated Web modules in the current thread of the WebSnap application. ItemCount provides an upper bound to the index of the Items (see page 3273) property array.

Because ItemCount counts only the instantiated Web modules, its value is always less than or equal to the value of FactoryCount (see page 3272), which gives the number of Web module factories.

See Also

Items (see page 3273)

FactoryCount (see page 3272)

13.1.4.3.4 TAbstractWebModuleList.Items Property

Lists the instantiated Web modules in the current thread.

Pascal

```
property Items [I: Integer]: TComponent;
```

C++

```
__property TComponent * Items[int I];
```

Description

Read Items to access the Web modules that have been created to process the current HTTP request.

Use the ItemCount (see page 3273) property in conjunction with Items to iterate over all the Web modules in the current thread.

I is the index of the object to read, where 0 identifies the first Web module, 1 identifies the second Web module, and so on, until ItemCount (see page 3273) – 1 identifies the last Web module.

Note: In Delphi, Items is the default property of TAbstractWebModuleList (see page 3266). This means that the property name may be omitted. Thus the line

Note: MyModule := WebContext.WebModules.Items[I];

Note: can be written

Note: MyModule := WebContext.WebModules[I];

Note: In C++, a similar effect to the use of Items as a default property can be achieved using the [] operator.

See Also

ItemCount (see page 3273)

Factory (see page 3272)

operator_sb

13.1.4.4 TAbstractWebModuleList Events

The events of the TAbstractWebModuleList class are listed here.

Public Events

	Name	Description
	OnModuleAdded (see page 3274)	Occurs when a new Web module is added to the Items (see page 3273) property array.

13.1.4.4.1 TAbstractWebModuleList.OnModuleAdded Event

Occurs when a new Web module is added to the Items (see page 3273) property array.

Pascal

```
property OnModuleAdded: TModuleAddedProc;
```

C++

```
__property TModuleAddedProc OnModuleAdded;
```

Description

Write an OnModuleAdded event handler to take specific action when a Web module is instantiated in the current Web context. When the WebSnap application creates a new Web module instance, it generates an OnModuleAdded event immediately after adding the instance to the Items (see page 3273) property array.

Note: Do not write an OnModuleAdded event handler if the application contains a TWebAppComponents object. TWebAppComponents uses this event to initialize the Web modules when they are added.

See Also

Items (see page 3273)

AddModuleClass (see page 3268)

AddModuleName (see page 3269)

TWebAppComponents

13.1.5 TAbstractWebPageInfo Class

TAbstractWebPageInfo represents the attributes of a Web page module.

Class Hierarchy

Pascal

```
TAbstractWebPageInfo = class;
```

C++

```
class TAbstractWebPageInfo;
```

File

HTTPApp

Description

TAbstractWebPageInfo is the abstract base class for Web page information objects. It introduces a number of properties that describe the attributes of a Web page module, including

PageName (see page 3283), which is the logical name for the Web page the module generates.

IsPublished (see page 3282), which indicates whether the WebSnap application automatically displays the page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 3283).

IsLoginRequired (see page 3281), which indicates whether the user must log in to access the Web page.

ViewAccess (see page 3284), which can be used to restrict access to the Web page.

PageTitle (see page 3284), which is the title that appears on the Web page.

PageFile (see page 3283), which identifies an associated HTML template that the Web page module uses to generate its Web page.

PageHREF (see page 3283), which identifies the HREF to use for references to the page that appear in hypertext links.

PageDescription (see page 3282), which describes the Web page.

Do not create instances of TAbstractWebPageInfo. It includes abstract or, in C++ terminology, pure virtual methods (methods that have no implementation) that must be overridden in a descendant class.

Web page information objects are used to set the attributes of a Web page module. An instance of a TAbstractWebPageInfo descendant, such as TWebPageInfo, is supplied to the constructor of the factory object that creates instances of the Web page module. Typically, the code to create this object and supply it to the Web page factory's constructor is generated by a Web page module wizard. You can change this generated code, which appears in the generated unit for the Web page module, to alter the properties of the Web page information object. For example, you may want to add a ViewAccess (see page 3284) string to allow your application to limit access to the Web page.

In a WebSnap application, you can access the Web page information object of any Web page module by calling the FindPageInfo method of the application's global Web context.

TWebPageModuleFactory

WebContext

13.1.5.1 TAbstractWebPageInfo Members

The following tables list the members exposed by TAbstractWebPageInfo.

Protected Methods

	Name	Description
	GetFactory (see page 3277)	Returns the value of the Factory (see page 3281) property.
V	GetIsLoginRequired (see page 3277)	Returns the value of the IsLoginRequired (see page 3281) property.
V	GetIsPublished (see page 3277)	Returns the value of the IsPublished (see page 3282) property.
V	GetPageDescription (see page 3278)	Returns the value of the PageDescription (see page 3282) property.
A	GetPageFile (see page 3278)	Returns the value of the PageFile (see page 3283) property.
V	GetPageHREF (see page 3278)	Returns the value of the PageHREF (see page 3283) property.
A	GetPageName (see page 3279)	Returns the value of the PageName (see page 3283) property.
V	GetPageTitle (see page 3279)	Returns the value of the PageTitle (see page 3284) property.
V	GetViewAccess (see page 3279)	Returns the value of the ViewAccess (see page 3284) property.
V	SetFactory (see page 3280)	Sets the value of the Factory (see page 3281) property.

Public Properties

	Name	Description
	Factory (see page 3281)	Specifies the factory object that creates instances of the Web page module this object describes.
R	IsLoginRequired (see page 3281)	Indicates whether callers must log in before accessing the associated Web page.
R	IsPublished (see page 3282)	Indicates whether the WebSnap application automatically displays the associated page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 3283).
R	PageDescription (see page 3282)	Describes the Web page.
R	PageFile (see page 3283)	Identifies an associated file that the Web page module uses to generate its Web page.
R	PageHREF (see page 3283)	Identifies the HREF to use for references to the associated Web page that appear in hypertext links.
R	PageName (see page 3283)	Denotes the logical name for the Web page that the associated module generates
R	PageTitle (see page 3284)	Indicates the title that appears on the associated Web page.
R	ViewAccess (see page 3284)	Indicates the view access string that controls access to the associated Web page.

13.1.5.2 TAbstractWebPageInfo Methods

The methods of the TAbstractWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetFactory (see page 3277)	Returns the value of the Factory (see page 3281) property.
V	GetIsLoginRequired (see page 3277)	Returns the value of the IsLoginRequired (see page 3281) property.
V	GetIsPublished (see page 3277)	Returns the value of the IsPublished (see page 3282) property.
V	GetPageDescription (see page 3278)	Returns the value of the PageDescription (see page 3282) property.
A	GetPageFile (see page 3278)	Returns the value of the PageFile (see page 3283) property.
V	GetPageHREF (see page 3278)	Returns the value of the PageHREF (see page 3283) property.
A	GetPageName (see page 3279)	Returns the value of the PageName (see page 3283) property.
V	GetPageTitle (see page 3279)	Returns the value of the PageTitle (see page 3284) property.

	GetViewAccess (see page 3279)	Returns the value of the ViewAccess (see page 3284) property.
	SetFactory (see page 3280)	Sets the value of the Factory (see page 3281) property.

13.1.5.2.1 TAbstractWebPageInfo.GetFactory Method

Returns the value of the Factory (see page 3281) property.

Pascal

```
function GetFactory: TAbstractWebPageModuleFactory;
```

C++

```
__fastcall TAbstractWebPageModuleFactory GetFactory();
```

Description

GetFactory is the protected read implementation of the Factory (see page 3281) property.

See Also

Factory (see page 3281)

SetFactory (see page 3280)

13.1.5.2.2 TAbstractWebPageInfo.GetIsLoginRequired Method

Returns the value of the IsLoginRequired (see page 3281) property.

Pascal

```
function GetIsLoginRequired: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetIsLoginRequired();
```

Description

GetIsLoginRequired is the protected read implementation of the IsLoginRequired (see page 3281) property.

In TAbstractWebPageInfo (see page 3275), GetIsLoginRequired always returns false. Descendant classes override this method to indicate when users must log in to access the associated Web page.

See Also

IsLoginRequired (see page 3281)

13.1.5.2.3 TAbstractWebPageInfo.GetIsPublished Method

Returns the value of the IsPublished (see page 3282) property.

Pascal

```
function GetIsPublished: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetIsPublished();
```

Description

GetIsPublished is the protected read implementation of the IsPublished (see page 3282) property.

In TAbstractWebPageInfo (see page 3275), GetIsPublished always returns false. Descendant classes override this method to indicate when the page dispatcher can automatically forward HTTP request messages that address the associated Web module.

See Also

IsPublished (see page 3282)

13.1.5.2.4 TAbstractWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription (see page 3282) property.

Pascal

```
function GetPageDescription: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetPageDescription();
```

Description

GetPageDescription is the protected read implementation of the PageDescription (see page 3282) property.

In TAbstractWebPageInfo (see page 3275), GetPageDescription returns the value of the PageName (see page 3283) property. Descendant classes override this method to allow page descriptions that differ from the Web page's logical name.

See Also

PageDescription (see page 3282)

PageName (see page 3283)

13.1.5.2.5 TAbstractWebPageInfo.GetPageFile Method

Returns the value of the PageFile (see page 3283) property.

Pascal

```
function GetPageFile: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetPageFile() = 0;
```

Description

GetPageFile is the protected read implementation of the PageFile (see page 3283) property.

In TAbstractWebPageInfo (see page 3275), GetPageFile is abstract or, in C++ terminology, pure virtual. Descendant classes must override this method to provide an implementation for the PageFile (see page 3283) property.

See Also

PageFile (see page 3283)

13.1.5.2.6 TAbstractWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF (see page 3283) property.

Pascal

```
function GetPageHREF: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetPageHREF();
```

Description

GetPageHREF is the protected read implementation of the PageHREF (see page 3283) property.

In TAbstractWebPageInfo (see page 3275), GetPageHREF returns the value of the PageName (see page 3283) property. Descendant classes override this method to allow HREF values that differ from the Web page's logical name.

See Also

PageHREF (see page 3283)

PageName (see page 3283)

13.1.5.2.7 TAbstractWebPageInfo.GetPageName Method

Returns the value of the PageName (see page 3283) property.

Pascal

```
function GetPageName: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetPageName() = 0;
```

Description

GetPageName is the protected read implementation of the PageName (see page 3283) property.

In TAbstractWebPageInfo (see page 3275), GetPageName is abstract or, in C++ terminology, pure virtual. Descendant classes must override this method to provide an implementation for the PageName (see page 3283) property.

See Also

PageName (see page 3283)

13.1.5.2.8 TAbstractWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle (see page 3284) property.

Pascal

```
function GetPageTitle: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetPageTitle();
```

Description

GetPageTitle is the protected read implementation of the PageTitle (see page 3284) property.

In TAbstractWebPageInfo (see page 3275), GetPageTitle returns the value of the PageName (see page 3283) property. Descendant classes override this method to allow Web pages to have titles that differ from their logical name.

See Also

PageTitle (see page 3284)

PageName (see page 3283)

13.1.5.2.9 TAbstractWebPageInfo.GetViewAccess Method

Returns the value of the ViewAccess (see page 3284) property.

Pascal

```
function GetViewAccess: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetViewAccess();
```

Description

GetViewAccess is the protected read implementation of the ViewAccess (see page 3284) property.

In TAbstractWebPageInfo (see page 3275), GetViewAccess returns an empty string. Descendant classes override this method to allow Web pages to have view access strings.

See Also

ViewAccess (see page 3284)

13.1.5.2.10 TAbstractWebPageInfo.SetFactory Method

Sets the value of the Factory (see page 3281) property.

Pascal

```
procedure SetFactory(AFactory: TAbstractWebPageModuleFactory); virtual;
```

C++

```
virtual __fastcall SetFactory(TAbstractWebPageModuleFactory AFactory);
```

Description

SetFactory is the protected write implementation of the Factory (see page 3281) property.

AFactory is the Web page module factory object that instantiates the Web page module that this object describes.

See Also

Factory (see page 3281)

GetFactory (see page 3277)

13.1.5.3 TAbstractWebPageInfo Properties

The properties of the TAbstractWebPageInfo class are listed here.

Public Properties

	Name	Description
	Factory (see page 3281)	Specifies the factory object that creates instances of the Web page module this object describes.
R	IsLoginRequired (see page 3281)	Indicates whether callers must log in before accessing the associated Web page.
R	IsPublished (see page 3282)	Indicates whether the WebSnap application automatically displays the associated page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 3283).
R	PageDescription (see page 3282)	Describes the Web page.
R	PageFile (see page 3283)	Identifies an associated file that the Web page module uses to generate its Web page.
R	PageHREF (see page 3283)	Identifies the HREF to use for references to the associated Web page that appear in hypertext links.
R	PageName (see page 3283)	Denotes the logical name for the Web page that the associated module generates
R	PageTitle (see page 3284)	Indicates the title that appears on the associated Web page.
R	ViewAccess (see page 3284)	Indicates the view access string that controls access to the associated Web page.

13.1.5.3.1 TAbstractWebPageInfo.Factory Property

Specifies the factory object that creates instances of the Web page module this object describes.

Pascal

```
property Factory: TAbstractWebPageModuleFactory;
```

C++

```
__property TAbstractWebPageModuleFactory Factory;
```

Description

Factory indicates the factory object that creates instances of the associated Web page module. If the associated Web page module is also the Web application module, Factory is an instance of TWebAppPageModuleFactory. Otherwise, it is an instance of TWebPageModuleFactory.

This property is set by the factory object's constructor.

See Also

TWebAppPageModuleFactory

TWebPageModuleFactory

Create_d

Create_c

13.1.5.3.2 TAbstractWebPageInfo.IsLoginRequired Property

Indicates whether callers must log in before accessing the associated Web page.

Pascal

```
property IsLoginRequired: Boolean;
```

C++

```
__property Boolean IsLoginRequired;
```

Description

Read IsLoginRequired to determine whether users must log in before accessing the associated Web page. The page dispatcher component (TPageDispatcher) checks this value to determine whether it can forward requests to the associated Web page when the caller has not yet logged in. The application can overrule the IsLoginRequired property by supplying an OnIsLoginRequired event handler to the page dispatcher.

In TAbstractWebPageInfo (see page 3275), IsLoginRequired is always false. Descendant classes override this property, initializing it to a value that is passed to the constructor.

See Also

Create_c

Create_d

IsPublished (see page 3282)

ViewAccess (see page 3284)

OnIsLoginRequired

TPageDispatcher

13.1.5.3.3 TAbstractWebPageInfo.IsPublished Property

Indicates whether the WebSnap application automatically displays the associated page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 3283).

Pascal

```
property IsPublished: Boolean;
```

C++

```
__property Boolean IsPublished;
```

Description

Read IsPublished to determine whether the page dispatcher (TPageDispatcher) automatically calls on the associated Web page module when it receives HTTP request messages that address it by name. HTTP request messages address a Web page module when the pathinfo portion of their target URL matches the value of the PageName (see page 3283) property.

When IsPublished is false, the WebSnap application must explicitly retrieve the content that the Web page module generates in order to use the Web page module.

In TAbstractWebPageInfo (see page 3275), IsPublished is always false. Descendant classes override this property, initializing it to a value that is passed to the constructor.

See Also

PageName (see page 3283)

Create_d

Create_c

TPageDispatcher

13.1.5.3.4 TAbstractWebPageInfo.PageDescription Property

Describes the Web page.

Pascal

```
property PageDescription: string;
```

C++

```
__property UnicodeString PageDescription;
```

Description

Read PageDescription to obtain a brief description of the Web page that the associated Web page module generates. This property can be used, for example, to provide descriptions for a dynamically generated catalog of available Web pages.

In TAbstractWebPageInfo (see page 3275), PageDescription is the same as the value of the PageName (see page 3283) property.

See Also

PageName (see page 3283)

PageTitle (see page 3284)

13.1.5.3.5 TAbstractWebPageInfo.PageFile Property

Identifies an associated file that the Web page module uses to generate its Web page.

Pascal

```
property PageFile: string;
```

C++

```
__property UnicodeString PageFile;
```

Description

Read PageFile to identify the file, if any, that the associated Web page module uses when generating its Web page. This can be the Web page that the Web page module returns, or it can be a template that the Web page module modifies to generate its final product.

In TAbstractWebPageInfo (see page 3275), the property read access method for PageFile is abstract pure virtual. Descendant classes must override the protected GetPageFile (see page 3278) method to provide an implementation for this property.

13.1.5.3.6 TAbstractWebPageInfo.PageHREF Property

Identifies the HREF to use for references to the associated Web page that appear in hypertext links.

Pascal

```
property PageHREF: string;
```

C++

```
__property UnicodeString PageHREF;
```

Description

Read PageHREF to obtain the string that should be inserted in HTML code to create a hypertext link to the associated Web page.

In TAbstractWebPageInfo (see page 3275), PageHREF is the same as the value of the PageName (see page 3283) property.

See Also

PageName (see page 3283)

13.1.5.3.7 TAbstractWebPageInfo.PageName Property

Denotes the logical name for the Web page that the associated module generates

Pascal

```
property PageName: string;
```

C++

```
__property UnicodeString PageName;
```

Description

Read PageName to determine the name of the associated Web page. This name is used to identify that page in server-side scripts, and as the pathinfo portion of the URL for the page when the IsPublished (see page 3282) property is true.

In TAbstractWebPageInfo (see page 3275), the property read access method for PageName is abstract pure virtual. Descendant classes must override the protected GetPageName (see page 3279) method to provide an implementation for this property.

See Also

PageTitle (see page 3284)

PageHREF (see page 3283)

IsPublished (see page 3282)

13.1.5.3.8 TAbstractWebPageInfo.PageTitle Property

Indicates the title that appears on the associated Web page.

Pascal

```
property PageTitle: string;
```

C++

```
__property UnicodeString PageTitle;
```

Description

Read PageTitle to determine the title that appears on the associated Web page when viewed from a user's browser.

In TAbstractWebPageInfo (see page 3275), PageTitle is the same as the value of the PageName (see page 3283) property.

See Also

PageName (see page 3283)

13.1.5.3.9 TAbstractWebPageInfo.ViewAccess Property

Indicates the view access string that controls access to the associated Web page.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

Read ViewAccess to obtain the view access string that controls which users have access to the associated Web page. When a user tries to access the associated Web page, the page dispatcher checks the user's access rights against this string by calling the HasViewRights method of the end user adapter. Adapters in the Web page module check execute and modify rights against this string by calling the HasExecuteRights and HasModifyRights methods of the end user adapter.

In TAbstractWebPageInfo (see page 3275), ViewAccess is always an empty string. Descendant classes override this property, initializing it to a value that is passed to the constructor.

See Also

HasExecuteRights

HasModifyRights

HasViewRights

13.1.6 TAbstractWebPageModuleFactory Class

TAbstractWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.

Class Hierarchy

Pascal

```
TAbstractWebPageModuleFactory = class(TAbstractWebModuleFactory);
```

C++

```
class TAbstractWebPageModuleFactory : public TAbstractWebModuleFactory;
```

File

HTTPApp

Description

All WebSnap modules are registered with the WebSnap application using a factory object. In Delphi, the factory object is typically created in the initialization section of the module source file. The factory object is responsible for creating Web module instances. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instances for reuse with subsequent request messages.

TAbstractWebPageModuleFactory is the base class for all Web module factory objects that generate Web page modules. In addition to holding components that perform tasks for the WebSnap application, Web page modules can generate a Web page. The Web page is described by a Web page information object, which the Web page module factory makes available as its WebPageInfo (see page 3266) property.

Do not create instances of TAbstractWebPageModuleFactory. Most of its methods are abstract or, in C++ terminology, pure virtual, meaning they have no implementation. Instead, create instances of a TAbstractWebPageModuleFactory descendant such as TWebPageModuleFactory or TWebAppPageModuleFactory.

TWebPageInfo

13.1.6.1 TAbstractWebPageModuleFactory Members

The following tables list the members exposed by TAbstractWebPageModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 3260)	Returns the value of the CacheMode (see page 3264) property.
	GetComponentClass (see page 3261)	Returns the value of the ComponentClass (see page 3264) property.
	GetCreateMode (see page 3261)	Returns the value of the CreateMode (see page 3265) property.
	GetIsAppModule (see page 3261)	Returns the value of the IsAppModule (see page 3265) property.

	GetModuleName (see page 3262)	Returns the value of the ModuleName (see page 3265) property.
	GetWebPageInfo (see page 3287)	Returns the value of the WebPageInfo (see page 3266) property.

Public Methods

	Name	Description
	Create (see page 3286)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 3286)	Disposes of an object instance.
	GetModule (see page 3262)	Creates an instance of the associated Web module.
	PreventDestruction (see page 3263)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
	CacheMode (see page 3264)	Indicates whether the factory can cache Web modules for reuse.
	ComponentClass (see page 3264)	Specifies the class type of the Web module that this factory creates.
	CreateMode (see page 3265)	Indicates when the factory creates instances of its Web module.
	IsAppModule (see page 3265)	Indicates whether the corresponding Web module is the main Web application module.
	ModuleName (see page 3265)	Specifies the name of the Web module class that this factory instantiates.
	WebPageInfo (see page 3266)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

13.1.6.2 TAbstractWebPageModuleFactory.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create(AWebPageInfo: TAbstractWebPageInfo);
```

C++

```
__fastcall TAbstractWebPageModuleFactory(TAbstractWebPageInfo AWebPageInfo);
```

Description

Do not create instances of TAbstractWebPageModuleFactory (see page 3285). Instead, construct descendants of TAbstractWebPageModuleFactory (see page 3285) using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy

new

13.1.6.3 TAbstractWebPageModuleFactory.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractWebPageModuleFactory();
```

Description

Do not call ~TAbstractWebPageModuleFactory (see page 3285) directly. Instead, use the delete keyword when destroying VCL objects.

~TAbstractWebPageModuleFactory (see page 3285) deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

delete

13.1.6.4 TAbstractWebPageModuleFactory Methods

The methods of the TAbstractWebPageModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetWebPageInfo (see page 3287)	Returns the value of the WebPageInfo (see page 3266) property.

13.1.6.4.1 TAbstractWebPageModuleFactory.GetWebPageInfo Method

Returns the value of the WebPageInfo (see page 3266) property.

Pascal

```
function GetWebPageInfo: TAbstractWebPageInfo; override;
```

C++

```
virtual __fastcall TAbstractWebPageInfo GetWebPageInfo();
```

Description

GetWebPageInfo is the protected read implementation of the WebPageInfo (see page 3266) property. It returns the Web page information object that is supplied to the TAbstractWebPageModuleFactory (see page 3285) constructor.

See Also

WebPageInfo

Create_c

13.1.7 TAbstractWebRequestFile Class

TAbstractWebRequestFile describes an uploaded file from an HTTP request.

Class Hierarchy

Pascal

```
TAbstractWebRequestFile = class(TObject);
```

C++

```
class TAbstractWebRequestFile : public TObject;
```

File

HTTPApp

Description

TAbstractWebRequestFile introduces properties to describe and provide access to an uploaded file from an HTTP request. These include

FileName (see page 3291), which gives the name of the uploaded file.

FieldName (see page 3291), which gives the name of the field whose value is the uploaded file.

ContentType (see page 3291), which describes how the file data is encoded.

Stream (see page 3292), which is a stream object from which you can read the file content.

The methods that implement these properties are all abstract or, in C++ terminology, pure virtual. This means that the Web server application does not instantiate TAbstractWebRequestFile. Instead, it uses a TAbstractWebRequestFile descendant such as TWebRequestFile (which is included in WebSnap).

Each TAbstractWebRequestFile descendant describes a single uploaded file. A collection of all the uploaded files from the current request is available as the Files property of TWebRequest (see page 3358). In addition, in WebSnap applications, adapter fields that work with uploaded files surface those files using a TUpdateFileList object or IActionFieldValues interface.

Note: Support for uploaded files is only included in WebSnap. For other Web server applications, this class exists only as a placeholder for the Files property on TWebRequest (see page 3358).

TAdapterFileField

13.1.7.1 TAbstractWebRequestFile Members

The following tables list the members exposed by TAbstractWebRequestFile.

Protected Methods

	Name	Description
	GetContentType (see page 3289)	Returns the value of the ContentType (see page 3291) property.
	GetFieldName (see page 3289)	Returns the value of the FieldName (see page 3291) property.
	GetFileName (see page 3290)	Returns the value of the FileName (see page 3291) property.
	GetStream (see page 3290)	Returns the value of the Stream (see page 3292) property.

Public Properties

	Name	Description
	ContentType (see page 3291)	Describes how the file data is encoded.
	FieldName (see page 3291)	Indicates the name of the adapter field whose value is the contents of the file.
	FileName (see page 3291)	Indicates the name of the uploaded file.
	Stream (see page 3292)	Provides access to the contents of the uploaded file.

13.1.7.2 TAbstractWebRequestFile Methods

The methods of the TAbstractWebRequestFile class are listed here.

Protected Methods

	Name	Description
	GetContentType (see page 3289)	Returns the value of the ContentType (see page 3291) property.
	GetFieldName (see page 3289)	Returns the value of the FieldName (see page 3291) property.
	GetFileName (see page 3290)	Returns the value of the FileName (see page 3291) property.
	GetStream (see page 3290)	Returns the value of the Stream (see page 3292) property.

13.1.7.2.1 TAbstractWebRequestFile.GetContentType Method

Returns the value of the ContentType (see page 3291) property.

Pascal

```
function GetContentType: AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetContentType() = 0;
```

Description

GetContentType is the protected read implementation for the ContentType (see page 3291) property.

In TAbstractWebRequestFile (see page 3288), GetContentType is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the ContentType (see page 3291) property.

See Also

ContentType (see page 3291)

13.1.7.2.2 TAbstractWebRequestFile.GetFieldName Method

Returns the value of the FieldName (see page 3291) property.

Pascal

```
function GetFieldName: AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFieldName() = 0;
```

Description

GetFieldName is the protected read implementation for the FieldName (see page 3291) property.

In TAbstractWebRequestFile (see page 3288), GetFieldName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FieldName (see page 3291) property.

See Also

FieldName (see page 3291)

13.1.7.2.3 TAbstractWebRequestFile.GetFileName Method

Returns the value of the FileName (see page 3291) property.

Pascal

```
function GetFileName: AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFileName() = 0;
```

Description

GetFileName is the protected read implementation for the FileName (see page 3291) property.

In TAbstractWebRequestFile (see page 3288), GetFileName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FileName (see page 3291) property.

See Also

FileName (see page 3291)

13.1.7.2.4 TAbstractWebRequestFile.GetStream Method

Returns the value of the Stream (see page 3292) property.

Pascal

```
function GetStream: TStream; virtual; abstract;
```

C++

```
virtual __fastcall TStream GetStream() = 0;
```

Description

GetStream is the protected read implementation for the Stream (see page 3292) property.

In TAbstractWebRequestFile (see page 3288), GetStream is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Stream (see page 3292) property.

See Also

Stream (see page 3292)

13.1.7.3 TAbstractWebRequestFile Properties

The properties of the TAbstractWebRequestFile class are listed here.

Public Properties

	Name	Description
	ContentType (see page 3291)	Describes how the file data is encoded.
	FieldName (see page 3291)	Indicates the name of the adapter field whose value is the contents of the file.
	FileName (see page 3291)	Indicates the name of the uploaded file.
	Stream (see page 3292)	Provides access to the contents of the uploaded file.

13.1.7.3.1 TAbstractWebRequestFile.ContentType Property

Describes how the file data is encoded.

Pascal

```
property ContentType: AnsiString;
```

C++

```
__property AnsiString ContentType;
```

Description

Read ContentType to determine the format of the data you can read from the Stream (see page 3292) property. ContentType is a string of the format Type/SubType, which names the MIME type and subtype used to encode the file contents.

See Also

Stream (see page 3292)

13.1.7.3.2 TAbstractWebRequestFile.FieldName Property

Indicates the name of the adapter field whose value is the contents of the file.

Pascal

```
property FieldName: AnsiString;
```

C++

```
__property AnsiString FieldName;
```

Description

Read FieldName to identify the adapter field for which this file was uploaded. This is the same as the FieldName property of the adapter field object.

See Also

FieldName

FileName (see page 3291)

13.1.7.3.3 TAbstractWebRequestFile.FileName Property

Indicates the name of the uploaded file.

Pascal

```
property FileName: AnsiString;
```

C++

```
__property AnsiString FileName;
```

Description

Read FileName to obtain the name of the uploaded file.

See Also

Stream (see page 3292)

13.1.7.3.4 TAbstractWebRequestFile.Stream Property

Provides access to the contents of the uploaded file.

Pascal

```
property Stream: TStream;
```

C++

```
__property TStream Stream;
```

Description

Use Stream to read the content of the uploaded file. Call the Read method of this stream to read the file contents.

Note: The ContentType (see page 3291) property indicates the format used to encode the file contents that you read from Stream.

See Also

FileName (see page 3291)

ContentType (see page 3291)

Read

13.1.8 TAbstractWebRequestFiles Class

TAbstractWebRequestFiles is a collection of TAbstractWebRequestFile (see page 3288) objects.

Class Hierarchy

Pascal

```
TAbstractWebRequestFiles = class(TObject);
```

C++

```
class TAbstractWebRequestFiles : public TObject;
```

File

HTTPApp

Description

TAbstractWebRequestFiles is the base class for objects that manage a set of Web request files objects

(TAbstractWebRequestFile (see page 3288) descendants). Each Web request file object in the collection describes an uploaded file that was extracted from the current HTTP request object.

TAbstractWebRequestFiles should not be instantiated. The methods that implement its properties are abstract or, in C++ terminology, pure virtual. Instead, applications use a TAbstractWebRequestFiles descendant such as TWebRequestFiles (which is included in WebSnap).

Note: Support for uploaded files is only included in WebSnap. For other Web server applications, this class exists only as a placeholder for the Files property on TWebRequest (see page 3358).

See Also

TAbstractWebRequestFile (see page 3288)

TWebRequest (see page 3358)

TUpdateFileList

TWebRequestFiles (see page 6700)

13.1.8.1 TAbstractWebRequestFiles Members

The following tables list the members exposed by TAbstractWebRequestFiles.

Protected Methods

	Name	Description
	GetCount (see page 3293)	Returns the value of the Count (see page 3294) property.
	GetItem (see page 3294)	Returns the value of the Items (see page 3295) property.

Public Properties

	Name	Description
	Count (see page 3294)	Indicates the number of uploaded files in the collection.
	Items (see page 3295)	Lists the uploaded files in the collection.

13.1.8.2 TAbstractWebRequestFiles Methods

The methods of the TAbstractWebRequestFiles class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 3293)	Returns the value of the Count (see page 3294) property.
	GetItem (see page 3294)	Returns the value of the Items (see page 3295) property.

13.1.8.2.1 TAbstractWebRequestFiles.GetCount Method

Returns the value of the Count (see page 3294) property.

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCount is the protected read implementation of the Count (see page 3294) property.

In TAbstractWebRequestFile (see page 3288), GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 3294) property.

See Also

Count (see page 3294)

13.1.8.2.2 TAbstractWebRequestFiles.GetItem Method

Returns the value of the Items (see page 3295) property.

Pascal

```
function GetItem(I: Integer): TAbstractWebRequestFile; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebRequestFile GetItem(int I) = 0;
```

Description

GetItem is the protected read implementation of the Items (see page 3295) property.

I is the index of the Web request file object to return.

In TAbstractWebRequestFile (see page 3288), GetCount (see page 3293) is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 3294) property.

13.1.8.3 TAbstractWebRequestFiles Properties

The properties of the TAbstractWebRequestFiles class are listed here.

Public Properties

	Name	Description
R	Count (see page 3294)	Indicates the number of uploaded files in the collection.
R	Items (see page 3295)	Lists the uploaded files in the collection.

13.1.8.3.1 TAbstractWebRequestFiles.Count Property

Indicates the number of uploaded files in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of files in this collection. Count provides an upper bound to the index of the Items (see page 3295) property.

See Also

Items (see page 3295)

13.1.8.3.2 TAbstractWebRequestFiles.Items Property

Lists the uploaded files in the collection.

Pascal

```
property Items [I: Integer]: TAbstractWebRequestFile;
```

C++

```
__property TAbstractWebRequestFile Items[int I];
```

Description

Read Items to access the descriptions of the individual uploaded files in the collection.

I is the index of the file to access, where 0 indicates the first file, 1 indicates the second file, and so on. The value of I must be less than the value of the Count (see page 3294) property.

Note: Items is the default property of TAbstractWebRequestFiles (see page 3292). This means that the property name can be omitted when using this property. Thus, the line

Note: Upload := WebContext.Request.Files.Items[0];

Note: can also be written

Note: Upload := WebContext.Request.Files[0];

Count (see page 3294)

Files (see page 3379)

operator_sb

13.1.9 TAbstractWebSession Class

TAbstractWebSession is the base class for objects that represent a session in a WebSnap application.

Class Hierarchy

Pascal

```
TAbstractWebSession = class(TObject);
```

C++

```
class TAbstractWebSession : public TObject;
```

File

HTTPApp

Description

TAbstractWebSession is the base class for all Web session objects. These include active sessions, which are represented by TWebSession objects, and invalid sessions (TInvalidWebSession), which are used to represent sessions that can no longer be used because they have expired.

A Web session has an ID and a list of name/value pairs. The ID is a random number that uniquely identifies the session. The name/value pairs are used to associate information with the ID. The values are variants. You can use these named Variants to store application-defined information that is associated with a single user. In this way, the information can persist over multiple calls from the same user.

The session ID is stored on the end user's computer using a cookie. When a request is received, the WebSnap application examines the cookie. If a session associated with this cookie exists, then it becomes the current session.

There is no need to instantiate session objects. A Session is created automatically when the WebSnap application receives an HTTP request message.

When the current session is terminated, its session ID and name/value pairs are discarded. For example, the current session is typically terminated when the user logs out. Sessions can also be terminated when they are not accessed within a specified time-out period, or when the application explicitly calls the session's Terminate (see page 3299) method. A new session is created after a session has been terminated.

TWebSession

13.1.9.1 TAbstractWebSession Members

The following tables list the members exposed by TAbstractWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 3297)	Returns the value of the SessionID (see page 3300) property.
	GetTimeoutMinutes (see page 3297)	Returns the value of the TimeoutMinutes (see page 3300) property.
	GetValue (see page 3298)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 3298)	Sets the value of the TimoutMinutes property.
	SetValue (see page 3299)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 3299)	Terminates the session.
	UpdateResponse (see page 3299)	Adds the session ID to a cookie in a response message.

Public Properties

	Name	Description
	SessionID (see page 3300)	Uniquely identifies the Session.
	TimeoutMinutes (see page 3300)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 3301)	Lists the named values that the session stores.

13.1.9.2 TAbstractWebSession Methods

The methods of the TAbstractWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 3297)	Returns the value of the SessionID (see page 3300) property.
	GetTimeoutMinutes (see page 3297)	Returns the value of the TimeoutMinutes (see page 3300) property.
	GetValue (see page 3298)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 3298)	Sets the value of the TimoutMinutes property.
	SetValue (see page 3299)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 3299)	Terminates the session.
	UpdateResponse (see page 3299)	Adds the session ID to a cookie in a response message.

13.1.9.2.1 TAbstractWebSession.GetSessionID Method

Returns the value of the SessionID (see page 3300) property.

Pascal

```
function GetSessionID: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetSessionID() = 0;
```

Description

GetSessionID is the protected read implementation of the SessionID (see page 3300) property.

In TAbstractWebSession (see page 3295), GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID (see page 3300) property.

See Also

SessionID (see page 3300)

13.1.9.2.2 TAbstractWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes (see page 3300) property.

Pascal

```
function GetTimeoutMinutes: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetTimeoutMinutes() = 0;
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes (see page 3300) property.

In TAbstractWebSession (see page 3295), GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes (see page 3300) property.

See Also

TimeoutMinutes (see page 3300)

SetTimeoutMinutes (see page 3298)

13.1.9.2.3 TAbstractWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; virtual; abstract;
```

C++

```
virtual __fastcall Variant GetValue(const UnicodeString AName) = 0;
```

Description

GetValue is the protected read implementation of the Values (see page 3301) property.

AName is the name of the value to return.

In TAbstractWebSession (see page 3295), GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values (see page 3301) property.

See Also

Values (see page 3301)

SetValue (see page 3299)

13.1.9.2.4 TAbstractWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue) = 0;
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes (see page 3300) property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession (see page 3295), SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes (see page 3300) property.

See Also

GetTimeoutMinutes (see page 3297)

TimeoutMinutes (see page 3300)

13.1.9.2.5 TAbstractWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall SetValue(const UnicodeString AName, const Variant AValue) = 0;
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession (see page 3295), SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values (see page 3301) property.

See Also

GetValue (see page 3298)

Values (see page 3301)

13.1.9.2.6 TAbstractWebSession.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate; virtual; abstract;
```

C++

```
virtual __fastcall Terminate() = 0;
```

Description

Call Terminate to explicitly terminate a session. Once a session terminates, the application can no longer access its Values (see page 3301).

Sessions are terminated automatically when the application does not receive any requests for the session for TimoutMinutes minutes.

In TAbstractWebSession (see page 3295), Terminate is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation.

See Also

TimeoutMinutes (see page 3300)

Values (see page 3301)

13.1.9.2.7 TAbstractWebSession.UpdateResponse Method

Adds the session ID to a cookie in a response message.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); virtual; abstract;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse) = 0;
```

Description

Call UpdateResponse to add the value of the SessionID (see page 3300) property to one of the response message's cookies. This allows the user's next request message to use the Values (see page 3301) stored in this session.

AResponse is the Web response message to which a cookie with the session ID should be added.

See Also

SessionID (see page 3300)

Values (see page 3301)

13.1.9.3 TAbstractWebSession Properties

The properties of the TAbstractWebSession class are listed here.

Public Properties

	Name	Description
R	SessionID (see page 3300)	Uniquely identifies the Session.
	TimeoutMinutes (see page 3300)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 3301)	Lists the named values that the session stores.

13.1.9.3.1 TAbstractWebSession.SessionID Property

Uniquely identifies the Session.

Pascal

```
property SessionID: string;
```

C++

```
__property UnicodeString SessionID;
```

Description

SessionID is an automatically-generated identifier that uniquely identifies the session. The UpdateResponse (see page 3299) method adds this identifier to response messages, using a cookie. When the WebSnap application receives a request containing a cookie with a session ID, the WebSnap application uses the ID to recreate a copy of the previous session object.

See Also

UpdateResponse (see page 3299)

13.1.9.3.2 TAbstractWebSession.TimeoutMinutes Property

Indicates the time, in minutes, that a session can be idle before it terminates itself.

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

Set TimeoutMinutes to specify the number of minutes that can elapse before a session times out. If this number of minutes elapses with no request messages that call for the session, the session is terminated.

If you do not specify a value for TimeoutMinutes, the session times out after the default time-out period associated with the application's sessions service (TSessionsService).

See Also

Terminate (see page 3299)

DefaultTimeout

13.1.9.3.3 TAbstractWebSession.Values Property

Lists the named values that the session stores.

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[UnicodeString const AName];
```

Description

Use Values to get or set the information that the session stores. Because sessions are associated with individual users, this information typically represents information about the user or choices the user makes. The Values property can be used to implement application-specific tasks, such as saving user preferences or maintaining a list user selections.

Each value is indexed by a name that indicates its meaning. The names can be any application-defined string.

See Also

TEndUserSessionAdapter

13.1.10 TContentParser Class

TContentParser is the default parser for extracting named value strings and uploaded files from an HTTP request.

Class Hierarchy

Pascal

```
TContentParser = class(TAbstractContentParser);
```

C++

```
class TContentParser : public TAbstractContentParser;
```

File

HTTPApp

Description

Web request objects use a TContentParser object to parse the content of an HTTP request message when there is no other registered content parser that knows how to interpret that content. The Web request uses the content parser to assign values for its ContentFields and Files properties.

TContentParser does not know how to parse special request formats. It simply calls the Web request object's own ExtractContentFields method to extract named value strings for the request's ContentFields property. It does not parse uploaded files, but merely returns an empty list for the request's Files property.

See Also

TWebRequest (see page 3358)

TWebRequest (see page 3358)

TWebRequest (see page 3358)

TMultipartContentParser (see page 6706)

TWebRequest (see page 3358)

13.1.10.1 TContentParser Members

The following tables list the members exposed by TContentParser.

Protected Properties

	Name	Description
	WebRequest (see page 3258)	Indicates the Web request object that uses this parser to parse its content.

Public Methods

	Name	Description
	CanParse (see page 3303)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	Create (see page 3256)	Creates and initializes a new TAbstractContentParser (see page 3255) object.
	Destroy (see page 3302)	Frees the memory associated with the TContentParser (see page 3301) object.
	GetContentFields (see page 3303)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 3304)	Returns a set of uploaded files that the parser extracts from the current Web request.

13.1.10.2 TContentParser.Destroy Destructor

Frees the memory associated with the TContentParser (see page 3301) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TContentParser();
```

Description

Do not free content parser instances. The Web request object frees the content parser when it no longer needs it.

See Also

System::TObject::Free

13.1.10.3 TContentParser Methods

The methods of the TContentParser class are listed here.

Public Methods

	Name	Description
	CanParse (see page 3303)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	GetContentFields (see page 3303)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 3304)	Returns a set of uploaded files that the parser extracts from the current Web request.

13.1.10.3.1 TContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a static class method, which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered content parser until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TContentParser (see page 3301), CanParse always returns true. TContentParser (see page 3301) is always the last content parser that the Web request object checks, and provides the default parsing when no other parser is available.

See Also

GetContentFields (see page 3303)

GetFiles (see page 3304)

13.1.10.3.2 TContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; override;
```

C++

```
virtual __fastcall TStrings GetContentFields();
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TContentParser (see page 3301), GetContentFields simply calls the ExtractContentFields method of the current Web request. This method assumes that fields are strings with the form "Name=Value", separated by ampersands (&).

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields (see page 3375)

ExtractContentFields (see page 3363)

13.1.10.3.3 TContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles();
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TContentParser (see page 3301), GetFiles always returns an empty list. That is, TContentParser (see page 3301) does not implement support for uploaded files in HTTP requests.

Note: The content parser owns the list it returns. The caller should not free this list.

See Also

Files (see page 3379)

TAbstractWebRequestFile (see page 3288)

13.1.11 TCookie Class

TCookie represents a Cookie header in an HTTP response message.

Class Hierarchy

Pascal

```
TCookie = class(TCollectionItem);
```

C++

```
class TCookie : public TCollectionItem;
```

File

HTTPApp

Description

Use TCookie to specify the cookie header that should be sent with a response message when responding to an HTTP request

message. Cookie headers contain state information that the Web client passes on to other locations on the Internet or Intranet.

See Also

TCookieCollection (see page 3309)

TWebResponse (see page 3389)

13.1.11.1 TCookie Members

The following tables list the members exposed by TCookie.

Protected Methods

	Name	Description
	GetHeaderValue (see page 3306)	This is GetHeaderValue, a member of class TCookie.

Public Methods

	Name	Description
V	AssignTo (see page 3306)	Copies the properties of the TCookie (see page 3304) object to another TCookie (see page 3304) object.
V	Create (see page 3305)	Creates an instance of TCookie (see page 3304).

Public Properties

	Name	Description
	Domain (see page 3307)	Specifies the Domain field of the cookie header.
	Expires (see page 3307)	Specifies when the cookie is no longer valid.
R	HeaderValue (see page 3307)	Specifies the Cookie header string that represents this TCookie (see page 3304) object.
	Name (see page 3308)	Specifies the name of the custom field represented by this Cookie header.
	Path (see page 3308)	Identifies the paths of URLs to which the Cookie should be sent.
	Secure (see page 3309)	Determines whether the Web client must use a secure connection to pass on the Cookie header.
	Value (see page 3309)	Specifies the value of the Cookie header field named by the Name (see page 3308) property.

13.1.11.2 TCookie.Create Constructor

Creates an instance of TCookie (see page 3304).

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TCookie(TCollection Collection);
```

Description

It is seldom necessary to call the constructor for TCookie (see page 3304) directly. Instead, create TCookie (see page 3304) objects indirectly by calling the Add method of TCookieCollection (see page 3309).

After calling the inherited constructor, Create initializes the Expires (see page 3307) property to indicate no expiration date.

See Also

Add (see page 3311)

Expires (see page 3307)

13.1.11.3 TCookie Methods

The methods of the TCookie class are listed here.

Protected Methods

	Name	Description
	GetHeaderValue (see page 3306)	This is GetHeaderValue, a member of class TCookie.

Public Methods

	Name	Description
	AssignTo (see page 3306)	Copies the properties of the TCookie (see page 3304) object to another TCookie (see page 3304) object.

13.1.11.3.1 TCookie.AssignTo Method

Copies the properties of the TCookie (see page 3304) object to another TCookie (see page 3304) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Do not call the AssignTo method for TCookie (see page 3304). Instead, call the Assign method of the destination object. The Assign method of the destination object calls the AssignTo method if it does not contain code for copying the properties of a TCookie (see page 3304) object. If the destination object is a TCookie (see page 3304) object, AssignTo copies the Name (see page 3308), Value (see page 3309), Domain (see page 3307), Path (see page 3308), Expires (see page 3307), and Secure (see page 3309) properties so the destination cookie generates the same Cookie header string.

See Also

Assign

13.1.11.3.2 TCookie.GetHeaderValue Method

Pascal

```
function GetHeaderValue: AnsiString;
```

C++

```
__fastcall AnsiString GetHeaderValue();
```

Description

This is GetHeaderValue, a member of class TCookie.

13.1.11.4 TCookie Properties

The properties of the TCookie class are listed here.

Public Properties

	Name	Description
	Domain (see page 3307)	Specifies the Domain field of the cookie header.

	Expires (see page 3307)	Specifies when the cookie is no longer valid.
R	HeaderValue (see page 3307)	Specifies the Cookie header string that represents this TCookie (see page 3304) object.
	Name (see page 3308)	Specifies the name of the custom field represented by this Cookie header.
	Path (see page 3308)	Identifies the paths of URLs to which the Cookie should be sent.
	Secure (see page 3309)	Determines whether the Web client must use a secure connection to pass on the Cookie header.
	Value (see page 3309)	Specifies the value of the Cookie header field named by the Name (see page 3308) property.

13.1.11.4.1 TCookie.Domain Property

Specifies the Domain field of the cookie header.

Pascal

```
property Domain: AnsiString;
```

C++

```
__property AnsiString Domain;
```

Description

Use Domain to limit the recipients of the cookie header to certain domains. The Web client will only send this cookie on to URIs in the specified domain. To limit the recipients to certain paths within the specified domain, use the Path (see page 3308) property.

See Also

Path (see page 3308)

13.1.11.4.2 TCookie.Expires Property

Specifies when the cookie is no longer valid.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Set Expires to the date and time after which the Web client should not send the cookie on with HTTP messages.

See Also

Expires (see page 3409)

13.1.11.4.3 TCookie.HeaderValue Property

Specifies the Cookie header string that represents this TCookie (see page 3304) object.

Pascal

```
property HeaderValue: AnsiString;
```

C++

```
__property AnsiString HeaderValue;
```

Description

Read HeaderValue to determine the Cookie header that is added to the HTTP response message for this TCookie (see page 3304) object. HeaderValue combines the information specified by the Name (see page 3308) and Value (see page 3309) properties into a single Name (see page 3308)=Value (see page 3309) field, and then adds the Domain (see page 3307), Path (see page 3308), Expires (see page 3307), and Secure (see page 3309) fields based on the values of the properties with the corresponding names.

See Also

Name (see page 3308)

Value (see page 3309)

Domain (see page 3307)

Path (see page 3308)

Expires (see page 3307)

Secure (see page 3309)

13.1.11.4.4 TCookie.Name Property

Specifies the name of the custom field represented by this Cookie header.

Pascal

```
property Name: AnsiString;
```

C++

```
__property AnsiString Name;
```

Description

Set Name to the name that identifies the use of the Value (see page 3309) property in the Cookie header. The Value (see page 3309) property is combined with the Name property into a string of the form Name=Value (see page 3309). This string appears as one of the fields in the Cookie header represented by the HeaderValue (see page 3307) property.

See Also

HeaderValue (see page 3307)

Value (see page 3309)

13.1.11.4.5 TCookie.Path Property

Identifies the paths of URLs to which the Cookie should be sent.

Pascal

```
property Path: AnsiString;
```

C++

```
__property AnsiString Path;
```

Description

Use Path to limit the recipients of the cookie header to certain paths. The Web client will only send this cookie header on to URLs with the specified path. To limit the recipients to certain domains, use the Domain (see page 3307) property.

See Also

Domain (see page 3307)

PathInfo (see page 3382)

13.1.11.4.6 TCookie.Secure Property

Determines whether the Web client must use a secure connection to pass on the Cookie header.

Pascal

```
property Secure: Boolean;
```

C++

```
__property Boolean Secure;
```

Description

Set Secure to true if the Web client must use a secure connection when sending the Cookie header. Secure connections are connections where messages may not be stored on any permanent medium such as a back-up tape. If the message is stored temporarily in a file, the file must be deleted.

Set Secure to false if it does not matter whether the Cookie header is sent using a secure connection.

13.1.11.4.7 TCookie.Value Property

Specifies the value of the Cookie header field named by the Name (see page 3308) property.

Pascal

```
property Value: AnsiString;
```

C++

```
__property AnsiString Value;
```

Description

Set Value to the value associated with the field named by the Name (see page 3308) property. The Value property is combined with the Name (see page 3308) property into a string of the form Name (see page 3308)=Value. This string appears as one of the fields in the Cookie header represented by the HeaderValue (see page 3307) property.

See Also

HeaderValue (see page 3307)

Name (see page 3308)

13.1.12 TCookieCollection Class

TCookieCollection is a collection of TCookie (see page 3304) objects.

Class Hierarchy

Pascal

```
TCookieCollection = class(TCollection);
```

C++

```
class TCookieCollection : public TCollection;
```

File

HTTPApp

Description

Use TCookieCollection to represent all the Cookie headers of an HTTP response message. Each Cookie header is represented by a single TCookie (see page 3304) object. A Cookie header includes a named field with an associated value, of the form Name=Value, plus a number of other, standard fields that specify the destination of the cookie, when the cookie is valid, and so on. Web clients pass Cookie headers on to the destinations specified by the fields of the Cookie header.

See Also

TCookie (see page 3304)

TWebResponse (see page 3389)

13.1.12.1 TCookieCollection Members

The following tables list the members exposed by TCookieCollection.

Protected Methods

	Name	Description
	GetCookie (see page 3311)	This is GetCookie, a member of class TCookieCollection.
	SetCookie (see page 3311)	This is SetCookie, a member of class TCookieCollection.

Public Methods

	Name	Description
	Add (see page 3311)	Creates a new TCookie (see page 3304) object and adds it to the end of the Items (see page 3312) property array.
	Create (see page 3310)	Creates and initializes a TCookieCollection (see page 3309) object.

Public Properties

	Name	Description
	Items (see page 3312)	Provides indexed access to the TCookie (see page 3304) objects in the collection.
R	WebResponse (see page 3312)	Indicates the TWebResponse (see page 3389) object that uses the cookie collection to represent all of its Cookie headers.

13.1.12.2 TCookieCollection.Create Constructor

Creates and initializes a TCookieCollection (see page 3309) object.

Pascal

```
constructor Create(WebResponse: TWebResponse; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TCookieCollection(TWebResponse WebResponse, TCollectionItemClass ItemClass);
```

Description

Applications should not need to call the Create method directly. The Web response object that uses the cookie collection to represent its Cookie headers creates the TCookieCollection (see page 3309) object from its own constructor.

13.1.12.3 TCookieCollection Methods

The methods of the TCookieCollection class are listed here.

Protected Methods

	Name	Description
	GetCookie (see page 3311)	This is GetCookie, a member of class TCookieCollection.
	SetCookie (see page 3311)	This is SetCookie, a member of class TCookieCollection.

Public Methods

	Name	Description
	Add (see page 3311)	Creates a new TCookie (see page 3304) object and adds it to the end of the Items (see page 3312) property array.

13.1.12.3.1 TCookieCollection.Add Method

Creates a new TCookie (see page 3304) object and adds it to the end of the Items (see page 3312) property array.

Pascal

```
function Add: TCookie;
```

C++

```
__fastcall TCookie Add();
```

Description

Call Add to add a new Cookie header to the set of cookie headers sent with the Web response message. Use Add when adding a Cookie header whose fields will be set at a later time. If the values of the TCookie (see page 3304) properties are known at the time of creation, use the SetCookieField method of the Web response object instead.

See Also

WebResponse (see page 3312)

SetCookieField (see page 3400)

Items (see page 3312)

13.1.12.3.2 TCookieCollection.GetCookie Method

Pascal

```
function GetCookie(Index: Integer): TCookie;
```

C++

```
__fastcall TCookie GetCookie(int Index);
```

Description

This is GetCookie, a member of class TCookieCollection.

13.1.12.3.3 TCookieCollection.SetCookie Method

Pascal

```
procedure SetCookie(Index: Integer; Cookie: TCookie);
```

C++

```
__fastcall SetCookie(int Index, TCookie Cookie);
```

Description

This is SetCookie, a member of class TCookieCollection.

13.1.12.4 TCookieCollection Properties

The properties of the TCookieCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 3312)	Provides indexed access to the TCookie (see page 3304) objects in the collection.
R	WebResponse (see page 3312)	Indicates the TWebResponse (see page 3389) object that uses the cookie collection to represent all of its Cookie headers.

13.1.12.4.1 TCookieCollection.Items Property

Provides indexed access to the TCookie (see page 3304) objects in the collection.

Pascal

```
property Items [Index: Integer]: TCookie;
```

C++

```
__property TCookie Items[int Index];
```

Description

Use Items to access the properties of the TCookie (see page 3304) objects maintained by TCookieCollection (see page 3309).

Note: In Delphi, items is the default property of TCookieCollection (see page 3309), so the name of the Items property can be left off when using this property. Thus the line

Note: FirstCookie := TApacheResponse1.Cookies.Items[0];

Note: can be written

Note: FirstCookie := TApacheResponse1.Cookies[0];

See Also

Cookies (see page 3407)

operator_sb

13.1.12.4.2 TCookieCollection.WebResponse Property

Indicates the TWebResponse (see page 3389) object that uses the cookie collection to represent all of its Cookie headers.

Pascal

```
property WebResponse: TWebResponse;
```

C++

```
__property TWebResponse WebResponse;
```

Description

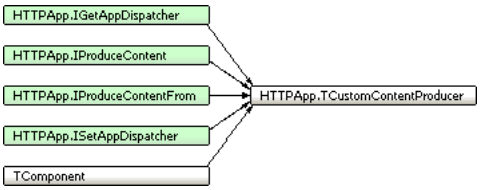
Read WebResponse to access the response object that is using the cookie collection. The response object is a descendant of TWebResponse (see page 3389), either TISAPIResponse, TWinCGIResponse,TCGIResponse, or TApacheResponse, depending on the type of Web server application.

Use the properties of the response object to obtain information about the other headers in the response message or the content of the response message. Many applications use this information to determine what field values to specify as Cookie headers.

13.1.13 TCustomContentProducer Class

TCustomContentProducer is the base class for all objects that produce the string that is sent as the contents of an HTTP response message.

Class Hierarchy



Pascal

```
TCustomContentProducer = class(TComponent, ISetAppDispatcher, IGetAppDispatcher,
IProduceContent, IProduceContentFrom);
```

C++

```
class TCustomContentProducer : public TComponent, public ISetAppDispatcher, public
IGetAppDispatcher, public IProduceContent, public IProduceContentFrom;
```

File

HTTPApp

Description

Use TCustomContentProducer as a base class when defining a class to produce the contents of an HTTP response message. In most cases, the content producer will assemble a string of HTML commands. However, descendants of TCustomContentProducer can be defined to produce any valid MIME type.

See Also

TDSTableProducer

TPageProducer (see page 3496)

TWebResponse (see page 3389)

Generating the Content of Response Messages

The Web Module

13.1.13.1 TCustomContentProducer Members

The following tables list the members exposed by TCustomContentProducer.

Protected Methods

	Name	Description
	GetAppDispatcher (see page 3316)	This is GetAppDispatcher, a member of class TCustomContentProducer.
V	Notification (see page 3316)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 3316)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3317)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 3317)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	SetAppDispatcher (see page 3317)	This is SetAppDispatcher, a member of class TCustomContentProducer.

Public Methods

	Name	Description
V	Content (see page 3314)	Returns the content produced by the content producer.
V	ContentFromStream (see page 3315)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 3315)	Returns the content produced in response to an input string.

Public Properties

	Name	Description
R	Dispatcher (see page 3317)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.
R	DispatcherComponent (see page 3318)	Provides access to the dispatcher component.

13.1.13.2 TCustomContentProducer Methods

The methods of the TCustomContentProducer class are listed here.

Protected Methods

	Name	Description
	GetAppDispatcher (see page 3316)	This is GetAppDispatcher, a member of class TCustomContentProducer.
V	Notification (see page 3316)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 3316)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3317)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 3317)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	SetAppDispatcher (see page 3317)	This is SetAppDispatcher, a member of class TCustomContentProducer.

Public Methods

	Name	Description
V	Content (see page 3314)	Returns the content produced by the content producer.
V	ContentFromStream (see page 3315)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 3315)	Returns the content produced in response to an input string.

13.1.13.2.1 TCustomContentProducer.Content Method

Returns the content produced by the content producer.

Pascal

```
function Content: string; virtual;
```

C++

```
virtual __fastcall UnicodeString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. TCustomContentProducer (see page 3313) returns an empty string. Descendants of TCustomContentProducer (see page 3313) return the value of the content that they produce. In most cases, this content is a string of HTML commands, although it can be any valid MIME type.

See Also

ContentFromStream (see page 3315)

ContentFromString (see page 3315)

Content (see page 3404)

Responding to Request Messages with Action Items

13.1.13.2.2 TCustomContentProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(Stream: TStream): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ContentFromStream(TStream Stream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter. TCustomContentProducer (see page 3313) ignores the Stream parameter and returns the value created by the Content (see page 3314) method.

Descendants of TCustomContentProducer (see page 3313) override this method to interpret streamed input in their own way.

See Also

Content (see page 3314)

ContentFromString (see page 3315)

Content (see page 3404)

13.1.13.2.3 TCustomContentProducer.ContentFromString Method

Returns the content produced in response to an input string.

Pascal

```
function ContentFromString(const S: string): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ContentFromString(const UnicodeString S);
```

Description

Call ContentFromString to retrieve the content produced by the content producer based on the information provided by the S

parameter. TCustomContentProducer (see page 3313) ignores the string and returns the value created by the Content (see page 3314) method.

Descendants of TCustomContentProducer (see page 3313) override this method to interpret the input string in their own way.

See Also

Content (see page 3314)

ContentFromStream (see page 3315)

Content (see page 3404)

13.1.13.2.4 TCustomContentProducer.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class TCustomContentProducer.

13.1.13.2.5 TCustomContentProducer.Notification Method

Overrides the inherited method to respond to messages that the dispatcher is going away.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification checks whether this call was triggered by the removal of the dispatcher. If so, the Dispatcher (see page 3317) property is set to nil. NULL.

See Also

DispatcherComponent (see page 3318)

Dispatcher (see page 3317)

13.1.13.2.6 TCustomContentProducer.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall UnicodeString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content (see page 3314)

13.1.13.2.7 TCustomContentProducer.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class TCustomContentProducer.

13.1.13.2.8 TCustomContentProducer.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromString(const UnicodeString S);
```

Description

This is ProduceContentFromString, a member of class TCustomContentProducer.

13.1.13.2.9 TCustomContentProducer.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class TCustomContentProducer.

13.1.13.3 TCustomContentProducer Properties

The properties of the TCustomContentProducer class are listed here.

Public Properties

	Name	Description
	Dispatcher (see page 3317)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.
	DispatcherComponent (see page 3318)	Provides access to the dispatcher component.

13.1.13.3.1 TCustomContentProducer.Dispatcher Property

Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.

Pascal

```
property Dispatcher: IWebDispatcherAccess;
```

C++

```
__property IWebDispatcherAccess Dispatcher;
```

Description

Read Dispatcher to access the interface of the dispatcher. In Web Broker applications, this is the interface of a TWebDispatcher (see page 3349) or TWebModule (see page 3354) component. In WebSnap applications, this is the interface of a TWebAppComponents component.

The IWebDispatcherAccess (see page 3431) interface has two methods:

Request, which returns the HTTP request message to which this component responds.

Response, which returns the HTTP response message for which this component generates content.

See Also

TWebModule (see page 3354)

TWebDispatcher (see page 3349)

TWebAppComponents

TWebRequest (see page 3358)

TWebResponse (see page 3389)

DispatcherComponent (see page 3318)

13.1.13.3.2 TCustomContentProducer.DispatcherComponent Property

Provides access to the dispatcher component.

Pascal

```
property DispatcherComponent: TComponent;
```

C++

```
__property TComponent * DispatcherComponent;
```

Description

Dispatcher (see page 3317) component is the component that implements the interface that is the value of the Dispatcher (see page 3317) property. The content producer uses this property so that it can respond to notifications when the component is freed. To use the dispatcher, use the Dispatcher (see page 3317) property instead.

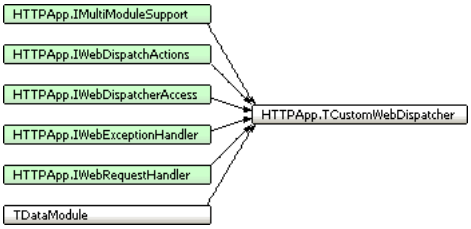
See Also

Dispatcher (see page 3317)

13.1.14 TCustomWebDispatcher Class

TCustomWebDispatcher is the abstract base class for Web dispatcher objects.

Class Hierarchy



Pascal

```
TCustomWebDispatcher = class(TDataModule, IWebRequestHandler, IWebDispatchActions,
IWebDispatcherAccess, IMultiModuleSupport, IWebExceptionHandler);
```

C++

```
class TCustomWebDispatcher : public TDataModule, public IWebRequestHandler, public
IWebDispatchActions, public IWebDispatcherAccess, public IMultiModuleSupport, public
IWebExceptionHandler;
```

File

HTTPApp

Description

Add a descendant of TCustomWebDispatcher to a Web application to enable it to respond to HTTP request messages. When a Web application is created, it automatically includes a TWebModule (see page 3354) object, which is a descendant of TCustomWebDispatcher. Keep the default Web module, or replace it with another data module that contains a descendant of TCustomWebDispatcher, such as TWebDispatcher (see page 3349).

TCustomWebDispatcher manages the action items that assemble responses to HTTP request messages. When the TWebApplication object receives an HTTP request message, TCustomWebDispatcher passes the request on to the appropriate action item or action items to service the message.

TCustomWebDispatcher also keeps track of information about the current HTTP message for the benefit of TCustomContentProducer (see page 3313) objects.

See Also

TWebDispatcher (see page 3349)

TWebModule (see page 3354)

TWebRequest (see page 3358)

TWebResponse (see page 3389)

The Web Module

13.1.14.1 TCustomWebDispatcher Members

The following tables list the members exposed by TCustomWebDispatcher.

Protected Events

	Name	Description
	AfterDispatch (see page 3329)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3329)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Protected Methods

	Name	Description
	Access_Request (see page 3322)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 3322)	This is Access_Response, a member of class TCustomWebDispatcher.
	DispatchAction (see page 3323)	Passes an HTTP request message to the action items in Actions (see page 3327) until it is handled.
	DoAfterDispatch (see page 3324)	Generates an AfterDispatch (see page 3329) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 3324)	Generates a BeforeDispatch (see page 3329) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
	FinishContext (see page 3325)	This is FinishContext, a member of class TCustomWebDispatcher.
	HandleException (see page 3325)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 3325)	Processes an HTTP request message.
	InitContext (see page 3326)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 3326)	This is InitModule, a member of class TCustomWebDispatcher.
V	Notification (see page 3326)	Responds to notifications when objects are added to the module.

Public Events

	Name	Description
	OnException (see page 3330)	Occurs when an unhandled exception occurs in the application.

Public Methods

	Name	Description
	ActionByName (see page 3322)	Returns the action item identified by the AName parameter.
V	Create (see page 3320)	Creates an instance of TCustomWebDispatcher (see page 3318).
V	Destroy (see page 3321)	Frees an instance of TCustomWebDispatcher (see page 3318).

Public Properties

	Name	Description
R	Action (see page 3327)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 3318) object.
	Actions (see page 3327)	Represents the collection of action items managed by the TCustomWebDispatcher (see page 3318) object.
R	Request (see page 3327)	Provides access to the TWebRequest (see page 3358) object that the dispatcher is currently handling.
R	Response (see page 3328)	Provides access to the TWebResponse (see page 3389) object for the message the dispatcher is currently handling.

13.1.14.2 TCustomWebDispatcher.Create Constructor

Creates an instance of TCustomWebDispatcher (see page 3318).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebDispatcher(TComponent * AOwner);
```

Description

Do not call the constructor for TCustomWebDispatcher (see page 3318). Web applications automatically include a Web module. If the Web module is replaced by another data model, the Web dispatcher should be added to the new data module at design time. Objects placed at design time are created automatically. If an application tries to create a dispatcher object in a Web module, or in a data module that already has a Web dispatcher, an exception is raised.

Create creates the TWebActionItems (see page 3344) object that holds the action items managed by the dispatcher. If the Web dispatcher is included in another data module, it adds a reference to itself to any content producer in that data module.

After the Web dispatcher is created automatically at runtime, an OnCreate event occurs.

See Also

Actions (see page 3327)

OnCreate

Dispatcher (see page 3317)

13.1.14.3 TCustomWebDispatcher.Destroy Destructor

Frees an instance of TCustomWebDispatcher (see page 3318).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebDispatcher();
```

Description

Do not destroy the TCustomWebDispatcher (see page 3318) directly in an application. The dispatcher is freed automatically when the server application shuts down.

Destroy frees the TWebActionItems (see page 3344) object used to hold the collection of action items.

See Also

Actions (see page 3327)

System::TObject::Free

13.1.14.4 TCustomWebDispatcher Methods

The methods of the TCustomWebDispatcher class are listed here.

Protected Methods

	Name	Description
	Access_Request (see page 3322)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 3322)	This is Access_Response, a member of class TCustomWebDispatcher.
	DispatchAction (see page 3323)	Passes an HTTP request message to the action items in Actions (see page 3327) until it is handled.
	DoAfterDispatch (see page 3324)	Generates an AfterDispatch (see page 3329) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 3324)	Generates a BeforeDispatch (see page 3329) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
	FinishContext (see page 3325)	This is FinishContext, a member of class TCustomWebDispatcher.

	HandleException (see page 3325)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 3325)	Processes an HTTP request message.
	InitContext (see page 3326)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 3326)	This is InitModule, a member of class TCustomWebDispatcher.
V	Notification (see page 3326)	Responds to notifications when objects are added to the module.

Public Methods

	Name	Description
	ActionByName (see page 3322)	Returns the action item identified by the AName parameter.

13.1.14.4.1 TCustomWebDispatcher.Access_Request Method

Pascal

```
function Access_Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Access_Request();
```

Description

This is Access_Request, a member of class TCustomWebDispatcher.

13.1.14.4.2 TCustomWebDispatcher.Access_Response Method

Pascal

```
function Access_Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Access_Response();
```

Description

This is Access_Response, a member of class TCustomWebDispatcher.

13.1.14.4.3 TCustomWebDispatcher.ActionByName Method

Returns the action item identified by the AName parameter.

Pascal

```
function ActionByName(const AName: string): TWebActionItem;
```

C++

```
__fastcall TWebActionItem ActionByName(const UnicodeString AName);
```

Description

Call ActionByName to gain access to an individual action item when its name is known. Change the properties of the action item so that it handles different HTTP request messages, or invoke its OnAction event handler to respond to an HTTP request message.

See Also

Action (see page 3327)

Actions (see page 3327)

TWebActionItem (see page 3335)

Name (see page 3341)

13.1.14.4.4 TCustomWebDispatcher.DispatchAction Method

Passes an HTTP request message to the action items in Actions (see page 3327) until it is handled.

Pascal

```
function DispatchAction(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchAction(TWebRequest Request, TWebResponse Response);
```

Description

The Web application calls DispatchAction when it receives an HTTP request message so that the dispatcher can dispatch the request to any action items that can generate the response.

Before DispatchAction looks for action items to handle the HTTP request message represented by the Request (see page 3327) parameter, it generates a BeforeDispatch (see page 3329) event. If the BeforeDispatch (see page 3329) event handler handles the action, the dispatcher does not pass the request message to any of the action items.

If there is no BeforeDispatch (see page 3329) event handler, or of the BeforeDispatch (see page 3329) event handler does not handle the request, DispatchAction attempts to match the MethodType and PathInfo of the request with the MethodType and PathInfo properties of each action item in the Actions (see page 3327) property. When an action item matches the MethodType and PathInfo of the request, DispatchAction calls its OnAction event handler.

The OnAction event handler can complete the response to the request, or indicate that the request is not fully handled and allow another action item to finish processing the request. If the OnAction event handler does not complete the request, DispatchAction continues checking the action items in the Actions (see page 3327) property and calling the OnAction event handler when a match is found.

If all of the action items are checked, and the request is still not fully handled, DispatchAction calls the OnAction event handler of the default action item.

Finally, if the request has been handled by the BeforeDispatch (see page 3329) event handler or any of the action items, DispatchAction generates an AfterDispatch (see page 3329) event. The AfterDispatch (see page 3329) event does not occur if the BeforeDispatch (see page 3329) event or any of the action items has already sent the response.

DispatchAction returns a Boolean value indicating whether the Web application should send the response message if it is not already sent. DispatchAction returns true if the action was handled by the action items and the AfterDispatch (see page 3329) event handler did not change its Handled parameter to false.

See Also

Actions (see page 3327)

AfterDispatch (see page 3329)

BeforeDispatch (see page 3329)

TWebActionItem (see page 3335)

OnAction (see page 3343)

HandleRequest

TWebRequest (see page 3358)

TWebResponse (see page 3389)

13.1.14.4.5 TCustomWebDispatcher.DoAfterDispatch Method

Generates an AfterDispatch (see page 3329) event and returns a value that indicates whether the Web application can send the response.

Pascal

```
function DoAfterDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoAfterDispatch(TWebRequest Request, TWebResponse Response);
```

Description

Applications cannot call DoAfterDispatch. The DispatchAction (see page 3323) method calls DoAfterDispatch after sending the HTTP request message to any matching action items. The DispatchAction (see page 3323) method does not call DoAfterDispatch if the HTTP request message was not handled by the action items or by a BeforeDispatch (see page 3329) event handler. DoAfterDispatch is also not called if the message was already sent back to the Web client.

If the AfterDispatch (see page 3329) event handler indicates that the response should not be sent, DoAfterDispatch returns false, and the Web application drops the connection without sending the response message. Otherwise, DoAfterDispatch returns true, and the Web application sends the response message if it was not sent from within the AfterDispatch (see page 3329) event handler.

See Also

AfterDispatch (see page 3329)

BeforeDispatch (see page 3329)

DispatchAction (see page 3323)

13.1.14.4.6 TCustomWebDispatcher.DoBeforeDispatch Method

Generates a BeforeDispatch (see page 3329) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.

Pascal

```
function DoBeforeDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoBeforeDispatch(TWebRequest Request, TWebResponse Response);
```

Description

Applications cannot call DoBeforeDispatch. The DispatchAction (see page 3323) method calls DoBeforeDispatch before trying to match the HTTP request message with any of its action items.

If the BeforeDispatch (see page 3329) event handler indicates that it has handled the request message, DoBeforeDispatch returns true, and the DispatchAction (see page 3323) method does not try to pass the request message to any of the action items. Otherwise, DoBeforeDispatch returns false, and unless the response message was sent from within the BeforeDispatch (see page 3329) event handler, the DispatchAction (see page 3323) method proceeds with looking for action items to handle the request message.

If DoBeforeDispatch returns true but the response has not been sent, DispatchAction (see page 3323) generates an AfterDispatch (see page 3329) event.

See Also

AfterDispatch (see page 3329)

BeforeDispatch (see page 3329)

DispatchAction (see page 3323)

13.1.14.4.7 TCustomWebDispatcher.FinishContext Method

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

This is FinishContext, a member of class TCustomWebDispatcher.

13.1.14.4.8 TCustomWebDispatcher.HandleException Method

Provides default handling of exceptions for the web application.

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

If an exception passes through all the try blocks in the web application code, the application automatically calls HandleException, which displays a dialog box indicating an error occurred. Unless the exception object is EAbort, HandleException calls the OnException (see page 3330) event handler.

To assign other exception handling code for the web application, use the OnException (see page 3330) event handler.

See Also

OnException (see page 3330)

13.1.14.4.9 TCustomWebDispatcher.HandleRequest Method

Processes an HTTP request message.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

Call HandleRequest to process an HTTP request message and obtain the response that should be sent back to the caller.

Request is the request object that describes the request to process.

Response is the response object that should be filled out when the request is processed.

13.1.14.4.10 TCustomWebDispatcher.InitContext Method

Pascal

```
procedure InitContext(Request: TWebRequest; Response: TWebResponse);
```

C++

```
__fastcall InitContext(TWebRequest Request, TWebResponse Response);
```

Description

This is InitContext, a member of class TCustomWebDispatcher.

13.1.14.4.11 TCustomWebDispatcher.InitModule Method

Pascal

```
procedure InitModule(AModule: TComponent);
```

C++

```
__fastcall InitModule(TComponent * AModule);
```

Description

This is InitModule, a member of class TCustomWebDispatcher.

13.1.14.4.12 TCustomWebDispatcher.Notification Method

Responds to notifications when objects are added to the module.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification ensures that all TCustomContentProducer (see page 3313) objects have access to the dispatcher, by setting their Dispatcher property as they are added to the application.

See Also

Dispatcher (see page 3317)

13.1.14.5 TCustomWebDispatcher Properties

The properties of the TCustomWebDispatcher class are listed here.

Public Properties

	Name	Description
R	Action (see page 3327)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 3318) object.
	Actions (see page 3327)	Represents the collection of action items managed by the TCustomWebDispatcher (see page 3318) object.
R	Request (see page 3327)	Provides access to the TWebRequest (see page 3358) object that the dispatcher is currently handling.

	Response (see page 3328)	Provides access to the TWebResponse (see page 3389) object for the message the dispatcher is currently handling.

13.1.14.5.1 TCustomWebDispatcher.Action Property

Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 3318) object.

Pascal

```
property Action [Index: Integer]: TWebActionItem;
```

C++

```
__property TWebActionItem Action[int Index];
```

Description

Use Action to iterate over all of the actions in the Actions (see page 3327) collection. Zero is the index of the first action item, one is the index of the second action item, and so on. To access individual actions by name, use the ActionByName (see page 3322) method.

See Also

Actions (see page 3327)

TWebActionItem (see page 3335)

13.1.14.5.2 TCustomWebDispatcher.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher (see page 3318) object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 3327)

ActionByName (see page 3322)

TWebActionItems (see page 3344)

13.1.14.5.3 TCustomWebDispatcher.Request Property

Provides access to the TWebRequest (see page 3358) object that the dispatcher is currently handling.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Use Request to obtain information about the current HTTP request message. The dispatcher matches this TWebRequest (see page 3358) object to an action item, and invokes the OnAction event handler of the action item to generate and send a response to the HTTP request message. OnAction event handlers often use descendants of TCustomContentProducer (see page 3313) to help generate the response to the request message. These content producers can use the Request property to correctly produce the content of the HTTP response.

See Also

DispatchAction (see page 3323)

Response (see page 3328)

TCustomContentProducer (see page 3313)

OnAction (see page 3343)

13.1.14.5.4 TCustomWebDispatcher.Response Property

Provides access to the TWebResponse (see page 3389) object for the message the dispatcher is currently handling.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Use Response to obtain information about the emerging response to the current HTTP request message. The dispatcher matches the request object specified by the Request (see page 3327) property to an action item. It then invokes the OnAction event handler of the action item to fill in the TWebResponse (see page 3389) object specified by the Response property. OnAction event handlers often use descendants of TCustomContentProducer (see page 3313) to help generate the response. These content producers can use Response to determine the state of the emerging response that is being produced.

See Also

DispatchAction (see page 3323)

Request (see page 3327)

TCustomContentProducer (see page 3313)

OnAction (see page 3343)

13.1.14.6 TCustomWebDispatcher Events

The events of the TCustomWebDispatcher class are listed here.

Protected Events

	Name	Description
	AfterDispatch (see page 3329)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3329)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Public Events

	Name	Description
	OnException (see page 3330)	Occurs when an unhandled exception occurs in the application.

13.1.14.6.1 TCustomWebDispatcher.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 3327)

BeforeDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

13.1.14.6.2 TCustomWebDispatcher.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch (see page 3329) event.

See Also

Actions (see page 3327)

AfterDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

Enabling and Disabling Action Items

13.1.14.6.3 TCustomWebDispatcher.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException (see page 3325) method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException (see page 3325) method. Unless the exception object is EAbort, HandleException (see page 3325) calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

See Also

Actions (see page 3327)

AfterDispatch (see page 3329)

TWebResponse (see page 3389)

13.1.15 TDefaultWebAppServices Class

Class Hierarchy

Pascal

```
TDefaultWebAppServices = class(TInterfacedObject, IWebAppServices);
```

C++

```
class TDefaultWebAppServices : public TInterfacedObject, public IWebAppServices;
```

File

HTTPApp

Description

This is class HTTPApp.TDefaultWebAppServices.

13.1.15.1 TDefaultWebAppServices Members

The following tables list the members exposed by TDefaultWebAppServices.

Protected Methods

	Name	Description
V	FindRequestHandler (see page 3331)	This is FindRequestHandler, a member of class TDefaultWebAppServices.
	FinishContext (see page 3332)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 3332)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetRequestHandler (see page 3332)	This is GetRequestHandler, a member of class TDefaultWebAppServices.
	HandleRequest (see page 3332)	Directs the processing of the current request message.
	InitContext (see page 3333)	Creates and initializes the Web context for the current Web request.
	InvokeDispatcher (see page 3334)	This is InvokeDispatcher, a member of class TDefaultWebAppServices.

Protected Properties

	Name	Description
R	Request (see page 3334)	This is Request, a member of class TDefaultWebAppServices.
R	RequestHandler (see page 3334)	This is RequestHandler, a member of class TDefaultWebAppServices.
R	Response (see page 3334)	This is Response, a member of class TDefaultWebAppServices.
R	WebModules (see page 3335)	This is WebModules, a member of class TDefaultWebAppServices.

Public Properties

	Name	Description
R	ExceptionHandler (see page 3427)	Indicates the object that handles exceptions that arise when processing a request message.

13.1.15.2 TDefaultWebAppServices Methods

The methods of the TDefaultWebAppServices class are listed here.

Protected Methods

	Name	Description
V	FindRequestHandler (see page 3331)	This is FindRequestHandler, a member of class TDefaultWebAppServices.
	FinishContext (see page 3332)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 3332)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetRequestHandler (see page 3332)	This is GetRequestHandler, a member of class TDefaultWebAppServices.
	HandleRequest (see page 3332)	Directs the processing of the current request message.
	InitContext (see page 3333)	Creates and initializes the Web context for the current Web request.
	InvokeDispatcher (see page 3334)	This is InvokeDispatcher, a member of class TDefaultWebAppServices.

13.1.15.2.1 TDefaultWebAppServices.FindRequestHandler Method

Pascal

```
function FindRequestHandler: IWebRequestHandler; virtual;
```

C++

```
virtual __fastcall IWebRequestHandler FindRequestHandler();
```

Description

This is FindRequestHandler, a member of class TDefaultWebAppServices.

13.1.15.2.2 TDefaultWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message (including the Web context).

See Also

InitContext (see page 3426)

WebContext

13.1.15.2.3 TDefaultWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler is the read implementation of the ExceptionHandler property.

See Also

ExceptionHandler (see page 3427)

13.1.15.2.4 TDefaultWebAppServices.GetRequestHandler Method

Pascal

```
function GetRequestHandler: IWebRequestHandler;
```

C++

```
__fastcall IWebRequestHandler GetRequestHandler();
```

Description

This is GetRequestHandler, a member of class TDefaultWebAppServices.

13.1.15.2.5 TDefaultWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext method is called to generate a Web context for the request.
2. HandleRequest is called to generate a response to the request.
3. FinishContext is called to perform any final cleanup.

HandleRequest locates the dispatcher components that handle the request and forwards the request to a dispatcher for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

InitContext (see page 3426)

FinishContext (see page 3425)

13.1.15.2.6 TDefaultWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse
Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message.

Request describes the new request message.

Response is the response object that the WebSnap application should fill out when handling the current request.

See Also

FinishContext (see page 3425)

WebContext

13.1.15.2.7 TDefaultWebAppServices.InvokeDispatcher Method

Pascal

```
function InvokeDispatcher: Boolean;
```

C++

```
__fastcall Boolean InvokeDispatcher();
```

Description

This is InvokeDispatcher, a member of class TDefaultWebAppServices.

13.1.15.3 TDefaultWebAppServices Properties

The properties of the TDefaultWebAppServices class are listed here.

Protected Properties

	Name	Description
	Request (see page 3334)	This is Request, a member of class TDefaultWebAppServices.
	RequestHandler (see page 3334)	This is RequestHandler, a member of class TDefaultWebAppServices.
	Response (see page 3334)	This is Response, a member of class TDefaultWebAppServices.
	WebModules (see page 3335)	This is WebModules, a member of class TDefaultWebAppServices.

13.1.15.3.1 TDefaultWebAppServices.Request Property

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

This is Request, a member of class TDefaultWebAppServices.

13.1.15.3.2 TDefaultWebAppServices.RequestHandler Property

Pascal

```
property RequestHandler: IWebRequestHandler;
```

C++

```
__property IWebRequestHandler RequestHandler;
```

Description

This is RequestHandler, a member of class TDefaultWebAppServices.

13.1.15.3.3 TDefaultWebAppServices.Response Property

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

This is Response, a member of class TDefaultWebAppServices.

13.1.15.3.4 TDefaultWebAppServices.WebModules Property

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

This is WebModules, a member of class TDefaultWebAppServices.

13.1.16 TWebActionItem Class

TWebActionItem allows a Web server application to create and send responses to HTTP request messages.

Class Hierarchy

Pascal

```
TWebActionItem = class(TCollectionItem);
```

C++

```
class TWebActionItem : public TCollectionItem;
```

File

HTTPApp

Description

Use TWebActionItem to assemble the response to a particular type of HTTP request message in a Web server application. Each action item is specific to a particular URI path and HTTP request method.

The web dispatcher chooses an appropriate action item to handle an HTTP request message by

matching the path portion of the URI requested by the Web client with the PathInfo (see page 3341) property in the TWebActionItem object

matching the method requested by the Web client with the method type the action item knows how to handle.

An action item handles an HTTP request message automatically using an associated content producer or using its OnAction (see page 3343) event handler. The OnAction (see page 3343) event handler can read the request message and assemble a response by setting the properties of a TWebResponse (see page 3389) object. It can tell the TWebResponse (see page 3389) object to send the response message back to the Web client, or allow the TWebApplication object to send the message after other action items have had a chance to add to the response.

See Also

TWebActionItems (see page 3344)

TWebDispatcher (see page 3349)

TWebRequest (see page 3358)

TWebResponse (see page 3389)

Action Items

13.1.16.1 TWebActionItem Members

The following tables list the members exposed by TWebActionItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 3338)	Returns the name of the collection item as it appears in the collection editor.
	GetPathInfo (see page 3338)	This is GetPathInfo, a member of class TWebActionItem.
	SetDisplayName (see page 3338)	Sets the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	AssignTo (see page 3337)	Copies the properties of the action item to another action item.
	Create (see page 3336)	Creates an instance of TWebActionItem (see page 3335).
	Destroy (see page 3337)	Destroys an instance of TWebActionItem (see page 3335).

Published Events

	Name	Description
	OnAction (see page 3343)	Occurs when TWebDispatcher (see page 3349) matches the action item to a newly-arrived HTTP request message.

Published Properties

	Name	Description
	Default (see page 3339)	Indicates whether the action item should handle any request that is not handled by another available action item.
	Enabled (see page 3340)	Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 3341) and PathInfo (see page 3341) properties.
	MethodType (see page 3341)	This is MethodType, a member of class TWebActionItem.
	Name (see page 3341)	Identifies an individual action item when it is referenced from other objects.
	PathInfo (see page 3341)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.
	Producer (see page 3342)	Specifies a content producer that generates the content of response messages when the action item executes.
	ProducerContent (see page 3342)	Specifies a content producer that generates the content of response messages when the action item executes.

13.1.16.2 TWebActionItem.Create Constructor

Creates an instance of TWebActionItem (see page 3335).

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TWebActionItem(TCollection Collection);
```

Description

Call Create to create a TWebActionItem (see page 3335) object at runtime. Action items created in the action editor at design time are instantiated automatically.

After calling the inherited constructor, Create initializes the Enabled (see page 3340) property to True, and sets the action item so that it will match any HTTP request targeted to a URI with an empty PathInfo (see page 3341).

See Also

Enabled (see page 3340)

PathInfo (see page 3341)

Create

13.1.16.3 TWebActionItem.Destroy Destructor

Destroys an instance of TWebActionItem (see page 3335).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebActionItem();
```

Description

Do not call Destroy directly in an application. Action items are destroyed when the TWebActionItems (see page 3344) object that manages them calls the Free method.

See Also

System::TObject::Free

TWebActionItems (see page 3344)

13.1.16.4 TWebActionItem Methods

The methods of the TWebActionItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 3338)	Returns the name of the collection item as it appears in the collection editor.
	GetPathInfo (see page 3338)	This is GetPathInfo, a member of class TWebActionItem.
	SetDisplayName (see page 3338)	Sets the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	AssignTo (see page 3337)	Copies the properties of the action item to another action item.

13.1.16.4.1 TWebActionItem.AssignTo Method

Copies the properties of the action item to another action item.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

To assign the value of one action item to another, use the Assign method of the target action item.

AssignTo enables the Assign method of a target action item to copy the properties of a source action item. AssignTo copies the values of the Default (see page 3339), Enabled (see page 3340), MethodType (see page 3341) and PathInfo (see page 3341) properties to the Dest parameter if it is an action item. If Dest is not an action item, AssignTo calls the inherited method.

See Also

Assign

Default (see page 3339)

Enabled (see page 3340)

MethodType (see page 3341)

PathInfo (see page 3341)

AssignTo

13.1.16.4.2 TWebActionItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName

GetNamePath

13.1.16.4.3 TWebActionItem.GetPathInfo Method

Pascal

```
function GetPathInfo: string;
```

C++

```
__fastcall UnicodeString GetPathInfo();
```

Description

This is GetPathInfo, a member of class TWebActionItem.

13.1.16.4.4 TWebActionItem.SetDisplayName Method

Sets the name of the collection item as it appears in the collection editor.

Pascal

```
procedure SetDisplayName(const Value: string); override;
```

C++

```
virtual __fastcall SetDisplayName(const UnicodeString Value);
```

Description

SetDisplayName is the protected write implementation of the DisplayName property.

Value specifies the name for the item that should appear in the collection editor.

See Also

DisplayName

13.1.16.5 TWebActionItem Properties

The properties of the TWebActionItem class are listed here.

Published Properties

	Name	Description
	Default (see page 3339)	Indicates whether the action item should handle any request that is not handled by another available action item.
	Enabled (see page 3340)	Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 3341) and PathInfo (see page 3341) properties.
	MethodType (see page 3341)	This is MethodType, a member of class TWebActionItem.
	Name (see page 3341)	Identifies an individual action item when it is referenced from other objects.
	PathInfo (see page 3341)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.
	Producer (see page 3342)	Specifies a content producer that generates the content of response messages when the action item executes.
	ProducerContent (see page 3342)	Specifies a content producer that generates the content of response messages when the action item executes.

13.1.16.5.1 TWebActionItem.Default Property

Indicates whether the action item should handle any request that is not handled by another available action item.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Set Default to true to make this action item the default action in the list of action items maintained by the TWebDispatcher (see page 3349) object. TWebDispatcher (see page 3349) attempts to match HTTP request messages to action items by matching the MethodType (see page 3341) and PathInfo (see page 3341) of the target URI. If no match can be found, the TWebDispatcher (see page 3349) invokes the default action item, regardless of its MethodType (see page 3341) or PathInfo (see page 3341) properties.

When an action item is chosen as the default action item, the value of its Enabled (see page 3340) property is ignored. Thus, if an action item sets Enabled (see page 3340) to false and Default to true, TWebDispatcher (see page 3349) will first look for a match with any other action item, even if the PathInfo (see page 3341) and MethodType (see page 3341) of the default action item match the request perfectly. Then, only after all other action items have been rejected, TWebDispatcher (see page

3349) selects the default action item. If the default action item is enabled, it may be selected before all other action items have been considered because the MethodType (see page 3341) and PathInfo (see page 3341) match the request.

The default action item must be prepared to generate a response to any HTTP request, for any MethodType (see page 3341) and PathInfo (see page 3341). This may consist of simply setting a response status code of 404 (the URI could not be matched) or 405 (the requested method is not supported).

Setting Default to true sets the Default property of the previous default action item to false.

See Also

Enabled (see page 3340)

OnAction (see page 3343)

MethodType (see page 3341)

PathInfo (see page 3341)

TWebDispatcher (see page 3349)

StatusCode (see page 3413)

Choosing a Default Action Item

13.1.16.5.2 TWebActionItem.Enabled Property

Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 3341) and PathInfo (see page 3341) properties.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Set Enabled to false to disable an action item. TWebDispatcher (see page 3349) will ignore disabled action items when it looks for an action item to handle a request.

When an action item is chosen as the default action item, the value of its Enabled property is ignored. Thus, if an action item sets Enabled to false and Default (see page 3339) to true, TWebDispatcher (see page 3349) will first look for a match with any other action item, even if the PathInfo (see page 3341) and MethodType (see page 3341) of the default action item match the request perfectly. Then, only after all other action items have been rejected, the TWebDispatcher (see page 3349) selects the default action item. If the default action item is enabled, it may be selected before all other action items have been considered because the MethodType (see page 3341) and PathInfo (see page 3341) match the request.

See Also

Default (see page 3339)

MethodType (see page 3341)

OnAction (see page 3343)

PathInfo (see page 3341)

TWebDispatcher (see page 3349)

Choosing a Default Action Item

Enabling and Disabling Action Items

13.1.16.5.3 TWebActionItem.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class TWebActionItem.

13.1.16.5.4 TWebActionItem.Name Property

Identifies an individual action item when it is referenced from other objects.

Pascal

```
property Name: string;
```

C++

```
__property UnicodeString Name;
```

Description

Use Name to uniquely specify an individual action item in code anywhere in the application. For action items, Name is equivalent to the DisplayName property. Therefore, when setting the Name property, the new value must not match the DisplayName of any other action item in the list maintained by TCustomWebDispatcher (see page 3318). Trying to set the Name to a DisplayName that is already in use raises an exception.

See Also

DisplayName

Name

13.1.16.5.5 TWebActionItem.PathInfo Property

Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.

Pascal

```
property PathInfo: string;
```

C++

```
__property UnicodeString PathInfo;
```

Description

Set PathInfo to the path portion of the URI for the target of any request messages serviced by the action item. TWebDispatcher (see page 3349) matches action items to request messages by comparing PathInfo with the path portion of the URI specified as the target of the request. If the PathInfo properties match, and the MethodType (see page 3341) matches, TWebDispatcher (see page 3349) invokes the action item to respond to the request message.

If the action item has an associated content producer, the value of PathInfo is the name of the producer unless it is explicitly changed.

See Also

OnAction (see page 3343)

MethodType (see page 3341)

TWebDispatcher (see page 3349)

PathInfo (see page 3382)

Producer (see page 3342)

The Target URL

13.1.16.5.6 TWebActionItem.Producer Property

Specifies a content producer that generates the content of response messages when the action item executes.

Pascal

```
property Producer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer Producer;
```

Description

Set Producer to associate the action item with a content producer of the type TCustomContentProducer (see page 3313). (If a content producer of type IProduceContent (see page 3420) is used instead of TCustomContentProducer (see page 3313), then the property ProducerContent (see page 3342) should be set instead.) If Producer is not nil (Delphi) or NULL (C++), then when the web dispatcher passes a request message to the action item, the action item sets the Content property of the response message to the value returned by the producer's Content method. After the content producer has assigned the response's Content property, the action item receives an OnAction (see page 3343) event, where it can optionally set other response properties or send the response message.

If Producer is nil (Delphi) or NULL (C++), the action item must use the OnAction (see page 3343) event handler to influence the response message.

The properties Producer and ProducerContent (see page 3342) are mutually exclusive. If one is set, the other must not be.

Note: Each content producer can be associated with only one action item at a time. Setting the Producer property of one action item causes the Web dispatcher that manages that item to check whether any other action item has its Producer property set to the same component. If another action item was associated with the same producer, its Producer property is changed to nil (Delphi) or NULL (C++).

See Also

Content (see page 3314)

ProducerContent (see page 3342)

Content (see page 3404)

Creating Web Pages with an InternetExpress Page Producer

Responding to Request Messages with Action Items

13.1.16.5.7 TWebActionItem.ProducerContent Property

Specifies a content producer that generates the content of response messages when the action item executes.

Pascal

```
property ProducerContent: TComponent;
```

C++

```
__property TComponent * ProducerContent;
```

Description

This property is identical to Producer (see page 3342) except for the type of content producer. ProducerContent is used when the producer is of type IProduceContent (see page 3420) instead of TCustomContentProducer (see page 3313). In the latter case, the property Producer (see page 3342) is set instead. Note that Producer (see page 3342) and ProducerContent are mutually exclusive; if one is set, the other must not be.

Producer (see page 3342)

13.1.16.6 TWebActionItem Events

The events of the TWebActionItem class are listed here.

Published Events

	Name	Description
	OnAction (see page 3343)	Occurs when TWebDispatcher (see page 3349) matches the action item to a newly-arrived HTTP request message.

13.1.16.6.1 TWebActionItem.OnAction Event

Occurs when TWebDispatcher (see page 3349) matches the action item to a newly-arrived HTTP request message.

Pascal

```
property OnAction: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAction;
```

Description

Write an OnAction event handler to respond to HTTP request messages that match the MethodType (see page 3341) and PathInfo (see page 3341) properties. OnAction occurs immediately after the response message's Content property has been initialized by the action item's Producer (see page 3342) property (if Producer (see page 3342) is set).

In an OnAction event handler, read Request and perform the requested Method if possible. Set the properties of the Response parameter as appropriate. If the OnAction event handler does not service the response, or if it only partially handles the request and must let another action item finish the response, set the Handled parameter to false.

An OnAction event handler can call the SendRedirect or SendResponse method of Response to send the HTTP response message to the Web client. If the OnAction event handler does not send the response, the Web application will send it after all action items have finished filling in the Response.

Tip: The OnAction event handler can use descendants of TCustomContentProducer (see page 3313) to help assemble the contents of the response message.

13.1.17 TWebActionItems Class

TWebActionItems is a collection of TWebActionItem (see page 3335) objects.

Class Hierarchy

Pascal

```
TWebActionItems = class(TCollection);
```

C++

```
class TWebActionItems : public TCollection;
```

File

HTTPApp

Description

TCustomWebDispatcher (see page 3318) uses TWebActionItems to store and manipulate the individual action items it manages. TWebActionItems provides properties and events to

Add (see page 3346) new action items to the collection.

Copy the list of action items from another TWebActionItems.

Get the attributes of specified action items in the collection.

Empty the collection of action items.

See Also

TCustomWebDispatcher (see page 3318)

TWebActionItem (see page 3335)

13.1.17.1 TWebActionItems Members

The following tables list the members exposed by TWebActionItems.

Protected Methods

	Name	Description
	GetAttr (see page 3346)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

	GetAttrCount (see page 3346)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 3347)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 3347)	Returns the owner of an object.
	SetItemName (see page 3348)	Initializes the name of a newly inserted collection item.
	Update (see page 3348)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 3346)	Adds a new action item to the end of the collection.
	Create (see page 3345)	Creates an instance of TWebActionItems (see page 3344).

Public Properties

	Name	Description
	Items (see page 3349)	Lists the TWebActionItem (see page 3335) objects stored by this TWebActionItems (see page 3344) object.
R	WebDispatcher (see page 3349)	Provides access to the dispatcher that uses TWebActionItems (see page 3344) to store and manipulate its action items.

13.1.17.2 TWebActionItems.Create Constructor

Creates an instance of TWebActionItems (see page 3344).

Pascal

```
constructor Create(WebDispatcher: TCustomWebDispatcher; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TWebActionItems(TCustomWebDispatcher WebDispatcher, TCollectionItemClass ItemClass);
```

Description

Do not call the constructor for TWebActionItems (see page 3344). TWebActionItems (see page 3344) is tailored to work with TCustomWebDispatcher (see page 3318). The TCustomWebDispatcher (see page 3318) object creates TWebActionItems (see page 3344) in its own constructor.

See Also

Create

13.1.17.3 TWebActionItems Methods

The methods of the TWebActionItems class are listed here.

Protected Methods

	Name	Description
	GetAttr (see page 3346)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 3346)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 3347)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 3347)	Returns the owner of an object.
	SetItemName (see page 3348)	Initializes the name of a newly inserted collection item.
	Update (see page 3348)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 3346)	Adds a new action item to the end of the collection.

13.1.17.3.1 TWebActionItems.Add Method

Adds a new action item to the end of the collection.

Pascal

```
function Add: TWebActionItem;
```

C++

```
__fastcall TWebActionItem Add();
```

Description

Call Add to add an action item to the collection of action items managed by the dispatcher. The new item is added to the end of the Items (see page 3349) array. Add returns the action item so that its properties can be set to specify its use.

Because the dispatcher looks through the action items in order when it tries to find an action item to handle an HTTP request message, add any action items that preprocess HTTP requests first. Then add the most specific action items. This way, more general action items will not be matched to request messages before a closer match can be found.

See Also

Items (see page 3349)

13.1.17.3.2 TWebActionItems.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount

GetItemAttr

13.1.17.3.3 TWebActionItems.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr

GetItemAttr

13.1.17.3.4 TWebActionItems.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr

GetAttrCount

13.1.17.3.5 TWebActionItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath

TCollection

TComponent

Owner

13.1.17.3.6 TWebActionItems.SetItemName Method

Initializes the name of a newly inserted collection item.

Pascal

```
procedure SetItemName(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall SetItemName(TCollectionItem Item);
```

Description

The Insert method calls SetItemName to initialize the Name property of items when it inserts them into the collection.

As implemented in TCollection, SetItemName does nothing. Some TCollection descendants override this method to provide collection items with default names.

See Also

Insert

Name

13.1.17.3.7 TWebActionItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

Changed

Changed

13.1.17.4 TWebActionItems Properties

The properties of the TWebActionItems class are listed here.

Public Properties

	Name	Description
	Items (see page 3349)	Lists the TWebActionItem (see page 3335) objects stored by this TWebActionItems (see page 3344) object.
R	WebDispatcher (see page 3349)	Provides access to the dispatcher that uses TWebActionItems (see page 3344) to store and manipulate its action items.

13.1.17.4.1 TWebActionItems.Items Property

Lists the TWebActionItem (see page 3335) objects stored by this TWebActionItems (see page 3344) object.

Pascal

```
property Items [Index: Integer]: TWebActionItem;
```

C++

```
__property TWebActionItem Items[int Index];
```

Description

Use Items to get access to the individual action items stored by the TWebActionItems (see page 3344) object. Items is an indexed array, where the first action item has index 0, the second action item has index 1, and so on. Use Items with the Count property to iterate over all the action items in the collection.

See Also

Count

TWebActionItem (see page 3335)

operator_sb

13.1.17.4.2 TWebActionItems.WebDispatcher Property

Provides access to the dispatcher that uses TWebActionItems (see page 3344) to store and manipulate its action items.

Pascal

```
property WebDispatcher: TCustomWebDispatcher;
```

C++

```
__property TCustomWebDispatcher WebDispatcher;
```

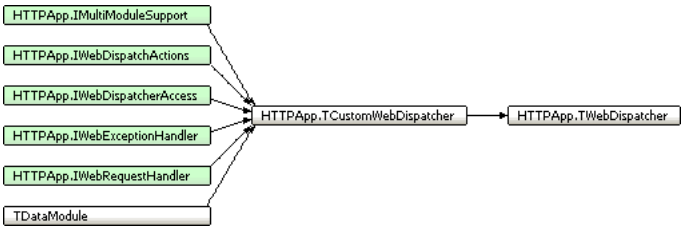
Description

Read WebDispatcher to get access to the dispatcher object that uses the collection of action items to respond to HTTP request messages.

13.1.18 TWebDispatcher Class

TWebDispatcher passes HTTP request messages on to the appropriate action items that assemble a response.

Class Hierarchy



Pascal

```
TWebDispatcher = class(TCustomWebDispatcher);
```

C++

```
class TWebDispatcher : public TCustomWebDispatcher;
```

File

HTTPApp

Description

Use TWebDispatcher to convert an ordinary data module to a Web module. Add a TWebDispatcher object to an existing data module that contains other nonvisual components and business rules for the Web application. Then delete the automatically generated Web module from the Web application and replace it with the data module that now contains the Web dispatcher.

TWebDispatcher enables the Web server application to respond to HTTP request messages. Only one Web dispatcher can be added to an application. This is why the automatically generated Web module, which is a type of Web dispatcher, must be deleted from the Web application before the data module containing TWebDispatcher can be added.

The TWebDispatcher object manages a collection of action items which know how to respond to HTTP request messages. View, add, and delete the action items managed by the dispatcher using the Action (see page 3327) editor which is opened by double-clicking on the TWebDispatcher icon.

TWebDispatcher publishes some of the properties and events introduced by TCustomWebDispatcher (see page 3318), but introduces no new properties, events, or methods of its own.

13.1.18.1 TWebDispatcher Members

The following tables list the members exposed by TWebDispatcher.

Protected Methods

	Name	Description
	Access_Request (see page 3322)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 3322)	This is Access_Response, a member of class TCustomWebDispatcher.
	DispatchAction (see page 3323)	Passes an HTTP request message to the action items in Actions (see page 3327) until it is handled.
	DoAfterDispatch (see page 3324)	Generates an AfterDispatch (see page 3329) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 3324)	Generates a BeforeDispatch (see page 3329) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.

	FinishContext (see page 3325)	This is FinishContext, a member of class TCustomWebDispatcher.
	HandleException (see page 3325)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 3325)	Processes an HTTP request message.
	InitContext (see page 3326)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 3326)	This is InitModule, a member of class TCustomWebDispatcher.
V	Notification (see page 3326)	Responds to notifications when objects are added to the module.

Public Methods

	Name	Description
	ActionByName (see page 3322)	Returns the action item identified by the AName parameter.
V	Create (see page 3320)	Creates an instance of TCustomWebDispatcher (see page 3318).
V	Destroy (see page 3321)	Frees an instance of TCustomWebDispatcher (see page 3318).
	FinishContext (see page 3420)	This is FinishContext, a member of class IMultiModuleSupport.
	HandleException (see page 3433)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 3435)	Processes an HTTP request message.
	InitContext (see page 3420)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 3420)	This is InitModule, a member of class IMultiModuleSupport.
	Request (see page 3432)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 3432)	Returns the Web response object for the HTTP response message that the application is assembling.

Public Properties

	Name	Description
R	Action (see page 3327)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 3318) object.
R	Request (see page 3327)	Provides access to the TWebRequest (see page 3358) object that the dispatcher is currently handling.
R	Response (see page 3328)	Provides access to the TWebResponse (see page 3389) object for the message the dispatcher is currently handling.

Published Events

	Name	Description
	AfterDispatch (see page 3352)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3353)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 3353)	Occurs when an unhandled exception occurs in the application.

Published Properties

	Name	Description
	Actions (see page 3351)	Represents the collection of action items managed by the TCustomWebDispatcher object.

13.1.18.2 TWebDispatcher Properties

The properties of the TWebDispatcher class are listed here.

Published Properties

	Name	Description
	Actions (see page 3351)	Represents the collection of action items managed by the TCustomWebDispatcher object.

13.1.18.2.1 TWebDispatcher.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 3327)

ActionByName (see page 3322)

TWebActionItems (see page 3344)

13.1.18.3 TWebDispatcher Events

The events of the TWebDispatcher class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 3352)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3353)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 3353)	Occurs when an unhandled exception occurs in the application.

13.1.18.3.1 TWebDispatcher.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 3327)

BeforeDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

13.1.18.3.2 TWebDispatcher.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch event.

See Also

Actions (see page 3327)

AfterDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

Enabling and Disabling Action Items

13.1.18.3.3 TWebDispatcher.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

See Also

Actions (see page 3327)

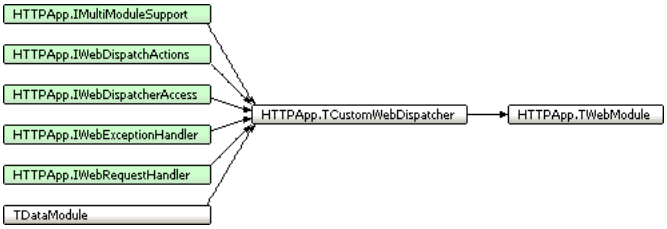
AfterDispatch (see page 3329)

TWebResponse (see page 3389)

13.1.19 TWebModule Class

TWebModule is the automatically generated Web module for a Web server application.

Class Hierarchy



Pascal

```
TWebModule = class(TCustomWebDispatcher);
```

C++

```
class TWebModule : public TCustomWebDispatcher;
```

File

HTTPApp

Description

When a new Web application is created, it automatically contains a Web module. The Web module serves as a repository for nonvisual components such as TPageProducer, TSQLDataSet, TDataSetTableProducer, etc. It also enables the Web server application to respond to HTTP request messages by passing the request and response objects to the appropriate action items. An application can have only one Web module.

The TWebModule object manages a collection of action items which know how to respond to HTTP request messages. View, add and delete the action items managed by the Web module using the Action (see page 3327) editor which is opened by double clicking on the TWebModule icon.

If a data module already exists which contains many of the non-visual components and business rules for the application, the Web module can be replaced by that data module. Simply delete the Web module, add the new data module in its place, and add a TWebDispatcher (see page 3349) object to the new data module.

See the WebServ demo for an example of how to use TWebModule.

Note: When you create a new Apache module project and save it with a new name, it may be necessary to change the name of the apache_module (in the exports section of the project source code) by hand.

The Web Module

13.1.19.1 TWebModule Members

The following tables list the members exposed by TWebModule.

Protected Methods

	Name	Description
	Access_Request (see page 3322)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 3322)	This is Access_Response, a member of class TCustomWebDispatcher.
	DispatchAction (see page 3323)	Passes an HTTP request message to the action items in Actions (see page 3327) until it is handled.
	DoAfterDispatch (see page 3324)	Generates an AfterDispatch (see page 3329) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 3324)	Generates a BeforeDispatch (see page 3329) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
	FinishContext (see page 3325)	This is FinishContext, a member of class TCustomWebDispatcher.
	HandleException (see page 3325)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 3325)	Processes an HTTP request message.
	InitContext (see page 3326)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 3326)	This is InitModule, a member of class TCustomWebDispatcher.
V	Notification (see page 3326)	Responds to notifications when objects are added to the module.

Public Methods

	Name	Description
	ActionByName (see page 3322)	Returns the action item identified by the AName parameter.
V	Create (see page 3356)	Creates an instance of TWebModule (see page 3354).
V	Destroy (see page 3321)	Frees an instance of TCustomWebDispatcher (see page 3318).
	FinishContext (see page 3420)	This is FinishContext, a member of class IMultiModuleSupport.
	HandleException (see page 3433)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 3435)	Processes an HTTP request message.
	InitContext (see page 3420)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 3420)	This is InitModule, a member of class IMultiModuleSupport.
	Request (see page 3432)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 3432)	Returns the Web response object for the HTTP response message that the application is assembling.

Public Properties

	Name	Description
R	Action (see page 3327)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 3318) object.
R	Request (see page 3327)	Provides access to the TWebRequest (see page 3358) object that the dispatcher is currently handling.
R	Response (see page 3328)	Provides access to the TWebResponse (see page 3389) object for the message the dispatcher is currently handling.

Published Events

	Name	Description
	AfterDispatch (see page 3357)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3357)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 3358)	Occurs when an unhandled exception occurs in the application.

Published Properties

	Name	Description
	Actions (see page 3356)	Represents the collection of action items managed by the TCustomWebDispatcher object.

13.1.19.2 TWebModule.Create Constructor

Creates an instance of TWebModule (see page 3354).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebModule(TComponent * AOwner);
```

Description

Do not create instances at runtime. The Web module is created automatically when a Web application project is created at design time. Every time a Web server application is run in response to an HTTP request message, a new TWebModule (see page 3354) is created based on the Web module that was created at design time.

Create generates an OnCreate event, so that Web applications can initialize the Web module before the new HTTP request message is processed.

OnCreate

Create_d

13.1.19.3 TWebModule Properties

The properties of the TWebModule class are listed here.

Published Properties

	Name	Description
	Actions (see page 3356)	Represents the collection of action items managed by the TCustomWebDispatcher object.

13.1.19.3.1 TWebModule.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 3327)

ActionByName (see page 3322)

TWebActionItems (see page 3344)

13.1.19.4 TWebModule Events

The events of the TWebModule class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 3357)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 3357)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 3358)	Occurs when an unhandled exception occurs in the application.

13.1.19.4.1 TWebModule.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 3327)

BeforeDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

13.1.19.4.2 TWebModule.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or

disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch event.

See Also

Actions (see page 3327)

AfterDispatch (see page 3329)

TWebResponse (see page 3389)

Dispatching Request Messages

Enabling and Disabling Action Items

13.1.19.4.3 TWebModule.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

Actions (see page 3327)

AfterDispatch (see page 3329)

TWebResponse (see page 3389)

13.1.20 TWebRequest Class

TWebRequest is the base class for all objects that represent client request information that is passed to a Web server application.

Class Hierarchy

Pascal

```
TWebRequest = class(TObject);
```

C++

```
class TWebRequest : public TObject;
```

File

HTTPApp

Description

Use a descendant of TWebRequest to interpret an HTTP request message.

Web application objects create TWebRequest objects to capture client requests. The properties of the TWebRequest objects are obtained from the HTTP request message. The Web application uses TWebRequest objects to create corresponding TWebResponse (see page 3389) objects. The TWebDispatcher (see page 3349) for the application then invokes the TWebActionItem (see page 3335) that is associated with the PathInfo (see page 3382) of the TWebRequest object.

TWebRequest has several descendants which represent client requests for different types of Web server applications. These descendants are

TApacheRequest objects for Apache server applications.

TCGIRequest objects for CGI server applications.

TISAPIRequest objects for DLLs that respond to the ISAPI or NSAPI servers (Windows only).

TWinCGIRequest objects for Windows-based CGI servers (Windows only).

13.1.20.1 TWebRequest Members

The following tables list the members exposed by TWebRequest.

Protected Methods

	Name	Description
	GetDateVariable (see page 3365)	Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.
	GetIntegerVariable (see page 3366)	Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.
	GetInternalPathInfo (see page 3366)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 3366)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 3366)	Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.
	UpdateMethodType (see page 3369)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	Create (see page 3361)	Creates an instance of TWebRequest (see page 3358).
	Destroy (see page 3361)	Destroys an instance of TWebRequest (see page 3358).
	ExtractContentFields (see page 3363)	Parses the Content (see page 3373) property into its constituent fields.
	ExtractCookieFields (see page 3363)	Parses the Cookie (see page 3377) property into its constituent fields.
	ExtractFields (see page 3363)	This is the overview for the ExtractFields method overload.
	ExtractQueryFields (see page 3364)	Parses the Query (see page 3384) property into its constituent fields.
	GetFieldByName (see page 3365)	Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 3367)	Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.
	ReadString (see page 3368)	Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.
	ReadUnicodeString (see page 3368)	This is ReadUnicodeString, a member of class TWebRequest.
	TranslateURI (see page 3368)	Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal representation of a location on the server.
	WriteClient (see page 3369)	Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 3370)	Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.
	WriteString (see page 3370)	Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

Public Properties

	Name	Description
	Accept (see page 3371)	Reports the value of the Accept header of the HTTP request message.
	Authorization (see page 3372)	Reports the value of the Authorization header of the HTTP request message.
	CacheControl (see page 3372)	Reports the value of the Cache-Control header of the HTTP request message.
	Connection (see page 3373)	Reports the value of the Connection header of the HTTP request message.
	Content (see page 3373)	Represents the unparsed contents of the HTTP request message.
	ContentEncoding (see page 3374)	Reports the value of the Content (see page 3373)-Encoding header of the HTTP request message.
	ContentFields (see page 3375)	Reports the parsed content of a POST request message.
	ContentLength (see page 3375)	Reports the value of the Content (see page 3373)-Length header of the HTTP request message.
	ContentParser (see page 3376)	Refers to the object's content parser object.
	ContentType (see page 3376)	Reports the value of the Content (see page 3373)-Type header of the HTTP request message.
	ContentVersion (see page 3376)	Reports the value of the Content (see page 3373)-Version header of the HTTP request message.
	Cookie (see page 3377)	Reports the value of the Cookie header of the HTTP request message.
	CookieFields (see page 3377)	Represents the parsed contents of the Cookie (see page 3377) header of an HTTP request message.
	Date (see page 3378)	Reports the value of the Date header of the HTTP request message.

	DerivedFrom (see page 3378)	Reports the value of the Derived-From (see page 3379) header of the HTTP request message.
	Expires (see page 3379)	Reports the value of the Expires header of the HTTP request message.
	Files (see page 3379)	Provides access to the files uploaded in the HTTP request.
	From (see page 3379)	Reports the value of the From header of the HTTP request message.
	Host (see page 3380)	Reports the value of the Host header of the HTTP request message.
	IfModifiedSince (see page 3380)	Reports the value of the If-Modified-Since header of the HTTP request message.
	InternalPathInfo (see page 3381)	Returns the path info portion of the URL (see page 3388).
	InternalScriptName (see page 3381)	Returns the ScriptName (see page 3386) part of the URL (see page 3388).
	Method (see page 3382)	This is Method, a member of class TWebRequest.
	MethodType (see page 3382)	This is MethodType, a member of class TWebRequest.
	PathInfo (see page 3382)	Reports the value of the path information (if any) of the URL (see page 3388) specified in the HTTP request message.
	PathTranslated (see page 3383)	Represents a translation of the PathInfo (see page 3382) property to a fully qualified path on the Web server.
	ProtocolVersion (see page 3383)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
	Query (see page 3384)	Indicates the value of the query information (if any) of the URL (see page 3388) specified in the HTTP request message.
	QueryFields (see page 3384)	Represents the parsed contents of the Query (see page 3384) in the URL (see page 3388) of the HTTP request message.
	RawContent (see page 3385)	This is RawContent, a member of class TWebRequest.
	Referer (see page 3385)	Reports the value of the Referer header of the HTTP request message.
	RemoteAddr (see page 3386)	Indicates the remote IP address of the client associated with the HTTP request message.
	RemoteHost (see page 3386)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
	ScriptName (see page 3386)	Indicates the value of the script information (if any) of the URL (see page 3388) specified in the HTTP request message.
	ServerPort (see page 3387)	Indicates the port number of the port on the Web server that receives the HTTP request message.
	Title (see page 3387)	Reports the value of the Title header of the HTTP request message.
	URL (see page 3388)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
	UserAgent (see page 3388)	Reports the value of the User-Agent header of the HTTP request message.

13.1.20.2 TWebRequest.Create Constructor

Creates an instance of TWebRequest (see page 3358).

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebRequest();
```

Description

Applications shouldn't need to call Create to instantiate a request object. The TWebApplication object creates a TWebRequest (see page 3358) object whenever it receives a client request.

See Also

TWebApplication

13.1.20.3 TWebRequest.Destroy Destructor

Destroys an instance of TWebRequest (see page 3358).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequest();
```

Description

Do not call Destroy. When the request message is fully handled, TWebApplication destroys the request object by calling its Free method.

Destroy frees the TStrings objects used to represent the ContentFields (see page 3375), CookieFields (see page 3377), and QueryFields (see page 3384) properties.

See Also

ContentFields (see page 3375)

CookieFields (see page 3377)

System::TObject::Free

QueryFields (see page 3384)

TWebApplication

13.1.20.4 TWebRequest Methods

The methods of the TWebRequest class are listed here.

Protected Methods

	Name	Description
	GetDateVariable (see page 3365)	Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.
	GetIntegerVariable (see page 3366)	Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.
	GetInternalPathInfo (see page 3366)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 3366)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 3366)	Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.
	UpdateMethodType (see page 3369)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	ExtractContentFields (see page 3363)	Parses the Content (see page 3373) property into its constituent fields.
	ExtractCookieFields (see page 3363)	Parses the Cookie (see page 3377) property into its constituent fields.
	ExtractFields (see page 3363)	This is the overview for the ExtractFields method overload.
	ExtractQueryFields (see page 3364)	Parses the Query (see page 3384) property into its constituent fields.
	GetFieldByName (see page 3365)	Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 3367)	Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.
	ReadString (see page 3368)	Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.
	ReadUnicodeString (see page 3368)	This is ReadUnicodeString, a member of class TWebRequest.
	TranslateURI (see page 3368)	Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal representation of a location on the server.

	WriteClient (see page 3369)	Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 3370)	Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.
	WriteString (see page 3370)	Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

13.1.20.4.1 TWebRequest.ExtractContentFields Method

Parses the Content (see page 3373) property into its constituent fields.

Pascal

```
procedure ExtractContentFields(Strings: TStrings);
```

C++

```
__fastcall ExtractContentFields(TStrings Strings);
```

Description

Call ExtractContentFields to fill the Strings parameter with the individual fields in the Content (see page 3373) property. ExtractContentFields assumes that fields are separated by ampersands (&). This is the format used when the MethodType (see page 3382) is mtPost. If the Content (see page 3373) property is not assigned, ExtractContentFields does nothing.

See Also

Content (see page 3373)

ContentFields (see page 3375)

MethodType (see page 3382)

TStrings

13.1.20.4.2 TWebRequest.ExtractCookieFields Method

Parses the Cookie (see page 3377) property into its constituent fields.

Pascal

```
procedure ExtractCookieFields(Strings: TStrings);
```

C++

```
__fastcall ExtractCookieFields(TStrings Strings);
```

Description

Call ExtractCookieFields to fill the Strings parameter with the individual fields in the Cookie (see page 3377) property. ExtractCookieFields assumes that fields are separated by semicolons. If the Cookie (see page 3377) property is not assigned, ExtractCookieFields does nothing.

See Also

Cookie (see page 3377)

CookieFields (see page 3377)

TStrings

13.1.20.4.3 ExtractFields Method

This is the overview for the ExtractFields method overload.

Overload List

	Name	Description
	TWebRequest.ExtractFields (TSysCharSet, TSysCharSet, AnsiString, TStrings) (see page 3364)	Parses a multi-valued string into its constituent fields.
	TWebRequest.ExtractFields (TSysCharSet, TSysCharSet, PChar, TStrings) (see page 3364)	Parses a multi-valued string into its constituent fields.

13.1.20.4.3.1 TWebRequest.ExtractFields Method (TSysCharSet, TSysCharSet, AnsiString, TStrings)

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content: PChar;
Strings: TStrings); overload;
procedure ExtractFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; const Content:
AnsiString; Strings: TStrings); overload;
```

C++

```
__fastcall ExtractFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings);
__fastcall ExtractFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const AnsiString
Content, TStrings Strings);
```

Description

Call ExtractFields to parse a multi-valued HTTP header into separate strings for each value. For example, if the separator character of the UserAgent (see page 3388) property is known, ExtractFields can parse this property into separate UserAgent (see page 3388) values.

Separators is a set of characters that are used to separate individual values within the multi-valued string. WhiteSpace is a set of characters that are to be ignored when parsing the string. Content (see page 3373) is the multi-valued string to be parsed. Strings is the TStrings object that receives the individual values that are parsed from Content (see page 3373).

See Also

ExtractContentFields (see page 3363)

ExtractCookieFields (see page 3363)

ExtractQueryFields (see page 3364)

TStrings

13.1.20.4.4 TWebRequest.ExtractQueryFields Method

Parses the Query (see page 3384) property into its constituent fields.

Pascal

```
procedure ExtractQueryFields(Strings: TStrings);
```

C++

```
__fastcall ExtractQueryFields(TStrings Strings);
```

Description

Call ExtractQueryFields to fill the Strings parameter with the individual fields in the Query (see page 3384) property. ExtractQueryFields assumes that fields are separated by ampersands (&). If the Query (see page 3384) property is not assigned, ExtractQueryFields does nothing.

See Also

Query (see page 3384)

QueryFields (see page 3384)

TStrings

13.1.20.4.5 TWebRequest.GetDateVariable Method

Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; virtual; abstract;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement GetDateVariable to provide a method by which the date-time values are read from the header strings of the HTTP request message. The request object uses GetDateVariable to access the properties that represent dates from the HTTP request headers.

See Also

Date (see page 3378)

Expires (see page 3379)

IfModifiedSince (see page 3380)

13.1.20.4.6 TWebRequest.GetFieldByName Method

Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.

Pascal

```
function GetFieldByName(const Name: AnsiString): AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFieldByName(const AnsiString Name) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement GetFieldByName to provide access to arbitrary header fields in the HTTP request message. Use GetFieldByName to read the value of an HTTP header variable that is not surfaced as one of the properties of TWebRequest (see page 3358). For information on possible HTTP request header variables, see the current Internet standards documents.

See Also

GetStringVariable (see page 3366)

Properties That Contain Request Header Information

13.1.20.4.7 TWebRequest.GetIntegerVariable Method

Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement GetIntegerVariable to provide a method by which the integer values are read from the header strings of the HTTP request message. The request object uses GetIntegerVariable to access the properties that represent integers from the HTTP request headers.

See Also

ContentLength (see page 3375)

ServerPort (see page 3387)

13.1.20.4.8 TWebRequest.GetInternalPathInfo Method

Pascal

```
function GetInternalPathInfo: AnsiString; virtual;
```

C++

```
virtual __fastcall AnsiString GetInternalPathInfo();
```

Description

This is GetInternalPathInfo, a member of class TWebRequest.

13.1.20.4.9 TWebRequest.GetInternalScriptName Method

Pascal

```
function GetInternalScriptName: AnsiString; virtual;
```

C++

```
virtual __fastcall AnsiString GetInternalScriptName();
```

Description

This is GetInternalScriptName, a member of class TWebRequest.

13.1.20.4.10 TWebRequest.GetStringVariable Method

Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement GetStringVariable to provide a method by which the string values are read from the header strings of the HTTP request message. The request object uses GetStringVariable to access the properties that represent strings from the HTTP request headers.

13.1.20.4.11 TWebRequest.ReadClient Method

Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.

Pascal

```
function ReadClient(var Buffer; Count: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int ReadClient( Buffer, int Count) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement ReadClient. ReadClient is used to read content information from the HTTP request. Use ReadClient to get the next chunk of information when the content of the request message is too large for the Content (see page 3373) property.

Use Buffer to provide a buffer to contain the content information. Use Count to specify the number of bytes to read. ReadClient returns the number of bytes actually read.

See Also

Content (see page 3373)

ReadString (see page 3368)

WriteClient (see page 3369)

13.1.20.4.12 TWebRequest.ReadString Method

Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.

Pascal

```
function ReadString(Count: Integer): AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ReadString(int Count) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement ReadString. ReadString is used to load content information from the HTTP request into a string. Use ReadString to get the next chunk of information when the content of the request message is too large for the Content (see page 3373) property.

See Also

Content (see page 3373)

ReadClient (see page 3367)

WriteString (see page 3370)

13.1.20.4.13 TWebRequest.ReadUnicodeString Method

Pascal

```
function ReadUnicodeString(Count: Integer): string;
```

C++

```
__fastcall UnicodeString ReadUnicodeString(int Count);
```

Description

This is ReadUnicodeString, a member of class TWebRequest.

13.1.20.4.14 TWebRequest.TranslateURI Method

Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal

representation of a location on the server.

Pascal

```
function TranslateURI(const URI: string): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString TranslateURI(const UnicodeString URI) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement TranslateURI. TranslateURI is used to translate the URI specified in a client request into a format that can be used by the server application. TranslateURI is not relevant to CGI applications.

Note: On Windows, the internal format varies, depending on whether the server application is an ISAPI or NSAPI application.

See Also

PathTranslated (see page 3383)

URL (see page 3388)

13.1.20.4.15 TWebRequest.UpdateMethodType Method

Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Pascal

```
procedure UpdateMethodType;
```

C++

```
__fastcall UpdateMethodType();
```

Description

Use UpdateMethodType to update the type of response that is requested by the Web client.

See Also

TWebRequest (see page 3358)

13.1.20.4.16 TWebRequest.WriteClient Method

Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.

Pascal

```
function WriteClient(var Buffer; Count: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int WriteClient( Buffer, int Count) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement WriteClient. WriteClient is used by TWebResponse (see page 3389) to send the contents of a response to the Web client.

See Also

ReadClient (see page 3367)

TWebResponse (see page 3389)

WriteString (see page 3370)

13.1.20.4.17 TWebRequest.WriteHeaders Method

Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.

Pascal

```
function WriteHeaders(StatusCode: Integer; const ReasonString: AnsiString; const Headers:
AnsiString): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteHeaders(int StatusCode, const AnsiString ReasonString, const
AnsiString Headers) = 0;
```

Description

Use WriteHeaders to write an HTTP header string.

See Also

WriteClient (see page 3369)

WriteString (see page 3370)

13.1.20.4.18 TWebRequest.WriteString Method

Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

Pascal

```
function WriteString(const AString: AnsiString): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteString(const AnsiString AString) = 0;
```

Description

Descendants of TWebRequest (see page 3358) implement WriteString. WriteString is used by TWebResponse (see page 3389) to send the contents of a response to the Web client.

See Also

ReadString (see page 3368)

TWebResponse (see page 3389)

WriteClient (see page 3369)

13.1.20.5 TWebRequest Properties

The properties of the TWebRequest class are listed here.

Public Properties

	Name	Description
R	Accept (see page 3371)	Reports the value of the Accept header of the HTTP request message.
R	Authorization (see page 3372)	Reports the value of the Authorization header of the HTTP request message.
R	CacheControl (see page 3372)	Reports the value of the Cache-Control header of the HTTP request message.
R	Connection (see page 3373)	Reports the value of the Connection header of the HTTP request message.
R	Content (see page 3373)	Represents the unparsed contents of the HTTP request message.
R	ContentEncoding (see page 3374)	Reports the value of the Content (see page 3373)-Encoding header of the HTTP request message.

	ContentFields (see page 3375)	Reports the parsed content of a POST request message.
	ContentLength (see page 3375)	Reports the value of the Content (see page 3373)-Length header of the HTTP request message.
	ContentParser (see page 3376)	Refers to the object's content parser object.
	ContentType (see page 3376)	Reports the value of the Content (see page 3373)-Type header of the HTTP request message.
	ContentVersion (see page 3376)	Reports the value of the Content (see page 3373)-Version header of the HTTP request message.
	Cookie (see page 3377)	Reports the value of the Cookie header of the HTTP request message.
	CookieFields (see page 3377)	Represents the parsed contents of the Cookie (see page 3377) header of an HTTP request message.
	Date (see page 3378)	Reports the value of the Date header of the HTTP request message.
	DerivedFrom (see page 3378)	Reports the value of the Derived-From (see page 3379) header of the HTTP request message.
	Expires (see page 3379)	Reports the value of the Expires header of the HTTP request message.
	Files (see page 3379)	Provides access to the files uploaded in the HTTP request.
	From (see page 3379)	Reports the value of the From header of the HTTP request message.
	Host (see page 3380)	Reports the value of the Host header of the HTTP request message.
	IfModifiedSince (see page 3380)	Reports the value of the If-Modified-Since header of the HTTP request message.
	InternalPathInfo (see page 3381)	Returns the path info portion of the URL (see page 3388).
	InternalScriptName (see page 3381)	Returns the ScriptName (see page 3386) part of the URL (see page 3388).
	Method (see page 3382)	This is Method, a member of class TWebRequest.
	MethodType (see page 3382)	This is MethodType, a member of class TWebRequest.
	PathInfo (see page 3382)	Reports the value of the path information (if any) of the URL (see page 3388) specified in the HTTP request message.
	PathTranslated (see page 3383)	Represents a translation of the PathInfo (see page 3382) property to a fully qualified path on the Web server.
	ProtocolVersion (see page 3383)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
	Query (see page 3384)	Indicates the value of the query information (if any) of the URL (see page 3388) specified in the HTTP request message.
	QueryFields (see page 3384)	Represents the parsed contents of the Query (see page 3384) in the URL (see page 3388) of the HTTP request message.
	RawContent (see page 3385)	This is RawContent, a member of class TWebRequest.
	Referer (see page 3385)	Reports the value of the Referer header of the HTTP request message.
	RemoteAddr (see page 3386)	Indicates the remote IP address of the client associated with the HTTP request message.
	RemoteHost (see page 3386)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
	ScriptName (see page 3386)	Indicates the value of the script information (if any) of the URL (see page 3388) specified in the HTTP request message.
	ServerPort (see page 3387)	Indicates the port number of the port on the Web server that receives the HTTP request message.
	Title (see page 3387)	Reports the value of the Title header of the HTTP request message.
	URL (see page 3388)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
	UserAgent (see page 3388)	Reports the value of the User-Agent header of the HTTP request message.

13.1.20.5.1 TWebRequest.Accept Property

Reports the value of the Accept header of the HTTP request message.

Pascal

```
property Accept: AnsiString;
```

C++

```
__property AnsiString Accept;
```

Description

Read Accept to determine the media types the Web client can accept in response to the request. Not every HTTP request message has an Accept header. If the Accept property is not set, then any media type is potentially acceptable in the response.

Accept headers usually indicate that the response should be limited to a small set of desired types. For example, a Web client requesting an audio response might produce a TWebRequest (see page 3358) object with Accept set to the following string:

```
audio/*; q=0.2, audio/basic
```

This request indicates that the preferred response media type is audio/basic, but that any audio type is acceptable if it is the best available after an 80% markdown in quality.

For information on the format of Accept headers, see the current Internet standards documentation.

See Also

ContentType (see page 3406)

Properties That Describe the Expected Response

13.1.20.5.2 TWebRequest.Authorization Property

Reports the value of the Authorization header of the HTTP request message.

Pascal

```
property Authorization: AnsiString;
```

C++

```
__property AnsiString Authorization;
```

Description

Read Authorization to check whether the client that sent the request message has provided the correct authentication information. Authorization allows the Web application to provided limited access to the resource specified by the URL (see page 3388) property.

For more information about HTTP authentication schemes, see the Internet standards documentation.

See Also

WWWAuthenticate (see page 3415)

URL (see page 3388)

13.1.20.5.3 TWebRequest.CacheControl Property

Reports the value of the Cache-Control header of the HTTP request message.

Pascal

```
property CacheControl: AnsiString;
```

C++

```
__property AnsiString CacheControl;
```

Description

Read CacheControl to determine any Web client directives that must be obeyed by all caching mechanisms along the request/response chain. The CacheControl directives of the HTTP request need not apply to the corresponding HTTP response.

The HTTP 1.1 standard defines the following directives for CacheControl:

Value	Meaning
no-cache	The request may not be cached. The Web server validates the request before the TWebRequest (see page 3358) object is created.
no-store	The request contains sensitive information and may not be stored on any permanent medium such as a backup tape. If the request is stored temporarily in a file, the file must be deleted.
max-age=ss	The request is considered invalid if it is older than ss seconds. This directive takes precedence over the Expires (see page 3379) property, even if Expires (see page 3379) is more restrictive. Invalid requests are validated by the Web server before the TWebRequest (see page 3358) object is created.
max-stale or max-stale=ss	The client is willing to accept a response that has exceeded its expiration time. The max-stale directive can optionally specify the number of seconds by which the response can exceed its expiration time.
min-fresh=ss	The client is not willing to accept a response that expires in less than ss seconds.

See Also

Date (see page 3378)

Expires (see page 3379)

13.1.20.5.4 TWebRequest.Connection Property

Reports the value of the Connection header of the HTTP request message.

Pascal

```
property Connection: AnsiString;
```

C++

```
__property AnsiString Connection;
```

Description

Read Connection to determine the options requested by the Web client for its connection to the server application. The HTTP 1.1 standard specifies only one value for the Connection header. If the value of Connection is close, the connection should be closed after the completion of the response.

See Also

Host (see page 3380)

RemoteAddr (see page 3386)

RemoteHost (see page 3386)

ServerPort (see page 3387)

Connecting to a Data Store Using TADOConnection

13.1.20.5.5 TWebRequest.Content Property

Represents the unparsed contents of the HTTP request message.

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

Use Content to read the contents of an HTTP request message that is sending information to the server. The value of Content depends on the Method (see page 3382) of the HTTP request. When the Method (see page 3382) is POST, Content is the unparsed string giving the values to be posted with their associated fields. When the Method (see page 3382) is PUT, Content is the value that should replace the URL (see page 3388) given by the URL (see page 3388) property.

Tip: When the Method (see page 3382) is POST, the parsed version of the post request is available in the ContentFields (see page 3375) property.

Note: If the content of a message is particularly large, it is transferred in chunks. In this case, the Content property does not contain the entire message content. To read the rest of the content, use the ReadClient (see page 3367) method.

See Also

ContentEncoding (see page 3374)

ContentFields (see page 3375)

ContentLength (see page 3375)

ContentType (see page 3376)

ContentVersion (see page 3376)

ExtractContentFields (see page 3363)

TWebRequest (see page 3358)

The Content of HTTP Request Messages

13.1.20.5.6 TWebRequest.ContentEncoding Property

Reports the value of the Content (see page 3373)-Encoding header of the HTTP request message.

Pascal

```
property ContentEncoding: AnsiString;
```

C++

```
__property AnsiString ContentEncoding;
```

Description

Read ContentEncoding to determine what encoding mechanisms, if any, have been applied to the Content (see page 3373) of the HTTP request. The encoding mechanisms are listed in the order in which the Web client applied them, separated by commas. Typically, ContentEncoding indicates a compression method or an encoding scheme used to transfer extended ASCII characters over the net.

Reverse the ContentEncoding mechanisms to decode the Content (see page 3373) into the form indicated by the ContentType (see page 3376) property.

See Also

Content (see page 3373)

ContentType (see page 3376)

Properties That Describe the Content

13.1.20.5.7 TWebRequest.ContentFields Property

Reports the parsed content of a POST request message.

Pascal

```
property ContentFields: TStrings;
```

C++

```
__property TStrings ContentFields;
```

Description

Use ContentFields to read the fields of an HTTP request message when the MethodType (see page 3382) is mtPost. The Content (see page 3373) of the HTTP request is parsed, separating into fields at the ampersand character.

Each field appears as a separate string in the ContentFields list with the form Name=Value. As a TStrings object, ContentFields allows applications to manipulate the individual fields by name or value.

See Also

Content (see page 3373)

ExtractContentFields (see page 3363)

TWebRequest (see page 3358)

TStrings

Names

Values

The Content of HTTP Request Messages

13.1.20.5.8 TWebRequest.ContentLength Property

Reports the value of the Content (see page 3373)-Length header of the HTTP request message.

Pascal

```
property ContentLength: Integer;
```

C++

```
__property int ContentLength;
```

Description

Read the ContentLength property to determine the length of the Content (see page 3373) property. ContentLength allows an application to determine the end of the Content (see page 3373) property when the ContentType (see page 3376) is not text/html. A ContentLength of 0 indicates that the length of the Content (see page 3373) property is not determined, either because the request does not include any Content (see page 3373), or because the Web client did not know the length.

Note: The length of the Content (see page 3373) may be less than ContentLength when the Content (see page 3373) is passed using chunked transfer coding.

See Also

Content (see page 3373)

ContentType (see page 3376)

TWebRequest (see page 3358)

Properties That Describe the Content

13.1.20.5.9 TWebRequest.ContentParser Property

Refers to the object's content parser object.

Pascal

```
property ContentParser: TAbstractContentParser;
```

C++

```
__property TAbstractContentParser ContentParser;
```

Description

Read ContentParser to locate the TWebRequest (see page 3358) instance's TAbstractContentParser (see page 3255) object. The TAbstractContentParser (see page 3255) is responsible for parsing the HTTP request.

13.1.20.5.10 TWebRequest.ContentType Property

Reports the value of the Content (see page 3373)-Type header of the HTTP request message.

Pascal

```
property ContentType: AnsiString;
```

C++

```
__property AnsiString ContentType;
```

Description

Read ContentType to determine the media type of the Content (see page 3373) of the HTTP request message. The ContentType is a string of the form Type/SubType.

Most HTTP requests do not require any Content (see page 3373) at all. For most requests with a Method (see page 3382) that requires a value for Content (see page 3373), the ContentType is text/html. However, HTTP requests for server-specific values of Method (see page 3382) can use any media type appropriate to the request.

See Also

Accept (see page 3371)

Content (see page 3373)

TWebRequest (see page 3358)

Properties That Describe the Content

13.1.20.5.11 TWebRequest.ContentVersion Property

Reports the value of the Content (see page 3373)-Version header of the HTTP request message.

Pascal

```
property ContentVersion: AnsiString;
```

C++

```
__property AnsiString ContentVersion;
```

Description

Read ContentVersion to determine the version of the Content (see page 3373) of the HTTP request message. Most HTTP

requests do not require any Content (see page 3373) at all. When the Method (see page 3382) requires a value for Content (see page 3373), the ContentVersion may be set to indicate the version of the source of that content. The format of the ContentVersion depends on the ContentType (see page 3376) of the request.

See Also

Content (see page 3373)

ContentType (see page 3376)

Properties That Describe the Content

13.1.20.5.12 TWebRequest.Cookie Property

Reports the value of the Cookie header of the HTTP request message.

Pascal

```
property Cookie: AnsiString;
```

C++

```
__property AnsiString Cookie;
```

Description

Use Cookie to read the "cookie" strings provided in the Web client request. Cookie strings are used to track state information in a Web application. Cookie is the unparsed value of the Cookie header. The Cookie header can include multiple fields separated by semicolons. Use the CookieFields (see page 3377) property to work with the Cookie header on a field-by-field basis.

See Also

CookieFields (see page 3377)

ExtractCookieFields (see page 3363)

Cookies (see page 3407)

Properties That Describe the Expected Response

13.1.20.5.13 TWebRequest.CookieFields Property

Represents the parsed contents of the Cookie (see page 3377) header of an HTTP request message.

Pascal

```
property CookieFields: TStrings;
```

C++

```
__property TStrings CookieFields;
```

Description

Use CookieFields to work with individual "cookie" strings provided by the Web client request. The Cookie (see page 3377) property is parsed into separate fields by separating into substrings whenever a semicolon is encountered.

Cookie (see page 3377) strings are used to track state information in a Web application. Each field appears as a separate string in the CookieFields list with the form Name=Value. As a TStrings object, CookieFields allows applications to manipulate the individual fields by name or value.

Note: Applications can give state variables any name except one of the reserved cookie field names. See the Netscape documentation for a list of reserved cookie field names and their meanings.

See Also

Cookie (see page 3377)

ExtractCookieFields (see page 3363)

TStrings

Names

Values

13.1.20.5.14 TWebRequest.Date Property

Reports the value of the Date header of the HTTP request message.

Pascal

```
property Date: TDateTime;
```

C++

```
__property TDateTime Date;
```

Description

Read Date to determine the date and time at which the HTTP request message originated. Date can be used to determine whether the Content (see page 3373) of the request is still valid. The value of Date is translated into local time as specified by the system clock from the time units set by the Web client.

For example, if an HTTP request message specifies a MethodType (see page 3382) of mtPost, and Date is older than the most recent values of the fields that are being posted, the server application may return a status code that indicates an error rather than overwriting more recent values.

Date is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 3379)

IfModifiedSince (see page 3380)

MethodType (see page 3382)

StatusCode (see page 3413)

13.1.20.5.15 TWebRequest.DerivedFrom Property

Reports the value of the Derived-From (see page 3379) header of the HTTP request message.

Pascal

```
property DerivedFrom: AnsiString;
```

C++

```
__property AnsiString DerivedFrom;
```

Description

Read DerivedFrom to determine the URI from which the value of Content (see page 3373) originated. DerivedFrom is only meaningful when the request includes a Content (see page 3373) property and the Content (see page 3373) did not originate with the Web client.

See Also

Content (see page 3373)

Referer (see page 3385)

Properties That Describe the Web Client

13.1.20.5.16 TWebRequest.Expires Property

Reports the value of the Expires header of the HTTP request message.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Use Expires to determine whether the request is "stale." Expires is the date and time at which the request becomes invalid. The value of Expires is translated into local time as specified by the system clock from the time units set by the Web client.

If the request has a CacheControl (see page 3372) value with a max-age directive, the max-age directive overrides the value of Expires.

Expires is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Date (see page 3378)

IfModifiedSince (see page 3380)

CacheControl (see page 3372)

13.1.20.5.17 TWebRequest.Files Property

Provides access to the files uploaded in the HTTP request.

Pascal

```
property Files: TAbstractWebRequestFiles;
```

C++

```
__property TAbstractWebRequestFiles Files;
```

Description

Use this property to find the specific instance of the object's TAbstractRequestFiles object. The TAbstractRequestFiles object contains uploaded files extracted from the HTTP request.

13.1.20.5.18 TWebRequest.From Property

Reports the value of the From header of the HTTP request message.

Pascal

```
property From: AnsiString;
```

C++

```
__property AnsiString From;
```

Description

Read From to determine the Internet e-mail address of the human user for whom the Web client sent the HTTP request message. This value can be used for logging purposes, or to contact the originator of the request if problems occur.

See Also

RemoteAddr (see page 3386)

RemoteHost (see page 3386)

UserAgent (see page 3388)

Properties That Describe the Web Client

13.1.20.5.19 TWebRequest.Host Property

Reports the value of the Host header of the HTTP request message.

Pascal

```
property Host: AnsiString;
```

C++

```
__property AnsiString Host;
```

Description

Read Host to determine the Internet host and port number of resource being requested. For example, if the client request specifies the following URL (see page 3388):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

The value of Host would be

`www.TSite.com`

The value of Host can be used to differentiate between internally ambiguous URLs, such as the root "/" URL (see page 3388) of a server for multiple host names on a single IP address.

See Also

PathInfo (see page 3382)

ScriptName (see page 3386)

ServerPort (see page 3387)

URL (see page 3388)

Properties That Identify the Target

13.1.20.5.20 TWebRequest.IfModifiedSince Property

Reports the value of the If-Modified-Since header of the HTTP request message.

Pascal

```
property IfModifiedSince: TDateTime;
```

C++

```
__property TDateTime IfModifiedSince;
```

Description

Read IfModifiedSince on a request with a MethodType (see page 3382) of mtGet to determine whether the request is conditional. If the information requested by the Web client was not modified since the time indicated by IfModifiedSince, the response should be a not modified error rather than the information indicated by the URL (see page 3388) property.

The value of IfModifiedSince is given according to the local clock, not the clock of the Web client.

Note: On Windows, the value of the local clock is specified in the Windows Control Panel.

IfModifiedSince is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 3379)

Date (see page 3378)

Properties That Describe the Expected Response

13.1.20.5.21 TWebRequest.InternalPathInfo Property

Returns the path info portion of the URL (see page 3388).

Pascal

```
property InternalPathInfo: AnsiString;
```

C++

```
__property AnsiString InternalPathInfo;
```

Description

InternalPathInfo contains the path information portion of the URL (see page 3388), which identifies the destination of the message. This property generally contains the same information as PathInfo.To ensure cross-platform code compatibility, use InternalPathInfo instead of PathInfo (see page 3382).

Note: On Windows, this property varies slightly from PathInfo (see page 3382) if the application has an embedded test server. In that case, information specific to the test server is contained in the InternalScriptName (see page 3381) instead of the InternalPathInfo.

See Also

PathInfo (see page 3382)

13.1.20.5.22 TWebRequest.InternalScriptName Property

Returns the ScriptName (see page 3386) part of the URL (see page 3388).

Pascal

```
property InternalScriptName: AnsiString;
```

C++

```
__property AnsiString InternalScriptName;
```

Description

InternalScriptName contains the script name portion of the URL (see page 3388), which specifies the name of a Web server application. This property generally contains the same information as ScriptName (see page 3386). To ensure cross platform code compatibility, use InternalScriptName instead of ScriptName (see page 3386).

Note: On Windows, this property varies slightly from ScriptName (see page 3386) if the application has an embedded test server. In that case, information specific to the test server is contained in the InternalScriptName instead of the InternalPathInfo (see page 3381).

See Also

ScriptName (see page 3386)

13.1.20.5.23 TWebRequest.Method Property

Pascal

```
property Method: AnsiString;
```

C++

```
__property AnsiString Method;
```

Description

This is Method, a member of class TWebRequest.

13.1.20.5.24 TWebRequest.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class TWebRequest.

13.1.20.5.25 TWebRequest.PathInfo Property

Reports the value of the path information (if any) of the URL (see page 3388) specified in the HTTP request message.

Pascal

```
property PathInfo: AnsiString;
```

C++

```
__property AnsiString PathInfo;
```

Description

Read PathInfo to determine the path on the server machine where the target of the request is found. For example, given this URL (see page 3388):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the PathInfo portion is

`/mammals`

The TWebDispatcher (see page 3349) object uses the PathInfo to identify the appropriate TWebActionItem (see page 3335) for servicing the request message.

See Also

Host (see page 3380)

PathTranslated (see page 3383)

Query (see page 3384)

ScriptName (see page 3386)

TWebActionItem (see page 3335)

TWebDispatcher (see page 3349)

InternalPathInfo (see page 3381)

URL (see page 3388)

Dispatching Request Messages

Properties That Identify the Target

13.1.20.5.26 TWebRequest.PathTranslated Property

Represents a translation of the PathInfo (see page 3382) property to a fully qualified path on the Web server.

Pascal

```
property PathTranslated: AnsiString;
```

C++

```
__property AnsiString PathTranslated;
```

Description

Use PathTranslated to refer to the location of the target of the request in an HTTP response.

See Also

Host (see page 3380)

PathInfo (see page 3382)

TWebActionItem (see page 3335)

TWebResponse (see page 3389)

URL (see page 3388)

13.1.20.5.27 TWebRequest.ProtocolVersion Property

Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.

Pascal

```
property ProtocolVersion: AnsiString;
```

C++

```
__property AnsiString ProtocolVersion;
```

Description

Use ProtocolVersion to determine the protocol used by the Web client when generating the HTTP request message.

Some properties of the HTTP request may be interpreted differently depending on the ProtocolVersion. For example, if ProtocolVersion is 1.0, then the connection should not be considered persistent, even if the Connection (see page 3373) property does not specify the close option.

See Also

Connection (see page 3373)

13.1.20.5.28 TWebRequest.Query Property

Indicates the value of the query information (if any) of the URL (see page 3388) specified in the HTTP request message.

Pascal

```
property Query: AnsiString;
```

C++

```
__property AnsiString Query;
```

Description

Read Query to determine the details of a query specified in the URL (see page 3388) of the Web client request. For example, given this URL (see page 3388):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the Query portion is

`animal=dog&color=black`

Query is the unparsed query portion of the URL (see page 3388). The query may include multiple fields separated by ampersands. Use the QueryFields (see page 3384) property to work with the query on a field-by-field basis.

See Also

ExtractQueryFields (see page 3364)

Host (see page 3380)

PathInfo (see page 3382)

QueryFields (see page 3384)

ScriptName (see page 3386)

Properties That Identify the Target

13.1.20.5.29 TWebRequest.QueryFields Property

Represents the parsed contents of the Query (see page 3384) in the URL (see page 3388) of the HTTP request message.

Pascal

```
property QueryFields: TStrings;
```

C++

```
__property TStrings QueryFields;
```

Description

Use QueryFields to work with individual query values provided by the Web client request. The Query (see page 3384) property is parsed into separate fields by separating into substrings whenever an ampersand is encountered.

Each query field appears as a separate string in the QueryFields list with the form Name=Value. As a TStrings object,

QueryFields allows applications to manipulate the individual fields by name or value.

See Also

ExtractQueryFields (see page 3364)

Query (see page 3384)

TStrings

Names

Values

Properties That Identify the Target

13.1.20.5.30 TWebRequest.RawContent Property

Pascal

```
property RawContent: AnsiString;
```

C++

```
__property AnsiString RawContent;
```

Description

This is RawContent, a member of class TWebRequest.

13.1.20.5.31 TWebRequest.Referer Property

Reports the value of the Referer header of the HTTP request message.

Pascal

```
property Referer: AnsiString;
```

C++

```
__property AnsiString Referer;
```

Description

Read Referer to determine the URI of the resource where the HTTP request message originated. Referer allows the server application to generate back-links to the source of the request. If Referer is a partial URI, it should be interpreted as a relative path to the URL (see page 3388) property.

The Referer property is not set when the URL (see page 3388) of the HTTP request was obtained from a source that does not have its own URI, such as input from the user keyboard.

See Also

DerivedFrom (see page 3378)

From (see page 3379)

RemoteAddr (see page 3386)

RemoteHost (see page 3386)

UserAgent (see page 3388)

Properties That Describe the Web Client

13.1.20.5.32 TWebRequest.RemoteAddr Property

Indicates the remote IP address of the client associated with the HTTP request message.

Pascal

```
property RemoteAddr: AnsiString;
```

C++

```
__property AnsiString RemoteAddr;
```

Description

Read RemoteAddr to obtain the IP address of the source of the Web client request.

See Also

From (see page 3379)

RemoteHost (see page 3386)

UserAgent (see page 3388)

Properties That Describe the Web Client

13.1.20.5.33 TWebRequest.RemoteHost Property

Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.

Pascal

```
property RemoteHost: AnsiString;
```

C++

```
__property AnsiString RemoteHost;
```

Description

Use RemoteHost to compose URI values for back-links to the source of the request when the Referer (see page 3385) property is not specified. RemoteHost does not include any path information.

See Also

Referer (see page 3385)

RemoteAddr (see page 3386)

UserAgent (see page 3388)

Properties That Describe the Web Client

13.1.20.5.34 TWebRequest.ScriptName Property

Indicates the value of the script information (if any) of the URL (see page 3388) specified in the HTTP request message.

Pascal

```
property ScriptName: AnsiString;
```

C++

```
__property AnsiString ScriptName;
```

Description

Read ScriptName to determine the full path to the Web server application specified by the client request. For example, given this URL (see page 3388):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the ScriptName portion is:

`/art/gallery.cgi`

See Also

Host (see page 3380)

PathInfo (see page 3382)

Query (see page 3384)

URL (see page 3388)

Properties That Identify the Target

13.1.20.5.35 TWebRequest.ServerPort Property

Indicates the port number of the port on the Web server that receives the HTTP request message.

Pascal

```
property ServerPort: Integer;
```

C++

```
__property int ServerPort;
```

Description

Read ServerPort to determine the number of the port used in the connection to the Web server. The Host (see page 3380) property will include the ServerPort if it is specified as part of the URL (see page 3388) for the client request.

See Also

Host (see page 3380)

URL (see page 3388)

13.1.20.5.36 TWebRequest.Title Property

Reports the value of the Title header of the HTTP request message.

Pascal

```
property Title: AnsiString;
```

C++

```
__property AnsiString Title;
```

Description

Read Title to determine the Title of the information requested in the Web client request.

See Also

Cookie (see page 3377)

Title (see page 3414)

Properties That Describe the Content

13.1.20.5.37 TWebRequest.URL Property

Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.

Pascal

```
property URL: AnsiString;
```

C++

```
__property AnsiString URL;
```

Description

Use the URL property to identify the resource the Web client identifies as the target of the request message. URL may be an HTML page to return, a resource to be created or deleted, or an object that provides some other service for the Web client.

The TWebRequest (see page 3358) object parses the URL into its constituent parts, yielding the Host (see page 3380), ScriptName (see page 3386), PathInfo (see page 3382), and Query (see page 3384) properties.

Note: Usually the URL property is a Uniform Resource Locator (URL) that can be parsed into host, script, path, and query portions. However, it is possible for HTTP request messages to specify the target in more general terms, as a Uniform Resource Identifier (URI).

See Also

Host (see page 3380)

PathInfo (see page 3382)

Query (see page 3384)

ScriptName (see page 3386)

Properties That Identify the Target

13.1.20.5.38 TWebRequest.UserAgent Property

Reports the value of the User-Agent header of the HTTP request message.

Pascal

```
property UserAgent: AnsiString;
```

C++

```
__property AnsiString UserAgent;
```

Description

Read UserAgent to obtain information about the user agent originating the client request. Use the UserAgent information for statistical purposes, for tracing protocol violations, and for tailoring responses to known limitations of specific applications that generate client requests. The UserAgent string contains one or more descriptors, in order of significance. Each descriptor gives the name of the product or application that generated the request, or a comment about the user agent.

Properties That Describe the Web Client

13.1.21 TWebResponse Class

TWebResponse is the base class for all objects that represent HTTP messages sent in response to an HTTP request message.

Class Hierarchy

Pascal

```
TWebResponse = class(TObject);
```

C++

```
class TWebResponse : public TObject;
```

File

HTTPApp

Description

Use a descendant of TWebResponse to specify the response to an HTTP request message.

A web application creates a TWebResponse object based on the TWebRequest (see page 3358) object for an incoming HTTP request message. The Web dispatcher for the application then passes the TWebResponse object to the TWebActionItem (see page 3335) associated with the TWebRequest (see page 3358) object, so that the response can be formulated.

TWebResponse has descendants that represent HTTP response messages in different types of web server applications. These descendants are

TApacheResponse objects in Apache server applications.

TCGIResponse objects in CGI server applications.

TISAPIResponse objects in server DLLs (Windows only).

TWinCGIResponse objects in Windows-based CGI servers (Windows only).

Dispatching Requests and Responses

13.1.21.1 TWebResponse Members

The following tables list the members exposed by TWebResponse.

Protected Fields

	Name	Description
	FCustomHeaders (see page 3392)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 3393)	This is FHTTPRequest, a member of class TWebResponse.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 3394)	Appends the custom headers specified by the CustomHeaders (see page 3408) property to the Headers parameter.
	FormatAuthenticate (see page 3394)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).
A	GetContent (see page 3395)	Provides the abstract (pure virtual) prototype of a method to access the Content (see page 3404) property.
A	GetDateVariable (see page 3395)	Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.
A	GetIntegerVariable (see page 3396)	Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.
A	GetLogMessage (see page 3396)	Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 3411) property.
A	GetStatusCode (see page 3396)	Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 3413) property.
A	GetStringVariable (see page 3397)	Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.
A	SetContent (see page 3399)	Provides the abstract (pure virtual) prototype of a method to set the Content (see page 3404) property.
V	SetContentStream (see page 3400)	Sets the value of the ContentStream (see page 3406) property to the Value parameter.
A	SetDateVariable (see page 3401)	Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.
A	SetIntegerVariable (see page 3401)	Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.
A	SetLogMessage (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 3411) property.
A	SetStatusCode (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 3413) property.
A	SetStringVariable (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Public Methods

	Name	Description
	Create (see page 3391)	Creates an instance of Create to represent the response to the HTTPRequest (see page 3410) parameter.
V	Destroy (see page 3392)	Disposes of an object instance.
	GetCustomHeader (see page 3395)	Returns the value of the custom header with the specified name.
A	SendRedirect (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 3413) of 301 (Moved Permanently) and a Location (see page 3411) of URI.
A	SendResponse (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.
A	SendStream (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.
V	Sent (see page 3399)	Indicates whether the HTTP response message has already been sent.
	SetCookieField (see page 3400)	Adds a cookie header to the response message.
	SetCustomHeader (see page 3400)	Replaces the value of a specified custom header.

Public Properties

	Name	Description
	Allow (see page 3404)	Lists the HTTP request methods that the application can service.
	Content (see page 3404)	Contains the information sent to the web client in response to an HTTP request message.
	ContentEncoding (see page 3405)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 3405)	Specifies the length, in bytes, of the Content (see page 3404) property.
	ContentStream (see page 3406)	Specifies the stream object for writing the contents of the HTTP response message to the web client.
	ContentType (see page 3406)	Indicates the media type of the Content (see page 3404) of the HTTP response message.
	ContentVersion (see page 3407)	Represents the version associated with the Content (see page 3404) of the HTTP response message.
R	Cookies (see page 3407)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 3408)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 3408)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 3409)	Specifies the URI of the resource where the Content (see page 3404) of the HTTP response originated.
	Expires (see page 3409)	Specifies the date and time after which the Content (see page 3404) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 3410)	Represents the HTTP request message for which this is a response.
	LastModified (see page 3410)	Indicates the date and time that the value of the Content (see page 3404) property was last updated.
	Location (see page 3411)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 3411)	Describes the HTTP response message for event logging purposes.
	RawContent (see page 3411)	This is RawContent, a member of class TWebResponse.
	Realm (see page 3411)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 3412)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 3412)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 3413)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 3414)	Specifies a title for the Content (see page 3404) of the HTTP response message.
	Version (see page 3415)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 3415)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).

13.1.21.2 TWebResponse.Create Constructor

Creates an instance of Create to represent the response to the HTTPRequest (see page 3410) parameter.

Pascal

```
constructor Create(HTTPRequest: TWebRequest);
```

C++

```
__fastcall TWebResponse(TWebRequest HTTPRequest);
```

Description

Applications shouldn't need to call Create to instantiate a response object. The TWebApplication object creates a Create for each TWebRequest (see page 3358) it creates.

See Also

TWebApplication

TWebRequest (see page 3358)

13.1.21.3 TWebResponse.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebResponse();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

13.1.21.4 TWebResponse Fields

The fields of the TWebResponse class are listed here.

Protected Fields

	Name	Description
	FCustomHeaders (see page 3392)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 3393)	This is FHTTPRequest, a member of class TWebResponse.

13.1.21.4.1 TWebResponse.FCustomHeaders Field

Pascal

```
FCustomHeaders: TStrings;
```

C++

```
TStrings FCustomHeaders;
```

Description

This is FCustomHeaders, a member of class TWebResponse.

13.1.21.4.2 TWebResponse.FHTTPRequest Field

Pascal

```
FHTTPRequest: TWebRequest;
```

C++

```
TWebRequest FHTTPRequest;
```

Description

This is FHTTPRequest, a member of class TWebResponse.

13.1.21.5 TWebResponse Methods

The methods of the TWebResponse class are listed here.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 3394)	Appends the custom headers specified by the CustomHeaders (see page 3408) property to the Headers parameter.
	FormatAuthenticate (see page 3394)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).
A	GetContent (see page 3395)	Provides the abstract (pure virtual) prototype of a method to access the Content (see page 3404) property.
A	GetDateVariable (see page 3395)	Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.
A	GetIntegerVariable (see page 3396)	Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.
A	GetLogMessage (see page 3396)	Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 3411) property.
A	GetStatusCode (see page 3396)	Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 3413) property.
A	GetStringVariable (see page 3397)	Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.
A	SetContent (see page 3399)	Provides the abstract (pure virtual) prototype of a method to set the Content (see page 3404) property.
V	SetContentStream (see page 3400)	Sets the value of the ContentStream (see page 3406) property to the Value parameter.
A	SetDateVariable (see page 3401)	Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.
A	SetIntegerVariable (see page 3401)	Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.
A	SetLogMessage (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 3411) property.
A	SetStatusCode (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 3413) property.
A	SetStringVariable (see page 3402)	Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Public Methods

	Name	Description
	GetCustomHeader (see page 3395)	Returns the value of the custom header with the specified name.
	SendRedirect (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 3413) of 301 (Moved Permanently) and a Location (see page 3411) of URI.
	SendResponse (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.
	SendStream (see page 3398)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.
	Sent (see page 3399)	Indicates whether the HTTP response message has already been sent.
	SetCookieField (see page 3400)	Adds a cookie header to the response message.
	SetCustomHeader (see page 3400)	Replaces the value of a specified custom header.

13.1.21.5.1 TWebResponse.AddCustomHeaders Method

Appends the custom headers specified by the CustomHeaders (see page 3408) property to the Headers parameter.

Pascal

```
procedure AddCustomHeaders(var Headers: string);
```

C++

```
__fastcall AddCustomHeaders(UnicodeString Headers);
```

Description

Call AddCustomHeaders to add the message headers described by the CustomHeaders (see page 3408) property to a string of message headers. Each header is added on its own line (separated by carriage return and line feed), in the format HeaderName: Value.

See Also

CustomHeaders (see page 3408)

GetCustomHeader (see page 3395)

13.1.21.5.2 TWebResponse.FormatAuthenticate Method

Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).

Pascal

```
function FormatAuthenticate: AnsiString;
```

C++

```
__fastcall AnsiString FormatAuthenticate();
```

Description

FormatAuthenticate returns the value of WWWAuthenticate (see page 3415) if Realm (see page 3411) is an empty string. If it is not empty, it returns a name/value pair describing the realm of the WWWAuthenticate (see page 3415) property.

See Also

WWWAuthenticate (see page 3415)

Realm (see page 3411)

13.1.21.5.3 TWebResponse.GetContent Method

Provides the abstract (pure virtual) prototype of a method to access the Content (see page 3404) property.

Pascal

```
function GetContent: AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetContent() = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement GetContent to provide an access method for their internal representation of the Content (see page 3404) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the Content (see page 3404) property differently.

See Also

Content (see page 3404)

SetContent (see page 3399)

13.1.21.5.4 TWebResponse.GetCustomHeader Method

Returns the value of the custom header with the specified name.

Pascal

```
function GetCustomHeader(const Name: string): String;
```

C++

```
__fastcall UnicodeString GetCustomHeader(const UnicodeString Name);
```

Description

Call GetCustomHeader to obtain the value of one of the custom headers specified in the CustomHeaders (see page 3408) property. The Name parameter specifies the name of the HTTP message header.

See Also

CustomHeaders (see page 3408)

SetCustomHeader (see page 3400)

13.1.21.5.5 TWebResponse.GetDateVariable Method

Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; virtual; abstract;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement GetDateVariable to provide a method by which date-time values are read from the internal table used to store HTTP header variables. The response object uses GetDateVariable to access the properties that represent dates.

See Also

Date (see page 3408)

Expires (see page 3409)

LastModified (see page 3410)

SetDateVariable (see page 3401)

13.1.21.5.6 TWebResponse.GetIntegerVariable Method

Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement GetIntegerVariable to provide a method by which integer values are read from the internal table used to store HTTP header variables. The response object uses GetIntegerVariable to access the properties that represent integers.

See Also

ContentLength (see page 3405)

SetIntegerVariable (see page 3401)

13.1.21.5.7 TWebResponse.GetLogMessage Method

Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 3411) property.

Pascal

```
function GetLogMessage: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetLogMessage() = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement GetLogMessage to provide an access method for internal representation of the LogMessage (see page 3411) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the LogMessage (see page 3411) property differently.

See Also

LogMessage (see page 3411)

SetLogMessage (see page 3402)

13.1.21.5.8 TWebResponse.GetStatusCode Method

Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 3413) property.

Pascal

```
function GetStatusCode: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetStatusCode() = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement GetStatusCode to provide an access method for internal representation of the StatusCode (see page 3413) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the StatusCode (see page 3413) property differently.

See Also

StatusCode (see page 3413)

SetStatusCode (see page 3402)

13.1.21.5.9 TWebResponse.GetStringVariable Method

Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): AnsiString; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index) = 0;
```

Description

GetStringVariable provides the abstract (pure virtual) prototype of a method to extract a string value from an indexed table of HTTP header variables. Descendants of TWebResponse (see page 3389) implement GetStringVariable to provide a method by which the string values are read from the internal table used to store HTTP header variables. The response object uses GetStringVariable to access the properties that represent strings.

See Also

Allow (see page 3404)

ContentEncoding (see page 3405)

ContentType (see page 3406)

ContentVersion (see page 3407)

DerivedFrom (see page 3409)

Location (see page 3411)

Realm (see page 3411)

ReasonString (see page 3412)

Server (see page 3412)

SetStringVariable (see page 3402)

Title (see page 3414)

Version (see page 3415)

WWWAuthenticate (see page 3415)

13.1.21.5.10 TWebResponse.SendRedirect Method

Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 3413) of 301 (Moved Permanently) and a Location (see page 3411) of URI.

Pascal

```
procedure SendRedirect(const URI: AnsiString); virtual; abstract;
```

C++

```
virtual __fastcall SendRedirect(const AnsiString URI) = 0;
```

Description

Call SendRedirect to redirect the web client request to another URI that is the proper target of the request. SendRedirect does the same thing as setting the StatusCode (see page 3413) to 301, the Location (see page 3411) to URI, and calling SendResponse (see page 3398).

See Also

Location (see page 3411)

SendResponse (see page 3398)

StatusCode (see page 3413)

Sending the Response

13.1.21.5.11 TWebResponse.SendResponse Method

Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.

Pascal

```
procedure SendResponse; virtual; abstract;
```

C++

```
virtual __fastcall SendResponse() = 0;
```

Description

Call SendResponse after setting the properties of the HTTP response object to specify the response that should be made to the web client. If the request should be redirected to another URI, it is more efficient to call SendRedirect (see page 3398) instead.

See Also

SendRedirect (see page 3398)

Sending the Response

13.1.21.5.12 TWebResponse.SendStream Method

Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.

Pascal

```
procedure SendStream(AStream: TStream); virtual; abstract;
```

C++

```
virtual __fastcall SendStream(TStream AStream) = 0;
```

Description

Only call SendStream after first calling SendResponse (see page 3398). Unlike SendStream, SendResponse (see page 3398) fills the header of the HTTP response message, based on the properties of the TWebResponse (see page 3389) object. If SendResponse (see page 3398) has not been called first to set the header of the HTTP response message, set the ContentStream (see page 3406) property to AStream, and call SendResponse (see page 3398).

See Also

ContentStream (see page 3406)

SendResponse (see page 3398)

Sent (see page 3399)

13.1.21.5.13 TWebResponse.Sent Method

Indicates whether the HTTP response message has already been sent.

Pascal

```
function Sent: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Sent();
```

Description

Because SendRedirect (see page 3398) and SendStream (see page 3398) are abstract (pure virtual) methods for TWebResponse (see page 3389), Sent always returns false. Descendants of TWebResponse (see page 3389) override Sent to check whether the message was sent and return true or false as appropriate.

TWebApplication objects read Sent and send unsent responses to the web client.

See Also

SendRedirect (see page 3398)

SendStream (see page 3398)

TWebApplication

13.1.21.5.14 TWebResponse.SetContent Method

Provides the abstract (pure virtual) prototype of a method to set the Content (see page 3404) property.

Pascal

```
procedure SetContent(const Value: AnsiString); virtual; abstract;
```

C++

```
virtual __fastcall SetContent(const AnsiString Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetContent to provide a method for setting the Content (see page 3404) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications can store the value of the Content (see page 3404) property differently.

See Also

Content (see page 3404)

GetContent (see page 3395)

13.1.21.5.15 TWebResponse.SetContentStream Method

Sets the value of the ContentStream (see page 3406) property to the Value parameter.

Pascal

```
procedure SetContentStream(Value: TStream); virtual;
```

C++

```
virtual __fastcall SetContentStream(TStream Value);
```

Description

SetContentStream frees the previous value of ContentStream (see page 3406) and replaces the property with the Value parameter.

See Also

ContentStream (see page 3406)

13.1.21.5.16 TWebResponse.SetCookieField Method

Adds a cookie header to the response message.

Pascal

```
procedure SetCookieField(Values: TStrings; const ADomain: AnsiString; const APath: AnsiString;
AExpires: TDateTime; ASecure: Boolean);
```

C++

```
__fastcall SetCookieField(TStrings Values, const AnsiString ADomain, const AnsiString APath,
TDateTime AExpires, Boolean ASecure);
```

Description

Call SetCookieField to add a cookie header to the Cookies (see page 3407) property. Each cookie header contains a set of name/value pairs that can be passed on by the client application. Use the Values parameter to specify the name/value pairs as strings of the form Name=Value. Use the ADomain and APath parameters to indicate which URLs the cookie should be sent to. Use the AExpires parameter to indicate when the cookie is no longer valid. Use the ASecure property to indicate whether the cookie should only be passed on by the client if a secure connection is used.

See the documentation on the Netscape Web site for more information about cookies.

See Also

Cookies (see page 3407)

13.1.21.5.17 TWebResponse.SetCustomHeader Method

Replaces the value of a specified custom header.

Pascal

```
procedure SetCustomHeader(const Name: string; const Value: string);
```

C++

```
__fastcall SetCustomHeader(const UnicodeString Name, const UnicodeString Value);
```

Description

Call SetCustomHeader to add a new custom header to the list maintained by the CustomHeaders (see page 3408) property, or to change the value of one of the headers already in the list. SetCustomHeader locates the header in the list with the name specified by the Name parameter. If a header with that name is in the list, SetCustomHeader replaces the value of that header with the value specified as the Value parameter. If the name was not found, SetCustomHeader adds a new header to the list with the given name and value.

See Also

CustomHeaders (see page 3408)

GetCustomHeader (see page 3395)

13.1.21.5.18 TWebResponse.SetDateVariable Method

Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.

Pascal

```
procedure SetDateVariable(Index: Integer; const Value: TDateTime); virtual; abstract;
```

C++

```
virtual __fastcall SetDateVariable(int Index, const TDateTime Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetDateVariable to provide a method by which date-time values are written to the internal table used to store HTTP header variables. The response object uses SetDateVariable to set the properties that represent dates.

See Also

Date (see page 3408)

Expires (see page 3409)

GetDateVariable (see page 3395)

LastModified (see page 3410)

13.1.21.5.19 TWebResponse.SetIntegerVariable Method

Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.

Pascal

```
procedure SetIntegerVariable(Index: Integer; Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetIntegerVariable(int Index, int Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetIntegerVariable to provide a method by which integer values are written to the internal table used to store HTTP header variables. The response object uses SetIntegerVariable to set the properties that represent integers.

See Also

ContentLength (see page 3405)

GetIntegerVariable (see page 3396)

13.1.21.5.20 TWebResponse.SetLogMessage Method

Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 3411) property.

Pascal

```
procedure SetLogMessage(const Value: string); virtual; abstract;
```

C++

```
virtual __fastcall SetLogMessage(const UnicodeString Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetLogMessage to provide a method to set the internal representation of the LogMessage (see page 3411) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the LogMessage (see page 3411) property differently.

See Also

GetLogMessage (see page 3396)

LogMessage (see page 3411)

13.1.21.5.21 TWebResponse.SetStatusCode Method

Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 3413) property.

Pascal

```
procedure SetStatusCode(Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetStatusCode(int Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetStatusCode to provide a method to set the internal representation of the StatusCode (see page 3413) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the StatusCode (see page 3413) property differently.

See Also

GetStatusCode (see page 3396)

StatusCode (see page 3413)

13.1.21.5.22 TWebResponse.SetStringVariable Method

Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Pascal

```
procedure SetStringVariable(Index: Integer; const Value: AnsiString); virtual; abstract;
```

C++

```
virtual __fastcall SetStringVariable(int Index, const AnsiString Value) = 0;
```

Description

Descendants of TWebResponse (see page 3389) implement SetStringVariable to provide a method by which string values are written to the internal table used to store HTTP header variables. The response object uses SetStringVariable to set the properties that represent strings.

See Also

Allow (see page 3404)

ContentEncoding (see page 3405)

ContentType (see page 3406)

ContentVersion (see page 3407)

DerivedFrom (see page 3409)

GetStringVariable (see page 3397)

Location (see page 3411)

Realm (see page 3411)

Title (see page 3414)

Version (see page 3415)

WWWAuthenticate (see page 3415)

13.1.21.6 TWebResponse Properties

The properties of the TWebResponse class are listed here.

Public Properties

	Name	Description
	Allow (see page 3404)	Lists the HTTP request methods that the application can service.
	Content (see page 3404)	Contains the information sent to the web client in response to an HTTP request message.
	ContentEncoding (see page 3405)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 3405)	Specifies the length, in bytes, of the Content (see page 3404) property.
	ContentStream (see page 3406)	Specifies the stream object for writing the contents of the HTTP response message to the web client.
	ContentType (see page 3406)	Indicates the media type of the Content (see page 3404) of the HTTP response message.
	ContentVersion (see page 3407)	Represents the version associated with the Content (see page 3404) of the HTTP response message.
R	Cookies (see page 3407)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 3408)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 3408)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 3409)	Specifies the URI of the resource where the Content (see page 3404) of the HTTP response originated.
	Expires (see page 3409)	Specifies the date and time after which the Content (see page 3404) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 3410)	Represents the HTTP request message for which this is a response.
	LastModified (see page 3410)	Indicates the date and time that the value of the Content (see page 3404) property was last updated.
	Location (see page 3411)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 3411)	Describes the HTTP response message for event logging purposes.
	RawContent (see page 3411)	This is RawContent, a member of class TWebResponse.

	Realm (see page 3411)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 3412)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 3412)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 3413)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 3414)	Specifies a title for the Content (see page 3404) of the HTTP response message.
	Version (see page 3415)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 3415)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).

13.1.21.6.1 TWebResponse.Allow Property

Lists the HTTP request methods that the application can service.

Pascal

```
property Allow: AnsiString;
```

C++

```
__property AnsiString Allow;
```

Description

Use Allow to indicate what type of request methods the server application can respond to for the URI specified by HTTPRequest (see page 3410). Allow is a string of method names, separated by commas. The method names can include any pre-defined methods from the HTTP standard, or any additional methods implemented by the server application. At a minimum, the TWebResponse (see page 3389) object must allow GET and HEAD requests.

See Also

HTTPRequest (see page 3410)

TWebRequest (see page 3358)

URL (see page 3388)

Describing the Server Application

13.1.21.6.2 TWebResponse.Content Property

Contains the information sent to the web client in response to an HTTP request message.

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

Use Content to send requested information to the web client. Not every HTTP request message requires content to be returned. For example, responses to requests with a Method of OPTIONS, HEAD, POST, PUT, DELETE, or TRACE should not include any Content. In all these cases, the response information is contained entirely in the response header, which is built from the other properties of the TWebResponse (see page 3389) object.

The response content can be a string of HTML commands, the name of an HTML file, graphic content such as a bit-stream, or any other MIME content type.

Note: If the ContentStream (see page 3406) property is set, it supersedes the value of the Content property. If both Content and ContentStream (see page 3406) are set, the web client is sent the value of the ContentStream (see page 3406), not the value of the Content property.

See Also

ContentEncoding (see page 3405)

ContentLength (see page 3405)

ContentStream (see page 3406)

ContentType (see page 3406)

ContentVersion (see page 3407)

DerivedFrom (see page 3409)

Expires (see page 3409)

TWebRequest (see page 3358)

Responding to Request Messages with Action Items

Setting the Response Content

13.1.21.6.3 TWebResponse.ContentEncoding Property

Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.

Pascal

```
property ContentEncoding: AnsiString;
```

C++

```
__property AnsiString ContentEncoding;
```

Description

Set ContentEncoding when the value of Content (see page 3404) has been encoded before it is sent to the web client. The encoding mechanisms are listed in the order in which they are applied, separated by commas. Typically, ContentEncoding indicates a compression method or an encoding method used to transfer extended-ASCII characters over the net.

See Also

Content (see page 3404)

ContentType (see page 3406)

Describing the Content

13.1.21.6.4 TWebResponse.ContentLength Property

Specifies the length, in bytes, of the Content (see page 3404) property.

Pascal

```
property ContentLength: Integer;
```

C++

```
__property int ContentLength;
```

Description

Set ContentLength to the length of the Content (see page 3404) property, if it is known. If the length of the Content (see page 3404) property is unknown, or if the response message does not include any content, set ContentLength to 0. Web clients use the ContentLength when reading the contents of the HTTP response message.

If the contents of the response message are taken from a stream, the value of ContentLength is set from the stream.

See Also

Content (see page 3404)

ContentStream (see page 3406)

Describing the Content

13.1.21.6.5 TWebResponse.ContentStream Property

Specifies the stream object for writing the contents of the HTTP response message to the web client.

Pascal

```
property ContentStream: TStream;
```

C++

```
__property TStream ContentStream;
```

Description

Use ContentStream to set the contents of the HTTP response message to a value that can be written from a stream. ContentStream allows the response object to write its contents directly from a stream.

The stream specified by ContentStream can access a string of HTML commands, the contents of a BLOB database field, or any MIME content type.

Note: ContentStream supersedes the Content (see page 3404) property. If both Content (see page 3404) and ContentStream are set, the web client is sent the value of the ContentStream, not the value of the Content (see page 3404) property.

See Also

Content (see page 3404)

ContentType (see page 3406)

ContentVersion (see page 3407)

DerivedFrom (see page 3409)

Expires (see page 3409)

Setting the Response Content

13.1.21.6.6 TWebResponse.ContentType Property

Indicates the media type of the Content (see page 3404) of the HTTP response message.

Pascal

```
property ContentType: AnsiString;
```

C++

```
__property AnsiString ContentType;
```

Description

Set ContentType to indicate the media type of the Content (see page 3404) of the HTTP response message. The value of ContentType must specify a valid MIME content type. The ContentType string has the form Type/SubType.

For example, if the HTTP response message sends a string of HTML commands to the web client in response to a GET request, the ContentType is text/html.

Note: If the HTTP request message includes an Accept header, ContentType should be one of the content types listed in the Accept property of TWebRequest (see page 3358).

See Also

Content (see page 3404)

Accept (see page 3371)

Describing the Content

13.1.21.6.7 TWebResponse.ContentVersion Property

Represents the version associated with the Content (see page 3404) of the HTTP response message.

Pascal

```
property ContentVersion: AnsiString;
```

C++

```
__property AnsiString ContentVersion;
```

Description

Use ContentVersion to specify a version associated with the Content (see page 3404) of the HTTP response. The meaning of ContentVersion depends on the type of information that is sent in the HTTP response. For example, if the Content (see page 3404) of the HTTP response has a ContentType (see page 3406) of text/html, ContentVersion would be the version of HTML used.

Server (see page 3412) applications that introduce meanings for the ContentVersion property should document the interpretation they assign to ContentVersion.

See Also

Content (see page 3404)

ContentType (see page 3406)

Describing the Content

13.1.21.6.8 TWebResponse.Cookies Property

Lists all cookie headers that should be sent with the response.

Pascal

```
property Cookies: TCookieCollection;
```

C++

```
__property TCookieCollection Cookies;
```

Description

Use Cookies to obtain direct access to the individual TCookie (see page 3304) objects that represent the fields of the cookie headers in the response message. Each TCookie (see page 3304) object represents in individual cookie header that is

included with the response message.

Use the Add method of the cookie collection to add a single cookie to the collection, or use the SetCookieField (see page 3400) method to add multiple related cookie headers to this collection. SetCookieField (see page 3400) creates and adds new cookies that share a common set of values for the domain, path, expires, and secure fields. Use the HeaderValue property of the individual entries in Cookies to determine the actual response header string that is sent for each cookie header.

Note: For more information about the use of cookies, see the documentation on Netscape's Web site.

See Also

SetCookieField (see page 3400)

Cookie (see page 3377)

TCookie (see page 3304)

Describing the Server Application

13.1.21.6.9 TWebResponse.CustomHeaders Property

Lists message header strings that are added to the response message before it is sent.

Pascal

```
property CustomHeaders: TStrings;
```

C++

```
__property TStrings CustomHeaders;
```

Description

Use CustomHeaders to add header information to the response that can not be specified using the other properties of TWebResponse (see page 3389). Each string in the CustomHeaders property has the form HeaderName=Value, where HeaderName specifies the name of the header, and Value is the value for that header, formatted as a string.

Note: Setting the CustomHeaders property assigns a set of strings to the custom headers list. It does not replace the TStrings object that is the value of CustomHeaders.

Warning: CustomHeaders includes at most one value for each HeaderName. If the HTTP message includes multiple headers with the same name, only the first header's value will appear in CustomHeaders.

See Also

GetCustomHeader (see page 3395)

SetCustomHeader (see page 3400)

TStrings

Assign

13.1.21.6.10 TWebResponse.Date Property

Indicates the time and date when the HTTP response message is sent to the web client.

Pascal

```
property Date: TDateTime;
```

C++

```
__property TDateTime Date;
```

Description

Set Date to the current date and time immediately before sending the HTTP response message to the web client. The Web client uses Date to determine the age of the information returned.

Date is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 3409)

LastModified (see page 3410)

13.1.21.6.11 TWebResponse.DerivedFrom Property

Specifies the URI of the resource where the Content (see page 3404) of the HTTP response originated.

Pascal

```
property DerivedFrom: AnsiString;
```

C++

```
__property AnsiString DerivedFrom;
```

Description

Set DerivedFrom to the URI where the value of Content (see page 3404) originates. It is especially important to set DerivedFrom when the Content (see page 3404) of the HTTP response did not originate from the resource indicated by the URL property of the request object.

See Also

Content (see page 3404)

URL (see page 3388)

Describing the Content

13.1.21.6.12 TWebResponse.Expires Property

Specifies the date and time after which the Content (see page 3404) of the HTTP response message should be considered invalid.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Set Expires when the Content (see page 3404) of the HTTP response message contains information that may become invalid with the passage of time. Setting an Expires value does not imply that the information or its source will necessarily change or cease to exist when the Expires date and time is reached. Web clients are simply warned to check the freshness of the information after the Expires date and time.

The value of Expires is specified in Greenwich Mean Time.

Expires is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Date (see page 3408)

LastModified (see page 3410)

Describing the Content

13.1.21.6.13 TWebResponse.HTTPRequest Property

Represents the HTTP request message for which this is a response.

Pascal

```
property HTTPRequest: TWebRequest;
```

C++

```
__property TWebRequest HTTPRequest;
```

Description

Read HTTPRequest to determine the header and contents of the HTTP request message that spawned this response message. The properties of HTTPRequest give access to the information sent in the web client request message.

See Also

TWebRequest (see page 3358)

13.1.21.6.14 TWebResponse.LastModified Property

Indicates the date and time that the value of the Content (see page 3404) property was last updated.

Pascal

```
property LastModified: TDateTime;
```

C++

```
__property TDateTime LastModified;
```

Description

Set LastModified to indicate the last time the Content (see page 3404) of the response was modified. This allows web clients to determine whether their local version of that information is up-to-date. When the HTTP request is a HEAD message, this may allow the web client and server to skip a potentially expensive transfer of information.

The value of LastModified is specified in the local time of the machine. The HTTP response message translates this value to the date encoding used by HTTP.

LastModified is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 3409)

Date (see page 3408)

IfModifiedSince (see page 3380)

Describing the Content

13.1.21.6.15 TWebResponse.Location Property

Specifies the URI of a resource the web client should point to for the completion of its request.

Pascal

```
property Location: AnsiString;
```

C++

```
__property AnsiString Location;
```

Description

Set Location when the TWebResponse (see page 3389) created a new resource in response to the HTTP request message, or when servicing of the request must be delegated to another URI than the one specified in the HTTP request message.

See Also

URL (see page 3388)

Indicating the Need for Client Action

13.1.21.6.16 TWebResponse.LogMessage Property

Describes the HTTP response message for event logging purposes.

Pascal

```
property LogMessage: string;
```

C++

```
__property UnicodeString LogMessage;
```

Description

Set LogMessage to a description of the action carried out by the TWebActionItem (see page 3335) object that services this HTTP response. Usually, LogMessage includes the URI that handled the request message, along with date and time information.

See Also

TWebActionItem (see page 3335)

TWebRequest (see page 3358)

13.1.21.6.17 TWebResponse.RawContent Property

Pascal

```
property RawContent: AnsiString;
```

C++

```
__property AnsiString RawContent;
```

Description

This is RawContent, a member of class TWebResponse.

13.1.21.6.18 TWebResponse.Realm Property

Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.

Pascal

```
property Realm: AnsiString;
```

C++

```
__property AnsiString Realm;
```

Description

Set Realm when the response message returns 401 (Unauthorized) or 402 (Payment required). Realm is the name of a set of URIs that require a password or payment before the web client can access them. All the URIs in the realm, including the URL specified in the request message, are made available as soon as the Web client provides the password or payment for the realm. The server application should keep track, internally, of the passwords or payments the client has provided, using the client information provided by the TWebRequest (see page 3358) object.

See Also

StatusCode (see page 3413)

TWebRequest (see page 3358)

URL (see page 3388)

WWWAuthenticate (see page 3415)

13.1.21.6.19 TWebResponse.ReasonString Property

Indicates the status of the response to the web client request as a human-readable string.

Pascal

```
property ReasonString: AnsiString;
```

C++

```
__property AnsiString ReasonString;
```

Description

Set ReasonString to inform the human web client of the success or failure of the HTTP request message. Each reason string is associated with a 3-digit status code whose value indicates the status of the response. The HTTP standard defines a number of stock status codes and corresponding reason strings. In addition, server applications can define new reason strings and associate them with unused status codes.

See Also

StatusCode (see page 3413)

Indicating the Response Status

13.1.21.6.20 TWebResponse.Server Property

Provides information about the software used by the server application to handle the request.

Pascal

```
property Server: AnsiString;
```

C++

```
__property AnsiString Server;
```

Description

Set Server to a string giving the name and version number of the application that provides the Content (see page 3404) of the

response message. The value of Server can contain multiple product identifiers and comments, listed in order of significance and separated by spaces. Product identifiers take the form ProductName/VersionNumber.

See Also

Content (see page 3404)

UserAgent (see page 3388)

Describing the Server Application

13.1.21.6.21 TWebResponse.StatusCode Property

Indicates the status of the response to the HTTP request message as a 3-digit integer.

Pascal

```
property StatusCode: Integer;
```

C++

```
__property int StatusCode;
```

Description

Set StatusCode to inform the web client the status of the HTTP request message. Status codes are standard return values that can be interpreted by all web clients. Each status code has a corresponding reason string that provides a human web client with a more understandable indication of the status.

The following tables lists the standard status codes and their corresponding reason strings.

StatusCode	ReasonString (see page 3412)
100	Continue
101	Switching Protocols
200	OK
201	Created
202	Accepted
203	Non-Authoritative Information
204	No Content (see page 3404)
205	Reset Content (see page 3404)
206	Partial Content (see page 3404)
300	Multiple Choices
301	Moved Permanently
302	Moved Temporarily
303	See Other
304	Not Modified
305	Use Proxy
400	Bad Request
401	Unauthorized
402	Payment Required
403	Forbidden

404	Not Found
405	Method Not Allowed
406	Not Acceptable
407	Proxy Authentication Required
408	Request Time-out
409	Conflict
410	Gone
411	Length Required
412	Precondition Failed
413	Request Entity Too Large
414	Request-URI Too Large
415	Unsupported Media Type
500	Internal Server (see page 3412) Error
501	Not Implemented
502	Bad Gateway
503	Service Unavailable
504	Gateway Time-out
505	HTTP Version (see page 3415) not supported

Status codes not in the table can be created by the server application. When creating a new status code, the most significant digit should indicate the class of response, as follows:

1xx: Informational (Request received, continuing process)

2xx: Success (Request received, understood, and accepted)

3xx: Redirection (Further action needed to complete the request)

4xx: Client Error (Request contains bad syntax or cannot be serviced)

5xx: Server (see page 3412) Error (Server (see page 3412) failed to handle a valid request)

See Also

ReasonString (see page 3412)

Indicating the Response Status

13.1.21.6.22 TWebResponse.Title Property

Specifies a title for the Content (see page 3404) of the HTTP response message.

Pascal

```
property Title: AnsiString;
```

C++

```
__property AnsiString Title;
```

Description

Set the Title property to add a Title header to the HTTP response message. Title is an optional application-specific title

associated with the information included in the message.

See Also

Title (see page 3387)

Describing the Content

13.1.21.6.23 TWebResponse.Version Property

Specifies the HTTP protocol version number that the web client is using.

Pascal

```
property Version: AnsiString;
```

C++

```
__property AnsiString Version;
```

Description

Read Version to ensure that the properties set in the TWebResponse (see page 3389) object will be understood by the Web client. The value of Version is taken from the ProtocolVersion property of the TWebRequest (see page 3358) object.

For more information on the different HTTP protocol versions, see the Internet standards documentation.

See Also

ProtocolVersion (see page 3383)

13.1.21.6.24 TWebResponse.WWWAuthenticate Property

Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 3413) 401 (Unauthorized).

Pascal

```
property WWWAuthenticate: AnsiString;
```

C++

```
__property AnsiString WWWAuthenticate;
```

Description

Set WWWAuthenticate when the HTTP request fails because it requires access to a URI in a realm for which the Web client has not provided a password. WWWAuthenticate consists of an authentication scheme name, followed by a comma-separated list of parameter/value pairs that specify the parameters to the authentication scheme. The first parameter/value pair indicates the realm.

For more information about HTTP authentication schemes, see the Internet standards documents.

See Also

Realm (see page 3411)

StatusCode (see page 3413)

Indicating the Need for Client Action

13.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IGetAppDispatcher (see page 3416)	This is class HTTPApp.IGetAppDispatcher.
	IGetWebAppServices (see page 3417)	This is class HTTPApp.IGetWebAppServices.
	IGetWebRequestHandler (see page 3418)	This is class HTTPApp.IGetWebRequestHandler.
	IMultiModuleSupport (see page 3419)	This is class HTTPApp.IMultiModuleSupport.
	IProduceContent (see page 3420)	IProduceContent is the interface for generating the content of a Web page.
	IProduceContentFrom (see page 3422)	This is class HTTPApp.IProduceContentFrom.
	ISetAppDispatcher (see page 3423)	This is class HTTPApp.ISetAppDispatcher.
	IWebAppServices (see page 3424)	IWebAppServices is the interface for setting up and finishing the processing of HTTP request messages.
	IWebDispatch (see page 3427)	
	IWebDispatchActions (see page 3430)	IWebDispatchActions is the interface for components that dispatch HTTP request messages using action items.
	IWebDispatcherAccess (see page 3431)	IWebDispatcherAccess provides access to the current HTTP request and response object.
	IWebExceptionHandler (see page 3433)	This is class HTTPApp.IWebExceptionHandler.
	IWebRequestHandler (see page 3434)	IWebRequestHandler is the interface for objects that dispatch HTTP request messages.

13.2.1 IGetAppDispatcher Interface

Class Hierarchy

Pascal

```
IGetAppDispatcher = interface;
```

C++

```
__interface IGetAppDispatcher;
```

File

HTTPApp

Description

This is class HTTPApp.IGetAppDispatcher.

13.2.1.1 IGetAppDispatcher Members

The following tables list the members exposed by IGetAppDispatcher.

Public Methods

	Name	Description
	GetAppDispatcher (see page 3417)	This is GetAppDispatcher, a member of class IGetAppDispatcher.

13.2.1.2 IGetAppDispatcher Methods

The methods of the IGetAppDispatcher class are listed here.

Public Methods

	Name	Description
	GetAppDispatcher (see page 3417)	This is GetAppDispatcher, a member of class IGetAppDispatcher.

13.2.1.2.1 IGetAppDispatcher.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class IGetAppDispatcher.

13.2.2 IGetWebAppServices Interface

Class Hierarchy

HTTPApp.IGetWebAppServices

Pascal

```
IGetWebAppServices = interface;
```

C++

```
__interface IGetWebAppServices;
```

File

HTTPApp

Description

This is class HTTPApp.IGetWebAppServices.

13.2.2.1 IGetWebAppServices Members

The following tables list the members exposed by IGetWebAppServices.

Public Methods

	Name	Description
	GetWebAppServices (see page 3418)	This is GetWebAppServices, a member of class IGetWebAppServices.

13.2.2.2 IGetWebAppServices Methods

The methods of the IGetWebAppServices class are listed here.

Public Methods

	Name	Description
	GetWebAppServices (see page 3418)	This is GetWebAppServices, a member of class IGetWebAppServices.

13.2.2.2.1 IGetWebAppServices.GetWebAppServices Method

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

This is GetWebAppServices, a member of class IGetWebAppServices.

13.2.3 IGetWebRequestHandler Interface

Class Hierarchy

HTTPApp.IGetWebRequestHandler

Pascal

```
IGetWebRequestHandler = interface;
```

C++

```
__interface IGetWebRequestHandler;
```

File

HTTPApp

Description

This is class HTTPApp.IGetWebRequestHandler.

13.2.3.1 IGetWebRequestHandler Members

The following tables list the members exposed by IGetWebRequestHandler.

Public Methods

	Name	Description
	GetWebRequestHandler (see page 3419)	This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

13.2.3.2 IGetWebRequestHandler Methods

The methods of the IGetWebRequestHandler class are listed here.

Public Methods

	Name	Description
	GetWebRequestHandler (see page 3419)	This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

13.2.3.2.1 IGetWebRequestHandler.GetWebRequestHandler Method

Pascal

```
function GetWebRequestHandler: IWebRequestHandler;
```

C++

```
__fastcall IWebRequestHandler GetWebRequestHandler();
```

Description

This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

13.2.4 IMultiModuleSupport Interface

Class Hierarchy

HTTPApp.IMultiModuleSupport

Pascal

```
IMultiModuleSupport = interface;
```

C++

```
__interface IMultiModuleSupport;
```

File

HTTPApp

Description

This is class HTTPApp.IMultiModuleSupport.

13.2.4.1 IMultiModuleSupport Members

The following tables list the members exposed by IMultiModuleSupport.

Public Methods

	Name	Description
	FinishContext (see page 3420)	This is FinishContext, a member of class IMultiModuleSupport.
	InitContext (see page 3420)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 3420)	This is InitModule, a member of class IMultiModuleSupport.

13.2.4.2 IMultiModuleSupport Methods

The methods of the IMultiModuleSupport class are listed here.

Public Methods

	Name	Description
	FinishContext (see page 3420)	This is FinishContext, a member of class IMultiModuleSupport.
	InitContext (see page 3420)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 3420)	This is InitModule, a member of class IMultiModuleSupport.

13.2.4.2.1 IMultiModuleSupport.FinishContext Method

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

This is FinishContext, a member of class IMultiModuleSupport.

13.2.4.2.2 IMultiModuleSupport.InitContext Method

Pascal

```
procedure InitContext(Request: TWebRequest; Response: TWebResponse);
```

C++

```
__fastcall InitContext(TWebRequest Request, TWebResponse Response);
```

Description

This is InitContext, a member of class IMultiModuleSupport.

13.2.4.2.3 IMultiModuleSupport.InitModule Method

Pascal

```
procedure InitModule(AModule: TComponent);
```

C++

```
__fastcall InitModule(TComponent * AModule);
```

Description

This is InitModule, a member of class IMultiModuleSupport.

13.2.5 IProduceContent Interface

IProduceContent is the interface for generating the content of a Web page.

Class Hierarchy

HTTPApp.IProduceContent

Pascal

```
IProduceContent = interface;
```

C++

```
__interface IProduceContent;
```

File

HTTPApp

Description

Content producers (such as TAdapaterPageProducer) implement the IProduceContent interface. This interface defines a single method, ProduceContent (see page 3421), which returns the content to assign to an HTTP response message in a WebSnap application.

Note: In C++, method declarations that use IProduceContent use the _di_IProduceContent type instead. This type is a DelphiInterface wrapper around the IProduceContent interface:

Note: typedef System::DelphiInterface< IProduceContent > _di_IProduceContent;

See Also

TCustomContentProducer (see page 3313)

TCustomWebPageModule

TAdapterPagePRoducer

TWebResponse (see page 3389)

13.2.5.1 IProduceContent Members

The following tables list the members exposed by IProduceContent.

Public Methods

	Name	Description
	ProduceContent (see page 3421)	Returns the content that the producer creates.

13.2.5.2 IProduceContent Methods

The methods of the IProduceContent class are listed here.

Public Methods

	Name	Description
	ProduceContent (see page 3421)	Returns the content that the producer creates.

13.2.5.2.1 IProduceContent.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall UnicodeString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content (see page 3314)

13.2.6 IProduceContentFrom Interface

Class Hierarchy

HTTPApp.IProduceContentFrom

Pascal

```
IProduceContentFrom = interface;
```

C++

```
__interface IProduceContentFrom;
```

File

HTTPApp

Description

This is class HTTPApp.IProduceContentFrom.

13.2.6.1 IProduceContentFrom Members

The following tables list the members exposed by IProduceContentFrom.

Public Methods

	Name	Description
	ProduceContentFromStream (see page 3422)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 3423)	This is ProduceContentFromString, a member of class IProduceContentFrom.

13.2.6.2 IProduceContentFrom Methods

The methods of the IProduceContentFrom class are listed here.

Public Methods

	Name	Description
	ProduceContentFromStream (see page 3422)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 3423)	This is ProduceContentFromString, a member of class IProduceContentFrom.

13.2.6.2.1 IProduceContentFrom.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class IProduceContentFrom.

13.2.6.2.2 IProduceContentFrom.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromString(const UnicodeString S);
```

Description

This is ProduceContentFromString, a member of class IProduceContentFrom.

13.2.7 ISetAppDispatcher Interface

Class Hierarchy

HTTPApp.ISetAppDispatcher

Pascal

```
ISetAppDispatcher = interface;
```

C++

```
__interface ISetAppDispatcher;
```

File

HTTPApp

Description

This is class HTTPApp.ISetAppDispatcher.

13.2.7.1 ISetAppDispatcher Members

The following tables list the members exposed by ISetAppDispatcher.

Public Methods

	Name	Description
	SetAppDispatcher (see page 3424)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

13.2.7.2 ISetAppDispatcher Methods

The methods of the ISetAppDispatcher class are listed here.

Public Methods

	Name	Description
	SetAppDispatcher (see page 3424)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

13.2.7.2.1 ISetAppDispatcher.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class ISetAppDispatcher.

13.2.8 IWebAppServices Interface

IWebAppServices is the interface for setting up and finishing the processing of HTTP request messages.

Class Hierarchy

HTTPApp.IWebAppServices

Pascal

```
IWebAppServices = interface;
```

C++

```
__interface IWebAppServices;
```

File

HTTPApp

Description

WebSnap applications use the IWebAppServices interface to drive the processing of incoming request messages. When the WebSnap application receives an HTTP request message it

1. Calls InitContext (see page 3426) to set up a Web context for the request.
2. Calls HandleRequest (see page 3426) to forward the request to the components that process it.
3. Calls FinishContext (see page 3425) to shut down the Web context in an orderly fashion.

In addition to providing access to these core methods of the application, IWebAppServices introduces the ExceptionHandler (see page 3427) property. The ExceptionHandler (see page 3427) property allows the application access to the component that handles any exceptions that escape all of the try blocks in the application while processing the message.

Note: Method declarations that use IWebAppServices use the _di_IWebAppServices type instead. This type is a DelphiInterface wrapper around the IWebAppServices interface:

Note: typedef System::DelphiInterface< IWebAppServices > _di_IWebAppServices;

See Also

TMultiModuleWebAppServices

AppServices

WebContext

13.2.8.1 IWebAppServices Members

The following tables list the members exposed by IWebAppServices.

Public Methods

	Name	Description
	FinishContext (see page 3425)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 3426)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleRequest (see page 3426)	Directs the processing of the current request message.
	InitContext (see page 3426)	Creates and initializes the Web context for the current Web request.

Public Properties

	Name	Description
R	ExceptionHandler (see page 3427)	Indicates the object that handles exceptions that arise when processing a request message.

13.2.8.2 IWebAppServices Methods

The methods of the IWebAppServices class are listed here.

Public Methods

	Name	Description
	FinishContext (see page 3425)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 3426)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleRequest (see page 3426)	Directs the processing of the current request message.
	InitContext (see page 3426)	Creates and initializes the Web context for the current Web request.

13.2.8.2.1 IWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message (including the Web context).

See Also

InitContext (see page 3426)

WebContext

13.2.8.2.2 IWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler is the read implementation of the ExceptionHandler (see page 3427) property.

See Also

ExceptionHandler (see page 3427)

13.2.8.2.3 IWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext (see page 3426) method is called to generate a Web context for the request.
2. HandleRequest is called to generate a response to the request.
3. FinishContext (see page 3425) is called to perform any final cleanup.

HandleRequest locates the dispatcher components that handle the request and forwards the request to a dispatcher for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

InitContext (see page 3426)

FinishContext (see page 3425)

13.2.8.2.4 IWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message.

Request describes the new request message.

Response is the response object that the WebSnap application should fill out when handling the current request.

See Also

FinishContext (see page 3425)

WebContext

13.2.8.3 IWebAppServices Properties

The properties of the IWebAppServices class are listed here.

Public Properties

	Name	Description
	ExceptionHandler (see page 3427)	Indicates the object that handles exceptions that arise when processing a request message.

13.2.8.3.1 IWebAppServices.ExceptionHandler Property

Indicates the object that handles exceptions that arise when processing a request message.

Pascal

```
property ExceptionHandler: TObject;
```

C++

```
__property TObject * ExceptionHandler;
```

Description

ExceptionHandler is the object that the WebSnap application calls when an exception is raised while trying to process a request message. The request handler must implement the IWebExceptionHandler (see page 3433) interface, which includes only a single method: HandleException.

13.2.9 IWebDispatch Interface

Class Hierarchy

HTTPApp.IWebDispatch

Pascal

```
IWebDispatch = interface;
```

C++

```
__interface IWebDispatch;
```

File

HTTPApp

See Also

TCustomWebDispatcher (see page 3318)

13.2.9.1 IWebDispatch Members

The following tables list the members exposed by IWebDispatch.

Public Methods

	Name	Description
	DispatchEnabled (see page 3428)	
	DispatchMask (see page 3429)	
	DispatchMethodType (see page 3429)	
	DispatchRequest (see page 3429)	

Public Properties

	Name	Description
R	Enabled (see page 3429)	
R	Mask (see page 3430)	
R	MethodType (see page 3430)	This is MethodType, a member of class IWebDispatch.

13.2.9.2 IWebDispatch Methods

The methods of the IWebDispatch class are listed here.

Public Methods

	Name	Description
	DispatchEnabled (see page 3428)	
	DispatchMask (see page 3429)	
	DispatchMethodType (see page 3429)	
	DispatchRequest (see page 3429)	

13.2.9.2.1 IWebDispatch.DispatchEnabled Method

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

See Also

Enabled (see page 3429)

13.2.9.2.2 IWebDispatch.DispatchMask Method

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

See Also

Mask (see page 3430)

13.2.9.2.3 IWebDispatch.DispatchMethodType Method

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

See Also

MethodType (see page 3430)

13.2.9.2.4 IWebDispatch.DispatchRequest Method

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

13.2.9.3 IWebDispatch Properties

The properties of the IWebDispatch class are listed here.

Public Properties

	Name	Description
R	Enabled (see page 3429)	
R	Mask (see page 3430)	
R	MethodType (see page 3430)	This is MethodType, a member of class IWebDispatch.

13.2.9.3.1 IWebDispatch.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

See Also

DispatchEnabled (see page 3428)

13.2.9.3.2 IWebDispatch.Mask Property

Pascal

```
property Mask: TMask;
```

C++

```
__property TMask Mask;
```

See Also

DispatchMask (see page 3429)

13.2.9.3.3 IWebDispatch.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class IWebDispatch.

13.2.10 IWebDispatchActions Interface

IWebDispatchActions is the interface for components that dispatch HTTP request messages using action items.

Class Hierarchy

HTTPApp.IWebDispatchActions

Pascal

```
IWebDispatchActions = interface;
```

C++

```
__interface IWebDispatchActions;
```

File

HTTPApp

Description

Web dispatcher components (TWebDispatcher (see page 3349) and TWebModule (see page 3354)) implement the IWebDispatchActions interface. This interface serves primarily to identify components that use action items to handle HTTP request messages.

To obtain an IWebDispatchActions interface, use the DispatchActions property of a TWebAppComponents object.

Note: In C++, method declarations that use IWebDispatchActions use the _di_IWebDispatchActions type instead. This type is a DelphiInterface wrapper around the IWebDispatchActions interface:

Note: typedef System::DelphiInterface< IWebDispatchActions > _di_IWebDispatchActions;

See Also

TWebDispatcher (see page 3349)

TWEbModule

TWebAppComponents

TCustomWebAppComponents

13.2.11 IWebDispatcherAccess Interface

IWebDispatcherAccess provides access to the current HTTP request and response object.

Class Hierarchy

Pascal

```
IWebDispatcherAccess = interface;
```

C++

```
__interface IWebDispatcherAccess;
```

File

HTTPApp

Description

The IWebDispatcherAccess interface declares two methods, Request (see page 3432) and Response (see page 3432). These return the objects that represent the current HTTP request message that is being processed and the emerging HTTP response message that will be sent back to the caller.

In Web Broker applications, a TWebDispatcher (see page 3349) or TWebModule (see page 3354) component implements this interface. In WebSnap applications, a TWebAppComponents component implements this interface.

Note: In C++, method declarations that use IWebDispatcherAccess use the _di_IWebDispatcherAccess type instead. This type is a DelphiInterface wrapper around the IWebDispatcherAccess interface:

Note: typedef System::DelphiInterface< IWebDispatcherAccess > _di_IWebDispatcherAccess;

See Also

TCustomContentProducer (see page 3313)

TWebDispatcher (see page 3349)

TWebAppComponents

TWebModule (see page 3354)

13.2.11.1 IWebDispatcherAccess Members

The following tables list the members exposed by IWebDispatcherAccess.

Public Methods

	Name	Description
	Request (see page 3432)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 3432)	Returns the Web response object for the HTTP response message that the application is assembling.

13.2.11.2 IWebDispatcherAccess Methods

The methods of the IWebDispatcherAccess class are listed here.

Public Methods

	Name	Description
	Request (see page 3432)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 3432)	Returns the Web response object for the HTTP response message that the application is assembling.

13.2.11.2.1 IWebDispatcherAccess.Request Method

Returns the Web request object for the HTTP request message to which the application is responding.

Pascal

```
function Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Request();
```

Description

Call Request to obtain access to the current Web request object. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 3432)

13.2.11.2.2 IWebDispatcherAccess.Response Method

Returns the Web response object for the HTTP response message that the application is assembling.

Pascal

```
function Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Response();
```

Description

Call Response to obtain access to the current Web response object. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 3432)

13.2.12 IWebExceptionHandler Interface

Class Hierarchy

HTTPApp.IWebExceptionHandler

Pascal

```
IWebExceptionHandler = interface;
```

C++

```
__interface IWebExceptionHandler;
```

File

HTTPApp

Description

This is class HTTPApp.IWebExceptionHandler.

13.2.12.1 IWebExceptionHandler Members

The following tables list the members exposed by IWebExceptionHandler.

Public Methods

	Name	Description
	HandleException (see page 3433)	This is HandleException, a member of class IWebExceptionHandler.

13.2.12.2 IWebExceptionHandler Methods

The methods of the IWebExceptionHandler class are listed here.

Public Methods

	Name	Description
	HandleException (see page 3433)	This is HandleException, a member of class IWebExceptionHandler.

13.2.12.2.1 IWebExceptionHandler.HandleException Method

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

This is HandleException, a member of class IWebExceptionHandler.

13.2.13 IWebRequestHandler Interface

IWebRequestHandler is the interface for objects that dispatch HTTP request messages.

Class Hierarchy

Pascal

```
IWebRequestHandler = interface;
```

C++

```
__interface IWebRequestHandler;
```

File

HTTPApp

Description

Dispatcher components such as TPageDispatcher , TAdapterDispatcher, and TWebDispatcher (see page 3349) implement the IWebRequestHandler interface. This interface includes only a single method, HandleRequest (see page 3435), which processes an HTTP request message, filling out the corresponding response, which can then be returned to the caller.

Note: In C++, method declarations that use IWebRequestHandler use the _di_IWebRequestHandler type instead. This type is a DelphiInterface wrapper around the IWebRequestHandler interface:

Note: typedef System::DelphiInterface< IWebRequestHandler > _di_IWebRequestHandler;

See Also

TWebRequest (see page 3358)

TWebResponse (see page 3389)

TMultiModuleWebAppServices

TPageDispatcher

TAdapterDispatcher

TWebDispatcher (see page 3349)

13.2.13.1 IWebRequestHandler Members

The following tables list the members exposed by IWebRequestHandler.

Public Methods

	Name	Description
	HandleRequest (see page 3435)	Processes an HTTP request message.

13.2.13.2 IWebRequestHandler Methods

The methods of the IWebRequestHandler class are listed here.

Public Methods

	Name	Description
	HandleRequest (see page 3435)	Processes an HTTP request message.

13.2.13.2.1 IWebRequestHandler.HandleRequest Method

Processes an HTTP request message.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

Call HandleRequest to process an HTTP request message and obtain the response that should be sent back to the caller.

Request is the request object that describes the request to process.

Response is the response object that should be filled out when the request is processed.

13.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DayOfWeekStr (see page 3436)	Converts a TDateTime into a string representing the day of the week.
	DosPathToUnixPath (see page 3437)	Converts a DOS-compatible path specification to a Unix-compatible path specification.
	EncodingFromContentType (see page 3437)	This is function HTTPApp.EncodingFromContentType.
	EncodingGetBytes (see page 3437)	This is function HTTPApp.EncodingGetBytes.
	EncodingGetString (see page 3438)	This is function HTTPApp.EncodingGetString.
	ExtractHeaderFields (see page 3438)	Parses a multi-valued string into its constituent fields.
	ExtractHeaderFields (see page 3438)	Parses a multi-valued string into its constituent fields.
	ExtractHTTPFields (see page 3439)	Parses a multi-valued string into its constituent fields.
	ExtractHTTPFields (see page 3439)	Parses a multi-valued string into its constituent fields.
	HTMLDecode (see page 3439)	This is function HTTPApp.HTMLDecode.
	HTMLEncode (see page 3440)	This is function HTTPApp.HTMLEncode.
	HTTPDecode (see page 3440)	Decodes a string that includes HTTP escape characters.
	HTTPEncode (see page 3441)	Converts a string into a form that contains no values that are illegal in an HTTP message header.
	MonthStr (see page 3441)	Converts a TDateTime into a string representing the month.
	ParseDate (see page 3442)	Converts a date value from an HTTP message header into a TDateTime.
	RegisterContentParser (see page 3442)	This is function HTTPApp.RegisterContentParser.
	StatusString (see page 3442)	Returns the explanatory string associated with one of the predefined HTTP response status codes.
	UnixPathToDosPath (see page 3443)	Converts a Unix-compatible path specification to a Dos-compatible path specification.

13.3.1 HTTPApp.DayOfWeekStr Function

Converts a TDateTime into a string representing the day of the week.

Pascal

```
function DayOfWeekStr(DateTime: TDateTime): string;
```

C++

```
UnicodeString DayOfWeekStr(TDateTime DateTime);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. DayOfWeekStr converts a TDateTime into a string representing the day of the week. DayOfWeekStr allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

See Also

MonthStr (see page 3441)

13.3.2 HTTPApp.DosPathToUnixPath Function

Converts a DOS-compatible path specification to a Unix-compatible path specification.

Pascal

```
function DosPathToUnixPath(const Path: string): string;
```

C++

```
UnicodeString DosPathToUnixPath(const UnicodeString Path);
```

File

HTTPApp

Description

Use DosPathToUnixPath to convert a path name on the local machine to a path name that can be sent in an HTTP message, or that will be used by a Unix-based application. DosPathToUnixPath converts all backslash characters (\) to forward slashes (/).

The Path parameter is the Dos-compatible path. The return value is the corresponding Unix-compatible path.

See Also

UnixPathToDosPath (see page 3443)

13.3.3 HTTPApp.EncodingFromContentType Function

Pascal

```
function EncodingFromContentType(const AContentType: AnsiString): TEncoding;
```

C++

```
TEncoding EncodingFromContentType(const AnsiString AContentType);
```

File

HTTPApp

Description

This is function HTTPApp.EncodingFromContentType.

13.3.4 HTTPApp.EncodingGetBytes Function

Pascal

```
function EncodingGetBytes(const AContentType: AnsiString; const AValue: string): TBytes;
```

C++

```
TBytes EncodingGetBytes(const AnsiString AContentType, const UnicodeString AValue);
```

File

HTTPApp

Description

This is function HTTPApp.EncodingGetBytes.

13.3.5 HTTPApp.EncodingGetString Function

Pascal

```
function EncodingGetString(const AContentType: AnsiString; const AValue: AnsiString): string;
```

C++

```
UnicodeString EncodingGetString(const AnsiString AContentType, const AnsiString AValue);
```

File

HTTPApp

Description

This is function HTTPApp.EncodingGetString.

13.3.6 HTTPApp.ExtractHeaderFields Function

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractHeaderFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content:
PChar; Strings: TStrings; Decode: Boolean; StripQuotes: Boolean = False); overload;
procedure ExtractHeaderFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; const Content:
AnsiString; Strings: TStrings; Decode: Boolean; StripQuotes: Boolean = False); overload;
```

C++

```
ExtractHeaderFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings, Boolean Decode, Boolean StripQuotes = False);
ExtractHeaderFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const AnsiString Content,
TStrings Strings, Boolean Decode, Boolean StripQuotes = False);
```

File

HTTPApp

Description

ExtractHeaderFields is a general utility to parse multi-valued HTTP header strings into separate substrings.

Separators is a set of characters that are used to separate individual values within the multi-valued string.

WhiteSpace is a set of characters that are to be ignored when parsing the string.

Content is the multi-valued string to be parsed.

Strings is the TStrings object that receives the individual values that are parsed from Content.

StripQuotes determines whether the surrounding quotes are removed from the resulting items. When StripQuotes is true, surrounding quotes are removed before substrings are added to Strings.

Note: Characters contained in Separators or WhiteSpace are treated as part of a value substring if the substring is surrounded by single or double quote marks. HTTP escape characters are converted using the HTTPDecode (see page 3440) function.

See Also

HTTPDecode (see page 3440)

TStrings

13.3.7 HTTPApp.ExtractHTTPFields Function

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractHTTPFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content: PChar;
Strings: TStrings; StripQuotes: Boolean = False); overload;
procedure ExtractHTTPFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; const Content:
AnsiString; Strings: TStrings; StripQuotes: Boolean = False); overload;
```

C++

```
ExtractHTTPFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings, Boolean StripQuotes = False);
ExtractHTTPFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const AnsiString Content,
TStrings Strings, Boolean StripQuotes = False);
```

File

HTTPApp

Description

ExtractHTTPFields is a general utility to parse multi-valued HTTP header strings into separate substrings.

Separators is a set of characters that are used to separate individual values within the multi-valued string.

WhiteSpace is a set of characters that are to be ignored when parsing the string.

Content is the multi-valued string to be parsed.

Strings is the TStrings object that receives the individual values that are parsed from Content.

StripQuotes determines whether the surrounding quotes are removed from the resulting items. When StripQuotes is true, surrounding quotes are removed before substrings are added to Strings.

Note: Characters contained in Separators or WhiteSpace are treated as part of a value substring if the substring is surrounded by single or double quote marks. HTTP escape characters are converted using the HTTPDecode (see page 3440) function.

See Also

HTTPDecode (see page 3440)

TStrings

13.3.8 HTTPApp.HTMLDecode Function

Pascal

```
function HTMLDecode(const AStr: String): String;
```

C++

```
UnicodeString HTMLDecode(const UnicodeString AStr);
```

File

HTTPApp

Description

This is function HTTPApp.HTMLDecode.

13.3.9 HTTPApp.HTMLEncode Function

Pascal

```
function HTMLEncode(const AStr: String): String;
```

C++

```
UnicodeString HTMLEncode(const UnicodeString AStr);
```

File

HTTPApp

Description

This is function HTTPApp.HTMLEncode.

13.3.10 HTTPApp.HTTPDecode Function

Decodes a string that includes HTTP escape characters.

Pascal

```
function HTTPDecode(const AStr: AnsiString): AnsiString;
```

C++

```
AnsiString HTTPDecode(const AnsiString AStr);
```

File

HTTPApp

Description

HTTPDecode decodes the escape characters (+ and %) in a string that comes from an HTTP message header. Plus characters (+) are converted into spaces. Percent signs (%) indicate that the next two characters are the hex representation of a character. If a percent sign is followed by another percent sign (%%), it is converted into a single percent sign.

For example, the string

%%+%3f

is converted into

% ?

The AStr parameter is the undecoded string. The return value is the converted version of the string.

See Also

ExtractHTTPFields (see page 3439)

HTTPEncode (see page 3441)

13.3.11 HTTPApp.HTTPEncode Function

Converts a string into a form that contains no values that are illegal in an HTTP message header.

Pascal

```
function HTTPEncode(const AStr: AnsiString): AnsiString;
```

C++

```
AnsiString HTTPEncode(const AnsiString AStr);
```

File

HTTPApp

Description

HTTPEncode converts all characters in the AStr parameter except for the letters A through Z (and a through z), numerals 0 through 9, the asterisk (*), dollar sign ($), exclamation point (!), at sign (@), period (.), underscore (_), single quote ('), comma (,) parentheses, and hyphen (-). Spaces are converted to plus characters (+), and all other characters are converted into hex values preceded by the percent sign (%).

For example, the string

% ?

is converted into

%%+%3f

HTTPEncode returns the converted string.

See Also

HTTPDecode (see page 3440)

13.3.12 HTTPApp.MonthStr Function

Converts a TDateTime into a string representing the month.

Pascal

```
function MonthStr(DateTime: TDateTime): string;
```

C++

```
UnicodeString MonthStr(TDateTime DateTime);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. MonthStr converts a TDateTime into a string representing the month. MonthStr allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

See Also

DayOfWeekStr (see page 3436)

13.3.13 HTTPApp.ParseDate Function

Converts a date value from an HTTP message header into a TDateTime.

Pascal

```
function ParseDate(const DateStr: string): TDateTime;
```

C++

```
TDateTime ParseDate(const UnicodeString DateStr);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. ParseDate converts from any of these formats into a TDateTime. ParseDate allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

Use ParseDate when interpreting temporal header values in HTTP request messages when they are not already parsed as a property of TWebRequest (see page 3358). TWebRequest (see page 3358) parses the Date header and Expires header automatically.

See Also

TWebRequest (see page 3358)

13.3.14 HTTPApp.RegisterContentParser Function

Pascal

```
procedure RegisterContentParser(AClass: TContentParserClass);
```

C++

```
RegisterContentParser(TContentParserClass AClass);
```

File

HTTPApp

Description

This is function HTTPApp.RegisterContentParser.

13.3.15 HTTPApp.StatusString Function

Returns the explanatory string associated with one of the predefined HTTP response status codes.

Pascal

```
function StatusString(StatusCode: Integer): AnsiString;
```

C++

```
AnsiString StatusString(int StatusCode);
```

File

HTTPApp

Description

The HTTP protocol specification defines a number of standard status codes that indicate the status of an HTTP request message. HTTP applications interpret these status codes, but for human beings, each of these codes has a corresponding string that provides a more understandable indication of the status of the HTTP request.

Call StatusString to obtain the string that corresponds to a standard status code. If the StatusCode parameter is not one of the codes defined in the HTTP standard, StatusString returns an empty string.

See Also

TWebResponse (see page 3389)

13.3.16 HTTPApp.UnixPathToDosPath Function

Converts a Unix-compatible path specification to a Dos-compatible path specification.

Pascal

```
function UnixPathToDosPath(const Path: string): string;
```

C++

```
UnicodeString UnixPathToDosPath(const UnicodeString Path);
```

File

HTTPApp

Description

Use UnixPathToDosPath to convert a path name obtained from an HTTP message or other Unix-based application to a path name that can be used by Windows. UnixPathToDosPath converts all forward slashes (/) to backslash characters (\).

The Path parameter is the Unix-compatible path. The return value is the corresponding Dos-compatible path.

See Also

DosPathToUnixPath (see page 3437)

13.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMethodType (see page 3444)	This is record HTTPApp.TMethodType.
	TWebModuleCacheMode (see page 3444)	This is record HTTPApp.TWebModuleCacheMode.
	TWebModuleCreateMode (see page 3445)	This is record HTTPApp.TWebModuleCreateMode.

13.4.1 HTTPApp.TMethodType Enumeration

Pascal

```
TMethodType = (
  mtAny,
  mtGet,
  mtPut,
  mtPost,
  mtHead
);
```

C++

```
enum TMethodType {
  mtAny,
  mtGet,
  mtPut,
  mtPost,
  mtHead
};
```

File

HTTPApp

Description

This is record HTTPApp.TMethodType.

13.4.2 HTTPApp.TWebModuleCacheMode Enumeration

Pascal

```
TWebModuleCacheMode = (
  caCache,
  caDestroy
);
```

C++

```
enum TWebModuleCacheMode {
  caCache,
  caDestroy
```

```
};
```

File

HTTPApp

Description

This is record HTTPApp.TWebModuleCacheMode.

13.4.3 HTTPApp.TWebModuleCreateMode Enumeration

Pascal

```
TWebModuleCreateMode = (
  crOnDemand,
  crAlways
);
```

C++

```
enum TWebModuleCreateMode {
  crOnDemand,
  crAlways
};
```

File

HTTPApp

Description

This is record HTTPApp.TWebModuleCreateMode.

13.5 Types

The following table lists types in this documentation.

Types

Name	Description
TContentParserClass (see page 3446)	This is type HTTPApp.TContentParserClass.
THTTPMethodEvent (see page 3446)	This is type HTTPApp.THTTPMethodEvent.
TModuleAddedProc (see page 3447)	This is type HTTPApp.TModuleAddedProc.
TWebExceptionEvent (see page 3447)	This is type HTTPApp.TWebExceptionEvent.
TWebModuleContext (see page 3447)	This is type HTTPApp.TWebModuleContext.

13.5.1 HTTPApp.TContentParserClass Type

Pascal

```
TContentParserClass = class of TAbstractContentParser;
```

C++

```
TAbstractContentParser TContentParserClass;
```

File

HTTPApp

Description

This is type HTTPApp.TContentParserClass.

13.5.2 HTTPApp.THTTPMethodEvent Type

Pascal

```
THTTPMethodEvent = procedure (Sender: TObject; Request: TWebRequest; Response: TWebResponse;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
THTTPMethodEvent)();
```

File

HTTPApp

Description

This is type HTTPApp.THTTPMethodEvent.

13.5.3 HTTPApp.TModuleAddedProc Type

Pascal

```
TModuleAddedProc = procedure (AWebModule: TComponent) of object;
```

C++

```
(AWebModule: TComponent) ( TModuleAddedProc)();
```

File

HTTPApp

Description

This is type HTTPApp.TModuleAddedProc.

13.5.4 HTTPApp.TWebExceptionEvent Type

Pascal

```
TWebExceptionEvent = procedure (Sender: TObject; E: Exception; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; E: Exception; var Handled: Boolean) ( TWebExceptionEvent)();
```

File

HTTPApp

Description

This is type HTTPApp.TWebExceptionEvent.

13.5.5 HTTPApp.TWebModuleContext Type

Pascal

```
TWebModuleContext = TObject;
```

C++

```
TObject * TWebModuleContext;
```

File

HTTPApp

Description

This is type HTTPApp.TWebModuleContext.

13.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MAX_DATETIMES (see page 3448)	This is constant HTTPApp.MAX_DATETIMES.
MAX_INTEGERS (see page 3448)	This is constant HTTPApp.MAX_INTEGERS.
MAX_STRINGS (see page 3449)	This is constant HTTPApp.MAX_STRINGS.
sDateFormat (see page 3449)	This is constant HTTPApp.sDateFormat.

13.6.1 HTTPApp.MAX_DATETIMES Constant

Pascal

```
MAX_DATETIMES = 3;
```

C++

```
MAX_DATETIMES = 3;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_DATETIMES.

13.6.2 HTTPApp.MAX_INTEGERS Constant

Pascal

```
MAX_INTEGERS = 1;
```

C++

```
MAX_INTEGERS = 1;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_INTEGERS.

13.6.3 HTTPApp.MAX_STRINGS Constant

Pascal

```
MAX_STRINGS = 12;
```

C++

```
MAX_STRINGS = 12;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_STRINGS.

13.6.4 HTTPApp.sDateFormat Constant

Pascal

```
sDateFormat = '"%s", dd "%s" yyyy hh:nn:ss';
```

C++

```
sDateFormat = '"%s", dd "%s" yyyy hh:nn:ss';
```

File

HTTPApp

Description

This is constant HTTPApp.sDateFormat.

14 HTTPProd Namespace

This is namespace HTTPProd.

Topics

Name	Description
Classes (see page 3453)	The following table lists classes in this documentation.
Interfaces (see page 3502)	The following table lists interfaces in this documentation.
Functions (see page 3518)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3521)	The following table lists structs, records, enums in this documentation.
Types (see page 3523)	The following table lists types in this documentation.
Variables (see page 3525)	The following table lists variables in this documentation.
Constants (see page 3526)	The following table lists constants in this documentation.

Classes

	Name	Description
	EScriptError (see page 3453)	This is class HTTPProd.EScriptError.
	TAbstractScriptEnginesList (see page 3455)	This is class HTTPProd.TAbstractScriptEnginesList.
	TAbstractScriptError (see page 3457)	This is class HTTPProd.TAbstractScriptError.
	TAbstractScriptErrors (see page 3460)	This is class HTTPProd.TAbstractScriptErrors.
	TAbstractScriptProducer (see page 3463)	
	TBasePageProducer (see page 3464)	TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.
	TCustomPageProducer (see page 3473)	TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.
	THTMLTableAttributes (see page 3478)	THTMLTableAttributes represents the display attributes of an HTML table tag.
	THTMLTableCellAttributes (see page 3484)	THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.
	THTMLTableElementAttributes (see page 3484)	THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.
	THTMLTableHeaderAttributes (see page 3488)	THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.
	THTMLTableRowAttributes (see page 3491)	THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.
	THTMLTagAttributes (see page 3492)	THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.
	TPageProducer (see page 3496)	TPageProducer produces a string of HTML commands based on an input template.

Constants

Name	Description
HTMLAlign (see page 3526)	This is constant HTTPProd.HTMLAlign.
HTMLVAlign (see page 3526)	This is constant HTTPProd.HTMLVAlign.

Functions

	Name	Description
	ContentFromScriptFile (see page 3518)	This is function HTTPProd.ContentFromScriptFile.
	ContentFromScriptStream (see page 3518)	This is function HTTPProd.ContentFromScriptStream.
	ContentFromStream (see page 3519)	This is function HTTPProd.ContentFromStream.
	ContentFromString (see page 3519)	This is function HTTPProd.ContentFromString.
	FindComponentWebModuleContext (see page 3519)	This is function HTTPProd.FindComponentWebModuleContext.
	GetEncodingOfStream (see page 3520)	This is function HTTPProd.GetEncodingOfStream.
	GetTagID (see page 3520)	This is function HTTPProd.GetTagID.

Interfaces

	Name	Description
	IDesignerFileManager (see page 3502)	This is class HTTPProd.IDesignerFileManager.
	IGetLocateFileService (see page 3503)	This is class HTTPProd.IGetLocateFileService.
	IGetProducerTemplate (see page 3504)	This is class HTTPProd.IGetProducerTemplate.
	ILocateFileService (see page 3505)	This is class HTTPProd.ILocateFileService.
	IScriptContext (see page 3506)	This is class HTTPProd.IScriptContext.
	IScriptProducer (see page 3508)	This is class HTTPProd.IScriptProducer.
	IWebVariableName (see page 3513)	This is class HTTPProd.IWebVariableName.
	IWebVariablesContainer (see page 3514)	This is class HTTPProd.IWebVariablesContainer.

Structs, Records, Enums

	Name	Description
	THTMLAlign (see page 3521)	This is record HTTPProd.THTMLAlign.
	THTMLVAlign (see page 3521)	This is record HTTPProd.THTMLVAlign.
	TTag (see page 3522)	This is record HTTPProd.TTag.

Types

Name	Description
THandledTagProc (see page 3523)	This is type HTTPProd.THandledTagProc.
THandleTagProc (see page 3523)	This is type HTTPProd.THandleTagProc.
THTMLBgColor (see page 3524)	This is type HTTPProd.THTMLBgColor.
THTMLTagEvent (see page 3524)	This is type HTTPProd.THTMLTagEvent.
TScriptProducerClass (see page 3524)	This is type HTTPProd.TScriptProducerClass.

Variables

Name	Description
DesignerFileManager (see page 3525)	This is variable HTTPProd.DesignerFileManager.
ScriptEnginesList (see page 3525)	This is variable HTTPProd.ScriptEnginesList.

14.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EScriptError (see page 3453)	This is class HTTPProd.EScriptError.
	TAbstractScriptEnginesList (see page 3455)	This is class HTTPProd.TAbstractScriptEnginesList.
	TAbstractScriptError (see page 3457)	This is class HTTPProd.TAbstractScriptError.
	TAbstractScriptErrors (see page 3460)	This is class HTTPProd.TAbstractScriptErrors.
	TAbstractScriptProducer (see page 3463)	
	TBasePageProducer (see page 3464)	TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.
	TCustomPageProducer (see page 3473)	TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.
	THTMLTableAttributes (see page 3478)	THTMLTableAttributes represents the display attributes of an HTML table tag.
	THTMLTableCellAttributes (see page 3484)	THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.
	THTMLTableElementAttributes (see page 3484)	THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.
	THTMLTableHeaderAttributes (see page 3488)	THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.
	THTMLTableRowAttributes (see page 3491)	THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.
	THTMLTagAttributes (see page 3492)	THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.
	TPageProducer (see page 3496)	TPageProducer produces a string of HTML commands based on an input template.

14.1.1 EScriptError Class

Class Hierarchy

Pascal

```
EScriptError = class(EWebBrokerException);
```

C++

```
class EScriptError : public EWebBrokerException;
```

File

HTTPProd

Description

This is class HTTPProd.EScriptError.

14.1.1.1 EScriptError Members

The following tables list the members exposed by EScriptError.

Public Methods

	Name	Description
	Create (see page 3454)	This is Create, a member of class EScriptError.
V	Destroy (see page 3454)	Disposes of an object instance.

Public Properties

	Name	Description
R	Content (see page 3455)	This is Content, a member of class EScriptError.
R	Errors (see page 3455)	This is Errors, a member of class EScriptError.

14.1.1.2 EScriptError.Create Constructor

Pascal

```
constructor Create(const AErrors: TAbstractScriptErrors; const AContent: string);
```

C++

```
__fastcall EScriptError(const TAbstractScriptErrors AErrors, const UnicodeString AContent);
```

Description

This is Create, a member of class EScriptError.

14.1.1.3 EScriptError.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~EScriptError();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

14.1.1.4 EScriptError Properties

The properties of the EScriptError class are listed here.

Public Properties

	Name	Description
	Content (see page 3455)	This is Content, a member of class EScriptError.
	Errors (see page 3455)	This is Errors, a member of class EScriptError.

14.1.1.4.1 EScriptError.Content Property

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

This is Content, a member of class EScriptError.

14.1.1.4.2 EScriptError.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class EScriptError.

14.1.2 TAbstractScriptEnginesList Class

Class Hierarchy

Pascal

```
TAbstractScriptEnginesList = class(TObject);
```

C++

```
class TAbstractScriptEnginesList : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptEnginesList.

14.1.2.1 TAbstractScriptEnginesList Members

The following tables list the members exposed by TAbstractScriptEnginesList.

Public Methods

	Name	Description
	Create (see page 3456)	Constructs an object and initializes its data before the object is first used.
	FindScriptProducerClass (see page 3456)	This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.

14.1.2.2 TAbstractScriptEnginesList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractScriptEnginesList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy

System::TObject::Free

14.1.2.3 TAbstractScriptEnginesList Methods

The methods of the TAbstractScriptEnginesList class are listed here.

Public Methods

	Name	Description
	FindScriptProducerClass (see page 3456)	This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.

14.1.2.3.1 TAbstractScriptEnginesList.FindScriptProducerClass Method

Pascal

```
function FindScriptProducerClass(const ALanguageName: string): TScriptProducerClass; virtual;
abstract;
```

C++

```
virtual __fastcall TScriptProducerClass FindScriptProducerClass(const UnicodeString
ALanguageName) = 0;
```

Description

This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.

14.1.3 TAbstractScriptError Class

Class Hierarchy

Pascal

```
TAbstractScriptError = class(TObject);
```

C++

```
class TAbstractScriptError : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptError.

14.1.3.1 TAbstractScriptError Members

The following tables list the members exposed by TAbstractScriptError.

Protected Methods

	Name	Description
	GetCharPos (see page 3458)	This is GetCharPos, a member of class TAbstractScriptError.
	GetDescription (see page 3458)	This is GetDescription, a member of class TAbstractScriptError.
	GetFileName (see page 3458)	This is GetFileName, a member of class TAbstractScriptError.
	GetLine (see page 3458)	This is GetLine, a member of class TAbstractScriptError.
	GetSourceLine (see page 3458)	This is GetSourceLine, a member of class TAbstractScriptError.
	SetDescription (see page 3459)	This is SetDescription, a member of class TAbstractScriptError.

Public Properties

	Name	Description
	CharPos (see page 3459)	This is CharPos, a member of class TAbstractScriptError.
	Description (see page 3459)	This is Description, a member of class TAbstractScriptError.
	FileName (see page 3460)	This is FileName, a member of class TAbstractScriptError.
	Line (see page 3460)	This is Line, a member of class TAbstractScriptError.
	SourceLine (see page 3460)	This is SourceLine, a member of class TAbstractScriptError.

14.1.3.2 TAbstractScriptError Methods

The methods of the TAbstractScriptError class are listed here.

Protected Methods

	Name	Description
	GetCharPos (see page 3458)	This is GetCharPos, a member of class TAbstractScriptError.
	GetDescription (see page 3458)	This is GetDescription, a member of class TAbstractScriptError.
	GetFileName (see page 3458)	This is GetFileName, a member of class TAbstractScriptError.
	GetLine (see page 3458)	This is GetLine, a member of class TAbstractScriptError.
	GetSourceLine (see page 3458)	This is GetSourceLine, a member of class TAbstractScriptError.

	SetDescription (see page 3459)	This is SetDescription, a member of class TAbstractScriptError.

14.1.3.2.1 TAbstractScriptError.GetCharPos Method

Pascal

```
function GetCharPos: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCharPos() = 0;
```

Description

This is GetCharPos, a member of class TAbstractScriptError.

14.1.3.2.2 TAbstractScriptError.GetDescription Method

Pascal

```
function GetDescription: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetDescription() = 0;
```

Description

This is GetDescription, a member of class TAbstractScriptError.

14.1.3.2.3 TAbstractScriptError.GetFileName Method

Pascal

```
function GetFileName: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetFileName() = 0;
```

Description

This is GetFileName, a member of class TAbstractScriptError.

14.1.3.2.4 TAbstractScriptError.GetLine Method

Pascal

```
function GetLine: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetLine() = 0;
```

Description

This is GetLine, a member of class TAbstractScriptError.

14.1.3.2.5 TAbstractScriptError.GetSourceLine Method

Pascal

```
function GetSourceLine: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetSourceLine() = 0;
```

Description

This is GetSourceLine, a member of class TAbstractScriptError.

14.1.3.2.6 TAbstractScriptError.SetDescription Method

Pascal

```
procedure SetDescription(const AValue: string); virtual; abstract;
```

C++

```
virtual __fastcall SetDescription(const UnicodeString AValue) = 0;
```

Description

This is SetDescription, a member of class TAbstractScriptError.

14.1.3.3 TAbstractScriptError Properties

The properties of the TAbstractScriptError class are listed here.

Public Properties

	Name	Description
R	CharPos (see page 3459)	This is CharPos, a member of class TAbstractScriptError.
	Description (see page 3459)	This is Description, a member of class TAbstractScriptError.
R	FileName (see page 3460)	This is FileName, a member of class TAbstractScriptError.
R	Line (see page 3460)	This is Line, a member of class TAbstractScriptError.
R	SourceLine (see page 3460)	This is SourceLine, a member of class TAbstractScriptError.

14.1.3.3.1 TAbstractScriptError.CharPos Property

Pascal

```
property CharPos: Integer;
```

C++

```
__property int CharPos;
```

Description

This is CharPos, a member of class TAbstractScriptError.

14.1.3.3.2 TAbstractScriptError.Description Property

Pascal

```
property Description: string;
```

C++

```
__property UnicodeString Description;
```

Description

This is Description, a member of class TAbstractScriptError.

14.1.3.3.3 TAbstractScriptError.FileName Property

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

This is FileName, a member of class TAbstractScriptError.

14.1.3.3.4 TAbstractScriptError.Line Property

Pascal

```
property Line: Integer;
```

C++

```
__property int Line;
```

Description

This is Line, a member of class TAbstractScriptError.

14.1.3.3.5 TAbstractScriptError.SourceLine Property

Pascal

```
property SourceLine: string;
```

C++

```
__property UnicodeString SourceLine;
```

Description

This is SourceLine, a member of class TAbstractScriptError.

14.1.4 TAbstractScriptErrors Class

Class Hierarchy

Pascal

```
TAbstractScriptErrors = class(TObject);
```

C++

```
class TAbstractScriptErrors : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptErrors.

14.1.4.1 TAbstractScriptErrors Members

The following tables list the members exposed by TAbstractScriptErrors.

Protected Methods

	Name	Description
	GetError (see page 3461)	This is GetError, a member of class TAbstractScriptErrors.
	GetErrorCount (see page 3462)	This is GetErrorCount, a member of class TAbstractScriptErrors.

Public Methods

	Name	Description
	Add (see page 3461)	This is Add, a member of class TAbstractScriptErrors.

Public Properties

	Name	Description
	Count (see page 3462)	This is Count, a member of class TAbstractScriptErrors.
	Errors (see page 3462)	This is Errors, a member of class TAbstractScriptErrors.

14.1.4.2 TAbstractScriptErrors Methods

The methods of the TAbstractScriptErrors class are listed here.

Protected Methods

	Name	Description
	GetError (see page 3461)	This is GetError, a member of class TAbstractScriptErrors.
	GetErrorCount (see page 3462)	This is GetErrorCount, a member of class TAbstractScriptErrors.

Public Methods

	Name	Description
	Add (see page 3461)	This is Add, a member of class TAbstractScriptErrors.

14.1.4.2.1 TAbstractScriptErrors.Add Method

Pascal

```
procedure Add(const AError: TAbstractScriptError); virtual; abstract;
```

C++

```
virtual __fastcall Add(const TAbstractScriptError AError) = 0;
```

Description

This is Add, a member of class TAbstractScriptErrors.

14.1.4.2.2 TAbstractScriptErrors.GetError Method

Pascal

```
function GetError(I: Integer): TAbstractScriptError; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptError GetError(int I) = 0;
```

Description

This is GetError, a member of class TAbstractScriptErrors.

14.1.4.2.3 TAbstractScriptErrors.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetErrorCount() = 0;
```

Description

This is GetErrorCount, a member of class TAbstractScriptErrors.

14.1.4.3 TAbstractScriptErrors Properties

The properties of the TAbstractScriptErrors class are listed here.

Public Properties

	Name	Description
	Count (see page 3462)	This is Count, a member of class TAbstractScriptErrors.
	Errors (see page 3462)	This is Errors, a member of class TAbstractScriptErrors.

14.1.4.3.1 TAbstractScriptErrors.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAbstractScriptErrors.

14.1.4.3.2 TAbstractScriptErrors.Errors Property

Pascal

```
property Errors [I: Integer]: TAbstractScriptError;
```

C++

```
__property TAbstractScriptError Errors[int I];
```

Description

This is Errors, a member of class TAbstractScriptErrors.

14.1.5 TAbstractScriptProducer Class

Class Hierarchy

Pascal

```
TAbstractScriptProducer = class(TInterfacedObject);
```

C++

```
class TAbstractScriptProducer : public TInterfacedObject;
```

File

HTTPProd

14.1.5.1 TAbstractScriptProducer Members

The following tables list the members exposed by TAbstractScriptProducer.

Public Methods

	Name	Description
	Create (see page 3463)	Constructs an object and initializes its data before the object is first used.

14.1.5.2 TAbstractScriptProducer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create(AWebModuleContext: TWebModuleContext; AStripParamQuotes: Boolean;
AHandleTag: THandleTagProc; const AScriptEngine: string; ALocateFileService:
ILocateFileService); virtual;
```

C++

```
virtual __fastcall TAbstractScriptProducer(TWebModuleContext AWebModuleContext, Boolean
AStripParamQuotes, THandleTagProc AHandleTag, const UnicodeString AScriptEngine,
ILocateFileService ALocateFileService);
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

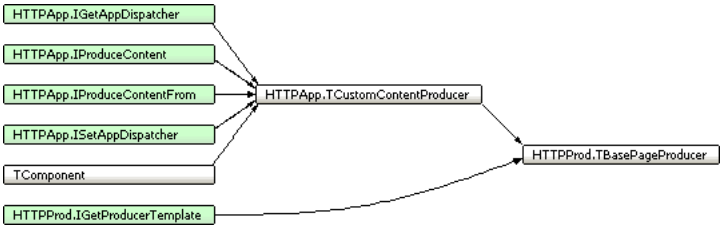
System::TObject::Destroy

new

14.1.6 TBasePageProducer Class

TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.

Class Hierarchy



Pascal

```
TBasePageProducer = class(TCustomContentProducer, IGetProducerTemplate);
```

C++

```
class TBasePageProducer : public TCustomContentProducer, public IGetProducerTemplate;
```

File

HTTPProd

Description

Do not create instances of TBasePageProducer. Instead, use TBasePageProducer as a base class when defining a page producer. TBasePageProducer has two descendants,

TCustomPageProducer (see page 3473), which is the base class for page producers that produce content based primarily on the content of HTTP messages and an OnHTML event handler. Examples include TPageProducer (see page 3496) and TDataSetPageProducer.

TComponentsPageProducer, which is the base class for page producers that assemble content from components that generate HTML. Examples include TAdapterPageProducer.

A page producer is an object that converts an HTML template into a string of HTML commands which can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page producer.

See Also

TDSTableProducer

TCustomPageProducer (see page 3473)

TPageProducer (see page 3496)

TWebResponse (see page 3389)

TDataSetPageProducer

TPageItemsProducer (see page 6394)

TInetXPageProducer (see page 5730)

TAdapterPageProducer

14.1.6.1 TBasePageProducer Members

The following tables list the members exposed by TBasePageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 3472)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Methods

	Name	Description
	DoTagEvent (see page 3468)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 3316)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetProducerTemplateFileName (see page 3468)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 3468)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 3469)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 3469)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 3469)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateStream (see page 3469)	This is GetTemplateStream, a member of class TBasePageProducer.
V	HandleScriptTag (see page 3469)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 3470)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 3470)	This is ImplHandleTag, a member of class TBasePageProducer.
V	Notification (see page 3316)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 3316)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3317)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 3317)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	ServerScriptFromStream (see page 3470)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAppDispatcher (see page 3317)	This is SetAppDispatcher, a member of class TCustomContentProducer.
V	UseScriptEngine (see page 3470)	This is UseScriptEngine, a member of class TBasePageProducer.

Public Methods

	Name	Description
V	Content (see page 3466)	Returns the content produced by the content producer.
V	ContentFromStream (see page 3467)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 3467)	Returns the content produced in response to an input string.
V	Create (see page 3466)	Creates an instance of TBasePageProducer (see page 3464).
	GetAppDispatcher (see page 3417)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	ProduceContent (see page 3421)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3422)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 3423)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	SetAppDispatcher (see page 3424)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

Public Properties

	Name	Description
R	Dispatcher (see page 3317)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.
R	DispatcherComponent (see page 3318)	Provides access to the dispatcher component.
	ScriptEngine (see page 3471)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 3471)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
R	WebModuleContext (see page 3471)	Provides access to the Web module context object.

14.1.6.2 TBasePageProducer.Create Constructor

Creates an instance of TBasePageProducer (see page 3464).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBasePageProducer(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TBasePageProducer (see page 3464).

AOwner is a component, typically a Web module, that is responsible for freeing the page producer.

See Also

Owner

14.1.6.3 TBasePageProducer Methods

The methods of the TBasePageProducer class are listed here.

Protected Methods

	Name	Description
	DoTagEvent (see page 3468)	This is DoTagEvent, a member of class TBasePageProducer.
	GetProducerTemplateFileName (see page 3468)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 3468)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 3469)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 3469)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 3469)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateStream (see page 3469)	This is GetTemplateStream, a member of class TBasePageProducer.
V	HandleScriptTag (see page 3469)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 3470)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 3470)	This is ImplHandleTag, a member of class TBasePageProducer.
	ServerScriptFromStream (see page 3470)	This is ServerScriptFromStream, a member of class TBasePageProducer.
V	UseScriptEngine (see page 3470)	This is UseScriptEngine, a member of class TBasePageProducer.

Public Methods

	Name	Description
V	Content (see page 3466)	Returns the content produced by the content producer.
V	ContentFromStream (see page 3467)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 3467)	Returns the content produced in response to an input string.

14.1.6.3.1 TBasePageProducer.Content Method

Returns the content produced by the content producer.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall UnicodeString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. TBasePageProducer (see page 3464) attempts to locate a default template and uses that to generate the resulting content.

See Also

ContentFromStream (see page 3467)

ContentFromString (see page 3467)

Content (see page 3404)

Specifying the HTML Template

14.1.6.3.2 TBasePageProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(Stream: TStream): string; override;
```

C++

```
virtual __fastcall UnicodeString ContentFromStream(TStream Stream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter.

When the ScriptEngine (see page 3471) property is assigned, the page producer generates its content using a special script-producer component. When ScriptEngine (see page 3471) is not assigned, the page producer uses only the OnHTMLTag (see page 3472) event, plus any other built-in translations provided by a descendant class.

See Also

Content (see page 3466)

ContentFromString (see page 3467)

Content (see page 3404)

ScriptEngine (see page 3471)

OnHTMLTag (see page 3472)

Specifying the HTML Template

14.1.6.3.3 TBasePageProducer.ContentFromString Method

Returns the content produced in response to an input string.

Pascal

```
function ContentFromString(const S: string): string; override;
```

C++

```
virtual __fastcall UnicodeString ContentFromString(const UnicodeString S);
```

Description

Call ContentFromString to retrieve the content produced by the content producer based on the information provided by the S parameter.

When the ScriptEngine (see page 3471) property is assigned, the page producer generates its content using a special script-producer component. When ScriptEngine (see page 3471) is not assigned, the page producer uses only the OnHTMLTag (see page 3472) event, plus any other built-in translations provided by a descendant class.

Content (see page 3404)

Chaining Page Producers Together

Specifying the HTML Template

14.1.6.3.4 TBasePageProducer.DoTagEvent Method

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); dynamic;
```

C++

```
__fastcall DoTagEvent(TTag Tag, const UnicodeString TagString, TStrings TagParams,
UnicodeString ReplaceText);
```

Description

This is DoTagEvent, a member of class TBasePageProducer.

14.1.6.3.5 TBasePageProducer.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall UnicodeString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class TBasePageProducer.

14.1.6.3.6 TBasePageProducer.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class TBasePageProducer.

14.1.6.3.7 TBasePageProducer.GetScriptEngine Method

Pascal

```
function GetScriptEngine: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetScriptEngine();
```

Description

This is GetScriptEngine, a member of class TBasePageProducer.

14.1.6.3.8 TBasePageProducer.GetTagID Method

Pascal

```
function GetTagID(const TagString: string): TTag;
```

C++

```
__fastcall TTag GetTagID(const UnicodeString TagString);
```

Description

This is GetTagID, a member of class TBasePageProducer.

14.1.6.3.9 TBasePageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TBasePageProducer.

14.1.6.3.10 TBasePageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TBasePageProducer.

14.1.6.3.11 TBasePageProducer.HandleScriptTag Method

Pascal

```
function HandleScriptTag(const TagString: string; TagParams: TStrings; var ReplaceString:
string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean HandleScriptTag(const UnicodeString TagString, TStrings TagParams,
UnicodeString ReplaceString);
```

Description

This is HandleScriptTag, a member of class TBasePageProducer.

14.1.6.3.12 TBasePageProducer.HandleTag Method

Pascal

```
function HandleTag(const TagString: string; TagParams: TStrings): string; virtual;
```

C++

```
virtual __fastcall UnicodeString HandleTag(const UnicodeString TagString, TStrings TagParams);
```

Description

This is HandleTag, a member of class TBasePageProducer.

14.1.6.3.13 TBasePageProducer.ImplHandleTag Method

Pascal

```
function ImplHandleTag(const TagString: string; TagParams: TStrings): string;
```

C++

```
__fastcall UnicodeString ImplHandleTag(const UnicodeString TagString, TStrings TagParams);
```

Description

This is ImplHandleTag, a member of class TBasePageProducer.

14.1.6.3.14 TBasePageProducer.ServerScriptFromStream Method

Pascal

```
function ServerScriptFromStream(Stream: TStream): string;
```

C++

```
__fastcall UnicodeString ServerScriptFromStream(TStream Stream);
```

Description

This is ServerScriptFromStream, a member of class TBasePageProducer.

14.1.6.3.15 TBasePageProducer.UseScriptEngine Method

Pascal

```
function UseScriptEngine: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseScriptEngine();
```

Description

This is UseScriptEngine, a member of class TBasePageProducer.

14.1.6.4 TBasePageProducer Properties

The properties of the TBasePageProducer class are listed here.

Public Properties

	Name	Description
	ScriptEngine (see page 3471)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 3471)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
R	WebModuleContext (see page 3471)	Provides access to the Web module context object.

14.1.6.4.1 TBasePageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property UnicodeString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag (see page 3472) event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 3472)

14.1.6.4.2 TBasePageProducer.StripParamQuotes Property

Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

Pascal

```
property StripParamQuotes: Boolean;
```

C++

```
__property Boolean StripParamQuotes;
```

Description

Set StripParamQuotes to indicate whether the page producer should strip quotation marks from the parameters of HTML-transparent tags before handling the tags. By setting StripParamQuotes to true, the page producer compensates for HTML editors that automatically insert quotation marks around the values of tag options.

14.1.6.4.3 TBasePageProducer.WebModuleContext Property

Provides access to the Web module context object.

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

Use WebModuleContext to get access to the TWebModuleContext (see page 3447) object. The TWebModuleContext (see page 3447) object maintains a list of named variables that the producer uses when translating HTML-transparent tags.

14.1.6.5 TBasePageProducer Events

The events of the TBasePageProducer class are listed here.

Protected Events

	Name	Description
	OnHTMLTag (see page 3472)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

14.1.6.5.1 TBasePageProducer.OnHTMLTag Event

Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Pascal

```
property OnHTMLTag: THTMLTagEvent;
```

C++

```
__property THTMLTagEvent OnHTMLTag;
```

Description

Write an OnHTMLTag event handler to convert an HTML-transparent tag into the corresponding HTML commands that can be interpreted by a Web browser. If an OnHTMLTag event is not supplied, the HTML-transparent tags in the HTML template will be replaced by empty strings.

Note: The sequence of HTML that the event handler produces for an HTML-transparent tag can contain HTML-transparent tags for another page producer to convert. For example, one page producer might have a template that represents the format of the final HTTP response. It could read the HTTP request and for each section in the request assemble a set of HTML-transparent tags with parameters based on the request. Another page producer might take the content of the first page producer, and interpret those parameters.

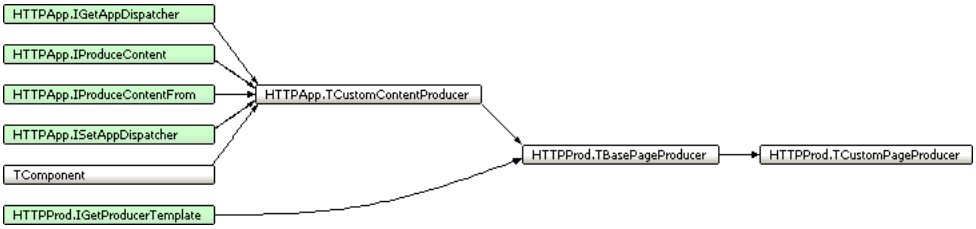
Converting HTML-transparent Tags

14.1.7 TCustomPageProducer Class

TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.

Class Hierarchy



Pascal

```
TCustomPageProducer = class(TBasePageProducer);
```

C++

```
class TCustomPageProducer : public TBasePageProducer;
```

File

HTTPProd

Description

Use TCustomPageProducer as a base class when defining an object that converts an HTML template into a string of HTML commands which can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page producer.

See Also

TDSTableProducer

TPageProducer (see page 3496)

14.1.7.1 TCustomPageProducer Members

The following tables list the members exposed by TCustomPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 3472)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Methods

	Name	Description
	DoTagEvent (see page 3468)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 3316)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetProducerTemplateFileName (see page 3468)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 3468)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 3469)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 3469)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 3475)	This is GetTemplateFileName, a member of class TCustomPageProducer.

	GetTemplateStream (see page 3476)	This is GetTemplateStream, a member of class TCustomPageProducer.
	HandleScriptTag (see page 3469)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleTag (see page 3476)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 3470)	This is ImplHandleTag, a member of class TBasePageProducer.
	Notification (see page 3316)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 3316)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3317)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 3317)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	ServerScriptFromStream (see page 3470)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAppDispatcher (see page 3317)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	UseScriptEngine (see page 3470)	This is UseScriptEngine, a member of class TBasePageProducer.

Public Methods

	Name	Description
	Content (see page 3314)	Returns the content produced by the content producer.
	Content (see page 3466)	Returns the content produced by the content producer.
	ContentFromStream (see page 3315)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 3467)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 3315)	Returns the content produced in response to an input string.
	ContentFromString (see page 3467)	Returns the content produced in response to an input string.
	Create (see page 3474)	Creates an instance of TCustomPageProducer (see page 3473).
	Destroy (see page 3475)	Destroys an instance of TCustomPageProducer (see page 3473).
	GetAppDispatcher (see page 3417)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetProducerTemplateFileName (see page 3505)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 3505)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	ProduceContent (see page 3421)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3422)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 3423)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	SetAppDispatcher (see page 3424)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

Public Properties

	Name	Description
	Dispatcher (see page 3317)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.
	DispatcherComponent (see page 3318)	Provides access to the dispatcher component.
	HTMLDoc (see page 3476)	Specifies the HTML template used to generate the value returned by the Content (see page 3466) method.
	HTMLFile (see page 3477)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 3466) method.
	ScriptEngine (see page 3471)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 3471)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	WebModuleContext (see page 3471)	Provides access to the Web module context object.

14.1.7.2 TCustomPageProducer.Create Constructor

Creates an instance of TCustomPageProducer (see page 3473).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomPageProducer(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomPageProducer (see page 3473).

After calling the inherited constructor, Create allocates the TStrings object that implements the HTMLDoc (see page 3476) property.

See Also

HTMLDoc (see page 3476)

Create

14.1.7.3 TCustomPageProducer.Destroy Destructor

Destroys an instance of TCustomPageProducer (see page 3473).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomPageProducer();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the page producer reference is not nil, and only then calls Destroy.

Destroy frees the TStrings object implements the HTMLDoc (see page 3476) property before calling the inherited destructor.

See Also

System::TObject::Free

HTMLDoc (see page 3476)

14.1.7.4 TCustomPageProducer Methods

The methods of the TCustomPageProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateFileName (see page 3475)	This is GetTemplateFileName, a member of class TCustomPageProducer.
	GetTemplateStream (see page 3476)	This is GetTemplateStream, a member of class TCustomPageProducer.
	HandleTag (see page 3476)	This is HandleTag, a member of class TCustomPageProducer.

14.1.7.4.1 TCustomPageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TCustomPageProducer.

14.1.7.4.2 TCustomPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomPageProducer.

14.1.7.4.3 TCustomPageProducer.HandleTag Method

Pascal

```
function HandleTag(const TagString: string; TagParams: TStrings): string; override;
```

C++

```
virtual __fastcall UnicodeString HandleTag(const UnicodeString TagString, TStrings TagParams);
```

Description

This is HandleTag, a member of class TCustomPageProducer.

14.1.7.5 TCustomPageProducer Properties

The properties of the TCustomPageProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 3476)	Specifies the HTML template used to generate the value returned by the Content (see page 3466) method.
	HTMLFile (see page 3477)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 3466) method.

14.1.7.5.1 TCustomPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content (see page 3466) method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The

pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile (see page 3477) property.

See Also

Content (see page 3466)

HTMLFile (see page 3477)

Specifying the HTML Template

14.1.7.5.2 TCustomPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 3466) method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 3476) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

Specifying the HTML Template

14.1.8 THTMLTableAttributes Class

THTMLTableAttributes represents the display attributes of an HTML table tag.

Class Hierarchy

Pascal

```
THTMLTableAttributes = class(THTMLTagAttributes);
```

C++

```
class THTMLTableAttributes : public THTMLTagAttributes;
```

File

HTTPProd

Description

Use THTMLTableAttributes to describe the desired appearance of an HTML table. The properties of the THTMLTableAttributes object correspond to the options that can be added to the HTML table tag. When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 3313)

TDSTableProducer

THTMLTableCellAttributes (see page 3484)

THTMLTableColumn

THTMLTableHeaderAttributes (see page 3488)

THTMLTableRowAttributes (see page 3491)

Specifying the Table Attributes

14.1.8.1 THTMLTableAttributes Members

The following tables list the members exposed by THTMLTableAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 3480)	Copies the properties of a THTMLTableAttributes (see page 3478) object to another THTMLTableAttributes (see page 3478) object.
	Changed (see page 3494)	Generates an OnChange (see page 3495) event.

Public Events

	Name	Description
	OnChange (see page 3495)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	Create (see page 3479)	Creates an instance of THTMLTableAttributes (see page 3478).
	RestoreDefaults (see page 3480)	Changes all properties of the table attributes object back to their initial settings.

Public Properties

	Name	Description
	Producer (see page 3495)	Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 3481)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 3482)	Specifies the background color of the HTML table.
	Border (see page 3482)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 3483)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 3483)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 3494)	Represents a tag option and its value in an HTML tag.
	Width (see page 3483)	Specifies the width of the entire HTML table.

14.1.8.2 THTMLTableAttributes.Create Constructor

Creates an instance of THTMLTableAttributes (see page 3478).

Pascal

```
constructor Create(Producer: TCustomContentProducer);
```

C++

```
__fastcall THTMLTableAttributes(TCustomContentProducer Producer);
```

Description

Call Create to create and initialize a THTMLTableAttributes (see page 3478) object. The Producer (see page 3495) parameter specifies the HTML producer that is using the THTMLTableAttributes (see page 3478) object to specify the attributes of an HTML table that makes up part of its output.

After calling the inherited constructor, Create initializes

Width (see page 3483) to a value of 100.

Border (see page 3482) to a value of -1.

CellPadding (see page 3483) to a value of -1.

CellSpacing (see page 3483) to a value of -1.

See Also

Border (see page 3482)

CellPadding (see page 3483)

CellSpacing (see page 3483)

Create (see page 3493)

Width (see page 3483)

14.1.8.3 THTMLTableAttributes Methods

The methods of the THTMLTableAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 3480)	Copies the properties of a THTMLTableAttributes (see page 3478) object to another THTMLTableAttributes (see page 3478) object.

Public Methods

	Name	Description
	RestoreDefaults (see page 3480)	Changes all properties of the table attributes object back to their initial settings.

14.1.8.3.1 THTMLTableAttributes.AssignTo Method

Copies the properties of a THTMLTableAttributes (see page 3478) object to another THTMLTableAttributes (see page 3478) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications cannot call the protected AssignTo method. To assign the properties of a THTMLTableAttributes (see page 3478) object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableAttributes (see page 3478) object as the source of the assignment, the AssignTo method of the THTMLTableAttributes (see page 3478) object is called. AssignTo checks whether the Dest parameter is another THTMLTableAttributes (see page 3478) object, and if so, copies the values of the Align (see page 3481), Border (see page 3482), CellSpacing (see page 3483), CellPadding (see page 3483), and Width (see page 3483) properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom (see page 3494) property.

See Also

Align (see page 3481)

Border (see page 3482)

CellPadding (see page 3483)

CellSpacing (see page 3483)

Assign

Width (see page 3483)

14.1.8.3.2 THTMLTableAttributes.RestoreDefaults Method

Changes all properties of the table attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table attributes either programmatically, or using the response editor at design time. RestoreAttributes sets

Align (see page 3481) to haDefault. (Delphi) or haDefault; (C++)

Border (see page 3482), CellPadding (see page 3483), and CellSpacing (see page 3483) to –1. (Delphi) or -1; (C++)

Custom (see page 3494) to an empty string.

Width (see page 3483) to 100. (Delphi) or 100; (C++)

See Also

Align (see page 3481)

Border (see page 3482)

CellPadding (see page 3483)

CellSpacing (see page 3483)

Custom (see page 3494)

Width (see page 3483)

14.1.8.4 THTMLTableAttributes Properties

The properties of the THTMLTableAttributes class are listed here.

Published Properties

	Name	Description
	Align (see page 3481)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 3482)	Specifies the background color of the HTML table.
	Border (see page 3482)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 3483)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 3483)	Specifies the amount of space to leave between cells in the HTML table.
	Width (see page 3483)	Specifies the width of the entire HTML table.

14.1.8.4.1 THTMLTableAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the table within the HTML document, or within the cell of a surrounding HTML table object. Align indicates the desired value of the Align option of the HTML table tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the HTML table

where it wants.

See Also

CellPadding (see page 3483)

Width (see page 3483)

14.1.8.4.2 THTMLTableAttributes.BgColor Property

Specifies the background color of the HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuschia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Use the BgColor property of the HTML attributes objects for the pieces of the table for more involved color effects.

See Also

BgColor

BgColor (see page 3487)

14.1.8.4.3 THTMLTableAttributes.Border Property

Specifies the thickness of the border drawn around the HTML table.

Pascal

```
property Border: Integer;
```

C++

```
__property int Border;
```

Description

Set Border to specify whether a border should be drawn around the table, and if so, how thick it should be. The thickness specified by any particular value of border depends on the web browser that views the HTML table. For any browser, however, larger numbers indicate thicker borders. A value of -1 indicates that no border should be drawn around the table.

See Also

CellSpacing (see page 3483)

14.1.8.4.4 THTMLTableAttributes.CellPadding Property

Specifies the amount of space to leave around the contents of each cell in the HTML table.

Pascal

```
property CellPadding: Integer;
```

C++

```
__property int CellPadding;
```

Description

Set CellPadding to specify how many pixels of whitespace should appear between a cell's contents and the edges of the cell. A value of -1 indicates that the web browser should decide how to pad the cells of the HTML table.

See Also

CellSpacing (see page 3483)

14.1.8.4.5 THTMLTableAttributes.CellSpacing Property

Specifies the amount of space to leave between cells in the HTML table.

Pascal

```
property CellSpacing: Integer;
```

C++

```
__property int CellSpacing;
```

Description

Set CellSpacing to specify how many pixels of whitespace should appear between the cells in the table. A value of -1 indicates that the web browser should decide how to separate the cells of the HTML table.

Note: CellSpacing refers to the whitespace between cells in an HTML table, not the thickness of the lines drawn to separate rows and columns.

See Also

Border (see page 3482)

CellPadding (see page 3483)

14.1.8.4.6 THTMLTableAttributes.Width Property

Specifies the width of the entire HTML table.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Set Width to indicate the desired width of the HTML table as a percentage of the width of the web browser window. If the value of Width is too small for the contents of the table, the web browser will ignore this property.

The default value of Width is 100, meaning the table will span the entire browser window. In this case, the value of the Align (

see page 3481) property is meaningless.

See Also

Align (see page 3481)

CellSpacing (see page 3483)

14.1.9 THTMLTableCellAttributes Class

THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.

Class Hierarchy

Pascal

```
THTMLTableCellAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableCellAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableCellAttributes to describe the desired appearance of a cell in an HTML table. The properties of the THTMLTableCellAttributes object correspond to the options that can be added to the HTML table data tag (TD). When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 3313)

THTMLTableAttributes (see page 3478)

THTMLTableColumn

THTMLTableHeaderAttributes (see page 3488)

THTMLTableRowAttributes (see page 3491)

14.1.10 THTMLTableElementAttributes Class

THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.

Class Hierarchy

Pascal

```
THTMLTableElementAttributes = class(THTMLTagAttributes);
```

C++

```
class THTMLTableElementAttributes : public THTMLTagAttributes;
```

File

HTTPProd

Description

Use the properties of THTMLTableElementAttributes to describe the desired appearance of a piece of an HTML table. The properties of THTMLTableElementAttributes correspond to the common options that can be added to the tags for the parts of the HTML table. When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 3313)

TDSTableProducer

THTMLTableCellAttributes (see page 3484)

THTMLTableHeaderAttributes (see page 3488)

THTMLTableRowAttributes (see page 3491)

14.1.10.1 THTMLTableElementAttributes Members

The following tables list the members exposed by THTMLTableElementAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 3486)	Copies the properties of a THTMLTableElementAttributes (see page 3484) object to another THTMLTableElementAttributes (see page 3484) object.
	Changed (see page 3494)	Generates an OnChange (see page 3495) event.

Public Events

	Name	Description
	OnChange (see page 3495)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	Create (see page 3493)	Creates an instance of THTMLTagAttributes (see page 3492).
	RestoreDefaults (see page 3486)	Changes all properties of the attributes object back to their initial settings.

Public Properties

	Name	Description
	Producer (see page 3495)	Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 3487)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 3487)	Specifies the background color of the HTML table element.
	Custom (see page 3494)	Represents a tag option and its value in an HTML tag.
	VAlign (see page 3488)	Specifies the vertical alignment of the contents of the HTML table element.

14.1.10.2 THTMLTableElementAttributes Methods

The methods of the THTMLTableElementAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 3486)	Copies the properties of a THTMLTableElementAttributes (see page 3484) object to another THTMLTableElementAttributes (see page 3484) object.

Public Methods

	Name	Description
	RestoreDefaults (see page 3486)	Changes all properties of the attributes object back to their initial settings.

14.1.10.2.1 THTMLTableElementAttributes.AssignTo Method

Copies the properties of a THTMLTableElementAttributes (see page 3484) object to another THTMLTableElementAttributes (see page 3484) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications can not call the protected AssignTo method. To assign the properties of a THTMLTableElementAttributes (see page 3484) object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableElementAttributes (see page 3484) object as the source of the assignment, the AssignTo method of the THTMLTableElementAttributes (see page 3484) object is called. AssignTo checks whether the Dest parameter is another THTMLTableElementAttributes (see page 3484) object, and if so, copies the values of the BgColor (see page 3487), Align (see page 3487), and VAlign (see page 3488) properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom (see page 3494) property.

See Also

Align (see page 3487)

Assign

VAlign (see page 3488)

14.1.10.2.2 THTMLTableElementAttributes.RestoreDefaults Method

Changes all properties of the attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table element attributes either programmatically, or using the Object Inspector at design time. RestoreAttributes sets

Align (see page 3487) to haDefault, and VAlign (see page 3488) to haVDefault.

BgColor (see page 3487) to an empty string.

Custom (see page 3494) to an empty string.

See Also

Align (see page 3487)

BgColor (see page 3487)

Custom (see page 3494)

VAlign (see page 3488)

14.1.10.3 THTMLTableElementAttributes Properties

The properties of the THTMLTableElementAttributes class are listed here.

Published Properties

	Name	Description
	Align (see page 3487)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 3487)	Specifies the background color of the HTML table element.
	VAlign (see page 3488)	Specifies the vertical alignment of the contents of the HTML table element.

14.1.10.3.1 THTMLTableElementAttributes.Align Property

Specifies the horizontal alignment of the contents of the HTML table element.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired horizontal alignment of the contents of the cell or cells indicated by the table element. Align indicates the desired value of the Align option of the HTML tag for the table element.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the contents of the table element wherever it wishes.

The Align property of table data cells or header cells overrides the Align property of the table row in which they appear.

See Also

VAlign (see page 3488)

14.1.10.3.2 THTMLTableElementAttributes.BgColor Property

Specifies the background color of the HTML table element.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table element. The value of BgColor is the name of color. This can be one of the following strings:

Use the BgColor property of the THTMLTableAttributes (see page 3478) object to set a background color for the entire table. Use the BgColor property of the table element attributes object to make a table element stand out from the rest of the table.

See Also

BgColor (see page 3482)

14.1.10.3.3 THTMLTableElementAttributes.VAlign Property

Specifies the vertical alignment of the contents of the HTML table element.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Set VAlign to indicate the desired vertical alignment of the contents of the HTML table element. VAlign indicates the desired value of the VAlign option of the HTML tag for the table element.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document positions the contents of cells in the table element wherever it wishes vertically.

The VAlign property of table data cells or header cells overrides the VAlign property of the table row in which they appear.

See Also

Align (see page 3487)

14.1.11 THTMLTableHeaderAttributes Class

THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.

Class Hierarchy

Pascal

```
THTMLTableHeaderAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableHeaderAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableHeaderAttributes to describe the desired appearance of a header cell in an HTML table. The properties of the THTMLTableHeaderAttributes object correspond to the options that can be added to the HTML header tag (TH). When the attributes of all the parts of the HTML table have been specified, the HTML content producer creates the HTML commands to specify the table as described.

See Also

THTMLTableCellAttributes (see page 3484)

14.1.11.1 THTMLTableHeaderAttributes Members

The following tables list the members exposed by THTMLTableHeaderAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 3490)	Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.
	Changed (see page 3494)	Generates an OnChange (see page 3495) event.

Public Events

	Name	Description
	OnChange (see page 3495)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	Create (see page 3493)	Creates an instance of THTMLTagAttributes (see page 3492).
	RestoreDefaults (see page 3490)	Changes all properties of the attributes object back to their initial settings.

Public Properties

	Name	Description
	Producer (see page 3495)	Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 3487)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 3487)	Specifies the background color of the HTML table element.
	Caption (see page 3491)	Represents the text that appears in the header cell.
	Custom (see page 3494)	Represents a tag option and its value in an HTML tag.
	VAlign (see page 3488)	Specifies the vertical alignment of the contents of the HTML table element.

14.1.11.2 THTMLTableHeaderAttributes Methods

The methods of the THTMLTableHeaderAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 3490)	Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.

Public Methods

	Name	Description
	RestoreDefaults (see page 3490)	Changes all properties of the attributes object back to their initial settings.

14.1.11.2.1 THTMLTableHeaderAttributes.AssignTo Method

Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications can not call the protected AssignTo method. To assign the properties of a THTMLTableElementAttributes object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableElementAttributes object as the source of the assignment, the AssignTo method of the THTMLTableElementAttributes object is called. AssignTo checks whether the Dest parameter is another THTMLTableElementAttributes object, and if so, copies the values of the BgColor, Align, and VAlign properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom property.

See Also

Align (see page 3487)

Assign

VAlign (see page 3488)

14.1.11.2.2 THTMLTableHeaderAttributes.RestoreDefaults Method

Changes all properties of the attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table element attributes either programmatically, or using the Object Inspector at design time. RestoreAttributes sets

Align (see page 3487) to haDefault, and VAlign (see page 3488) to haVDefault.

BgColor (see page 3487) to an empty string.

Caption (see page 3491) to an empty string.

Custom (see page 3494) to an empty string.

See Also

Align (see page 3487)

BgColor (see page 3487)

Caption (see page 3491)

Custom (see page 3494)

VAlign (see page 3488)

14.1.11.3 THTMLTableHeaderAttributes Properties

The properties of the THTMLTableHeaderAttributes class are listed here.

Published Properties

	Name	Description
	Caption (see page 3491)	Represents the text that appears in the header cell.

14.1.11.3.1 THTMLTableHeaderAttributes.Caption Property

Represents the text that appears in the header cell.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Set the Caption property to provide a caption for the column that contains the header cell. If the header cell is used by a dataset table producer or a query table producer, the Caption property overrides the field name that would label the column by default.

See Also

TDataSetTableProducer

TQueryTableProducer

TSQLQueryTableProducer

14.1.12 THTMLTableRowAttributes Class

THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.

Class Hierarchy

Pascal

```
THTMLTableRowAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableRowAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableRowAttributes to describe the desired appearance of a row of an HTML table. The properties of the THTMLTableRowAttributes object correspond to the options that can be added to the HTML row tag (TR). When the attributes of all the parts of the HTML table have been specified, the content producer creates the HTML commands to specify the table as described.

See Also

TDSTableProducer

THTMLTableHeaderAttributes (see page 3488)

Specifying the Row Attributes

14.1.13 THTMLTagAttributes Class

THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.

Class Hierarchy

Pascal

```
THTMLTagAttributes = class(TPersistent);
```

C++

```
class THTMLTagAttributes : public TPersistent;
```

File

HTTPProd

Description

Descendants of TCustomContentProducer (see page 3313) use THTMLTagAttributes objects to encapsulate the options added to the HTML tags in the HTML commands that they produce. When the TCustomContentProducer (see page 3313) object generates HTML commands, it looks up the tag attributes represented by the properties of its tag attributes objects, and generates the appropriate tag options.

See Also

TCustomContentProducer (see page 3313)

14.1.13.1 THTMLTagAttributes Members

The following tables list the members exposed by THTMLTagAttributes.

Protected Methods

	Name	Description
	Changed (see page 3494)	Generates an OnChange (see page 3495) event.

Public Events

	Name	Description
	OnChange (see page 3495)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	Create (see page 3493)	Creates an instance of THTMLTagAttributes (see page 3492).
V	RestoreDefaults (see page 3494)	Changes all properties of the tag attributes object back to their initial settings.

Public Properties

	Name	Description
R	Producer (see page 3495)	Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Custom (see page 3494)	Represents a tag option and its value in an HTML tag.

14.1.13.2 THTMLTagAttributes.Create Constructor

Creates an instance of THTMLTagAttributes (see page 3492).

Pascal

```
constructor Create(Producer: TCustomContentProducer);
```

C++

```
__fastcall THTMLTagAttributes(TCustomContentProducer Producer);
```

Description

Call Create to create and initialize an instance of THTMLTagAttributes (see page 3492) at runtime. After calling the inherited constructor, Create sets the Producer (see page 3495) property to the value of the Producer (see page 3495) parameter.

See Also

Producer (see page 3495)

System::TObject::Create

14.1.13.3 THTMLTagAttributes Methods

The methods of the THTMLTagAttributes class are listed here.

Protected Methods

	Name	Description
	Changed (see page 3494)	Generates an OnChange (see page 3495) event.

Public Methods

	Name	Description
V	RestoreDefaults (see page 3494)	Changes all properties of the tag attributes object back to their initial settings.

14.1.13.3.1 THTMLTagAttributes.Changed Method

Generates an OnChange (see page 3495) event.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Call Changed from a descendant of THTMLTagAttributes (see page 3492) after a tag option introduced by that descendant changes. Changed is exposed as a protected method so that component writers can create descendants of THTMLTagAttributes (see page 3492) which correctly trigger the OnChange (see page 3495) event handler.

See Also

OnChange (see page 3495)

14.1.13.3.2 THTMLTagAttributes.RestoreDefaults Method

Changes all properties of the tag attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; virtual;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the tag attributes either programmatically, or at design time. RestoreAttributes sets the Custom (see page 3494) property to an empty string.

See Also

Custom (see page 3494)

14.1.13.4 THTMLTagAttributes Properties

The properties of the THTMLTagAttributes class are listed here.

Public Properties

	Name	Description
	Producer (see page 3495)	Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Custom (see page 3494)	Represents a tag option and its value in an HTML tag.

14.1.13.4.1 THTMLTagAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options to be added to an HTML tag. Each option and its value should have the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to merge a cell in an HTML table with the three adjacent cells to the left and below, the table data tag for the cell requires the ROWSPAN and COLSPAN options to be set. The value of Custom to specify these values would be the string

```
ROWSPAN=2 COLSPAN=2
```

The HTML producer inserts the Custom string into the HTML tag when it generates its Content.

See Also

Producer (see page 3495)

Content (see page 3314)

14.1.13.4.2 THTMLTagAttributes.Producer Property

Indicates the content producer that uses the THTMLTagAttributes (see page 3492) object to represent the options for one of the HTML tags in the content it produces.

Pascal

```
property Producer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer Producer;
```

Description

Use Producer to gain access to the HTML producer object that is using the THTMLTagAttributes (see page 3492) object. The THTMLTagAttributes (see page 3492) object can use the Producer property in an OnChange (see page 3495) event handler to notify the TCustomContentProducer (see page 3313) object of changes to the attributes it represents.

See Also

OnChange (see page 3495)

14.1.13.5 THTMLTagAttributes Events

The events of the THTMLTagAttributes class are listed here.

Public Events

	Name	Description
	OnChange (see page 3495)	Occurs immediately after a tag attributes property changes.

14.1.13.5.1 THTMLTagAttributes.OnChange Event

Occurs immediately after a tag attributes property changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever any of the properties of the tag attributes object changes. When OnChange occurs, the tag attributes object already has the new property setting. Use an OnChange event handler to inform the HTML content producer whenever the attributes of a tag change so that the content producer can update the content it is producing.

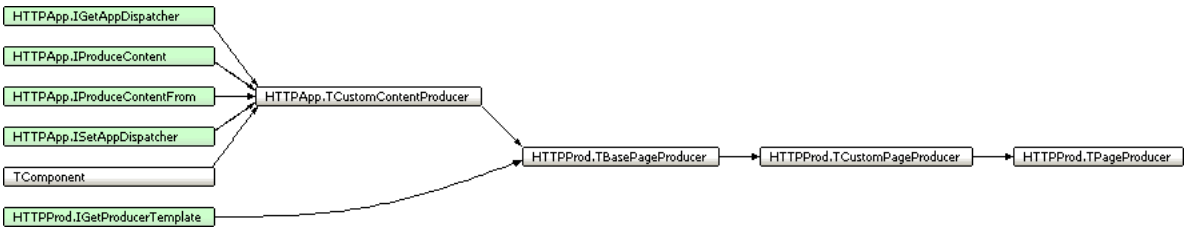
See Also

Producer (see page 3495)

14.1.14 TPageProducer Class

TPageProducer produces a string of HTML commands based on an input template.

Class Hierarchy



Pascal

```
TPageProducer = class(TCustomPageProducer);
```

C++

```
class TPageProducer : public TCustomPageProducer;
```

File

HTTPProd

Description

Use TPageProducer to convert an HTML template into a string of HTML commands that can be interpreted by a client application such as a Web browser. In Web Broker applications, HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the OnHTMLTag (see page 3500) event. WebSnap application page templates often include server-side scripting (such as JScript or JavaScript) to dynamically generate content.

14.1.14.1 TPageProducer Members

The following tables list the members exposed by TPageProducer.

Protected Methods

	Name	Description
	DoTagEvent (see page 3468)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 3316)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetProducerTemplateFileName (see page 3468)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 3468)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
	GetScriptEngine (see page 3469)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 3469)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 3469)	This is GetTemplateFileName, a member of class TBasePageProducer.
	GetTemplateFileName (see page 3475)	This is GetTemplateFileName, a member of class TCustomPageProducer.
	GetTemplateStream (see page 3469)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTemplateStream (see page 3476)	This is GetTemplateStream, a member of class TCustomPageProducer.
	HandleScriptTag (see page 3469)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleTag (see page 3470)	This is HandleTag, a member of class TBasePageProducer.
	HandleTag (see page 3476)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 3470)	This is ImplHandleTag, a member of class TBasePageProducer.
	Notification (see page 3316)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 3316)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3317)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 3317)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	ServerScriptFromStream (see page 3470)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAppDispatcher (see page 3317)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	UseScriptEngine (see page 3470)	This is UseScriptEngine, a member of class TBasePageProducer.

Public Methods

	Name	Description
	Content (see page 3314)	Returns the content produced by the content producer.
	Content (see page 3466)	Returns the content produced by the content producer.
	ContentFromStream (see page 3315)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 3467)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 3315)	Returns the content produced in response to an input string.
	ContentFromString (see page 3467)	Returns the content produced in response to an input string.
	Create (see page 3466)	Creates an instance of TBasePageProducer (see page 3464).
	Create (see page 3474)	Creates an instance of TCustomPageProducer (see page 3473).
	Destroy (see page 3475)	Destroys an instance of TCustomPageProducer (see page 3473).
	GetAppDispatcher (see page 3417)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetProducerTemplateFileName (see page 3505)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 3505)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	ProduceContent (see page 3421)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 3422)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 3423)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	SetAppDispatcher (see page 3424)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

Public Properties

	Name	Description
	Dispatcher (see page 3317)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 3313) object.
	DispatcherComponent (see page 3318)	Provides access to the dispatcher component.
	WebModuleContext (see page 3471)	Provides access to the Web module context object.

Published Events

	Name	Description
	OnHTMLTag (see page 3500)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	HTMLDoc (see page 3498)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 3499)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	ScriptEngine (see page 3500)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 3500)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

14.1.14.2 TPageProducer Properties

The properties of the TPageProducer class are listed here.

Published Properties

	Name	Description
	HTMLDoc (see page 3498)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 3499)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	ScriptEngine (see page 3500)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 3500)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

14.1.14.2.1 TPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true

HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile property.

Specifying the HTML Template

14.1.14.2.2 TPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

See Also

Content (see page 3466)

HTMLDoc (see page 3476)

Specifying the HTML Template

14.1.14.2.3 TPageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property UnicodeString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 3472)

14.1.14.2.4 TPageProducer.StripParamQuotes Property

Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

Pascal

```
property StripParamQuotes: Boolean;
```

C++

```
__property Boolean StripParamQuotes;
```

Description

Set StripParamQuotes to indicate whether the page producer should strip quotation marks from the parameters of HTML-transparent tags before handling the tags. By setting StripParamQuotes to true, the page producer compensates for HTML editors that automatically insert quotation marks around the values of tag options.

14.1.14.3 TPageProducer Events

The events of the TPageProducer class are listed here.

Published Events

	Name	Description
	OnHTMLTag (see page 3500)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

14.1.14.3.1 TPageProducer.OnHTMLTag Event

Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Pascal

```
property OnHTMLTag: THTMLTagEvent;
```

C++

```
__property THTMLTagEvent OnHTMLTag;
```

Description

Write an OnHTMLTag event handler to convert an HTML-transparent tag into the corresponding HTML commands that can be interpreted by a Web browser. If an OnHTMLTag event is not supplied, the HTML-transparent tags in the HTML template will be replaced by empty strings.

Note: The sequence of HTML that the event handler produces for an HTML-transparent tag can contain HTML-transparent tags for another page producer to convert. For example, one page producer might have a template that represents the format of the final HTTP response. It could read the HTTP request and for each section in the request assemble a set of HTML-transparent tags with parameters based on the request. Another page producer might take the content of the first page producer, and interpret those parameters.

14.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDesignerFileManager (see page 3502)	This is class HTTPProd.IDesignerFileManager.
	IGetLocateFileService (see page 3503)	This is class HTTPProd.IGetLocateFileService.
	IGetProducerTemplate (see page 3504)	This is class HTTPProd.IGetProducerTemplate.
	ILocateFileService (see page 3505)	This is class HTTPProd.ILocateFileService.
	IScriptContext (see page 3506)	This is class HTTPProd.IScriptContext.
	IScriptProducer (see page 3508)	This is class HTTPProd.IScriptProducer.
	IWebVariableName (see page 3513)	This is class HTTPProd.IWebVariableName.
	IWebVariablesContainer (see page 3514)	This is class HTTPProd.IWebVariablesContainer.

14.2.1 IDesignerFileManager Interface

Class Hierarchy

HTTPProd.IDesignerFileManager

Pascal

```
IDesignerFileManager = interface;
```

C++

```
__interface IDesignerFileManager;
```

File

HTTPProd

Description

This is class HTTPProd.IDesignerFileManager.

14.2.1.1 IDesignerFileManager Members

The following tables list the members exposed by IDesignerFileManager.

Public Methods

	Name	Description
	GetStream (see page 3503)	This is GetStream, a member of class IDesignerFileManager.
	QualifyFileName (see page 3503)	This is QualifyFileName, a member of class IDesignerFileManager.

14.2.1.2 IDesignerFileManager Methods

The methods of the IDesignerFileManager class are listed here.

Public Methods

	Name	Description
	GetStream (see page 3503)	This is GetStream, a member of class IDesignerFileManager.
	QualifyFileName (see page 3503)	This is QualifyFileName, a member of class IDesignerFileManager.

14.2.1.2.1 IDesignerFileManager.GetStream Method

Pascal

```
function GetStream(const AFileName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetStream(const UnicodeString AFileName, Boolean AOwned);
```

Description

This is GetStream, a member of class IDesignerFileManager.

14.2.1.2.2 IDesignerFileManager.QualifyFileName Method

Pascal

```
function QualifyFileName(const AFileName: string): string;
```

C++

```
__fastcall UnicodeString QualifyFileName(const UnicodeString AFileName);
```

Description

This is QualifyFileName, a member of class IDesignerFileManager.

14.2.2 IGetLocateFileService Interface

Class Hierarchy

Pascal

```
IGetLocateFileService = interface;
```

C++

```
__interface IGetLocateFileService;
```

File

HTTPProd

Description

This is class HTTPProd.IGetLocateFileService.

14.2.2.1 IGetLocateFileService Members

The following tables list the members exposed by IGetLocateFileService.

Public Methods

	Name	Description
	GetLocateFileService (see page 3504)	This is GetLocateFileService, a member of class IGetLocateFileService.

14.2.2.2 IGetLocateFileService Methods

The methods of the IGetLocateFileService class are listed here.

Public Methods

	Name	Description
	GetLocateFileService (see page 3504)	This is GetLocateFileService, a member of class IGetLocateFileService.

14.2.2.2.1 IGetLocateFileService.GetLocateFileService Method

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

This is GetLocateFileService, a member of class IGetLocateFileService.

14.2.3 IGetProducerTemplate Interface

Class Hierarchy

HTTPProd.IGetProducerTemplate

Pascal

```
IGetProducerTemplate = interface;
```

C++

```
__interface IGetProducerTemplate;
```

File

HTTPProd

Description

This is class HTTPProd.IGetProducerTemplate.

14.2.3.1 IGetProducerTemplate Members

The following tables list the members exposed by IGetProducerTemplate.

Public Methods

	Name	Description
	GetProducerTemplateFileName (see page 3505)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.

	GetProducerTemplateStream (see page 3505)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

14.2.3.2 IGetProducerTemplate Methods

The methods of the IGetProducerTemplate class are listed here.

Public Methods

	Name	Description
	GetProducerTemplateFileName (see page 3505)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 3505)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

14.2.3.2.1 IGetProducerTemplate.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall UnicodeString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.

14.2.3.2.2 IGetProducerTemplate.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

14.2.4 ILocateFileService Interface

Class Hierarchy

Pascal

```
ILocateFileService = interface;
```

C++

```
__interface ILocateFileService;
```

File

HTTPProd

Description

This is class HTTPProd.ILocateFileService.

14.2.4.1 ILocateFileService Members

The following tables list the members exposed by ILocateFileService.

Public Methods

	Name	Description
	GetTemplateStream (see page 3506)	This is GetTemplateStream, a member of class ILocateFileService.

14.2.4.2 ILocateFileService Methods

The methods of the ILocateFileService class are listed here.

Public Methods

	Name	Description
	GetTemplateStream (see page 3506)	This is GetTemplateStream, a member of class ILocateFileService.

14.2.4.2.1 ILocateFileService.GetTemplateStream Method

Pascal

```
function GetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned: Boolean):
TStream;
```

C++

```
__fastcall TStream GetTemplateStream(TComponent * AComponent, UnicodeString AFileName, Boolean
AOwned);
```

Description

This is GetTemplateStream, a member of class ILocateFileService.

14.2.5 IScriptContext Interface

Class Hierarchy

Pascal

```
IScriptContext = interface;
```

C++

```
__interface IScriptContext;
```

File

HTTPProd

Description

This is class HTTPProd.IScriptContext.

14.2.5.1 IScriptContext Members

The following tables list the members exposed by IScriptContext.

Public Methods

	Name	Description
	GetWebModuleContext (see page 3507)	This is GetWebModuleContext, a member of class IScriptContext.

Public Properties

	Name	Description
R	WebModuleContext (see page 3507)	This is WebModuleContext, a member of class IScriptContext.

14.2.5.2 IScriptContext Methods

The methods of the IScriptContext class are listed here.

Public Methods

	Name	Description
	GetWebModuleContext (see page 3507)	This is GetWebModuleContext, a member of class IScriptContext.

14.2.5.2.1 IScriptContext.GetWebModuleContext Method

Pascal

```
function GetWebModuleContext: TWebModuleContext;
```

C++

```
__fastcall TWebModuleContext GetWebModuleContext();
```

Description

This is GetWebModuleContext, a member of class IScriptContext.

14.2.5.3 IScriptContext Properties

The properties of the IScriptContext class are listed here.

Public Properties

	Name	Description
R	WebModuleContext (see page 3507)	This is WebModuleContext, a member of class IScriptContext.

14.2.5.3.1 IScriptContext.WebModuleContext Property

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

This is WebModuleContext, a member of class IScriptContext.

14.2.6 IScriptProducer Interface

Class Hierarchy

Pascal

```
IScriptProducer = interface(IScriptContext);
```

C++

```
__interface IScriptProducer : public IScriptContext;
```

File

HTTPProd

Description

This is class HTTPProd.IScriptProducer.

14.2.6.1 IScriptProducer Members

The following tables list the members exposed by IScriptProducer.

Public Methods

	Name	Description
	Evaluate (see page 3509)	This is Evaluate, a member of class IScriptProducer.
	GetContent (see page 3509)	This is GetContent, a member of class IScriptProducer.
	GetErrors (see page 3509)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 3510)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 3510)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	GetWebModuleContext (see page 3507)	This is GetWebModuleContext, a member of class IScriptContext.
	HandleScriptError (see page 3510)	This is HandleScriptError, a member of class IScriptProducer.
	ParseStream (see page 3510)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 3510)	This is ParseString, a member of class IScriptProducer.
	ReplaceTags (see page 3511)	This is ReplaceTags, a member of class IScriptProducer.
	SetContent (see page 3511)	This is SetContent, a member of class IScriptProducer.
	Write (see page 3511)	This is the overview for the Write method overload.
	WriteItem (see page 3512)	This is WriteItem, a member of class IScriptProducer.

Public Properties

	Name	Description
	Content (see page 3512)	This is Content, a member of class IScriptProducer.
R	Errors (see page 3512)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 3513)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 3513)	This is HTMLBlocks, a member of class IScriptProducer.
R	WebModuleContext (see page 3507)	This is WebModuleContext, a member of class IScriptContext.

14.2.6.2 IScriptProducer Methods

The methods of the IScriptProducer class are listed here.

Public Methods

	Name	Description
	Evaluate (see page 3509)	This is Evaluate, a member of class IScriptProducer.
	GetContent (see page 3509)	This is GetContent, a member of class IScriptProducer.
	GetErrors (see page 3509)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 3510)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 3510)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	HandleScriptError (see page 3510)	This is HandleScriptError, a member of class IScriptProducer.
	ParseStream (see page 3510)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 3510)	This is ParseString, a member of class IScriptProducer.
	ReplaceTags (see page 3511)	This is ReplaceTags, a member of class IScriptProducer.
	SetContent (see page 3511)	This is SetContent, a member of class IScriptProducer.
	Write (see page 3511)	This is the overview for the Write method overload.
	WriteItem (see page 3512)	This is WriteItem, a member of class IScriptProducer.

14.2.6.2.1 IScriptProducer.Evaluate Method

Pascal

```
function Evaluate: string;
```

C++

```
__fastcall UnicodeString Evaluate();
```

Description

This is Evaluate, a member of class IScriptProducer.

14.2.6.2.2 IScriptProducer.GetContent Method

Pascal

```
function GetContent: string;
```

C++

```
__fastcall UnicodeString GetContent();
```

Description

This is GetContent, a member of class IScriptProducer.

14.2.6.2.3 IScriptProducer.GetErrors Method

Pascal

```
function GetErrors: TAbstractScriptErrors;
```

C++

```
__fastcall TAbstractScriptErrors GetErrors();
```

Description

This is GetErrors, a member of class IScriptProducer.

14.2.6.2.4 IScriptProducer.GetHTMLBlock Method

Pascal

```
function GetHTMLBlock(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetHTMLBlock(int I);
```

Description

This is GetHTMLBlock, a member of class IScriptProducer.

14.2.6.2.5 IScriptProducer.GetHTMLBlockCount Method

Pascal

```
function GetHTMLBlockCount: Integer;
```

C++

```
__fastcall int GetHTMLBlockCount();
```

Description

This is GetHTMLBlockCount, a member of class IScriptProducer.

14.2.6.2.6 IScriptProducer.HandleScriptError Method

Pascal

```
function HandleScriptError(const ScriptError: IUnknown): HRESULT;
```

C++

```
__fastcall HRESULT HandleScriptError(const IUnknown ScriptError);
```

Description

This is HandleScriptError, a member of class IScriptProducer.

14.2.6.2.7 IScriptProducer.ParseStream Method

Pascal

```
procedure ParseStream(Stream: TStream; Owned: Boolean = False);
```

C++

```
__fastcall ParseStream(TStream Stream, Boolean Owned = False);
```

Description

This is ParseStream, a member of class IScriptProducer.

14.2.6.2.8 IScriptProducer.ParseString Method

Pascal

```
procedure ParseString(const S: string);
```

C++

```
__fastcall ParseString(const UnicodeString S);
```

Description

This is ParseString, a member of class IScriptProducer.

14.2.6.2.9 IScriptProducer.ReplaceTags Method

Pascal

```
function ReplaceTags(const S: string): string;
```

C++

```
__fastcall UnicodeString ReplaceTags(const UnicodeString S);
```

Description

This is ReplaceTags, a member of class IScriptProducer.

14.2.6.2.10 IScriptProducer.SetContent Method

Pascal

```
procedure SetContent(const Value: string);
```

C++

```
__fastcall SetContent(const UnicodeString Value);
```

Description

This is SetContent, a member of class IScriptProducer.

14.2.6.2.11 Write Method

This is the overview for the Write method overload.

Overload List

	Name	Description
	IScriptProducer.Write (PWideChar, Integer) (see page 3511)	This is Write, a member of class IScriptProducer.
	IScriptProducer.Write (string) (see page 3511)	This is Write, a member of class IScriptProducer.

14.2.6.2.11.1 IScriptProducer.Write Method (PWideChar, Integer)

Pascal

```
procedure Write(const Value: PWideChar; ALength: Integer); overload;
```

C++

```
__fastcall Write(const PWideChar Value, int ALength);
```

Description

This is Write, a member of class IScriptProducer.

14.2.6.2.11.2 IScriptProducer.Write Method (string)

Pascal

```
procedure Write(const Value: string); overload;
```

C++

```
__fastcall Write(const UnicodeString Value);
```

Description

This is Write, a member of class IScriptProducer.

14.2.6.2.12 IScriptProducer.WriteItem Method

Pascal

```
procedure WriteItem(Index: Integer);
```

C++

```
__fastcall WriteItem(int Index);
```

Description

This is WriteItem, a member of class IScriptProducer.

14.2.6.3 IScriptProducer Properties

The properties of the IScriptProducer class are listed here.

Public Properties

	Name	Description
	Content (see page 3512)	This is Content, a member of class IScriptProducer.
R	Errors (see page 3512)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 3513)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 3513)	This is HTMLBlocks, a member of class IScriptProducer.

14.2.6.3.1 IScriptProducer.Content Property

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

This is Content, a member of class IScriptProducer.

14.2.6.3.2 IScriptProducer.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class IScriptProducer.

14.2.6.3.3 IScriptProducer.HTMLBlockCount Property

Pascal

```
property HTMLBlockCount: Integer;
```

C++

```
__property int HTMLBlockCount;
```

Description

This is HTMLBlockCount, a member of class IScriptProducer.

14.2.6.3.4 IScriptProducer.HTMLBlocks Property

Pascal

```
property HTMLBlocks [I: Integer]: string;
```

C++

```
__property UnicodeString HTMLBlocks[int I];
```

Description

This is HTMLBlocks, a member of class IScriptProducer.

14.2.7 IWebVariableName Interface

Class Hierarchy

HTTPProd.IWebVariableName

Pascal

```
IWebVariableName = interface;
```

C++

```
__interface IWebVariableName;
```

File

HTTPProd

Description

This is class HTTPProd.IWebVariableName.

14.2.7.1 IWebVariableName Members

The following tables list the members exposed by IWebVariableName.

Public Methods

	Name	Description
	GetVariableName (see page 3514)	This is GetVariableName, a member of class IWebVariableName.

Public Properties

	Name	Description
	VariableName (see page 3514)	This is VariableName, a member of class IWebVariableName.

14.2.7.2 IWebVariableName Methods

The methods of the IWebVariableName class are listed here.

Public Methods

	Name	Description
	GetVariableName (see page 3514)	This is GetVariableName, a member of class IWebVariableName.

14.2.7.2.1 IWebVariableName.GetVariableName Method

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

This is GetVariableName, a member of class IWebVariableName.

14.2.7.3 IWebVariableName Properties

The properties of the IWebVariableName class are listed here.

Public Properties

	Name	Description
	VariableName (see page 3514)	This is VariableName, a member of class IWebVariableName.

14.2.7.3.1 IWebVariableName.VariableName Property

Pascal

```
property VariableName: string;
```

C++

```
__property UnicodeString VariableName;
```

Description

This is VariableName, a member of class IWebVariableName.

14.2.8 IWebVariablesContainer Interface

Class Hierarchy

HTTPProd.IWebVariablesContainer

Pascal

```
IWebVariablesContainer = interface;
```

C++

```
__interface IWebVariablesContainer;
```

File

HTTPProd

Description

This is class HTTPProd.IWebVariablesContainer.

14.2.8.1 IWebVariablesContainer Members

The following tables list the members exposed by IWebVariablesContainer.

Public Methods

	Name	Description
	FindVariable (see page 3515)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 3516)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	GetVariable (see page 3516)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 3516)	This is GetVariableCount, a member of class IWebVariablesContainer.

Public Properties

	Name	Description
R	VariableCount (see page 3516)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 3517)	This is Variables, a member of class IWebVariablesContainer.

14.2.8.2 IWebVariablesContainer Methods

The methods of the IWebVariablesContainer class are listed here.

Public Methods

	Name	Description
	FindVariable (see page 3515)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 3516)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	GetVariable (see page 3516)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 3516)	This is GetVariableCount, a member of class IWebVariablesContainer.

14.2.8.2.1 IWebVariablesContainer.FindVariable Method

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

This is FindVariable, a member of class IWebVariablesContainer.

14.2.8.2.2 IWebVariablesContainer.FindVariableContainer Method

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

This is FindVariableContainer, a member of class IWebVariablesContainer.

14.2.8.2.3 IWebVariablesContainer.GetVariable Method

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

This is GetVariable, a member of class IWebVariablesContainer.

14.2.8.2.4 IWebVariablesContainer.GetVariableCount Method

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

This is GetVariableCount, a member of class IWebVariablesContainer.

14.2.8.3 IWebVariablesContainer Properties

The properties of the IWebVariablesContainer class are listed here.

Public Properties

	Name	Description
	VariableCount (see page 3516)	This is VariableCount, a member of class IWebVariablesContainer.
	Variables (see page 3517)	This is Variables, a member of class IWebVariablesContainer.

14.2.8.3.1 IWebVariablesContainer.VariableCount Property

Pascal

```
property VariableCount: Integer;
```

C++

```
__property int VariableCount;
```

Description

This is VariableCount, a member of class IWebVariablesContainer.

14.2.8.3.2 IWebVariablesContainer.Variables Property

Pascal

```
property Variables [I: Integer]: TComponent;
```

C++

```
__property TComponent * Variables[int I];
```

Description

This is Variables, a member of class IWebVariablesContainer.

14.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ContentFromScriptFile (see page 3518)	This is function HTTPProd.ContentFromScriptFile.
	ContentFromScriptStream (see page 3518)	This is function HTTPProd.ContentFromScriptStream.
	ContentFromStream (see page 3519)	This is function HTTPProd.ContentFromStream.
	ContentFromString (see page 3519)	This is function HTTPProd.ContentFromString.
	FindComponentWebModuleContext (see page 3519)	This is function HTTPProd.FindComponentWebModuleContext.
	GetEncodingOfStream (see page 3520)	This is function HTTPProd.GetEncodingOfStream.
	GetTagID (see page 3520)	This is function HTTPProd.GetTagID.

14.3.1 HTTPProd.ContentFromScriptFile Function

Pascal

```
function ContentFromScriptFile(const AFileName: TFileName; AWebModuleContext:
TWebModuleContext; AStripParamQuotes: Boolean; AHandleTag: THandleTagProc; AHandleScriptTag:
THandledTagProc; const AScriptEngine: string; ALocateFileService: ILocateFileService): string;
```

C++

```
UnicodeString ContentFromScriptFile(const TFileName AFileName, TWebModuleContext
AWebModuleContext, Boolean AStripParamQuotes, THandleTagProc AHandleTag, THandledTagProc
AHandleScriptTag, const UnicodeString AScriptEngine, ILocateFileService ALocateFileService);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromScriptFile.

14.3.2 HTTPProd.ContentFromScriptStream Function

Pascal

```
function ContentFromScriptStream(AStream: TStream; AWebModuleContext: TWebModuleContext;
AStripParamQuotes: Boolean; AHandleTag: THandleTagProc; AHandleScriptTag: THandledTagProc;
const AScriptEngine: string; ALocateFileService: ILocateFileService): string;
```

C++

```
UnicodeString ContentFromScriptStream(TStream AStream, TWebModuleContext AWebModuleContext,
Boolean AStripParamQuotes, THandleTagProc AHandleTag, THandledTagProc AHandleScriptTag, const
UnicodeString AScriptEngine, ILocateFileService ALocateFileService);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromScriptStream.

14.3.3 HTTPProd.ContentFromStream Function

Pascal

```
function ContentFromStream(AStream: TStream; AStripParamQuotes: Boolean; AHandleTag:
THandleTagProc; AHandledTag: THandledTagProc): string;
```

C++

```
UnicodeString ContentFromStream(TStream AStream, Boolean AStripParamQuotes, THandleTagProc
AHandleTag, THandledTagProc AHandledTag);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromStream.

14.3.4 HTTPProd.ContentFromString Function

Pascal

```
function ContentFromString(const AValue: string; AStripParamQuotes: Boolean; AHandleTag:
THandleTagProc; AHandledTag: THandledTagProc): string;
```

C++

```
UnicodeString ContentFromString(const UnicodeString AValue, Boolean AStripParamQuotes,
THandleTagProc AHandleTag, THandledTagProc AHandledTag);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromString.

14.3.5 HTTPProd.FindComponentWebModuleContext Function

Pascal

```
function FindComponentWebModuleContext(AComponent: TComponent): TWebModuleContext;
```

C++

```
TWebModuleContext FindComponentWebModuleContext(TComponent * AComponent);
```

File

HTTPProd

Description

This is function HTTPProd.FindComponentWebModuleContext.

14.3.6 HTTPProd.GetEncodingOfStream Function

Pascal

```
function GetEncodingOfStream(AStream: TStream; out ASignatureSize: Integer): TEncoding;
```

C++

```
TEncoding GetEncodingOfStream(TStream AStream, int ASignatureSize);
```

File

HTTPProd

Description

This is function HTTPProd.GetEncodingOfStream.

14.3.7 HTTPProd.GetTagID Function

Pascal

```
function GetTagID(const TagString: string): TTag;
```

C++

```
TTag GetTagID(const UnicodeString TagString);
```

File

HTTPProd

Description

This is function HTTPProd.GetTagID.

14.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	THTMLAlign (see page 3521)	This is record HTTPProd.THTMLAlign.
	THTMLVAlign (see page 3521)	This is record HTTPProd.THTMLVAlign.
	TTag (see page 3522)	This is record HTTPProd.TTag.

14.4.1 HTTPProd.THTMLAlign Enumeration

Pascal

```
THTMLAlign = (
  haDefault,
  haLeft,
  haRight,
  haCenter
);
```

C++

```
enum THTMLAlign {
  haDefault,
  haLeft,
  haRight,
  haCenter
};
```

File

HTTPProd

Description

This is record HTTPProd.THTMLAlign.

14.4.2 HTTPProd.THTMLVAlign Enumeration

Pascal

```
THTMLVAlign = (
  haVDefault,
  haTop,
  haMiddle,
  haBottom,
  haBaseline
);
```

C++

```
enum THTMLVAlign {
  haVDefault,
```

```
    haTop,
    haMiddle,
    haBottom,
    haBaseline
  };
```

File

HTTPProd

Description

This is record HTTPProd.THTMLVAlign.

14.4.3 HTTPProd.TTag Enumeration

Pascal

```
  TTag = (
    tgCustom,
    tgLink,
    tgImage,
    tgTable,
    tgImageMap,
    tgObject,
    tgEmbed
  );
```

C++

```
  enum TTag {
    tgCustom,
    tgLink,
    tgImage,
    tgTable,
    tgImageMap,
    tgObject,
    tgEmbed
  };
```

File

HTTPProd

Description

This is record HTTPProd.TTag.

14.5 Types

The following table lists types in this documentation.

Types

Name	Description
THandledTagProc (see page 3523)	This is type HTTPProd.THandledTagProc.
THandleTagProc (see page 3523)	This is type HTTPProd.THandleTagProc.
THTMLBgColor (see page 3524)	This is type HTTPProd.THTMLBgColor.
THTMLTagEvent (see page 3524)	This is type HTTPProd.THTMLTagEvent.
TScriptProducerClass (see page 3524)	This is type HTTPProd.TScriptProducerClass.

14.5.1 HTTPProd.THandledTagProc Type

Pascal

```
THandledTagProc = function (const TagString: string; TagParams: TStrings; var ReplaceString:
string): Boolean of object;
```

C++

```
(const TagString: string; TagParams: TStrings; var ReplaceString: string): Boolean (
THandledTagProc)();
```

File

HTTPProd

Description

This is type HTTPProd.THandledTagProc.

14.5.2 HTTPProd.THandleTagProc Type

Pascal

```
THandleTagProc = function (const TagString: string; TagParams: TStrings): string of object;
```

C++

```
(const TagString: string; TagParams: TStrings): string ( THandleTagProc)();
```

File

HTTPProd

Description

This is type HTTPProd.THandleTagProc.

14.5.3 HTTPProd.THTMLBgColor Type

Pascal

```
THTMLBgColor = type string;
```

C++

```
type string THTMLBgColor;
```

File

HTTPProd

Description

This is type HTTPProd.THTMLBgColor.

14.5.4 HTTPProd.THTMLTagEvent Type

Pascal

```
THTMLTagEvent = procedure (Sender: TObject; Tag: TTag; const TagString: string; TagParams:
TStrings; var ReplaceText: string) of object;
```

C++

```
(Sender: TObject; Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string) ( THTMLTagEvent)();
```

File

HTTPProd

Description

This is type HTTPProd.THTMLTagEvent.

14.5.5 HTTPProd.TScriptProducerClass Type

Pascal

```
TScriptProducerClass = class of TAbstractScriptProducer;
```

C++

```
TAbstractScriptProducer TScriptProducerClass;
```

File

HTTPProd

Description

This is type HTTPProd.TScriptProducerClass.

14.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DesignerFileManager (see page 3525)	This is variable HTTPProd.DesignerFileManager.
ScriptEnginesList (see page 3525)	This is variable HTTPProd.ScriptEnginesList.

14.6.1 HTTPProd.DesignerFileManager Variable

Pascal

```
DesignerFileManager: IDesignerFileManager = nil;
```

C++

```
IDesignerFileManager DesignerFileManager = nil;
```

File

HTTPProd

Description

This is variable HTTPProd.DesignerFileManager.

14.6.2 HTTPProd.ScriptEnginesList Variable

Pascal

```
ScriptEnginesList: TAbstractScriptEnginesList = nil;
```

C++

```
TAbstractScriptEnginesList ScriptEnginesList = nil;
```

File

HTTPProd

Description

This is variable HTTPProd.ScriptEnginesList.

14.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
HTMLAlign (see page 3526)	This is constant HTTPProd.HTMLAlign.
HTMLVAlign (see page 3526)	This is constant HTTPProd.HTMLVAlign.

14.7.1 HTTPProd.HTMLAlign Constant

Pascal

```
HTMLAlign: array[THTMLAlign] of string = ('', ' Align="left"', ' Align="right"', '
Align="center"');
```

C++

```
array[THTMLAlign] of string HTMLAlign = ('', ' Align="left"', ' Align="right"', '
Align="center"');
```

File

HTTPProd

Description

This is constant HTTPProd.HTMLAlign.

14.7.2 HTTPProd.HTMLVAlign Constant

Pascal

```
HTMLVAlign: array[THTMLVAlign] of string = ('', ' VAlign="top"', ' VAlign="middle"', '
VAlign="bottom"', ' VAlign="baseline"');
```

C++

```
array[THTMLVAlign] of string HTMLVAlign = ('', ' VAlign="top"', ' VAlign="middle"', '
VAlign="bottom"', ' VAlign="baseline"');
```

File

HTTPProd

Description

This is constant HTTPProd.HTMLVAlign.

15 HTTPUtil Namespace

This is namespace HTTPUtil.

Topics

Name	Description
Interfaces (see page 3528)	The following table lists interfaces in this documentation.
Functions (see page 3537)	The following table lists functions in this documentation.

Functions

	Name	Description
	FirstDelimiter (see page 3537)	This is function HTTPUtil.FirstDelimiter.
	FirstDelimiter (see page 3537)	This is function HTTPUtil.FirstDelimiter.
	GetDefaultStreamLoader (see page 3538)	This is function HTTPUtil.GetDefaultStreamLoader.
	HTMLEscape (see page 3538)	This is function HTTPUtil.HTMLEscape.
	StartsWith (see page 3538)	This is function HTTPUtil.StartsWith.
	StringTokenizer (see page 3539)	This is function HTTPUtil.StringTokenizer.
	StringToStringArray (see page 3539)	This is function HTTPUtil.StringToStringArray.

Interfaces

	Name	Description
	IStreamLoader (see page 3528)	IStreamLoader is the interface for loading a WSDL document into a memory stream.
	IStringTokenizer (see page 3534)	A string tokenizer breaks a string into tokens.

15.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IStreamLoader (see page 3528)	IStreamLoader is the interface for loading a WSDL document into a memory stream.
	IStringTokenizer (see page 3534)	A string tokenizer breaks a string into tokens.

15.1.1 IStreamLoader Interface

IStreamLoader is the interface for loading a WSDL document into a memory stream.

Class Hierarchy

Pascal

```
IStreamLoader = interface;
```

C++

```
__interface IStreamLoader;
```

File

HTTPUtil

Description

IStreamLoader is an interface for objects that load WSDL documents. The properties specify information needed to connect to the server that hosts the WSDL document. In addition, IStreamLoader defines a Load (see page 3530) method, which loads a WSDL document into a memory stream. TWSDLItems uses the IStreamLoader interface to load its WSDL document.

Note: C++ method declarations that use IStreamLoader use the _di_IStreamLoader type instead. This type is a DelphiInterface wrapper around the IStreamLoader interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IStreamLoaders >  _di_IStreamLoader;
```

See Also

TWSDLItems

TMemoryStream

15.1.1.1 IStreamLoader Members

The following tables list the members exposed by IStreamLoader.

Public Methods

	Name	Description
	GetPassword (see page 3529)	Returns the value of the Password (see page 3532) property.
	GetProxy (see page 3530)	Returns the value of the Proxy (see page 3533) property.
	GetTimeout (see page 3530)	This is GetTimeout, a member of class IStreamLoader.
	GetUserName (see page 3530)	Returns the value of the UserName (see page 3533) property.
	Load (see page 3530)	Loads a WSDL document into a memory stream.
	SetPassword (see page 3531)	Sets the value of the Password (see page 3532) property.
	SetProxy (see page 3531)	Sets the value of the Proxy (see page 3533) property.
	SetTimeout (see page 3532)	This is SetTimeout, a member of class IStreamLoader.
	SetUserName (see page 3532)	Sets the value of the UserName (see page 3533) property.

Public Properties

	Name	Description
	Password (see page 3532)	Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.
	Proxy (see page 3533)	Lists any proxy servers that are required to connect to a server that hosts the WSDL document.
	Timeout (see page 3533)	This is Timeout, a member of class IStreamLoader.
	UserName (see page 3533)	Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

15.1.1.2 IStreamLoader Methods

The methods of the IStreamLoader class are listed here.

Public Methods

	Name	Description
	GetPassword (see page 3529)	Returns the value of the Password (see page 3532) property.
	GetProxy (see page 3530)	Returns the value of the Proxy (see page 3533) property.
	GetTimeout (see page 3530)	This is GetTimeout, a member of class IStreamLoader.
	GetUserName (see page 3530)	Returns the value of the UserName (see page 3533) property.
	Load (see page 3530)	Loads a WSDL document into a memory stream.
	SetPassword (see page 3531)	Sets the value of the Password (see page 3532) property.
	SetProxy (see page 3531)	Sets the value of the Proxy (see page 3533) property.
	SetTimeout (see page 3532)	This is SetTimeout, a member of class IStreamLoader.
	SetUserName (see page 3532)	Sets the value of the UserName (see page 3533) property.

15.1.1.2.1 IStreamLoader.GetPassword Method

Returns the value of the Password (see page 3532) property.

Pascal

```
function GetPassword: string;
```

C++

```
__fastcall UnicodeString GetPassword();
```

Description

GetPassword is the read implementation for the Password (see page 3532) property.

See Also

Password (see page 3532)

15.1.1.2.2 IStreamLoader.GetProxy Method

Returns the value of the Proxy (see page 3533) property.

Pascal

```
function GetProxy: string;
```

C++

```
__fastcall UnicodeString GetProxy();
```

Description

GetProxy is the read implementation for the Proxy (see page 3533) property.

See Also

Proxy (see page 3533)

15.1.1.2.3 IStreamLoader.GetTimeout Method

Pascal

```
function GetTimeout: Integer;
```

C++

```
__fastcall int GetTimeout();
```

Description

This is GetTimeout, a member of class IStreamLoader.

15.1.1.2.4 IStreamLoader.GetUserName Method

Returns the value of the UserName (see page 3533) property.

Pascal

```
function GetUserName: string;
```

C++

```
__fastcall UnicodeString GetUserName();
```

Description

GetUserName is the read implementation for the UserName (see page 3533) property.

See Also

UserName (see page 3533)

15.1.1.2.5 IStreamLoader.Load Method

Loads a WSDL document into a memory stream.

Pascal

```
procedure Load(const WSDLFileName: WideString; Stream: TMemoryStream);
```

C++

```
__fastcall Load(const BSTR WSDLFileName, TMemoryStream Stream);
```

Description

Load reads the specified WSDL document into the specified memory stream.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found. If WSDLFileName is an URL, you may need to use the UserName (see page 3533), Password (see page 3532), and Proxy (see page 3533) properties to indicate how the stream loader can connect to the host identified in that URL.

Stream is a memory stream to which the stream loader writes the contents of the WSDL document.

See Also

UserName (see page 3533)

Password (see page 3532)

Proxy (see page 3533)

15.1.1.2.6 IStreamLoader.SetPassword Method

Sets the value of the Password (see page 3532) property.

Pascal

```
procedure SetPassword(const Password: string);
```

C++

```
__fastcall SetPassword(const UnicodeString Password);
```

Description

SetPassword is the write implementation for the Password (see page 3532) property.

Password (see page 3532) is the password to use when connecting to the server that hosts the WSDL document.

See Also

Password (see page 3532)

15.1.1.2.7 IStreamLoader.SetProxy Method

Sets the value of the Proxy (see page 3533) property.

Pascal

```
procedure SetProxy(const Proxy: string);
```

C++

```
__fastcall SetProxy(const UnicodeString Proxy);
```

Description

SetProxy is the write implementation for the Proxy (see page 3533) property.

Proxy (see page 3533) lists any proxy servers to use when connecting to the server that hosts the WSDL document.

See Also

Proxy (see page 3533)

15.1.1.2.8 IStreamLoader.SetTimeout Method

Pascal

```
procedure SetTimeout(ATimeOut: Integer);
```

C++

```
__fastcall SetTimeout(int ATimeOut);
```

Description

This is SetTimeout, a member of class IStreamLoader.

15.1.1.2.9 IStreamLoader.SetUserName Method

Sets the value of the UserName (see page 3533) property.

Pascal

```
procedure SetUserName(const UserName: string);
```

C++

```
__fastcall SetUserName(const UnicodeString UserName);
```

Description

SetUserName is the write implementation for the UserName (see page 3533) property.

UserName (see page 3533) is the user name to use when connecting to the server that hosts the WSDL document.

See Also

UserName (see page 3533)

15.1.1.3 IStreamLoader Properties

The properties of the IStreamLoader class are listed here.

Public Properties

	Name	Description
	Password (see page 3532)	Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.
	Proxy (see page 3533)	Lists any proxy servers that are required to connect to a server that hosts the WSDL document.
	Timeout (see page 3533)	This is Timeout, a member of class IStreamLoader.
	UserName (see page 3533)	Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

15.1.1.3.1 IStreamLoader.Password Property

Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

Use Password to provide a password that the stream loader can use if the WSDL document is on a server that requires authentication or if it needs to use a proxy server that requires authentication. Password is the password for the user specified by the UserName (see page 3533) property.

See Also

UserName (see page 3533)

Proxy (see page 3533)

15.1.1.3.2 IStreamLoader.Proxy Property

Lists any proxy servers that are required to connect to a server that hosts the WSDL document.

Pascal

```
property Proxy: string;
```

C++

```
__property UnicodeString Proxy;
```

Description

Use Proxy if the stream loader can't resolve the host portion of an URL for the WSDL document locally. If the server that hosts the WSDL document is registered locally or if the WSDL document is a file on the local machine, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

Password (see page 3532)

UserName (see page 3533)

Load (see page 3530)

15.1.1.3.3 IStreamLoader.Timeout Property

Pascal

```
property Timeout: integer;
```

C++

```
__property int Timeout;
```

Description

This is Timeout, a member of class IStreamLoader.

15.1.1.3.4 IStreamLoader.UserName Property

Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

Use UserName to specify the user name that the stream loader can use if the WSDL document is on a server that requires authentication or if it needs to use a proxy server that requires authentication. The password for this user name is specified by the Password (see page 3532) property.

See Also

Password (see page 3532)

Proxy (see page 3533)

15.1.2 IStringTokenizer Interface

A string tokenizer breaks a string into tokens.

Class Hierarchy

Pascal

```
IStringTokenizer = interface;
```

C++

```
__interface IStringTokenizer;
```

File

HTTPUtil

Description

IStringTokenizer is implemented by string tokenizers, objects which iterate through the tokens in a string. To obtain a simple string tokenizer, call StringTokenizer (see page 3539).

A tokenizer is created from two strings: a source string and a delimiter string. In the source string, any characters in the delimiter string separate tokens, while any other characters are part of the tokens themselves. Thus in the following calls:

StringTokenizer (see page 3539)('This is a token/So+is+this', '/'); // Delphi example

StringTokenizer (see page 3539)("This is a token/So+is+this', '/'); // C++ example

StringTokenizer (see page 3539) creates a tokenizer that produces two tokens, consisting of the strings "This is a token" and "So+is+this".

Use the nextToken (see page 3535) method to iterate through the tokens.

See Also

StringTokenizer (see page 3539)

15.1.2.1 IStringTokenizer Members

The following tables list the members exposed by IStringTokenizer.

Public Methods

	Name	Description
	getTokenCounts (see page 3535)	Implements countTokens (see page 3536) property.

	hasMoreTokens (see page 3535)	Returns true if more tokens available.
	nextToken (see page 3535)	Returns next available token.

Public Properties

	Name	Description
R	countTokens (see page 3536)	Contains number of tokens in string.

15.1.2.2 IStringTokenizer Methods

The methods of the IStringTokenizer class are listed here.

Public Methods

	Name	Description
	getTokenCounts (see page 3535)	Implements countTokens (see page 3536) property.
	hasMoreTokens (see page 3535)	Returns true if more tokens available.
	nextToken (see page 3535)	Returns next available token.

15.1.2.2.1 IStringTokenizer.getTokenCounts Method

Implements countTokens (see page 3536) property.

Pascal

```
function getTokenCounts: integer;
```

C++

```
__fastcall int getTokenCounts();
```

Description

The getTokenCounts method returns the value of the countTokens (see page 3536) property.

See Also

counttokens (see page 3536)

15.1.2.2.2 IStringTokenizer.hasMoreTokens Method

Returns true if more tokens available.

Pascal

```
function hasMoreTokens: boolean;
```

C++

```
__fastcall boolean hasMoreTokens();
```

Description

The hasMoreTokens method returns true if unretrieved tokens remain, false otherwise.

See Also

nextToken

15.1.2.2.3 IStringTokenizer.nextToken Method

Returns next available token.

Pascal

```
function nextToken: WideString;
```

C++

```
__fastcall BSTR nextToken();
```

Description

The nextToken method returns the next available token. If no more tokens are available (hasMoreTokens (see page 3535) returns false), nextToken returns an empty string.

See Also

nextToken

15.1.2.3 IStringTokenizer Properties

The properties of the IStringTokenizer class are listed here.

Public Properties

	Name	Description
R	countTokens (see page 3536)	Contains number of tokens in string.

15.1.2.3.1 IStringTokenizer.countTokens Property

Contains number of tokens in string.

Pascal

```
property countTokens: integer;
```

C++

```
__property int countTokens;
```

Description

The countTokens property contains the number of tokens in the string.

operator_sb

15.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FirstDelimiter (see page 3537)	This is function HTTPUtil.FirstDelimiter.
	FirstDelimiter (see page 3537)	This is function HTTPUtil.FirstDelimiter.
	GetDefaultStreamLoader (see page 3538)	This is function HTTPUtil.GetDefaultStreamLoader.
	HTMLEscape (see page 3538)	This is function HTTPUtil.HTMLEscape.
	StartsWith (see page 3538)	This is function HTTPUtil.StartsWith.
	StringTokenizer (see page 3539)	This is function HTTPUtil.StringTokenizer.
	StringToStringArray (see page 3539)	This is function HTTPUtil.StringToStringArray.

15.2.1 HTTPUtil.FirstDelimiter Function

Pascal

```
function FirstDelimiter(const delimiters: WideString; const Str: WideString): integer;
overload;
```

C++

```
int FirstDelimiter(const BSTR delimiters, const BSTR Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.FirstDelimiter.

15.2.2 HTTPUtil.FirstDelimiter Function

Pascal

```
function FirstDelimiter(const delimiters: string; const Str: String): integer; overload;
```

C++

```
int FirstDelimiter(const UnicodeString delimiters, const UnicodeString Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.FirstDelimiter.

15.2.3 HTTPUtil.GetDefaultStreamLoader Function

Pascal

```
function GetDefaultStreamLoader: IStreamLoader;
```

C++

```
IStreamLoader GetDefaultStreamLoader();
```

File

HTTPUtil

Description

This is function HTTPUtil.GetDefaultStreamLoader.

15.2.4 HTTPUtil.HTMLEscape Function

Pascal

```
function HTMLEscape(const Str: string): string;
```

C++

```
UnicodeString HTMLEscape(const UnicodeString Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.HTMLEscape.

15.2.5 HTTPUtil.StartsWith Function

Pascal

```
function StartsWith(const str: string; const sub: string): Boolean;
```

C++

```
Boolean StartsWith(const UnicodeString str, const UnicodeString sub);
```

File

HTTPUtil

Description

This is function HTTPUtil.StartsWith.

15.2.6 HTTPUtil.StringTokenizer Function

Pascal

```
function StringTokenizer(const str: string; const delim: string): IStringTokenizer;
```

C++

```
IStringTokenizer StringTokenizer(const UnicodeString str, const UnicodeString delim);
```

File

HTTPUtil

Description

This is function HTTPUtil.StringTokenizer.

15.2.7 HTTPUtil.StringToStringArray Function

Pascal

```
function StringToStringArray(const str: string; const delim: string): TStringDynArray;
```

C++

```
TStringDynArray StringToStringArray(const UnicodeString str, const UnicodeString delim);
```

File

HTTPUtil

Description

This is function HTTPUtil.StringToStringArray.

16 IB Namespace

This is namespace IB.

Topics

Name	Description
Classes (see page 3543)	The following table lists classes in this documentation.
Functions (see page 3547)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3551)	The following table lists structs, records, enums in this documentation.
Types (see page 3557)	The following table lists types in this documentation.
Variables (see page 3560)	The following table lists variables in this documentation.
Constants (see page 3561)	The following table lists constants in this documentation.

Classes

	Name	Description
	EIBClientError (see page 3543)	EIBClientError represents a client-specific error in an InterBase Express application.
	EIBError (see page 3543)	EIBError is the exception class for InterBase errors.
	EIBInterBaseError (see page 3545)	EIBInterBaseError is used to raise server-specific errors.
	EIBInterBaseRoleError (see page 3546)	This is class IB.EIBInterBaseRoleError.

Constants

Name	Description
IBBigLocalBufferLength (see page 3561)	This is constant IB.IBBigLocalBufferLength.
IBErrorMessages (see page 3561)	This is constant IB.IBErrorMessages.
IBHugeLocalBufferLength (see page 3562)	This is constant IB.IBHugeLocalBufferLength.
IBLocalBufferLength (see page 3563)	This is constant IB.IBLocalBufferLength.
IBPalette1 (see page 3563)	This is constant IB.IBPalette1.
IBPalette2 (see page 3563)	This is constant IB.IBPalette2.

Functions

	Name	Description
	CheckStatusVector (see page 3547)	Sets or unsets status vector checking.
	GetIBDataBaseErrorMessages (see page 3547)	Returns the current error message setting.
	IBAlloc (see page 3548)	Allocates or de-allocates memory for a given size, and initializes the new memory to zero.
	IBDataBaseError (see page 3548)	Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 3545) exception.

	IBError (see page 3548)	Returns the error message for the specified error code.
	SetIBDataBaseErrorMessages (see page 3549)	Enables you to choose the error messages you want to see.
	StatusVector (see page 3549)	Retrieves the thread-specific status vector from thread-local storage.
	StatusVectorArray (see page 3549)	Returns a pointer to the status vector array.
	StatusVectorAsText (see page 3550)	Gets the status vector and returns it as a formatted string.

Structs, Records, Enums

	Name	Description
	TIBClientError (see page 3551)	This is record IB.TIBClientError.
	TIBDataBaseErrorMessage (see page 3555)	This is record IB.TIBDataBaseErrorMessage.
	TTraceFlag (see page 3555)	This is record IB.TTraceFlag.

Types

Name	Description
PStatusVector (see page 3557)	This is type IB.PStatusVector.
TIBDataBaseErrorMessages (see page 3557)	TIBDataBaseErrorMessage (see page 3555) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.
TStatusVector (see page 3558)	This is type IB.TStatusVector.
TTraceFlags (see page 3558)	TTraceFlag (see page 3555) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

Variables

Name	Description
IBCS (see page 3560)	This is variable IB.IBCS.

16.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIBClientError (see page 3543)	EIBClientError represents a client-specific error in an InterBase Express application.
	EIBError (see page 3543)	EIBError is the exception class for InterBase errors.
	EIBInterBaseError (see page 3545)	EIBInterBaseError is used to raise server-specific errors.
	EIBInterBaseRoleError (see page 3546)	This is class IB.EIBInterBaseRoleError.

16.1.1 EIBClientError Class

EIBClientError represents a client-specific error in an InterBase Express application.

Class Hierarchy

Pascal

```
EIBClientError = class(EIBError);
```

C++

```
class EIBClientError : public EIBError;
```

File

IB

Description

Use EIBClientError to raise an exception for client-specific errors. It is raised when an application tries to use a component improperly. For example, an EIBClientError is raised when a component can't access the database because it does not have an IBDatabase (see page 3703) component specified, attempts to edit a read-only dataset, tries to execute an empty query, and so on.

16.1.2 EIBError Class

EIBError is the exception class for InterBase errors.

Class Hierarchy

Pascal

```
EIBError = class(EDatabaseError);
```

C++

```
class EIBError : public EDatabaseError;
```

File

IB

Description

Use EIBError to raise an exception when a component detects an error in the database or in the component implementation. EIBError is the base class for all errors that arise in the use of InterBase Express. Its descendants represent specific types of errors, and include EIBClientError (see page 3543), EIBInterBaseError (see page 3545), and EIBInterbaseRoleError.

16.1.2.1 EIBError Members

The following tables list the members exposed by EIBError.

Public Methods

	Name	Description
	Create (see page 3544)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
R	IBErrorCode (see page 3545)	Returns the InterBase error code.
R	SQLCode (see page 3545)	Translates an InterBase error code in the error status vector to an SQL error number code.

16.1.2.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	EIBError.Create (Long, Long, string) (see page 3544)	Calls the inherited Create and sets the SQLCode (see page 3545) and IBErrorCode (see page 3545)
	EIBError.Create (Long, string) (see page 3544)	Calls the inherited Create and sets the SQLCode (see page 3545) and IBErrorCode (see page 3545)

16.1.2.2.1 EIBError.Create Constructor (Long, Long, string)

Calls the inherited Create and sets the SQLCode (see page 3545) and IBErrorCode (see page 3545)

Pascal

```
constructor Create(ASQLCode: Long; Msg: string); overload;
constructor Create(ASQLCode: Long; AIBErrorCode: Long; Msg: string); overload;
```

C++

```
__fastcall EIBError(Long ASQLCode, UnicodeString Msg);
__fastcall EIBError(Long ASQLCode, Long AIBErrorCode, UnicodeString Msg);
```

Description

Note: Use Create to call to the inherited Create and sets the SQL code and IBErrorCode (see page 3545).

16.1.2.3 EIBError Properties

The properties of the EIBError class are listed here.

Public Properties

	Name	Description
	IBErrorCode (see page 3545)	Returns the InterBase error code.
	SQLCode (see page 3545)	Translates an InterBase error code in the error status vector to an SQL error number code.

16.1.2.3.1 EIBError.IBErrorCode Property

Returns the InterBase error code.

Pascal

```
property IBErrorCode: Long;
```

C++

```
__property Long IBErrorCode;
```

Description

Use IBErrorCode to get the InterBase error code.

16.1.2.3.2 EIBError.SQLCode Property

Translates an InterBase error code in the error status vector to an SQL error number code.

Pascal

```
property SQLCode: Long;
```

C++

```
__property Long SQLCode;
```

Description

Translates an InterBase error code in the error status vector to an SQL error number code.

Delphi syntax:

```
property SQLCode: Long;
```

C++ syntax:

```
__property
        int SQLCode = {read=FSQLCode, nodefault};
```

Description

Use SQLCode to translate an InterBase error code in the error status vector to an SQL error number code. Typically, this call is used to populate a program variable with an SQL error number for use in an SQL error-handling routine.

16.1.3 EIBInterBaseError Class

EIBInterBaseError is used to raise server-specific errors.

Class Hierarchy

Pascal

```
EIBInterBaseError = class(EIBError);
```

C++

```
class EIBInterBaseError : public EIBError;
```

File

IB

Description

Use EIBInterBaseError to raise an exception that represents an error code that the InterBase server returns.

16.1.4 EIBInterBaseRoleError Class

Class Hierarchy

Pascal

```
EIBInterBaseRoleError = class(EIBError);
```

C++

```
class EIBInterBaseRoleError : public EIBError;
```

File

IB

Description

This is class IB.EIBInterBaseRoleError.

16.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckStatusVector (see page 3547)	Sets or unsets status vector checking.
	GetIBDataBaseErrorMessages (see page 3547)	Returns the current error message setting.
	IBAlloc (see page 3548)	Allocates or de-allocates memory for a given size, and initializes the new memory to zero.
	IBDataBaseError (see page 3548)	Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 3545) exception.
	IBError (see page 3548)	Returns the error message for the specified error code.
	SetIBDataBaseErrorMessages (see page 3549)	Enables you to choose the error messages you want to see.
	StatusVector (see page 3549)	Retrieves the thread-specific status vector from thread-local storage.
	StatusVectorArray (see page 3549)	Returns a pointer to the status vector array.
	StatusVectorAsText (see page 3550)	Gets the status vector and returns it as a formatted string.

16.2.1 IB.CheckStatusVector Function

Sets or unsets status vector checking.

Pascal

```
function CheckStatusVector(ErrorCodes: array of ISC_STATUS): Boolean;
```

C++

```
Boolean CheckStatusVector(array of ISC_STATUS ErrorCodes);
```

File

IB

Description

Set CheckStatusVector to true to enable status vector checking.

16.2.2 IB.GetIBDataBaseErrorMessages Function

Returns the current error message setting.

Pascal

```
function GetIBDataBaseErrorMessages: TIBDataBaseErrorMessages;
```

C++

```
TIBDataBaseErrorMessages GetIBDataBaseErrorMessages();
```

File

IB

Description

Use the GetIBDataBaseErrorMessages function to return the current error message setting.

16.2.3 IB.IBAlloc Function

Allocates or de-allocates memory for a given size, and initializes the new memory to zero.

Pascal

```
procedure IBAlloc(var P; OldSize: Integer; NewSize: Integer);
```

C++

```
IBAlloc( P, int OldSize, int NewSize);
```

File

IB

Description

Use IBAlloc to allocate or de-allocate memory for a given size, and initialize the new memory to zero.

16.2.4 IB.IBDataBaseError Function

Interprets the SQLCode and IBErrorCode status and passes it to the EIBInterBaseError (see page 3545) exception.

Pascal

```
procedure IBDataBaseError;
```

C++

```
IBDataBaseError();
```

File

IB

Description

Use the IBDataBaseError procedure to look at the status vector, interpret the SQLCode and IBErrorCode status, construct the status string, and pass it to the EIBInterBaseError (see page 3545) exception.

16.2.5 IB.IBError Function

Returns the error message for the specified error code.

Pascal

```
procedure IBError(ErrMess: TIBClientError; const Args: array of const);
```

C++

```
IBError(TIBClientError ErrMess, const array of const Args);
```

File

IB

Description

Use the IBError procedure to look up the appropriate error message for a specified error code and raise an EIBClientError (see page 3543) exception.

16.2.6 IB.SetIBDataBaseErrorMessages Function

Enables you to choose the error messages you want to see.

Pascal

```
procedure SetIBDataBaseErrorMessages(Value: TIBDataBaseErrorMessages);
```

C++

```
SetIBDataBaseErrorMessages(TIBDataBaseErrorMessages Value);
```

File

IB

Description

Use the SetIBDataBaseErrorMessages procedure to choose the error messages that you want to use. The available options are defined in TIBDataBaseErrorMessages (see page 3557).

16.2.7 IB.StatusVector Function

Retrieves the thread-specific status vector from thread-local storage.

Pascal

```
function StatusVector: PISC_STATUS;
```

C++

```
PISC_STATUS StatusVector();
```

File

IB

Description

Use the StatusVector function to retrieve the thread-specific status from the thread-local storage.

16.2.8 IB.StatusVectorArray Function

Returns a pointer to the status vector array.

Pascal

```
function StatusVectorArray: PStatusVector;
```

C++

```
PStatusVector StatusVectorArray();
```

File

IB

Description

Use the StatusVectorArray function to return a pointer to the status vector array from the thread-local storage.

16.2.9 IB.StatusVectorAsText Function

Gets the status vector and returns it as a formatted string.

Pascal

```
function StatusVectorAsText: string;
```

C++

```
UnicodeString StatusVectorAsText();
```

File

IB

Description

Use the StatusVector (see page 3549) function to retrieve the status vector and return it as a formatted string.

16.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBClientError (see page 3551)	This is record IB.TIBClientError.
	TIBDataBaseErrorMessage (see page 3555)	This is record IB.TIBDataBaseErrorMessage.
	TTraceFlag (see page 3555)	This is record IB.TTraceFlag.

16.3.1 IB.TIBClientError Enumeration

Pascal

```
TIBClientError = (
  ibxeUnknownError,
  ibxeInterBaseMissing,
  ibxeInterBaseInstallMissing,
  ibxeIB60feature,
  ibxeNotSupported,
  ibxeNotPermitted,
  ibxeFileAccessError,
  ibxeConnectionTimeout,
  ibxeCannotSetDatabase,
  ibxeCannotSetTransaction,
  ibxeOperationCancelled,
  ibxeDPBConstantNotSupported,
  ibxeDPBConstantUnknown,
  ibxeTPBConstantNotSupported,
  ibxeTPBConstantUnknown,
  ibxeDatabaseClosed,
  ibxeDatabaseOpen,
  ibxeDatabaseNameMissing,
  ibxeNotInTransaction,
  ibxeInTransaction,
  ibxeTimeoutNegative,
  ibxeNoDatabasesInTransaction,
  ibxeUpdateWrongDB,
  ibxeUpdateWrongTR,
  ibxeDatabaseNotAssigned,
  ibxeTransactionNotAssigned,
  ibxeXSQLDAIndexOutOfRange,
  ibxeXSQLDANameDoesNotExist,
  ibxeEOF,
  ibxeBOF,
  ibxeInvalidStatementHandle,
  ibxeSQLOpen,
  ibxeSQLClosed,
  ibxeDatasetOpen,
  ibxeDatasetClosed,
  ibxeUnknownSQLDataType,
  ibxeInvalidColumnIndex,
  ibxeInvalidParamColumnIndex,
  ibxeInvalidDataConversion,
  ibxeColumnIsNotNullable,
  ibxeBlobCannotBeRead,
```

```
    ibxeBlobCannotBeWritten,
    ibxeEmptyQuery,
    ibxeCannotOpenNonSQLSelect,
    ibxeNoFieldAccess,
    ibxeFieldReadOnly,
    ibxeFieldNotFound,
    ibxeNotEditing,
    ibxeCannotInsert,
    ibxeCannotPost,
    ibxeCannotUpdate,
    ibxeCannotDelete,
    ibxeCannotRefresh,
    ibxeBufferNotSet,
    ibxeCircularReference,
    ibxeSQLParseError,
    ibxeUserAbort,
    ibxeDataSetUniDirectional,
    ibxeCannotCreateSharedResource,
    ibxeWindowsAPIError,
    ibxeColumnListsDontMatch,
    ibxeColumnTypesDontMatch,
    ibxeCantEndSharedTransaction,
    ibxeFieldUnsupportedType,
    ibxeCircularDataLink,
    ibxeEmptySQLStatement,
    ibxeIsASelectStatement,
    ibxeRequiredParamNotSet,
    ibxeNoStoredProcName,
    ibxeIsAExecuteProcedure,
    ibxeUpdateFailed,
    ibxeNotCachedUpdates,
    ibxeNotLiveRequest,
    ibxeNoProvider,
    ibxeNoRecordsAffected,
    ibxeNoTableName,
    ibxeCannotCreatePrimaryIndex,
    ibxeCannotDropSystemIndex,
    ibxeTableNameMismatch,
    ibxeIndexFieldMissing,
    ibxeInvalidCancellation,
    ibxeInvalidEvent,
    ibxeMaximumEvents,
    ibxeNoEventsRegistered,
    ibxeInvalidQueueing,
    ibxeInvalidRegistration,
    ibxeInvalidBatchMove,
    ibxeSQLDialectInvalid,
    ibxeSPBConstantNotSupported,
    ibxeSPBConstantUnknown,
    ibxeServiceActive,
    ibxeServiceInActive,
    ibxeServerNameMissing,
    ibxeQueryParamsError,
    ibxeStartParamsError,
    ibxeOutputParsingError,
    ibxeUseSpecificProcedures,
    ibxeSQLMonitorAlreadyPresent,

    ibxeDPBConstantUnknownEx,
```

```
    ibxeTPBConstantUnknownEx,
    ibxeUnknownPlan,
    ibxeFieldSizeMismatch,
    ibxeEventAlreadyRegistered,
    ibxeStringTooLarge
  };
```

File

IB

Description

This is record IB.TIBClientError.

16.3.2 IB.TIBDataBaseErrorMessage Enumeration

Pascal

```
  TIBDataBaseErrorMessage = (
    ShowSQLCode,
    ShowIBMessage,
    ShowSQLMessage
  );
```

C++

```
  enum TIBDataBaseErrorMessage {
    ShowSQLCode,
    ShowIBMessage,
    ShowSQLMessage
  };
```

File

IB

Description

This is record IB.TIBDataBaseErrorMessage.

16.3.3 IB.TTraceFlag Enumeration

Pascal

```
  TTraceFlag = (
    tfQPrepare,
    tfQExecute,
    tfQFetch,
    tfError,
    tfStmt,
    tfConnect,
    tfTransact,
    tfBlob,
    tfService,
    tfMisc
  );
```

C++

```
  enum TTraceFlag {
    tfQPrepare,
```

```
    tfQExecute,
    tfQFetch,
    tfError,
    tfStmt,
    tfConnect,
    tfTransact,
    tfBlob,
    tfService,
    tfMisc
  };
```

File

IB

Description

This is record IB.TTraceFlag.

16.4 Types

The following table lists types in this documentation.

Types

Name	Description
PStatusVector (see page 3557)	This is type IB.PStatusVector.
TIBDataBaseErrorMessages (see page 3557)	TIBDataBaseErrorMessage (see page 3555) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.
TStatusVector (see page 3558)	This is type IB.TStatusVector.
TTraceFlags (see page 3558)	TTraceFlag (see page 3555) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

16.4.1 IB.PStatusVector Type

Pascal

```
PStatusVector = ^TStatusVector;
```

C++

```
^TStatusVector PStatusVector;
```

File

IB

Description

This is type IB.PStatusVector.

16.4.2 IB.TIBDataBaseErrorMessages Type

TIBDataBaseErrorMessage (see page 3555) and TIBDataBaseErrorMessages indicate the various strings available to describe an error that an IBX component encountered.

Pascal

```
TIBDataBaseErrorMessages = set of TIBDataBaseErrorMessage;
```

C++

```
TIBDataBaseErrorMessage TIBDataBaseErrorMessages;
```

File

IB

Description

TIBDataBaseErrorMessages is a set of TIBDataBaseErrorMessage (see page 3555) values. The following table lists the possible values:

Value Meaning

ShowSQLCode The SQL code that the server was trying to execute when the error occurred.

ShowIBMessage The error message InterBase provides for the error.

ShowSQLMessage The error message that describes what part of the SQL code caused the error.

16.4.3 IB.TStatusVector Type

Pascal

```
TStatusVector = array[0..19] of ISC_STATUS;
```

C++

```
array[0..19] of ISC_STATUS TStatusVector;
```

File

IB

Description

This is type IB.TStatusVector.

16.4.4 IB.TTraceFlags Type

TTraceFlag (see page 3555) and TTraceFlags indicate the types of messages that pass between an application and the InterBase server.

Pascal

```
TTraceFlags = set of TTraceFlag;
```

C++

```
TTraceFlag TTraceFlags;
```

File

IB

Description

TTraceFlags is a set of TTraceFlag (see page 3555) values. The following table lists the possible values:

Values Meaning

tfQPrepare Monitor Prepare statements.

tfQExecute Monitor ExecSQL statements.

tfError Monitor server error messages. Such messages may include an error code.

tfStmt Monitor all SQL statements.

tfConnect Monitor database connect and disconnect operations, including allocation of connection handles, and freeing connection handles.

tfTransact Monitor transaction statements, such as StartTransaction, Commit, and Rollback.

tfBlob Monitor operations on blob data types.

tfService Monitor messages to one of the IB (see page 3541) services.

tfMisc Monitor any statements not covered by other flag options.

16.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
IBCS (see page 3560)	This is variable IB.IBCS.

16.5.1 IB.IBCS Variable

Pascal

```
IBCS: TRTLCriticalSection;
```

C++

```
TRTLCriticalSection IBCS;
```

File

IB

Description

This is variable IB.IBCS.

16.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IBBigLocalBufferLength (see page 3561)	This is constant IB.IBBigLocalBufferLength.
IBErrorMessages (see page 3561)	This is constant IB.IBErrorMessages.
IBHugeLocalBufferLength (see page 3562)	This is constant IB.IBHugeLocalBufferLength.
IBLocalBufferLength (see page 3563)	This is constant IB.IBLocalBufferLength.
IBPalette1 (see page 3563)	This is constant IB.IBPalette1.
IBPalette2 (see page 3563)	This is constant IB.IBPalette2.

16.6.1 IB.IBBigLocalBufferLength Constant

Pascal

```
IBBigLocalBufferLength = IBLocalBufferLength * 2;
```

C++

```
IBBigLocalBufferLength = IBLocalBufferLength * 2;
```

File

IB

Description

This is constant IB.IBBigLocalBufferLength.

16.6.2 IB.IBErrorMessages Constant

Pascal

```
IBErrorMessages: array[TIBClientError] of string = ( SUnknownError, SInterBaseMissing,
SInterBaseInstallMissing, SIB60feature, SNotSupported, SNotPermitted, SFileAccessError,
SConnectionTimeout, SCannotSetDatabase, SCannotSetTransaction, SOperationCancelled,
SDPBConstantNotSupported, SDPBConstantUnknown, STPBConstantNotSupported, STPBConstantUnknown,
SDatabaseClosed, SDatabaseOpen, SDatabaseNameMissing, SNotInTransaction, SInTransaction,

SInvalidOnStatusResult, SDPBConstantUnknownEx, STPBConstantUnknownEx, SUnknownPlan,
SFieldSizeMismatch, SEventAlreadyRegistered, SStringTooLarge );
```

File

IB

Description

This is constant IB.IBErrorMessages.

16.6.3 IB.IBHugeLocalBufferLength Constant

Pascal

```
IBHugeLocalBufferLength = IBBigLocalBufferLength * 20;
```

C++

```
IBHugeLocalBufferLength = IBBigLocalBufferLength * 20;
```

File

IB

Description

This is constant IB.IBHugeLocalBufferLength.

16.6.4 IB.IBLocalBufferLength Constant

Pascal

```
IBLocalBufferLength = 512;
```

C++

```
IBLocalBufferLength = 512;
```

File

IB

Description

This is constant IB.IBLocalBufferLength.

16.6.5 IB.IBPalette1 Constant

Pascal

```
IBPalette1 = 'InterBase';
```

C++

```
IBPalette1 = 'InterBase';
```

File

IB

Description

This is constant IB.IBPalette1.

16.6.6 IB.IBPalette2 Constant

Pascal

```
IBPalette2 = 'InterBase Admin';
```

C++

```
IBPalette2 = 'InterBase Admin';
```

File

IB

Description

This is constant IB.IBPalette2.

17 IBBatchMove Namespace

This is namespace IBBatchMove.

Topics

Name	Description
Classes (see page 3566)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3578)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TIBBatchMove (see page 3566)	TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

Structs, Records, Enums

	Name	Description
	TBatchMode (see page 3578)	This is record IBBatchMove.TBatchMode.

17.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBatchMove (see page 3566)	TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

17.1.1 TIBBatchMove Class

TIBBatchMove enables applications to perform database operations on groups of records or entire tables.

Class Hierarchy

Pascal

```
TIBBatchMove = class(TComponent);
```

C++

```
class TIBBatchMove : public TComponent;
```

File

IBBatchMove

Description

Set the properties of the TIBBatchMove object to

- Add the records in a dataset to a database table.
- Delete the records in a dataset from a database table.
- Copy a dataset to create a new database table or overwrite an existing table.

Call the Execute (see page 3568) method to perform the actual operation. TIBTable (see page 4142) objects can also perform the same batch operations, but only with the options specified by the default TIBBatchMove property values.

17.1.1.1 TIBBatchMove Members

The following tables list the members exposed by TIBBatchMove.

Protected Methods

	Name	Description
	Notification (see page 3569)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	Create (see page 3567)	Creates an instance of TIBBatchMove (see page 3566).
	Destroy (see page 3568)	Destroys an instance of TIBBatchMove (see page 3566).

	Execute (see page 3568)	Performs the batch operation specified by Mode (see page 3574).

Public Properties

	Name	Description
R	ChangedCount (see page 3571)	Indicates the number of records from the Destination (see page 3572) table that are altered as a result of the batch operation.
R	KeyViolCount (see page 3572)	Reports the number of records that could not be replaced, added, or deleted from Destination (see page 3572) because of integrity or key violations.
R	MovedCount (see page 3574)	Reports the number of records form the Source (see page 3576) which were applied to the destination.
R	ProblemCount (see page 3575)	Indicates the number of records which could not be added to Destination (see page 3572) without loss of data due to a field type mismatch.

Published Properties

	Name	Description
	AbortOnKeyViol (see page 3570)	Specifies whether the batch operation is terminated immediately when integrity or key violations occur.
	AbortOnProblem (see page 3570)	Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 3572).
	ChangedTableName (see page 3571)	Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.
	CommitCount (see page 3571)	Specifies how many records are batch moved before a commit occurs.
	Destination (see page 3572)	Specifies the TIBTable (see page 4142) object for the database table that is the destination of the batch operation.
	KeyViolTableName (see page 3573)	Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 3576) that cannot participate in the batch operation because of integrity or key violations.
	Mappings (see page 3573)	Specifies the column mappings for a batch operation.
	Mode (see page 3574)	Specifies what the TIBBatchMove (see page 3566) object does when the Execute (see page 3568) method is called.
	ProblemTableName (see page 3575)	Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 3576) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 3572) table.
	RecordCount (see page 3576)	Specifies the maximum number of records that are applied to the Destination (see page 3572) when Execute (see page 3568) is called.
	Source (see page 3576)	Specifies the dataset that is the source of the batch operation.
	Transliterate (see page 3577)	Specifies whether the data in the Source (see page 3576) records should be converted form the locale of the Source (see page 3576) to the locale of the Destination (see page 3572) when the Execute (see page 3568) method is called.

17.1.1.2 TIBBatchMove.Create Constructor

Creates an instance of TIBBatchMove (see page 3566).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBatchMove(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBBatchMove (see page 3566) for performing a batch operation. Create allocates the memory for the TIBBatchMove (see page 3566) object and

- Sets AbortOnKeyViol (see page 3570) to True.
- Sets AbortOnProblem (see page 3570) to True.
- Sets Transliterate (see page 3577) to True.

- Creates a TStringList object to hold the Mappings (see page 3573).

The property settings made by Create are the values used when a TIBTable (see page 4142) object performs batch operations using its BatchMove method.

17.1.1.3 TIBBatchMove.Destroy Destructor

Destroys an instance of TIBBatchMove (see page 3566).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBatchMove();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBBatchMove (see page 3566) object is not already freed and only then calls Destroy.

Before calling the inherited destructor, Destroy frees the TStringList object that implements the Mappings (see page 3573) property.

17.1.1.4 TIBBatchMove Methods

The methods of the TIBBatchMove class are listed here.

Protected Methods

	Name	Description
	Notification (see page 3569)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	Execute (see page 3568)	Performs the batch operation specified by Mode (see page 3574).

17.1.1.4.1 TIBBatchMove.Execute Method

Performs the batch operation specified by Mode (see page 3574).

Pascal

```
procedure Execute;
```

C++

```
__fastcall Execute();
```

Description

After setting properties to indicate what batch operation should be performed and how, call Execute to perform the operation. As a minimum, the Mode (see page 3574), Source (see page 3576), and Destination (see page 3572) properties must be set.

After calling Execute, the values of the ChangedCount (see page 3571), KeyViolCount (see page 3572), MovedCount (see page 3574), ProblemCount (see page 3575), and RecordCount (see page 3576) properties will become available. These properties will give an indication of what happened as a result of the call to Execute. Additional information about the batch operation will be available through the creation of a changed table, a keyviol table, and/or a problems table if it was requested.

17.1.1.4.2 TIBBatchMove.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

17.1.1.5 TIBBatchMove Properties

The properties of the TIBBatchMove class are listed here.

Public Properties

	Name	Description
R	ChangedCount (see page 3571)	Indicates the number of records from the Destination (see page 3572) table that are altered as a result of the batch operation.
R	KeyViolCount (see page 3572)	Reports the number of records that could not be replaced, added, or deleted from Destination (see page 3572) because of integrity or key violations.
R	MovedCount (see page 3574)	Reports the number of records form the Source (see page 3576) which were applied to the destination.
R	ProblemCount (see page 3575)	Indicates the number of records which could not be added to Destination (see page 3572) without loss of data due to a field type mismatch.

Published Properties

	Name	Description
	AbortOnKeyViol (see page 3570)	Specifies whether the batch operation is terminated immediately when integrity or key violations occur.
	AbortOnProblem (see page 3570)	Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 3572).
	ChangedTableName (see page 3571)	Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.
	CommitCount (see page 3571)	Specifies how many records are batch moved before a commit occurs.
	Destination (see page 3572)	Specifies the TIBTable (see page 4142) object for the database table that is the destination of the batch operation.

	KeyViolTableName (see page 3573)	Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 3576) that cannot participate in the batch operation because of integrity or key violations.
	Mappings (see page 3573)	Specifies the column mappings for a batch operation.
	Mode (see page 3574)	Specifies what the TIBBatchMove (see page 3566) object does when the Execute (see page 3568) method is called.
	ProblemTableName (see page 3575)	Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 3576) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 3572) table.
	RecordCount (see page 3576)	Specifies the maximum number of records that are applied to the Destination (see page 3572) when Execute (see page 3568) is called.
	Source (see page 3576)	Specifies the dataset that is the source of the batch operation.
	Transliterate (see page 3577)	Specifies whether the data in the Source (see page 3576) records should be converted form the locale of the Source (see page 3576) to the locale of the Destination (see page 3572) when the Execute (see page 3568) method is called.

17.1.1.5.1 TIBBatchMove.AbortOnKeyViol Property

Specifies whether the batch operation is terminated immediately when integrity or key violations occur.

Pascal

```
property AbortOnKeyViol: Boolean;
```

C++

```
__property Boolean AbortOnKeyViol;
```

Description

Set AbortOnKeyViol to true (the default) to cancel the batch operation when it causes integrity or key violations in the destination table. Set AbortOnKeyViol to false to cause records that would cause integrity or key violations to be posted to a key violations table instead. Provide a KeyViolTableName (see page 3573) when setting AbortOnKeyViol to false. If there is no KeyViolTableName (see page 3573), AbortOnKeyViol may still be set to false, in which case problem records are counted but not saved in a table.

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

17.1.1.5.2 TIBBatchMove.AbortOnProblem Property

Specifies whether the batch operation is terminated immediately when it is necessary to truncate data to make it fit in the specified Destination (see page 3572).

Pascal

```
property AbortOnProblem: Boolean;
```

C++

```
__property Boolean AbortOnProblem;
```

Description

Set AbortOnProblem to true to cancel the batch operation when types of the fields in the Source (see page 3576) table records do not match the types of the fields in the Destination (see page 3572) table records. Set AbortOnProblem to false to cause

the mismatched fields to be 'trimmed'. When AbortOnProblem is false, set the ProblemTableName (see page 3575) to have all the untrimmed versions of records that were trimmed saved to a separate table.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 3566) to raise an exception.

Trimming does not occur when the Mode (see page 3574) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table that do not exactly match the values from the source table may be deleted.

17.1.1.5.3 TIBBatchMove.ChangedCount Property

Indicates the number of records from the Destination (see page 3572) table that are altered as a result of the batch operation.

Pascal

```
property ChangedCount: Longint;
```

C++

```
__property Longint ChangedCount;
```

Description

Use ChangedCount to learn the number of records in the Destination (see page 3572) table that are updated when the Mode (see page 3574) is batUpdate or batAppendUpdate, or to learn the number that are deleted when the Mode (see page 3574) is batDelete.

Set the ChangedTableName (see page 3571) property to save the unchanged versions of the altered records to a separate table. ChangedCount is then the number of records in that separate table.

17.1.1.5.4 TIBBatchMove.ChangedTableName Property

Specifies the name of a local Interbase table that is created to hold copies of all records from the destination table that are changed by the batch operation.

Pascal

```
property ChangedTableName: TFileName;
```

C++

```
__property TFileName ChangedTableName;
```

Description

Set ChangedTableName to create a table that saves all unchanged versions of records that are changed by the batch operation. ChangedTableName must specify the name of a Interbase table. Setting ChangedTableName ensures that no information in the Destination (see page 3572) table gets lost when the records are altered or deleted.

When the Mode (see page 3574) property is batUpdate or batAppendUpdate, the new table will hold all records that were updated. When the Mode (see page 3574) property is batDelete, the new table will hold all records that were deleted.

The ChangedCount (see page 3571) property specifies the number of records in the new table.

17.1.1.5.5 TIBBatchMove.CommitCount Property

Specifies how many records are batch moved before a commit occurs.

Pascal

```
property CommitCount: Integer;
```

C++

```
__property int CommitCount;
```

Description

Use CommitCount to chunk batch operations into smaller operations. CommitCount allows an application to accommodate server transaction logs that are not big enough to handle the entire batch. Setting CommitCount to 0 will cause chunking into the number of records that will fit in 32K bytes.

Note: If the Execute (see page 3568) method is called within an explicit transaction on the database containing the tables, CommitCount is ignored.

17.1.1.5.6 TIBBatchMove.Destination Property

Specifies the TIBTable (see page 4142) object for the database table that is the destination of the batch operation.

Pascal

```
property Destination: TIBTable;
```

C++

```
__property TIBTable Destination;
```

Description

Use Destination to indicate the database table that will be created or altered by the batch operation. The batch operation affects the Destination differently depending on the Mode (see page 3574):

Mode (see page 3574) Effect on Destination

- batAppend Records are added to the destination table. No pre-existing records are altered. The destination table must already exist.
- batUpdate Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source records. No new records are added. The destination table must already exist and must have an index defined.
- batAppendUpdate Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source. Source (see page 3576) records that do not match key fields are added to the destination table. The destination table must already exist and must have an index defined.
- batDelete Records in the destination table that match the records in the source are deleted. The destination table must already exist and must have an index defined.
- batCopy The destination table is created to match the records in the source. If Destination already exists, it is replaced by the copy of the source.

17.1.1.5.7 TIBBatchMove.KeyViolCount Property

Reports the number of records that could not be replaced, added, or deleted from Destination (see page 3572) because of integrity or key violations.

Pascal

```
property KeyViolCount: Longint;
```

C++

```
__property Longint KeyViolCount;
```

Description

Use KeyViolCount to learn the number of records form the Source (see page 3576) table that could not be applied to the Destination (see page 3572) table because of integrity or key violations. To obtain a table of the offending records from the Source (see page 3576) table, specify a KeyViolTableName (see page 3573).

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

Note: If AbortOnKeyViol (see page 3570) is true, KeyViolCount will never be greater than one, because the first violation will cause the batch operation to terminate.

17.1.1.5.8 TIBBatchMove.KeyViolTableName Property

Specifies the name of an InterBase table that will be created to contain all records from the Source (see page 3576) that cannot participate in the batch operation because of integrity or key violations.

Pascal

```
property KeyViolTableName: TFileName;
```

C++

```
__property TFileName KeyViolTableName;
```

Description

Use KeyViolTableName to obtain a table of records that could not be applied to the Destination (see page 3572) table because of integrity or key violations. KeyViolCount (see page 3572) has the number of records in the table that is created.

Key violations occur when appending records to a table that has a primary key. On a table with a primary key, no two records may have the same values on all of the key fields. If a record that is being appended has the same values on all the key fields as a record in the destination table, it cannot be appended.

Integrity violations occur when deleting, appending or updating records to a table that has a referential integrity specification. A referential integrity specification requires that certain fields in one table must have values that exist in a particular field of another table. If a record that is being added does not match the restrictions imposed by referential integrity, it cannot be added. If deleting record would cause tighter referential integrity restrictions that another table cannot meet, it cannot be deleted.

Note: If AbortOnKeyViol (see page 3570) is true, then there will be at most one record in this table because the operation aborts with that first record.

17.1.1.5.9 TIBBatchMove.Mappings Property

Specifies the column mappings for a batch operation.

Pascal

```
property Mappings: TStrings;
```

C++

```
__property TStrings Mappings;
```

Description

Set Mappings to specify the correspondence between fields in the Source (see page 3576) and fields in the Destination (see page 3572). By default TIBBatchMove (see page 3566) matches fields based on their position in the source and destination tables. That is, the first column in the source is matched with the first column in the destination, and so on. Mappings enables an application to override this default.

Mappings is a list of column mappings (one per line) in one of two forms. To map the column ColName in the source table to the column of the same name in the destination table, use:

```
ColName
```

To map the column named SourceColName in the source table to the column named DestColName in the destination table, use:

```
DestColName=SourceColName
```

When adding or appending records, fields in Destination (see page 3572) which have no entry in Mappings will be set to NULL. When copying a dataset, fields in Destination (see page 3572) which have no entry in Mappings will not appear as columns in the copy of the table.

If source and destination column data types are not the same, TIBBatchMove (see page 3566) can either cancel the batch operation or perform a 'best fit.' If AbortOnProblem (see page 3570) is true, type mismatches will terminate the batch move. Otherwise, the field values from the Source (see page 3576) will be converted, if possible, to be compatible with the Destination (see page 3572).

17.1.1.5.10 TIBBatchMove.Mode Property

Specifies what the TIBBatchMove (see page 3566) object does when the Execute (see page 3568) method is called.

Pascal

```
property Mode: TBatchMode;
```

C++

```
__property TBatchMode Mode;
```

Description

Use Mode to indicate whether the TIBBatchMove (see page 3566) object should add records, replace records, delete records, or copy the Source (see page 3576). These are the possible values for Mode:

Value	Meaning
batAppend	Append the records in the source to the destination table. The destination table must already exist, and the two tables must not have records with duplicate keys. This is the default mode.
batUpdate	Replace records in the destination table with matching records from the source table. The destination table must exist and must have an index defined to match records.
batAppendUpdate	If a matching record exists in the destination table, replace it. Otherwise, append records to the destination table. The destination table must exist and must have an index defined to match records.
batCopy	Create (see page 3567) the destination table based on the structure of the source table. If the destination already exists, the operation will delete it, and replace it with the new copy of the source.
batDelete	Delete records in the destination table that match records in the source table. The destination table must already exist and must have an index defined.

17.1.1.5.11 TIBBatchMove.MovedCount Property

Reports the number of records form the Source (see page 3576) which were applied to the destination.

Pascal

```
property MovedCount: Longint;
```

C++

```
__property Longint MovedCount;
```

Description

Read MovedCount to learn the number of records from the Source (see page 3576) that were read during the Execute (see page 3568) method. The MovedCount value includes any records which caused key or integrity violations, or which were trimmed.

17.1.1.5.12 TIBBatchMove.ProblemCount Property

Indicates the number of records which could not be added to Destination (see page 3572) without loss of data due to a field type mismatch.

Pascal

```
property ProblemCount: Longint;
```

C++

```
__property Longint ProblemCount;
```

Description

Read ProblemCount to learn the number of records from the Source (see page 3576) that had field values that could not be mapped to destination fields without being 'trimmed'. If a ProblemTableName (see page 3575) is specified, ProblemCount is the number of records in that table.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 3566) to raise an exception.

Trimming does not occur when the Mode (see page 3574) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table may be deleted that do not exactly match the values from the source table.

Note: If AbortOnProblem (see page 3570) is true, then ProblemCount will be at most one, because the operation aborts when the problem occurs.

17.1.1.5.13 TIBBatchMove.ProblemTableName Property

Specifies the name of a Interbase table that will be created to contain all records from the Source (see page 3576) that contain fields which were trimmed to match the corresponding field type in the Destination (see page 3572) table.

Pascal

```
property ProblemTableName: TFileName;
```

C++

```
__property TFileName ProblemTableName;
```

Description

Set ProblemTableName to create a table that holds records from the Source (see page 3576) that contain fields that had to be trimmed to be applied to the Destination (see page 3572). ProblemCount (see page 3575) will have the number of records placed in the new table. If ProblemTableName is not specified, the data in the record is still trimmed when applied to the destination table, but there will be no easy way to tell which fields were trimmed.

Trimming a field means converting its value to a value compatible with the destination field type. For example, if a field in the destination table holds a string of size 10 characters, and the corresponding field in the source table holds a string of size 15 characters, any values from the source table longer than 10 characters must be truncated. Values that cannot be converted will cause TIBBatchMove (see page 3566) to raise an exception.

Trimming does not occur when the Mode (see page 3574) property is set to batCopy. Trimming fields on a delete operation means that records in the destination table may be deleted that do not exactly match the values from the source table.

Note: If AbortOnProblem (see page 3570) is true, then there will be at most one record in this table because the operation aborts with the first record that has a problem.

17.1.1.5.14 TIBBatchMove.RecordCount Property

Specifies the maximum number of records that are applied to the Destination (see page 3572) when Execute (see page 3568) is called.

Pascal

```
property RecordCount: Longint;
```

C++

```
__property Longint RecordCount;
```

Description

Use RecordCount to limit the number of Source (see page 3576) records that are applied to the Destination (see page 3572). If zero, all records are added, subtracted, or copied, beginning with the first record in Source (see page 3576). If RecordCount is greater than zero, up to RecordCount records are applied to the Destination (see page 3572), starting with the current record in the dataset. If RecordCount exceeds the number of records remaining in Source (see page 3576), no wraparound occurs; the operation is terminated.

17.1.1.5.15 TIBBatchMove.Source Property

Specifies the dataset that is the source of the batch operation.

Pascal

```
property Source: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet Source;
```

Description

Use Source to indicate the dataset that contains the records that will be added to, subtracted from, or copied to the Destination (see page 3572). If Source is a TIBQuery component, the query is executed before the move is executed. If a filter is currently in effect on Source, the filter conditions are respected when the batch move executes. The Mode (see page 3574) property indicates how the Source records are applied to the Destination (see page 3572):

Mode (see page 3574)	Effect on Destination (see page 3572)
batAppend	batAppend Records are added to the destination table.
batUpdate	Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source records.

batAppendUpdate	Records in the destination table with key fields matching the corresponding fields in the source are changed to match the source. Source records that do not match key fields are added to the destination table.
batDelete	Records in the destination table that match the records in the source are deleted.
batCopy	Destination (see page 3572) table is created to match the records in the source.

17.1.1.5.16 TIBBatchMove.Transliterate Property

Specifies whether the data in the Source (see page 3576) records should be converted form the locale of the Source (see page 3576) to the locale of the Destination (see page 3572) when the Execute (see page 3568) method is called.

Pascal

```
property Transliterate: Boolean;
```

C++

```
__property Boolean Transliterate;
```

Description

Set Transliterate to true when the Source (see page 3576) dataset and the Destination (see page 3572) table use different language drivers and the data may contain extended ASCII characters. Set Transliterate to false to avoid the overhead of the character set conversion when both the Source (see page 3576) and the Destination (see page 3572) use the same language driver or the data does not contain extended ASCII characters.

17.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBatchMode (see page 3578)	This is record IBBatchMove.TBatchMode.

17.2.1 IBBatchMove.TBatchMode Enumeration

Pascal

```
TBatchMode = (
  batAppend,
  batUpdate,
  batAppendUpdate,
  batDelete,
  batCopy
);
```

C++

```
enum TBatchMode {
  batAppend,
  batUpdate,
  batAppendUpdate,
  batDelete,
  batCopy
};
```

File

IBBatchMove

Description

This is record IBBatchMove.TBatchMode.

18 IBBlob Namespace

This is namespace IBBlob.

Topics

Name	Description
Classes (see page 3580)	The following table lists classes in this documentation.
Functions (see page 3594)	The following table lists functions in this documentation.
Constants (see page 3596)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBlobStream (see page 3580)	TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

Constants

Name	Description
DefaultBlobSegmentSize (see page 3596)	This is constant IBBlob.DefaultBlobSegmentSize.

Functions

	Name	Description
	GetBlobInfo (see page 3594)	This is function IBBlob.GetBlobInfo.
	ReadBlob (see page 3594)	This is function IBBlob.ReadBlob.
	WriteBlob (see page 3595)	This is function IBBlob.WriteBlob.

18.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBlobStream (see page 3580)	TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

18.1.1 TIBBlobStream Class

TIBBlobStream is a stream object that lets applications read from or write to field objects that represent Blob fields.

Class Hierarchy

Pascal

```
TIBBlobStream = class(TStream);
```

C++

```
class TIBBlobStream : public TStream;
```

File

IBBlob

Description

Use TIBBlobStream to access or modify the value of a Blob field object. Blob field objects are TBlobField objects and descendants of TBlobField such as TGraphicField and TMemoField. Blob fields use Blob streams to implement many of their data access properties and methods.

TIBBlobStream allows objects that have no specialized knowledge of how data is stored in a Blob field to read or write such data by employing the uniform stream interface.

To use a Blob stream, create an instance of TIBBlobStream, use the methods of the stream to read or write the data, and then free the Blob stream. Do not use the same instance of TBlobStream to access data from more than one record. Instead, create a new TIBBlobStream object every time you need to read or write Blob data on a new record.

18.1.1.1 TIBBlobStream Members

The following tables list the members exposed by TIBBlobStream.

Protected Methods

	Name	Description
	CloseBlob (see page 3584)	This is CloseBlob, a member of class TIBBlobStream.
	CreateBlob (see page 3584)	This is CreateBlob, a member of class TIBBlobStream.
	EnsureBlobInitialized (see page 3584)	This is EnsureBlobInitialized, a member of class TIBBlobStream.
	GetBlobInfo (see page 3585)	This is GetBlobInfo, a member of class TIBBlobStream.

	GetDatabase (see page 3585)	This is GetDatabase, a member of class TIBBlobStream.
	GetDBHandle (see page 3585)	This is GetDBHandle, a member of class TIBBlobStream.
	GetTransaction (see page 3585)	This is GetTransaction, a member of class TIBBlobStream.
	GetTRHandle (see page 3586)	This is GetTRHandle, a member of class TIBBlobStream.
	OpenBlob (see page 3586)	This is OpenBlob, a member of class TIBBlobStream.
	SetBlobID (see page 3588)	This is SetBlobID, a member of class TIBBlobStream.
	SetDatabase (see page 3588)	This is SetDatabase, a member of class TIBBlobStream.
	SetMode (see page 3589)	This is SetMode, a member of class TIBBlobStream.
	SetTransaction (see page 3589)	This is SetTransaction, a member of class TIBBlobStream.

Public Methods

	Name	Description
	Call (see page 3583)	Returns an error message based on the error code.
	Cancel (see page 3583)	Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.
	CheckReadable (see page 3583)	Indicates whether or not a Blob is readable.
	CheckWritable (see page 3584)	Indicates whether or not a Blob is write-able.
	Create (see page 3581)	Creates an instance of TIBBlobStream (see page 3580).
V	Destroy (see page 3582)	Destroys an instance of TIBBlobStream (see page 3580).
	Finalize (see page 3585)	Creates a Blob on the InterBase server and writes the data from the BlobStream to it.
	LoadFromFile (see page 3586)	Loads a Blob from a file to the field.
	LoadFromStream (see page 3586)	Loads a Blob from a stream into the field.
V	Read (see page 3587)	Reads up to Count bytes from the current position in the field's data into Buffer.
	SaveToFile (see page 3587)	Saves the contents of the Blob field to a file.
	SaveToStream (see page 3587)	Saves the contents of the BLOB field to a stream.
V	Seek (see page 3588)	Resets the current position of the TIBBlobStream (see page 3580) object.
V	SetSize (see page 3589)	Set the new total size of the Blob.
	Truncate (see page 3589)	Discards all data in the Blob field from the current position on.
V	Write (see page 3590)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

Public Properties

	Name	Description
	BlobID (see page 3590)	Sets or returns the Blob ID.
R	BlobMaxSegmentSize (see page 3591)	Returns the maximum segment size.
R	BlobNumSegments (see page 3591)	Returns the total number of segments in the Blob.
R	BlobSize (see page 3591)	Returns the total size of the Blob.
R	BlobType (see page 3591)	Returns the Blob type.
	Database (see page 3592)	Sets or returns the associated database.
R	DBHandle (see page 3592)	Indicates the database handle.
R	Handle (see page 3592)	Indicates the Blob handle.
	Mode (see page 3592)	Sets or returns the Blob stream mode type.
R	Modified (see page 3593)	Indicates whether the Blob field has been modified.
	Transaction (see page 3593)	Gets or sets the associated transaction.
R	TRHandle (see page 3593)	Indicates the transaction handle.

18.1.1.2 TIBBlobStream.Create Constructor

Creates an instance of TIBBlobStream (see page 3580).

Pascal

```
constructor Create;
```

C++

```
__fastcall TIBBlobStream();
```

Description

Call (see page 3583) Create to obtain an instance of TIBBlobStream (see page 3580) for reading from or writing to a specific TBlobField object.

18.1.1.3 TIBBlobStream.Destroy Destructor

Destroys an instance of TIBBlobStream (see page 3580).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBlobStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TIBBlobStream (see page 3580) object is not already freed and only then calls Destroy.

Destroy the TIBBlobStream (see page 3580) object by calling Free when it is no longer needed for reading from or writing to the BLOB field.

Destroy triggers an OnDataChange event if the Blob stream was used to overwrite or modify the data in the field. Destroy then frees any buffers that were allocated to handle the data.

18.1.1.4 TIBBlobStream Methods

The methods of the TIBBlobStream class are listed here.

Protected Methods

	Name	Description
	CloseBlob (see page 3584)	This is CloseBlob, a member of class TIBBlobStream.
	CreateBlob (see page 3584)	This is CreateBlob, a member of class TIBBlobStream.
	EnsureBlobInitialized (see page 3584)	This is EnsureBlobInitialized, a member of class TIBBlobStream.
	GetBlobInfo (see page 3585)	This is GetBlobInfo, a member of class TIBBlobStream.
	GetDatabase (see page 3585)	This is GetDatabase, a member of class TIBBlobStream.
	GetDBHandle (see page 3585)	This is GetDBHandle, a member of class TIBBlobStream.
	GetTransaction (see page 3585)	This is GetTransaction, a member of class TIBBlobStream.
	GetTRHandle (see page 3586)	This is GetTRHandle, a member of class TIBBlobStream.
	OpenBlob (see page 3586)	This is OpenBlob, a member of class TIBBlobStream.
	SetBlobID (see page 3588)	This is SetBlobID, a member of class TIBBlobStream.
	SetDatabase (see page 3588)	This is SetDatabase, a member of class TIBBlobStream.
	SetMode (see page 3589)	This is SetMode, a member of class TIBBlobStream.
	SetTransaction (see page 3589)	This is SetTransaction, a member of class TIBBlobStream.

Public Methods

	Name	Description
	Call (see page 3583)	Returns an error message based on the error code.
	Cancel (see page 3583)	Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.

	CheckReadable (see page 3583)	Indicates whether or not a Blob is readable.
	CheckWritable (see page 3584)	Indicates whether or not a Blob is write-able.
	Finalize (see page 3585)	Creates a Blob on the InterBase server and writes the data from the BlobStream to it.
	LoadFromFile (see page 3586)	Loads a Blob from a file to the field.
	LoadFromStream (see page 3586)	Loads a Blob from a stream into the field.
	Read (see page 3587)	Reads up to Count bytes from the current position in the field's data into Buffer.
	SaveToFile (see page 3587)	Saves the contents of the Blob field to a file.
	SaveToStream (see page 3587)	Saves the contents of the BLOB field to a stream.
	Seek (see page 3588)	Resets the current position of the TIBBlobStream (see page 3580) object.
	SetSize (see page 3589)	Set the new total size of the Blob.
	Truncate (see page 3589)	Discards all data in the Blob field from the current position on.
	Write (see page 3590)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

18.1.1.4.1 TIBBlobStream.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

18.1.1.4.2 TIBBlobStream.Cancel Method

Cancels all changes to the BLOB field, reverting to its state when the Blob stream was created.

Pascal

```
procedure Cancel;
```

C++

```
__fastcall Cancel();
```

Description

Call (see page 3583) Cancel to back out all changes to the Blob field using this Blob stream. After a call to Cancel, the Modified (see page 3593) property is reset to false.

18.1.1.4.3 TIBBlobStream.CheckReadable Method

Indicates whether or not a Blob is readable.

Pascal

```
procedure CheckReadable;
```

C++

```
__fastcall CheckReadable();
```

Description

Call (see page 3583) CheckReadable to determine whether or not a Blob is readable. This method raises an exception if the Blob is not readable.

18.1.1.4.4 TIBBlobStream.CheckWritable Method

Indicates whether or not a Blob is write-able.

Pascal

```
procedure CheckWritable;
```

C++

```
__fastcall CheckWritable();
```

Description

Call (see page 3583) CheckWritable to determine whether or not a Blob is writeable. This method raises an exception if the Blob is not writeable.

18.1.1.4.5 TIBBlobStream.CloseBlob Method

Pascal

```
procedure CloseBlob;
```

C++

```
__fastcall CloseBlob();
```

Description

This is CloseBlob, a member of class TIBBlobStream.

18.1.1.4.6 TIBBlobStream.CreateBlob Method

Pascal

```
procedure CreateBlob;
```

C++

```
__fastcall CreateBlob();
```

Description

This is CreateBlob, a member of class TIBBlobStream.

18.1.1.4.7 TIBBlobStream.EnsureBlobInitialized Method

Pascal

```
procedure EnsureBlobInitialized;
```

C++

```
__fastcall EnsureBlobInitialized();
```

Description

This is EnsureBlobInitialized, a member of class TIBBlobStream.

18.1.1.4.8 TIBBlobStream.Finalize Method

Creates a Blob on the InterBase server and writes the data from the BlobStream to it.

Pascal

```
procedure Finalize;
```

C++

```
__fastcall Finalize();
```

Description

Finalize creates a Blob on the InterBase server and writes the data from the BlobStream to the Blob and then closes the Blob.

18.1.1.4.9 TIBBlobStream.GetBlobInfo Method

Pascal

```
procedure GetBlobInfo;
```

C++

```
__fastcall GetBlobInfo();
```

Description

This is GetBlobInfo, a member of class TIBBlobStream.

18.1.1.4.10 TIBBlobStream.GetDatabase Method

Pascal

```
function GetDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase GetDatabase();
```

Description

This is GetDatabase, a member of class TIBBlobStream.

18.1.1.4.11 TIBBlobStream.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE;
```

C++

```
__fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBBlobStream.

18.1.1.4.12 TIBBlobStream.GetTransaction Method

Pascal

```
function GetTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction GetTransaction();
```

Description

This is GetTransaction, a member of class TIBBlobStream.

18.1.1.4.13 TIBBlobStream.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE;
```

C++

```
__fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBBlobStream.

18.1.1.4.14 TIBBlobStream.LoadFromFile Method

Loads a Blob from a file to the field.

Pascal

```
procedure LoadFromFile(Filename: string);
```

C++

```
__fastcall LoadFromFile(UnicodeString Filename);
```

Description

Use LoadFromFile to load the contents of a file into a Blob field. Specify the name of the file to load into the field as the value of the FileName parameter.

18.1.1.4.15 TIBBlobStream.LoadFromStream Method

Loads a Blob from a stream into the field.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to copy the contents of a stream into the Blob field. Specify the stream from which the field's value is copied as the value of the Stream parameter.

18.1.1.4.16 TIBBlobStream.OpenBlob Method

Pascal

```
procedure OpenBlob;
```

C++

```
__fastcall OpenBlob();
```

Description

This is OpenBlob, a member of class TIBBlobStream.

18.1.1.4.17 TIBBlobStream.Read Method

Reads up to Count bytes from the current position in the field's data into Buffer.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Call (see page 3583) Read to read data from the Blob field when the number of bytes in the field's data is not known. Buffer must have at least Count bytes allocated to hold the data that was read from the field.

Read transfers up to Count bytes from the Blob data into Buffer, starting in the current position, and then advances the current position by the number of bytes actually transferred. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read checks the Transliterate property of the field, and converts the data into ANSI from the character set specified by the dataset if Transliterate is true.

All the other data-reading methods of a Blob stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

Do not call Read when the TIBBlobStream (see page 3580) was created in bmWrite mode.

18.1.1.4.18 TIBBlobStream.SaveToFile Method

Saves the contents of the Blob field to a file.

Pascal

```
procedure SaveToFile(Filename: string);
```

C++

```
__fastcall SaveToFile(UnicodeString Filename);
```

Description

Use SaveToFile to save the contents of the Blob field to a file. Specify the name of the file as the value of the FileName parameter.

18.1.1.4.19 TIBBlobStream.SaveToStream Method

Saves the contents of the BLOB field to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to copy the contents of a Blob field to a stream. Specify the name of the stream to which the field's value is

saved as the value of the Stream parameter.

18.1.1.4.20 TIBBlobStream.Seek Method

Resets the current position of the TIBBlobStream (see page 3580) object.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Use Seek to move the current position within the Blob data by the indicated offset. Seek allows an application to read from or write to a particular location within the Blob data.

The Origin parameter indicates how to interpret the Offset parameter. Origin should be one of the following values:

Value	Meaning
soFromBeginning	Offset is from the beginning of the Blob data Seek moves to the position Offset Offset must be >= 0
soFromCurrent	Offset is from the current position in the Blob data Seek moves to Position + Offset
soFromEnd	Offset is from the end of the Blob data Offset must be <= 0 to indicate a number of bytes before the end of the Blob

Seek returns the new value of the Position property, the new current position in the Blob data.

18.1.1.4.21 TIBBlobStream.SetBlobID Method

Pascal

```
procedure SetBlobID(Value: TISC_QUAD);
```

C++

```
__fastcall SetBlobID(TISC_QUAD Value);
```

Description

This is SetBlobID, a member of class TIBBlobStream.

18.1.1.4.22 TIBBlobStream.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase);
```

C++

```
__fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBBlobStream.

18.1.1.4.23 TIBBlobStream.SetMode Method

Pascal

```
procedure SetMode(Value: TBlobStreamMode);
```

C++

```
__fastcall SetMode(TBlobStreamMode Value);
```

Description

This is SetMode, a member of class TIBBlobStream.

18.1.1.4.24 TIBBlobStream.SetSize Method

Set the new total size of the Blob.

Pascal

```
procedure SetSize(NewSize: Long); override;
```

C++

```
virtual __fastcall SetSize(Long NewSize);
```

Description

Call (see page 3583) SetSize to set the new total size of the Blob.

18.1.1.4.25 TIBBlobStream.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction);
```

C++

```
__fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBBlobStream.

18.1.1.4.26 TIBBlobStream.Truncate Method

Discards all data in the Blob field from the current position on.

Pascal

```
procedure Truncate;
```

C++

```
__fastcall Truncate();
```

Description

Use Truncate to limit the size of the Blob data. Calling Truncate when the current position is 0 will clear the contents of the Blob field.

Do not call Truncate when the TIBBlobStream (see page 3580) was created in bmRead mode.

18.1.1.4.27 TIBBlobStream.Write Method

Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write Count bytes to the Blob field, starting at the current position. The Write method for TIBBlobStream (see page 3580) always writes the entire Count bytes, as Blob data does not necessarily include a termination character. Thus, Write is equivalent to the WriteBuffer method.

Write checks the Transliterate property of the field, and converts the data from ANSI into the character set of the dataset if Transliterate is true.

All the other data-writing methods of a Blob stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

Do not call Write when the TIBBlobStream (see page 3580) was created in bmRead mode.

18.1.1.5 TIBBlobStream Properties

The properties of the TIBBlobStream class are listed here.

Public Properties

	Name	Description
	BlobID (see page 3590)	Sets or returns the Blob ID.
R	BlobMaxSegmentSize (see page 3591)	Returns the maximum segment size.
R	BlobNumSegments (see page 3591)	Returns the total number of segments in the Blob.
R	BlobSize (see page 3591)	Returns the total size of the Blob.
R	BlobType (see page 3591)	Returns the Blob type.
	Database (see page 3592)	Sets or returns the associated database.
R	DBHandle (see page 3592)	Indicates the database handle.
R	Handle (see page 3592)	Indicates the Blob handle.
	Mode (see page 3592)	Sets or returns the Blob stream mode type.
R	Modified (see page 3593)	Indicates whether the Blob field has been modified.
	Transaction (see page 3593)	Gets or sets the associated transaction.
R	TRHandle (see page 3593)	Indicates the transaction handle.

18.1.1.5.1 TIBBlobStream.BlobID Property

Sets or returns the Blob ID.

Pascal

```
property BlobID: TISC_QUAD;
```

C++

```
__property TISC_QUAD BlobID;
```

Description

Use BlobID to set or return the 64-bit system-defined Blob ID, which is stored in a field in the table and points to the first segment of the Blob or to a page of pointers to Blob fragments

18.1.1.5.2 TIBBlobStream.BlobMaxSegmentSize Property

Returns the maximum segment size.

Pascal

```
property BlobMaxSegmentSize: Long;
```

C++

```
__property Long BlobMaxSegmentSize;
```

Description

Use BlobMaxSegmentSize to return the length of the longest Blob segment.

18.1.1.5.3 TIBBlobStream.BlobNumSegments Property

Returns the total number of segments in the Blob.

Pascal

```
property BlobNumSegments: Long;
```

C++

```
__property Long BlobNumSegments;
```

Description

Use BlobNumSegments to return the total number of segments in the Blob.

18.1.1.5.4 TIBBlobStream.BlobSize Property

Returns the total size of the Blob.

Pascal

```
property BlobSize: Long;
```

C++

```
__property Long BlobSize;
```

Description

Use BlobSize to return the total size of the Blob in bytes.

18.1.1.5.5 TIBBlobStream.BlobType Property

Returns the Blob type.

Pascal

```
property BlobType: Short;
```

C++

```
__property Short BlobType;
```

Description

Use BlobType to return the Blob type; either 0 for segmented, or 1 for stream.

18.1.1.5.6 TIBBlobStream.Database Property

Sets or returns the associated database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the associated database.

18.1.1.5.7 TIBBlobStream.DBHandle Property

Indicates the database handle.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use DBHandle to return the database handle.

18.1.1.5.8 TIBBlobStream.Handle Property

Indicates the Blob handle.

Pascal

```
property Handle: TISC_BLOB_HANDLE;
```

C++

```
__property TISC_BLOB_HANDLE Handle;
```

Description

Use Handle to return the Blob handle.

18.1.1.5.9 TIBBlobStream.Mode Property

Sets or returns the Blob stream mode type.

Pascal

```
property Mode: TBlobStreamMode;
```

C++

```
__property TBlobStreamMode Mode;
```

Description

Use Mode to set or read the Blob stream mode type. The Mode specifies whether the stream is used for reading BLOB values, writing BLOB values, or both.

18.1.1.5.10 TIBBlobStream.Modified Property

Indicates whether the Blob field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Modified is true when the value to a Blob field has changed. If the value of the Blob field is set using the properties of TBlobField, or using a TIBBlobStream (see page 3580) object, Modified is automatically set to true.

18.1.1.5.11 TIBBlobStream.Transaction Property

Gets or sets the associated transaction.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to set or read the associated transaction.

18.1.1.5.12 TIBBlobStream.TRHandle Property

Indicates the transaction handle.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use TRHandle to obtain the transaction handle.

18.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetBlobInfo (see page 3594)	This is function IBBlob.GetBlobInfo.
	ReadBlob (see page 3594)	This is function IBBlob.ReadBlob.
	WriteBlob (see page 3595)	This is function IBBlob.WriteBlob.

18.2.1 IBBlob.GetBlobInfo Function

Pascal

```
procedure GetBlobInfo(hBlobHandle: PISC_BLOB_HANDLE; var NumSegments: Long; var
MaxSegmentSize: Long; var TotalSize: Long; var BlobType: Short);
```

C++

```
GetBlobInfo(PISC_BLOB_HANDLE hBlobHandle, Long NumSegments, Long MaxSegmentSize, Long
TotalSize, Short BlobType);
```

File

IBBlob

Description

This is function IBBlob.GetBlobInfo.

18.2.2 IBBlob.ReadBlob Function

Pascal

```
procedure ReadBlob(hBlobHandle: PISC_BLOB_HANDLE; Buffer: PChar; BlobSize: Long);
```

C++

```
ReadBlob(PISC_BLOB_HANDLE hBlobHandle, const char * Buffer, Long BlobSize);
```

File

IBBlob

Description

This is function IBBlob.ReadBlob.

18.2.3 IBBlob.WriteBlob Function

Pascal

```
procedure WriteBlob(hBlobHandle: PISC_BLOB_HANDLE; Buffer: PChar; BlobSize: Long);
```

C++

```
WriteBlob(PISC_BLOB_HANDLE hBlobHandle, const char * Buffer, Long BlobSize);
```

File

IBBlob

Description

This is function IBBlob.WriteBlob.

18.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DefaultBlobSegmentSize (see page 3596)	This is constant IBBlob.DefaultBlobSegmentSize.

18.3.1 IBBlob.DefaultBlobSegmentSize Constant

Pascal

```
DefaultBlobSegmentSize = 16 * 1024;
```

C++

```
DefaultBlobSegmentSize = 16 * 1024;
```

File

IBBlob

Description

This is constant IBBlob.DefaultBlobSegmentSize.

19 IBCustomDataSet Namespace

This is namespace IBCustomDataSet.

Topics

Name	Description
Classes (see page 3599)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3689)	The following table lists structs, records, enums in this documentation.
Types (see page 3694)	The following table lists types in this documentation.
Variables (see page 3699)	The following table lists variables in this documentation.
Constants (see page 3700)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBCDField (see page 3599)	TIBBCDField represents a numeric field as a Currency type..
	TIBCustomDataSet (see page 3602)	TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.
	TIBDataLink (see page 3651)	TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 3654) and to respond to data events.
	TIBDataSet (see page 3654)	TIBDataSet executes InterBase SQL statements.
	TIBDataSetUpdateObject (see page 3674)	TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise ununpdateable queries when cached updates are enabled.
	TIBDSBlobStream (see page 3678)	TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 3541) Dataset.
	TIBGeneratorField (see page 3682)	TIBGeneratorField calls the server to generate values for a field in an IB (see page 3541) dataset.
	TIBStringField (see page 3686)	TIBStringField allows for strings in excess of 8196 bytes of data.

Constants

Name	Description
BufferCacheSize (see page 3700)	This is constant IBCustomDataSet.BufferCacheSize.
DefaultFieldClasses (see page 3700)	This is constant IBCustomDataSet.DefaultFieldClasses.
UniCache (see page 3701)	This is constant IBCustomDataSet.UniCache.

Structs, Records, Enums

	Name	Description
	TCachedUpdateStatus (see page 3689)	TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.
	TFieldData (see page 3690)	This is record IBCustomDataSet.TFieldData.

	TIBDBKey (see page 3690)	TIBDBKey stores the key for a row in an InterBase table.
	TIBGeneratorApplyEvent (see page 3691)	TIBGeneratorApplyEvent indicates when a generator should create field values.
	TIBUpdateAction (see page 3691)	TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.
	TLiveMode (see page 3692)	This is record IBCustomDataSet.TLiveMode.
	TRecordData (see page 3693)	This is record IBCustomDataSet.TRecordData.

Types

Name	Description
PBlobDataArray (see page 3694)	This is type IBCustomDataSet.PBlobDataArray.
PDateTime (see page 3694)	This is type IBCustomDataSet.PDateTime.
PFieldData (see page 3695)	This is type IBCustomDataSet.PFieldData.
PIBDBKey (see page 3695)	This is type IBCustomDataSet.PIBDBKey.
PRecordData (see page 3695)	This is type IBCustomDataSet.PRecordData.
TBlobDataArray (see page 3696)	This is type IBCustomDataSet.TBlobDataArray.
TIBUpdateErrorEvent (see page 3696)	TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.
TIBUpdateRecordEvent (see page 3696)	TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.
TIBUpdateRecordTypes (see page 3697)	TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.
TLiveModes (see page 3697)	TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

Variables

Name	Description
CreateProviderProc (see page 3699)	This is variable IBCustomDataSet.CreateProviderProc.

19.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBCDField (see page 3599)	TIBBCDField represents a numeric field as a Currency type..
	TIBCustomDataSet (see page 3602)	TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.
	TIBDataLink (see page 3651)	TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 3654) and to respond to data events.
	TIBDataSet (see page 3654)	TIBDataSet executes InterBase SQL statements.
	TIBDataSetUpdateObject (see page 3674)	TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise unupdateable queries when cached updates are enabled.
	TIBDSBlobStream (see page 3678)	TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 3541) Dataset.
	TIBGeneratorField (see page 3682)	TIBGeneratorField calls the server to generate values for a field in an IB (see page 3541) dataset.
	TIBStringField (see page 3686)	TIBStringField allows for strings in excess of 8196 bytes of data.

19.1.1 TIBBCDField Class

TIBBCDField represents a numeric field as a Currency type..

Class Hierarchy

Pascal

```
TIBBCDField = class(TBCDField);
```

C++

```
class TIBBCDField : public TBCDField;
```

File

IBCustomDataSet

Description

TIBBCDField encapsulates the Currency type. Despite the name, TIBBCDField does not represent a BCD value. Rather, TIBBCDFields represent InterBase Numeric(x, y) fields, where x < 18 and y <= 4.

19.1.1.1 TIBBCDField Members

The following tables list the members exposed by TIBBCDField.

Protected Methods

	Name	Description
	CheckTypeSize (see page 3600)	This is CheckTypeSize, a member of class TIBBCDField.
	GetAsCurrency (see page 3601)	This is GetAsCurrency, a member of class TIBBCDField.

	GetAsString (see page 3601)	This is GetAsString, a member of class TIBBCDField.
	GetAsVariant (see page 3601)	This is GetAsVariant, a member of class TIBBCDField.
	GetDataSize (see page 3601)	This is GetDataSize, a member of class TIBBCDField.

Public Methods

	Name	Description
	Create (see page 3600)	Creates an instance of a TIBBCDField (see page 3599) object.

Published Properties

	Name	Description
	Size (see page 3602)	This is Size, a member of class TIBBCDField.

19.1.1.2 TIBBCDField.Create Constructor

Creates an instance of a TIBBCDField (see page 3599) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBCDField(TComponent * AOwner);
```

Description

Create sets the datatype to ftBCD and the size to 8.

19.1.1.3 TIBBCDField Methods

The methods of the TIBBCDField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 3600)	This is CheckTypeSize, a member of class TIBBCDField.
	GetAsCurrency (see page 3601)	This is GetAsCurrency, a member of class TIBBCDField.
	GetAsString (see page 3601)	This is GetAsString, a member of class TIBBCDField.
	GetAsVariant (see page 3601)	This is GetAsVariant, a member of class TIBBCDField.
	GetDataSize (see page 3601)	This is GetDataSize, a member of class TIBBCDField.

19.1.1.3.1 TIBBCDField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TIBBCDField.

19.1.1.3.2 TIBBCDField.GetAsCurrency Method

Pascal

```
function GetAsCurrency: Currency; override;
```

C++

```
virtual __fastcall Currency GetAsCurrency();
```

Description

This is GetAsCurrency, a member of class TIBBCDField.

19.1.1.3.3 TIBBCDField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall UnicodeString GetAsString();
```

Description

This is GetAsString, a member of class TIBBCDField.

19.1.1.3.4 TIBBCDField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TIBBCDField.

19.1.1.3.5 TIBBCDField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TIBBCDField.

19.1.1.4 TIBBCDField Properties

The properties of the TIBBCDField class are listed here.

Published Properties

	Name	Description
	Size (see page 3602)	This is Size, a member of class TIBBCDField.

19.1.1.4.1 TIBBCDField.Size Property

Pascal

```
property Size;
```

C++

```
__property Size;
```

Description

This is Size, a member of class TIBBCDField.

19.1.2 TIBCustomDataSet Class

TIBCustomDataSet is the base class for all datasets that represent data fetched using InterBase Express.

Class Hierarchy

Pascal

```
TIBCustomDataSet = class(TDataset);
```

C++

```
class TIBCustomDataSet : public TDataset;
```

File

IBCustomDataSet

Description

TIBCustomDataSet is a dataset object that defines InterBase Express (IBX) functionality for a dataset. Applications never use TIBCustomDataSet objects directly. Instead they use the descendants of TIBCustomDataSet, such as TIBDataSet (see page 3654), TIBQuery, TIBStoredProc, and TIBTable, which inherit its dataset-related properties and methods.

Getting Started with InterBase Express

19.1.2.1 TIBCustomDataSet Members

The following tables list the members exposed by TIBCustomDataSet.

Protected Events

	Name	Description
	AfterDatabaseDisconnect (see page 3649)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3649)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3649)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3649)	Occurs immediately before a transaction that includes this dataset's query ends.

	DatabaseFree (see page 3650)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 3651)	Occurs when the transaction that includes this dataset's query is freed.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 3613)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 3614)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 3615)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 3616)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 3619)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 3621)	This is InternalOpen, a member of class TIBCustomDataSet.
V	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 3622)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 3622)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.

	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 3627)	This is PSGetTableName, a member of class TIBCustomDataSet.
	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	BufferChunks (see page 3638)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3638)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 3639)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 3640)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3640)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 3641)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 3641)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 3642)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	Params (see page 3643)	Specifies the parameters to use for any parameterized queries.
R	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.
R	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
R	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
R	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
R	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	RefreshSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 3645)	Gets the handle for the SELECT statement.
R	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
R	StatementType (see page 3646)	Returns the statement type of the QSelect (see page 3644) query.
	UniDirectional (see page 3647)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.
V	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 3611)	Compares two bookmarks.
V	Create (see page 3606)	Creates an instance of a TDataSet component.
V	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
V	Destroy (see page 3606)	Destroys the instance of a dataset component.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
V	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.
V	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 3624)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.
V	Post (see page 3626)	Writes a modified record to the database server.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
V	UpdateStatus (see page 3632)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 3639)	Specifies the database handle for the dataset.
R	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
R	RowsAffected (see page 3645)	Indicates the number of rows operated on by the latest query execution.
R	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 3647)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.

Published Properties

	Name	Description
	AfterCancel (see page 3634)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 3634)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 3634)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 3634)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 3635)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 3635)	This is AfterOpen, a member of class TIBCustomDataSet.

	AfterPost (see page 3635)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3635)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 3636)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 3636)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 3636)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 3636)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 3637)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 3637)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 3637)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 3637)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3638)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3641)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 3642)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 3642)	This is OnEditError, a member of class TIBCustomDataSet.
	OnNewRecord (see page 3642)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 3642)	This is OnPostError, a member of class TIBCustomDataSet.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.

19.1.2.2 TIBCustomDataSet.Create Constructor

Creates an instance of a TDataSet component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomDataSet(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset component at runtime. Ordinarily applications instantiate dataset descendants, such as TIBTable, TIBQuery, TIBDataSet (see page 3654), or TIBStoredProc, rather than TIBCustomDataSet (see page 3602). These instantiated objects are handled automatically.

On the other hand, applications that create specialized dataset components, such as custom components, may need to instantiate a TIBCustomDataSet (see page 3602) component by calling Create. Create:

- Calls the inherited Create for TDataSet.
- Creates the five query objects.
- Creates the base object to hold the reference to the database and transaction.
- Associates database and transaction related events to the base object component.

19.1.2.3 TIBCustomDataSet.Destroy Destructor

Destroys the instance of a dataset component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically by Delphi. If an application creates its own instances of a dataset, however, the application should call Free, which verifies that the dataset component is not already freed before calling Destroy.

Destroy performs the following tasks:

- Frees the associated query objects.
- Frees the base object.
- Frees the associated internal resources.

19.1.2.4 TIBCustomDataSet Methods

The methods of the TIBCustomDataSet class are listed here.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 3613)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 3614)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 3615)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 3616)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.

	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
	InternalClose (see page 3619)	This is InternalClose, a member of class TIBCustomDataSet.
	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
	InternalOpen (see page 3621)	This is InternalOpen, a member of class TIBCustomDataSet.
	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
	InternalRefresh (see page 3622)	This is InternalRefresh, a member of class TIBCustomDataSet.
	InternalRefreshRow (see page 3622)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 3627)	This is PSGetTableName, a member of class TIBCustomDataSet.
	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.

Public Methods

	Name	Description
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.
	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 3611)	Compares two bookmarks.
	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.

	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 3624)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.
	Post (see page 3626)	Writes a modified record to the database server.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
	UpdateStatus (see page 3632)	Reports the update status for the current record.

19.1.2.4.1 TIBCustomDataSet.ActivateConnection Method

Pascal

```
procedure ActivateConnection;
```

C++

```
__fastcall ActivateConnection();
```

Description

This is ActivateConnection, a member of class TIBCustomDataSet.

19.1.2.4.2 TIBCustomDataSet.ActivateTransaction Method

Pascal

```
function ActivateTransaction: Boolean;
```

C++

```
__fastcall Boolean ActivateTransaction();
```

Description

This is ActivateTransaction, a member of class TIBCustomDataSet.

19.1.2.4.3 TIBCustomDataSet.AllocRecordBuffer Method

Pascal

```
function AllocRecordBuffer: PChar; override;
```

C++

```
virtual __fastcall const char * AllocRecordBuffer();
```

Description

This is AllocRecordBuffer, a member of class TIBCustomDataSet.

19.1.2.4.4 TIBCustomDataSet.ApplyUpdates Method

Writes a dataset's pending cached updates to the database.

Pascal

```
procedure ApplyUpdates;
```

C++

```
__fastcall ApplyUpdates();
```

Description

Call ApplyUpdates to write a dataset's pending cached updates to a database. This method passes cached data to the database for storage, but the changes are not committed to the database. An application must explicitly call the TIBTransaction (see page 3746) component's Commit method to commit the changes to the database if the write is successful, or call the TIBTransaction (see page 3746) component's Rollback method to undo the changes if there is an error.

Note: The preferred method for updating datasets is to call a database component's ApplyUpdates method rather than to call each individual dataset's ApplyUpdates method. The application is responsible for committing or rolling back the transaction.

19.1.2.4.5 TIBCustomDataSet.BookmarkValid Method

Indicates the validity of a specified bookmark.

Pascal

```
function BookmarkValid(Bookmark: TBookmark): Boolean; override;
```

C++

```
virtual __fastcall Boolean BookmarkValid(TBookmark Bookmark);
```

Description

This function returns true if the specified bookmark can be used to identify a record in the dataset, false otherwise.

19.1.2.4.6 TIBCustomDataSet.CachedUpdateStatus Method

Returns the status of the cached updates.

Pascal

```
function CachedUpdateStatus: TCachedUpdateStatus;
```

C++

```
__fastcall TCachedUpdateStatus CachedUpdateStatus();
```

Description

Call CachedUpdateStatus to return the cached update status of the current record in the dataset.

19.1.2.4.7 TIBCustomDataSet.CancelUpdates Method

Clears all pending cached updates from the cache.

Pascal

```
procedure CancelUpdates;
```

C++

```
__fastcall CancelUpdates();
```

Description

Call CancelUpdates to clear all pending cached updates from the cache.

When a dataset is closed, or the CachedUpdates (see page 3638) property is set to false, CancelUpdates is called automatically.

Note: To undo changes to a single record, call RevertRecord (see page 3629).

19.1.2.4.8 TIBCustomDataSet.CheckDatasetClosed Method

Pascal

```
procedure CheckDatasetClosed;
```

C++

```
__fastcall CheckDatasetClosed();
```

Description

This is CheckDatasetClosed, a member of class TIBCustomDataSet.

19.1.2.4.9 TIBCustomDataSet.CheckDatasetOpen Method

Pascal

```
procedure CheckDatasetOpen;
```

C++

```
__fastcall CheckDatasetOpen();
```

Description

This is CheckDatasetOpen, a member of class TIBCustomDataSet.

19.1.2.4.10 TIBCustomDataSet.CheckNotUniDirectional Method

Pascal

```
procedure CheckNotUniDirectional;
```

C++

```
__fastcall CheckNotUniDirectional();
```

Description

This is CheckNotUniDirectional, a member of class TIBCustomDataSet.

19.1.2.4.11 TIBCustomDataSet.ClearCalcFields Method

Pascal

```
procedure ClearCalcFields(Buffer: PChar); override;
```

C++

```
virtual __fastcall ClearCalcFields(const char * Buffer);
```

Description

This is ClearCalcFields, a member of class TIBCustomDataSet.

19.1.2.4.12 TIBCustomDataSet.CompareBookmarks Method

Compares two bookmarks.

Pascal

```
function CompareBookmarks(Bookmark1: TBookmark; Bookmark2: TBookmark): Integer; override;
```

C++

```
virtual __fastcall int CompareBookmarks(TBookmark Bookmark1, TBookmark Bookmark2);
```

Description

Call CompareBookmarks to compare one bookmark to another. CompareBookmarks returns an integer value indicating the difference between the two bookmarks. CompareBookmarks returns a 0 (zero) if the two bookmarks are the same, a -1 (negative one) if bookmark one is less than bookmark two, or a 1 (positive one) if bookmark one is greater than bookmark two. CompareBookmarks also returns a zero if one of the two bookmarks is nil (Delphi) or NULL (C++).

Bookmark1 and Bookmark2 are the two TBookmark values to compare.

19.1.2.4.13 TIBCustomDataSet.ConstraintsStored Method

Pascal

```
function ConstraintsStored: Boolean;
```

C++

```
__fastcall Boolean ConstraintsStored();
```

Description

This is ConstraintsStored, a member of class TIBCustomDataSet.

19.1.2.4.14 TIBCustomDataSet.CreateBlobStream Method

Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.

Pascal

```
function CreateBlobStream(Field: TField; Mode: TBlobStreamMode): TStream; override;
```

C++

```
virtual __fastcall TStream CreateBlobStream(TField Field, TBlobStreamMode Mode);
```

Description

Call CreateBlobStream to obtain a stream for reading data from or writing data to a binary large object (BLOB) field. The Field parameter must specify a TBlobField component from the Fields property array. The Mode parameter specifies whether the stream will be used for reading, writing, or updating the contents of the field.

Note: The stream that this method returns belongs to the dataset. Do not free the stream: the dataset handles all allocation and freeing of streams that this method creates.

19.1.2.4.15 TIBCustomDataSet.CreateFields Method

Pascal

```
procedure CreateFields; override;
```

C++

```
virtual __fastcall CreateFields();
```

Description

This is CreateFields, a member of class TIBCustomDataSet.

19.1.2.4.16 TIBCustomDataSet.Current Method

Returns the descriptor area that holds information about the current query.

Pascal

```
function Current: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Current();
```

Description

Most applications do not need to call the Current method. It returns the extended descriptor area for the dataset's SQL statement, which can be used to retrieve properties of the SQL statement.

19.1.2.4.17 TIBCustomDataSet.DeactivateTransaction Method

Pascal

```
procedure DeactivateTransaction;
```

C++

```
__fastcall DeactivateTransaction();
```

Description

This is DeactivateTransaction, a member of class TIBCustomDataSet.

19.1.2.4.18 TIBCustomDataSet.Disconnect Method

Pascal

```
procedure Disconnect; virtual;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBCustomDataSet.

19.1.2.4.19 TIBCustomDataSet.DoBeforeDelete Method

Pascal

```
procedure DoBeforeDelete; override;
```

C++

```
virtual __fastcall DoBeforeDelete();
```

Description

This is DoBeforeDelete, a member of class TIBCustomDataSet.

19.1.2.4.20 TIBCustomDataSet.DoBeforeEdit Method

Pascal

```
procedure DoBeforeEdit; override;
```

C++

```
virtual __fastcall DoBeforeEdit();
```

Description

This is DoBeforeEdit, a member of class TIBCustomDataSet.

19.1.2.4.21 TIBCustomDataSet.DoBeforeInsert Method

Pascal

```
procedure DoBeforeInsert; override;
```

C++

```
virtual __fastcall DoBeforeInsert();
```

Description

This is DoBeforeInsert, a member of class TIBCustomDataSet.

19.1.2.4.22 TIBCustomDataSet.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TIBCustomDataSet.

19.1.2.4.23 TIBCustomDataSet.FetchAll Method

Retrieves all records from the current cursor position to the end of the file and stores them locally.

Pascal

```
procedure FetchAll;
```

C++

```
__fastcall FetchAll();
```

Description

Call FetchAll to reduce network traffic when using cached updates. FetchAll calls CheckBrowseMode to post any pending changes, and then retrieves all records from the current cursor position to the end of the file, and stores them locally. Ordinarily when cached updates are enabled, a transaction retrieves only as much data as it needs for return purposes.

Note: Using FetchAll is not always appropriate. For example, when an application accesses a database used by many simultaneous clients and there is a high degree of contention for updating the same records, fetching all records at once may not be advantageous because some fetched records may be changed by other applications. Always weigh the advantages of reduced network traffic against the need for reduced record contention.

19.1.2.4.24 TIBCustomDataSet.FreeRecordBuffer Method

Pascal

```
procedure FreeRecordBuffer(var Buffer: PChar); override;
```

C++

```
virtual __fastcall FreeRecordBuffer(const char * Buffer);
```

Description

This is FreeRecordBuffer, a member of class TIBCustomDataSet.

19.1.2.4.25 TIBCustomDataSet.GetActiveBuf Method

Pascal

```
function GetActiveBuf: PChar;
```

C++

```
__fastcall const char * GetActiveBuf();
```

Description

This is GetActiveBuf, a member of class TIBCustomDataSet.

19.1.2.4.26 TIBCustomDataSet.GetBookmarkData Method

Pascal

```
procedure GetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall GetBookmarkData(const char * Buffer, void * Data);
```

Description

This is GetBookmarkData, a member of class TIBCustomDataSet.

19.1.2.4.27 TIBCustomDataSet.GetBookmarkFlag Method

Pascal

```
function GetBookmarkFlag(Buffer: PChar): TBookmarkFlag; override;
```

C++

```
virtual __fastcall TBookmarkFlag GetBookmarkFlag(const char * Buffer);
```

Description

This is GetBookmarkFlag, a member of class TIBCustomDataSet.

19.1.2.4.28 TIBCustomDataSet.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TIBCustomDataSet.

19.1.2.4.29 TIBCustomDataSet.GetCurrentRecord Method

Retrieves the current record into a buffer.

Pascal

```
function GetCurrentRecord(Buffer: PChar): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCurrentRecord(const char * Buffer);
```

Description

Most applications should not need to call GetCurrentRecord. TDataSet automatically allocates a buffer for the active record.

Call GetCurrentRecord to copy the current record into a buffer allocated by the application. Buffer must be at least as big as the record size indicated by the RecordSize property.

19.1.2.4.30 TIBCustomDataSet.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TIBCustomDataSet.

19.1.2.4.31 TIBCustomDataSet.GetFieldClass Method

Pascal

```
function GetFieldClass(FieldType: TFieldType): TFieldClass; override;
```

C++

```
virtual __fastcall TFieldClass GetFieldClass(TFieldType FieldType);
```

Description

This is GetFieldClass, a member of class TIBCustomDataSet.

19.1.2.4.32 GetFieldData Method

This is the overview for the GetFieldData method overload.

Overload List

	Name	Description
	TIBCustomDataSet.GetFieldData (TField, Pointer) (see page 3617)	Reads the field data into a buffer.
	TIBCustomDataSet.GetFieldData (TField, Pointer, Boolean) (see page 3617)	Reads the field data into a buffer.

19.1.2.4.32.1 TIBCustomDataSet.GetFieldData Method (TField, Pointer)

Reads the field data into a buffer.

Pascal

```
function GetFieldData(Field: TField; Buffer: Pointer): Boolean; override; overload;
function GetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean): Boolean;
override; overload;
```

C++

```
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer);
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
```

Description

Reads the field data into a buffer.

Delphi syntax:

```
        function GetFieldData(FieldNo: Integer; Buffer: Pointer): Boolean; overload;
    function GetFieldData(Field: TField; Buffer: Pointer): Boolean; overload; override;
    function GetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean): Boolean;
overload; override;
```

C++ syntax:

```
        virtual bool __fastcall GetFieldData(Db::TField* Field, void * Buffer);
    virtual bool __fastcall GetFieldData(Db::TField* Field, void * Buffer, bool NativeFormat);
    virtual bool __fastcall GetFieldData(int FieldNo, void * Buffer);
```

Description

Most applications do not need to call GetFieldData. TField objects call this method to implement their GetData method.

The Field or FieldNo parameter indicates the field whose data should be fetched. Field specifies the component itself, while FieldNo indicates its field number. The Buffer parameter is a memory buffer with sufficient space to accept the value of the field as it exists in the database (unformatted and untranslated). NativeFormat indicates whether the dataset fetches the field in Delphi's native format for the field type. When NativeFormat is false, the dataset must convert the field value to the native type. This allows the field to handle data from different types of datasets (IBX, BDE-based, and so on) in a uniform manner.

GetFieldData returns true if the data was successfully written to Buffer.

19.1.2.4.33 TIBCustomDataSet.GetRecNo Method

Pascal

```
function GetRecNo: Integer; override;
```

C++

```
virtual __fastcall int GetRecNo();
```

Description

This is GetRecNo, a member of class TIBCustomDataSet.

19.1.2.4.34 TIBCustomDataSet.GetRecord Method

Pascal

```
function GetRecord(Buffer: PChar; GetMode: TGetMode; DoCheck: Boolean): TGetResult; override;
```

C++

```
virtual __fastcall TGetResult GetRecord(const char * Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is GetRecord, a member of class TIBCustomDataSet.

19.1.2.4.35 TIBCustomDataSet.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TIBCustomDataSet.

19.1.2.4.36 TIBCustomDataSet.GetRecordSize Method

Pascal

```
function GetRecordSize: Word; override;
```

C++

```
virtual __fastcall Word GetRecordSize();
```

Description

This is GetRecordSize, a member of class TIBCustomDataSet.

19.1.2.4.37 TIBCustomDataSet.InitRecord Method

Pascal

```
procedure InitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InitRecord(const char * Buffer);
```

Description

This is InitRecord, a member of class TIBCustomDataSet.

19.1.2.4.38 TIBCustomDataSet.InternalAddRecord Method

Pascal

```
procedure InternalAddRecord(Buffer: Pointer; Append: Boolean); override;
```

C++

```
virtual __fastcall InternalAddRecord(void * Buffer, Boolean Append);
```

Description

This is InternalAddRecord, a member of class TIBCustomDataSet.

19.1.2.4.39 TIBCustomDataSet.InternalBatchInput Method

Pascal

```
procedure InternalBatchInput(InputObject: TIBBatchInput); virtual;
```

C++

```
virtual __fastcall InternalBatchInput(TIBBatchInput InputObject);
```

Description

This is InternalBatchInput, a member of class TIBCustomDataSet.

19.1.2.4.40 TIBCustomDataSet.InternalBatchOutput Method

Pascal

```
procedure InternalBatchOutput(OutputObject: TIBBatchOutput); virtual;
```

C++

```
virtual __fastcall InternalBatchOutput(TIBBatchOutput OutputObject);
```

Description

This is InternalBatchOutput, a member of class TIBCustomDataSet.

19.1.2.4.41 TIBCustomDataSet.InternalCancel Method

Pascal

```
procedure InternalCancel; override;
```

C++

```
virtual __fastcall InternalCancel();
```

Description

This is InternalCancel, a member of class TIBCustomDataSet.

19.1.2.4.42 TIBCustomDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TIBCustomDataSet.

19.1.2.4.43 TIBCustomDataSet.InternalDelete Method

Pascal

```
procedure InternalDelete; override;
```

C++

```
virtual __fastcall InternalDelete();
```

Description

This is InternalDelete, a member of class TIBCustomDataSet.

19.1.2.4.44 TIBCustomDataSet.InternalExecQuery Method

Pascal

```
procedure InternalExecQuery; virtual;
```

C++

```
virtual __fastcall InternalExecQuery();
```

Description

This is InternalExecQuery, a member of class TIBCustomDataSet.

19.1.2.4.45 TIBCustomDataSet.InternalFirst Method

Pascal

```
procedure InternalFirst; override;
```

C++

```
virtual __fastcall InternalFirst();
```

Description

This is InternalFirst, a member of class TIBCustomDataSet.

19.1.2.4.46 TIBCustomDataSet.InternalGotoBookmark Method

Pascal

```
procedure InternalGotoBookmark(Bookmark: Pointer); override;
```

C++

```
virtual __fastcall InternalGotoBookmark(void * Bookmark);
```

Description

This is InternalGotoBookmark, a member of class TIBCustomDataSet.

19.1.2.4.47 TIBCustomDataSet.InternalHandleException Method

Pascal

```
procedure InternalHandleException; override;
```

C++

```
virtual __fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TIBCustomDataSet.

19.1.2.4.48 TIBCustomDataSet.InternalInitFieldDefs Method

Pascal

```
procedure InternalInitFieldDefs; override;
```

C++

```
virtual __fastcall InternalInitFieldDefs();
```

Description

This is InternalInitFieldDefs, a member of class TIBCustomDataSet.

19.1.2.4.49 TIBCustomDataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalInitRecord(const char * Buffer);
```

Description

This is InternalInitRecord, a member of class TIBCustomDataSet.

19.1.2.4.50 TIBCustomDataSet.InternalInsert Method

Pascal

```
procedure InternalInsert; override;
```

C++

```
virtual __fastcall InternalInsert();
```

Description

This is InternalInsert, a member of class TIBCustomDataSet.

19.1.2.4.51 TIBCustomDataSet.InternalLast Method

Pascal

```
procedure InternalLast; override;
```

C++

```
virtual __fastcall InternalLast();
```

Description

This is InternalLast, a member of class TIBCustomDataSet.

19.1.2.4.52 TIBCustomDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBCustomDataSet.

19.1.2.4.53 TIBCustomDataSet.InternalPost Method

Pascal

```
procedure InternalPost; override;
```

C++

```
virtual __fastcall InternalPost();
```

Description

This is InternalPost, a member of class TIBCustomDataSet.

19.1.2.4.54 TIBCustomDataSet.InternalPrepare Method

Pascal

```
procedure InternalPrepare; virtual;
```

C++

```
virtual __fastcall InternalPrepare();
```

Description

This is InternalPrepare, a member of class TIBCustomDataSet.

19.1.2.4.55 TIBCustomDataSet.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TIBCustomDataSet.

19.1.2.4.56 TIBCustomDataSet.InternalRefreshRow Method

Pascal

```
procedure InternalRefreshRow; virtual;
```

C++

```
virtual __fastcall InternalRefreshRow();
```

Description

This is InternalRefreshRow, a member of class TIBCustomDataSet.

19.1.2.4.57 TIBCustomDataSet.InternalSetParamsFromCursor Method

Pascal

```
procedure InternalSetParamsFromCursor; virtual;
```

C++

```
virtual __fastcall InternalSetParamsFromCursor();
```

Description

This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.

19.1.2.4.58 TIBCustomDataSet.InternalSetToRecord Method

Pascal

```
procedure InternalSetToRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalSetToRecord(const char * Buffer);
```

Description

This is InternalSetToRecord, a member of class TIBCustomDataSet.

19.1.2.4.59 TIBCustomDataSet.InternalUnPrepare Method

Pascal

```
procedure InternalUnPrepare; virtual;
```

C++

```
virtual __fastcall InternalUnPrepare();
```

Description

This is InternalUnPrepare, a member of class TIBCustomDataSet.

19.1.2.4.60 TIBCustomDataSet.IsCursorOpen Method

Pascal

```
function IsCursorOpen: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCursorOpen();
```

Description

This is IsCursorOpen, a member of class TIBCustomDataSet.

19.1.2.4.61 TIBCustomDataSet.IsSequenced Method

IsSequenced indicates whether sequence numbers are available for database records.

Pascal

```
function IsSequenced: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsSequenced();
```

Description

IsSequenced indicates whether sequence numbers are available for database records.

Delphi syntax:

```
function IsSequenced: Boolean; override;
```

C++ syntax:

```
virtual bool __fastcall IsSequenced(void);
```

Description

Call IsSequenced to determine whether database records can be located by sequence numbers. When IsSequenced is true, the dataset can navigate directly to a specific record by setting the RecNo property. If IsSequenced is false, the only way to navigate to a specific record is to start at the beginning and count records.

19.1.2.4.62 TIBCustomDataSet.Loaded Method

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

This is Loaded, a member of class TIBCustomDataSet.

19.1.2.4.63 TIBCustomDataSet.Locate Method

Searches the dataset for a specified record and makes that record the current record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific record and position the cursor on it.

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine. For example:

```
        with CustTable do
    Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '408-431-1000']),
[loPartialKey]);
       TLocateOptions Opts;
    Opts.Clear();
    Opts << loPartialKey;
```

```
Variant locvalues[3];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
locvalues[2] = Variant("408-431-1000");
CustTable->Locate("Company;Contact;Phone", VarArrayOf(locvalues, 2), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then Locate allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

Locate returns true if it finds a matching record, and makes that record the current one. Otherwise Locate returns false.

Locate uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, Locate uses the index. Otherwise Locate creates a filter for the search.

19.1.2.4.64 TIBCustomDataSet.LocateNext Method

Searches the dataset for the record after a specified record and makes that record the current record.

Pascal

```
function LocateNext(const KeyFields: string; const KeyValues: Variant; Options:
TLocateOptions): Boolean;
```

C++

```
__fastcall Boolean LocateNext(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call LocateNext to search a dataset for a record after the current cursor position

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine.

The Options parameter is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then LocateNext ignores case when matching fields. If Options contains the loPartialKey setting, then LocateNext allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

LocateNext returns true if it finds a matching record, and makes that record the current one. Otherwise LocateNext returns false.

LocateNext uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, LocateNext uses the index. Otherwise LocateNext creates a filter for the search.

19.1.2.4.65 TIBCustomDataSet.Lookup Method

Retrieves field values from a record that matches specified search values.

Pascal

```
function Lookup(const KeyFields: string; const KeyValues: Variant; const ResultFields:
string): Variant; override;
```

C++

```
virtual __fastcall Variant Lookup(const UnicodeString KeyFields, const Variant KeyValues,
```

```
const UnicodeString ResultFields);
```

Description

Call Lookup to retrieve values for specified fields from a record that matches search criteria. KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant array containing the values to match in the key fields. To specify multiple search values, pass KeyValues as a variant array as an argument, or construct a variant array on the fly using the VarArrayOf routine.

ResultFields is a string containing a semicolon-delimited list of field names whose values should be returned from the matching record.

Lookup returns a variant array containing the values from the fields specified in ResultFields.

If the search fields in KeyFields are indexed, Lookup uses the index. Otherwise Lookup creates a filter for the search.

19.1.2.4.66 TIBCustomDataSet.Post Method

Writes a modified record to the database server.

Pascal

```
procedure Post; override;
```

C++

```
virtual __fastcall Post();
```

Description

Post writes any changes to the current record to the database server. Dataset methods that change the dataset state, such as Edit, Insert, or Append, or that move from one record to another, such as First, Last, Next, and Prior automatically call Post.

Before posting the current record, Post checks the GeneratorField (see page 3640) property to determine whether it must generate any field values before posting the record. After changing the generated field, if necessary, Post triggers a BeforePost (see page 3637) event, writes the modified record to the server, and then triggers an AfterPost (see page 3635) event.

19.1.2.4.67 TIBCustomDataSet.PSEndTransaction Method

Pascal

```
procedure PSEndTransaction(Commit: Boolean); override;
```

C++

```
virtual __fastcall PSEndTransaction(Boolean Commit);
```

Description

This is PSEndTransaction, a member of class TIBCustomDataSet.

19.1.2.4.68 TIBCustomDataSet.PSExecuteStatement Method

Pascal

```
function PSExecuteStatement(const ASQL: string; AParams: TParams; ResultSet: Pointer = nil):
Integer; override;
```

C++

```
virtual __fastcall int PSExecuteStatement(const UnicodeString ASQL, TParams AParams, void *
ResultSet = nil);
```

Description

This is PSExecuteStatement, a member of class TIBCustomDataSet.

19.1.2.4.69 TIBCustomDataSet.PSGetQuoteChar Method

Pascal

```
function PSGetQuoteChar: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetQuoteChar();
```

Description

This is PSGetQuoteChar, a member of class TIBCustomDataSet.

19.1.2.4.70 TIBCustomDataSet.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBCustomDataSet.

19.1.2.4.71 TIBCustomDataSet.PSGetUpdateException Method

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError; override;
```

C++

```
virtual __fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

This is PSGetUpdateException, a member of class TIBCustomDataSet.

19.1.2.4.72 TIBCustomDataSet.PSInTransaction Method

Pascal

```
function PSInTransaction: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSInTransaction();
```

Description

This is PSInTransaction, a member of class TIBCustomDataSet.

19.1.2.4.73 TIBCustomDataSet.PSIsSQLBased Method

Pascal

```
function PSIsSQLBased: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLBased();
```

Description

This is PSIsSQLBased, a member of class TIBCustomDataSet.

19.1.2.4.74 TIBCustomDataSet.PSIsSQLSupported Method

Pascal

```
function PSIsSQLSupported: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLSupported();
```

Description

This is PSIsSQLSupported, a member of class TIBCustomDataSet.

19.1.2.4.75 TIBCustomDataSet.PSReset Method

Pascal

```
procedure PSReset; override;
```

C++

```
virtual __fastcall PSReset();
```

Description

This is PSReset, a member of class TIBCustomDataSet.

19.1.2.4.76 TIBCustomDataSet.PSStartTransaction Method

Pascal

```
procedure PSStartTransaction; override;
```

C++

```
virtual __fastcall PSStartTransaction();
```

Description

This is PSStartTransaction, a member of class TIBCustomDataSet.

19.1.2.4.77 TIBCustomDataSet.PSUpdateRecord Method

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean; override;
```

C++

```
virtual __fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

This is PSUpdateRecord, a member of class TIBCustomDataSet.

19.1.2.4.78 TIBCustomDataSet.RecordModified Method

Sets the record to modified or unmodified.

Pascal

```
procedure RecordModified(Value: Boolean);
```

C++

```
__fastcall RecordModified(Boolean Value);
```

Description

Call RecordModified to mark a record as modified or unmodified.

Note: This method is for internal use.

19.1.2.4.79 TIBCustomDataSet.ReQuery Method

Pascal

```
procedure ReQuery;
```

C++

```
__fastcall ReQuery();
```

Description

This is ReQuery, a member of class TIBCustomDataSet.

19.1.2.4.80 TIBCustomDataSet.RevertRecord Method

Restores the current record in the dataset to an unmodified state when cached updates are enabled.

Pascal

```
procedure RevertRecord;
```

C++

```
__fastcall RevertRecord();
```

Description

Call RevertRecord to undo changes made to the current record when cached updates are enabled.

Note: To undo all changes to all pending updates in the cache, call CancelUpdates (see page 3610).

19.1.2.4.81 TIBCustomDataSet.SetActive Method

Pascal

```
procedure SetActive(Value: Boolean); override;
```

C++

```
virtual __fastcall SetActive(Boolean Value);
```

Description

This is SetActive, a member of class TIBCustomDataSet.

19.1.2.4.82 TIBCustomDataSet.SetBookmarkData Method

Pascal

```
procedure SetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall SetBookmarkData(const char * Buffer, void * Data);
```

Description

This is SetBookmarkData, a member of class TIBCustomDataSet.

19.1.2.4.83 TIBCustomDataSet.SetBookmarkFlag Method

Pascal

```
procedure SetBookmarkFlag(Buffer: PChar; Value: TBookmarkFlag); override;
```

C++

```
virtual __fastcall SetBookmarkFlag(const char * Buffer, TBookmarkFlag Value);
```

Description

This is SetBookmarkFlag, a member of class TIBCustomDataSet.

19.1.2.4.84 TIBCustomDataSet.SetCachedUpdates Method

Pascal

```
procedure SetCachedUpdates(Value: Boolean);
```

C++

```
__fastcall SetCachedUpdates(Boolean Value);
```

Description

This is SetCachedUpdates, a member of class TIBCustomDataSet.

19.1.2.4.85 TIBCustomDataSet.SetDataSource Method

Pascal

```
procedure SetDataSource(Value: TDataSource);
```

C++

```
__fastcall SetDataSource(TDataSource Value);
```

Description

This is SetDataSource, a member of class TIBCustomDataSet.

19.1.2.4.86 SetFieldData Method

This is the overview for the SetFieldData method overload.

Overload List

	Name	Description
	TIBCustomDataSet.SetFieldData (TField, Pointer) (see page 3631)	This is SetFieldData, a member of class TIBCustomDataSet.
	TIBCustomDataSet.SetFieldData (TField, Pointer, Boolean) (see page 3631)	This is SetFieldData, a member of class TIBCustomDataSet.

19.1.2.4.86.1 TIBCustomDataSet.SetFieldData Method (TField, Pointer)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TIBCustomDataSet.

19.1.2.4.86.2 TIBCustomDataSet.SetFieldData Method (TField, Pointer, Boolean)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean); override;
overload;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
```

Description

This is SetFieldData, a member of class TIBCustomDataSet.

19.1.2.4.87 TIBCustomDataSet.SetRecNo Method

Pascal

```
procedure SetRecNo(Value: Integer); override;
```

C++

```
virtual __fastcall SetRecNo(int Value);
```

Description

This is SetRecNo, a member of class TIBCustomDataSet.

19.1.2.4.88 TIBCustomDataSet.SQLType Method

Returns the type of query to be executed.

Pascal

```
function SQLType: TIBSQLTypes;
```

C++

```
__fastcall TIBSQLTypes SQLType();
```

Description

Use the SQLType to determine the type of query to be executed. This is the same as the SQLType property of the query specified by QSelect (see page 3644).

19.1.2.4.89 TIBCustomDataSet.Undelete Method

Restores a record deleted from the dataset.

Pascal

```
procedure Undelete;
```

C++

```
__fastcall Undelete();
```

Description

Call Undelete to restore a record deleted or uninserted from the dataset.

19.1.2.4.90 TIBCustomDataSet.UpdateStatus Method

Reports the update status for the current record.

Pascal

```
function UpdateStatus: TUpdateStatus; override;
```

C++

```
virtual __fastcall TUpdateStatus UpdateStatus();
```

Description

Call UpdateStatus to determine the update status for the current record when cached updates are enabled. Update status can change frequently as records are edited, inserted, or deleted. UpdateStatus offers a convenient method for applications to assess the current status before undertaking or completing operations that depend on the update status of records.

19.1.2.5 TIBCustomDataSet Properties

The properties of the TIBCustomDataSet class are listed here.

Protected Properties

	Name	Description
	BufferChunks (see page 3638)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3638)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 3639)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 3640)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3640)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 3641)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 3641)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 3642)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	Params (see page 3643)	Specifies the parameters to use for any parameterized queries.
R	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.

	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	RefreshSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	SelectStmtHandle (see page 3645)	Gets the handle for the SELECT statement.
	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
	StatementType (see page 3646)	Returns the statement type of the QSelect (see page 3644) query.
	UniDirectional (see page 3647)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Properties

	Name	Description
	DBHandle (see page 3639)	Specifies the database handle for the dataset.
	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
	RowsAffected (see page 3645)	Indicates the number of rows operated on by the latest query execution.
	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 3647)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Properties

	Name	Description
	AfterCancel (see page 3634)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 3634)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 3634)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 3634)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 3635)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 3635)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 3635)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3635)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 3636)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 3636)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 3636)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 3636)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 3637)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 3637)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 3637)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 3637)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3638)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3641)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 3642)	This is OnDeleteError, a member of class TIBCustomDataSet.

	OnEditError (see page 3642)	This is OnEditError, a member of class TIBCustomDataSet.
	OnNewRecord (see page 3642)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 3642)	This is OnPostError, a member of class TIBCustomDataSet.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.

19.1.2.5.1 TIBCustomDataSet.AfterCancel Property

Pascal

```
property AfterCancel;
```

C++

```
__property AfterCancel;
```

Description

This is AfterCancel, a member of class TIBCustomDataSet.

19.1.2.5.2 TIBCustomDataSet.AfterClose Property

Pascal

```
property AfterClose;
```

C++

```
__property AfterClose;
```

Description

This is AfterClose, a member of class TIBCustomDataSet.

19.1.2.5.3 TIBCustomDataSet.AfterDelete Property

Pascal

```
property AfterDelete;
```

C++

```
__property AfterDelete;
```

Description

This is AfterDelete, a member of class TIBCustomDataSet.

19.1.2.5.4 TIBCustomDataSet.AfterEdit Property

Pascal

```
property AfterEdit;
```

C++

```
__property AfterEdit;
```

Description

This is AfterEdit, a member of class TIBCustomDataSet.

19.1.2.5.5 TIBCustomDataSet.AfterInsert Property

Pascal

```
property AfterInsert;
```

C++

```
__property AfterInsert;
```

Description

This is AfterInsert, a member of class TIBCustomDataSet.

19.1.2.5.6 TIBCustomDataSet.AfterOpen Property

Pascal

```
property AfterOpen;
```

C++

```
__property AfterOpen;
```

Description

This is AfterOpen, a member of class TIBCustomDataSet.

19.1.2.5.7 TIBCustomDataSet.AfterPost Property

Pascal

```
property AfterPost;
```

C++

```
__property AfterPost;
```

Description

This is AfterPost, a member of class TIBCustomDataSet.

19.1.2.5.8 TIBCustomDataSet.AfterRefresh Property

Pascal

```
property AfterRefresh;
```

C++

```
__property AfterRefresh;
```

Description

This is AfterRefresh, a member of class TIBCustomDataSet.

19.1.2.5.9 TIBCustomDataSet.AfterScroll Property

Pascal

```
property AfterScroll;
```

C++

```
__property AfterScroll;
```

Description

This is AfterScroll, a member of class TIBCustomDataSet.

19.1.2.5.10 TIBCustomDataSet.AutoCalcFields Property

Pascal

```
property AutoCalcFields;
```

C++

```
__property AutoCalcFields;
```

Description

This is AutoCalcFields, a member of class TIBCustomDataSet.

19.1.2.5.11 TIBCustomDataSet.BeforeCancel Property

Pascal

```
property BeforeCancel;
```

C++

```
__property BeforeCancel;
```

Description

This is BeforeCancel, a member of class TIBCustomDataSet.

19.1.2.5.12 TIBCustomDataSet.BeforeClose Property

Pascal

```
property BeforeClose;
```

C++

```
__property BeforeClose;
```

Description

This is BeforeClose, a member of class TIBCustomDataSet.

19.1.2.5.13 TIBCustomDataSet.BeforeDelete Property

Pascal

```
property BeforeDelete;
```

C++

```
__property BeforeDelete;
```

Description

This is BeforeDelete, a member of class TIBCustomDataSet.

19.1.2.5.14 TIBCustomDataSet.BeforeEdit Property

Pascal

```
property BeforeEdit;
```

C++

```
__property BeforeEdit;
```

Description

This is BeforeEdit, a member of class TIBCustomDataSet.

19.1.2.5.15 TIBCustomDataSet.BeforeInsert Property

Pascal

```
property BeforeInsert;
```

C++

```
__property BeforeInsert;
```

Description

This is BeforeInsert, a member of class TIBCustomDataSet.

19.1.2.5.16 TIBCustomDataSet.BeforeOpen Property

Pascal

```
property BeforeOpen;
```

C++

```
__property BeforeOpen;
```

Description

This is BeforeOpen, a member of class TIBCustomDataSet.

19.1.2.5.17 TIBCustomDataSet.BeforePost Property

Pascal

```
property BeforePost;
```

C++

```
__property BeforePost;
```

Description

This is BeforePost, a member of class TIBCustomDataSet.

19.1.2.5.18 TIBCustomDataSet.BeforeRefresh Property

Pascal

```
property BeforeRefresh;
```

C++

```
__property BeforeRefresh;
```

Description

This is BeforeRefresh, a member of class TIBCustomDataSet.

19.1.2.5.19 TIBCustomDataSet.BeforeScroll Property

Pascal

```
property BeforeScroll;
```

C++

```
__property BeforeScroll;
```

Description

This is BeforeScroll, a member of class TIBCustomDataSet.

19.1.2.5.20 TIBCustomDataSet.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When Unidirectional is true, BufferChunks has no meaning.

19.1.2.5.21 TIBCustomDataSet.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

19.1.2.5.22 TIBCustomDataSet.Database Property

Identifies the database component for which this dataset represents one or more tables.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to access the properties, events, and methods of the database component associated with this dataset.

See Also

Creating and Deleting Tables

Using Query-type Datasets

Using Stored Procedure-type Datasets

Using Table Type Datasets

Connecting Directly to a Database Server

19.1.2.5.23 TIBCustomDataSet.DBHandle Property

Specifies the database handle for the dataset.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Check DBHandle to determine the database handle for the dataset.

19.1.2.5.24 TIBCustomDataSet.DeleteSQL Property

Holds the SQL statement used to delete rows from the dataset.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Use DeleteSQL to delete rows in the dataset.

19.1.2.5.25 TIBCustomDataSet.ForcedRefresh Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property ForcedRefresh: Boolean;
```

C++

```
__property Boolean ForcedRefresh;
```

Description

Set ForcedRefresh to true to force the dataset to refresh its data every time it posts a record. When ForcedRefresh is false (the default), the data is only refreshed when you call the Refresh method, or when the dataset needs to fetch the value of a default or internally calculated field.

19.1.2.5.26 TIBCustomDataSet.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField (see page 3682) object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField (see page 3682) object that is the value of this property.

19.1.2.5.27 TIBCustomDataSet.InsertSQL Property

Holds the SQL statement used to insert rows into the dataset.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Use InsertSQL to insert rows into the dataset.

19.1.2.5.28 TIBCustomDataSet.InternalPrepared Property

Indicates whether the dataset has prepared its queries for execution.

Pascal

```
property InternalPrepared: Boolean;
```

C++

```
__property Boolean InternalPrepared;
```

Description

TIBCustomDataSet (see page 3602) uses InternalPrepared internally to determine when it needs to prepare its set of queries

for execution. The dataset checks InternalPrepared before executing a query, and prepares the query if InternalPrepared is false.

19.1.2.5.29 TIBCustomDataSet.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

19.1.2.5.30 TIBCustomDataSet.ModifySQL Property

Provides the ability to access the SQL object encapsulating the ModifySQL statement.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Use ModifySQL to access the SQL object that encapsulates the ModifySQL statement.

19.1.2.5.31 TIBCustomDataSet.ObjectView Property

Pascal

```
property ObjectView;
```

C++

```
__property ObjectView;
```

Description

This is ObjectView, a member of class TIBCustomDataSet.

19.1.2.5.32 TIBCustomDataSet.OnCalcFields Property

Pascal

```
property OnCalcFields;
```

C++

```
__property OnCalcFields;
```

Description

This is OnCalcFields, a member of class TIBCustomDataSet.

19.1.2.5.33 TIBCustomDataSet.OnDeleteError Property

Pascal

```
property OnDeleteError;
```

C++

```
__property OnDeleteError;
```

Description

This is OnDeleteError, a member of class TIBCustomDataSet.

19.1.2.5.34 TIBCustomDataSet.OnEditError Property

Pascal

```
property OnEditError;
```

C++

```
__property OnEditError;
```

Description

This is OnEditError, a member of class TIBCustomDataSet.

19.1.2.5.35 TIBCustomDataSet.OnNewRecord Property

Pascal

```
property OnNewRecord;
```

C++

```
__property OnNewRecord;
```

Description

This is OnNewRecord, a member of class TIBCustomDataSet.

19.1.2.5.36 TIBCustomDataSet.OnPostError Property

Pascal

```
property OnPostError;
```

C++

```
__property OnPostError;
```

Description

This is OnPostError, a member of class TIBCustomDataSet.

19.1.2.5.37 TIBCustomDataSet.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params (see page 3643) property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params (see page 3643) property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet (see page 3602). For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet (see page 3602) executing the DDL statement.

19.1.2.5.38 TIBCustomDataSet.Params Property

Specifies the parameters to use for any parameterized queries.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use Params to set up the parameters for the SQL object specified by the QSelect (see page 3644) property. Params is the same as the SQLParams (see page 3646) property.

19.1.2.5.39 TIBCustomDataSet.Plan Property

Indicates the PLAN portion of the dataset's SELECT query.

Pascal

```
property Plan: String;
```

C++

```
__property UnicodeString Plan;
```

Description

Read the Plan property to determine the PLAN clause in the query specified by QSelect (see page 3644).

19.1.2.5.40 TIBCustomDataSet.QDelete Property

Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.

Pascal

```
property QDelete: TIBSQL;
```

C++

```
__property TIBSQL QDelete;
```

Description

Use QDelete to access the SQL object that encapsulates the Delete SQL statement.

19.1.2.5.41 TIBCustomDataSet.QInsert Property

Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.

Pascal

```
property QInsert: TIBSQL;
```

C++

```
__property TIBSQL QInsert;
```

Description

Use QInsert to access the SQL object that encapsulates the InsertSQL (see page 3640) statement.

19.1.2.5.42 TIBCustomDataSet.QModify Property

Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.

Pascal

```
property QModify: TIBSQL;
```

C++

```
__property TIBSQL QModify;
```

Description

Use QModify to access the SQL object that encapsulates the ModifySQL (see page 3641) statement.

19.1.2.5.43 TIBCustomDataSet.QRefresh Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.

Pascal

```
property QRefresh: TIBSQL;
```

C++

```
__property TIBSQL QRefresh;
```

Description

Use QRefresh to access the SQL object that encapsulates the RefreshSQL (see page 3645) statement.

19.1.2.5.44 TIBCustomDataSet.QSelect Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.

Pascal

```
property QSelect: TIBSQL;
```

C++

```
__property TIBSQL QSelect;
```

Description

Use QSelect to access the SQL object that encapsulates the SelectSQL (see page 3645) statement.

19.1.2.5.45 TIBCustomDataSet.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

19.1.2.5.46 TIBCustomDataSet.RowsAffected Property

Indicates the number of rows operated on by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

When the dataset represents a query that does not return a result set, you can't use the RecordCount property to ascertain the number of records affected by the query. In such cases, read RowsAffected to determine how many rows were updated or deleted by the query when it executed. If no rows were updated or deleted, RowsAffected is zero. RowsAffected is -1 if the query could not be executed due to an error condition. (This latter situation typically follows the throwing of an exception.)

19.1.2.5.47 TIBCustomDataSet.SelectSQL Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.

Pascal

```
property SelectSQL: TStrings;
```

C++

```
__property TStrings SelectSQL;
```

Description

Use SelectSQL to access the SQL object that encapsulates the SelectSQL statement.

19.1.2.5.48 TIBCustomDataSet.SelectStmtHandle Property

Gets the handle for the SELECT statement.

Pascal

```
property SelectStmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE SelectStmtHandle;
```

Description

Use SelectStmtHandle to get the handle for the SELECT statement.

19.1.2.5.49 TIBCustomDataSet.SQLParams Property

Specifies the parameters to use for any parameterized queries.

Pascal

```
property SQLParams: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA SQLParams;
```

Description

Use SQLParams to set up the parameters for the SQL object specified by the QSelect (see page 3644) property. SQLParams is the same as the Params (see page 3643) property.

19.1.2.5.50 TIBCustomDataSet.StatementType Property

Returns the statement type of the QSelect (see page 3644) query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect (see page 3644) query.

19.1.2.5.51 TIBCustomDataSet.Transaction Property

Identifies the transaction under which the query executes.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to determine the transaction that contains any query this dataset executes. Set the properties of this transaction object to control how the transaction executes, or set the Transaction property to cause this dataset's queries to be included in an existing transaction.

19.1.2.5.52 TIBCustomDataSet.TRHandle Property

Specifies the transaction handle for the dataset.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Check TRHandle to determine the transaction handle for the dataset.

19.1.2.5.53 TIBCustomDataSet.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

19.1.2.5.54 TIBCustomDataSet.UpdateMode Property

Indicates how records are located when updating records.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

UpdateMode is not currently implemented in IB (see page 3541) datasets. It is reserved for future use.

19.1.2.5.55 TIBCustomDataSet.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject (see page 3674) component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject (see page 3674) is especially useful for complicated updates from an OnUpdateRecord (see page 3651) event.

19.1.2.5.56 TIBCustomDataSet.UpdateRecordTypes Property

Specifies the type of records visible in a dataset when cached updates are enabled.

Pascal

```
property UpdateRecordTypes: TIBUpdateRecordTypes;
```

C++

```
__property TIBUpdateRecordTypes UpdateRecordTypes;
```

Description

Use UpdateRecordTypes to specify the records that are visible in a dataset when cached updates are enabled. UpdateRecordTypes is a set that can have the following values:

By default, a dataset is created with an UpdateRecordTypes set of cusModified, cusInserted, or cusUnmodified, meaning that all existing, edited, or inserted records are visible to the user.

An application that must cycle through a dataset to undelete records may change UpdateRecordTypes as part of an undelete method, so that deleted records are 'visible' long enough to restore them to their previously undeleted conditions.

Similarly, an application that must cycle through a dataset to uninsert records may change UpdateRecordTypes as part of an uninsert method, so that uninserted records are 'visible' long enough to restore them to their previously inserted conditions.

An application might also use UpdateRecordTypes like a filter to temporarily limit visible records to those added or inserted by the user during the current session.

19.1.2.5.57 TIBCustomDataSet.UpdatesPending Property

Indicates whether the cached updates buffer contains records that are not yet applied.

Pascal

```
property UpdatesPending: Boolean;
```

C++

```
__property Boolean UpdatesPending;
```

Description

Examine UpdatesPending to check the status of the cached updates buffer. If UpdatesPending is true, then there are edited, deleted, or inserted records to apply to the database. If UpdatesPending is false, there are no records in the cache.

19.1.2.6 TIBCustomDataSet Events

The events of the TIBCustomDataSet class are listed here.

Protected Events

	Name	Description
	AfterDatabaseDisconnect (see page 3649)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3649)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3649)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3649)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 3650)	Occurs when the database associated with this dataset is freed.

	TransactionFree (see page 3651)	Occurs when the transaction that includes this dataset's query is freed.

Published Events

	Name	Description
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.

19.1.2.6.1 TIBCustomDataSet.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database (see page 3639) property.

19.1.2.6.2 TIBCustomDataSet.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction (see page 3646) property ends.

19.1.2.6.3 TIBCustomDataSet.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database (see page 3639) property.

19.1.2.6.4 TIBCustomDataSet.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction (see page 3646) property is about to end.

19.1.2.6.5 TIBCustomDataSet.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database (see page 3639) property is freed.

19.1.2.6.6 TIBCustomDataSet.OnUpdateError Event

Occurs if an exception is generated when cached updates are applied to a database.

Pascal

```
property OnUpdateError: TIBUpdateErrorEvent;
```

C++

```
__property TIBUpdateErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to exceptions generated when cached updates are applied to a database.

Because there is a delay between the time a record is first cached and the time cached updates are applied, there is a possibility that another application may change one or more of the same records in the database before the cached changes can be applied. DataSet is the name of the dataset to which updates are applied.

The error handler can use the OldValue and NewValue properties of TField to evaluate error conditions, and set NewValue to a new value to reapply. In this case, set UpdateAction to uaRetry before exiting.

Note: If a call to ApplyUpdates (see page 3609) raises an exception and ApplyUpdates (see page 3609) is not called within the context of a try..except (Delphi) or try..catch (C++) block, an error message is returned. If an OnUpdateError handler cannot correct the error condition and leaves UpdateAction set to uaFail, the error message is returned twice. To prevent re-return, set UpdateAction to uaAbort in the error handler.

Warning: **Important:** The code in an OnUpdateError handler must not call any methods that make a different record the current one.

19.1.2.6.7 TIBCustomDataSet.OnUpdateRecord Event

Occurs when cached updates are applied to a record.

Pascal

```
property OnUpdateRecord: TIBUpdateRecordEvent;
```

C++

```
__property TIBUpdateRecordEvent OnUpdateRecord;
```

Description

Write an OnUpdateRecord event handler to process updates that cannot be handled by a single update component, such as implementation of cascading updates, insertions, or deletions. This handler is also useful for applications that require additional control over parameter substitution in update components.

Note: The code in an OnUpdateRecord handler must not call any methods that make a different record the current one.

19.1.2.6.8 TIBCustomDataSet.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction (see page 3646) property is freed.

19.1.3 TIBDataLink Class

TIBDataLink is a helper class used by data-aware objects to coordinate the actions of TIBDataSet (see page 3654) and to respond to data events.

Class Hierarchy

Pascal

```
TIBDataLink = class(TDetailDataLink);
```

C++

```
class TIBDataLink : public TDetailDataLink;
```

File

IBCustomDataSet

Description

Use TIBDataLink or one of its descendants in any data-aware object that implements a DataSource property to represent its link to a dataset or that needs to respond to data events.

The constructor of the data-aware object should call the constructor of TIBDataLink, and initialize any relevant properties. The data-aware object can then link to a TDataSource by using the DataSource property of the TIBDataLink.

Data-aware objects that link to a single field in a dataset should use a TFieldDataLink instead.

19.1.3.1 TIBDataLink Members

The following tables list the members exposed by TIBDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 3653)	This is ActiveChanged, a member of class TIBDataLink.
	CheckBrowseMode (see page 3653)	This is CheckBrowseMode, a member of class TIBDataLink.
	GetDetailDataSet (see page 3653)	This is GetDetailDataSet, a member of class TIBDataLink.
	RecordChanged (see page 3654)	This is RecordChanged, a member of class TIBDataLink.

Public Methods

	Name	Description
	Create (see page 3652)	Creates an instance of TIBDataLink (see page 3651).
	Destroy (see page 3652)	Destroys an instance of TIBDataLink (see page 3651).

19.1.3.2 TIBDataLink.Create Constructor

Creates an instance of TIBDataLink (see page 3651).

Pascal

```
constructor Create(ADataSet: TIBCustomDataSet);
```

C++

```
__fastcall TIBDataLink(TIBCustomDataSet ADataSet);
```

Description

Create is called from the constructor of any data-aware object that uses a TIBDataLink (see page 3651) to implement its DataSource property.

After calling the inherited constructor, Create initializes the BufferCount property to 1. Data-aware objects that use a TIBDataLink (see page 3651) object to manage their link to a DataSource should change the BufferCount property to the number or records they represent, after calling the inherited constructor.

19.1.3.3 TIBDataLink.Destroy Destructor

Destroys an instance of TIBDataLink (see page 3651).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataLink();
```

Description

Do not call Destroy directly in an application. Instead, call the Free method. Free verifies that the TIBDataLink (see page 3651) object is not already freed and only then calls Destroy.

Before calling the inherited destructor, Destroy removes any reference to the TIBDataLink (see page 3651) from the data source object.

The TIBDataLink (see page 3651) object should be destroyed in the destructor of its Owner, where that Owner calls Create (see page 3652) from its constructor.

19.1.3.4 TIBDataLink Methods

The methods of the TIBDataLink class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 3653)	This is ActiveChanged, a member of class TIBDataLink.
	CheckBrowseMode (see page 3653)	This is CheckBrowseMode, a member of class TIBDataLink.
	GetDetailDataSet (see page 3653)	This is GetDetailDataSet, a member of class TIBDataLink.
	RecordChanged (see page 3654)	This is RecordChanged, a member of class TIBDataLink.

19.1.3.4.1 TIBDataLink.ActiveChanged Method

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

This is ActiveChanged, a member of class TIBDataLink.

19.1.3.4.2 TIBDataLink.CheckBrowseMode Method

Pascal

```
procedure CheckBrowseMode; override;
```

C++

```
virtual __fastcall CheckBrowseMode();
```

Description

This is CheckBrowseMode, a member of class TIBDataLink.

19.1.3.4.3 TIBDataLink.GetDetailDataSet Method

Pascal

```
function GetDetailDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDetailDataSet();
```

Description

This is GetDetailDataSet, a member of class TIBDataLink.

19.1.3.4.4 TIBDataLink.RecordChanged Method

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

This is RecordChanged, a member of class TIBDataLink.

19.1.4 TIBDataSet Class

TIBDataSet executes InterBase SQL statements.

Class Hierarchy

Pascal

```
TIBDataSet = class(TIBCustomDataSet);
```

C++

```
class TIBDataSet : public TIBCustomDataSet;
```

File

IBCustomDataSet

Description

Use TIBDataSet to execute InterBase SQL statements. Each TIBDataSet component has properties for a statement to fetch data (typically an SQL SELECT statement), a statement to modify those records, one for inserting records, one for deleting records, and one to refresh the dataset.

TIBDataSet buffers the result set, making it completely scrollable. Since TIBDataSet is a descendant of TDataSet, it works well with all data-aware components.

19.1.4.1 TIBDataSet Members

The following tables list the members exposed by TIBDataSet.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.

	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	Disconnect (see page 3613)	This is Disconnect, a member of class TIBCustomDataSet.
V	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 3614)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 3615)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 3616)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
V	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 3619)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 3659)	This is InternalOpen, a member of class TIBDataSet.
V	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 3622)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 3622)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
V	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.
V	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
V	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
V	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
V	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
V	PSGetTableName (see page 3627)	This is PSGetTableName, a member of class TIBCustomDataSet.
V	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
V	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
V	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.

	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 3660)	This is PSSetCommandText, a member of class TIBDataSet.
	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 3660)	This is SetFiltered, a member of class TIBDataSet.
	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.
	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.
	BatchInput (see page 3659)	Executes the parameterized query in SQL for input in the referenced input object.
	BatchOutput (see page 3659)	Outputs the selected query in SQL to the referenced OutputObject.
	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 3611)	Compares two bookmarks.
	Create (see page 3606)	Creates an instance of a TDataSet component.
	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
	Destroy (see page 3606)	Destroys the instance of a dataset component.
	ExecSQL (see page 3659)	Executes the SQL statement that the SelectSQL (see page 3671) property specifies when it is not a SELECT statement.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.
	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 3624)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.

	ParamByName (see page 3660)	Returns a specified parameter of the SELECT query that fetches this dataset's data.
V	Post (see page 3626)	Writes a modified record to the database server.
	Prepare (see page 3660)	Prepares all queries in the dataset to be executed.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
	UnPrepare (see page 3661)	Resets the state of a dataset's internal queries.
V	UpdateStatus (see page 3632)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 3639)	Specifies the database handle for the dataset.
	LiveMode (see page 3668)	Indicates what types of edits, if any, can be made to the data in the dataset.
	Params (see page 3670)	Provides the ability to specify values for a parameterized query.
R	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
R	Prepared (see page 3671)	Determines whether or not a set of dataset queries is prepared for execution.
R	RowsAffected (see page 3645)	Indicates the number of rows operated on by the latest query execution.
	SelectStmtHandle (see page 3671)	Gets the handle for the SELECT statement.
	StatementType (see page 3672)	Returns the statement type of the QSelect query.
R	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 3673)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3673)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3673)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3674)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 3674)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 3674)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 3662)	This is Active, a member of class TIBDataSet.
	AfterCancel (see page 3662)	This is AfterCancel, a member of class TIBDataSet.
	AfterClose (see page 3662)	This is AfterClose, a member of class TIBDataSet.
	AfterDelete (see page 3663)	This is AfterDelete, a member of class TIBDataSet.
	AfterEdit (see page 3663)	This is AfterEdit, a member of class TIBDataSet.
	AfterInsert (see page 3663)	This is AfterInsert, a member of class TIBDataSet.
	AfterOpen (see page 3663)	This is AfterOpen, a member of class TIBDataSet.
	AfterPost (see page 3663)	This is AfterPost, a member of class TIBDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3664)	This is AfterScroll, a member of class TIBDataSet.
	AutoCalcFields (see page 3664)	This is AutoCalcFields, a member of class TIBDataSet.
	BeforeCancel (see page 3664)	This is BeforeCancel, a member of class TIBDataSet.
	BeforeClose (see page 3664)	This is BeforeClose, a member of class TIBDataSet.
	BeforeDelete (see page 3665)	This is BeforeDelete, a member of class TIBDataSet.

	BeforeEdit (see page 3665)	This is BeforeEdit, a member of class TIBDataSet.
	BeforeInsert (see page 3665)	This is BeforeInsert, a member of class TIBDataSet.
	BeforeOpen (see page 3665)	This is BeforeOpen, a member of class TIBDataSet.
	BeforePost (see page 3665)	This is BeforePost, a member of class TIBDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3666)	This is BeforeScroll, a member of class TIBDataSet.
	BufferChunks (see page 3666)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3666)	Specifies whether cached updates are enabled for a dataset.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	DataSource (see page 3667)	This is DataSource, a member of class TIBDataSet.
	DeleteSQL (see page 3667)	Holds the SQL statement used to delete rows from the dataset.
	Filtered (see page 3667)	Specifies whether or not filtering is active for the dataset.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	GeneratorField (see page 3667)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3668)	Holds the SQL statement used to insert rows into the dataset.
	ModifySQL (see page 3668)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3669)	This is OnCalcFields, a member of class TIBDataSet.
	OnDeleteError (see page 3669)	This is OnDeleteError, a member of class TIBDataSet.
	OnEditError (see page 3669)	This is OnEditError, a member of class TIBDataSet.
	OnFilterRecord (see page 3669)	This is OnFilterRecord, a member of class TIBDataSet.
	OnNewRecord (see page 3669)	This is OnNewRecord, a member of class TIBDataSet.
	OnPostError (see page 3670)	This is OnPostError, a member of class TIBDataSet.
	ParamCheck (see page 3670)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	RefreshSQL (see page 3671)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3671)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.
	UniDirectional (see page 3672)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 3672)	Specifies the update object component used to update a read-only result set.

19.1.4.2 TIBDataSet Methods

The methods of the TIBDataSet class are listed here.

Protected Methods

	Name	Description
	InternalOpen (see page 3659)	This is InternalOpen, a member of class TIBDataSet.
	PSSetCommandText (see page 3660)	This is PSSetCommandText, a member of class TIBDataSet.
	SetFiltered (see page 3660)	This is SetFiltered, a member of class TIBDataSet.

Public Methods

	Name	Description
	BatchInput (see page 3659)	Executes the parameterized query in SQL for input in the referenced input object.
	BatchOutput (see page 3659)	Outputs the selected query in SQL to the referenced OutputObject.
	ExecSQL (see page 3659)	Executes the SQL statement that the SelectSQL (see page 3671) property specifies when it is not a SELECT statement.
	ParamByName (see page 3660)	Returns a specified parameter of the SELECT query that fetches this dataset's data.
	Prepare (see page 3660)	Prepares all queries in the dataset to be executed.
	UnPrepare (see page 3661)	Resets the state of a dataset's internal queries.

19.1.4.2.1 TIBDataSet.BatchInput Method

Executes the parameterized query in SQL for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call BatchInput to execute the parameterized query in SQL for input in the referenced input object.

19.1.4.2.2 TIBDataSet.BatchOutput Method

Outputs the selected query in SQL to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call BatchOutput to output the selected query in SQL to the referenced OutputObject.

19.1.4.2.3 TIBDataSet.ExecSQL Method

Executes the SQL statement that the SelectSQL (see page 3671) property specifies when it is not a SELECT statement.

Pascal

```
procedure ExecSQL;
```

C++

```
__fastcall ExecSQL();
```

Description

Call ExecSQL to execute the main query for this dataset when it is not a SELECT statement. If the value of the SelectSQL (see page 3671) property is not set, or if it is set to a SELECT statement, ExecSQL raises an EIBError (see page 3543) exception.

19.1.4.2.4 TIBDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBDataSet.

19.1.4.2.5 TIBDataSet.ParamByName Method

Returns a specified parameter of the SELECT query that fetches this dataset's data.

Pascal

```
function ParamByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ParamByName(UnicodeString Idx);
```

Description

Call ParamByName to retrieve the object that represents a parameter of the query that fetches this dataset's data. Use the TIBXSQLVAR (see page 4086) object this method returns to get or set the parameter value.

Idx is the name of the parameter.

19.1.4.2.6 TIBDataSet.Prepare Method

Prepares all queries in the dataset to be executed.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to prepare all queries in the dataset to be executed.

19.1.4.2.7 TIBDataSet.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBDataSet.

19.1.4.2.8 TIBDataSet.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBDataSet.

19.1.4.2.9 TIBDataSet.UnPrepare Method

Resets the state of a dataset's internal queries.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Note: Call UnPrepare to reset the state of a dataset's internal queries.

19.1.4.3 TIBDataSet Properties

The properties of the TIBDataSet class are listed here.

Public Properties

	Name	Description
	LiveMode (see page 3668)	Indicates what types of edits, if any, can be made to the data in the dataset.
	Params (see page 3670)	Provides the ability to specify values for a parameterized query.
R	Prepared (see page 3671)	Determines whether or not a set of dataset queries is prepared for execution.
	SelectStmtHandle (see page 3671)	Gets the handle for the SELECT statement.
	StatementType (see page 3672)	Returns the statement type of the QSelect query.

Published Properties

	Name	Description
	Active (see page 3662)	This is Active, a member of class TIBDataSet.
	AfterCancel (see page 3662)	This is AfterCancel, a member of class TIBDataSet.
	AfterClose (see page 3662)	This is AfterClose, a member of class TIBDataSet.
	AfterDelete (see page 3663)	This is AfterDelete, a member of class TIBDataSet.
	AfterEdit (see page 3663)	This is AfterEdit, a member of class TIBDataSet.
	AfterInsert (see page 3663)	This is AfterInsert, a member of class TIBDataSet.
	AfterOpen (see page 3663)	This is AfterOpen, a member of class TIBDataSet.
	AfterPost (see page 3663)	This is AfterPost, a member of class TIBDataSet.
	AfterScroll (see page 3664)	This is AfterScroll, a member of class TIBDataSet.
	AutoCalcFields (see page 3664)	This is AutoCalcFields, a member of class TIBDataSet.
	BeforeCancel (see page 3664)	This is BeforeCancel, a member of class TIBDataSet.
	BeforeClose (see page 3664)	This is BeforeClose, a member of class TIBDataSet.
	BeforeDelete (see page 3665)	This is BeforeDelete, a member of class TIBDataSet.
	BeforeEdit (see page 3665)	This is BeforeEdit, a member of class TIBDataSet.
	BeforeInsert (see page 3665)	This is BeforeInsert, a member of class TIBDataSet.
	BeforeOpen (see page 3665)	This is BeforeOpen, a member of class TIBDataSet.
	BeforePost (see page 3665)	This is BeforePost, a member of class TIBDataSet.
	BeforeScroll (see page 3666)	This is BeforeScroll, a member of class TIBDataSet.
	BufferChunks (see page 3666)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3666)	Specifies whether cached updates are enabled for a dataset.
	DataSource (see page 3667)	This is DataSource, a member of class TIBDataSet.
	DeleteSQL (see page 3667)	Holds the SQL statement used to delete rows from the dataset.
	Filtered (see page 3667)	Specifies whether or not filtering is active for the dataset.
	GeneratorField (see page 3667)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3668)	Holds the SQL statement used to insert rows into the dataset.

	ModifySQL (see page 3668)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	OnCalcFields (see page 3669)	This is OnCalcFields, a member of class TIBDataSet.
	OnDeleteError (see page 3669)	This is OnDeleteError, a member of class TIBDataSet.
	OnEditError (see page 3669)	This is OnEditError, a member of class TIBDataSet.
	OnFilterRecord (see page 3669)	This is OnFilterRecord, a member of class TIBDataSet.
	OnNewRecord (see page 3669)	This is OnNewRecord, a member of class TIBDataSet.
	OnPostError (see page 3670)	This is OnPostError, a member of class TIBDataSet.
	ParamCheck (see page 3670)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	RefreshSQL (see page 3671)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3671)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
	UniDirectional (see page 3672)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 3672)	Specifies the update object component used to update a read-only result set.

19.1.4.3.1 TIBDataSet.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBDataSet.

19.1.4.3.2 TIBDataSet.AfterCancel Property

Pascal

```
property AfterCancel;
```

C++

```
__property AfterCancel;
```

Description

This is AfterCancel, a member of class TIBDataSet.

19.1.4.3.3 TIBDataSet.AfterClose Property

Pascal

```
property AfterClose;
```

C++

```
__property AfterClose;
```

Description

This is AfterClose, a member of class TIBDataSet.

19.1.4.3.4 TIBDataSet.AfterDelete Property

Pascal

```
property AfterDelete;
```

C++

```
__property AfterDelete;
```

Description

This is AfterDelete, a member of class TIBDataSet.

19.1.4.3.5 TIBDataSet.AfterEdit Property

Pascal

```
property AfterEdit;
```

C++

```
__property AfterEdit;
```

Description

This is AfterEdit, a member of class TIBDataSet.

19.1.4.3.6 TIBDataSet.AfterInsert Property

Pascal

```
property AfterInsert;
```

C++

```
__property AfterInsert;
```

Description

This is AfterInsert, a member of class TIBDataSet.

19.1.4.3.7 TIBDataSet.AfterOpen Property

Pascal

```
property AfterOpen;
```

C++

```
__property AfterOpen;
```

Description

This is AfterOpen, a member of class TIBDataSet.

19.1.4.3.8 TIBDataSet.AfterPost Property

Pascal

```
property AfterPost;
```

C++

```
__property AfterPost;
```

Description

This is AfterPost, a member of class TIBDataSet.

19.1.4.3.9 TIBDataSet.AfterScroll Property

Pascal

```
property AfterScroll;
```

C++

```
__property AfterScroll;
```

Description

This is AfterScroll, a member of class TIBDataSet.

19.1.4.3.10 TIBDataSet.AutoCalcFields Property

Pascal

```
property AutoCalcFields;
```

C++

```
__property AutoCalcFields;
```

Description

This is AutoCalcFields, a member of class TIBDataSet.

19.1.4.3.11 TIBDataSet.BeforeCancel Property

Pascal

```
property BeforeCancel;
```

C++

```
__property BeforeCancel;
```

Description

This is BeforeCancel, a member of class TIBDataSet.

19.1.4.3.12 TIBDataSet.BeforeClose Property

Pascal

```
property BeforeClose;
```

C++

```
__property BeforeClose;
```

Description

This is BeforeClose, a member of class TIBDataSet.

19.1.4.3.13 TIBDataSet.BeforeDelete Property

Pascal

```
property BeforeDelete;
```

C++

```
__property BeforeDelete;
```

Description

This is BeforeDelete, a member of class TIBDataSet.

19.1.4.3.14 TIBDataSet.BeforeEdit Property

Pascal

```
property BeforeEdit;
```

C++

```
__property BeforeEdit;
```

Description

This is BeforeEdit, a member of class TIBDataSet.

19.1.4.3.15 TIBDataSet.BeforeInsert Property

Pascal

```
property BeforeInsert;
```

C++

```
__property BeforeInsert;
```

Description

This is BeforeInsert, a member of class TIBDataSet.

19.1.4.3.16 TIBDataSet.BeforeOpen Property

Pascal

```
property BeforeOpen;
```

C++

```
__property BeforeOpen;
```

Description

This is BeforeOpen, a member of class TIBDataSet.

19.1.4.3.17 TIBDataSet.BeforePost Property

Pascal

```
property BeforePost;
```

C++

```
__property BeforePost;
```

Description

This is BeforePost, a member of class TIBDataSet.

19.1.4.3.18 TIBDataSet.BeforeScroll Property

Pascal

```
property BeforeScroll;
```

C++

```
__property BeforeScroll;
```

Description

This is BeforeScroll, a member of class TIBDataSet.

19.1.4.3.19 TIBDataSet.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When Unidirectional is true, BufferChunks has no meaning.

19.1.4.3.20 TIBDataSet.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

19.1.4.3.21 TIBDataSet.DataSource Property

Pascal

```
property DataSource;
```

C++

```
__property DataSource;
```

Description

This is DataSource, a member of class TIBDataSet.

19.1.4.3.22 TIBDataSet.DeleteSQL Property

Holds the SQL statement used to delete rows from the dataset.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Use DeleteSQL to delete rows in the dataset.

19.1.4.3.23 TIBDataSet.Filtered Property

Specifies whether or not filtering is active for the dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 3669) event handler, set Filtered to true.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

19.1.4.3.24 TIBDataSet.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField object that is the value of this property.

19.1.4.3.25 TIBDataSet.InsertSQL Property

Holds the SQL statement used to insert rows into the dataset.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Use InsertSQL to insert rows into the dataset.

19.1.4.3.26 TIBDataSet.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

19.1.4.3.27 TIBDataSet.ModifySQL Property

Provides the ability to access the SQL object encapsulating the ModifySQL statement.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Use ModifySQL to access the SQL object that encapsulates the ModifySQL statement.

19.1.4.3.28 TIBDataSet.OnCalcFields Property

Pascal

```
property OnCalcFields;
```

C++

```
__property OnCalcFields;
```

Description

This is OnCalcFields, a member of class TIBDataSet.

19.1.4.3.29 TIBDataSet.OnDeleteError Property

Pascal

```
property OnDeleteError;
```

C++

```
__property OnDeleteError;
```

Description

This is OnDeleteError, a member of class TIBDataSet.

19.1.4.3.30 TIBDataSet.OnEditError Property

Pascal

```
property OnEditError;
```

C++

```
__property OnEditError;
```

Description

This is OnEditError, a member of class TIBDataSet.

19.1.4.3.31 TIBDataSet.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBDataSet.

19.1.4.3.32 TIBDataSet.OnNewRecord Property

Pascal

```
property OnNewRecord;
```

C++

```
__property OnNewRecord;
```

Description

This is OnNewRecord, a member of class TIBDataSet.

19.1.4.3.33 TIBDataSet.OnPostError Property

Pascal

```
property OnPostError;
```

C++

```
__property OnPostError;
```

Description

This is OnPostError, a member of class TIBDataSet.

19.1.4.3.34 TIBDataSet.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet executing the DDL statement.

19.1.4.3.35 TIBDataSet.Params Property

Provides the ability to specify values for a parameterized query.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use Params to specify values for a parameterized query.

For example:

```
DataSet1.Params[0].AsInteger := 24
 DataSet1.Params.ByName['Field2'].AsString := 'foo'
    DataSet1->Params->Items[0]->AsInteger = 24;
 DataSet1->Params->ByName["Field2"]->AsString = "foo";
```

19.1.4.3.36 TIBDataSet.Prepared Property

Determines whether or not a set of dataset queries is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a set of queries is already prepared for execution. If Prepared is true, the set of queries is prepared, and if Prepared is false, the set of queries is not prepared. While a set of queries need not be prepared before execution, execution performance is enhanced if the set of queries is prepared beforehand, particularly if it is a parameterized set of queries that is executed more than once using the same parameter values.

19.1.4.3.37 TIBDataSet.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

19.1.4.3.38 TIBDataSet.SelectSQL Property

Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.

Pascal

```
property SelectSQL: TStrings;
```

C++

```
__property TStrings SelectSQL;
```

Description

Use SelectSQL to access the SQL object that encapsulates the SelectSQL statement.

19.1.4.3.39 TIBDataSet.SelectStmtHandle Property

Gets the handle for the SELECT statement.

Pascal

```
property SelectStmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE SelectStmtHandle;
```

Description

Use SelectStmtHandle to get the handle for the SELECT statement.

19.1.4.3.40 TIBDataSet.StatementType Property

Returns the statement type of the QSelect query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect query.

19.1.4.3.41 TIBDataSet.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

19.1.4.3.42 TIBDataSet.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

19.1.4.4 TIBDataSet Events

The events of the TIBDataSet class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 3673)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3673)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3673)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3674)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 3674)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 3674)	Occurs when the transaction that includes this dataset's query is freed.

19.1.4.4.1 TIBDataSet.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

19.1.4.4.2 TIBDataSet.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

19.1.4.4.3 TIBDataSet.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database

specified by the Database property.

19.1.4.4.4 TIBDataSet.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

19.1.4.4.5 TIBDataSet.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

19.1.4.4.6 TIBDataSet.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

19.1.5 TIBDataSetUpdateObject Class

TIBDataSetUpdateObject is the abstract base class for update objects used to update otherwise unupdateable queries when cached updates are enabled.

Class Hierarchy

Pascal

```
TIBDataSetUpdateObject = class(TComponent);
```

C++

```
class TIBDataSetUpdateObject : public TComponent;
```

File

IBCustomDataSet

Description

Use TIBDataSetUpdateObject as a base class when creating customized update objects that can be used to update datasets. TIBDataSetUpdateObject declares a single property and some abstract methods, but provides no implementation details: these must be provided by descendant objects.

19.1.5.1 TIBDataSetUpdateObject Members

The following tables list the members exposed by TIBDataSetUpdateObject.

Protected Methods

	Name	Description
	Apply (see page 3676)	This is Apply, a member of class TIBDataSetUpdateObject.
	GetDataSet (see page 3676)	This is GetDataSet, a member of class TIBDataSetUpdateObject.
	GetSQL (see page 3677)	This is GetSQL, a member of class TIBDataSetUpdateObject.
	SetDataSet (see page 3677)	This is SetDataSet, a member of class TIBDataSetUpdateObject.

Protected Properties

	Name	Description
	DataSet (see page 3677)	This is DataSet, a member of class TIBDataSetUpdateObject.

Public Methods

	Name	Description
	Create (see page 3675)	Creates an instance of a TIBDataSetUpdateObject (see page 3674) component.
	Destroy (see page 3676)	Frees all resources associated with this instance.

Published Properties

	Name	Description
	RefreshSQL (see page 3677)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

19.1.5.2 TIBDataSetUpdateObject.Create Constructor

Creates an instance of a TIBDataSetUpdateObject (see page 3674) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDataSetUpdateObject(TComponent * AOwner);
```

Description

Call Create to create an instance of a TIBDataSetUpdateObject (see page 3674) component.

19.1.5.3 TIBDataSetUpdateObject.Destroy Destructor

Frees all resources associated with this instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataSetUpdateObject();
```

Description

Do not call Destroy directly in an application. Usually destruction of objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

19.1.5.4 TIBDataSetUpdateObject Methods

The methods of the TIBDataSetUpdateObject class are listed here.

Protected Methods

	Name	Description
	Apply (see page 3676)	This is Apply, a member of class TIBDataSetUpdateObject.
	GetDataSet (see page 3676)	This is GetDataSet, a member of class TIBDataSetUpdateObject.
	GetSQL (see page 3677)	This is GetSQL, a member of class TIBDataSetUpdateObject.
	SetDataSet (see page 3677)	This is SetDataSet, a member of class TIBDataSetUpdateObject.

19.1.5.4.1 TIBDataSetUpdateObject.Apply Method

Pascal

```
procedure Apply(UpdateKind: TUpdateKind); virtual; abstract;
```

C++

```
virtual __fastcall Apply(TUpdateKind UpdateKind) = 0;
```

Description

This is Apply, a member of class TIBDataSetUpdateObject.

19.1.5.4.2 TIBDataSetUpdateObject.GetDataSet Method

Pascal

```
function GetDataSet: TIBCustomDataSet; virtual; abstract;
```

C++

```
virtual __fastcall TIBCustomDataSet GetDataSet() = 0;
```

Description

This is GetDataSet, a member of class TIBDataSetUpdateObject.

19.1.5.4.3 TIBDataSetUpdateObject.GetSQL Method

Pascal

```
function GetSQL(UpdateKind: TUpdateKind): TStrings; virtual; abstract;
```

C++

```
virtual __fastcall TStrings GetSQL(TUpdateKind UpdateKind) = 0;
```

Description

This is GetSQL, a member of class TIBDataSetUpdateObject.

19.1.5.4.4 TIBDataSetUpdateObject.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TIBCustomDataSet); virtual; abstract;
```

C++

```
virtual __fastcall SetDataSet(TIBCustomDataSet ADataSet) = 0;
```

Description

This is SetDataSet, a member of class TIBDataSetUpdateObject.

19.1.5.5 TIBDataSetUpdateObject Properties

The properties of the TIBDataSetUpdateObject class are listed here.

Protected Properties

	Name	Description
	DataSet (see page 3677)	This is DataSet, a member of class TIBDataSetUpdateObject.

Published Properties

	Name	Description
	RefreshSQL (see page 3677)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

19.1.5.5.1 TIBDataSetUpdateObject.DataSet Property

Pascal

```
property DataSet: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet DataSet;
```

Description

This is DataSet, a member of class TIBDataSetUpdateObject.

19.1.5.5.2 TIBDataSetUpdateObject.RefreshSQL Property

Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

Pascal

```
property RefreshSQL: TStrings;
```

C++

```
__property TStrings RefreshSQL;
```

Description

Use RefreshSQL to access the SQL object that encapsulates the RefreshSQL statement.

19.1.6 TIBDSBlobStream Class

TIBDSBlobStream reads from and writes to BLOB fields on behalf of an IB (see page 3541) Dataset.

Class Hierarchy

Pascal

```
TIBDSBlobStream = class(TStream);
```

C++

```
class TIBDSBlobStream : public TStream;
```

File

IBCustomDataSet

Description

TIBDSBlobStream is the type of stream returned when an application calls an IB (see page 3541) dataset's CreateBlobStream method. Use this stream to access or modify the value of a Blob field in the dataset. TIBDSBlobStream allows objects that have no specialized knowledge of how data is stored in a Blob field to read or write such data by employing the uniform stream interface.

To use TIBDSBlobStream, call CreateBlobStream to obtain an instance of the stream and use the methods of the stream to read or write the data. The dataset retains ownership of the stream, so you should not free this Blob stream when you are done.

19.1.6.1 TIBDSBlobStream Members

The following tables list the members exposed by TIBDSBlobStream.

Protected Fields

	Name	Description
	FBlobStream (see page 3679)	This is FBlobStream, a member of class TIBDSBlobStream.
	FField (see page 3680)	This is FField, a member of class TIBDSBlobStream.
	FModified (see page 3680)	This is FModified, a member of class TIBDSBlobStream.

Public Methods

	Name	Description
	Create (see page 3679)	Resets the stream to the beginning of the Blob.
V	Destroy (see page 3679)	Frees the instance of TIBDSBlobStream (see page 3678).
V	Read (see page 3680)	Reads the requested number of bytes from the Blob.
V	Seek (see page 3681)	Resets the current position of the TIBDSBlobStream (see page 3678) object.

	SetSize (see page 3681)	Set the size of the Blob to the requested size.
	Write (see page 3681)	Sets the field to be modified.

19.1.6.2 TIBDSBlobStream.Create Constructor

Resets the stream to the beginning of the Blob.

Pascal

```
constructor Create(AField: TField; ABlobStream: TIBBlobStream; Mode: TBlobStreamMode);
```

C++

```
__fastcall TIBDSBlobStream(TField AField, TIBBlobStream ABlobStream, TBlobStreamMode Mode);
```

Description

Call Create to reset the stream to the beginning of the Blob. Depending on the mode, it also truncates the Blob stream.

19.1.6.3 TIBDSBlobStream.Destroy Destructor

Frees the instance of TIBDSBlobStream (see page 3678).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDSBlobStream();
```

Description

Destroy frees the blob stream object and writes the BLOB value to the underlying TBlobField object.

Do not explicitly destroy the instance of TIBDSBlobStream (see page 3678) that you obtain by calling a dataset's CreateBlobStream method. The Dataset retains ownership of this stream and is responsible for freeing it.

When working with a Blob stream that you explicitly create and destroy, use the TIBBlobStream (see page 3580) class instead.

19.1.6.4 TIBDSBlobStream Fields

The fields of the TIBDSBlobStream class are listed here.

Protected Fields

	Name	Description
	FBlobStream (see page 3679)	This is FBlobStream, a member of class TIBDSBlobStream.
	FField (see page 3680)	This is FField, a member of class TIBDSBlobStream.
	FModified (see page 3680)	This is FModified, a member of class TIBDSBlobStream.

19.1.6.4.1 TIBDSBlobStream.FBlobStream Field

Pascal

```
FBlobStream: TIBBlobStream;
```

C++

```
TIBBlobStream FBlobStream;
```

Description

This is FBlobStream, a member of class TIBDSBlobStream.

19.1.6.4.2 TIBDSBlobStream.FField Field

Pascal

```
FField: TField;
```

C++

```
TField FField;
```

Description

This is FField, a member of class TIBDSBlobStream.

19.1.6.4.3 TIBDSBlobStream.FModified Field

Pascal

```
FModified: Boolean;
```

C++

```
Boolean FModified;
```

Description

This is FModified, a member of class TIBDSBlobStream.

19.1.6.5 TIBDSBlobStream Methods

The methods of the TIBDSBlobStream class are listed here.

Public Methods

	Name	Description
	Read (see page 3680)	Reads the requested number of bytes from the Blob.
	Seek (see page 3681)	Resets the current position of the TIBDSBlobStream (see page 3678) object.
	SetSize (see page 3681)	Set the size of the Blob to the requested size.
	Write (see page 3681)	Sets the field to be modified.

19.1.6.5.1 TIBDSBlobStream.Read Method

Reads the requested number of bytes from the Blob.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Call Read to read data from the Blob field when the number of bytes in the field's data is not known. Buffer must have at least Count bytes allocated to hold the data that was read from the field.

Read transfers up to Count bytes from the Blob data into Buffer, starting in the current position, and then advances the current

position by the number of bytes actually transferred. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read checks the Transliterate property of the field, and converts the data into ANSI from the character set specified by the dataset if Transliterate is true.

All the other data-reading methods of a Blob stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

Do not call Read when the TIBDSBlobStream (see page 3678) was created in bmWrite mode.

19.1.6.5.2 TIBDSBlobStream.Seek Method

Resets the current position of the TIBDSBlobStream (see page 3678) object.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Use Seek to move the current position within the Blob data by the indicated offset. Seek allows an application to read from or write to a particular location within the Blob data.

The Origin parameter indicates how to interpret the Offset parameter. Origin should be one of the following values:

Value	Meaning
soFromBeginning	Offset is from the beginning of the Blob data Seek moves to the position Offset Offset must be >= 0
soFromCurrent	Offset is from the current position in the Blob data Seek moves to Position + Offset
soFromEnd	Offset is from the end of the Blob data Offset must be <= 0 to indicate a number of bytes before the end of the Blob

Seek returns the new value of the Position property, the new current position in the Blob data.

19.1.6.5.3 TIBDSBlobStream.SetSize Method

Set the size of the Blob to the requested size.

Pascal

```
procedure SetSize(NewSize: Longint); override;
```

C++

```
virtual __fastcall SetSize(Longint NewSize);
```

Description

Call SetSize to set the size of the Blob to the requested size.

19.1.6.5.4 TIBDSBlobStream.Write Method

Sets the field to be modified.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to set the field to be modified, write the requested number of bytes to the Blob stream.

19.1.7 TIBGeneratorField Class

TIBGeneratorField calls the server to generate values for a field in an IB (see page 3541) dataset.

Class Hierarchy

Pascal

```
TIBGeneratorField = class(TPersistent);
```

C++

```
class TIBGeneratorField : public TPersistent;
```

File

IBCustomDataSet

Description

Assign (see page 3684) an instance of TIBGeneratorField as the value of a dataset's GeneratorField property to indicate that the value of a specified field in the dataset can be generated by the server.

Use the Field (see page 3685) property to specify the field whose value is generated by the TIBGeneratorField object. Use the Generator (see page 3685) and IncrementBy (see page 3686) properties to specify how the server should generate field values. Use the ApplyEvent (see page 3685) property to indicate when the TIBGeneratorField should call the server to generate field values.

19.1.7.1 TIBGeneratorField Members

The following tables list the members exposed by TIBGeneratorField.

Public Methods

	Name	Description
	Apply (see page 3683)	Calls the generator on the server to generate a field value and assigns it to the associated field.
	Assign (see page 3684)	Copies the properties of another object.
	Create (see page 3683)	Creates an instance of TIBGeneratorField (see page 3682).
	ValueName (see page 3684)	Returns a string that describes the value that the IB (see page 3541) generate fetches.

Published Properties

	Name	Description
	ApplyEvent (see page 3685)	Indicates when the TIBGeneratorField (see page 3682) instance calls the server to generate a value for the associated field.

	Field (see page 3685)	Specifies the field whose value the TIBGeneratorField (see page 3682) object generates.
	Generator (see page 3685)	Names the generator on the server that TIBGeneratorField (see page 3682) calls to generate field values.
	IncrementBy (see page 3686)	Names the amount by which a generator on the server increments the value of the associated field.

19.1.7.2 TIBGeneratorField.Create Constructor

Creates an instance of TIBGeneratorField (see page 3682).

Pascal

```
constructor Create(ADataSet: TIBCustomDataSet);
```

C++

```
__fastcall TIBGeneratorField(TIBCustomDataSet ADataSet);
```

Description

Do not create instances of TIBGeneratorField (see page 3682). This class is designed to work with an IB (see page 3541) dataset and is automatically created by the dataset to implement its GeneratorField property.

ADataSet is the dataset that creates the TIBGeneratorField (see page 3682) instance and which contains the field whose value the generator field assigns.

19.1.7.3 TIBGeneratorField Methods

The methods of the TIBGeneratorField class are listed here.

Public Methods

	Name	Description
	Apply (see page 3683)	Calls the generator on the server to generate a field value and assigns it to the associated field.
	Assign (see page 3684)	Copies the properties of another object.
	ValueName (see page 3684)	Returns a string that describes the value that the IB (see page 3541) generate fetches.

19.1.7.3.1 TIBGeneratorField.Apply Method

Calls the generator on the server to generate a field value and assigns it to the associated field.

Pascal

```
procedure Apply;
```

C++

```
__fastcall Apply();
```

Description

Call Apply to fetch the server-generated value for the field identified by the Field (see page 3685) property and assign that value to the field.

If the ApplyEvent (see page 3685) property is not gamOnServer, the associated dataset calls Apply automatically at the point indicated by ApplyEvent (see page 3685).

19.1.7.3.2 TIBGeneratorField.Assign Method

Copies the properties of another object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties of another object on to this TIBGeneratorField (see page 3682) instance. TIBGeneratorField (see page 3682) overrides the inherited method to copy the Field (see page 3685), Generator (see page 3685), IncrementBy (see page 3686) and ApplyEvent (see page 3685) properties of the object specified by Source if it is another TIBGeneratorField (see page 3682) instance.

If Source is not another TIBGeneratorField (see page 3682), Assign calls the inherited method, which allows any objects that know how to assign themselves to a TIBGeneratorField (see page 3682) to copy their properties.

19.1.7.3.3 TIBGeneratorField.ValueName Method

Returns a string that describes the value that the IB (see page 3541) generate fetches.

Pascal

```
function ValueName: string;
```

C++

```
__fastcall UnicodeString ValueName();
```

Description

ValueName returns a string of the form

```
Generator -> Field By IncrementBy
```

where Generator (see page 3685) is the value of the Generator (see page 3685) property, Field (see page 3685) is the value of the Field (see page 3685) property, and IncrementBy (see page 3686) is the value of the IncrementBy (see page 3686) property.

19.1.7.4 TIBGeneratorField Properties

The properties of the TIBGeneratorField class are listed here.

Published Properties

	Name	Description
	ApplyEvent (see page 3685)	Indicates when the TIBGeneratorField (see page 3682) instance calls the server to generate a value for the associated field.
	Field (see page 3685)	Specifies the field whose value the TIBGeneratorField (see page 3682) object generates.
	Generator (see page 3685)	Names the generator on the server that TIBGeneratorField (see page 3682) calls to generate field values.
	IncrementBy (see page 3686)	Names the amount by which a generator on the server increments the value of the associated field.

19.1.7.4.1 TIBGeneratorField.ApplyEvent Property

Indicates when the TIBGeneratorField (see page 3682) instance calls the server to generate a value for the associated field.

Pascal

```
property ApplyEvent: TIBGeneratorApplyEvent;
```

C++

```
__property TIBGeneratorApplyEvent ApplyEvent;
```

Description

Set TIBGeneratorApplyEvent (see page 3691) to indicate when the server generates field values using this generator.

Note: Regardless of the value of ApplyEvent, applications can generate the field value at any time by calling the Apply (see page 3683) method.

19.1.7.4.2 TIBGeneratorField.Field Property

Specifies the field whose value the TIBGeneratorField (see page 3682) object generates.

Pascal

```
property Field: string;
```

C++

```
__property UnicodeString Field;
```

Description

Set Field to the name of the field whose value the generator sets. When the event specified by the ApplyEvent (see page 3685) property occurs, or when an application calls the Apply (see page 3683) method, the TIBGeneratorField (see page 3682) object calls the server to generate a field value and assigns that value to the specified field.

Field must be the FieldName property of one of the fields in the associated dataset's Fields property list. The TIBGeneratorField (see page 3682) object is associated with a dataset when it is the value of that dataset's GeneratorField property.

19.1.7.4.3 TIBGeneratorField.Generator Property

Names the generator on the server that TIBGeneratorField (see page 3682) calls to generate field values.

Pascal

```
property Generator: string;
```

C++

```
__property UnicodeString Generator;
```

Description

TIBGeneratorField (see page 3682) uses Generator, along with the IncrementBy (see page 3686) property, to generate the SQL statement that fetches the generated field value. The generated SQL statement has the form

SELECT GEN_ID(Generator, IncrementBy (see page 3686)) FROM RDB$DATABASE

Where 'Generator' is replaced by the value of Generator and 'IncrementBy (see page 3686)' is replaced by the value of IncrementBy (see page 3686).

19.1.7.4.4 TIBGeneratorField.IncrementBy Property

Names the amount by which a generator on the server increments the value of the associated field.

Pascal

```
property IncrementBy: Integer;
```

C++

```
__property int IncrementBy;
```

Description

TIBGeneratorField (see page 3682) uses IncrementBy, along with the Generator (see page 3685) property, to generate the SQL statement that fetches the generated field value. The generated SQL statement has the form

SELECT GEN_ID(Generator (see page 3685), IncrementBy) FROM RDB$DATABASE

Where 'Generator (see page 3685)' is replaced by the value of Generator (see page 3685) and 'IncrementBy' is replaced by the value of IncrementBy.

19.1.8 TIBStringField Class

TIBStringField allows for strings in excess of 8196 bytes of data.

Class Hierarchy

Pascal

```
TIBStringField = class(TStringField);
```

C++

```
class TIBStringField : public TStringField;
```

File

IBCustomDataSet

Description

A value of a string field is physically stored as a sequence of characters. Common uses for string fields are to store text, such as names and addresses.

TIBStringField introduces properties to translate between string values and other data types, and to manage language driver conversions. As a descendent of TStringField, TIBStringField inherits many properties, methods, and events that are useful for managing the value and properties of a field in a database. TIBStringField allows for strings in excess of 8196 bytes of data.

19.1.8.1 TIBStringField Members

The following tables list the members exposed by TIBStringField.

Public Methods

	Name	Description
	CheckTypeSize (see page 3687)	Indicates the type size of the string field.
	Create (see page 3687)	Creates an instance of a TIBStringField (see page 3686) object.

	GetAsString (see page 3688)	Returns the value of a field as a string.
	GetAsVariant (see page 3688)	Returns the value of a field as a variant.
	GetValue (see page 3688)	Returns the value of a field.
	SetAsString (see page 3688)	Sets the value of a field as a string type.

19.1.8.2 TIBStringField.Create Constructor

Creates an instance of a TIBStringField (see page 3686) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBStringField(TComponent * AOwner);
```

Description

It is seldom necessary to call Create directly, because a string field component is instantiated automatically for all string fields in a dataset.

After calling the inherited constructor, Create sets

- DataType to ftString.
- Size to 20.
- Transliterate to True.
- BlanksToNull to True

19.1.8.3 TIBStringField Methods

The methods of the TIBStringField class are listed here.

Public Methods

	Name	Description
	CheckTypeSize (see page 3687)	Indicates the type size of the string field.
	GetAsString (see page 3688)	Returns the value of a field as a string.
	GetAsVariant (see page 3688)	Returns the value of a field as a variant.
	GetValue (see page 3688)	Returns the value of a field.
	SetAsString (see page 3688)	Sets the value of a field as a string type.

19.1.8.3.1 TIBStringField.CheckTypeSize Method

Indicates the type size of the string field.

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

Call CheckTypeSize to determine the type size of the string field.

There is both a virtual method and a static method for the CheckTypeSize method.

All sizes are valid for a TIBString field.

19.1.8.3.2 TIBStringField.GetAsString Method

Returns the value of a field as a string.

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall UnicodeString GetAsString();
```

Description

Call GetAsString to return the value of a field as a string.

19.1.8.3.3 TIBStringField.GetAsVariant Method

Returns the value of a field as a variant.

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

Call GetAsVariant return the value of a field as type Variant.

19.1.8.3.4 TIBStringField.GetValue Method

Returns the value of a field.

Pascal

```
function GetValue(var Value: string): Boolean;
```

C++

```
__fastcall Boolean GetValue(UnicodeString Value);
```

Description

Call GetValue to return the value of a field.

19.1.8.3.5 TIBStringField.SetAsString Method

Sets the value of a field as a string type.

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const UnicodeString Value);
```

Description

Call SetAsString to set the value of a field as a string type.

19.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCachedUpdateStatus (see page 3689)	TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.
	TIBGeneratorApplyEvent (see page 3691)	TIBGeneratorApplyEvent indicates when a generator should create field values.
	TIBUpdateAction (see page 3691)	TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.
	TLiveMode (see page 3692)	This is record IBCustomDataSet.TLiveMode.

Records

	Name	Description
	TFieldData (see page 3690)	This is record IBCustomDataSet.TFieldData.
	TIBDBKey (see page 3690)	TIBDBKey stores the key for a row in an InterBase table.
	TRecordData (see page 3693)	This is record IBCustomDataSet.TRecordData.

19.2.1 IBCustomDataSet.TCachedUpdateStatus Enumeration

TCachedUpdateStatus indicates the status of a record in a dataset that has cached updates.

Pascal

```
TCachedUpdateStatus = (
  cusUnmodified,
  cusModified,
  cusInserted,
  cusDeleted,
  cusUninserted
);
```

C++

```
enum TCachedUpdateStatus {
  cusUnmodified,
  cusModified,
  cusInserted,
  cusDeleted,
  cusUninserted
};
```

File

IBCustomDataSet

Description

TCachedUpdateStatus values are:

Value Meaning

cusModified Modified records.

cusInserted Inserted records.

cusDeleted Deleted records.

cusUnmodified Unmodified records.

cusUninserted Uninserted records.

19.2.2 IBCustomDataSet.TFieldData Record

Pascal

```
TFieldData = record
  fdDataType: Short;
  fdDataScale: Short;
  fdNullable: Boolean;
  fdIsNull: Boolean;
  fdDataSize: Short;
  fdDataLength: Short;
  fdDataOfs: Integer;
end;
```

C++

```
struct TFieldData {
  Short fdDataType;
  Short fdDataScale;
  Boolean fdNullable;
  Boolean fdIsNull;
  Short fdDataSize;
  Short fdDataLength;
  int fdDataOfs;
};
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TFieldData.

19.2.3 IBCustomDataSet.TIBDBKey Record

TIBDBKey stores the key for a row in an InterBase table.

Pascal

```
TIBDBKey = record
  DBKey: array[0..7] of Byte;
end;
```

C++

```
struct TIBDBKey {
  array[0..7] of Byte DBKey;
};
```

File

IBCustomDataSet

Description

TIBDBKey stores the unique row identifier for the current row in the current transaction.

19.2.4 IBCustomDataSet.TIBGeneratorApplyEvent Enumeration

TIBGeneratorApplyEvent indicates when a generator should create field values.

Pascal

```
TIBGeneratorApplyEvent = (
  gamOnNewRecord,
  gamOnPost,
  gamOnServer
);
```

C++

```
enum TIBGeneratorApplyEvent {
  gamOnNewRecord,
  gamOnPost,
  gamOnServer
};
```

File

IBCustomDataSet

Description

TIBGeneratorApplyEvent values are:

Value Meaning

gamOnNewRecord The dataset calls the server to generate the field value immediately after it inserts or appends a new record (before the OnNewRecord event).

gamOnPost The dataset calls the server to generate the field value immediately before it posts a record to the server (before the BeforePost event).

gamOnServer The dataset does not need to call the server to generate field values: the server generates these values automatically. With gamOnServer, TIBGeneratorField (see page 3682) serves primarily to ensure that the user is not required to enter a value in the field.

19.2.5 IBCustomDataSet.TIBUpdateAction Enumeration

TIBUpdateAction indicates the action that a dataset should take after an event handler has responded to an update error.

Pascal

```
TIBUpdateAction = (
  uaFail,
  uaAbort,
  uaSkip,
  uaRetry,
  uaApply,
```

```
    uaApplied
  );
```

C++

```
  enum TIBUpdateAction {
    uaFail,
    uaAbort,
    uaSkip,
    uaRetry,
    uaApply,
    uaApplied
  };
```

File

IBCustomDataSet

Description

TIBUpdateAction values are:

Value Meaning

uaFail Abort the update operation and display an error message

uaAbort Abort the update operation without displaying an error message

uaSkip Skip updating the record that raised the error condition, and leave the unapplied changes in the cache

uaRetry Repeat the update operation that originally raised the error condition

uaApplied The event handler applied the update (not used in error handling event handlers). Free the current record update from the cache.

uaApply For internal use only

19.2.6 IBCustomDataSet.TLiveMode Enumeration

Pascal

```
  TLiveMode = (
    lmInsert,
    lmModify,
    lmDelete,
    lmRefresh
  );
```

C++

```
  enum TLiveMode {
    lmInsert,
    lmModify,
    lmDelete,
    lmRefresh
  };
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TLiveMode.

19.2.7 IBCustomDataSet.TRecordData Record

Pascal

```
TRecordData = record
  rdBookmarkFlag: TBookmarkFlag;
  rdFieldCount: Short;
  rdRecordNumber: Long;
  rdCachedUpdateStatus: TCachedUpdateStatus;
  rdUpdateStatus: TUpdateStatus;
  rdSavedOffset: DWORD;
  rdDBKey: TIBDBKey;
  rdFields: array[1..1] of TFieldData;
end;
```

C++

```
struct TRecordData {
  TBookmarkFlag rdBookmarkFlag;
  Short rdFieldCount;
  Long rdRecordNumber;
  TCachedUpdateStatus rdCachedUpdateStatus;
  TUpdateStatus rdUpdateStatus;
  DWORD rdSavedOffset;
  TIBDBKey rdDBKey;
  array[1..1] of TFieldData rdFields;
};
```

File

IBCustomDataSet

Description

This is record IBCustomDataSet.TRecordData.

19.3 Types

The following table lists types in this documentation.

Types

Name	Description
PBlobDataArray (see page 3694)	This is type IBCustomDataSet.PBlobDataArray.
PDateTime (see page 3694)	This is type IBCustomDataSet.PDateTime.
PFieldData (see page 3695)	This is type IBCustomDataSet.PFieldData.
PIBDBKey (see page 3695)	This is type IBCustomDataSet.PIBDBKey.
PRecordData (see page 3695)	This is type IBCustomDataSet.PRecordData.
TBlobDataArray (see page 3696)	This is type IBCustomDataSet.TBlobDataArray.
TIBUpdateErrorEvent (see page 3696)	TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.
TIBUpdateRecordEvent (see page 3696)	TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.
TIBUpdateRecordTypes (see page 3697)	TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.
TLiveModes (see page 3697)	TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

19.3.1 IBCustomDataSet.PBlobDataArray Type

Pascal

```
PBlobDataArray = ^TBlobDataArray;
```

C++

```
^TBlobDataArray PBlobDataArray;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PBlobDataArray.

19.3.2 IBCustomDataSet.PDateTime Type

Pascal

```
PDateTime = ^TDateTime;
```

C++

```
^TDateTime PDateTime;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PDateTime.

19.3.3 IBCustomDataSet.PFieldData Type

Pascal

```
PFieldData = ^TFieldData;
```

C++

```
^TFieldData PFieldData;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PFieldData.

19.3.4 IBCustomDataSet.PIBDBKey Type

Pascal

```
PIBDBKey = ^TIBDBKey;
```

C++

```
^TIBDBKey PIBDBKey;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PIBDBKey.

19.3.5 IBCustomDataSet.PRecordData Type

Pascal

```
PRecordData = ^TRecordData;
```

C++

```
^TRecordData PRecordData;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.PRecordData.

19.3.6 IBCustomDataSet.TBlobDataArray Type

Pascal

```
TBlobDataArray = array[0..0] of TIBBlobStream;
```

C++

```
array[0..0] of TIBBlobStream TBlobDataArray;
```

File

IBCustomDataSet

Description

This is type IBCustomDataSet.TBlobDataArray.

19.3.7 IBCustomDataSet.TIBUpdateErrorEvent Type

TIBUpdateErrorEvent is the type of event handlers that respond when an IBX dataset encounters an error applying a cached update.

Pascal

```
TIBUpdateErrorEvent = procedure (DataSet: TDataSet; E: EDatabaseError; UpdateKind:
TUpdateKind; var UpdateAction: TIBUpdateAction) of object;
```

C++

```
(DataSet: TDataSet; E: EDatabaseError; UpdateKind: TUpdateKind; var UpdateAction:
TIBUpdateAction) ( TIBUpdateErrorEvent)();
```

File

IBCustomDataSet

Description

DataSet is the TIBCustomDataSet (see page 3602) descendant that is attempting to apply cached updates.

E is an EDBEngineError object from which an application can extract an error message and the actual cause of the error condition. An OnUpdateError handler can use this information to determine how to respond to the error condition.

UpdateKind indicates whether the error occurred while inserting, deleting, or modifying a record.

UpdateAction indicates the action to take when the OnUpdateError handler exits. On entry into the handler, UpdateAction is always set to uaFail. If OnUpdateError can handle or correct the error, set UpdateAction to uaRetry before exiting the error handler.

19.3.8 IBCustomDataSet.TIBUpdateRecordEvent Type

TIBUpdateRecordEvent is the type of event handlers that respond when an IBX dataset applies a cached update.

Pascal

```
TIBUpdateRecordEvent = procedure (DataSet: TDataSet; UpdateKind: TUpdateKind; var
```

```
  UpdateAction: TIBUpdateAction) of object;
```

C++

```
  (DataSet: TDataSet; UpdateKind: TUpdateKind; var UpdateAction: TIBUpdateAction) (
  TIBUpdateRecordEvent)();
```

File

IBCustomDataSet

Description

DataSet is the dataset that is applying updates.

UpdateKind whether the current update is the insertion of a record, the deletion of a record, or the modification of a record.

UpdateAction indicates the action taken by the OnUpdateRecord handler before it exits. On entry into the handler, UpdateAction is always set to uaFail. If OnUpdateRecord is successful, it should set UpdateAction to uaApplied before exiting.

19.3.9 IBCustomDataSet.TIBUpdateRecordTypes Type

TIBUpdateRecordTypes is a subset of all possible record types in a dataset that caches updates.

Pascal

```
  TIBUpdateRecordTypes = set of TCachedUpdateStatus;
```

C++

```
  TCachedUpdateStatus TIBUpdateRecordTypes;
```

File

IBCustomDataSet

Description

TIBUpdateRecordTypes is a set of TCachedUpdateStatus (see page 3689) values. It describes the different types of status allowed for records in a dataset that caches updates if they are to be included in a specified set.

19.3.10 IBCustomDataSet.TLiveModes Type

TLiveModes and TLiveModes indicate what operations an application can perform on an IBX dataset.

Pascal

```
  TLiveModes = set of TLiveMode;
```

C++

```
  TLiveMode TLiveModes;
```

File

IBCustomDataSet

Description

TLiveModes is a set of TLiveMode (see page 3692) values. The following table lists the possible values:

Value	Meaning
lmInsert	The application can insert records.
lmModify	The application can modify existing records.
lmDelete	The application can delete records.
lmRefresh	The application can refresh the records in the dataset.

19.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
CreateProviderProc (see page 3699)	This is variable IBCustomDataSet.CreateProviderProc.

19.4.1 IBCustomDataSet.CreateProviderProc Variable

Pascal

```
CreateProviderProc: function(DataSet: TIBCustomDataSet): IProviderSupport = nil;
```

C++

```
function(DataSet: TIBCustomDataSet): IProviderSupport CreateProviderProc = nil;
```

File

IBCustomDataSet

Description

This is variable IBCustomDataSet.CreateProviderProc.

19.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BufferCacheSize (see page 3700)	This is constant IBCustomDataSet.BufferCacheSize.
DefaultFieldClasses (see page 3700)	This is constant IBCustomDataSet.DefaultFieldClasses.
UniCache (see page 3701)	This is constant IBCustomDataSet.UniCache.

19.5.1 IBCustomDataSet.BufferCacheSize Constant

Pascal

```
BufferCacheSize = 1000;
```

C++

```
BufferCacheSize = 1000;
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.BufferCacheSize.

19.5.2 IBCustomDataSet.DefaultFieldClasses Constant

Pascal

```
DefaultFieldClasses: array[TFieldType] of TFieldClass = ( nil, TIBStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TIBBCDField,
TDateField, TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField,
TBlobField, TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil,
TStringField, nil, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, nil, nil, nil, nil);
```

C++

```
array[TFieldType] of TFieldClass DefaultFieldClasses = ( nil, TIBStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TIBBCDField,
TDateField, TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField,
TBlobField, TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil,
TStringField, nil, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, nil, nil, nil, nil);
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.DefaultFieldClasses.

19.5.3 IBCustomDataSet.UniCache Constant

Pascal

```
UniCache = 2;
```

C++

```
UniCache = 2;
```

File

IBCustomDataSet

Description

This is constant IBCustomDataSet.UniCache.

20 IBDatabase Namespace

This is namespace IBDatabase.

Topics

Name	Description
Classes (see page 3705)	The following table lists classes in this documentation.
Interfaces (see page 3761)	The following table lists interfaces in this documentation.
Functions (see page 3764)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 3765)	The following table lists structs, records, enums in this documentation.
Types (see page 3767)	The following table lists types in this documentation.
Constants (see page 3768)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBBase (see page 3705)	TIBBase is the ancestor object from which TIBTransaction (see page 3746) descends.
	TIBDataBase (see page 3716)	This is class IBDatabase.TIBDataBase.
	TIBSchema (see page 3741)	This is class IBDatabase.TIBSchema.
	TIBTimer (see page 3742)	This is class IBDatabase.TIBTimer.
	TIBTransaction (see page 3746)	TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

Constants

Name	Description
DPBConstantNames (see page 3768)	This is constant IBDatabase.DPBConstantNames.
DPBPrefix (see page 3769)	This is constant IBDatabase.DPBPrefix.
TPBConstantNames (see page 3769)	This is constant IBDatabase.TPBConstantNames.
TPBPrefix (see page 3769)	This is constant IBDatabase.TPBPrefix.

Functions

	Name	Description
	GenerateDPB (see page 3764)	This is function IBDatabase.GenerateDPB.
	GenerateTPB (see page 3764)	This is function IBDatabase.GenerateTPB.

Interfaces

	Name	Description
	IIBEventNotifier (see page 3761)	IIBEventNotifier allows a TIBDatabase component to automatically register interest in events on the InterBase server.

Structs, Records, Enums

	Name	Description
	TAutoStopAction (see page 3765)	TAutoStopAction indicates the action to take on automatically ended transactions.
	TTransactionAction (see page 3766)	TTransactionAction indicates the action a transaction can take when it times out.

Types

Name	Description
TIBDatabaseLoginEvent (see page 3767)	TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 3541) database component forms a connection to an InterBase server.
TIBFileName (see page 3767)	This is type IBDatabase.TIBFileName.

20.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBase (see page 3705)	TIBBase is the ancestor object from which TIBTransaction (see page 3746) descends.
	TIBDataBase (see page 3716)	This is class IBDatabase.TIBDataBase.
	TIBSchema (see page 3741)	This is class IBDatabase.TIBSchema.
	TIBTimer (see page 3742)	This is class IBDatabase.TIBTimer.
	TIBTransaction (see page 3746)	TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

20.1.1 TIBBase Class

TIBBase is the ancestor object from which TIBTransaction (see page 3746) descends.

Class Hierarchy

Pascal

```
TIBBase = class(TObject);
```

C++

```
class TIBBase : public TObject;
```

File

IBDatabase

Description

TIBBase is the ancestor object from which TIBTransaction (see page 3746) descends.

20.1.1.1 TIBBase Members

The following tables list the members exposed by TIBBase.

Protected Fields

	Name	Description
	FAfterDatabaseDisconnect (see page 3707)	This is FAfterDatabaseDisconnect, a member of class TIBBase.
	FAfterTransactionEnd (see page 3707)	This is FAfterTransactionEnd, a member of class TIBBase.
	FBeforeDatabaseDisconnect (see page 3708)	This is FBeforeDatabaseDisconnect, a member of class TIBBase.
	FBeforeTransactionEnd (see page 3708)	This is FBeforeTransactionEnd, a member of class TIBBase.
	FDatabase (see page 3708)	This is FDatabase, a member of class TIBBase.
	FIndexInDatabase (see page 3708)	This is FIndexInDatabase, a member of class TIBBase.
	FIndexInTransaction (see page 3709)	This is FIndexInTransaction, a member of class TIBBase.
	FOnDatabaseFree (see page 3709)	This is FOnDatabaseFree, a member of class TIBBase.

	FOnTransactionFree (see page 3709)	This is FOnTransactionFree, a member of class TIBBase.
	FOwner (see page 3709)	This is FOwner, a member of class TIBBase.
	FTransaction (see page 3709)	This is FTransaction, a member of class TIBBase.

Protected Methods

	Name	Description
	DoAfterDatabaseDisconnect (see page 3711)	This is DoAfterDatabaseDisconnect, a member of class TIBBase.
	DoAfterTransactionEnd (see page 3711)	This is DoAfterTransactionEnd, a member of class TIBBase.
	DoBeforeDatabaseDisconnect (see page 3711)	This is DoBeforeDatabaseDisconnect, a member of class TIBBase.
	DoBeforeTransactionEnd (see page 3711)	This is DoBeforeTransactionEnd, a member of class TIBBase.
	DoDatabaseFree (see page 3711)	This is DoDatabaseFree, a member of class TIBBase.
	DoTransactionFree (see page 3712)	This is DoTransactionFree, a member of class TIBBase.
	GetDBHandle (see page 3712)	This is GetDBHandle, a member of class TIBBase.
	GetTRHandle (see page 3712)	This is GetTRHandle, a member of class TIBBase.
	SetDatabase (see page 3712)	This is SetDatabase, a member of class TIBBase.
	SetTransaction (see page 3713)	This is SetTransaction, a member of class TIBBase.

Public Events

	Name	Description
	AfterDatabaseDisconnect (see page 3715)	Occurs after a database is disconnected.
	AfterTransactionEnd (see page 3715)	Occurs after a transaction has ended.
	BeforeDatabaseDisconnect (see page 3715)	Occurs before a database disconnects.
	BeforeTransactionEnd (see page 3715)	Occurs before a transaction ends.
	OnDatabaseFree (see page 3716)	Occurs after a database is freed from memory.
	OnTransactionFree (see page 3716)	Occurs after a transaction has been freed from memory.

Public Methods

	Name	Description
	CheckDatabase (see page 3710)	Checks if the database is active.
	CheckTransaction (see page 3710)	Checks if the transaction is active.
	Create (see page 3706)	Creates an instance of an IBBase object.
	Destroy (see page 3707)	Destroys an IBBase object.

Public Properties

	Name	Description
	Database (see page 3713)	Sets or returns the associated database.
	DBHandle (see page 3713)	Indicates the database handle.
	Owner (see page 3714)	Indicates which component owns the component.
	Transaction (see page 3714)	Sets or returns the associated transaction.
	TRHandle (see page 3714)	Returns the transaction handle.

20.1.1.2 TIBBase.Create Constructor

Creates an instance of an IBBase object.

Pascal

```
constructor Create(AOwner: TObject);
```

C++

```
__fastcall TIBBase(TObject * AOwner);
```

Description

Call Create to create an instance of an IBBase object.

20.1.1.3 TIBBase.Destroy Destructor

Destroys an IBBase object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBase();
```

Description

Call Destroy to destroy an IBBase object and to free up any resources associated with it.

20.1.1.4 TIBBase Fields

The fields of the TIBBase class are listed here.

Protected Fields

	Name	Description
	FAfterDatabaseDisconnect (see page 3707)	This is FAfterDatabaseDisconnect, a member of class TIBBase.
	FAfterTransactionEnd (see page 3707)	This is FAfterTransactionEnd, a member of class TIBBase.
	FBeforeDatabaseDisconnect (see page 3708)	This is FBeforeDatabaseDisconnect, a member of class TIBBase.
	FBeforeTransactionEnd (see page 3708)	This is FBeforeTransactionEnd, a member of class TIBBase.
	FDatabase (see page 3708)	This is FDatabase, a member of class TIBBase.
	FIndexInDatabase (see page 3708)	This is FIndexInDatabase, a member of class TIBBase.
	FIndexInTransaction (see page 3709)	This is FIndexInTransaction, a member of class TIBBase.
	FOnDatabaseFree (see page 3709)	This is FOnDatabaseFree, a member of class TIBBase.
	FOnTransactionFree (see page 3709)	This is FOnTransactionFree, a member of class TIBBase.
	FOwner (see page 3709)	This is FOwner, a member of class TIBBase.
	FTransaction (see page 3709)	This is FTransaction, a member of class TIBBase.

20.1.1.4.1 TIBBase.FAfterDatabaseDisconnect Field

Pascal

```
FAfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
TNotifyEvent FAfterDatabaseDisconnect;
```

Description

This is FAfterDatabaseDisconnect, a member of class TIBBase.

20.1.1.4.2 TIBBase.FAfterTransactionEnd Field

Pascal

```
FAfterTransactionEnd: TNotifyEvent;
```

C++

```
TNotifyEvent FAfterTransactionEnd;
```

Description

This is FAfterTransactionEnd, a member of class TIBBase.

20.1.1.4.3 TIBBase.FBeforeDatabaseDisconnect Field

Pascal

```
FBeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
TNotifyEvent FBeforeDatabaseDisconnect;
```

Description

This is FBeforeDatabaseDisconnect, a member of class TIBBase.

20.1.1.4.4 TIBBase.FBeforeTransactionEnd Field

Pascal

```
FBeforeTransactionEnd: TNotifyEvent;
```

C++

```
TNotifyEvent FBeforeTransactionEnd;
```

Description

This is FBeforeTransactionEnd, a member of class TIBBase.

20.1.1.4.5 TIBBase.FDatabase Field

Pascal

```
FDatabase: TIBDatabase;
```

C++

```
TIBDatabase FDatabase;
```

Description

This is FDatabase, a member of class TIBBase.

20.1.1.4.6 TIBBase.FIndexInDatabase Field

Pascal

```
FIndexInDatabase: Integer;
```

C++

```
int FIndexInDatabase;
```

Description

This is FIndexInDatabase, a member of class TIBBase.

20.1.1.4.7 TIBBase.FIndexInTransaction Field

Pascal

```
FIndexInTransaction: Integer;
```

C++

```
int FIndexInTransaction;
```

Description

This is FIndexInTransaction, a member of class TIBBase.

20.1.1.4.8 TIBBase.FOnDatabaseFree Field

Pascal

```
FOnDatabaseFree: TNotifyEvent;
```

C++

```
TNotifyEvent FOnDatabaseFree;
```

Description

This is FOnDatabaseFree, a member of class TIBBase.

20.1.1.4.9 TIBBase.FOnTransactionFree Field

Pascal

```
FOnTransactionFree: TNotifyEvent;
```

C++

```
TNotifyEvent FOnTransactionFree;
```

Description

This is FOnTransactionFree, a member of class TIBBase.

20.1.1.4.10 TIBBase.FOwner Field

Pascal

```
FOwner: TObject;
```

C++

```
TObject * FOwner;
```

Description

This is FOwner, a member of class TIBBase.

20.1.1.4.11 TIBBase.FTransaction Field

Pascal

```
FTransaction: TIBTransaction;
```

C++

```
TIBTransaction FTransaction;
```

Description

This is FTransaction, a member of class TIBBase.

20.1.1.5 TIBBase Methods

The methods of the TIBBase class are listed here.

Protected Methods

	Name	Description
	DoAfterDatabaseDisconnect (see page 3711)	This is DoAfterDatabaseDisconnect, a member of class TIBBase.
	DoAfterTransactionEnd (see page 3711)	This is DoAfterTransactionEnd, a member of class TIBBase.
	DoBeforeDatabaseDisconnect (see page 3711)	This is DoBeforeDatabaseDisconnect, a member of class TIBBase.
	DoBeforeTransactionEnd (see page 3711)	This is DoBeforeTransactionEnd, a member of class TIBBase.
	DoDatabaseFree (see page 3711)	This is DoDatabaseFree, a member of class TIBBase.
	DoTransactionFree (see page 3712)	This is DoTransactionFree, a member of class TIBBase.
	GetDBHandle (see page 3712)	This is GetDBHandle, a member of class TIBBase.
	GetTRHandle (see page 3712)	This is GetTRHandle, a member of class TIBBase.
	SetDatabase (see page 3712)	This is SetDatabase, a member of class TIBBase.
	SetTransaction (see page 3713)	This is SetTransaction, a member of class TIBBase.

Public Methods

	Name	Description
	CheckDatabase (see page 3710)	Checks if the database is active.
	CheckTransaction (see page 3710)	Checks if the transaction is active.

20.1.1.5.1 TIBBase.CheckDatabase Method

Checks if the database is active.

Pascal

```
procedure CheckDatabase; virtual;
```

C++

```
virtual __fastcall CheckDatabase();
```

Description

Call CheckDatabase to check if the database is assigned and active.

20.1.1.5.2 TIBBase.CheckTransaction Method

Checks if the transaction is active.

Pascal

```
procedure CheckTransaction; virtual;
```

C++

```
virtual __fastcall CheckTransaction();
```

Description

Call CheckTransaction to check if the transaction is assigned and active.

20.1.1.5.3 TIBBase.DoAfterDatabaseDisconnect Method

Pascal

```
procedure DoAfterDatabaseDisconnect; virtual;
```

C++

```
virtual __fastcall DoAfterDatabaseDisconnect();
```

Description

This is DoAfterDatabaseDisconnect, a member of class TIBBase.

20.1.1.5.4 TIBBase.DoAfterTransactionEnd Method

Pascal

```
procedure DoAfterTransactionEnd; virtual;
```

C++

```
virtual __fastcall DoAfterTransactionEnd();
```

Description

This is DoAfterTransactionEnd, a member of class TIBBase.

20.1.1.5.5 TIBBase.DoBeforeDatabaseDisconnect Method

Pascal

```
procedure DoBeforeDatabaseDisconnect; virtual;
```

C++

```
virtual __fastcall DoBeforeDatabaseDisconnect();
```

Description

This is DoBeforeDatabaseDisconnect, a member of class TIBBase.

20.1.1.5.6 TIBBase.DoBeforeTransactionEnd Method

Pascal

```
procedure DoBeforeTransactionEnd; virtual;
```

C++

```
virtual __fastcall DoBeforeTransactionEnd();
```

Description

This is DoBeforeTransactionEnd, a member of class TIBBase.

20.1.1.5.7 TIBBase.DoDatabaseFree Method

Pascal

```
procedure DoDatabaseFree; virtual;
```

C++

```
virtual __fastcall DoDatabaseFree();
```

Description

This is DoDatabaseFree, a member of class TIBBase.

20.1.1.5.8 TIBBase.DoTransactionFree Method

Pascal

```
procedure DoTransactionFree; virtual;
```

C++

```
virtual __fastcall DoTransactionFree();
```

Description

This is DoTransactionFree, a member of class TIBBase.

20.1.1.5.9 TIBBase.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE; virtual;
```

C++

```
virtual __fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBBase.

20.1.1.5.10 TIBBase.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE; virtual;
```

C++

```
virtual __fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBBase.

20.1.1.5.11 TIBBase.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase); virtual;
```

C++

```
virtual __fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBBase.

20.1.1.5.12 TIBBase.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction); virtual;
```

C++

```
virtual __fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBBase.

20.1.1.6 TIBBase Properties

The properties of the TIBBase class are listed here.

Public Properties

	Name	Description
	Database (see page 3713)	Sets or returns the associated database.
R	DBHandle (see page 3713)	Indicates the database handle.
R	Owner (see page 3714)	Indicates which component owns the component.
	Transaction (see page 3714)	Sets or returns the associated transaction.
R	TRHandle (see page 3714)	Returns the transaction handle.

20.1.1.6.1 TIBBase.Database Property

Sets or returns the associated database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the associated database.

20.1.1.6.2 TIBBase.DBHandle Property

Indicates the database handle.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use DBHandle to return the database handle.

20.1.1.6.3 TIBBase.Owner Property

Indicates which component owns the component.

Pascal

```
property Owner: TObject;
```

C++

```
__property TObject * Owner;
```

Description

Owner refers to the SQL object (DataSet, TIBSQL, or Blob) that created the TIBBase (see page 3705) component.

20.1.1.6.4 TIBBase.Transaction Property

Sets or returns the associated transaction.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use Transaction to set or return the associated transaction.

20.1.1.6.5 TIBBase.TRHandle Property

Returns the transaction handle.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use TRHandle to return the transaction handle.

20.1.1.7 TIBBase Events

The events of the TIBBase class are listed here.

Public Events

	Name	Description
	AfterDatabaseDisconnect (see page 3715)	Occurs after a database is disconnected.
	AfterTransactionEnd (see page 3715)	Occurs after a transaction has ended.
	BeforeDatabaseDisconnect (see page 3715)	Occurs before a database disconnects.
	BeforeTransactionEnd (see page 3715)	Occurs before a transaction ends.
	OnDatabaseFree (see page 3716)	Occurs after a database is freed from memory.
	OnTransactionFree (see page 3716)	Occurs after a transaction has been freed from memory.

20.1.1.7.1 TIBBase.AfterDatabaseDisconnect Event

Occurs after a database is disconnected.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to take specific actions after a database is disconnected.

20.1.1.7.2 TIBBase.AfterTransactionEnd Event

Occurs after a transaction has ended.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to take specific actions after a transaction has ended.

20.1.1.7.3 TIBBase.BeforeDatabaseDisconnect Event

Occurs before a database disconnects.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to take specific actions before a database disconnects.

20.1.1.7.4 TIBBase.BeforeTransactionEnd Event

Occurs before a transaction ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to take specific actions before a transaction ends.

20.1.1.7.5 TIBBase.OnDatabaseFree Event

Occurs after a database is freed from memory.

Pascal

```
property OnDatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDatabaseFree;
```

Description

Write an OnDatabaseFree event handler to take specific actions after a database is freed from memory.

20.1.1.7.6 TIBBase.OnTransactionFree Event

Occurs after a transaction has been freed from memory.

Pascal

```
property OnTransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTransactionFree;
```

Description

Write an OnTransactionFree event handler to take specific actions after a transaction has been freed from memory.

20.1.2 TIBDataBase Class

Class Hierarchy

Pascal

```
TIBDataBase = class(TCustomConnection);
```

C++

```
class TIBDataBase : public TCustomConnection;
```

File

IBDatabase

Description

This is class IBDatabase.TIBDataBase.

20.1.2.1 TIBDataBase Members

The following tables list the members exposed by TIBDataBase.

Protected Methods

	Name	Description
	DoConnect (see page 3722)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 3723)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 3724)	Returns the value of the Connected property.
	Loaded (see page 3726)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 3726)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	AddEventNotifier (see page 3720)	Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.
	AddTransaction (see page 3720)	Adds an association between the transaction component and the database component.
	ApplyUpdates (see page 3720)	Posts pending cached updates for specified datasets to the database server.
	Call (see page 3721)	Returns an error message based on the error code.
	CheckActive (see page 3721)	Checks to see if the database connection is active.
	CheckDatabaseName (see page 3721)	Checks to see if the DatabaseName (see page 3730) property is not empty.
	CheckInactive (see page 3721)	Checks to see if the database connection is inactive.
	CloseDataSets (see page 3722)	Closes all datasets associated with the database component without disconnecting from the database server.
	Create (see page 3718)	Creates an instance of a TIBDatabase component.
	CreateDatabase (see page 3722)	Creates a database using Params (see page 3736).
	Destroy (see page 3718)	Destroys the instance of the database component.
	DropDatabase (see page 3723)	Drops a database.
	FindDefaultTransaction (see page 3723)	Returns the default transaction.
	FindTransaction (see page 3724)	Finds the index of a transaction.
	FlushSchema (see page 3724)	Clears the schema cache for the database.
	ForceClose (see page 3724)	Forces the database connection to close.
	GetFieldNames (see page 3725)	Populates a list with the names of the fields in the table.
	GetTableNames (see page 3725)	Populates a string list with the names of tables in the database.
	Has_COMPUTED_BLR (see page 3725)	Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.
	Has_DEFAULT_VALUE (see page 3726)	Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.
	IndexOfDBConst (see page 3726)	Searches for the named parameter in the database parameters list.
	RemoveEventNotifier (see page 3727)	Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.
	RemoveTransaction (see page 3727)	Disassociates a transaction from the database.
	RemoveTransactions (see page 3728)	Disassociates all transactions from the database.
	SetHandle (see page 3728)	Sets the handle for the database.
	TestConnected (see page 3728)	Tests whether a database is connected.

Public Properties

	Name	Description
	DBParamByDPB (see page 3730)	Specifies the name of the database to associate with this database component.
	Handle (see page 3731)	Specifies the InterBase API database handle.
	HandleIsShared (see page 3731)	Indicates whether or not a the handle is shared.
	InternalTransaction (see page 3732)	Used internally by InterBase transactions.
	IsReadOnly (see page 3732)	Indicates whether or not the database is set to read-only.
	SQLObjectCount (see page 3737)	Returns the number of SQL objects.
	SQLObjects (see page 3737)	Returns an SQL object.
	TransactionCount (see page 3738)	Returns the number of transactions associated with the TIBDatabase component.
	Transactions (see page 3738)	Specifies a transaction for the given index.

Published Events

	Name	Description
	AfterConnect (see page 3738)	Occurs after a connection is established.
	AfterDisconnect (see page 3739)	Occurs after the connection closes.
	BeforeConnect (see page 3739)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 3739)	Occurs immediately before the connection closes.
	OnDialectDowngradeWarning (see page 3740)	Occurs after the SQL dialect of the client connection is downgraded.
	OnIdleTimer (see page 3740)	Occurs after a database connection times out.
	OnLogin (see page 3741)	Occurs when an application connects to a database.

Published Properties

	Name	Description
	AllowStreamedConnected (see page 3729)	Indicates whether the Connected (see page 3729) property can be set at design time.
	Connected (see page 3729)	Indicates whether or not a database connection is active.
	DatabaseName (see page 3730)	Specifies the name of the database to associate with this database component.
R	DBSQLDialect (see page 3730)	Returns the database SQL dialect.
	DefaultTransaction (see page 3731)	Sets or returns the default database transaction.
	IdleTimer (see page 3731)	Specifies how long the database should wait before disconnecting an idle connection.
	LoginPrompt (see page 3732)	Specifies whether a login dialog appears immediately before opening a new connection.
	Params (see page 3736)	Specifies the database parameters to pass to the InterBase server.
	SQLDialect (see page 3736)	Sets or returns the SQL dialect used by the client.
	TraceFlags (see page 3737)	Specifies the database operations to track with the SQL Monitor at runtime.

20.1.2.2 TIBDataBase.Create Constructor

Creates an instance of a TIBDatabase component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDataBase(TComponent * AOwner);
```

Description

Call (see page 3721) Create to instantiate a database component at runtime. An application can create a database component in order to control the component's existence and set its properties and events.

Create instantiates a database component and creates an empty list of dataset components for the DataSets property and an empty string list for the Params (see page 3736) property.

20.1.2.3 TIBDataBase.Destroy Destructor

Destroys the instance of the database component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDataBase();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the database component is not already freed before calling Destroy.

Destroy disconnects from the database server, if necessary. It then frees the string resources allocated for the Params (see page 3736) and DataSets properties before calling its inherited destructor.

20.1.2.4 TIBDataBase Methods

The methods of the TIBDataBase class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 3722)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 3723)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 3724)	Returns the value of the Connected property.
	Loaded (see page 3726)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 3726)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	AddEventNotifier (see page 3720)	Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.
	AddTransaction (see page 3720)	Adds an association between the transaction component and the database component.
	ApplyUpdates (see page 3720)	Posts pending cached updates for specified datasets to the database server.
	Call (see page 3721)	Returns an error message based on the error code.
	CheckActive (see page 3721)	Checks to see if the database connection is active.
	CheckDatabaseName (see page 3721)	Checks to see if the DatabaseName (see page 3730) property is not empty.
	CheckInactive (see page 3721)	Checks to see if the database connection is inactive.
	CloseDataSets (see page 3722)	Closes all datasets associated with the database component without disconnecting from the database server.
	CreateDatabase (see page 3722)	Creates a database using Params (see page 3736).
	DropDatabase (see page 3723)	Drops a database.
	FindDefaultTransaction (see page 3723)	Returns the default transaction.
	FindTransaction (see page 3724)	Finds the index of a transaction.
	FlushSchema (see page 3724)	Clears the schema cache for the database.
	ForceClose (see page 3724)	Forces the database connection to close.
	GetFieldNames (see page 3725)	Populates a list with the names of the fields in the table.
	GetTableNames (see page 3725)	Populates a string list with the names of tables in the database.
	Has_COMPUTED_BLR (see page 3725)	Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.
	Has_DEFAULT_VALUE (see page 3726)	Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.
	IndexOfDBConst (see page 3726)	Searches for the named parameter in the database parameters list.
	RemoveEventNotifier (see page 3727)	Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.
	RemoveTransaction (see page 3727)	Disassociates a transaction from the database.
	RemoveTransactions (see page 3728)	Disassociates all transactions from the database.
	SetHandle (see page 3728)	Sets the handle for the database.
	TestConnected (see page 3728)	Tests whether a database is connected.

20.1.2.4.1 TIBDataBase.AddEventNotifier Method

Adds an event notifier to the database's internal list so that the database can handle registering and unregistering interest in events.

Pascal

```
procedure AddEventNotifier(Notifier: IIBEventNotifier);
```

C++

```
__fastcall AddEventNotifier(IIBEventNotifier Notifier);
```

Description

Call (see page 3721) AddEventNotifier when you want the database to automatically register and unregister an interest in server events when it opens and closes a connection to the server.

Notifier is the interface to an object that has in interest in a set of events on the InterBase server. For example, Notifier can be the interface to a TIBEvents object.

AddEventNotifier adds Notifier to its internal list of event notifiers. When TIBDatabase opens a connection, it checks every notifier in its list, and if a notifier indicates that it wants to be auto-registered, AddEventNotifier calls its RegisterEvents method so that the notifier registers its interest with the InterBase Event manager. Before TIBDatabase closes a connection, it unregisters interest from every notifier in its list.

Note: If Notifier is a TIBEvents object, AddEventNotifier is automatically called when you set the Database property.

20.1.2.4.2 TIBDataBase.AddTransaction Method

Adds an association between the transaction component and the database component.

Pascal

```
function AddTransaction(TR: TIBTransaction): Integer;
```

C++

```
__fastcall int AddTransaction(TIBTransaction TR);
```

Description

Call (see page 3721) AddTransaction to add an association between the transaction component and the database component.

20.1.2.4.3 TIBDataBase.ApplyUpdates Method

Posts pending cached updates for specified datasets to the database server.

Pascal

```
procedure ApplyUpdates(const DataSets: array of TDataSet);
```

C++

```
__fastcall ApplyUpdates(const array of TDataSet DataSets);
```

Description

Call (see page 3721) ApplyUpdates to post pending cached updates for a specific set of open datasets to the database server. ApplyUpdates is only meaningful if the CachedUpdates property of a specified dataset is true.

DataSets is a list of dataset names specifying the datasets for which to post pending updates. DataSets need not list every currently open dataset. For each listed dataset ApplyUpdates calls the dataset's ApplyUpdates and CommitUpdates methods to

post that dataset's pending cached updates.

20.1.2.4.4 TIBDataBase.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

20.1.2.4.5 TIBDataBase.CheckActive Method

Checks to see if the database connection is active.

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

Call (see page 3721) CheckActive to determine if the connection to a database server is active. If the database connection is inactive, an ibxeDatabaseClosed exception is raised.

20.1.2.4.6 TIBDataBase.CheckDatabaseName Method

Checks to see if the DatabaseName (see page 3730) property is not empty.

Pascal

```
procedure CheckDatabaseName;
```

C++

```
__fastcall CheckDatabaseName();
```

Description

Call (see page 3721) CheckDatabaseName to determine whether the DatabaseName (see page 3730) property is empty. If the DatabaseName (see page 3730) is empty, an ibxeDatabaseNameMissing exception is raised.

20.1.2.4.7 TIBDataBase.CheckInactive Method

Checks to see if the database connection is inactive.

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

Call (see page 3721) CheckInactive to determine whether the connection to a database server is inactive. If the database connection is active, an ibxeDatabaseOpen exception is raised.

20.1.2.4.8 TIBDataBase.CloseDataSets Method

Closes all datasets associated with the database component without disconnecting from the database server.

Pascal

```
procedure CloseDataSets;
```

C++

```
__fastcall CloseDataSets();
```

Description

Call (see page 3721) CloseDataSets to close all active datasets without disconnecting from the database server. Ordinarily, when an application calls Close, all datasets are closed, and the connection to the database server is dropped. Calling CloseDataSets instead of Close ensures that an application can close all active datasets without having to reconnect to the database server at a later time.

20.1.2.4.9 TIBDataBase.CreateDatabase Method

Creates a database using Params (see page 3736).

Pascal

```
procedure CreateDatabase;
```

C++

```
__fastcall CreateDatabase();
```

Description

Call (see page 3721) CreateDatabase to create a database using Params (see page 3736) as the rest of the CREATE DATABASE command.

For example, if you wanted to create a local InterBase database, you could do the following:

1. Set the database name to the drive, path, and filename of the database file.
2. Set Params (see page 3736) to the parameter for the CREATE DATABASE statement: `USER "SYSDBA" PASSWORD "masterkey" PAGE_SIZE 4096`
3. Set the SQLDialect (see page 3736) value.
4. Call (see page 3721) the CreateDatabase method.

20.1.2.4.10 TIBDataBase.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected

DoDisconnect

20.1.2.4.11 TIBDataBase.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected

DoConnect

20.1.2.4.12 TIBDataBase.DropDatabase Method

Drops a database.

Pascal

```
procedure DropDatabase;
```

C++

```
__fastcall DropDatabase();
```

Description

Call (see page 3721) DropDatabase to drop a database, which removes the database file from the server.

20.1.2.4.13 TIBDataBase.FindDefaultTransaction Method

Returns the default transaction.

Pascal

```
function FindDefaultTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction FindDefaultTransaction();
```

Description

Call (see page 3721) FindDefaultTransaction to return the default transaction for the database.

20.1.2.4.14 TIBDataBase.FindTransaction Method

Finds the index of a transaction.

Pascal

```
function FindTransaction(TR: TIBTransaction): Integer;
```

C++

```
__fastcall int FindTransaction(TIBTransaction TR);
```

Description

Call (see page 3721) FindTransaction to find the index of a specified transaction.

20.1.2.4.15 TIBDataBase.FlushSchema Method

Clears the schema cache for the database.

Pascal

```
procedure FlushSchema;
```

C++

```
__fastcall FlushSchema();
```

Description

Call (see page 3721) FlushSchema to clear the schema cache.

20.1.2.4.16 TIBDataBase.ForceClose Method

Forces the database connection to close.

Pascal

```
procedure ForceClose;
```

C++

```
__fastcall ForceClose();
```

Description

Use ForceClose to force the database connection to close.

Note: Forcing a database to close attempts to close the connection to the server. Even if the call fails, the database handle is reset to nil (Delphi) or NULL (C++).

20.1.2.4.17 TIBDataBase.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to

return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected

SetConnected

20.1.2.4.18 TIBDataBase.GetFieldNames Method

Populates a list with the names of the fields in the table.

Pascal

```
procedure GetFieldNames(const TableName: Widestring; List: TWideStrings);
```

C++

```
__fastcall GetFieldNames(const BSTR TableName, TWideStrings List);
```

Description

Call (see page 3721) GetFieldNames to retrieve a list of fields in the associated table.

20.1.2.4.19 TIBDataBase.GetTableNames Method

Populates a string list with the names of tables in the database.

Pascal

```
procedure GetTableNames(List: TWideStrings; SystemTables: Boolean = False);
```

C++

```
__fastcall GetTableNames(TWideStrings List, Boolean SystemTables = False);
```

Description

Call (see page 3721) GetTableNames to retrieve a list of tables in the associated database.

List is the already-existing string list object into which the tables' names are put.

Set SystemTables to indicate whether the list of table names should include the database's system tables.

```
IBDatabase1.GetTableNames(ListBox2.Items, False);
    IBDatabase1->GetTableNames(ListBox2->Items, false);
```

Note: Any contents already in the target string list object are eliminated and overwritten by the data produced by GetTableNames.

20.1.2.4.20 TIBDataBase.Has_COMPUTED_BLR Method

Indicates whether a specified field in a specified relation includes a COMPUTED_BLR attribute.

Pascal

```
function Has_COMPUTED_BLR(Relation: String; Field: String): Boolean;
```

C++

```
__fastcall Boolean Has_COMPUTED_BLR(UnicodeString Relation, UnicodeString Field);
```

Description

Call (see page 3721) Has_COMPUTED_BLR to determine whether the Field in Relation includes a COMPUTED_BLR attribute.

20.1.2.4.21 TIBDataBase.Has_DEFAULT_VALUE Method

Indicates whether a specified field in a specified relation includes a DEFAULT_VALUE attribute.

Pascal

```
function Has_DEFAULT_VALUE(Relation: String; Field: String): Boolean;
```

C++

```
__fastcall Boolean Has_DEFAULT_VALUE(UnicodeString Relation, UnicodeString Field);
```

Description

Call (see page 3721) Has_DEFAULT_VALUE to determine whether Field has a default value when used in Relation.

20.1.2.4.22 TIBDataBase.IndexOfDBConst Method

Searches for the named parameter in the database parameters list.

Pascal

```
function IndexOfDBConst(st: String): Integer;
```

C++

```
__fastcall int IndexOfDBConst(UnicodeString st);
```

Description

Use IndexOfDBConst to locate a parameter in the database parameters list. If the parameter is not found, IndexOfDBConst returns -1.

20.1.2.4.23 TIBDataBase.Loaded Method

Initializes the connection component after all objects in the form or data module have been loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. It is called automatically after the form or data module that contains the connection component has loaded all its owned objects. TCustomConnection overrides the inherited method to establish a connection if the Connected property is true.

See Also

StreamedConnected

Loaded

20.1.2.4.24 TIBDataBase.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

20.1.2.4.25 TIBDataBase.RemoveEventNotifier Method

Removes an event notifier from the database's internal list so that the database no longer handles registering and unregistering interest in events.

Pascal

```
procedure RemoveEventNotifier(Notifier: IIBEventNotifier);
```

C++

```
__fastcall RemoveEventNotifier(IIBEventNotifier Notifier);
```

Description

Call (see page 3721) RemoveEventNotifier when you no longer want the database to automatically register and unregister an interest in server events when it opens and closes a connection to the server. For example, TIBEvents automatically calls RemoveEventNotifier when you change its Database property.

Notifier is the event notifier previously added to the database's internal list by a call to AddEventNotifier (see page 3720).

RemoveEventNotifier removes Notifier from its internal list of event notifiers.

Note: Removing an event notifier from the list does not first unregister an interest in any registered events.

20.1.2.4.26 TIBDataBase.RemoveTransaction Method

Disassociates a transaction from the database.

Pascal

```
procedure RemoveTransaction(Idx: Integer);
```

C++

```
__fastcall RemoveTransaction(int Idx);
```

Description

Call (see page 3721) RemoveTransaction to disassociate a specified transaction from the database.

20.1.2.4.27 TIBDataBase.RemoveTransactions Method

Disassociates all transactions from the database.

Pascal

```
procedure RemoveTransactions;
```

C++

```
__fastcall RemoveTransactions();
```

Description

Call (see page 3721) RemoveTransactions to disassociate all transactions from the database.

20.1.2.4.28 TIBDataBase.SetHandle Method

Sets the handle for the database.

Pascal

```
procedure SetHandle(Value: TISC_DB_HANDLE);
```

C++

```
__fastcall SetHandle(TISC_DB_HANDLE Value);
```

Description

Call (see page 3721) SetHandle to set the handle for the database.

20.1.2.4.29 TIBDataBase.TestConnected Method

Tests whether a database is connected.

Pascal

```
function TestConnected: Boolean;
```

C++

```
__fastcall Boolean TestConnected();
```

Description

Use TestConnected to determine whether a database is connected to the server. TestConnected returns true if the connection is good, and false if it is not.

20.1.2.5 TIBDataBase Properties

The properties of the TIBDataBase class are listed here.

Public Properties

	Name	Description
	DBParamByDPB (see page 3730)	Specifies the name of the database to associate with this database component.
R	Handle (see page 3731)	Specifies the InterBase API database handle.

	HandleIsShared (see page 3731)	Indicates whether or not a the handle is shared.
	InternalTransaction (see page 3732)	Used internally by InterBase transactions.
	IsReadOnly (see page 3732)	Indicates whether or not the database is set to read-only.
	SQLObjectCount (see page 3737)	Returns the number of SQL objects.
	SQLObjects (see page 3737)	Returns an SQL object.
	TransactionCount (see page 3738)	Returns the number of transactions associated with the TIBDatabase component.
	Transactions (see page 3738)	Specifies a transaction for the given index.

Published Properties

	Name	Description
	AllowStreamedConnected (see page 3729)	Indicates whether the Connected (see page 3729) property can be set at design time.
	Connected (see page 3729)	Indicates whether or not a database connection is active.
	DatabaseName (see page 3730)	Specifies the name of the database to associate with this database component.
	DBSQLDialect (see page 3730)	Returns the database SQL dialect.
	DefaultTransaction (see page 3731)	Sets or returns the default database transaction.
	IdleTimer (see page 3731)	Specifies how long the database should wait before disconnecting an idle connection.
	LoginPrompt (see page 3732)	Specifies whether a login dialog appears immediately before opening a new connection.
	Params (see page 3736)	Specifies the database parameters to pass to the InterBase server.
	SQLDialect (see page 3736)	Sets or returns the SQL dialect used by the client.
	TraceFlags (see page 3737)	Specifies the database operations to track with the SQL Monitor at runtime.

20.1.2.5.1 TIBDataBase.AllowStreamedConnected Property

Indicates whether the Connected (see page 3729) property can be set at design time.

Pascal

```
property AllowStreamedConnected: Boolean;
```

C++

```
__property Boolean AllowStreamedConnected;
```

Description

When AllowStreamedConnected is true (the default), then setting the Connected (see page 3729) property to true at design time causes this component to automatically establish a database connection when the application starts up. When AllowStreamedConnected is false, the connection must be explicitly opened at runtime, either by setting the Connected (see page 3729) property to true, or by calling the Open method.

Set AllowStreamedConnected to false when using a local test database at design time and a different database at runtime. This allows the application to set the appropriate runtime connection information before opening a runtime connection, without having to explicitly shut down the database connection that is used at design time.

20.1.2.5.2 TIBDataBase.Connected Property

Indicates whether or not a database connection is active.

Pascal

```
property Connected;
```

C++

```
__property Connected;
```

Description

Set Connected to true to establish a database connection without opening a dataset. Set Connected to false to close a database connection. An application can check Connected to determine the current status of a database connection. If Connected is true, the database connection is active; if false, then the connection is inactive.

20.1.2.5.3 TIBDataBase.DatabaseName Property

Specifies the name of the database to associate with this database component.

Pascal

```
property DatabaseName: TIBFileName;
```

C++

```
__property TIBFileName DatabaseName;
```

Description

Use DatabaseName to specify the name of the database to use with a database component. For local InterBase databases, this can be a filename.

To connect to an InterBase database on a remote server using TCP/IP the syntax is <server_name>:<filename>.

To connect to an InterBase database on a remote server using NetBEUI, the syntax is: \\<server_name>\<filename>.

To connect to an InterBase database on a remote server using SPX, the syntax is: <server_name>@<filename>.

20.1.2.5.4 TIBDataBase.DBParamByDPB Property

Specifies the name of the database to associate with this database component.

Pascal

```
property DBParamByDPB [const Idx: Integer]: String;
```

C++

```
__property UnicodeString DBParamByDPB[int const Idx];
```

Description

Use DBParamByDPB to inspect and set DPB parameters without looking at the Params (see page 3736) string list.

For example,

```
DBParamByDPB[isc_dpb_user_name]
```

can be used to set and inspect the user name.

20.1.2.5.5 TIBDataBase.DBSQLDialect Property

Returns the database SQL dialect.

Pascal

```
property DBSQLDialect: Integer;
```

C++

```
__property int DBSQLDialect;
```

Description

Use DBSQLDialect to get the database SQL dialect.

20.1.2.5.6 TIBDataBase.DefaultTransaction Property

Sets or returns the default database transaction.

Pascal

```
property DefaultTransaction: TIBTransaction;
```

C++

```
__property TIBTransaction DefaultTransaction;
```

Description

Use DefaultTransaction to set or return the default database transaction.

A single database connection can manage one or more transactions. DefaultTransaction is a convenient way to specify a default transaction to a database connection.

20.1.2.5.7 TIBDataBase.Handle Property

Specifies the InterBase API database handle.

Pascal

```
property Handle: TISC_DB_HANDLE;
```

C++

```
__property TISC_DB_HANDLE Handle;
```

Description

Use Handle to make calls directly to the InterBase API. Many of the InterBase API functions require a database handle as one of their arguments. Handle is assigned an initial value when a database is opened.

20.1.2.5.8 TIBDataBase.HandleIsShared Property

Indicates whether or not a the handle is shared.

Pascal

```
property HandleIsShared: Boolean;
```

C++

```
__property Boolean HandleIsShared;
```

Description

Read HandleIsShared to determine if the handle to the database is shared.

20.1.2.5.9 TIBDataBase.IdleTimer Property

Specifies how long the database should wait before disconnecting an idle connection.

Pascal

```
property IdleTimer: Integer;
```

C++

```
__property int IdleTimer;
```

Description

Use IdleTimer to indicate how long the database should wait before automatically terminating the connection.

20.1.2.5.10 TIBDataBase.InternalTransaction Property

Used internally by InterBase transactions.

Pascal

```
property InternalTransaction: TIBTransaction;
```

C++

```
__property TIBTransaction InternalTransaction;
```

Description

Do not use InternalTransaction directly. It is for internal use only.

20.1.2.5.11 TIBDataBase.IsReadOnly Property

Indicates whether or not the database is set to read-only.

Pascal

```
property IsReadOnly: Boolean;
```

C++

```
__property Boolean IsReadOnly;
```

Description

Read IsReadOnly to determine if the database is read-only.

Read-only databases are an InterBase 6 feature.

20.1.2.5.12 TIBDataBase.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt;
```

C++

```
__property LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If

there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

C++ Examples:

```
//
//This example demostrates the use of ADO for database conectivity.
//Example assumes that a TDBGrid is placed on the form.
//
void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Login details */
    String UserName = "db_user_name";
    String PassWord = "db_pass_word";
    String Server = "my.db.server";

    /* Connection String */
    String ConnString =
        "Provider=SQLOLEDB.1;Persist Security Info=False;";
    ConnString +=
        "User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;";
    ConnString +=
        "Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;";
    ConnString +=
        "Tag with column collation when possible=False";

    /* SQL Query */
    String SQLStr = "SELECT * FROM customer WHERE customer_id = :AnId;";

    /* All ADO variables */
    TADOConnection* ADOConn;
    TADOQuery* ADOQuery;
    TDataSource* DataSrc;
    TParameter* Param;

    /* Create an ADO connection */
    ADOConn = new TADOConnection(this);

    /* Setup the connection string */
    ADOConn->ConnectionString = Format(ConnString,
```

```
        ARRAYOFCONST((UserName, PassWord, Server)));

    /* Disable login prompt */
    ADOConn->LoginPrompt = False;

    try
    {
        ADOConn->Connected = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                   TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the query */
    ADOQuery = new TADOQuery(this);
    ADOQuery->Connection = ADOConn;
    ADOQuery->SQL->Add(SQLStr);

    /* Update the parameter that was parsed from the SQL query: AnId */
    Param = ADOQuery->Parameters->ParamByName("AnId");
    Param->DataType = ftInteger;
    Param->Value = 1;

    /* Set the query to Prepared - will improve performance */
    ADOQuery->Prepared = true;

    try
    {
        ADOQuery->Active = true;
    }
    catch (EADOError *e)
    {
        MessageDlg("Error while connecting", mtError,
                   TMsgDlgButtons() << mbOK, 0);
        return;
    }

    /* Create the data source */
    DataSrc = new TDataSource(this);
    DataSrc->DataSet = ADOQuery;
    DataSrc->Enabled = true;

    /* Finally initilalize the grid */
    DBGrid1->DataSource = DataSrc;
}
```

Delphi Examples:

```
{
This example demostrates the use of ADO for database conectivity.
Example assumes that a TDBGrid is placed on the form.
}
procedure TForm2.FormCreate(Sender: TObject);
const
  { Connection string }
  ConnString =
  'Provider=SQLOLEDB.1;Persist Security Info=False;' +
  'User ID=%s;Password=%s;Data Source=%s;Use Procedure for Prepare=1;' +
  'Auto Translate=True;Packet Size=4096;Use Encryption for Data=False;'+
  'Tag with column collation when possible=False';

  { SQL Query }
  SQLStr = 'SELECT * FROM customer WHERE customer_id = :AnId;';
```

```
    { User access }
    UserName = 'db_user_name';
    PassWord = 'db_pass_word';
    Server = 'my.db.server';

  var
    ADOConn  : TADOConnection;
    ADOQuery : TADOQuery;
    DataSrc  : TDataSource;
    Param    : TParameter;

  begin
    { Create an ADO connection }
    ADOConn := TADOConnection.Create(Self);
    { Setup the provider engine }

    { Setup the connection string }
    ADOConn.ConnectionString := Format(ConnString,
      [UserName, PassWord, Server]);

    { Disable login prompt }
    ADOConn.LoginPrompt := False;

    try
      ADOConn.Connected := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while connecting', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the query }
    ADOQuery := TADOQuery.Create(Self);
    ADOQuery.Connection := ADOConn;
    ADOQuery.SQL.Add(SQLStr);

    { Update the parameter that was parsed from the SQL query: AnId }
    Param := ADOQuery.Parameters.ParamByName('AnId');
    Param.DataType := ftInteger;
    Param.Value := 1;

    { Set the query to Prepared - will improve performance }
    ADOQuery.Prepared := true;

    try
      ADOQuery.Active := True;
    except
      on e: EADOError do
      begin
        MessageDlg('Error while doing query', mtError,
                   [mbOK], 0);

        Exit;
      end;
    end;

    { Create the data source }
    DataSrc := TDataSource.Create(Self);
    DataSrc.DataSet := ADOQuery;
    DataSrc.Enabled := true;

    { Finally initilalize the grid }
```

```
  DBGrid1.DataSource := DataSrc;
end;
```

20.1.2.5.13 TIBDataBase.Params Property

Specifies the database parameters to pass to the InterBase server.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use Params to specify the database parameters to pass to the InterBase server.

Database parameters are passed to the server as text in order to establish the connection. For example:

```
user_name=sysdba
    password=masterkey
    sql_role_name=finance
    lc_ctype=WIN1252
```

For more information on character sets, refer to 'Character Sets and Collation Orders' in the InterBase Language Reference.

For other information, refer to the InterBase API Guide.

20.1.2.5.14 TIBDataBase.SQLDialect Property

Sets or returns the SQL dialect used by the client.

Pascal

```
property SQLDialect: Integer;
```

C++

```
__property int SQLDialect;
```

Description

Use the SQLDialect property to set or return the SQL dialect used by the client. If the connection is active, the SQLDialect property cannot be set to a value greater than the database SQL dialect. If the connection is inactive, then on connect an OnDialectDowngradeWarning (see page 3740) event may be fired if the SQLDialect is greater than the database SQL dialect. In such a case, the SQLDialect property will be downgraded to match the database SQL dialect.

20.1.2.5.15 TIBDataBase.SQLObjectCount Property

Returns the number of SQL objects.

Pascal

```
property SQLObjectCount: Integer;
```

C++

```
__property int SQLObjectCount;
```

Description

Use the SQLObjectCount property to return the number of SQL objects in the database.

SQL objects are usually defined as InterBase datasets, IBSQL (see page 4035), and Blobs.

20.1.2.5.16 TIBDataBase.SQLObjects Property

Returns an SQL object.

Pascal

```
property SQLObjects [Index: Integer]: TIBBase;
```

C++

```
__property TIBBase SQLObjects[int Index];
```

Description

Use the SQLObjects property to return an SQL object based on its numeric index.

SQL objects are usually defined as InterBase datasets, IBSQL (see page 4035), and Blobs.

20.1.2.5.17 TIBDataBase.TraceFlags Property

Specifies the database operations to track with the SQL Monitor at runtime.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags is only meaningful for the SQL Monitor, which is provided to enable performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

The value of a session component's TraceFlags property determines the initial settings of the TraceFlags property for database components associated with the session.

Because TraceFlags is a set property, an application can specify different combinations of flags to monitor different combinations of statements. For example, the following statement limits monitoring to database connections and SQL statement preparation:

```
TraceFlags := [tfConnect, tfQPrepare];
    TraceFlags = [tfConnect, tfQPrepare];
```

20.1.2.5.18 TIBDataBase.TransactionCount Property

Returns the number of transactions associated with the TIBDatabase component.

Pascal

```
property TransactionCount: Integer;
```

C++

```
__property int TransactionCount;
```

Description

Use TransactionCount to return how many transactions are currently associated with the InterBase database component.

20.1.2.5.19 TIBDataBase.Transactions Property

Specifies a transaction for the given index.

Pascal

```
property Transactions [Index: Integer]: TIBTransaction;
```

C++

```
__property TIBTransaction Transactions[int Index];
```

Description

Given an integer index, Transactions returns the transaction at the given index. This is used internally for broadcasting important messages to attached components.

20.1.2.6 TIBDataBase Events

The events of the TIBDataBase class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 3738)	Occurs after a connection is established.
	AfterDisconnect (see page 3739)	Occurs after the connection closes.
	BeforeConnect (see page 3739)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 3739)	Occurs immediately before the connection closes.
	OnDialectDowngradeWarning (see page 3740)	Occurs after the SQL dialect of the client connection is downgraded.
	OnIdleTimer (see page 3740)	Occurs after a database connection times out.
	OnLogin (see page 3741)	Occurs when an application connects to a database.

20.1.2.6.1 TIBDataBase.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect;
```

C++

```
__property AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect

Connected

Connecting to a Database Server

20.1.2.6.2 TIBDataBase.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect;
```

C++

```
__property AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect

Connected

Disconnecting from a Database Server

20.1.2.6.3 TIBDataBase.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect;
```

C++

```
__property BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect

Connected

Connecting to a Database Server

20.1.2.6.4 TIBDataBase.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect;
```

C++

```
__property BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect

Connected

Disconnecting from a Database Server

20.1.2.6.5 TIBDataBase.OnDialectDowngradeWarning Event

Occurs after the SQL dialect of the client connection is downgraded.

Pascal

```
property OnDialectDowngradeWarning: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialectDowngradeWarning;
```

Description

Write an OnDialectDowngradeWarning event handler to take specific actions when the SQL dialect is downgraded.

For example, if the SQL dialect for your application is set to 3 and then a connection is made to a dialect 1 database, then the SQL dialect is downgraded to 1 and a OnDialectDowngradeWarning event is fired.

20.1.2.6.6 TIBDataBase.OnIdleTimer Event

Occurs after a database connection times out.

Pascal

```
property OnIdleTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnIdleTimer;
```

Description

Write an OnIdleTimer event handler to take specific actions when the connection times out in the time specified by IdleTimer (see page 3731).

20.1.2.6.7 TIBDataBase.OnLogin Event

Occurs when an application connects to a database.

Pascal

```
property OnLogin: TIBDatabaseLoginEvent;
```

C++

```
__property TIBDatabaseLoginEvent OnLogin;
```

Description

Write an OnLogin event handler to take specific actions when an application attempts to connect to a database. By default, a database login is required. The current USER_NAME is read from the Params (see page 3736) property, and a standard Login dialog box opens. The dialog prompts for a user name and password combination, and then uses the values entered by the user to set the USER_NAME and PASSWORD values in the Params (see page 3736) property. These values are then passed to the remote server.

Applications that provide alternative OnLogin event handlers must set the USER_NAME and PASSWORD values in LoginParams parameter of the event handler.

Note: OnLogin does not occur unless the LoginPrompt (see page 3732) property is set to true.

20.1.3 TIBSchema Class

Class Hierarchy

Pascal

```
TIBSchema = class(TObject);
```

C++

```
class TIBSchema : public TObject;
```

File

IBDatabase

Description

This is class IBDatabase.TIBSchema.

20.1.3.1 TIBSchema Members

The following tables list the members exposed by TIBSchema.

Public Methods

	Name	Description
	FreeNodes (see page 3742)	This is FreeNodes, a member of class TIBSchema.
	Has_COMPUTED_BLR (see page 3742)	This is Has_COMPUTED_BLR, a member of class TIBSchema.
	Has_DEFAULT_VALUE (see page 3742)	This is Has_DEFAULT_VALUE, a member of class TIBSchema.

20.1.3.2 TIBSchema Methods

The methods of the TIBSchema class are listed here.

Public Methods

	Name	Description
	FreeNodes (see page 3742)	This is FreeNodes, a member of class TIBSchema.
	Has_COMPUTED_BLR (see page 3742)	This is Has_COMPUTED_BLR, a member of class TIBSchema.
	Has_DEFAULT_VALUE (see page 3742)	This is Has_DEFAULT_VALUE, a member of class TIBSchema.

20.1.3.2.1 TIBSchema.FreeNodes Method

Pascal

```
procedure FreeNodes; virtual; abstract;
```

C++

```
virtual __fastcall FreeNodes() = 0;
```

Description

This is FreeNodes, a member of class TIBSchema.

20.1.3.2.2 TIBSchema.Has_COMPUTED_BLR Method

Pascal

```
function Has_COMPUTED_BLR(Relation: String; Field: String): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean Has_COMPUTED_BLR(UnicodeString Relation, UnicodeString Field) = 0;
```

Description

This is Has_COMPUTED_BLR, a member of class TIBSchema.

20.1.3.2.3 TIBSchema.Has_DEFAULT_VALUE Method

Pascal

```
function Has_DEFAULT_VALUE(Relation: String; Field: String): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean Has_DEFAULT_VALUE(UnicodeString Relation, UnicodeString Field) = 0;
```

Description

This is Has_DEFAULT_VALUE, a member of class TIBSchema.

20.1.4 TIBTimer Class

Class Hierarchy

Pascal

```
TIBTimer = class(TComponent);
```

C++

```
class TIBTimer : public TComponent;
```

File

IBDatabase

Description

This is class IBDatabase.TIBTimer.

20.1.4.1 TIBTimer Members

The following tables list the members exposed by TIBTimer.

Protected Methods

	Name	Description
	Timer (see page 3745)	This is Timer, a member of class TIBTimer.

Public Methods

	Name	Description
	Create (see page 3743)	Allocates memory and constructs a safely initialized instance of a component.
	Destroy (see page 3744)	Disposes of the component and its owned components.

Published Events

	Name	Description
	OnTimer (see page 3746)	This is OnTimer, a member of class TIBTimer.

Published Properties

	Name	Description
	Enabled (see page 3745)	This is Enabled, a member of class TIBTimer.
	Interval (see page 3746)	This is Interval, a member of class TIBTimer.

20.1.4.2 TIBTimer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTimer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Components

ComponentStyle

System::TObject::Create

Destroy

System::TObject::Free

Owner

20.1.4.3 TIBTimer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTimer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

20.1.4.4 TIBTimer Methods

The methods of the TIBTimer class are listed here.

Protected Methods

	Name	Description
	Timer (see page 3745)	This is Timer, a member of class TIBTimer.

20.1.4.4.1 TIBTimer.Timer Method

Pascal

```
procedure Timer; dynamic;
```

C++

```
__fastcall Timer();
```

Description

This is Timer, a member of class TIBTimer.

20.1.4.5 TIBTimer Properties

The properties of the TIBTimer class are listed here.

Published Properties

	Name	Description
	Enabled (see page 3745)	This is Enabled, a member of class TIBTimer.
	Interval (see page 3746)	This is Interval, a member of class TIBTimer.

20.1.4.5.1 TIBTimer.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

This is Enabled, a member of class TIBTimer.

20.1.4.5.2 TIBTimer.Interval Property

Pascal

```
property Interval: Cardinal;
```

C++

```
__property unsigned Interval;
```

Description

This is Interval, a member of class TIBTimer.

20.1.4.6 TIBTimer Events

The events of the TIBTimer class are listed here.

Published Events

	Name	Description
	OnTimer (see page 3746)	This is OnTimer, a member of class TIBTimer.

20.1.4.6.1 TIBTimer.OnTimer Event

Pascal

```
property OnTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTimer;
```

Description

This is OnTimer, a member of class TIBTimer.

20.1.5 TIBTransaction Class

TIBTransaction provides discrete transaction control over a one or more database connections in a database application.

Class Hierarchy

Pascal

```
TIBTransaction = class(TComponent);
```

C++

```
class TIBTransaction : public TComponent;
```

File

IBDatabase

Description

All TIBCustomDataSet descendants and TIBSQL need to use a transaction along with a database component to gain access to data in a database.

Note: In applications that connect an InterBaseExpress dataset to a client dataset, every query must be in its own transaction. You must use one transaction component for each query component.

See Also

Getting Started with InterBase Express

20.1.5.1 TIBTransaction Members

The following tables list the members exposed by TIBTransaction.

Protected Methods

	Name	Description
	Loaded (see page 3752)	Initializes the component after the form file has been read into memory.
	Notification (see page 3752)	Forwards notification messages to all owned components.
	SetHandle (see page 3754)	This is SetHandle, a member of class TIBTransaction.

Public Methods

	Name	Description
	AddDatabase (see page 3749)	Associates a database to the transaction.
	Call (see page 3749)	Returns an error message based on the error code.
	CheckAutoStop (see page 3750)	Performs the action that the AutoStopAction (see page 3755) property specifies.
	CheckDatabasesInList (see page 3750)	Checks for databases in the list.
	CheckInTransaction (see page 3750)	Checks whether the transaction is active and whether there are any databases in the transaction's database list.
	CheckNotInTransaction (see page 3750)	Checks that the transaction is not active and that there are no databases in the transaction's database list.
	Commit (see page 3751)	Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.
	CommitRetaining (see page 3751)	Commits the active transaction and retains the transaction context after a commit.
	Create (see page 3748)	Creates an instance of a transaction component.
	Destroy (see page 3748)	Destroys the instance of the transaction component.
	FindDatabase (see page 3751)	Finds the index of the associated database.
	FindDefaultDatabase (see page 3752)	Finds the default database for the transaction.
	RemoveDatabase (see page 3753)	Disassociates a database from the transaction.
	RemoveDatabases (see page 3753)	Disassociates all databases from the transaction.
	Rollback (see page 3753)	Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.
	RollbackRetaining (see page 3754)	Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.
	StartTransaction (see page 3754)	Begins a new transaction against the database server.

Public Properties

	Name	Description
	DatabaseCount (see page 3756)	Indicates the number of databases that are part of the transaction.
	Databases (see page 3756)	Returns the database at the given integer index.
	Handle (see page 3757)	Returns the transaction handle.
	HandleIsShared (see page 3757)	Indicates whether or not the handle is shared.
	InTransaction (see page 3758)	Indicates whether a database transaction is in progress or not.
	SQLObjectCount (see page 3758)	Returns the number of active datasets associated with the database component.
	SQLObjects (see page 3758)	Provides an indexed array of all active datasets for a database component.
	TPB (see page 3759)	Provides a read-only view of the transaction parameter buffer.
	TPBLength (see page 3759)	Returns the length of the transaction parameter buffer.

Published Events

	Name	Description
	OnIdleTimer (see page 3759)	Occurs after a transaction has timed out.

Published Properties

	Name	Description
	Active (see page 3755)	Specifies whether or not a transaction is active.
	AutoStopAction (see page 3755)	Specifies what action to take when automatically ending transactions.
	DefaultAction (see page 3756)	Specifies what action a transaction should take upon timing out.
	DefaultDatabase (see page 3757)	Sets or returns the default database for the transaction.
	IdleTimer (see page 3757)	Specifies how long the transaction should wait before automatically committing or rolling back.
	Params (see page 3758)	Returns the transaction parameter buffer associated with the transaction component.

20.1.5.2 TIBTransaction.Create Constructor

Creates an instance of a transaction component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTransaction(TComponent * AOwner);
```

Description

Call (see page 3749) Create to instantiate a transaction component at runtime. An application creates a transaction component in order to control the component's existence and set its properties and events.

Create instantiates a transaction component and creates an empty string list for the Params (see page 3758) property.

20.1.5.3 TIBTransaction.Destroy Destructor

Destroys the instance of the transaction component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTransaction();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the transaction component is not already freed before calling Destroy.

Destroy disconnects from the database server, if necessary. It then frees the string resources allocated for the Params (see page 3758) and SQLObjects (see page 3758) properties before calling its inherited destructor.

20.1.5.4 TIBTransaction Methods

The methods of the TIBTransaction class are listed here.

Protected Methods

	Name	Description
	Loaded (see page 3752)	Initializes the component after the form file has been read into memory.
	Notification (see page 3752)	Forwards notification messages to all owned components.
	SetHandle (see page 3754)	This is SetHandle, a member of class TIBTransaction.

Public Methods

	Name	Description
	AddDatabase (see page 3749)	Associates a database to the transaction.
	Call (see page 3749)	Returns an error message based on the error code.
	CheckAutoStop (see page 3750)	Performs the action that the AutoStopAction (see page 3755) property specifies.
	CheckDatabasesInList (see page 3750)	Checks for databases in the list.
	CheckInTransaction (see page 3750)	Checks whether the transaction is active and whether there are any databases in the transaction's database list.
	CheckNotInTransaction (see page 3750)	Checks that the transaction is not active and that there are no databases in the transaction's database list.
	Commit (see page 3751)	Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.
	CommitRetaining (see page 3751)	Commits the active transaction and retains the transaction context after a commit.
	FindDatabase (see page 3751)	Finds the index of the associated database.
	FindDefaultDatabase (see page 3752)	Finds the default database for the transaction.
	RemoveDatabase (see page 3753)	Disassociates a database from the transaction.
	RemoveDatabases (see page 3753)	Disassociates all databases from the transaction.
	Rollback (see page 3753)	Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.
	RollbackRetaining (see page 3754)	Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.
	StartTransaction (see page 3754)	Begins a new transaction against the database server.

20.1.5.4.1 TIBTransaction.AddDatabase Method

Associates a database to the transaction.

Pascal

```
function AddDatabase(db: TIBDatabase): Integer;
```

C++

```
__fastcall int AddDatabase(TIBDatabase db);
```

Description

Call (see page 3749) AddDatabase to associate a database to the transaction.

20.1.5.4.2 TIBTransaction.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning

an error based on the value of RaiseError.

20.1.5.4.3 TIBTransaction.CheckAutoStop Method

Performs the action that the AutoStopAction (see page 3755) property specifies.

Pascal

```
procedure CheckAutoStop;
```

C++

```
__fastcall CheckAutoStop();
```

Description

Datasets call CheckAutoStop at times when it is appropriate to implicitly end a transaction. CheckAutoStop then performs the action that the AutoStopAction (see page 3755) property specifies.

20.1.5.4.4 TIBTransaction.CheckDatabasesInList Method

Checks for databases in the list.

Pascal

```
procedure CheckDatabasesInList;
```

C++

```
__fastcall CheckDatabasesInList();
```

Description

Call (see page 3749) CheckDatabasesInList to check if there are any databases in the list. If there are no databases in the list, an exception is raised.

20.1.5.4.5 TIBTransaction.CheckInTransaction Method

Checks whether the transaction is active and whether there are any databases in the transaction's database list.

Pascal

```
procedure CheckInTransaction;
```

C++

```
__fastcall CheckInTransaction();
```

Description

Call (see page 3749) CheckInTransaction to determine whether the transaction is active and whether there are any databases in the transaction's database list. If either condition is false, an exception is raised.

20.1.5.4.6 TIBTransaction.CheckNotInTransaction Method

Checks that the transaction is not active and that there are no databases in the transaction's database list.

Pascal

```
procedure CheckNotInTransaction;
```

C++

```
__fastcall CheckNotInTransaction();
```

Description

Call (see page 3749) CheckInTransaction (see page 3750) to determine that the transaction is not active and that there are no databases in the transaction's database list. If either condition is false, an exception is raised.

20.1.5.4.7 TIBTransaction.Commit Method

Permanently stores updates, insertions, and deletions of data associated with the current transaction, and ends the current transactions.

Pascal

```
procedure Commit;
```

C++

```
__fastcall Commit();
```

Description

Call (see page 3749) Commit to permanently store to the database server all updates, insertions, and deletions of data associated with the current transaction and then end the transaction. The current transaction is the last transaction started by calling StartTransaction (see page 3754).

Note: Before calling Commit, an application may check the status of the InTransaction (see page 3758) property. If an application calls Commit and there is no current transaction, an exception is raised.

20.1.5.4.8 TIBTransaction.CommitRetaining Method

Commits the active transaction and retains the transaction context after a commit.

Pascal

```
procedure CommitRetaining;
```

C++

```
__fastcall CommitRetaining();
```

Description

Call (see page 3749) CommitRetaining to permanently store to the database server all updates, insertions, and deletions of data associated with the current transaction and then retain the transaction context. The current transaction is the last transaction started by calling StartTransaction (see page 3754).

Note: Before calling CommitRetaining, an application may check the status of the InTransaction (see page 3758) property. If an application calls CommitRetaining and there is no current transaction, an exception is raised.

20.1.5.4.9 TIBTransaction.FindDatabase Method

Finds the index of the associated database.

Pascal

```
function FindDatabase(db: TIBDatabase): Integer;
```

C++

```
__fastcall int FindDatabase(TIBDatabase db);
```

Description

Call (see page 3749) FindDatabase to find the index of the associated database.

20.1.5.4.10 TIBTransaction.FindDefaultDatabase Method

Finds the default database for the transaction.

Pascal

```
function FindDefaultDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase FindDefaultDatabase();
```

Description

Call (see page 3749) FindDefaultDatabase to find the default database associated with the transaction.

20.1.5.4.11 TIBTransaction.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState

Create

TReader

20.1.5.4.12 TIBTransaction.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

20.1.5.4.13 TIBTransaction.RemoveDatabase Method

Disassociates a database from the transaction.

Pascal

```
procedure RemoveDatabase(Idx: Integer);
```

C++

```
__fastcall RemoveDatabase(int Idx);
```

Description

Call (see page 3749) RemoveDatabase to disassociate a specified database from the transaction.

20.1.5.4.14 TIBTransaction.RemoveDatabases Method

Disassociates all databases from the transaction.

Pascal

```
procedure RemoveDatabases;
```

C++

```
__fastcall RemoveDatabases();
```

Description

Call (see page 3749) RemoveDatabases to disassociate all databases from the transaction.

20.1.5.4.15 TIBTransaction.Rollback Method

Cancels all updates, insertions, and deletions for the current transaction and ends the transaction.

Pascal

```
procedure Rollback;
```

C++

```
__fastcall Rollback();
```

Description

Call (see page 3749) Rollback to cancel all updates, insertions, and deletions for the current transaction and to end the transaction. The current transaction is the last transaction started by calling StartTransaction (see page 3754).

Note: Before calling Rollback, an application may check the status of the InTransaction (see page 3758) property. If an application calls Rollback and there is no current transaction, an exception is raised.

20.1.5.4.16 TIBTransaction.RollbackRetaining Method

Cancels all updates, insertions, and deletions for the current transaction and retains the transaction context.

Pascal

```
procedure RollbackRetaining;
```

C++

```
__fastcall RollbackRetaining();
```

Description

Call (see page 3749) RollbackRetaining to roll back to the database server all updates, insertions, and deletions of data associated with the current transaction and then retain the transaction context. The current transaction is the last transaction started by calling StartTransaction (see page 3754).

Note: Before calling RollbackRetaining, an application may check the status of the InTransaction (see page 3758) property. If an application calls RollbackRetaining and there is no current transaction, an exception is raised.

Note: You must install InterBase 6 to use this feature.

20.1.5.4.17 TIBTransaction.SetHandle Method

Pascal

```
procedure SetHandle(Value: TISC_TR_HANDLE);
```

C++

```
__fastcall SetHandle(TISC_TR_HANDLE Value);
```

Description

This is SetHandle, a member of class TIBTransaction.

20.1.5.4.18 TIBTransaction.StartTransaction Method

Begins a new transaction against the database server.

Pascal

```
procedure StartTransaction;
```

C++

```
__fastcall StartTransaction();
```

Description

Call (see page 3749) StartTransaction to begin a new transaction against the database server. Before calling StartTransaction, an application should check the status of the InTransaction (see page 3758) property. If InTransaction (see page 3758) is true, indicating that a transaction is already in progress, a subsequent call to StartTransaction without first calling Commit (see page 3751) or Rollback (see page 3753) to end the current transaction raises an exception.

Updates, insertions, and deletions that take place after a call to StartTransaction are held by the server until an application calls Commit (see page 3751) to save the changes or Rollback (see page 3753) is to cancel them.

20.1.5.5 TIBTransaction Properties

The properties of the TIBTransaction class are listed here.

Public Properties

	Name	Description
	DatabaseCount (see page 3756)	Indicates the number of databases that are part of the transaction.
	Databases (see page 3756)	Returns the database at the given integer index.
	Handle (see page 3757)	Returns the transaction handle.
	HandleIsShared (see page 3757)	Indicates whether or not the handle is shared.
	InTransaction (see page 3758)	Indicates whether a database transaction is in progress or not.
	SQLObjectCount (see page 3758)	Returns the number of active datasets associated with the database component.
	SQLObjects (see page 3758)	Provides an indexed array of all active datasets for a database component.
	TPB (see page 3759)	Provides a read-only view of the transaction parameter buffer.
	TPBLength (see page 3759)	Returns the length of the transaction parameter buffer.

Published Properties

	Name	Description
	Active (see page 3755)	Specifies whether or not a transaction is active.
	AutoStopAction (see page 3755)	Specifies what action to take when automatically ending transactions.
	DefaultAction (see page 3756)	Specifies what action a transaction should take upon timing out.
	DefaultDatabase (see page 3757)	Sets or returns the default database for the transaction.
	IdleTimer (see page 3757)	Specifies how long the transaction should wait before automatically committing or rolling back.
	Params (see page 3758)	Returns the transaction parameter buffer associated with the transaction component.

20.1.5.5.1 TIBTransaction.Active Property

Specifies whether or not a transaction is active.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine or set a transaction's active state.

20.1.5.5.2 TIBTransaction.AutoStopAction Property

Specifies what action to take when automatically ending transactions.

Pascal

```
property AutoStopAction: TAutoStopAction;
```

C++

```
__property TAutoStopAction AutoStopAction;
```

Description

Use AutoStopAction to specify how the transaction should end when it is implicitly stopped. Transactions are implicitly stopped when AutoStopAction is not saNone and the last dataset associated with the transaction closes.

Note: This property only works with the closing of TDataSet descendants. If the transaction also includes TIBSQL components, AutoStopAction should be saNone, because the transaction can't tell whether there are any active TIBSQL components.

20.1.5.5.3 TIBTransaction.DatabaseCount Property

Indicates the number of databases that are part of the transaction.

Pascal

```
property DatabaseCount: Integer;
```

C++

```
__property int DatabaseCount;
```

Description

Use DatabaseCount to determine the number of databases involved in a transaction.

20.1.5.5.4 TIBTransaction.Databases Property

Returns the database at the given integer index.

Pascal

```
property Databases [Index: Integer]: TIBDatabase;
```

C++

```
__property TIBDatabase Databases[int Index];
```

Description

Use Databases to return the database at the given integer index.

20.1.5.5.5 TIBTransaction.DefaultAction Property

Specifies what action a transaction should take upon timing out.

Pascal

```
property DefaultAction: TTransactionAction;
```

C++

```
__property TTransactionAction DefaultAction;
```

Description

Use DefaultAction to what action the transaction should take when the IdleTimer (see page 3757) limit is met.

20.1.5.5.6 TIBTransaction.DefaultDatabase Property

Sets or returns the default database for the transaction.

Pascal

```
property DefaultDatabase: TIBDatabase;
```

C++

```
__property TIBDatabase DefaultDatabase;
```

Description

Use DefaultDatabase to set or return the default database for the transaction.

20.1.5.5.7 TIBTransaction.Handle Property

Returns the transaction handle.

Pascal

```
property Handle: TISC_TR_HANDLE;
```

C++

```
__property TISC_TR_HANDLE Handle;
```

Description

Use Handle to retrieve a handle to the transaction. Handle is assigned an initial value when a transaction is started.

20.1.5.5.8 TIBTransaction.HandleIsShared Property

Indicates whether or not the handle is shared.

Pascal

```
property HandleIsShared: Boolean;
```

C++

```
__property Boolean HandleIsShared;
```

Description

HandleIsShared returns true when the transaction handle is shared by more than one transaction component.

20.1.5.5.9 TIBTransaction.IdleTimer Property

Specifies how long the transaction should wait before automatically committing or rolling back.

Pascal

```
property IdleTimer: Integer;
```

C++

```
__property int IdleTimer;
```

Description

Use IdleTimer to indicate how long a transaction should be allowed to remain idle before automatically committing or rolling back the data. Use DefaultAction (see page 3756) to determine which action the transaction should take.

20.1.5.5.10 TIBTransaction.InTransaction Property

Indicates whether a database transaction is in progress or not.

Pascal

```
property InTransaction: Boolean;
```

C++

```
__property Boolean InTransaction;
```

Description

Examine InTransaction at run-time to determine if a database transaction is currently in progress. InTransaction is true if a transaction is in progress, false otherwise.

The value of InTransaction cannot be changed directly. Calling StartTransaction (see page 3754) sets InTransaction to true. Calling Commit (see page 3751) or Rollback (see page 3753) sets InTransaction to false.

20.1.5.5.11 TIBTransaction.Params Property

Returns the transaction parameter buffer associated with the transaction component.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use Params to examine and set parameters in the transaction parameter buffer. Refer to the Interbase API Guide for the names of the parameters to provide.

20.1.5.5.12 TIBTransaction.SQLObjectCount Property

Returns the number of active datasets associated with the database component.

Pascal

```
property SQLObjectCount: Integer;
```

C++

```
__property int SQLObjectCount;
```

Description

Use the SQLObjectCount property to return the number currently active InterBase datasets, TIBSQL objects, and Blobs associated with the database component. As SQL objects are opened and closed, this value changes appropriately.

20.1.5.5.13 TIBTransaction.SQLObjects Property

Provides an indexed array of all active datasets for a database component.

Pascal

```
property SQLObjects [Index: Integer]: TIBBase;
```

C++

```
__property TIBBase SQLObjects[int Index];
```

Description

Use the SQLObjects to access active InterBase datasets, TIBSQL objects, and Blobs associated with the database component.

20.1.5.5.14 TIBTransaction.TPB Property

Provides a read-only view of the transaction parameter buffer.

Pascal

```
property TPB: PChar;
```

C++

```
__property const char * TPB;
```

Description

Use TPB view the transaction parameter buffer. To write to the transaction parameter buffer, use the Params (see page 3758) property.

20.1.5.5.15 TIBTransaction.TPBLength Property

Returns the length of the transaction parameter buffer.

Pascal

```
property TPBLength: Short;
```

C++

```
__property Short TPBLength;
```

Description

Use TPBLength to retrieve the length of the transaction parameter buffer

20.1.5.6 TIBTransaction Events

The events of the TIBTransaction class are listed here.

Published Events

	Name	Description
	OnIdleTimer (see page 3759)	Occurs after a transaction has timed out.

20.1.5.6.1 TIBTransaction.OnIdleTimer Event

Occurs after a transaction has timed out.

Pascal

```
property OnIdleTimer: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnIdleTimer;
```

Description

Write an OnIdleTimer event handler to take specific actions after a transaction is allowed to remain idle for the number of seconds specified by IdleTimer (see page 3757).

20.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IIBEventNotifier (see page 3761)	IIBEventNotifier allows a TIBDatabase component to automatically register interest in events on the InterBase server.

20.2.1 IIBEventNotifier Interface

IIBEventNotifier allows a TIBDatabase component to automatically register interest in events on the InterBase server.

Class Hierarchy

Pascal

```
IIBEventNotifier = interface;
```

C++

```
__interface IIBEventNotifier;
```

File

IBDatabase

Description

TIBDatabase uses the IIBEventNotifier interface to communicate with objects such as TIBEvents that register an interest in events on the InterBase server.

Note: VCL Method declarations that use IIBEventNotifier use the _di_IIBEventNotifier type instead. This is a DelphiInterface wrapper around the IIBEventNotifier interface:

```
typedef System::DelphiInterface< IIBEventNotifier > _di_IIBEventNotifier;
```

20.2.1.1 IIBEventNotifier Members

The following tables list the members exposed by IIBEventNotifier.

Public Methods

	Name	Description
	GetAutoRegister (see page 3762)	Indicates whether the database should automatically register events after it connects to the server.
	RegisterEvents (see page 3762)	Registers interest in a set of events with the InterBase Event manager.
	UnRegisterEvents (see page 3762)	Unregisters interest in the events previously registered by a call to RegisterEvents (see page 3762).

20.2.1.2 IIBEventNotifier Methods

The methods of the IIBEventNotifier class are listed here.

Public Methods

	Name	Description
	GetAutoRegister (see page 3762)	Indicates whether the database should automatically register events after it connects to the server.
	RegisterEvents (see page 3762)	Registers interest in a set of events with the InterBase Event manager.
	UnRegisterEvents (see page 3762)	Unregisters interest in the events previously registered by a call to RegisterEvents (see page 3762).

20.2.1.2.1 IIBEventNotifier.GetAutoRegister Method

Indicates whether the database should automatically register events after it connects to the server.

Pascal

```
function GetAutoRegister: Boolean;
```

C++

```
__fastcall Boolean GetAutoRegister();
```

Description

When TIBDatabase connects to an InterBase server, it calls the GetAutoRegister method for every object in its list of event notifiers. For any event notifier that returns true, it calls the RegisterEvents (see page 3762) method, so that the event notifier can register interest in its events with the InterBase Event Manager.

20.2.1.2.2 IIBEventNotifier.RegisterEvents Method

Registers interest in a set of events with the InterBase Event manager.

Pascal

```
procedure RegisterEvents;
```

C++

```
__fastcall RegisterEvents();
```

Description

RegisterEvents tells the event notifier to register its interest in a set of events with the InterBase Event manager.

20.2.1.2.3 IIBEventNotifier.UnRegisterEvents Method

Unregisters interest in the events previously registered by a call to RegisterEvents (see page 3762).

Pascal

```
procedure UnRegisterEvents;
```

C++

```
__fastcall UnRegisterEvents();
```

Description

UnRegisterEvents cancels the interest in the events that was previously registered by a call to RegisterEvents (see page 3762). TIBDataBase (see page 3716) uses this interface to unregister all of its event notifiers when it disconnects from the

InterBase server.

20.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GenerateDPB (see page 3764)	This is function IBDatabase.GenerateDPB.
	GenerateTPB (see page 3764)	This is function IBDatabase.GenerateTPB.

20.3.1 IBDatabase.GenerateDPB Function

Pascal

```
procedure GenerateDPB(sl: TStrings; var DPB: string; var DPBLength: Short);
```

C++

```
GenerateDPB(TStrings sl, UnicodeString DPB, Short DPBLength);
```

File

IBDatabase

Description

This is function IBDatabase.GenerateDPB.

20.3.2 IBDatabase.GenerateTPB Function

Pascal

```
procedure GenerateTPB(sl: TStrings; var TPB: string; var TPBLength: Short);
```

C++

```
GenerateTPB(TStrings sl, UnicodeString TPB, Short TPBLength);
```

File

IBDatabase

Description

This is function IBDatabase.GenerateTPB.

20.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoStopAction (see page 3765)	TAutoStopAction indicates the action to take on automatically ended transactions.
	TTransactionAction (see page 3766)	TTransactionAction indicates the action a transaction can take when it times out.

20.4.1 IBDatabase.TAutoStopAction Enumeration

TAutoStopAction indicates the action to take on automatically ended transactions.

Pascal

```
TAutoStopAction = (
  saNone,
  saRollback,
  saCommit,
  saRollbackRetaining,
  saCommitRetaining
);
```

C++

```
enum TAutoStopAction {
  saNone,
  saRollback,
  saCommit,
  saRollbackRetaining,
  saCommitRetaining
};
```

File

IBDatabase

Description

TAutoStopAction values are:

Value Meaning

saNone Transactions are not implicitly stopped.

saRollback Transactions are rolled back and closed when stopped implicitly.

saCommit Transactions are committed and closed when stopped implicitly.

saRollbackRetaining Transactions are not stopped when the last dataset closes, but all updates, insertions, and deletions of data associated with the current transaction are backed out. This option is only supported in InterBase 6.0 and later.

saCommitRetaining Transactions are not stopped when the last dataset closes, but all updates, insertions, and deletions of data associated with the current transaction are committed.

20.4.2 IBDatabase.TTransactionAction Enumeration

TTransactionAction indicates the action a transaction can take when it times out.

Pascal

```
TTransactionAction = (
  TARollback,
  TACommit,
  TARollbackRetaining,
  TACommitRetaining
);
```

C++

```
enum TTransactionAction {
  TARollback,
  TACommit,
  TARollbackRetaining,
  TACommitRetaining
};
```

File

IBDatabase

Description

TTransactionAction values are:

Value Meaning

TARollback Roll back the transaction.

TACommit Commit the transaction.

TARollbackRetaining Roll back the transaction, but retain the current transaction context. (Requires InterBase 6.0 or later)

TACommitRetaining Commit the transaction, but retain the current transaction context.

20.5 Types

The following table lists types in this documentation.

Types

Name	Description
TIBDatabaseLoginEvent (see page 3767)	TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 3541) database component forms a connection to an InterBase server.
TIBFileName (see page 3767)	This is type IBDatabase.TIBFileName.

20.5.1 IBDatabase.TIBDatabaseLoginEvent Type

TIBDatabaseLoginEvent is the type of event handlers that respond when an IB (see page 3541) database component forms a connection to an InterBase server.

Pascal

```
TIBDatabaseLoginEvent = procedure (Database: TIBDatabase; LoginParams: TStrings) of object;
```

C++

```
(Database: TIBDatabase; LoginParams: TStrings) ( TIBDatabaseLoginEvent)();
```

File

IBDatabase

Description

Database is the connection component that establishes the connection to the InterBase server.

LoginParams is a temporary string list that contains the login parameters for forming the connection. The event handler can examine or change any of these value. Each parameter is of the form Name=Value. Of particular importance are the parameters with the names USER_NAME and PASSWORD. This string list does not persist: the IB (see page 3541) database component frees it when it is no longer needed.

20.5.2 IBDatabase.TIBFileName Type

Pascal

```
TIBFileName = type string;
```

C++

```
type string TIBFileName;
```

File

IBDatabase

Description

This is type IBDatabase.TIBFileName.

20.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DPBConstantNames (see page 3768)	This is constant IBDatabase.DPBConstantNames.
DPBPrefix (see page 3769)	This is constant IBDatabase.DPBPrefix.
TPBConstantNames (see page 3769)	This is constant IBDatabase.TPBConstantNames.
TPBPrefix (see page 3769)	This is constant IBDatabase.TPBPrefix.

20.6.1 IBDatabase.DPBConstantNames Constant

Pascal

```
DPBConstantNames: array[1..isc_dpb_last_dpb_constant] of string = ( 'cdd_pathname',
'allocation', 'journal', 'page_size', 'num_buffers', 'buffer_length', 'debug',
'garbage_collect', 'verify', 'sweep', 'enable_journal', 'disable_journal', 'dbkey_scope',
'number_of_users', 'trace', 'no_garbage_collect', 'damaged', 'license', 'sys_user_name',
'encrypt_key', 'activate_shadow', 'sweep_interval', 'delete_shadow', 'force_write',
'begin_log', 'quit_log', 'no_reserve', 'user_name', 'password', 'password_enc',
'sys_user_name_enc', 'interp', 'online_dump', 'old_file_size', 'old_num_files', 'old_file',
'old_start_page', 'old_start_seqno', 'old_start_file', 'drop_walfile', 'old_dump_id',
'wal_backup_dir', 'wal_chkptlen', 'wal_numbufs', 'wal_bufsize', 'wal_grp_cmt_wait',
'lc_messages', 'lc_ctype', 'cache_manager', 'shutdown', 'online', 'shutdown_delay',
'reserved', 'overwrite', 'sec_attach', 'disable_wal', 'connect_timeout',
'dummy_packet_interval', 'gbak_attach', 'sql_role_name', 'set_page_buffers',
'working_directory', 'sql_dialect', 'set_db_readonly', 'set_db_sql_dialect', 'gfix_attach',
'gstat_attach' );
```

C++

```
array[1..isc_dpb_last_dpb_constant] of string DPBConstantNames = ( 'cdd_pathname',
'allocation', 'journal', 'page_size', 'num_buffers', 'buffer_length', 'debug',
'garbage_collect', 'verify', 'sweep', 'enable_journal', 'disable_journal', 'dbkey_scope',
'number_of_users', 'trace', 'no_garbage_collect', 'damaged', 'license', 'sys_user_name',
'encrypt_key', 'activate_shadow', 'sweep_interval', 'delete_shadow', 'force_write',
'begin_log', 'quit_log', 'no_reserve', 'user_name', 'password', 'password_enc',
'sys_user_name_enc', 'interp', 'online_dump', 'old_file_size', 'old_num_files', 'old_file',
'old_start_page', 'old_start_seqno', 'old_start_file', 'drop_walfile', 'old_dump_id',
'wal_backup_dir', 'wal_chkptlen', 'wal_numbufs', 'wal_bufsize', 'wal_grp_cmt_wait',
'lc_messages', 'lc_ctype', 'cache_manager', 'shutdown', 'online', 'shutdown_delay',
'reserved', 'overwrite', 'sec_attach', 'disable_wal', 'connect_timeout',
'dummy_packet_interval', 'gbak_attach', 'sql_role_name', 'set_page_buffers',
'working_directory', 'sql_dialect', 'set_db_readonly', 'set_db_sql_dialect', 'gfix_attach',
'gstat_attach' );
```

File

IBDatabase

Description

This is constant IBDatabase.DPBConstantNames.

20.6.2 IBDatabase.DPBPrefix Constant

Pascal

```
DPBPrefix = 'isc_dpb_';
```

C++

```
DPBPrefix = 'isc_dpb_';
```

File

IBDatabase

Description

This is constant IBDatabase.DPBPrefix.

20.6.3 IBDatabase.TPBConstantNames Constant

Pascal

```
TPBConstantNames: array[1..isc_tpb_last_tpb_constant] of string = ( 'consistency',
'concurrency', 'shared', 'protected', 'exclusive', 'wait', 'nowait', 'read', 'write',
'lock_read', 'lock_write', 'verb_time', 'commit_time', 'ignore_limbo', 'read_committed',
'autocommit', 'rec_version', 'no_rec_version', 'restart_requests', 'no_auto_undo' );
```

C++

```
array[1..isc_tpb_last_tpb_constant] of string TPBConstantNames = ( 'consistency',
'concurrency', 'shared', 'protected', 'exclusive', 'wait', 'nowait', 'read', 'write',
'lock_read', 'lock_write', 'verb_time', 'commit_time', 'ignore_limbo', 'read_committed',
'autocommit', 'rec_version', 'no_rec_version', 'restart_requests', 'no_auto_undo' );
```

File

IBDatabase

Description

This is constant IBDatabase.TPBConstantNames.

20.6.4 IBDatabase.TPBPrefix Constant

Pascal

```
TPBPrefix = 'isc_tpb_';
```

C++

```
TPBPrefix = 'isc_tpb_';
```

File

IBDatabase

Description

This is constant IBDatabase.TPBPrefix.

21 IBDatabaseInfo Namespace

This is namespace IBDatabaseInfo.

Topics

Name	Description
Classes (see page 3772)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBDatabaseInfo (see page 3772)	TIBDatabaseInfo returns information about the attached database.

21.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBDatabaseInfo (see page 3772)	TIBDatabaseInfo returns information about the attached database.

21.1.1 TIBDatabaseInfo Class

TIBDatabaseInfo returns information about the attached database.

Class Hierarchy

Pascal

```
TIBDatabaseInfo = class(TComponent);
```

C++

```
class TIBDatabaseInfo : public TComponent;
```

File

IBDatabaseInfo

Description

Use TIBDatabaseInfo to fetch information about the attached database, such as the version of the online disk structure (ODS) used by the attachment, the number of database cache buffers allocated, the number of database pages read from or written to, or write-ahead log information.

21.1.1.1 TIBDatabaseInfo Members

The following tables list the members exposed by TIBDatabaseInfo.

Protected Fields

	Name	Description
	FBackoutCount (see page 3775)	This is FBackoutCount, a member of class TIBDatabaseInfo.
	FDatabase (see page 3775)	This is FDatabase, a member of class TIBDatabaseInfo.
	FDeleteCount (see page 3776)	This is FDeleteCount, a member of class TIBDatabaseInfo.
	FExpungeCount (see page 3776)	This is FExpungeCount, a member of class TIBDatabaseInfo.
	FIBLoaded (see page 3776)	This is FIBLoaded, a member of class TIBDatabaseInfo.
	FInsertCount (see page 3776)	This is FInsertCount, a member of class TIBDatabaseInfo.
	FPurgeCount (see page 3776)	This is FPurgeCount, a member of class TIBDatabaseInfo.
	FReadIdxCount (see page 3777)	This is FReadIdxCount, a member of class TIBDatabaseInfo.

	FReadSeqCount (see page 3777)	This is FReadSeqCount, a member of class TIBDatabaseInfo.
	FUpdateCount (see page 3777)	This is FUpdateCount, a member of class TIBDatabaseInfo.
	FUserNames (see page 3777)	This is FUserNames, a member of class TIBDatabaseInfo.

Protected Methods

	Name	Description
	GetAllocation (see page 3779)	This is GetAllocation, a member of class TIBDatabaseInfo.
	GetBackoutCount (see page 3779)	This is GetBackoutCount, a member of class TIBDatabaseInfo.
	GetBaseLevel (see page 3779)	This is GetBaseLevel, a member of class TIBDatabaseInfo.
	GetCurrentMemory (see page 3779)	This is GetCurrentMemory, a member of class TIBDatabaseInfo.
	GetDBFileName (see page 3779)	This is GetDBFileName, a member of class TIBDatabaseInfo.
	GetDBImplementationClass (see page 3780)	This is GetDBImplementationClass, a member of class TIBDatabaseInfo.
	GetDBImplementationNo (see page 3780)	This is GetDBImplementationNo, a member of class TIBDatabaseInfo.
	GetDBSiteName (see page 3780)	This is GetDBSiteName, a member of class TIBDatabaseInfo.
	GetDBSQLDialect (see page 3780)	This is GetDBSQLDialect, a member of class TIBDatabaseInfo.
	GetDeleteCount (see page 3781)	This is GetDeleteCount, a member of class TIBDatabaseInfo.
	GetExpungeCount (see page 3781)	This is GetExpungeCount, a member of class TIBDatabaseInfo.
	GetFetches (see page 3781)	This is GetFetches, a member of class TIBDatabaseInfo.
	GetForcedWrites (see page 3781)	This is GetForcedWrites, a member of class TIBDatabaseInfo.
	GetInsertCount (see page 3781)	This is GetInsertCount, a member of class TIBDatabaseInfo.
	GetMarks (see page 3782)	This is GetMarks, a member of class TIBDatabaseInfo.
	GetMaxMemory (see page 3782)	This is GetMaxMemory, a member of class TIBDatabaseInfo.
	GetNoReserve (see page 3782)	This is GetNoReserve, a member of class TIBDatabaseInfo.
	GetNumBuffers (see page 3783)	This is GetNumBuffers, a member of class TIBDatabaseInfo.
	GetODSMajorVersion (see page 3783)	This is GetODSMajorVersion, a member of class TIBDatabaseInfo.
	GetODSMinorVersion (see page 3783)	This is GetODSMinorVersion, a member of class TIBDatabaseInfo.
	GetOperationCounts (see page 3783)	This is GetOperationCounts, a member of class TIBDatabaseInfo.
	GetPageSize (see page 3784)	This is GetPageSize, a member of class TIBDatabaseInfo.
	GetPurgeCount (see page 3784)	This is GetPurgeCount, a member of class TIBDatabaseInfo.
	GetReadIdxCount (see page 3784)	This is GetReadIdxCount, a member of class TIBDatabaseInfo.
	GetReadOnly (see page 3784)	This is GetReadOnly, a member of class TIBDatabaseInfo.
	GetReads (see page 3784)	This is GetReads, a member of class TIBDatabaseInfo.
	GetReadSeqCount (see page 3785)	This is GetReadSeqCount, a member of class TIBDatabaseInfo.
	GetStringDatabaseInfo (see page 3785)	This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.
	GetSweepInterval (see page 3785)	This is GetSweepInterval, a member of class TIBDatabaseInfo.
	GetUpdateCount (see page 3785)	This is GetUpdateCount, a member of class TIBDatabaseInfo.
	GetUserNames (see page 3786)	This is GetUserNames, a member of class TIBDatabaseInfo.
	GetVersion (see page 3786)	This is GetVersion, a member of class TIBDatabaseInfo.
	GetWrites (see page 3786)	This is GetWrites, a member of class TIBDatabaseInfo.

Public Methods

	Name	Description
	Call (see page 3778)	Returns an error message based on the error code.
V	Create (see page 3774)	Creates an instance of a DatabaseInfo component.
V	Destroy (see page 3774)	Destroys an instance of a DatabaseInfo component.
	GetLongDatabaseInfo (see page 3782)	Returns a specified long integer that describes some aspect of the associated database.

Public Properties

	Name	Description
R	Allocation (see page 3787)	Returns the number of database pages allocated.
R	BackoutCount (see page 3787)	Returns the number of removals of a version of a record.
R	BaseLevel (see page 3788)	Returns the database version number.
R	CurrentMemory (see page 3788)	Returns the amount of server memory currently in use.
R	DBFileName (see page 3788)	Returns the database filename.

	DBImplementationClass (see page 3789)	Returns the database implementation class number.
	DBImplementationNo (see page 3789)	Returns the database implementation number.
	DBSiteName (see page 3789)	Returns the database site name.
	DBSQLDialect (see page 3789)	Returns the SQL dialect.
	DeleteCount (see page 3790)	Returns the number of database deletes since the database was last attached.
	ExpungeCount (see page 3790)	Returns the number of removals of a record and all of its ancestors.
	Fetches (see page 3790)	Returns the number of reads from the memory buffer cache.
	ForcedWrites (see page 3790)	Returns the mode in which database writes are performed.
	InsertCount (see page 3791)	Returns number of inserts into the database since the database was last attached.
	Marks (see page 3791)	Returns the number of writes to the memory buffer cache.
	MaxMemory (see page 3791)	Returns the maximum amount of memory used at one time since the first process attached to the database.
	NoReserve (see page 3791)	Returns whether or not space is reserved on each database page for holding backup versions of modified records.
	NumBuffers (see page 3792)	Returns the number of memory buffers currently allocated.
	ODSMajorVersion (see page 3792)	Returns the on disk structure (ODS) major version number.
	ODSMinorVersion (see page 3792)	Returns the on disk structure (ODS) minor version number.
	PageSize (see page 3792)	Returns the number of bytes per page of the attached database.
	PurgeCount (see page 3793)	Returns the number of removals of fully mature records from the database.
	ReadIdxCount (see page 3793)	Returns the number of reads done via an index since the database was last attached.
	ReadOnly (see page 3793)	Indicates whether or not the database is read only.
	Reads (see page 3793)	Returns the number of page reads from the database.
	ReadSeqCount (see page 3794)	Returns the number of sequential database reads done on each table since the database was last attached.
	SweepInterval (see page 3794)	Returns the number of transactions that are committed between 'sweeps.'
	UpdateCount (see page 3794)	Returns the number of database updates since the database was last attached.
	UserNames (see page 3795)	Returns the names of all users currently attached to the database.
	Version (see page 3795)	Returns the version of the database implementation.
	Writes (see page 3795)	Returns the number of page writes to the database.

Published Properties

	Name	Description
	Database (see page 3788)	Sets or returns the database.

21.1.1.2 TIBDatabaseInfo.Create Constructor

Creates an instance of a DatabaseInfo component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBDatabaseInfo(TComponent * AOwner);
```

Description

Call (see page 3778) Create to instantiate a DatabaseInfo component declared in an application.

21.1.1.3 TIBDatabaseInfo.Destroy Destructor

Destroys an instance of a DatabaseInfo component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBDatabaseInfo();
```

Description

Do not call Destroy directly. Instead call Free to verify that the DatabaseInfo component is not already freed before calling Destroy. Destroy disconnects from the server, frees the parameter list, and calls its inherited Destroy destructor.

21.1.1.4 TIBDatabaseInfo Fields

The fields of the TIBDatabaseInfo class are listed here.

Protected Fields

	Name	Description
	FBackoutCount (see page 3775)	This is FBackoutCount, a member of class TIBDatabaseInfo.
	FDatabase (see page 3775)	This is FDatabase, a member of class TIBDatabaseInfo.
	FDeleteCount (see page 3776)	This is FDeleteCount, a member of class TIBDatabaseInfo.
	FExpungeCount (see page 3776)	This is FExpungeCount, a member of class TIBDatabaseInfo.
	FIBLoaded (see page 3776)	This is FIBLoaded, a member of class TIBDatabaseInfo.
	FInsertCount (see page 3776)	This is FInsertCount, a member of class TIBDatabaseInfo.
	FPurgeCount (see page 3776)	This is FPurgeCount, a member of class TIBDatabaseInfo.
	FReadIdxCount (see page 3777)	This is FReadIdxCount, a member of class TIBDatabaseInfo.
	FReadSeqCount (see page 3777)	This is FReadSeqCount, a member of class TIBDatabaseInfo.
	FUpdateCount (see page 3777)	This is FUpdateCount, a member of class TIBDatabaseInfo.
	FUserNames (see page 3777)	This is FUserNames, a member of class TIBDatabaseInfo.

21.1.1.4.1 TIBDatabaseInfo.FBackoutCount Field

Pascal

```
FBackoutCount: TStringList;
```

C++

```
TStringList FBackoutCount;
```

Description

This is FBackoutCount, a member of class TIBDatabaseInfo.

21.1.1.4.2 TIBDatabaseInfo.FDatabase Field

Pascal

```
FDatabase: TIBDatabase;
```

C++

```
TIBDatabase FDatabase;
```

Description

This is FDatabase, a member of class TIBDatabaseInfo.

21.1.1.4.3 TIBDatabaseInfo.FDeleteCount Field

Pascal

```
FDeleteCount: TStringList;
```

C++

```
TStringList FDeleteCount;
```

Description

This is FDeleteCount, a member of class TIBDatabaseInfo.

21.1.1.4.4 TIBDatabaseInfo.FExpungeCount Field

Pascal

```
FExpungeCount: TStringList;
```

C++

```
TStringList FExpungeCount;
```

Description

This is FExpungeCount, a member of class TIBDatabaseInfo.

21.1.1.4.5 TIBDatabaseInfo.FIBLoaded Field

Pascal

```
FIBLoaded: Boolean;
```

C++

```
Boolean FIBLoaded;
```

Description

This is FIBLoaded, a member of class TIBDatabaseInfo.

21.1.1.4.6 TIBDatabaseInfo.FInsertCount Field

Pascal

```
FInsertCount: TStringList;
```

C++

```
TStringList FInsertCount;
```

Description

This is FInsertCount, a member of class TIBDatabaseInfo.

21.1.1.4.7 TIBDatabaseInfo.FPurgeCount Field

Pascal

```
FPurgeCount: TStringList;
```

C++

```
TStringList FPurgeCount;
```

Description

This is FPurgeCount, a member of class TIBDatabaseInfo.

21.1.1.4.8 TIBDatabaseInfo.FReadIdxCount Field

Pascal

```
FReadIdxCount: TStringList;
```

C++

```
TStringList FReadIdxCount;
```

Description

This is FReadIdxCount, a member of class TIBDatabaseInfo.

21.1.1.4.9 TIBDatabaseInfo.FReadSeqCount Field

Pascal

```
FReadSeqCount: TStringList;
```

C++

```
TStringList FReadSeqCount;
```

Description

This is FReadSeqCount, a member of class TIBDatabaseInfo.

21.1.1.4.10 TIBDatabaseInfo.FUpdateCount Field

Pascal

```
FUpdateCount: TStringList;
```

C++

```
TStringList FUpdateCount;
```

Description

This is FUpdateCount, a member of class TIBDatabaseInfo.

21.1.1.4.11 TIBDatabaseInfo.FUserNames Field

Pascal

```
FUserNames: TStringList;
```

C++

```
TStringList FUserNames;
```

Description

This is FUserNames, a member of class TIBDatabaseInfo.

21.1.1.5 TIBDatabaseInfo Methods

The methods of the TIBDatabaseInfo class are listed here.

Protected Methods

	Name	Description
	GetAllocation (see page 3779)	This is GetAllocation, a member of class TIBDatabaseInfo.
	GetBackoutCount (see page 3779)	This is GetBackoutCount, a member of class TIBDatabaseInfo.
	GetBaseLevel (see page 3779)	This is GetBaseLevel, a member of class TIBDatabaseInfo.
	GetCurrentMemory (see page 3779)	This is GetCurrentMemory, a member of class TIBDatabaseInfo.
	GetDBFileName (see page 3779)	This is GetDBFileName, a member of class TIBDatabaseInfo.
	GetDBImplementationClass (see page 3780)	This is GetDBImplementationClass, a member of class TIBDatabaseInfo.
	GetDBImplementationNo (see page 3780)	This is GetDBImplementationNo, a member of class TIBDatabaseInfo.
	GetDBSiteName (see page 3780)	This is GetDBSiteName, a member of class TIBDatabaseInfo.
	GetDBSQLDialect (see page 3780)	This is GetDBSQLDialect, a member of class TIBDatabaseInfo.
	GetDeleteCount (see page 3781)	This is GetDeleteCount, a member of class TIBDatabaseInfo.
	GetExpungeCount (see page 3781)	This is GetExpungeCount, a member of class TIBDatabaseInfo.
	GetFetches (see page 3781)	This is GetFetches, a member of class TIBDatabaseInfo.
	GetForcedWrites (see page 3781)	This is GetForcedWrites, a member of class TIBDatabaseInfo.
	GetInsertCount (see page 3781)	This is GetInsertCount, a member of class TIBDatabaseInfo.
	GetMarks (see page 3782)	This is GetMarks, a member of class TIBDatabaseInfo.
	GetMaxMemory (see page 3782)	This is GetMaxMemory, a member of class TIBDatabaseInfo.
	GetNoReserve (see page 3782)	This is GetNoReserve, a member of class TIBDatabaseInfo.
	GetNumBuffers (see page 3783)	This is GetNumBuffers, a member of class TIBDatabaseInfo.
	GetODSMajorVersion (see page 3783)	This is GetODSMajorVersion, a member of class TIBDatabaseInfo.
	GetODSMinorVersion (see page 3783)	This is GetODSMinorVersion, a member of class TIBDatabaseInfo.
	GetOperationCounts (see page 3783)	This is GetOperationCounts, a member of class TIBDatabaseInfo.
	GetPageSize (see page 3784)	This is GetPageSize, a member of class TIBDatabaseInfo.
	GetPurgeCount (see page 3784)	This is GetPurgeCount, a member of class TIBDatabaseInfo.
	GetReadIdxCount (see page 3784)	This is GetReadIdxCount, a member of class TIBDatabaseInfo.
	GetReadOnly (see page 3784)	This is GetReadOnly, a member of class TIBDatabaseInfo.
	GetReads (see page 3784)	This is GetReads, a member of class TIBDatabaseInfo.
	GetReadSeqCount (see page 3785)	This is GetReadSeqCount, a member of class TIBDatabaseInfo.
	GetStringDatabaseInfo (see page 3785)	This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.
	GetSweepInterval (see page 3785)	This is GetSweepInterval, a member of class TIBDatabaseInfo.
	GetUpdateCount (see page 3785)	This is GetUpdateCount, a member of class TIBDatabaseInfo.
	GetUserNames (see page 3786)	This is GetUserNames, a member of class TIBDatabaseInfo.
	GetVersion (see page 3786)	This is GetVersion, a member of class TIBDatabaseInfo.
	GetWrites (see page 3786)	This is GetWrites, a member of class TIBDatabaseInfo.

Public Methods

	Name	Description
	Call (see page 3778)	Returns an error message based on the error code.
	GetLongDatabaseInfo (see page 3782)	Returns a specified long integer that describes some aspect of the associated database.

21.1.1.5.1 TIBDatabaseInfo.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning

an error based on the value of RaiseError.

21.1.1.5.2 TIBDatabaseInfo.GetAllocation Method

Pascal

```
function GetAllocation: Long;
```

C++

```
__fastcall Long GetAllocation();
```

Description

This is GetAllocation, a member of class TIBDatabaseInfo.

21.1.1.5.3 TIBDatabaseInfo.GetBackoutCount Method

Pascal

```
function GetBackoutCount: TStringList;
```

C++

```
__fastcall TStringList GetBackoutCount();
```

Description

This is GetBackoutCount, a member of class TIBDatabaseInfo.

21.1.1.5.4 TIBDatabaseInfo.GetBaseLevel Method

Pascal

```
function GetBaseLevel: Long;
```

C++

```
__fastcall Long GetBaseLevel();
```

Description

This is GetBaseLevel, a member of class TIBDatabaseInfo.

21.1.1.5.5 TIBDatabaseInfo.GetCurrentMemory Method

Pascal

```
function GetCurrentMemory: Long;
```

C++

```
__fastcall Long GetCurrentMemory();
```

Description

This is GetCurrentMemory, a member of class TIBDatabaseInfo.

21.1.1.5.6 TIBDatabaseInfo.GetDBFileName Method

Pascal

```
function GetDBFileName: String;
```

C++

```
__fastcall UnicodeString GetDBFileName();
```

Description

This is GetDBFileName, a member of class TIBDatabaseInfo.

21.1.1.5.7 TIBDatabaseInfo.GetDBImplementationClass Method

Pascal

```
function GetDBImplementationClass: Long;
```

C++

```
__fastcall Long GetDBImplementationClass();
```

Description

This is GetDBImplementationClass, a member of class TIBDatabaseInfo.

21.1.1.5.8 TIBDatabaseInfo.GetDBImplementationNo Method

Pascal

```
function GetDBImplementationNo: Long;
```

C++

```
__fastcall Long GetDBImplementationNo();
```

Description

This is GetDBImplementationNo, a member of class TIBDatabaseInfo.

21.1.1.5.9 TIBDatabaseInfo.GetDBSiteName Method

Pascal

```
function GetDBSiteName: String;
```

C++

```
__fastcall UnicodeString GetDBSiteName();
```

Description

This is GetDBSiteName, a member of class TIBDatabaseInfo.

21.1.1.5.10 TIBDatabaseInfo.GetDBSQLDialect Method

Pascal

```
function GetDBSQLDialect: Long;
```

C++

```
__fastcall Long GetDBSQLDialect();
```

Description

This is GetDBSQLDialect, a member of class TIBDatabaseInfo.

21.1.1.5.11 TIBDatabaseInfo.GetDeleteCount Method

Pascal

```
function GetDeleteCount: TStringList;
```

C++

```
__fastcall TStringList GetDeleteCount();
```

Description

This is GetDeleteCount, a member of class TIBDatabaseInfo.

21.1.1.5.12 TIBDatabaseInfo.GetExpungeCount Method

Pascal

```
function GetExpungeCount: TStringList;
```

C++

```
__fastcall TStringList GetExpungeCount();
```

Description

This is GetExpungeCount, a member of class TIBDatabaseInfo.

21.1.1.5.13 TIBDatabaseInfo.GetFetches Method

Pascal

```
function GetFetches: Long;
```

C++

```
__fastcall Long GetFetches();
```

Description

This is GetFetches, a member of class TIBDatabaseInfo.

21.1.1.5.14 TIBDatabaseInfo.GetForcedWrites Method

Pascal

```
function GetForcedWrites: Long;
```

C++

```
__fastcall Long GetForcedWrites();
```

Description

This is GetForcedWrites, a member of class TIBDatabaseInfo.

21.1.1.5.15 TIBDatabaseInfo.GetInsertCount Method

Pascal

```
function GetInsertCount: TStringList;
```

C++

```
__fastcall TStringList GetInsertCount();
```

Description

This is GetInsertCount, a member of class TIBDatabaseInfo.

21.1.1.5.16 TIBDatabaseInfo.GetLongDatabaseInfo Method

Returns a specified long integer that describes some aspect of the associated database.

Pascal

```
function GetLongDatabaseInfo(DatabaseInfoCommand: Integer): Long;
```

C++

```
__fastcall Long GetLongDatabaseInfo(int DatabaseInfoCommand);
```

Description

TIBDatabaseInfo (see page 3772) uses GetLongDatabaseInfo internally to fetch information that can be expressed as a long integer. For example, this method provides the underlying implementation for fetching the version number or page size. It is exposed as a public member so that as the underlying _DatabaseInfoCommand interface expands its capabilities, TIBDatabaseInfo (see page 3772) can still be used to fetch information for which there is no specified property.

DatabaseInfoCommand is an index that identifies the information to fetch. It is one of the constants declared in the IBHeader unit.

Long returns desired information.

21.1.1.5.17 TIBDatabaseInfo.GetMarks Method

Pascal

```
function GetMarks: Long;
```

C++

```
__fastcall Long GetMarks();
```

Description

This is GetMarks, a member of class TIBDatabaseInfo.

21.1.1.5.18 TIBDatabaseInfo.GetMaxMemory Method

Pascal

```
function GetMaxMemory: Long;
```

C++

```
__fastcall Long GetMaxMemory();
```

Description

This is GetMaxMemory, a member of class TIBDatabaseInfo.

21.1.1.5.19 TIBDatabaseInfo.GetNoReserve Method

Pascal

```
function GetNoReserve: Long;
```

C++

```
__fastcall Long GetNoReserve();
```

Description

This is GetNoReserve, a member of class TIBDatabaseInfo.

21.1.1.5.20 TIBDatabaseInfo.GetNumBuffers Method

Pascal

```
function GetNumBuffers: Long;
```

C++

```
__fastcall Long GetNumBuffers();
```

Description

This is GetNumBuffers, a member of class TIBDatabaseInfo.

21.1.1.5.21 TIBDatabaseInfo.GetODSMajorVersion Method

Pascal

```
function GetODSMajorVersion: Long;
```

C++

```
__fastcall Long GetODSMajorVersion();
```

Description

This is GetODSMajorVersion, a member of class TIBDatabaseInfo.

21.1.1.5.22 TIBDatabaseInfo.GetODSMinorVersion Method

Pascal

```
function GetODSMinorVersion: Long;
```

C++

```
__fastcall Long GetODSMinorVersion();
```

Description

This is GetODSMinorVersion, a member of class TIBDatabaseInfo.

21.1.1.5.23 TIBDatabaseInfo.GetOperationCounts Method

Pascal

```
function GetOperationCounts(DBInfoCommand: Integer; FOperation: TStringList): TStringList;
```

C++

```
__fastcall TStringList GetOperationCounts(int DBInfoCommand, TStringList FOperation);
```

Description

This is GetOperationCounts, a member of class TIBDatabaseInfo.

21.1.1.5.24 TIBDatabaseInfo.GetPageSize Method

Pascal

```
function GetPageSize: Long;
```

C++

```
__fastcall Long GetPageSize();
```

Description

This is GetPageSize, a member of class TIBDatabaseInfo.

21.1.1.5.25 TIBDatabaseInfo.GetPurgeCount Method

Pascal

```
function GetPurgeCount: TStringList;
```

C++

```
__fastcall TStringList GetPurgeCount();
```

Description

This is GetPurgeCount, a member of class TIBDatabaseInfo.

21.1.1.5.26 TIBDatabaseInfo.GetReadIdxCount Method

Pascal

```
function GetReadIdxCount: TStringList;
```

C++

```
__fastcall TStringList GetReadIdxCount();
```

Description

This is GetReadIdxCount, a member of class TIBDatabaseInfo.

21.1.1.5.27 TIBDatabaseInfo.GetReadOnly Method

Pascal

```
function GetReadOnly: Long;
```

C++

```
__fastcall Long GetReadOnly();
```

Description

This is GetReadOnly, a member of class TIBDatabaseInfo.

21.1.1.5.28 TIBDatabaseInfo.GetReads Method

Pascal

```
function GetReads: Long;
```

C++

```
__fastcall Long GetReads();
```

Description

This is GetReads, a member of class TIBDatabaseInfo.

21.1.1.5.29 TIBDatabaseInfo.GetReadSeqCount Method

Pascal

```
function GetReadSeqCount: TStringList;
```

C++

```
__fastcall TStringList GetReadSeqCount();
```

Description

This is GetReadSeqCount, a member of class TIBDatabaseInfo.

21.1.1.5.30 TIBDatabaseInfo.GetStringDatabaseInfo Method

Pascal

```
function GetStringDatabaseInfo(DatabaseInfoCommand: Integer): String;
```

C++

```
__fastcall UnicodeString GetStringDatabaseInfo(int DatabaseInfoCommand);
```

Description

This is GetStringDatabaseInfo, a member of class TIBDatabaseInfo.

21.1.1.5.31 TIBDatabaseInfo.GetSweepInterval Method

Pascal

```
function GetSweepInterval: Long;
```

C++

```
__fastcall Long GetSweepInterval();
```

Description

This is GetSweepInterval, a member of class TIBDatabaseInfo.

21.1.1.5.32 TIBDatabaseInfo.GetUpdateCount Method

Pascal

```
function GetUpdateCount: TStringList;
```

C++

```
__fastcall TStringList GetUpdateCount();
```

Description

This is GetUpdateCount, a member of class TIBDatabaseInfo.

21.1.1.5.33 TIBDatabaseInfo.GetUserNames Method

Pascal

```
function GetUserNames: TStringList;
```

C++

```
__fastcall TStringList GetUserNames();
```

Description

This is GetUserNames, a member of class TIBDatabaseInfo.

21.1.1.5.34 TIBDatabaseInfo.GetVersion Method

Pascal

```
function GetVersion: String;
```

C++

```
__fastcall UnicodeString GetVersion();
```

Description

This is GetVersion, a member of class TIBDatabaseInfo.

21.1.1.5.35 TIBDatabaseInfo.GetWrites Method

Pascal

```
function GetWrites: Long;
```

C++

```
__fastcall Long GetWrites();
```

Description

This is GetWrites, a member of class TIBDatabaseInfo.

21.1.1.6 TIBDatabaseInfo Properties

The properties of the TIBDatabaseInfo class are listed here.

Public Properties

	Name	Description
	Allocation (see page 3787)	Returns the number of database pages allocated.
	BackoutCount (see page 3787)	Returns the number of removals of a version of a record.
	BaseLevel (see page 3788)	Returns the database version number.
	CurrentMemory (see page 3788)	Returns the amount of server memory currently in use.
	DBFileName (see page 3788)	Returns the database filename.
	DBImplementationClass (see page 3789)	Returns the database implementation class number.
	DBImplementationNo (see page 3789)	Returns the database implementation number.
	DBSiteName (see page 3789)	Returns the database site name.
	DBSQLDialect (see page 3789)	Returns the SQL dialect.
	DeleteCount (see page 3790)	Returns the number of database deletes since the database was last attached.
	ExpungeCount (see page 3790)	Returns the number of removals of a record and all of its ancestors.
	Fetches (see page 3790)	Returns the number of reads from the memory buffer cache.

	ForcedWrites (see page 3790)	Returns the mode in which database writes are performed.
	InsertCount (see page 3791)	Returns number of inserts into the database since the database was last attached.
	Marks (see page 3791)	Returns the number of writes to the memory buffer cache.
	MaxMemory (see page 3791)	Returns the maximum amount of memory used at one time since the first process attached to the database.
	NoReserve (see page 3791)	Returns whether or not space is reserved on each database page for holding backup versions of modified records.
	NumBuffers (see page 3792)	Returns the number of memory buffers currently allocated.
	ODSMajorVersion (see page 3792)	Returns the on disk structure (ODS) major version number.
	ODSMinorVersion (see page 3792)	Returns the on disk structure (ODS) minor version number.
	PageSize (see page 3792)	Returns the number of bytes per page of the attached database.
	PurgeCount (see page 3793)	Returns the number of removals of fully mature records from the database.
	ReadIdxCount (see page 3793)	Returns the number of reads done via an index since the database was last attached.
	ReadOnly (see page 3793)	Indicates whether or not the database is read only.
	Reads (see page 3793)	Returns the number of page reads from the database.
	ReadSeqCount (see page 3794)	Returns the number of sequential database reads done on each table since the database was last attached.
	SweepInterval (see page 3794)	Returns the number of transactions that are committed between 'sweeps.'
	UpdateCount (see page 3794)	Returns the number of database updates since the database was last attached.
	UserNames (see page 3795)	Returns the names of all users currently attached to the database.
	Version (see page 3795)	Returns the version of the database implementation.
	Writes (see page 3795)	Returns the number of page writes to the database.

Published Properties

	Name	Description
	Database (see page 3788)	Sets or returns the database.

21.1.1.6.1 TIBDatabaseInfo.Allocation Property

Returns the number of database pages allocated.

Pascal

```
property Allocation: Long;
```

C++

```
__property Long Allocation;
```

Description

Use Allocation to return the number of database pages allocated.

21.1.1.6.2 TIBDatabaseInfo.BackoutCount Property

Returns the number of removals of a version of a record.

Pascal

```
property BackoutCount: TStringList;
```

C++

```
__property TStringList BackoutCount;
```

Description

Use BackoutCount to determine the number of times a version of a database record has been removed.

21.1.1.6.3 TIBDatabaseInfo.BaseLevel Property

Returns the database version number.

Pascal

```
property BaseLevel: Long;
```

C++

```
__property Long BaseLevel;
```

Description

Use BaseLevel to return the database version number, which consists of 1 byte containing the number 1, and 1 byte containing the version number.

21.1.1.6.4 TIBDatabaseInfo.CurrentMemory Property

Returns the amount of server memory currently in use.

Pascal

```
property CurrentMemory: Long;
```

C++

```
__property Long CurrentMemory;
```

Description

Use CurrentMemory to return the amount of server memory (in bytes) currently in use.

21.1.1.6.5 TIBDatabaseInfo.Database Property

Sets or returns the database.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to set or return the database on which information is being returned.

21.1.1.6.6 TIBDatabaseInfo.DBFileName Property

Returns the database filename.

Pascal

```
property DBFileName: String;
```

C++

```
__property UnicodeString DBFileName;
```

Description

Use DBFileName to return the database filename.

21.1.1.6.7 TIBDatabaseInfo.DBImplementationClass Property

Returns the database implementation class number.

Pascal

```
property DBImplementationClass: Long;
```

C++

```
__property Long DBImplementationClass;
```

Description

Use DBImplementationClass to return the database implementation class number, either 1 or 12.

21.1.1.6.8 TIBDatabaseInfo.DBImplementationNo Property

Returns the database implementation number.

Pascal

```
property DBImplementationNo: Long;
```

C++

```
__property Long DBImplementationNo;
```

Description

Use DBImplementationNo to return the database implementation number.

21.1.1.6.9 TIBDatabaseInfo.DBSiteName Property

Returns the database site name.

Pascal

```
property DBSiteName: String;
```

C++

```
__property UnicodeString DBSiteName;
```

Description

Use DBSiteName to return the database site name.

21.1.1.6.10 TIBDatabaseInfo.DBSQLDialect Property

Returns the SQL dialect.

Pascal

```
property DBSQLDialect: Long;
```

C++

```
__property Long DBSQLDialect;
```

Description

Use DBSQLDialect to return the SQL dialect.

21.1.1.6.11 TIBDatabaseInfo.DeleteCount Property

Returns the number of database deletes since the database was last attached.

Pascal

```
property DeleteCount: TStringList;
```

C++

```
__property TStringList DeleteCount;
```

Description

Use DeleteCount to return the number of database deletes since the database was last attached.

21.1.1.6.12 TIBDatabaseInfo.ExpungeCount Property

Returns the number of removals of a record and all of its ancestors.

Pascal

```
property ExpungeCount: TStringList;
```

C++

```
__property TStringList ExpungeCount;
```

Description

Use ExpungeCount to return the number of removals of a record and all of its ancestors for records whose deletions have been committed.

21.1.1.6.13 TIBDatabaseInfo.Fetches Property

Returns the number of reads from the memory buffer cache.

Pascal

```
property Fetches: Long;
```

C++

```
__property Long Fetches;
```

Description

Use Fetches to return the number of reads from the memory buffer cache.

21.1.1.6.14 TIBDatabaseInfo.ForcedWrites Property

Returns the mode in which database writes are performed.

Pascal

```
property ForcedWrites: Long;
```

C++

```
__property Long ForcedWrites;
```

Description

Use ForcedWrites to return the number specifying the mode in which database writes are performed. ForcedWrites returns 0 for asynchronous mode, or returns 1 for synchronous mode

21.1.1.6.15 TIBDatabaseInfo.InsertCount Property

Returns number of inserts into the database since the database was last attached.

Pascal

```
property InsertCount: TStringList;
```

C++

```
__property TStringList InsertCount;
```

Description

Use InsertCount to return the number of inserts into the database since the database was last attached.

21.1.1.6.16 TIBDatabaseInfo.Marks Property

Returns the number of writes to the memory buffer cache.

Pascal

```
property Marks: Long;
```

C++

```
__property Long Marks;
```

Description

Use Marks to return the number of writes to the memory buffer cache.

21.1.1.6.17 TIBDatabaseInfo.MaxMemory Property

Returns the maximum amount of memory used at one time since the first process attached to the database.

Pascal

```
property MaxMemory: Long;
```

C++

```
__property Long MaxMemory;
```

Description

Use MaxMemory to return in bytes the maximum amount of memory used at one time since the first process attached to the database.

21.1.1.6.18 TIBDatabaseInfo.NoReserve Property

Returns whether or not space is reserved on each database page for holding backup versions of modified records.

Pascal

```
property NoReserve: Long;
```

C++

```
__property Long NoReserve;
```

Description

Use NoReserve to return whether or not space is reserved on each database page for holding backup versions of modified records. NoReserve will return 0 to indicate that space is reserved (the default) or 1 to indicate that no space is reserved.

21.1.1.6.19 TIBDatabaseInfo.NumBuffers Property

Returns the number of memory buffers currently allocated.

Pascal

```
property NumBuffers: Long;
```

C++

```
__property Long NumBuffers;
```

Description

Use NumBuffers to return the number of memory buffers currently allocated.

21.1.1.6.20 TIBDatabaseInfo.ODSMajorVersion Property

Returns the on disk structure (ODS) major version number.

Pascal

```
property ODSMajorVersion: Long;
```

C++

```
__property Long ODSMajorVersion;
```

Description

Use ODSMajorVersion to return the ODS major version number for the database. Databases with different major version numbers have different physical layouts.

A database engine can access only databases with a particular ODS major version number. Attaching to a database with a different ODS number results in an error.

21.1.1.6.21 TIBDatabaseInfo.ODSMinorVersion Property

Returns the on disk structure (ODS) minor version number.

Pascal

```
property ODSMinorVersion: Long;
```

C++

```
__property Long ODSMinorVersion;
```

Description

Use ODSMinorVersion to return the (ODS) minor version number. An increase in a minor version number indicates a non-structural change, one that still allows the database to be accessed by databases with the same major version number but possibly different minor version numbers.

21.1.1.6.22 TIBDatabaseInfo.PageSize Property

Returns the number of bytes per page of the attached database.

Pascal

```
property PageSize: Long;
```

C++

```
__property Long PageSize;
```

Description

Use PageSize to return the number of bytes per page of the attached database. Use with Allocation (see page 3787) to determine the size of the database.

21.1.1.6.23 TIBDatabaseInfo.PurgeCount Property

Returns the number of removals of fully mature records from the database.

Pascal

```
property PurgeCount: TStringList;
```

C++

```
__property TStringList PurgeCount;
```

Description

Use PurgeCount to return the number of removals of fully mature records (that is, records committed, resulting in older versions no longer being needed) from the database.

21.1.1.6.24 TIBDatabaseInfo.ReadIdxCount Property

Returns the number of reads done via an index since the database was last attached.

Pascal

```
property ReadIdxCount: TStringList;
```

C++

```
__property TStringList ReadIdxCount;
```

Description

Use ReadIdxCount to return the number of reads done via an index since the database was last attached.

21.1.1.6.25 TIBDatabaseInfo.ReadOnly Property

Indicates whether or not the database is read only.

Pascal

```
property ReadOnly: Long;
```

C++

```
__property Long ReadOnly;
```

Description

Use ReadOnly to determine whether the database is read only or not. ReadOnly returns 1 if the database is read-write and 0 if it is read only.

Read-only databases are an InterBase 6 feature.

21.1.1.6.26 TIBDatabaseInfo.Reads Property

Returns the number of page reads from the database.

Pascal

```
property Reads: Long;
```

C++

```
__property Long Reads;
```

Description

Use Reads to return the number of page reads from the database since the current database was first attached, that is, an aggregate of all reads done by all attached processes, rather than the number of reads done for the calling program since it attached to the database.

21.1.1.6.27 TIBDatabaseInfo.ReadSeqCount Property

Returns the number of sequential database reads done on each table since the database was last attached.

Pascal

```
property ReadSeqCount: TStringList;
```

C++

```
__property TStringList ReadSeqCount;
```

Description

Use ReadSeqCount to return the number of sequential database reads (that is, the number of sequential table scans) done on each table since the database was last attached

21.1.1.6.28 TIBDatabaseInfo.SweepInterval Property

Returns the number of transactions that are committed between 'sweeps.'

Pascal

```
property SweepInterval: Long;
```

C++

```
__property Long SweepInterval;
```

Description

Use SweepInterval to return the number of transactions that are committed between 'sweeps' to remove database record versions that are no longer needed.

21.1.1.6.29 TIBDatabaseInfo.UpdateCount Property

Returns the number of database updates since the database was last attached.

Pascal

```
property UpdateCount: TStringList;
```

C++

```
__property TStringList UpdateCount;
```

Description

Use UpdateCount to return the number of database updates since the database was last attached.

21.1.1.6.30 TIBDatabaseInfo.UserNames Property

Returns the names of all users currently attached to the database.

Pascal

```
property UserNames: TStringList;
```

C++

```
__property TStringList UserNames;
```

Description

Use UserNames to return the names of all users currently attached to the database.

21.1.1.6.31 TIBDatabaseInfo.Version Property

Returns the version of the database implementation.

Pascal

```
property Version: String;
```

C++

```
__property UnicodeString Version;
```

Description

Use Version to return the version identification string of the database implementation.

21.1.1.6.32 TIBDatabaseInfo.Writes Property

Returns the number of page writes to the database.

Pascal

```
property Writes: Long;
```

C++

```
__property Long Writes;
```

Description

Use Writes to return the number of page writes to the current database since it was first attached by any process; that is, an aggregate of all write done by all attached processes, rather than the number of writes done for the calling program since it attached to the database.

22 IBEvents Namespace

This is namespace IBEvents.

Topics

Name	Description
Classes (see page 3798)	The following table lists classes in this documentation.
Types (see page 3806)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBEvents (see page 3798)	TIBEvents enables applications to respond to posted events.

Types

Name	Description
TErrorEvent (see page 3806)	TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.
TEventAlert (see page 3806)	TEventAlert is the type of event handlers that respond to InterBase events.

22.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBEvents (see page 3798)	TIBEvents enables applications to respond to posted events.

22.1.1 TIBEvents Class

TIBEvents enables applications to respond to posted events.

Class Hierarchy

Pascal

```
TIBEvents = class(TComponent, IIBEventNotifier);
```

C++

```
class TIBEvents : public TComponent, public IIBEventNotifier;
```

File

IBEvents

Description

Use a TIBEvents component to allow your application to register interest in, and asynchronously handle, events posted by an InterBase server. The InterBase event allows applications to respond to actions and database changes made by other, concurrently running applications, without having to resort to polling the database on a regular basis, or communicating directly with the other applications.

In essence, the TIBEvents component allows an application to say 'I want to be informed when events X, Y and Z occur.' When any of the requested events does occur, the InterBase server notifies the application and OnEventAlert (see page 3805) is called.

To use TIBEvents, set the Database (see page 3803) property to the component that connects to the InterBase server. Then, use the Events (see page 3804) property to indicate the events to which you want to respond. You can set the AutoRegister (see page 3803) property to true if you want TIBEvents to automatically register interest in its events when the database component opens a connection, or set the Registered (see page 3804) property to true after the connection is open to explicitly register your interest. Finally, write an OnEventAlert (see page 3805) event handler to respond when the InterBase event handler informs TIBEvents that an event occurred.

22.1.1.1 TIBEvents Members

The following tables list the members exposed by TIBEvents.

Protected Methods

	Name	Description
	EventChange (see page 3800)	This is EventChange, a member of class TIBEvents.
	GetNativeHandle (see page 3801)	This is GetNativeHandle, a member of class TIBEvents.
	Notification (see page 3801)	Forwards notification messages to all owned components.
	ThreadEnded (see page 3802)	This is ThreadEnded, a member of class TIBEvents.
	ValidateDatabase (see page 3803)	This is ValidateDatabase, a member of class TIBEvents.

Public Methods

	Name	Description
	Create (see page 3799)	Creates an instance of TIBEvents (see page 3798).
	Destroy (see page 3800)	Destroys an instance of TIBEvents (see page 3798).
	GetAutoRegister (see page 3800)	Returns the value of the AutoRegister (see page 3803) property.
	RegisterEvents (see page 3801)	Registers interest in the events listed by the Events (see page 3804) property.
	SetAutoRegister (see page 3802)	Sets the AutoRegister (see page 3803) property.
	UnRegisterEvents (see page 3802)	Unregisters interest in the events listed by the Events (see page 3804) property.

Public Properties

	Name	Description
	NativeHandle (see page 3804)	Supplies the InterBase handle for the database on which events occur.

Published Events

	Name	Description
	OnError (see page 3805)	Occurs when an exception is caught while monitoring events.
	OnEventAlert (see page 3805)	Occurs when an InterBase event is received.

Published Properties

	Name	Description
	AutoRegister (see page 3803)	Specifies the AutoRegister on which to perform event alerter tasks.
	Database (see page 3803)	Specifies the database on which to perform event alerter tasks.
	Events (see page 3804)	Specifies the events to which TIBEvents (see page 3798) responds.
	Registered (see page 3804)	Indicates whether the events in the Events (see page 3804) property are registered.

22.1.1.2 TIBEvents.Create Constructor

Creates an instance of TIBEvents (see page 3798).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBEvents(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBEvents (see page 3798). TIBEvents (see page 3798) objects placed on a form or data module at design time are created automatically.

AOwner specifies the object (typically a form or data module) that is responsible for freeing the TIBEvents (see page 3798) instance.

22.1.1.3 TIBEvents.Destroy Destructor

Destroys an instance of TIBEvents (see page 3798).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBEvents();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBEvents (see page 3798) object is not nil and only then calls Destroy. Destroy unregisters the events and then frees them.

22.1.1.4 TIBEvents Methods

The methods of the TIBEvents class are listed here.

Protected Methods

	Name	Description
	EventChange (see page 3800)	This is EventChange, a member of class TIBEvents.
	GetNativeHandle (see page 3801)	This is GetNativeHandle, a member of class TIBEvents.
	Notification (see page 3801)	Forwards notification messages to all owned components.
	ThreadEnded (see page 3802)	This is ThreadEnded, a member of class TIBEvents.
	ValidateDatabase (see page 3803)	This is ValidateDatabase, a member of class TIBEvents.

Public Methods

	Name	Description
	GetAutoRegister (see page 3800)	Returns the value of the AutoRegister (see page 3803) property.
	RegisterEvents (see page 3801)	Registers interest in the events listed by the Events (see page 3804) property.
	SetAutoRegister (see page 3802)	Sets the AutoRegister (see page 3803) property.
	UnRegisterEvents (see page 3802)	Unregisters interest in the events listed by the Events (see page 3804) property.

22.1.1.4.1 TIBEvents.EventChange Method

Pascal

```
procedure EventChange(Sender: TObject); virtual;
```

C++

```
virtual __fastcall EventChange(TObject * Sender);
```

Description

This is EventChange, a member of class TIBEvents.

22.1.1.4.2 TIBEvents.GetAutoRegister Method

Returns the value of the AutoRegister (see page 3803) property.

Pascal

```
function GetAutoRegister: Boolean;
```

C++

```
__fastcall Boolean GetAutoRegister();
```

Description

GetAutoRegister is the read implementation of the AutoRegister (see page 3803) property.

22.1.1.4.3 TIBEvents.GetNativeHandle Method

Pascal

```
function GetNativeHandle: TISC_DB_HANDLE; virtual;
```

C++

```
virtual __fastcall TISC_DB_HANDLE GetNativeHandle();
```

Description

This is GetNativeHandle, a member of class TIBEvents.

22.1.1.4.4 TIBEvents.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

22.1.1.4.5 TIBEvents.RegisterEvents Method

Registers interest in the events listed by the Events (see page 3804) property.

Pascal

```
procedure RegisterEvents; virtual;
```

C++

```
virtual __fastcall RegisterEvents();
```

Description

Call RegisterEvents to register interest in the events listed in the Events (see page 3804) property with the InterBase Event Manager. Once this interest is registered, the InterBase Event Manager generates an OnEventAlert (see page 3805) event when any of the registered events occurs.

Note: RegisterEvents is called automatically when you set the Registered (see page 3804) property to true or when the AutoRegister (see page 3803) property is true and the database connection is open.

22.1.1.4.6 TIBEvents.SetAutoRegister Method

Sets the AutoRegister (see page 3803) property.

Pascal

```
procedure SetAutoRegister(const Value: Boolean);
```

C++

```
__fastcall SetAutoRegister(const Boolean Value);
```

Description

SetAutoRegister is the write implementation method for the AutoRegister (see page 3803) property.

Value is the new value for the AutoRegister (see page 3803) property.

When SetAutoRegister changes the AutoRegister (see page 3803) property to true, it checks whether the database connection is already open. If so, it calls RegisterEvents (see page 3801) to register the events.

22.1.1.4.7 TIBEvents.ThreadEnded Method

Pascal

```
procedure ThreadEnded(Sender: TObject); virtual;
```

C++

```
virtual __fastcall ThreadEnded(TObject * Sender);
```

Description

This is ThreadEnded, a member of class TIBEvents.

22.1.1.4.8 TIBEvents.UnRegisterEvents Method

Unregisters interest in the events listed by the Events (see page 3804) property.

Pascal

```
procedure UnRegisterEvents; virtual;
```

C++

```
virtual __fastcall UnRegisterEvents();
```

Description

Call UnRegisterEvents to unregister interest in the events in the Events (see page 3804) list. When the database closes a connection, or when the IBEvents (see page 3797) component is destroyed, UnRegisterEvents is called automatically.

22.1.1.4.9 TIBEvents.ValidateDatabase Method

Pascal

```
procedure ValidateDatabase(DataBase: TIBDatabase); virtual;
```

C++

```
virtual __fastcall ValidateDatabase(TIBDatabase DataBase);
```

Description

This is ValidateDatabase, a member of class TIBEvents.

22.1.1.5 TIBEvents Properties

The properties of the TIBEvents class are listed here.

Public Properties

	Name	Description
	NativeHandle (see page 3804)	Supplies the InterBase handle for the database on which events occur.

Published Properties

	Name	Description
	AutoRegister (see page 3803)	Specifies the AutoRegister on which to perform event alerter tasks.
	Database (see page 3803)	Specifies the database on which to perform event alerter tasks.
	Events (see page 3804)	Specifies the events to which TIBEvents (see page 3798) responds.
	Registered (see page 3804)	Indicates whether the events in the Events (see page 3804) property are registered.

22.1.1.5.1 TIBEvents.AutoRegister Property

Specifies the AutoRegister on which to perform event alerter tasks.

Pascal

```
property AutoRegister: Boolean;
```

C++

```
__property Boolean AutoRegister;
```

Description

When AutoRegister is true, the database automatically registers this component's events whenever it opens a connection to the InterBase server. When AutoRegister is false, you must explicitly register the events by setting the Registered (see page 3804) property to true (or calling RegisterEvents (see page 3801)) after the database connection is opened.

Note: The database always unregisters the events when it closes a connection. By setting AutoRegister to true, you do not need to explicitly re-register interest in the events when the database reopens a connection.

22.1.1.5.2 TIBEvents.Database Property

Specifies the database on which to perform event alerter tasks.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to specify the component that manages a connection to the InterBase server. This connection must be open for TIBEvents (see page 3798) to register an interest in its events with the InterBase Event manager on that server.

When you set the Database property, TIBEvents (see page 3798) automatically calls the database component's AddEventNotifier method so that it can register this component's events when it opens a connection (if AutoRegister (see page 3803) is true), and so that it can unregister this component's events before closing the connection.

22.1.1.5.3 TIBEvents.Events Property

Specifies the events to which TIBEvents (see page 3798) responds.

Pascal

```
property Events: TStrings;
```

C++

```
__property TStrings Events;
```

Description

Use the Events property to list events to which the IBEvents (see page 3797) component responds.

To add an event use code similar to the following:

```
Delphi: IBEvents.Events.Add('EVENT_NAME')
    C++: IBEvents->Events->Add("EVENT_NAME")
```

Note: Event names are case-sensitive.

22.1.1.5.4 TIBEvents.NativeHandle Property

Supplies the InterBase handle for the database on which events occur.

Pascal

```
property NativeHandle: TISC_DB_HANDLE;
```

C++

```
__property TISC_DB_HANDLE NativeHandle;
```

Description

Read NativeHandle to get the InterBase handle for the server on which the events occur. This property can be used when working with the InterBase API.

22.1.1.5.5 TIBEvents.Registered Property

Indicates whether the events in the Events (see page 3804) property are registered.

Pascal

```
property Registered: Boolean;
```

C++

```
__property Boolean Registered;
```

Description

Set Registered to true to call RegisterEvents (see page 3801), which registers the events listed by the Events (see page 3804) property. Read Registered to determine whether TIBEvents (see page 3798) is currently registered (that is, if the InterBase Event manager is notifying this component when any of its events occur.)

22.1.1.6 TIBEvents Events

The events of the TIBEvents class are listed here.

Published Events

	Name	Description
	OnError (see page 3805)	Occurs when an exception is caught while monitoring events.
	OnEventAlert (see page 3805)	Occurs when an InterBase event is received.

22.1.1.6.1 TIBEvents.OnError Event

Occurs when an exception is caught while monitoring events.

Pascal

```
property OnError: TErrorEvent;
```

C++

```
__property TErrorEvent OnError;
```

Description

Write an OnError event handler to respond when TIBEvents (see page 3798) encounters an exception in the process of monitoring events.

22.1.1.6.2 TIBEvents.OnEventAlert Event

Occurs when an InterBase event is received.

Pascal

```
property OnEventAlert: TEventAlert;
```

C++

```
__property TEventAlert OnEventAlert;
```

Description

Write an OnEventAlert event handler to take specific actions when an InterBase event is received.

In the event handler, set CancelAlerts to true to cancel interest in any further events. To start receiving events again, call the GetAutoRegister (see page 3800) method. You cannot call RegisterEvents (see page 3801), UnRegisterEvents (see page 3802), GetAutoRegister (see page 3800) or SetAutoRegister (see page 3802) from within an OnEventAlert event handler.

OnEventAlert runs as a separate thread to allow for true asynchronous event processing, however, the IBEvents (see page 3797) component provides synchronization code to ensure that only one OnEventAlert event handler executes at any one time.

22.2 Types

The following table lists types in this documentation.

Types

Name	Description
TErrorEvent (see page 3806)	TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.
TEventAlert (see page 3806)	TEventAlert is the type of event handlers that respond to InterBase events.

22.2.1 IBEvents.TErrorEvent Type

TErrorEvent is the type of event handlers that respond to exceptions that occur when monitoring InterBase events.

Pascal

```
TErrorEvent = procedure ( Sender: TObject; ErrorCode:integer) of object;
```

C++

```
( Sender: TObject; ErrorCode:integer) ( TErrorEvent)();
```

File

IBEvents

Description

Sender is the TIBEvents (see page 3798) component that encounters the exception.

If the exception is an EIBError (see page 3543) object, ErrorCode is the InterBase error code it represents. Otherwise, ErrorCode is 0.

22.2.2 IBEvents.TEventAlert Type

TEventAlert is the type of event handlers that respond to InterBase events.

Pascal

```
TEventAlert = procedure ( Sender: TObject; EventName: string; EventCount: longint; var
CancelAlerts: Boolean) of object;
```

C++

```
( Sender: TObject; EventName: string; EventCount: longint; var CancelAlerts: Boolean) (
TEventAlert)();
```

File

IBEvents

Description

Sender is the TIBEvents (see page 3798) object that is monitoring InterBase events.

EventName is the name of the most recently received event.

EventCount is the number of EventName events received since the last time the event handler was called.

CancelAlerts returns true if the TIBEvents (see page 3798) object should stop monitoring events, false if the event monitoring should continue.

23 IBExtract Namespace

This is namespace IBExtract.

Topics

Name	Description
Classes (see page 3811)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3823)	The following table lists structs, records, enums in this documentation.
Types (see page 3827)	The following table lists types in this documentation.
Constants (see page 3829)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBExtract (see page 3811)	TIBExtract fetches metadata from an InterBase server.

Constants

Name	Description
ColumnTypes (see page 3830)	This is constant IBExtract.ColumnTypes.
FILE_cache (see page 3830)	This is constant IBExtract.FILE_cache.
FILE_conditional (see page 3830)	This is constant IBExtract.FILE_conditional.
FILE_inactive (see page 3831)	This is constant IBExtract.FILE_inactive.
FILE_manual (see page 3831)	This is constant IBExtract.FILE_manual.
FILE_shadow (see page 3831)	This is constant IBExtract.FILE_shadow.
IntegralSubtypes (see page 3832)	This is constant IBExtract.IntegralSubtypes.
LOG_default (see page 3832)	This is constant IBExtract.LOG_default.
LOG_overflow (see page 3832)	This is constant IBExtract.LOG_overflow.
LOG_raw (see page 3833)	This is constant IBExtract.LOG_raw.
LOG_serial (see page 3833)	This is constant IBExtract.LOG_serial.
MAX_INTSUBTYPES (see page 3833)	This is constant IBExtract.MAX_INTSUBTYPES.
MAXSUBTYPES (see page 3834)	This is constant IBExtract.MAXSUBTYPES.
obj_computed (see page 3834)	This is constant IBExtract.obj_computed.
obj_count (see page 3834)	This is constant IBExtract.obj_count.
obj_exception (see page 3835)	This is constant IBExtract.obj_exception.
obj_expression_index (see page 3835)	This is constant IBExtract.obj_expression_index.
obj_field (see page 3835)	This is constant IBExtract.obj_field.
obj_index (see page 3836)	This is constant IBExtract.obj_index.
obj_procedure (see page 3836)	This is constant IBExtract.obj_procedure.

obj_relation (see page 3836)	This is constant IBExtract.obj_relation.
obj_sql_role (see page 3837)	This is constant IBExtract.obj_sql_role.
obj_trigger (see page 3837)	This is constant IBExtract.obj_trigger.
obj_user (see page 3837)	This is constant IBExtract.obj_user.
obj_user_group (see page 3838)	This is constant IBExtract.obj_user_group.
obj_validation (see page 3838)	This is constant IBExtract.obj_validation.
obj_view (see page 3838)	This is constant IBExtract.obj_view.
ODS_VERSION10 (see page 3839)	This is constant IBExtract.ODS_VERSION10.
ODS_VERSION6 (see page 3839)	This is constant IBExtract.ODS_VERSION6.
ODS_VERSION7 (see page 3839)	This is constant IBExtract.ODS_VERSION7.
ODS_VERSION8 (see page 3840)	This is constant IBExtract.ODS_VERSION8.
ODS_VERSION9 (see page 3840)	This is constant IBExtract.ODS_VERSION9.
priv_DELETE (see page 3840)	This is constant IBExtract.priv_DELETE.
priv_EXECUTE (see page 3841)	This is constant IBExtract.priv_EXECUTE.
priv_INSERT (see page 3841)	This is constant IBExtract.priv_INSERT.
priv_REFERENCES (see page 3841)	This is constant IBExtract.priv_REFERENCES.
priv_SELECT (see page 3842)	This is constant IBExtract.priv_SELECT.
priv_UNKNOWN (see page 3842)	This is constant IBExtract.priv_UNKNOWN.
priv_UPDATE (see page 3842)	This is constant IBExtract.priv_UPDATE.
PrivTypes (see page 3843)	This is constant IBExtract.PrivTypes.
SubTypes (see page 3843)	This is constant IBExtract.SubTypes.
TriggerTypes (see page 3843)	This is constant IBExtract.TriggerTypes.

Structs, Records, Enums

	Name	Description
	TExtractObjectTypes (see page 3823)	TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.
	TExtractType (see page 3824)	This is record IBExtract.TExtractType.
	TPrivTypes (see page 3825)	This is record IBExtract.TPrivTypes.
	TSQLType (see page 3825)	This is record IBExtract.TSQLType.

Types

Name	Description
TExtractTypes (see page 3827)	TExtractType (see page 3824) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.
TSQLTypes (see page 3828)	This is type IBExtract.TSQLTypes.

23.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBExtract (see page 3811)	TIBExtract fetches metadata from an InterBase server.

23.1.1 TIBExtract Class

TIBExtract fetches metadata from an InterBase server.

Class Hierarchy

Pascal

```
TIBExtract = class(TComponent);
```

C++

```
class TIBExtract : public TComponent;
```

File

IBExtract

Description

Use a TIBExtract component to fetch metadata information such as a list of tables, views, roles, indexes, and so on. To use TIBExtract,

1. et the Database (see page 3821) and Transaction (see page 3822) properties to specify the database from which to fetch information and to provide a transaction to use when fetching that information.
2. all the ExtractObject (see page 3814) method, indicating the type of metadata you want to fetch.
3. ead the extracted information from the Items (see page 3821) property.

Getting Started with InterBase Express

23.1.1.1 TIBExtract Members

The following tables list the members exposed by TIBExtract.

Protected Methods

	Name	Description
	ExtractDDL (see page 3814)	This is ExtractDDL, a member of class TIBExtract.
	ExtractListTable (see page 3814)	This is ExtractListTable, a member of class TIBExtract.
	ExtractListView (see page 3814)	This is ExtractListView, a member of class TIBExtract.
	ListAllTables (see page 3816)	This is ListAllTables, a member of class TIBExtract.

	ListCheck (see page 3817)	This is ListCheck, a member of class TIBExtract.
	ListCreateDb (see page 3817)	This is ListCreateDb, a member of class TIBExtract.
	ListData (see page 3817)	This is ListData, a member of class TIBExtract.
	ListDomains (see page 3817)	This is ListDomains, a member of class TIBExtract.
	ListException (see page 3818)	This is ListException, a member of class TIBExtract.
	ListFilters (see page 3818)	This is ListFilters, a member of class TIBExtract.
	ListForeign (see page 3818)	This is ListForeign, a member of class TIBExtract.
	ListFunctions (see page 3818)	This is ListFunctions, a member of class TIBExtract.
	ListGenerators (see page 3818)	This is ListGenerators, a member of class TIBExtract.
	ListGrants (see page 3819)	This is ListGrants, a member of class TIBExtract.
	ListIndex (see page 3819)	This is ListIndex, a member of class TIBExtract.
	ListProcs (see page 3819)	This is ListProcs, a member of class TIBExtract.
	ListRoles (see page 3819)	This is ListRoles, a member of class TIBExtract.
	ListTriggers (see page 3820)	This is ListTriggers, a member of class TIBExtract.
	ListViews (see page 3820)	This is ListViews, a member of class TIBExtract.
	PrintSet (see page 3820)	This is PrintSet, a member of class TIBExtract.

Public Methods

	Name	Description
V	Create (see page 3812)	Creates an instance of TIBExtract (see page 3811).
V	Destroy (see page 3813)	Destroys an instance of TIBExtract (see page 3811).
	ExtractObject (see page 3814)	Fetches specified metadata from the InterBase server and writes it to the Items (see page 3821) property.
	GetArrayField (see page 3816)	Returns the dimensions of an array field as a printable string.
	GetCharacterSets (see page 3816)	Returns a specified character set and collation order as a printable string.
	GetFieldType (see page 3816)	Returns the full description of a specified field type as a printable string.
V	Notification (see page 3820)	Responds to notifications when components are created or freed.

Public Properties

	Name	Description
R	DatabaseInfo (see page 3821)	Represents information about the associated database.
R	Items (see page 3821)	Lists the information that the TIBExtract (see page 3811) object has fetched from the database server.

Published Properties

	Name	Description
	Database (see page 3821)	Specifies the database from which to fetch metadata.
	ShowSystem (see page 3822)	Reserved for future use.
	Transaction (see page 3822)	Specifies the transaction to use when fetching metadata from the server.

23.1.1.2 TIBExtract.Create Constructor

Creates an instance of TIBExtract (see page 3811).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBExtract(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBExtract (see page 3811) at runtime. TIBExtract (see page 3811) components added to forms or data modules at design time are created automatically.

AOwner specifies the component that is responsible for freeing the TIBExtract (see page 3811) instance. If AOwner is a

TIBDatabase component, it is used to initialize the Database (see page 3821) property.

23.1.1.3 TIBExtract.Destroy Destructor

Destroys an instance of TIBExtract (see page 3811).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBExtract();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBExtract (see page 3811) object is not already freed and only then calls Destroy.

There is no need to explicitly free a TIBExtract (see page 3811) instance that is created with an Owner. The component's Owner handles the task of freeing it.

23.1.1.4 TIBExtract Methods

The methods of the TIBExtract class are listed here.

Protected Methods

	Name	Description
	ExtractDDL (see page 3814)	This is ExtractDDL, a member of class TIBExtract.
	ExtractListTable (see page 3814)	This is ExtractListTable, a member of class TIBExtract.
	ExtractListView (see page 3814)	This is ExtractListView, a member of class TIBExtract.
	ListAllTables (see page 3816)	This is ListAllTables, a member of class TIBExtract.
	ListCheck (see page 3817)	This is ListCheck, a member of class TIBExtract.
	ListCreateDb (see page 3817)	This is ListCreateDb, a member of class TIBExtract.
	ListData (see page 3817)	This is ListData, a member of class TIBExtract.
	ListDomains (see page 3817)	This is ListDomains, a member of class TIBExtract.
	ListException (see page 3818)	This is ListException, a member of class TIBExtract.
	ListFilters (see page 3818)	This is ListFilters, a member of class TIBExtract.
	ListForeign (see page 3818)	This is ListForeign, a member of class TIBExtract.
	ListFunctions (see page 3818)	This is ListFunctions, a member of class TIBExtract.
	ListGenerators (see page 3818)	This is ListGenerators, a member of class TIBExtract.
	ListGrants (see page 3819)	This is ListGrants, a member of class TIBExtract.
	ListIndex (see page 3819)	This is ListIndex, a member of class TIBExtract.
	ListProcs (see page 3819)	This is ListProcs, a member of class TIBExtract.
	ListRoles (see page 3819)	This is ListRoles, a member of class TIBExtract.
	ListTriggers (see page 3820)	This is ListTriggers, a member of class TIBExtract.
	ListViews (see page 3820)	This is ListViews, a member of class TIBExtract.
	PrintSet (see page 3820)	This is PrintSet, a member of class TIBExtract.

Public Methods

	Name	Description
	ExtractObject (see page 3814)	Fetches specified metadata from the InterBase server and writes it to the Items (see page 3821) property.
	GetArrayField (see page 3816)	Returns the dimensions of an array field as a printable string.
	GetCharacterSets (see page 3816)	Returns a specified character set and collation order as a printable string.
	GetFieldType (see page 3816)	Returns the full description of a specified field type as a printable string.

	Notification (see page 3820)	Responds to notifications when components are created or freed.

23.1.1.4.1 TIBExtract.ExtractDDL Method

Pascal

```
function ExtractDDL(Flag: Boolean; TableName: String): Boolean;
```

C++

```
__fastcall Boolean ExtractDDL(Boolean Flag, UnicodeString TableName);
```

Description

This is ExtractDDL, a member of class TIBExtract.

23.1.1.4.2 TIBExtract.ExtractListTable Method

Pascal

```
function ExtractListTable(RelationName: String; NewName: String; DomainFlag: Boolean): Boolean;
```

C++

```
__fastcall Boolean ExtractListTable(UnicodeString RelationName, UnicodeString NewName, Boolean
DomainFlag);
```

Description

This is ExtractListTable, a member of class TIBExtract.

23.1.1.4.3 TIBExtract.ExtractListView Method

Pascal

```
procedure ExtractListView(ViewName: String);
```

C++

```
__fastcall ExtractListView(UnicodeString ViewName);
```

Description

This is ExtractListView, a member of class TIBExtract.

23.1.1.4.4 TIBExtract.ExtractObject Method

Fetches specified metadata from the InterBase server and writes it to the Items (see page 3821) property.

Pascal

```
procedure ExtractObject(ObjectType: TExtractObjectTypes; ObjectName: String = '';
ExtractTypes: TExtractTypes = []);
```

C++

```
__fastcall ExtractObject(TExtractObjectTypes ObjectType, UnicodeString ObjectName = '',
TExtractTypes ExtractTypes = []);
```

Description

Call ExtractObject to fetch metadata from the database specified by the Database (see page 3821) property and write it to the Items (see page 3821) property.

ObjectType indicates the desired type of metadata. Its meaning is modified by the ObjectName and ExtractTypes parameters, as

indicated in the following table:

Value Meaning

eoDatabase Lists all objects defined on the database. This is the list that would be fetched by calling ExtractObject for each of the other object types in turn (plus the create database command that is supported), with no limits placed by the ObjectName and ExtractTypes parameters.

eoDomain Lists all domains. If ExtractTypes includes etTable, this list includes only domains for the table specified by ObjectName.

eoTable If ObjectName is an empty string, lists all the tables defined on the server. If ObjectName is non-empty, lists all the columns and types of the table named by ObjectName, plus any information specified by ExtractTypes that pertains to that table. This can include domains (etDomain), indexes (etIndex), foreign key constrains (etForeign), check constrains (etCheck), triggers (etTrigger), user permissions (etGrant), and data (etData).

eoView If ObjectName is an empty string, lists the text of all views. Otherwise, lists the text of the view named by the ObjectName parameter.

eoProcedure If ObjectName is an empty string, lists all the stored procedures. Otherwise, lists the text of the stored procedure named by the ObjectName parameter. To handle the situation where procedures reference each other, ExtractObject creates dummy procedures of the correct name and then alters these to their correct form. If ExtractTypes includes etAlterProc, only the corrected form is fetched.

eoFunction Lists all external functions. If ObjectName is non-empty, the list is filtered to include only those functions that match the specified name.

eoGenerator Lists all non-system generators. If ObjectName is non-empty, the list is filtered to include only those generators that match the specified name.

eoException Lists all exceptions that the database defines. If ObjectName is non-empty, the list is filtered to include only those exceptions that match the specified name.

eoBLOBFilter Lists all blob filters. If ObjectName is non-empty, the list is filtered to include only those filters whose function name matches the specified name.

eoRole Lists all roles. If ObjectName is non-empty, the list is filtered to include only those roles whose name matches the specified string.

eoTrigger If ExtractTypes includes etTable, lists all triggers defined for the table specified by ObjectName. Otherwise, lists all triggers or, if ObjectName is nonempty, all triggers that match the string specified by ObjectName.

eoForeign If ExtractTypes includes etTable, lists all foreign key constraints that pertain to the table specified by ObjectName. Otherwise, list all foreign key constraints, or, if ObjectName is nonempty, all foreign key constraints that have a name that matches ObjectName.

eoIndexes If ExtractTypes includes etTable, lists all indexes defined on the table specified by ObjectName. Otherwise, lists all indexes, or, if ObjectName is nonempty, all indexes that have a name that matches ObjectName.

eoChecks If ExtractTypes includes etTable, lists all non-foreign check constraints on the table specified by ObjectName. Otherwise, lists all non-foreign check constraints, or, if ObjectName is nonempty, all check constraints that have a name that matches ObjectName.

eoData Lists all the data in the object named by the ObjectName parameter.

ObjectName specifies the name of an object (such as a table or stored procedure) about which you want information. The type of this object and the way it limits the fetched information depends on the values of ObjectType and ExtractTypes.

ExtractTypes modifies the interpretation of ObjectType, to filter the type of information fetched.

23.1.1.4.5 TIBExtract.GetArrayField Method

Returns the dimensions of an array field as a printable string.

Pascal

```
function GetArrayField(FieldName: String): String;
```

C++

```
__fastcall UnicodeString GetArrayField(UnicodeString FieldName);
```

Description

GetArrayField returns the dimensions of the array field with the name specified by the FieldName parameter. The resulting string has the form

```
[lower:upper, lower:upper,..]
```

23.1.1.4.6 TIBExtract.GetCharacterSets Method

Returns a specified character set and collation order as a printable string.

Pascal

```
function GetCharacterSets(CharSetId: Short; Collation: Short; CollateOnly: Boolean): String;
```

C++

```
__fastcall UnicodeString GetCharacterSets(Short CharSetId, Short Collation, Boolean
CollateOnly);
```

Description

GetCharacterSets looks up a specified character set and collation order, and returns their names.

CharSetId is the identifier of the desired character set.

Collation is the identifier of the desired collation order.

CollateOnly indicates that the return string should include the name of the collation order but not the name of the character set.

23.1.1.4.7 TIBExtract.GetFieldType Method

Returns the full description of a specified field type as a printable string.

Pascal

```
function GetFieldType(FieldType: Integer; FieldSubType: Integer; FieldScale: Integer;
FieldSize: Integer; FieldPrec: Integer; FieldLen: Integer): String;
```

C++

```
__fastcall UnicodeString GetFieldType(int FieldType, int FieldSubType, int FieldScale, int
FieldSize, int FieldPrec, int FieldLen);
```

Description

GetFieldType returns the string description with the specified field type, subtype, scale, size, precision, and length.

23.1.1.4.8 TIBExtract.ListAllTables Method

Pascal

```
procedure ListAllTables(flag: Boolean);
```

C++

```
__fastcall ListAllTables(Boolean flag);
```

Description

This is ListAllTables, a member of class TIBExtract.

23.1.1.4.9 TIBExtract.ListCheck Method

Pascal

```
procedure ListCheck(ObjectName: String = ''; ExtractType: TExtractType = etCheck);
```

C++

```
__fastcall ListCheck(UnicodeString ObjectName = '', TExtractType ExtractType = etCheck);
```

Description

This is ListCheck, a member of class TIBExtract.

23.1.1.4.10 TIBExtract.ListCreateDb Method

Pascal

```
procedure ListCreateDb(TargetDb: String = '');
```

C++

```
__fastcall ListCreateDb(UnicodeString TargetDb = '');
```

Description

This is ListCreateDb, a member of class TIBExtract.

23.1.1.4.11 TIBExtract.ListData Method

Pascal

```
procedure ListData(ObjectName: String);
```

C++

```
__fastcall ListData(UnicodeString ObjectName);
```

Description

This is ListData, a member of class TIBExtract.

23.1.1.4.12 TIBExtract.ListDomains Method

Pascal

```
procedure ListDomains(ObjectName: String = ''; ExtractType: TExtractType = etDomain);
```

C++

```
__fastcall ListDomains(UnicodeString ObjectName = '', TExtractType ExtractType = etDomain);
```

Description

This is ListDomains, a member of class TIBExtract.

23.1.1.4.13 TIBExtract.ListException Method

Pascal

```
procedure ListException(ExceptionName: String = '');
```

C++

```
__fastcall ListException(UnicodeString ExceptionName = '');
```

Description

This is ListException, a member of class TIBExtract.

23.1.1.4.14 TIBExtract.ListFilters Method

Pascal

```
procedure ListFilters(FilterName: String = '');
```

C++

```
__fastcall ListFilters(UnicodeString FilterName = '');
```

Description

This is ListFilters, a member of class TIBExtract.

23.1.1.4.15 TIBExtract.ListForeign Method

Pascal

```
procedure ListForeign(ObjectName: String = ''; ExtractType: TExtractType = etForeign);
```

C++

```
__fastcall ListForeign(UnicodeString ObjectName = '', TExtractType ExtractType = etForeign);
```

Description

This is ListForeign, a member of class TIBExtract.

23.1.1.4.16 TIBExtract.ListFunctions Method

Pascal

```
procedure ListFunctions(FunctionName: String = '');
```

C++

```
__fastcall ListFunctions(UnicodeString FunctionName = '');
```

Description

This is ListFunctions, a member of class TIBExtract.

23.1.1.4.17 TIBExtract.ListGenerators Method

Pascal

```
procedure ListGenerators(GeneratorName: String = '');
```

C++

```
__fastcall ListGenerators(UnicodeString GeneratorName = '');
```

Description

This is ListGenerators, a member of class TIBExtract.

23.1.1.4.18 TIBExtract.ListGrants Method

Pascal

```
procedure ListGrants;
```

C++

```
__fastcall ListGrants();
```

Description

This is ListGrants, a member of class TIBExtract.

23.1.1.4.19 TIBExtract.ListIndex Method

Pascal

```
procedure ListIndex(ObjectName: String = ''; ExtractType: TExtractType = etIndex);
```

C++

```
__fastcall ListIndex(UnicodeString ObjectName = '', TExtractType ExtractType = etIndex);
```

Description

This is ListIndex, a member of class TIBExtract.

23.1.1.4.20 TIBExtract.ListProcs Method

Pascal

```
procedure ListProcs(ProcedureName: String = ''; AlterOnly: Boolean = false);
```

C++

```
__fastcall ListProcs(UnicodeString ProcedureName = '', Boolean AlterOnly = false);
```

Description

This is ListProcs, a member of class TIBExtract.

23.1.1.4.21 TIBExtract.ListRoles Method

Pascal

```
procedure ListRoles(ObjectName: String = '');
```

C++

```
__fastcall ListRoles(UnicodeString ObjectName = '');
```

Description

This is ListRoles, a member of class TIBExtract.

23.1.1.4.22 TIBExtract.ListTriggers Method

Pascal

```
procedure ListTriggers(ObjectName: String = ''; ExtractType: TExtractType = etTrigger);
```

C++

```
__fastcall ListTriggers(UnicodeString ObjectName = '', TExtractType ExtractType = etTrigger);
```

Description

This is ListTriggers, a member of class TIBExtract.

23.1.1.4.23 TIBExtract.ListViews Method

Pascal

```
procedure ListViews(ViewName: String = '');
```

C++

```
__fastcall ListViews(UnicodeString ViewName = '');
```

Description

This is ListViews, a member of class TIBExtract.

23.1.1.4.24 TIBExtract.Notification Method

Responds to notifications when components are created or freed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when objects are created or freed so that TIBExtract (see page 3811) can make any necessary adjustments.

AComponent is the component that was just created or that is about to be destroyed.

Operation indicates whether AComponent was just created (opInsert) or is about to be freed (opRemove).

In TIBExtract (see page 3811), Notification checks whether the components that implement the Database (see page 3821) and Transaction (see page 3822) properties are about to be freed, and if so, sets the appropriate property to nil (Delphi) or NULL (C++).

23.1.1.4.25 TIBExtract.PrintSet Method

Pascal

```
function PrintSet(var Used: Boolean): String;
```

C++

```
__fastcall UnicodeString PrintSet(Boolean Used);
```

Description

This is PrintSet, a member of class TIBExtract.

23.1.1.5 TIBExtract Properties

The properties of the TIBExtract class are listed here.

Public Properties

	Name	Description
	DatabaseInfo (see page 3821)	Represents information about the associated database.
	Items (see page 3821)	Lists the information that the TIBExtract (see page 3811) object has fetched from the database server.

Published Properties

	Name	Description
	Database (see page 3821)	Specifies the database from which to fetch metadata.
	ShowSystem (see page 3822)	Reserved for future use.
	Transaction (see page 3822)	Specifies the transaction to use when fetching metadata from the server.

23.1.1.5.1 TIBExtract.Database Property

Specifies the database from which to fetch metadata.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use Database to specify the database from which to fetch metadata.

23.1.1.5.2 TIBExtract.DatabaseInfo Property

Represents information about the associated database.

Pascal

```
property DatabaseInfo: TIBDatabaseInfo;
```

C++

```
__property TIBDatabaseInfo DatabaseInfo;
```

Description

Read DatabaseInfo to obtain information about the database that is specified by the Database (see page 3821) property. DatabaseInfo provides a variety of information about the database itself, such as the version of the online disk structure (ODS) used by the attachment, the number of database cache buffers allocated, the number of database pages read from or written to, and write-ahead log information.

23.1.1.5.3 TIBExtract.Items Property

Lists the information that the TIBExtract (see page 3811) object has fetched from the database server.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use the Items property to read the metadata information that was fetched from the database server. The ExtractObject (see page 3814) method writes information to the Items property every time you call it.

Tip: TIBExtract (see page 3811) does not clear the Items property when you make a new call to ExtractObject (see page 3814). You may want to clear this list of strings between calls to ExtractObject (see page 3814) so that the list does not get too long.

23.1.1.5.4 TIBExtract.ShowSystem Property

Reserved for future use.

Pascal

```
property ShowSystem: Boolean;
```

C++

```
__property Boolean ShowSystem;
```

Description

Currently, ShowSystem is not implemented.

23.1.1.5.5 TIBExtract.Transaction Property

Specifies the transaction to use when fetching metadata from the server.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Set Transaction to specify a transaction to use when fetching metadata from the server. The ExtractObject (see page 3814) method executes all calls to the server within the context of this transaction.

23.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TExtractObjectTypes (see page 3823)	TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.
	TExtractType (see page 3824)	This is record IBExtract.TExtractType.

Records

	Name	Description
	TPrivTypes (see page 3825)	This is record IBExtract.TPrivTypes.
	TSQLType (see page 3825)	This is record IBExtract.TSQLType.

23.2.1 IBExtract.TExtractObjectTypes Enumeration

TExtractObjectTypes indicates the type of metadata to fetch from an InterBase server.

Pascal

```
TExtractObjectTypes = (
  eoDatabase,
  eoDomain,
  eoTable,
  eoView,
  eoProcedure,
  eoFunction,
  eoGenerator,
  eoException,
  eoBLOBFilter,
  eoRole,
  eoTrigger,
  eoForeign,
  eoIndexes,
  eoChecks,
  eoData
);
```

C++

```
enum TExtractObjectTypes {
  eoDatabase,
  eoDomain,
  eoTable,
  eoView,
  eoProcedure,
  eoFunction,
  eoGenerator,
  eoException,
  eoBLOBFilter,
  eoRole,
  eoTrigger,
  eoForeign,
  eoIndexes,
  eoChecks,
```

```
    eoData
  };
```

File

IBExtract

Description

Value Meaning

eoDatabase Fetch metadata about all objects defined on the database.

eoDomain List all domains, either for the entire database or only those that pertain to a specified table.

eoTable List all tables or information about a specified table.

eoView List all views in the database or the text of a specified view.

eoProcedure List all stored procedures or the text of a specified stored procedure.

eoFunction List all external functions, or list those external functions that match a specified name.

eoGenerator List all non-system generators, or only those generators that match a specified name.

eoException List all exceptions that the database defines, or only those exceptions that match a specified name.

eoBLOBFilter List all blob filters or only those filters whose function name matches a specified name.

eoRole List all roles or only those roles whose name matches a specified string.

eoTrigger List all triggers. The scope can be the entire database, those triggers that match a specified string, or those triggers defined for a specified table.

eoForeign List all foreign key constraints. The scope can be the entire database, those foreign key constraints with a specified name, or those that pertain to a specified table.

eoIndexes List all indexes. The scope can be the entire database, those indexes with a specified name, or those that are defined for a specified table.

eoChecks List all non-foreign check constraints. The scope can be the entire database, those check constraints with a specified name, or those that pertain to a specified table.

eoData List all the data a specified object.

23.2.2 IBExtract.TExtractType Enumeration

Pascal

```
TExtractType = (
  etDomain,
  etTable,
  etRole,
  etTrigger,
  etForeign,
  etIndex,
  etData,
  etGrant,
  etCheck,
  etAlterProc
);
```

C++

```
enum TExtractType {
  etDomain,
  etTable,
  etRole,
  etTrigger,
  etForeign,
  etIndex,
  etData,
  etGrant,
  etCheck,
  etAlterProc
};
```

File

IBExtract

Description

This is record IBExtract.TExtractType.

23.2.3 IBExtract.TPrivTypes Record

Pascal

```
TPrivTypes = record
  PrivFlag: Integer;
  PrivString: String;
end;
```

C++

```
struct TPrivTypes {
  int PrivFlag;
  UnicodeString PrivString;
};
```

File

IBExtract

Description

This is record IBExtract.TPrivTypes.

23.2.4 IBExtract.TSQLType Record

Pascal

```
TSQLType = record
  SqlType: Integer;
  TypeName: String;
end;
```

C++

```
struct TSQLType {
  int SqlType;
  UnicodeString TypeName;
```

```
};
```

File

IBExtract

Description

This is record IBExtract.TSQLType.

23.3 Types

The following table lists types in this documentation.

Types

Name	Description
TExtractTypes (see page 3827)	TExtractType (see page 3824) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.
TSQLTypes (see page 3828)	This is type IBExtract.TSQLTypes.

23.3.1 IBExtract.TExtractTypes Type

TExtractType (see page 3824) and TExtractTypes indicate the scope of metadata to extract from an InterBase server.

Pascal

```
TExtractTypes = set of TExtractType;
```

C++

```
TExtractType TExtractTypes;
```

File

IBExtract

Description

TExtractTypes is a set of TExtractType (see page 3824) values. The following table lists the possible values:

Value Meaning

etDomain When fetching metadata about a database table, include information about all domains that pertain to the table.

etTable Fetch metadata of the target type that pertains only to a specified named table.

etRole When fetching metadata about a database table, include information about all roles that have access to the table.

etTrigger When fetching metadata about a database table, include information about all triggers that pertain to the table.

etForeign When fetching metadata about a database table, include information about foreign key constraints.

etIndex When fetching metadata about a database table, include information about indexes defined for the table.

etData When fetching metadata about a database table, include the data values.

etGrant When fetching metadata about a database table, include information about user permissions.

etCheck When fetching metadata about a database table, include information about check constraints.

etAlterProc When fetching metadata about stored procedures, the extraction may involve the creation of dummy procedures to handle the situation where procedures reference each other. These dummy procedures, which stand in for a referenced stored procedure, are later altered to their correct form. This flag indicates that only the corrected form should be fetched.

23.3.2 IBExtract.TSQLTypes Type

Pascal

```
TSQLTypes = Array[0..13] of TSQLType;
```

C++

```
Array[0..13] of TSQLType TSQLTypes;
```

File

IBExtract

Description

This is type IBExtract.TSQLTypes.

23.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ColumnTypes (see page 3830)	This is constant IBExtract.ColumnTypes.
FILE_cache (see page 3830)	This is constant IBExtract.FILE_cache.
FILE_conditional (see page 3830)	This is constant IBExtract.FILE_conditional.
FILE_inactive (see page 3831)	This is constant IBExtract.FILE_inactive.
FILE_manual (see page 3831)	This is constant IBExtract.FILE_manual.
FILE_shadow (see page 3831)	This is constant IBExtract.FILE_shadow.
IntegralSubtypes (see page 3832)	This is constant IBExtract.IntegralSubtypes.
LOG_default (see page 3832)	This is constant IBExtract.LOG_default.
LOG_overflow (see page 3832)	This is constant IBExtract.LOG_overflow.
LOG_raw (see page 3833)	This is constant IBExtract.LOG_raw.
LOG_serial (see page 3833)	This is constant IBExtract.LOG_serial.
MAX_INTSUBTYPES (see page 3833)	This is constant IBExtract.MAX_INTSUBTYPES.
MAXSUBTYPES (see page 3834)	This is constant IBExtract.MAXSUBTYPES.
obj_computed (see page 3834)	This is constant IBExtract.obj_computed.
obj_count (see page 3834)	This is constant IBExtract.obj_count.
obj_exception (see page 3835)	This is constant IBExtract.obj_exception.
obj_expression_index (see page 3835)	This is constant IBExtract.obj_expression_index.
obj_field (see page 3835)	This is constant IBExtract.obj_field.
obj_index (see page 3836)	This is constant IBExtract.obj_index.
obj_procedure (see page 3836)	This is constant IBExtract.obj_procedure.
obj_relation (see page 3836)	This is constant IBExtract.obj_relation.
obj_sql_role (see page 3837)	This is constant IBExtract.obj_sql_role.
obj_trigger (see page 3837)	This is constant IBExtract.obj_trigger.
obj_user (see page 3837)	This is constant IBExtract.obj_user.
obj_user_group (see page 3838)	This is constant IBExtract.obj_user_group.
obj_validation (see page 3838)	This is constant IBExtract.obj_validation.
obj_view (see page 3838)	This is constant IBExtract.obj_view.
ODS_VERSION10 (see page 3839)	This is constant IBExtract.ODS_VERSION10.
ODS_VERSION6 (see page 3839)	This is constant IBExtract.ODS_VERSION6.
ODS_VERSION7 (see page 3839)	This is constant IBExtract.ODS_VERSION7.
ODS_VERSION8 (see page 3840)	This is constant IBExtract.ODS_VERSION8.
ODS_VERSION9 (see page 3840)	This is constant IBExtract.ODS_VERSION9.
priv_DELETE (see page 3840)	This is constant IBExtract.priv_DELETE.
priv_EXECUTE (see page 3841)	This is constant IBExtract.priv_EXECUTE.
priv_INSERT (see page 3841)	This is constant IBExtract.priv_INSERT.
priv_REFERENCES (see page 3841)	This is constant IBExtract.priv_REFERENCES.
priv_SELECT (see page 3842)	This is constant IBExtract.priv_SELECT.
priv_UNKNOWN (see page 3842)	This is constant IBExtract.priv_UNKNOWN.
priv_UPDATE (see page 3842)	This is constant IBExtract.priv_UPDATE.
PrivTypes (see page 3843)	This is constant IBExtract.PrivTypes.
SubTypes (see page 3843)	This is constant IBExtract.SubTypes.
TriggerTypes (see page 3843)	This is constant IBExtract.TriggerTypes.

23.4.1 IBExtract.ColumnTypes Constant

Pascal

```
ColumnTypes: TSQLTypes = ( (SqlType : blr_short; TypeName : 'SMALLINT'), (SqlType : blr_long;
TypeName : 'INTEGER'), (SqlType : blr_quad; TypeName : 'QUAD'), (SqlType : blr_float; TypeName
: 'FLOAT'), (SqlType : blr_text; TypeName : 'CHAR'), (SqlType : blr_double; TypeName : 'DOUBLE
PRECISION'), (SqlType : blr_varying; TypeName : 'VARCHAR'), (SqlType : blr_cstring; TypeName :
'CSTRING'), (SqlType : blr_blob_id; TypeName : 'BLOB_ID'), (SqlType : blr_blob; TypeName :
'BLOB'), (SqlType : blr_sql_time; TypeName : 'TIME'), (SqlType : blr_sql_date; TypeName :
'DATE'), (SqlType : blr_timestamp; TypeName : 'TIMESTAMP'), (SqlType : blr_int64; TypeName :
'INT64'));
```

C++

```
TSQLTypes ColumnTypes = ( (SqlType : blr_short; TypeName : 'SMALLINT'), (SqlType : blr_long;
TypeName : 'INTEGER'), (SqlType : blr_quad; TypeName : 'QUAD'), (SqlType : blr_float; TypeName
: 'FLOAT'), (SqlType : blr_text; TypeName : 'CHAR'), (SqlType : blr_double; TypeName : 'DOUBLE
PRECISION'), (SqlType : blr_varying; TypeName : 'VARCHAR'), (SqlType : blr_cstring; TypeName :
'CSTRING'), (SqlType : blr_blob_id; TypeName : 'BLOB_ID'), (SqlType : blr_blob; TypeName :
'BLOB'), (SqlType : blr_sql_time; TypeName : 'TIME'), (SqlType : blr_sql_date; TypeName :
'DATE'), (SqlType : blr_timestamp; TypeName : 'TIMESTAMP'), (SqlType : blr_int64; TypeName :
'INT64'));
```

File

IBExtract

Description

This is constant IBExtract.ColumnTypes.

23.4.2 IBExtract.FILE_cache Constant

Pascal

```
FILE_cache = 8;
```

C++

```
FILE_cache = 8;
```

File

IBExtract

Description

This is constant IBExtract.FILE_cache.

23.4.3 IBExtract.FILE_conditional Constant

Pascal

```
FILE_conditional = 16;
```

C++

```
FILE_conditional = 16;
```

File

IBExtract

Description

This is constant IBExtract.FILE_conditional.

23.4.4 IBExtract.FILE_inactive Constant

Pascal

```
FILE_inactive = 2;
```

C++

```
FILE_inactive = 2;
```

File

IBExtract

Description

This is constant IBExtract.FILE_inactive.

23.4.5 IBExtract.FILE_manual Constant

Pascal

```
FILE_manual = 4;
```

C++

```
FILE_manual = 4;
```

File

IBExtract

Description

This is constant IBExtract.FILE_manual.

23.4.6 IBExtract.FILE_shadow Constant

Pascal

```
FILE_shadow = 1;
```

C++

```
FILE_shadow = 1;
```

File

IBExtract

Description

This is constant IBExtract.FILE_shadow.

23.4.7 IBExtract.IntegralSubtypes Constant

Pascal

```
IntegralSubtypes: Array[0..2] of String = ( 'UNKNOWN', 'NUMERIC', 'DECIMAL');
```

C++

```
Array[0..2] of String IntegralSubtypes = ( 'UNKNOWN', 'NUMERIC', 'DECIMAL');
```

File

IBExtract

Description

This is constant IBExtract.IntegralSubtypes.

23.4.8 IBExtract.LOG_default Constant

Pascal

```
LOG_default = 2;
```

C++

```
LOG_default = 2;
```

File

IBExtract

Description

This is constant IBExtract.LOG_default.

23.4.9 IBExtract.LOG_overflow Constant

Pascal

```
LOG_overflow = 8;
```

C++

```
LOG_overflow = 8;
```

File

IBExtract

Description

This is constant IBExtract.LOG_overflow.

23.4.10 IBExtract.LOG_raw Constant

Pascal

```
LOG_raw = 4;
```

C++

```
LOG_raw = 4;
```

File

IBExtract

Description

This is constant IBExtract.LOG_raw.

23.4.11 IBExtract.LOG_serial Constant

Pascal

```
LOG_serial = 1;
```

C++

```
LOG_serial = 1;
```

File

IBExtract

Description

This is constant IBExtract.LOG_serial.

23.4.12 IBExtract.MAX_INTSUBTYPES Constant

Pascal

```
MAX_INTSUBTYPES = 2;
```

C++

```
MAX_INTSUBTYPES = 2;
```

File

IBExtract

Description

This is constant IBExtract.MAX_INTSUBTYPES.

23.4.13 IBExtract.MAXSUBTYPES Constant

Pascal

```
MAXSUBTYPES = 8;
```

C++

```
MAXSUBTYPES = 8;
```

File

IBExtract

Description

This is constant IBExtract.MAXSUBTYPES.

23.4.14 IBExtract.obj_computed Constant

Pascal

```
obj_computed = 3;
```

C++

```
obj_computed = 3;
```

File

IBExtract

Description

This is constant IBExtract.obj_computed.

23.4.15 IBExtract.obj_count Constant

Pascal

```
obj_count = 11;
```

C++

```
obj_count = 11;
```

File

IBExtract

Description

This is constant IBExtract.obj_count.

23.4.16 IBExtract.obj_exception Constant

Pascal

```
obj_exception = 7;
```

C++

```
obj_exception = 7;
```

File

IBExtract

Description

This is constant IBExtract.obj_exception.

23.4.17 IBExtract.obj_expression_index Constant

Pascal

```
obj_expression_index = 6;
```

C++

```
obj_expression_index = 6;
```

File

IBExtract

Description

This is constant IBExtract.obj_expression_index.

23.4.18 IBExtract.obj_field Constant

Pascal

```
obj_field = 9;
```

C++

```
obj_field = 9;
```

File

IBExtract

Description

This is constant IBExtract.obj_field.

23.4.19 IBExtract.obj_index Constant

Pascal

```
obj_index = 10;
```

C++

```
obj_index = 10;
```

File

IBExtract

Description

This is constant IBExtract.obj_index.

23.4.20 IBExtract.obj_procedure Constant

Pascal

```
obj_procedure = 5;
```

C++

```
obj_procedure = 5;
```

File

IBExtract

Description

This is constant IBExtract.obj_procedure.

23.4.21 IBExtract.obj_relation Constant

Pascal

```
obj_relation = 0;
```

C++

```
obj_relation = 0;
```

File

IBExtract

Description

This is constant IBExtract.obj_relation.

23.4.22 IBExtract.obj_sql_role Constant

Pascal

```
obj_sql_role = 13;
```

C++

```
obj_sql_role = 13;
```

File

IBExtract

Description

This is constant IBExtract.obj_sql_role.

23.4.23 IBExtract.obj_trigger Constant

Pascal

```
obj_trigger = 2;
```

C++

```
obj_trigger = 2;
```

File

IBExtract

Description

This is constant IBExtract.obj_trigger.

23.4.24 IBExtract.obj_user Constant

Pascal

```
obj_user = 8;
```

C++

```
obj_user = 8;
```

File

IBExtract

Description

This is constant IBExtract.obj_user.

23.4.25 IBExtract.obj_user_group Constant

Pascal

```
obj_user_group = 12;
```

C++

```
obj_user_group = 12;
```

File

IBExtract

Description

This is constant IBExtract.obj_user_group.

23.4.26 IBExtract.obj_validation Constant

Pascal

```
obj_validation = 4;
```

C++

```
obj_validation = 4;
```

File

IBExtract

Description

This is constant IBExtract.obj_validation.

23.4.27 IBExtract.obj_view Constant

Pascal

```
obj_view = 1;
```

C++

```
obj_view = 1;
```

File

IBExtract

Description

This is constant IBExtract.obj_view.

23.4.28 IBExtract.ODS_VERSION10 Constant

Pascal

```
ODS_VERSION10 = 10;
```

C++

```
ODS_VERSION10 = 10;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION10.

23.4.29 IBExtract.ODS_VERSION6 Constant

Pascal

```
ODS_VERSION6 = 6;
```

C++

```
ODS_VERSION6 = 6;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION6.

23.4.30 IBExtract.ODS_VERSION7 Constant

Pascal

```
ODS_VERSION7 = 7;
```

C++

```
ODS_VERSION7 = 7;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION7.

23.4.31 IBExtract.ODS_VERSION8 Constant

Pascal

```
ODS_VERSION8 = 8;
```

C++

```
ODS_VERSION8 = 8;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION8.

23.4.32 IBExtract.ODS_VERSION9 Constant

Pascal

```
ODS_VERSION9 = 9;
```

C++

```
ODS_VERSION9 = 9;
```

File

IBExtract

Description

This is constant IBExtract.ODS_VERSION9.

23.4.33 IBExtract.priv_DELETE Constant

Pascal

```
priv_DELETE = 16;
```

C++

```
priv_DELETE = 16;
```

File

IBExtract

Description

This is constant IBExtract.priv_DELETE.

23.4.34 IBExtract.priv_EXECUTE Constant

Pascal

```
priv_EXECUTE = 32;
```

C++

```
priv_EXECUTE = 32;
```

File

IBExtract

Description

This is constant IBExtract.priv_EXECUTE.

23.4.35 IBExtract.priv_INSERT Constant

Pascal

```
priv_INSERT = 4;
```

C++

```
priv_INSERT = 4;
```

File

IBExtract

Description

This is constant IBExtract.priv_INSERT.

23.4.36 IBExtract.priv_REFERENCES Constant

Pascal

```
priv_REFERENCES = 64;
```

C++

```
priv_REFERENCES = 64;
```

File

IBExtract

Description

This is constant IBExtract.priv_REFERENCES.

23.4.37 IBExtract.priv_SELECT Constant

Pascal

```
priv_SELECT = 2;
```

C++

```
priv_SELECT = 2;
```

File

IBExtract

Description

This is constant IBExtract.priv_SELECT.

23.4.38 IBExtract.priv_UNKNOWN Constant

Pascal

```
priv_UNKNOWN = 1;
```

C++

```
priv_UNKNOWN = 1;
```

File

IBExtract

Description

This is constant IBExtract.priv_UNKNOWN.

23.4.39 IBExtract.priv_UPDATE Constant

Pascal

```
priv_UPDATE = 8;
```

C++

```
priv_UPDATE = 8;
```

File

IBExtract

Description

This is constant IBExtract.priv_UPDATE.

23.4.40 IBExtract.PrivTypes Constant

Pascal

```
PrivTypes: Array[0..5] of TPrivTypes = ( (PrivFlag : priv_DELETE; PrivString : 'DELETE' ),
(PrivFlag : priv_EXECUTE; PrivString : 'EXECUTE' ), (PrivFlag : priv_INSERT; PrivString :
'INSERT' ), (PrivFlag : priv_SELECT; PrivString : 'SELECT' ), (PrivFlag : priv_UPDATE;
PrivString : 'UPDATE' ), (PrivFlag : priv_REFERENCES; PrivString : 'REFERENCES'));
```

C++

```
Array[0..5] of TPrivTypes PrivTypes = ( (PrivFlag : priv_DELETE; PrivString : 'DELETE' ),
(PrivFlag : priv_EXECUTE; PrivString : 'EXECUTE' ), (PrivFlag : priv_INSERT; PrivString :
'INSERT' ), (PrivFlag : priv_SELECT; PrivString : 'SELECT' ), (PrivFlag : priv_UPDATE;
PrivString : 'UPDATE' ), (PrivFlag : priv_REFERENCES; PrivString : 'REFERENCES'));
```

File

IBExtract

Description

This is constant IBExtract.PrivTypes.

23.4.41 IBExtract.SubTypes Constant

Pascal

```
SubTypes: Array[0..8] of String = ( 'UNKNOWN', 'TEXT', 'BLR', 'ACL', 'RANGES', 'SUMMARY',
'FORMAT', 'TRANSACTION_DESCRIPTION', 'EXTERNAL_FILE_DESCRIPTION');
```

C++

```
Array[0..8] of String SubTypes = ( 'UNKNOWN', 'TEXT', 'BLR', 'ACL', 'RANGES', 'SUMMARY',
'FORMAT', 'TRANSACTION_DESCRIPTION', 'EXTERNAL_FILE_DESCRIPTION');
```

File

IBExtract

Description

This is constant IBExtract.SubTypes.

23.4.42 IBExtract.TriggerTypes Constant

Pascal

```
TriggerTypes: Array[0..6] of String = ( '', 'BEFORE INSERT', 'AFTER INSERT', 'BEFORE UPDATE',
'AFTER UPDATE', 'BEFORE DELETE', 'AFTER DELETE');
```

C++

```
Array[0..6] of String TriggerTypes = ( '', 'BEFORE INSERT', 'AFTER INSERT', 'BEFORE UPDATE',
'AFTER UPDATE', 'BEFORE DELETE', 'AFTER DELETE');
```

File

IBExtract

Description

This is constant IBExtract.TriggerTypes.

24 IBInstall Namespace

This is namespace IBInstall.

Topics

Name	Description
Classes (see page 3847)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 3868)	The following table lists structs, records, enums in this documentation.
Types (see page 3873)	The following table lists types in this documentation.

Classes

	Name	Description
	EIBInstall (see page 3847)	EIBInstall catches all of the installation exceptions.
	EIBInstallerError (see page 3849)	This is class IBInstall.EIBInstallerError.
	EIBInstallError (see page 3850)	This is class IBInstall.EIBInstallError.
	TIBInstall (see page 3850)	Use TIBInstall to set up an InterBase installation component.
	TIBSetup (see page 3857)	TIBSetup is the ancestor object from which TIBInstall (see page 3850) and TIBUnInstall (see page 3862) are derived.
	TIBUnInstall (see page 3862)	Use TIBUnInstall to set up an uninstall component.
	TInstallOptions (see page 3865)	TInstallOptions configures the options of a TIBInstall (see page 3850) instance.

Structs, Records, Enums

	Name	Description
	TCmdOption (see page 3868)	TCmdOption and TCmdOptions (see page 3873) indicate which of the command-line tools are installed.
	TConnectivityOption (see page 3869)	TConnectivityOption and TConnectivityOptions (see page 3873) identify InterBase connectivity clients.
	TErrorResult (see page 3869)	This is record IBInstall.TErrorResult.
	TExamplesOption (see page 3870)	TExamplesOption and TExamplesOptions (see page 3874) identify InterBase Examples clients.
	TIBInstallerError (see page 3870)	This is record IBInstall.TIBInstallerError.
	TMainOption (see page 3871)	TMainOption and TMainOptions (see page 3876) identify the main InterBase components.
	TStatusResult (see page 3872)	This is record IBInstall.TStatusResult.
	TWarningResult (see page 3872)	This is record IBInstall.TWarningResult.

Types

Name	Description
TCmdOptions (see page 3873)	This is type IBInstall.TCmdOptions.
TConnectivityOptions (see page 3873)	This is type IBInstall.TConnectivityOptions.
TExamplesOptions (see page 3874)	This is type IBInstall.TExamplesOptions.
TIBSetupOnError (see page 3874)	TIBSetupOnError is the type of event handlers that respond to installation errors.
TIBSetupOnStatus (see page 3874)	TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.
TIBSetupOnWarning (see page 3875)	TIBSetupOnWarning is the type of event handlers that respond to installation warnings.
TIscError (see page 3875)	This is type IBInstall.TIscError.
TMainOptions (see page 3876)	This is type IBInstall.TMainOptions.

24.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIBInstall (see page 3847)	EIBInstall catches all of the installation exceptions.
	EIBInstallerError (see page 3849)	This is class IBInstall.EIBInstallerError.
	EIBInstallError (see page 3850)	This is class IBInstall.EIBInstallError.
	TIBInstall (see page 3850)	Use TIBInstall to set up an InterBase installation component.
	TIBSetup (see page 3857)	TIBSetup is the ancestor object from which TIBInstall (see page 3850) and TIBUnInstall (see page 3862) are derived.
	TIBUnInstall (see page 3862)	Use TIBUnInstall to set up an uninstall component.
	TInstallOptions (see page 3865)	TInstallOptions configures the options of a TIBInstall (see page 3850) instance.

24.1.1 EIBInstall Class

EIBInstall catches all of the installation exceptions.

Class Hierarchy

Pascal

```
EIBInstall = class(Exception);
```

C++

```
class EIBInstall : public Exception;
```

File

IBInstall

Description

Use EIBInstall to catch installation exceptions from InterBase and InterBase Express (IBX).

Note: You must install InterBase 6 to use this feature.

24.1.1.1 EIBInstall Members

The following tables list the members exposed by EIBInstall.

Public Methods

	Name	Description
	Create (see page 3848)	This is the overview for the Create constructor overload.

Public Properties

	Name	Description
	InstallerError (see page 3848)	Returns IBX error messages.

	InstallError (see page 3849)	Returns InterBase installation error messages.

24.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	EIBInstall.Create (MSG_NO, string) (see page 3848)	Creates an instance of an EIBInstall (see page 3847) object.
	EIBInstall.Create (TIBInstallerError, string) (see page 3848)	Creates an instance of an EIBInstall (see page 3847) object.

24.1.1.2.1 EIBInstall.Create Constructor (MSG_NO, string)

Creates an instance of an EIBInstall (see page 3847) object.

Pascal

```
constructor Create(IscCode: MSG_NO; IscMessage: string); virtual; overload;
constructor Create(ECode: TIBInstallerError; EMessage: string); virtual; overload;
```

C++

```
virtual __fastcall EIBInstall(MSG_NO IscCode, UnicodeString IscMessage);
virtual __fastcall EIBInstall(TIBInstallerError ECode, UnicodeString EMessage);
```

Description

Call Create to create an instance of an EIBInstall (see page 3847) exception object.

Note: You must install InterBase 6 to use this feature.

24.1.1.3 EIBInstall Properties

The properties of the EIBInstall class are listed here.

Public Properties

	Name	Description
	InstallerError (see page 3848)	Returns IBX error messages.
	InstallError (see page 3849)	Returns InterBase installation error messages.

24.1.1.3.1 EIBInstall.InstallerError Property

Returns IBX error messages.

Pascal

```
property InstallerError: TIBInstallerError;
```

C++

```
__property TIBInstallerError InstallerError;
```

Description

Use InstallerError to return error messages generated by the IBX install components. InstallerError can be one of:

ieSuccess	Installation is successful
ieDelphiException	Installation fails due to a Delphi exception
ieNoOptionsSet	Installation fails because no installation options are set
ieNoDestinationDirectory	Installation fails because no destination directory is set
ieNoSourceDirectory	Installation fails because no source directory is set
ieNoUninstallFile	Installation fails because no uninstall file is named
ieOptionNeedsClient	Installation fails because the installation needs the InterBase Client component to succeed
ieOptionNeedsServer	Installation fails because the installation needs the InterBase Server component to succeed
ieInvalidOption	Option is invalid
ieInvalidOnErrorResult	The OnError event result is invalid
ieInvalidOnStatusResult	The OnStatus event result is invalid

Note: You must install InterBase 6 to use this feature.

24.1.1.3.2 EIBInstall.InstallError Property

Returns InterBase installation error messages.

Pascal

```
property InstallError: MSG_NO;
```

C++

```
__property MSG_NO InstallError;
```

Description

Use InstallError to return error messages generated by the InterBase API.

Note: You must install InterBase 6 to use this feature.

24.1.2 EIBInstallerError Class

Class Hierarchy

Pascal

```
EIBInstallerError = class(EIBInstall);
```

C++

```
class EIBInstallerError : public EIBInstall;
```

File

IBInstall

Description

This is class IBInstall.EIBInstallerError.

24.1.3 EIBInstallError Class

Class Hierarchy

Pascal

```
EIBInstallError = class(EIBInstall);
```

C++

```
class EIBInstallError : public EIBInstall;
```

File

IBInstall

Description

This is class IBInstall.EIBInstallError.

24.1.4 TIBInstall Class

Use TIBInstall to set up an InterBase installation component.

Class Hierarchy

Pascal

```
TIBInstall = class(TIBSetup);
```

C++

```
class TIBInstall : public TIBSetup;
```

File

IBInstall

Description

Use TIBInstall to set up an InterBase installation component.

Note: To use this component, you must install InterBase 6 and you must place ibinstall.dll in the path.

See Also

Getting Started with InterBase Express

24.1.4.1 TIBInstall Members

The following tables list the members exposed by TIBInstall.

Protected Methods

	Name	Description
	Call (see page 3858)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 3858)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 3859)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 3859)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 3859)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 3851)	Creates an installation component.
V	Destroy (see page 3852)	Destroys the instance of TIBInstall (see page 3850).
	GetOptionDescription (see page 3852)	This is the overview for the GetOptionDescription method overload.
	GetOptionName (see page 3853)	This is the overview for the GetOptionName method overload.
	GetOptionSpaceRequired (see page 3853)	This is the overview for the GetOptionSpaceRequired method overload.
	InstallCheck (see page 3854)	Checks if the installation is ready to be performed.
	InstallExecute (see page 3854)	Executes the installation.

Public Properties

	Name	Description
	ErrorContext (see page 3859)	Sets or returns the error context.
	MsgFilePath (see page 3860)	Sets or returns the installation message file path.
R	Progress (see page 3860)	Returns the installation progress.
R	RebootToComplete (see page 3860)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 3861)	Sets or returns the status context.
R	SuggestedDestination (see page 3856)	Returns the suggested installation target destination.
R	UnInstallFile (see page 3856)	Returns the name and path of the uninstall file.

Published Events

	Name	Description
	OnError (see page 3861)	Occurs when an installation error occurs.
	OnStatusChange (see page 3862)	Occurs when a change in installation status occurs.
	OnWarning (see page 3862)	Occurs when an installation warning occurs.

Published Properties

	Name	Description
	DestinationDirectory (see page 3855)	Sets or returns the installation target path.
	InstallOptions (see page 3855)	Sets or displays the installation options.
	SourceDirectory (see page 3856)	Sets or returns the path of the InterBase installation source files.

24.1.4.2 TIBInstall.Create Constructor

Creates an installation component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBInstall(TComponent * AOwner);
```

Description

Call (see page 3858) Create to create an installation component.

Note: You must install InterBase 6 to use this feature.

24.1.4.3 TIBInstall.Destroy Destructor

Destroys the instance of TIBInstall (see page 3850).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInstall();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the install object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

24.1.4.4 TIBInstall Methods

The methods of the TIBInstall class are listed here.

Public Methods

	Name	Description
	GetOptionDescription (see page 3852)	This is the overview for the GetOptionDescription method overload.
	GetOptionName (see page 3853)	This is the overview for the GetOptionName method overload.
	GetOptionSpaceRequired (see page 3853)	This is the overview for the GetOptionSpaceRequired method overload.
	InstallCheck (see page 3854)	Checks if the installation is ready to be performed.
	InstallExecute (see page 3854)	Executes the installation.

24.1.4.4.1 GetOptionDescription Method

This is the overview for the GetOptionDescription method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionDescription (TCmdOption) (see page 3852)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TConnectivityOption) (see page 3852)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TExamplesOption) (see page 3852)	Returns a description of a specified option.
	TIBInstall.GetOptionDescription (TMainOption) (see page 3852)	Returns a description of a specified option.

24.1.4.4.1.1 TIBInstall.GetOptionDescription Method (TCmdOption)

Returns a description of a specified option.

Pascal

```
function GetOptionDescription(Option: TExamplesOption): string; overload;
function GetOptionDescription(Option: TMainOption): string; overload;
```

```
function GetOptionDescription(Option: TConnectivityOption): string; overload;
function GetOptionDescription(Option: TCmdOption): string; overload;
```

C++

```
__fastcall UnicodeString GetOptionDescription(TExamplesOption Option);
__fastcall UnicodeString GetOptionDescription(TMainOption Option);
__fastcall UnicodeString GetOptionDescription(TConnectivityOption Option);
__fastcall UnicodeString GetOptionDescription(TCmdOption Option);
```

Description

Call (see page 3858) GetOptionDescription to return a description of the indicated option. If the specified option is not valid, an error is returned.

Note: You must install InterBase 6 to use this feature.

24.1.4.4.2 GetOptionName Method

This is the overview for the GetOptionName method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionName (TCmdOption) (see page 3853)	Returns the option name.
	TIBInstall.GetOptionName (TConnectivityOption) (see page 3853)	Returns the option name.
	TIBInstall.GetOptionName (TExamplesOption) (see page 3853)	Returns the option name.
	TIBInstall.GetOptionName (TMainOption) (see page 3853)	Returns the option name.

24.1.4.4.2.1 TIBInstall.GetOptionName Method (TCmdOption)

Returns the option name.

Pascal

```
function GetOptionName(Option: TExamplesOption): string; overload;
function GetOptionName(Option: TMainOption): string; overload;
function GetOptionName(Option: TConnectivityOption): string; overload;
function GetOptionName(Option: TCmdOption): string; overload;
```

C++

```
__fastcall UnicodeString GetOptionName(TExamplesOption Option);
__fastcall UnicodeString GetOptionName(TMainOption Option);
__fastcall UnicodeString GetOptionName(TConnectivityOption Option);
__fastcall UnicodeString GetOptionName(TCmdOption Option);
```

Description

Call (see page 3858) GetOptionName to return the name of the indicated option.

Note: You must install InterBase 6 to use this feature.

24.1.4.4.3 GetOptionSpaceRequired Method

This is the overview for the GetOptionSpaceRequired method overload.

Overload List

	Name	Description
	TIBInstall.GetOptionSpaceRequired (TCmdOption) (see page 3854)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TConnectivityOption) (see page 3854)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TExamplesOption) (see page 3854)	Returns the space required to install the indicated option.
	TIBInstall.GetOptionSpaceRequired (TMainOption) (see page 3854)	Returns the space required to install the indicated option.

24.1.4.4.3.1 TIBInstall.GetOptionSpaceRequired Method (TCmdOption)

Returns the space required to install the indicated option.

Pascal

```
function GetOptionSpaceRequired(Option: TExamplesOption): longword; overload;
function GetOptionSpaceRequired(Option: TMainOption): longword; overload;
function GetOptionSpaceRequired(Option: TConnectivityOption): longword; overload;
function GetOptionSpaceRequired(Option: TCmdOption): longword; overload;
```

C++

```
__fastcall longword GetOptionSpaceRequired(TExamplesOption Option);
__fastcall longword GetOptionSpaceRequired(TMainOption Option);
__fastcall longword GetOptionSpaceRequired(TConnectivityOption Option);
__fastcall longword GetOptionSpaceRequired(TCmdOption Option);
```

Description

Call (see page 3858) GetOptionSpaceRequired to return the space required in kilobytes for the indicated option.

Note: You must install InterBase 6 to use this feature.

24.1.4.4.4 TIBInstall.InstallCheck Method

Checks if the installation is ready to be performed.

Pascal

```
procedure InstallCheck;
```

C++

```
__fastcall InstallCheck();
```

Description

Call (see page 3858) InstallCheck to check if everything is ready for the installation to be performed.

Note: You must install InterBase 6 to use this feature.

24.1.4.4.5 TIBInstall.InstallExecute Method

Executes the installation.

Pascal

```
procedure InstallExecute;
```

C++

```
__fastcall InstallExecute();
```

Description

Call (see page 3858) InstallExecute to execute the installation.

Note: You must install InterBase 6 to use this feature.

24.1.4.5 TIBInstall Properties

The properties of the TIBInstall class are listed here.

Public Properties

	Name	Description
	SuggestedDestination (see page 3856)	Returns the suggested installation target destination.
	UnInstallFile (see page 3856)	Returns the name and path of the uninstall file.

Published Properties

	Name	Description
	DestinationDirectory (see page 3855)	Sets or returns the installation target path.
	InstallOptions (see page 3855)	Sets or displays the installation options.
	SourceDirectory (see page 3856)	Sets or returns the path of the InterBase installation source files.

24.1.4.5.1 TIBInstall.DestinationDirectory Property

Sets or returns the installation target path.

Pascal

```
property DestinationDirectory: string;
```

C++

```
__property UnicodeString DestinationDirectory;
```

Description

Use DestinationDirectory to set or returns the installation target path. Initially, this will be the same as the SuggestedDestination (see page 3856).

Note: You must install InterBase 6 to use this feature.

24.1.4.5.2 TIBInstall.InstallOptions Property

Sets or displays the installation options.

Pascal

```
property InstallOptions: TInstallOptions;
```

C++

```
__property TInstallOptions InstallOptions;
```

Description

Use InstallOptions to set or display the installation options (TInstallOptions (see page 3865)). TInstallOptions (see page 3865) are:

Option	Installs:
CmdLineTools	The InterBase command line tools
ConnectivityClients	The InterBase connectivity clients
Examples	The InterBase examples
MainComponents	The main InterBase components

Note: You must install InterBase 6 to use this feature.

24.1.4.5.3 TIBInstall.SourceDirectory Property

Sets or returns the path of the InterBase installation source files.

Pascal

```
property SourceDirectory: string;
```

C++

```
__property UnicodeString SourceDirectory;
```

Description

Use SourceDirectory to set or return the path of the installation source files. In most cases, this will be a path on the InterBase CDROM.

Note: You must install InterBase 6 to use this feature.

24.1.4.5.4 TIBInstall.SuggestedDestination Property

Returns the suggested installation target destination.

Pascal

```
property SuggestedDestination: string;
```

C++

```
__property UnicodeString SuggestedDestination;
```

Description

Use SuggestedDestination to return suggested installation target destination.

Note: You must install InterBase 6 to use this feature.

24.1.4.5.5 TIBInstall.UnInstallFile Property

Returns the name and path of the uninstall file.

Pascal

```
property UnInstallFile: string;
```

C++

```
__property UnicodeString UnInstallFile;
```

Description

Use UnInstallFile to return the binary log file name and path of the uninstall file. The uninstall file contains information on which options were installed. This information lets the TIBUnInstall (see page 3862) component know what needs to be removed.

Note: You must install InterBase 6 to use this feature.

24.1.5 TIBSetup Class

TIBSetup is the ancestor object from which TIBInstall (see page 3850) and TIBUnInstall (see page 3862) are derived.

Class Hierarchy

Pascal

```
TIBSetup = class(TComponent);
```

C++

```
class TIBSetup : public TComponent;
```

File

IBInstall

Description

TIBSetup is the ancestor object from which TIBInstall (see page 3850) and TIBUnInstall (see page 3862) are derived.

Note: You must install InterBase 6 to use this feature.

24.1.5.1 TIBSetup Members

The following tables list the members exposed by TIBSetup.

Protected Methods

	Name	Description
	Call (see page 3858)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 3858)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 3859)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 3859)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 3859)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 3858)	Creates an installation component.

Public Properties

	Name	Description
	ErrorContext (see page 3859)	Sets or returns the error context.
	MsgFilePath (see page 3860)	Sets or returns the installation message file path.
R	Progress (see page 3860)	Returns the installation progress.
R	RebootToComplete (see page 3860)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 3861)	Sets or returns the status context.

Published Events

	Name	Description
	OnError (see page 3861)	Occurs when an installation error occurs.
	OnStatusChange (see page 3862)	Occurs when a change in installation status occurs.

	OnWarning (see page 3862)	Occurs when an installation warning occurs.

24.1.5.2 TIBSetup.Create Constructor

Creates an installation component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSetup(TComponent * AOwner);
```

Description

Call (see page 3858) Create to create an installation component.

Note: You must install InterBase 6 to use this feature.

24.1.5.3 TIBSetup Methods

The methods of the TIBSetup class are listed here.

Protected Methods

	Name	Description
	Call (see page 3858)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 3858)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 3859)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 3859)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 3859)	This is StatusInternal, a member of class TIBSetup.

24.1.5.3.1 TIBSetup.Call Method

Pascal

```
procedure Call(IscCode: MSG_NO);
```

C++

```
__fastcall Call(MSG_NO IscCode);
```

Description

This is Call, a member of class TIBSetup.

24.1.5.3.2 TIBSetup.ErrorInternal Method

Pascal

```
function ErrorInternal(IscCode: MSG_NO; const ActionDescription: TEXT): Integer;
```

C++

```
__fastcall int ErrorInternal(MSG_NO IscCode, const TEXT ActionDescription);
```

Description

This is ErrorInternal, a member of class TIBSetup.

24.1.5.3.3 TIBSetup.GetInstallMessage Method

Pascal

```
function GetInstallMessage(IscCode: MSG_NO): string;
```

C++

```
__fastcall UnicodeString GetInstallMessage(MSG_NO IscCode);
```

Description

This is GetInstallMessage, a member of class TIBSetup.

24.1.5.3.4 TIBSetup.IBInstallError Method

Pascal

```
procedure IBInstallError(IscCode: MSG_NO);
```

C++

```
__fastcall IBInstallError(MSG_NO IscCode);
```

Description

This is IBInstallError, a member of class TIBSetup.

24.1.5.3.5 TIBSetup.StatusInternal Method

Pascal

```
function StatusInternal(Status: Integer; const ActionDescription: TEXT): Integer;
```

C++

```
__fastcall int StatusInternal(int Status, const TEXT ActionDescription);
```

Description

This is StatusInternal, a member of class TIBSetup.

24.1.5.4 TIBSetup Properties

The properties of the TIBSetup class are listed here.

Public Properties

	Name	Description
	ErrorContext (see page 3859)	Sets or returns the error context.
	MsgFilePath (see page 3860)	Sets or returns the installation message file path.
R	Progress (see page 3860)	Returns the installation progress.
R	RebootToComplete (see page 3860)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 3861)	Sets or returns the status context.

24.1.5.4.1 TIBSetup.ErrorContext Property

Sets or returns the error context.

Pascal

```
property ErrorContext: Pointer;
```

C++

```
__property void * ErrorContext;
```

Description

Use ErrorContext to set or return the user-defined data for the error function.

Note: You must install InterBase 6 to use this feature.

24.1.5.4.2 TIBSetup.MsgFilePath Property

Sets or returns the installation message file path.

Pascal

```
property MsgFilePath: string;
```

C++

```
__property UnicodeString MsgFilePath;
```

Description

Use MsgFilePath to set or return the full directory path to the filename.msg file. Most of the time this is the same as the source and path where the InterBase product is installed.

This property allows you to supply your own installation messages. It is also possible to write the setup program in such a way that you could switch languages on demand, by providing several filename.msg files at different locations.

The filename.msg file normally contains:

- Error messages
- Option names and descriptions
- Actions descriptions and status messages that are logged to the ibinstall.log file

Note: You must install InterBase 6 to use this feature.

24.1.5.4.3 TIBSetup.Progress Property

Returns the installation progress.

Pascal

```
property Progress: Integer;
```

C++

```
__property int Progress;
```

Description

Use Progress to return the installation progress as an integer between 0 and 100. Progress is updated by the OnStatusChange (see page 3862) event.

Note: You must install InterBase 6 to use this feature.

24.1.5.4.4 TIBSetup.RebootToComplete Property

Sets whether it is necessary to reboot to complete the installation.

Pascal

```
property RebootToComplete: Boolean;
```

C++

```
__property Boolean RebootToComplete;
```

Description

Use RebootToComplete to set whether it is necessary to reboot the system to complete the installation or uninstallation. By default, this is not necessary (False).

Note: You must install InterBase 6 to use this feature.

24.1.5.4.5 TIBSetup.StatusContext Property

Sets or returns the status context.

Pascal

```
property StatusContext: Pointer;
```

C++

```
__property void * StatusContext;
```

Description

Use StatusContext to set or return the user-defined data for the status function.

Note: You must install InterBase 6 to use this feature.

24.1.5.5 TIBSetup Events

The events of the TIBSetup class are listed here.

Published Events

	Name	Description
	OnError (see page 3861)	Occurs when an installation error occurs.
	OnStatusChange (see page 3862)	Occurs when a change in installation status occurs.
	OnWarning (see page 3862)	Occurs when an installation warning occurs.

24.1.5.5.1 TIBSetup.OnError Event

Occurs when an installation error occurs.

Pascal

```
property OnError: TIBSetupOnError;
```

C++

```
__property TIBSetupOnError OnError;
```

Description

Write an OnError event handler to take specific actions when an error occurs during installation.

Note: You must install InterBase 6 to use this feature.

24.1.5.5.2 TIBSetup.OnStatusChange Event

Occurs when a change in installation status occurs.

Pascal

```
property OnStatusChange: TIBSetupOnStatus;
```

C++

```
__property TIBSetupOnStatus OnStatusChange;
```

Description

Write an OnStatusChange event handler to take specific actions when a status change occurs during installation.

Status events are generated from time to time when InstallExecute is called. The event informs the user of the installation progress. The event handler might want to use the StatusContext (see page 3861) property to display information about the current installation status. The progress is returned by the Progress (see page 3860) property as an integer from 1-100.

Note: You must install InterBase 6 to use this feature.

24.1.5.5.3 TIBSetup.OnWarning Event

Occurs when an installation warning occurs.

Pascal

```
property OnWarning: TIBSetupOnWarning;
```

C++

```
__property TIBSetupOnWarning OnWarning;
```

Description

Write an OnWarning event handler to take specific actions when a warning occurs.

An OnWarning event is generated whenever warning is reported, and must return either isc_fp_install_continue or isc_install_abort.

Note: You must install InterBase 6 to use this feature.

24.1.6 TIBUnInstall Class

Use TIBUnInstall to set up an uninstall component.

Class Hierarchy

Pascal

```
TIBUnInstall = class(TIBSetup);
```

C++

```
class TIBUnInstall : public TIBSetup;
```

File

IBInstall

Description

Use TIBUnInstall to set up an uninstall component.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

24.1.6.1 TIBUnInstall Members

The following tables list the members exposed by TIBUnInstall.

Protected Methods

	Name	Description
	Call (see page 3858)	This is Call, a member of class TIBSetup.
	ErrorInternal (see page 3858)	This is ErrorInternal, a member of class TIBSetup.
	GetInstallMessage (see page 3859)	This is GetInstallMessage, a member of class TIBSetup.
	IBInstallError (see page 3859)	This is IBInstallError, a member of class TIBSetup.
	StatusInternal (see page 3859)	This is StatusInternal, a member of class TIBSetup.

Public Methods

	Name	Description
V	Create (see page 3858)	Creates an installation component.
	UnInstallCheck (see page 3864)	Checks to see if uninstallation is possible.
	UnInstallExecute (see page 3864)	Executes the uninstallation.

Public Properties

	Name	Description
	ErrorContext (see page 3859)	Sets or returns the error context.
	MsgFilePath (see page 3860)	Sets or returns the installation message file path.
R	Progress (see page 3860)	Returns the installation progress.
R	RebootToComplete (see page 3860)	Sets whether it is necessary to reboot to complete the installation.
	StatusContext (see page 3861)	Sets or returns the status context.
	UnInstallFile (see page 3864)	Returns the name and path of the InterBase uninstall file.

Published Events

	Name	Description
	OnError (see page 3861)	Occurs when an installation error occurs.
	OnStatusChange (see page 3862)	Occurs when a change in installation status occurs.
	OnWarning (see page 3862)	Occurs when an installation warning occurs.

24.1.6.2 TIBUnInstall Methods

The methods of the TIBUnInstall class are listed here.

Public Methods

	Name	Description
	UnInstallCheck (see page 3864)	Checks to see if uninstallation is possible.
	UnInstallExecute (see page 3864)	Executes the uninstallation.

24.1.6.2.1 TIBUnInstall.UnInstallCheck Method

Checks to see if uninstallation is possible.

Pascal

```
procedure UnInstallCheck;
```

C++

```
__fastcall UnInstallCheck();
```

Description

Call (see page 3858) UnInstallCheck to check if uninstallation is possible.

Note: You must install InterBase 6 to use this feature.

24.1.6.2.2 TIBUnInstall.UnInstallExecute Method

Executes the uninstallation.

Pascal

```
procedure UnInstallExecute;
```

C++

```
__fastcall UnInstallExecute();
```

Description

Call (see page 3858) UnInstallExecute to execute the uninstallation.

Note: You must install InterBase 6 to use this feature.

24.1.6.3 TIBUnInstall Properties

The properties of the TIBUnInstall class are listed here.

Public Properties

	Name	Description
	UnInstallFile (see page 3864)	Returns the name and path of the InterBase uninstall file.

24.1.6.3.1 TIBUnInstall.UnInstallFile Property

Returns the name and path of the InterBase uninstall file.

Pascal

```
property UnInstallFile: string;
```

C++

```
__property UnicodeString UnInstallFile;
```

Description

Use UnInstallFile to return the name and path of the InterBase uninstall file.

Note: You must install InterBase 6 to use this feature.

24.1.7 TInstallOptions Class

TInstallOptions configures the options of a TIBInstall (see page 3850) instance.

Class Hierarchy

Pascal

```
TInstallOptions = class(TPersistent);
```

C++

```
class TInstallOptions : public TPersistent;
```

File

IBInstall

Description

Use TInstallOptions to indicate the options to use when installing InterBase. This is the type of the Options property on TIBInstall (see page 3850).

Note: You must install InterBase 6 to use this feature.

24.1.7.1 TInstallOptions Members

The following tables list the members exposed by TInstallOptions.

Published Properties

	Name	Description
	CmdLineTools (see page 3865)	Installs the command line tools for InterBase.
	ConnectivityClients (see page 3866)	Installs the connectivity clients for InterBase.
	Examples (see page 3866)	Installs all the InterBase examples.
	MainComponents (see page 3866)	Installs the InterBase main components.

24.1.7.2 TInstallOptions Properties

The properties of the TInstallOptions class are listed here.

Published Properties

	Name	Description
	CmdLineTools (see page 3865)	Installs the command line tools for InterBase.
	ConnectivityClients (see page 3866)	Installs the connectivity clients for InterBase.
	Examples (see page 3866)	Installs all the InterBase examples.
	MainComponents (see page 3866)	Installs the InterBase main components.

24.1.7.2.1 TInstallOptions.CmdLineTools Property

Installs the command line tools for InterBase.

Pascal

```
property CmdLineTools: TCmdOptions;
```

C++

```
__property TCmdOptions CmdLineTools;
```

Description

Use CmdLineTools to indicate which of the command line tools for InterBase should be installed. The installer issues a warning for any of these if the MainComponents (see page 3866) property does not include moClient.

Note: You must install InterBase 6 to use this feature.

24.1.7.2.2 TInstallOptions.ConnectivityClients Property

Installs the connectivity clients for InterBase.

Pascal

```
property ConnectivityClients: TConnectivityOptions;
```

C++

```
__property TConnectivityOptions ConnectivityClients;
```

Description

Use ConnectivityClients to install the InterBase connectivity clients.

Note: You must install InterBase 6 to use this feature.

24.1.7.2.3 TInstallOptions.Examples Property

Installs all the InterBase examples.

Pascal

```
property Examples: TExamplesOptions;
```

C++

```
__property TExamplesOptions Examples;
```

Description

Use Examples to indicates which of the InterBase examples should be installed.

When Examples includes exAPI, the MainComponents (see page 3866) property must include moClient and moDevelopment. When Examples includes exDev, MainComponents (see page 3866) must include moServer.

Note: You must install InterBase 6 to use this feature.

24.1.7.2.4 TInstallOptions.MainComponents Property

Installs the InterBase main components.

Pascal

```
property MainComponents: TMainOptions;
```

C++

```
__property TMainOptions MainComponents;
```

Description

Use MainComponents to indicate which of the InterBase main components to install. These can include the client, server, development tools, documentation, and ODBC driver and driver manager.

Note: You must install InterBase 6 to use this feature.

24.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCmdOption (see page 3868)	TCmdOption and TCmdOptions (see page 3873) indicate which of the command-line tools are installed.
	TConnectivityOption (see page 3869)	TConnectivityOption and TConnectivityOptions (see page 3873) identify InterBase connectivity clients.
	TErrorResult (see page 3869)	This is record IBInstall.TErrorResult.
	TExamplesOption (see page 3870)	TExamplesOption and TExamplesOptions (see page 3874) identify InterBase Examples clients.
	TIBInstallerError (see page 3870)	This is record IBInstall.TIBInstallerError.
	TMainOption (see page 3871)	TMainOption and TMainOptions (see page 3876) identify the main InterBase components.
	TStatusResult (see page 3872)	This is record IBInstall.TStatusResult.
	TWarningResult (see page 3872)	This is record IBInstall.TWarningResult.

24.2.1 IBInstall.TCmdOption Enumeration

TCmdOption and TCmdOptions (see page 3873) indicate which of the command-line tools are installed.

Pascal

```
TCmdOption = (
  cmDBMgmt,
  cmDBQuery,
  cmUsrMgmt
);
```

C++

```
enum TCmdOption {
  cmDBMgmt,
  cmDBQuery,
  cmUsrMgmt
};
```

File

IBInstall

Description

TCmdOption indicates a particular command-line tool for InterBase. TCmdOptions (see page 3873) is a set of TCmdOption values that indicates the tools that are installed. The following table lists the TCmdOption values:

Value Meaning

cmDBMgmt gbak and gfix database management tools.

cmDBQuery isql, gdef, and qli database query tools.

cmUsrMgmt gsec user management tool.

24.2.2 IBInstall.TConnectivityOption Enumeration

TConnectivityOption and TConnectivityOptions (see page 3873) identify InterBase connectivity clients.

Pascal

```
TConnectivityOption = (
  cnODBC,
  cnOLEDB,
  cnJDBC
);
```

C++

```
enum TConnectivityOption {
  cnODBC,
  cnOLEDB,
  cnJDBC
};
```

File

IBInstall

Description

TConnectivityOption indicates a particular connectivity client. TConnectivityOptions (see page 3873) is a set of TConnectivityOption values that indicates the clients that are installed. The following table lists the TConnectivityOption values:

Value Meaning

cnODBC The Open Database Connectivity client.

cnOLEDB The OLE DB connectivity client.

cnJDBC The InterClient Java (see page 4529) connectivity client.

24.2.3 IBInstall.TErrorResult Enumeration

Pascal

```
TErrorResult = (
  erAbort,
  erContinue,
  erRetry
);
```

C++

```
enum TErrorResult {
  erAbort,
  erContinue,
  erRetry
};
```

File

IBInstall

Description

This is record IBInstall.TErrorResult.

24.2.4 IBInstall.TExamplesOption Enumeration

TExamplesOption and TExamplesOptions (see page 3874) identify InterBase Examples clients.

Pascal

```
TExamplesOption = (
  exDB,
  exAPI
);
```

C++

```
enum TExamplesOption {
  exDB,
  exAPI
};
```

File

IBInstall

Description

TExamplesOption indicates a particular example that ships with InterBase. TExamplesOptions (see page 3874) is a set of TExamplesOption values that indicates the examples that are installed. The following table lists the TExamplesOption values:

Value Meaning

exAPI API, SQL, DSQL, and ESQL example files.

exDB Database examples.

24.2.5 IBInstall.TIBInstallerError Enumeration

Pascal

```
TIBInstallerError = (
  ieSuccess,
  ieDelphiException,
  ieNoOptionsSet,
  ieNoDestinationDirectory,
  ieNosourceDirectory,
  ieNoUninstallFile,
  ieOptionNeedsClient,
  ieOptionNeedsServer,
  ieInvalidOption,
  ieInvalidOnErrorResult,
  ieInvalidOnStatusResult
);
```

C++

```
enum TIBInstallerError {
  ieSuccess,
  ieDelphiException,
```

```
    ieNoOptionsSet,
    ieNoDestinationDirectory,
    ieNosourceDirectory,
    ieNoUninstallFile,
    ieOptionNeedsClient,
    ieOptionNeedsServer,
    ieInvalidOption,
    ieInvalidOnErrorResult,
    ieInvalidOnStatusResult
  };
```

File

IBInstall

Description

This is record IBInstall.TIBInstallerError.

24.2.6 IBInstall.TMainOption Enumeration

TMainOption and TMainOptions (see page 3876) identify the main InterBase components.

Pascal

```
  TMainOption = (
    moServer,
    moClient,
    moConServer,
    moGuiTools,
    moDocumentation,
    moDevelopment
  );
```

C++

```
  enum TMainOption {
    moServer,
    moClient,
    moConServer,
    moGuiTools,
    moDocumentation,
    moDevelopment
  };
```

File

IBInstall

Description

TMainOption indicates one of the main InterBase components. TMainOptions (see page 3876) is a set of TMainOption values that indicates the components that are installed. The following table lists the TMainOption values:

Value Meaning

moServer Server component, including: the server, license file (if present), message file, the Guardian, server configuration tool, the database information tools, UDF library, International character set library, and help files (Windows only).

moClient Client component, including the client library, license file, and message file.

moConServer Connectivity server, for future implementation.

moGuiTools Graphical interface tools, including IBConsole.

moDocumentation Documentation, including PDF files and indexes.

moDevelopment Development tools, including gpre, the import libraries, and the header files.

24.2.7 IBInstall.TStatusResult Enumeration

Pascal

```
TStatusResult = (
  srAbort,
  srContinue
);
```

C++

```
enum TStatusResult {
  srAbort,
  srContinue
};
```

File

IBInstall

Description

This is record IBInstall.TStatusResult.

24.2.8 IBInstall.TWarningResult Enumeration

Pascal

```
TWarningResult = (
  wrAbort,
  wrContinue
);
```

C++

```
enum TWarningResult {
  wrAbort,
  wrContinue
};
```

File

IBInstall

Description

This is record IBInstall.TWarningResult.

24.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCmdOptions (see page 3873)	This is type IBInstall.TCmdOptions.
TConnectivityOptions (see page 3873)	This is type IBInstall.TConnectivityOptions.
TExamplesOptions (see page 3874)	This is type IBInstall.TExamplesOptions.
TIBSetupOnError (see page 3874)	TIBSetupOnError is the type of event handlers that respond to installation errors.
TIBSetupOnStatus (see page 3874)	TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.
TIBSetupOnWarning (see page 3875)	TIBSetupOnWarning is the type of event handlers that respond to installation warnings.
TIscError (see page 3875)	This is type IBInstall.TIscError.
TMainOptions (see page 3876)	This is type IBInstall.TMainOptions.

24.3.1 IBInstall.TCmdOptions Type

Pascal

```
TCmdOptions = set of TCmdOption;
```

C++

```
TCmdOption TCmdOptions;
```

File

IBInstall

Description

This is type IBInstall.TCmdOptions.

24.3.2 IBInstall.TConnectivityOptions Type

Pascal

```
TConnectivityOptions = set of TConnectivityOption;
```

C++

```
TConnectivityOption TConnectivityOptions;
```

File

IBInstall

Description

This is type IBInstall.TConnectivityOptions.

24.3.3 IBInstall.TExamplesOptions Type

Pascal

```
TExamplesOptions = set of TExamplesOption;
```

C++

```
TExamplesOption TExamplesOptions;
```

File

IBInstall

Description

This is type IBInstall.TExamplesOptions.

24.3.4 IBInstall.TIBSetupOnError Type

TIBSetupOnError is the type of event handlers that respond to installation errors.

Pascal

```
TIBSetupOnError = function (Sender : TObject; IscCode : TIscError; ErrorMessage, ErrorComment
: string): TErrorResult of object;
```

C++

```
(Sender : TObject; IscCode : TIscError; ErrorMessage, ErrorComment : string): TErrorResult (
TIBSetupOnError)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 3857) component that encounters the exception.

IscCode is the error code for the problem that was encounted.

ErrorMessage is the error message fro the problem that occurred.

ErrorComment returns a string that will be displayed to the user.

The event handler is expected to return isc_fp_install_continue, isc_install_abort or isc_fp_install_retry.

24.3.5 IBInstall.TIBSetupOnStatus Type

TIBSetupOnStatus is the type of event handlers that respond during the InterBase installation or de-installation process.

Pascal

```
TIBSetupOnStatus = function (Sender : TObject; StatusComment : string): TStatusResult of
object;
```

C++

```
(Sender : TObject; StatusComment : string): TStatusResult ( TIBSetupOnStatus)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 3857) component that is installing or uninstalling.

StatusComment is a short string that indicates what operation is currently occurring. This can be used to supply the user with feedback on the installation process.

The event handler can return isc_fp_install_continue if the installation should continue, or isc_install_abort if the user cancels the installation process.

24.3.6 IBInstall.TIBSetupOnWarning Type

TIBSetupOnWarning is the type of event handlers that respond to installation warnings.

Pascal

```
TIBSetupOnWarning = function (Sender :TObject; WarningCode: TIscError; WarningMessage :
string): TWarningResult of object;
```

C++

```
(Sender :TObject; WarningCode: TIscError; WarningMessage : string): TWarningResult (
TIBSetupOnWarning)();
```

File

IBInstall

Description

Sender is the TIBSetup (see page 3857) component that encounters the warning.

WarningCode is the warning code for the situation that was encounted.

WarningMessage is the warning message for the situation that occurred.

The event handler must return either isc_fp_install_continue or isc_install_abort.

24.3.7 IBInstall.TIscError Type

Pascal

```
TIscError = MSG_NO;
```

C++

```
MSG_NO TIscError;
```

File

IBInstall

Description

This is type IBInstall.TIscError.

24.3.8 IBInstall.TMainOptions Type

Pascal

```
TMainOptions = set of TMainOption;
```

C++

```
TMainOption TMainOptions;
```

File

IBInstall

Description

This is type IBInstall.TMainOptions.

25 IBIntf Namespace

This is namespace IBIntf.

Topics

Name	Description
Functions (see page 3880)	The following table lists functions in this documentation.
Variables (see page 3891)	The following table lists variables in this documentation.

Functions

	Name	Description
	CheckIBInstallLoaded (see page 3880)	Attempts to load IBInstall.DLL into memory if it is not already loaded.
	CheckIBLoaded (see page 3881)	Attempts to load GDS32.DLL into memory if it is not already loaded.
	FreeIBInstallLibrary (see page 3881)	Frees the IBInstall.DLL from memory.
	FreeIBLibrary (see page 3881)	Frees the GDS32.DLL from memory.
	GetIBClientVersion (see page 3882)	Returns the major version number of the InterBase client.
	isc_decode_sql_date_stub (see page 3882)	This is function IBIntf.isc_decode_sql_date_stub.
	isc_decode_sql_time_stub (see page 3882)	This is function IBIntf.isc_decode_sql_time_stub.
	isc_decode_timestamp_stub (see page 3883)	This is function IBIntf.isc_decode_timestamp_stub.
	isc_encode_sql_date_stub (see page 3883)	This is function IBIntf.isc_encode_sql_date_stub.
	isc_encode_sql_time_stub (see page 3883)	This is function IBIntf.isc_encode_sql_time_stub.
	isc_encode_timestamp_stub (see page 3884)	This is function IBIntf.isc_encode_timestamp_stub.
	isc_install_clear_options_stub (see page 3884)	This is function IBIntf.isc_install_clear_options_stub.
	isc_install_execute_stub (see page 3884)	This is function IBIntf.isc_install_execute_stub.
	isc_install_get_info_stub (see page 3885)	This is function IBIntf.isc_install_get_info_stub.
	isc_install_get_message_stub (see page 3885)	This is function IBIntf.isc_install_get_message_stub.
	isc_install_load_external_text_stub (see page 3885)	This is function IBIntf.isc_install_load_external_text_stub.
	isc_install_precheck_stub (see page 3886)	This is function IBIntf.isc_install_precheck_stub.
	isc_install_set_option_stub (see page 3886)	This is function IBIntf.isc_install_set_option_stub.
	isc_install_unset_option_stub (see page 3886)	This is function IBIntf.isc_install_unset_option_stub.
	isc_rollback_retaining_stub (see page 3887)	This is function IBIntf.isc_rollback_retaining_stub.
	isc_service_attach_stub (see page 3887)	This is function IBIntf.isc_service_attach_stub.
	isc_service_detach_stub (see page 3887)	This is function IBIntf.isc_service_detach_stub.
	isc_service_query_stub (see page 3888)	This is function IBIntf.isc_service_query_stub.
	isc_service_start_stub (see page 3888)	This is function IBIntf.isc_service_start_stub.
	isc_uninstall_execute_stub (see page 3888)	This is function IBIntf.isc_uninstall_execute_stub.
	isc_uninstall_precheck_stub (see page 3889)	This is function IBIntf.isc_uninstall_precheck_stub.

	LoadIBInstallLibrary (see page 3889)	Loads IBInstall.DLL into memory.
	LoadIBLibrary (see page 3889)	Loads GDS32.DLL into memory.
	TryIBLoad (see page 3890)	This is function IBIntf.TryIBLoad.

Variables

Name	Description
BLOB_get (see page 3892)	This is variable IBIntf.BLOB_get.
BLOB_put (see page 3892)	This is variable IBIntf.BLOB_put.
isc_add_user (see page 3893)	This is variable IBIntf.isc_add_user.
isc_attach_database (see page 3893)	This is variable IBIntf.isc_attach_database.
isc_blob_info (see page 3893)	This is variable IBIntf.isc_blob_info.
isc_cancel_events (see page 3894)	This is variable IBIntf.isc_cancel_events.
isc_close_blob (see page 3894)	This is variable IBIntf.isc_close_blob.
isc_commit_retaining (see page 3894)	This is variable IBIntf.isc_commit_retaining.
isc_commit_transaction (see page 3895)	This is variable IBIntf.isc_commit_transaction.
isc_create_blob2 (see page 3895)	This is variable IBIntf.isc_create_blob2.
isc_database_info (see page 3895)	This is variable IBIntf.isc_database_info.
isc_decode_date (see page 3896)	This is variable IBIntf.isc_decode_date.
isc_decode_sql_date (see page 3896)	This is variable IBIntf.isc_decode_sql_date.
isc_decode_sql_time (see page 3896)	This is variable IBIntf.isc_decode_sql_time.
isc_decode_timestamp (see page 3897)	This is variable IBIntf.isc_decode_timestamp.
isc_delete_user (see page 3897)	This is variable IBIntf.isc_delete_user.
isc_detach_database (see page 3897)	This is variable IBIntf.isc_detach_database.
isc_drop_database (see page 3898)	This is variable IBIntf.isc_drop_database.
isc_dsql_alloc_statement2 (see page 3898)	This is variable IBIntf.isc_dsql_alloc_statement2.
isc_dsql_describe (see page 3898)	This is variable IBIntf.isc_dsql_describe.
isc_dsql_describe_bind (see page 3899)	This is variable IBIntf.isc_dsql_describe_bind.
isc_dsql_execute (see page 3899)	This is variable IBIntf.isc_dsql_execute.
isc_dsql_execute_immediate (see page 3899)	This is variable IBIntf.isc_dsql_execute_immediate.
isc_dsql_execute2 (see page 3900)	This is variable IBIntf.isc_dsql_execute2.
isc_dsql_fetch (see page 3900)	This is variable IBIntf.isc_dsql_fetch.
isc_dsql_free_statement (see page 3900)	This is variable IBIntf.isc_dsql_free_statement.
isc_dsql_prepare (see page 3901)	This is variable IBIntf.isc_dsql_prepare.
isc_dsql_set_cursor_name (see page 3901)	This is variable IBIntf.isc_dsql_set_cursor_name.
isc_dsql_sql_info (see page 3901)	This is variable IBIntf.isc_dsql_sql_info.
isc_encode_date (see page 3902)	This is variable IBIntf.isc_encode_date.
isc_encode_sql_date (see page 3902)	This is variable IBIntf.isc_encode_sql_date.
isc_encode_sql_time (see page 3902)	This is variable IBIntf.isc_encode_sql_time.
isc_encode_timestamp (see page 3903)	This is variable IBIntf.isc_encode_timestamp.
isc_event_block (see page 3903)	This is variable IBIntf.isc_event_block.
isc_event_counts (see page 3903)	This is variable IBIntf.isc_event_counts.
isc_free (see page 3904)	This is variable IBIntf.isc_free.
isc_get_segment (see page 3904)	This is variable IBIntf.isc_get_segment.
isc_install_clear_options (see page 3904)	This is variable IBIntf.isc_install_clear_options.
isc_install_execute (see page 3905)	This is variable IBIntf.isc_install_execute.
isc_install_get_info (see page 3905)	This is variable IBIntf.isc_install_get_info.
isc_install_get_message (see page 3905)	This is variable IBIntf.isc_install_get_message.
isc_install_load_external_text (see page 3906)	This is variable IBIntf.isc_install_load_external_text.
isc_install_precheck (see page 3906)	This is variable IBIntf.isc_install_precheck.
isc_install_set_option (see page 3906)	This is variable IBIntf.isc_install_set_option.
isc_install_unset_option (see page 3907)	This is variable IBIntf.isc_install_unset_option.
isc_interprete (see page 3907)	This is variable IBIntf.isc_interprete.
isc_modify_user (see page 3907)	This is variable IBIntf.isc_modify_user.
isc_open_blob2 (see page 3908)	This is variable IBIntf.isc_open_blob2.

isc_prepare_transaction (see page 3908)	This is variable IBIntf.isc_prepare_transaction.
isc_prepare_transaction2 (see page 3908)	This is variable IBIntf.isc_prepare_transaction2.
isc_put_segment (see page 3909)	This is variable IBIntf.isc_put_segment.
isc_que_events (see page 3909)	This is variable IBIntf.isc_que_events.
isc_rollback_retaining (see page 3909)	This is variable IBIntf.isc_rollback_retaining.
isc_rollback_transaction (see page 3910)	This is variable IBIntf.isc_rollback_transaction.
isc_service_attach (see page 3910)	This is variable IBIntf.isc_service_attach.
isc_service_detach (see page 3910)	This is variable IBIntf.isc_service_detach.
isc_service_query (see page 3911)	This is variable IBIntf.isc_service_query.
isc_service_start (see page 3911)	This is variable IBIntf.isc_service_start.
isc_sql_interprete (see page 3911)	This is variable IBIntf.isc_sql_interprete.
isc_sqlcode (see page 3912)	This is variable IBIntf.isc_sqlcode.
isc_start_multiple (see page 3912)	This is variable IBIntf.isc_start_multiple.
isc_uninstall_execute (see page 3912)	This is variable IBIntf.isc_uninstall_execute.
isc_uninstall_precheck (see page 3913)	This is variable IBIntf.isc_uninstall_precheck.
isc_vax_integer (see page 3913)	This is variable IBIntf.isc_vax_integer.

25.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckIBInstallLoaded (see page 3880)	Attempts to load IBInstall.DLL into memory if it is not already loaded.
	CheckIBLoaded (see page 3881)	Attempts to load GDS32.DLL into memory if it is not already loaded.
	FreeIBInstallLibrary (see page 3881)	Frees the IBInstall.DLL from memory.
	FreeIBLibrary (see page 3881)	Frees the GDS32.DLL from memory.
	GetIBClientVersion (see page 3882)	Returns the major version number of the InterBase client.
	isc_decode_sql_date_stub (see page 3882)	This is function IBIntf.isc_decode_sql_date_stub.
	isc_decode_sql_time_stub (see page 3882)	This is function IBIntf.isc_decode_sql_time_stub.
	isc_decode_timestamp_stub (see page 3883)	This is function IBIntf.isc_decode_timestamp_stub.
	isc_encode_sql_date_stub (see page 3883)	This is function IBIntf.isc_encode_sql_date_stub.
	isc_encode_sql_time_stub (see page 3883)	This is function IBIntf.isc_encode_sql_time_stub.
	isc_encode_timestamp_stub (see page 3884)	This is function IBIntf.isc_encode_timestamp_stub.
	isc_install_clear_options_stub (see page 3884)	This is function IBIntf.isc_install_clear_options_stub.
	isc_install_execute_stub (see page 3884)	This is function IBIntf.isc_install_execute_stub.
	isc_install_get_info_stub (see page 3885)	This is function IBIntf.isc_install_get_info_stub.
	isc_install_get_message_stub (see page 3885)	This is function IBIntf.isc_install_get_message_stub.
	isc_install_load_external_text_stub (see page 3885)	This is function IBIntf.isc_install_load_external_text_stub.
	isc_install_precheck_stub (see page 3886)	This is function IBIntf.isc_install_precheck_stub.
	isc_install_set_option_stub (see page 3886)	This is function IBIntf.isc_install_set_option_stub.
	isc_install_unset_option_stub (see page 3886)	This is function IBIntf.isc_install_unset_option_stub.
	isc_rollback_retaining_stub (see page 3887)	This is function IBIntf.isc_rollback_retaining_stub.
	isc_service_attach_stub (see page 3887)	This is function IBIntf.isc_service_attach_stub.
	isc_service_detach_stub (see page 3887)	This is function IBIntf.isc_service_detach_stub.
	isc_service_query_stub (see page 3888)	This is function IBIntf.isc_service_query_stub.
	isc_service_start_stub (see page 3888)	This is function IBIntf.isc_service_start_stub.
	isc_uninstall_execute_stub (see page 3888)	This is function IBIntf.isc_uninstall_execute_stub.
	isc_uninstall_precheck_stub (see page 3889)	This is function IBIntf.isc_uninstall_precheck_stub.
	LoadIBInstallLibrary (see page 3889)	Loads IBInstall.DLL into memory.
	LoadIBLibrary (see page 3889)	Loads GDS32.DLL into memory.
	TryIBLoad (see page 3890)	This is function IBIntf.TryIBLoad.

25.1.1 IBIntf.CheckIBInstallLoaded Function

Attempts to load IBInstall.DLL into memory if it is not already loaded.

Pascal

```
procedure CheckIBInstallLoaded;
```

C++

```
CheckIBInstallLoaded();
```

File

IBIntf

Description

Use the CheckIBInstallLibrary procedure to load IBInstall.DLL into memory if it is not already loaded. If unsuccessful, this procedure raises an exception.

25.1.2 IBIntf.CheckIBLoaded Function

Attempts to load GDS32.DLL into memory if it is not already loaded.

Pascal

```
procedure CheckIBLoaded;
```

C++

```
CheckIBLoaded();
```

File

IBIntf

Description

Use the CheckIBInstallLibrary procedure to load GDS32.DLL into memory if it is not already loaded. If unsuccessful, this procedure raises an exception.

25.1.3 IBIntf.FreeIBInstallLibrary Function

Frees the IBInstall.DLL from memory.

Pascal

```
procedure FreeIBInstallLibrary;
```

C++

```
FreeIBInstallLibrary();
```

File

IBIntf

Description

Use the FreeIBInstallLibrary procedure to free the previously loaded the IBInstall.DLL from memory.

25.1.4 IBIntf.FreeIBLibrary Function

Frees the GDS32.DLL from memory.

Pascal

```
procedure FreeIBLibrary;
```

C++

```
FreeIBLibrary();
```

File

IBIntf

Description

Use the FreeIBInstallLibrary (see page 3881) procedure to free the previously loaded the GDS32.DLL from memory.

25.1.5 IBIntf.GetIBClientVersion Function

Returns the major version number of the InterBase client.

Pascal

```
function GetIBClientVersion: Integer;
```

C++

```
int GetIBClientVersion();
```

File

IBIntf

Description

Use the GetIBClientVersion function to retrieve the major version number of the InterBase client.

25.1.6 IBIntf.isc_decode_sql_date_stub Function

Pascal

```
procedure isc_decode_sql_date_stub(ib_date: PISC_DATE; tm_date: PCTimeStructure); stdcall;
```

C++

```
__stdcall isc_decode_sql_date_stub(PISC_DATE ib_date, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_sql_date_stub.

25.1.7 IBIntf.isc_decode_sql_time_stub Function

Pascal

```
procedure isc_decode_sql_time_stub(ib_time: PISC_TIME; tm_date: PCTimeStructure); stdcall;
```

C++

```
__stdcall isc_decode_sql_time_stub(PISC_TIME ib_time, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_sql_time_stub.

25.1.8 IBIntf.isc_decode_timestamp_stub Function

Pascal

```
procedure isc_decode_timestamp_stub(ib_timestamp: PISC_TIMESTAMP; tm_date: PCTimeStructure);
stdcall;
```

C++

```
__stdcall isc_decode_timestamp_stub(PISC_TIMESTAMP ib_timestamp, PCTimeStructure tm_date);
```

File

IBIntf

Description

This is function IBIntf.isc_decode_timestamp_stub.

25.1.9 IBIntf.isc_encode_sql_date_stub Function

Pascal

```
procedure isc_encode_sql_date_stub(tm_date: PCTimeStructure; ib_date: PISC_DATE); stdcall;
```

C++

```
__stdcall isc_encode_sql_date_stub(PCTimeStructure tm_date, PISC_DATE ib_date);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_sql_date_stub.

25.1.10 IBIntf.isc_encode_sql_time_stub Function

Pascal

```
procedure isc_encode_sql_time_stub(tm_date: PCTimeStructure; ib_time: PISC_TIME); stdcall;
```

C++

```
__stdcall isc_encode_sql_time_stub(PCTimeStructure tm_date, PISC_TIME ib_time);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_sql_time_stub.

25.1.11 IBIntf.isc_encode_timestamp_stub Function

Pascal

```
procedure isc_encode_timestamp_stub(tm_date: PCTimeStructure; ib_timestamp: PISC_TIMESTAMP);
stdcall;
```

C++

```
__stdcall isc_encode_timestamp_stub(PCTimeStructure tm_date, PISC_TIMESTAMP ib_timestamp);
```

File

IBIntf

Description

This is function IBIntf.isc_encode_timestamp_stub.

25.1.12 IBIntf.isc_install_clear_options_stub Function

Pascal

```
function isc_install_clear_options_stub(hOption: POPTIONS_HANDLE): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_clear_options_stub(POPTIONS_HANDLE hOption);
```

File

IBIntf

Description

This is function IBIntf.isc_install_clear_options_stub.

25.1.13 IBIntf.isc_install_execute_stub Function

Pascal

```
function isc_install_execute_stub(hOption: OPTIONS_HANDLE; src_dir: TEXT; dest_dir: TEXT;
status_func: FP_STATUS; status_data: pointer; error_func: FP_ERROR; error_data: pointer;
uninstal_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_execute_stub(OPTIONS_HANDLE hOption, TEXT src_dir, TEXT dest_dir,
FP_STATUS status_func, void * status_data, FP_ERROR error_func, void * error_data, TEXT
uninstal_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_install_execute_stub.

25.1.14 IBIntf.isc_install_get_info_stub Function

Pascal

```
function isc_install_get_info_stub(info_type: integer; option: OPT; info_buffer: Pointer;
buf_len: Cardinal): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_get_info_stub(int info_type, OPT option, void * info_buffer,
unsigned buf_len);
```

File

IBIntf

Description

This is function IBIntf.isc_install_get_info_stub.

25.1.15 IBIntf.isc_install_get_message_stub Function

Pascal

```
function isc_install_get_message_stub(hOption: OPTIONS_HANDLE; message_no: MSG_NO;
message_txt: Pointer; message_len: Cardinal): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_get_message_stub(OPTIONS_HANDLE hOption, MSG_NO message_no, void
* message_txt, unsigned message_len);
```

File

IBIntf

Description

This is function IBIntf.isc_install_get_message_stub.

25.1.16 IBIntf.isc_install_load_external_text_stub Function

Pascal

```
function isc_install_load_external_text_stub(msg_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_load_external_text_stub(TEXT msg_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_install_load_external_text_stub.

25.1.17 IBIntf.isc_install_precheck_stub Function

Pascal

```
function isc_install_precheck_stub(hOption: OPTIONS_HANDLE; src_dir: TEXT; dest_dir: TEXT):
MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_precheck_stub(OPTIONS_HANDLE hOption, TEXT src_dir, TEXT
dest_dir);
```

File

IBIntf

Description

This is function IBIntf.isc_install_precheck_stub.

25.1.18 IBIntf.isc_install_set_option_stub Function

Pascal

```
function isc_install_set_option_stub(hOption: POPTIONS_HANDLE; option: OPT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_set_option_stub(POPTIONS_HANDLE hOption, OPT option);
```

File

IBIntf

Description

This is function IBIntf.isc_install_set_option_stub.

25.1.19 IBIntf.isc_install_unset_option_stub Function

Pascal

```
function isc_install_unset_option_stub(hOption: POPTIONS_HANDLE; option: OPT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_install_unset_option_stub(POPTIONS_HANDLE hOption, OPT option);
```

File

IBIntf

Description

This is function IBIntf.isc_install_unset_option_stub.

25.1.20 IBIntf.isc_rollback_retaining_stub Function

Pascal

```
function isc_rollback_retaining_stub(status_vector: PISC_STATUS; tran_handle: PISC_TR_HANDLE):
ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_rollback_retaining_stub(PISC_STATUS status_vector, PISC_TR_HANDLE
tran_handle);
```

File

IBIntf

Description

This is function IBIntf.isc_rollback_retaining_stub.

25.1.21 IBIntf.isc_service_attach_stub Function

Pascal

```
function isc_service_attach_stub(status_vector: PISC_STATUS; isc_arg2: UShort; isc_arg3:
PChar; service_handle: PISC_SVC_HANDLE; isc_arg5: UShort; isc_arg6: PChar): ISC_STATUS;
stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_attach_stub(PISC_STATUS status_vector, UShort isc_arg2, const
char * isc_arg3, PISC_SVC_HANDLE service_handle, UShort isc_arg5, const char * isc_arg6);
```

File

IBIntf

Description

This is function IBIntf.isc_service_attach_stub.

25.1.22 IBIntf.isc_service_detach_stub Function

Pascal

```
function isc_service_detach_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE):
ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_detach_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle);
```

File

IBIntf

Description

This is function IBIntf.isc_service_detach_stub.

25.1.23 IBIntf.isc_service_query_stub Function

Pascal

```
function isc_service_query_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE;
recv_handle: PISC_SVC_HANDLE; isc_arg4: UShort; isc_arg5: PChar; isc_arg6: UShort; isc_arg7:
PChar; isc_arg8: UShort; isc_arg9: PChar): ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_query_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle, PISC_SVC_HANDLE recv_handle, UShort isc_arg4, const char * isc_arg5, UShort
isc_arg6, const char * isc_arg7, UShort isc_arg8, const char * isc_arg9);
```

File

IBIntf

Description

This is function IBIntf.isc_service_query_stub.

25.1.24 IBIntf.isc_service_start_stub Function

Pascal

```
function isc_service_start_stub(status_vector: PISC_STATUS; service_handle: PISC_SVC_HANDLE;
recv_handle: PISC_SVC_HANDLE; isc_arg4: UShort; isc_arg5: PChar): ISC_STATUS; stdcall;
```

C++

```
__stdcall ISC_STATUS isc_service_start_stub(PISC_STATUS status_vector, PISC_SVC_HANDLE
service_handle, PISC_SVC_HANDLE recv_handle, UShort isc_arg4, const char * isc_arg5);
```

File

IBIntf

Description

This is function IBIntf.isc_service_start_stub.

25.1.25 IBIntf.isc_uninstall_execute_stub Function

Pascal

```
function isc_uninstall_execute_stub(uninstall_file_name: TEXT; status_func: FP_STATUS;
status_data: pointer; error_func: FP_ERROR; error_data: pointer): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_uninstall_execute_stub(TEXT uninstall_file_name, FP_STATUS status_func,
void * status_data, FP_ERROR error_func, void * error_data);
```

File

IBIntf

Description

This is function IBIntf.isc_uninstall_execute_stub.

25.1.26 IBIntf.isc_uninstall_precheck_stub Function

Pascal

```
function isc_uninstall_precheck_stub(uninstall_file_name: TEXT): MSG_NO; stdcall;
```

C++

```
__stdcall MSG_NO isc_uninstall_precheck_stub(TEXT uninstall_file_name);
```

File

IBIntf

Description

This is function IBIntf.isc_uninstall_precheck_stub.

25.1.27 IBIntf.LoadIBInstallLibrary Function

Loads IBInstall.DLL into memory.

Pascal

```
procedure LoadIBInstallLibrary;
```

C++

```
LoadIBInstallLibrary();
```

File

IBIntf

Description

Use the LoadIBInstallLibrary procedure to load the IBInstall.DLL into memory and resolve the respective entry points into to the respective procedure pointer in the unit.

25.1.28 IBIntf.LoadIBLibrary Function

Loads GDS32.DLL into memory.

Pascal

```
procedure LoadIBLibrary;
```

C++

```
LoadIBLibrary();
```

File

IBIntf

Description

Use the LoadIBLibrary procedure to load the GDS32.DLL into memory and resolve the respective entry points into to the respective procedure pointer in the unit. In addition, it loads the InterBase entry points, if they are available.

25.1.29 IBIntf.TryIBLoad Function

Pascal

```
function TryIBLoad: Boolean;
```

C++

```
Boolean TryIBLoad();
```

File

IBIntf

Description

This is function IBIntf.TryIBLoad.

25.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
BLOB_get (see page 3892)	This is variable IBIntf.BLOB_get.
BLOB_put (see page 3892)	This is variable IBIntf.BLOB_put.
isc_add_user (see page 3893)	This is variable IBIntf.isc_add_user.
isc_attach_database (see page 3893)	This is variable IBIntf.isc_attach_database.
isc_blob_info (see page 3893)	This is variable IBIntf.isc_blob_info.
isc_cancel_events (see page 3894)	This is variable IBIntf.isc_cancel_events.
isc_close_blob (see page 3894)	This is variable IBIntf.isc_close_blob.
isc_commit_retaining (see page 3894)	This is variable IBIntf.isc_commit_retaining.
isc_commit_transaction (see page 3895)	This is variable IBIntf.isc_commit_transaction.
isc_create_blob2 (see page 3895)	This is variable IBIntf.isc_create_blob2.
isc_database_info (see page 3895)	This is variable IBIntf.isc_database_info.
isc_decode_date (see page 3896)	This is variable IBIntf.isc_decode_date.
isc_decode_sql_date (see page 3896)	This is variable IBIntf.isc_decode_sql_date.
isc_decode_sql_time (see page 3896)	This is variable IBIntf.isc_decode_sql_time.
isc_decode_timestamp (see page 3897)	This is variable IBIntf.isc_decode_timestamp.
isc_delete_user (see page 3897)	This is variable IBIntf.isc_delete_user.
isc_detach_database (see page 3897)	This is variable IBIntf.isc_detach_database.
isc_drop_database (see page 3898)	This is variable IBIntf.isc_drop_database.
isc_dsql_alloc_statement2 (see page 3898)	This is variable IBIntf.isc_dsql_alloc_statement2.
isc_dsql_describe (see page 3898)	This is variable IBIntf.isc_dsql_describe.
isc_dsql_describe_bind (see page 3899)	This is variable IBIntf.isc_dsql_describe_bind.
isc_dsql_execute (see page 3899)	This is variable IBIntf.isc_dsql_execute.
isc_dsql_execute_immediate (see page 3899)	This is variable IBIntf.isc_dsql_execute_immediate.
isc_dsql_execute2 (see page 3900)	This is variable IBIntf.isc_dsql_execute2.
isc_dsql_fetch (see page 3900)	This is variable IBIntf.isc_dsql_fetch.
isc_dsql_free_statement (see page 3900)	This is variable IBIntf.isc_dsql_free_statement.
isc_dsql_prepare (see page 3901)	This is variable IBIntf.isc_dsql_prepare.
isc_dsql_set_cursor_name (see page 3901)	This is variable IBIntf.isc_dsql_set_cursor_name.
isc_dsql_sql_info (see page 3901)	This is variable IBIntf.isc_dsql_sql_info.
isc_encode_date (see page 3902)	This is variable IBIntf.isc_encode_date.
isc_encode_sql_date (see page 3902)	This is variable IBIntf.isc_encode_sql_date.
isc_encode_sql_time (see page 3902)	This is variable IBIntf.isc_encode_sql_time.
isc_encode_timestamp (see page 3903)	This is variable IBIntf.isc_encode_timestamp.
isc_event_block (see page 3903)	This is variable IBIntf.isc_event_block.
isc_event_counts (see page 3903)	This is variable IBIntf.isc_event_counts.
isc_free (see page 3904)	This is variable IBIntf.isc_free.
isc_get_segment (see page 3904)	This is variable IBIntf.isc_get_segment.
isc_install_clear_options (see page 3904)	This is variable IBIntf.isc_install_clear_options.
isc_install_execute (see page 3905)	This is variable IBIntf.isc_install_execute.
isc_install_get_info (see page 3905)	This is variable IBIntf.isc_install_get_info.
isc_install_get_message (see page 3905)	This is variable IBIntf.isc_install_get_message.
isc_install_load_external_text (see page 3906)	This is variable IBIntf.isc_install_load_external_text.
isc_install_precheck (see page 3906)	This is variable IBIntf.isc_install_precheck.
isc_install_set_option (see page 3906)	This is variable IBIntf.isc_install_set_option.

isc_install_unset_option (see page 3907)	This is variable IBIntf.isc_install_unset_option.
isc_interprete (see page 3907)	This is variable IBIntf.isc_interprete.
isc_modify_user (see page 3907)	This is variable IBIntf.isc_modify_user.
isc_open_blob2 (see page 3908)	This is variable IBIntf.isc_open_blob2.
isc_prepare_transaction (see page 3908)	This is variable IBIntf.isc_prepare_transaction.
isc_prepare_transaction2 (see page 3908)	This is variable IBIntf.isc_prepare_transaction2.
isc_put_segment (see page 3909)	This is variable IBIntf.isc_put_segment.
isc_que_events (see page 3909)	This is variable IBIntf.isc_que_events.
isc_rollback_retaining (see page 3909)	This is variable IBIntf.isc_rollback_retaining.
isc_rollback_transaction (see page 3910)	This is variable IBIntf.isc_rollback_transaction.
isc_service_attach (see page 3910)	This is variable IBIntf.isc_service_attach.
isc_service_detach (see page 3910)	This is variable IBIntf.isc_service_detach.
isc_service_query (see page 3911)	This is variable IBIntf.isc_service_query.
isc_service_start (see page 3911)	This is variable IBIntf.isc_service_start.
isc_sql_interprete (see page 3911)	This is variable IBIntf.isc_sql_interprete.
isc_sqlcode (see page 3912)	This is variable IBIntf.isc_sqlcode.
isc_start_multiple (see page 3912)	This is variable IBIntf.isc_start_multiple.
isc_uninstall_execute (see page 3912)	This is variable IBIntf.isc_uninstall_execute.
isc_uninstall_precheck (see page 3913)	This is variable IBIntf.isc_uninstall_precheck.
isc_vax_integer (see page 3913)	This is variable IBIntf.isc_vax_integer.

25.2.1 IBIntf.BLOB_get Variable

Pascal

```
BLOB_get: TBLOB_get;
```

C++

```
TBLOB_get BLOB_get;
```

File

IBIntf

Description

This is variable IBIntf.BLOB_get.

25.2.2 IBIntf.BLOB_put Variable

Pascal

```
BLOB_put: TBLOB_put;
```

C++

```
TBLOB_put BLOB_put;
```

File

IBIntf

Description

This is variable IBIntf.BLOB_put.

25.2.3 IBIntf.isc_add_user Variable

Pascal

```
isc_add_user: Tisc_add_user;
```

C++

```
Tisc_add_user isc_add_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_add_user.

25.2.4 IBIntf.isc_attach_database Variable

Pascal

```
isc_attach_database: Tisc_attach_database;
```

C++

```
Tisc_attach_database isc_attach_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_attach_database.

25.2.5 IBIntf.isc_blob_info Variable

Pascal

```
isc_blob_info: Tisc_blob_info;
```

C++

```
Tisc_blob_info isc_blob_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_blob_info.

25.2.6 IBIntf.isc_cancel_events Variable

Pascal

```
isc_cancel_events: Tisc_cancel_events;
```

C++

```
Tisc_cancel_events isc_cancel_events;
```

File

IBIntf

Description

This is variable IBIntf.isc_cancel_events.

25.2.7 IBIntf.isc_close_blob Variable

Pascal

```
isc_close_blob: Tisc_close_blob;
```

C++

```
Tisc_close_blob isc_close_blob;
```

File

IBIntf

Description

This is variable IBIntf.isc_close_blob.

25.2.8 IBIntf.isc_commit_retaining Variable

Pascal

```
isc_commit_retaining: Tisc_commit_retaining;
```

C++

```
Tisc_commit_retaining isc_commit_retaining;
```

File

IBIntf

Description

This is variable IBIntf.isc_commit_retaining.

25.2.9 IBIntf.isc_commit_transaction Variable

Pascal

```
isc_commit_transaction: Tisc_commit_transaction;
```

C++

```
Tisc_commit_transaction isc_commit_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_commit_transaction.

25.2.10 IBIntf.isc_create_blob2 Variable

Pascal

```
isc_create_blob2: Tisc_create_blob2;
```

C++

```
Tisc_create_blob2 isc_create_blob2;
```

File

IBIntf

Description

This is variable IBIntf.isc_create_blob2.

25.2.11 IBIntf.isc_database_info Variable

Pascal

```
isc_database_info: Tisc_database_info;
```

C++

```
Tisc_database_info isc_database_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_database_info.

25.2.12 IBIntf.isc_decode_date Variable

Pascal

```
isc_decode_date: Tisc_decode_date;
```

C++

```
Tisc_decode_date isc_decode_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_date.

25.2.13 IBIntf.isc_decode_sql_date Variable

Pascal

```
isc_decode_sql_date: Tisc_decode_sql_date;
```

C++

```
Tisc_decode_sql_date isc_decode_sql_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_sql_date.

25.2.14 IBIntf.isc_decode_sql_time Variable

Pascal

```
isc_decode_sql_time: Tisc_decode_sql_time;
```

C++

```
Tisc_decode_sql_time isc_decode_sql_time;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_sql_time.

25.2.15 IBIntf.isc_decode_timestamp Variable

Pascal

```
isc_decode_timestamp: Tisc_decode_timestamp;
```

C++

```
Tisc_decode_timestamp isc_decode_timestamp;
```

File

IBIntf

Description

This is variable IBIntf.isc_decode_timestamp.

25.2.16 IBIntf.isc_delete_user Variable

Pascal

```
isc_delete_user: Tisc_delete_user;
```

C++

```
Tisc_delete_user isc_delete_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_delete_user.

25.2.17 IBIntf.isc_detach_database Variable

Pascal

```
isc_detach_database: Tisc_detach_database;
```

C++

```
Tisc_detach_database isc_detach_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_detach_database.

25.2.18 IBIntf.isc_drop_database Variable

Pascal

```
isc_drop_database: Tisc_drop_database;
```

C++

```
Tisc_drop_database isc_drop_database;
```

File

IBIntf

Description

This is variable IBIntf.isc_drop_database.

25.2.19 IBIntf.isc_dsql_alloc_statement2 Variable

Pascal

```
isc_dsql_alloc_statement2: Tisc_dsql_alloc_statement2;
```

C++

```
Tisc_dsql_alloc_statement2 isc_dsql_alloc_statement2;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_alloc_statement2.

25.2.20 IBIntf.isc_dsql_describe Variable

Pascal

```
isc_dsql_describe: Tisc_dsql_describe;
```

C++

```
Tisc_dsql_describe isc_dsql_describe;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_describe.

25.2.21 IBIntf.isc_dsql_describe_bind Variable

Pascal

```
isc_dsql_describe_bind: Tisc_dsql_describe_bind;
```

C++

```
Tisc_dsql_describe_bind isc_dsql_describe_bind;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_describe_bind.

25.2.22 IBIntf.isc_dsql_execute Variable

Pascal

```
isc_dsql_execute: Tisc_dsql_execute;
```

C++

```
Tisc_dsql_execute isc_dsql_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute.

25.2.23 IBIntf.isc_dsql_execute_immediate Variable

Pascal

```
isc_dsql_execute_immediate: Tisc_dsql_execute_immediate;
```

C++

```
Tisc_dsql_execute_immediate isc_dsql_execute_immediate;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute_immediate.

25.2.24 IBIntf.isc_dsql_execute2 Variable

Pascal

```
isc_dsql_execute2: Tisc_dsql_execute2;
```

C++

```
Tisc_dsql_execute2 isc_dsql_execute2;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_execute2.

25.2.25 IBIntf.isc_dsql_fetch Variable

Pascal

```
isc_dsql_fetch: Tisc_dsql_fetch;
```

C++

```
Tisc_dsql_fetch isc_dsql_fetch;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_fetch.

25.2.26 IBIntf.isc_dsql_free_statement Variable

Pascal

```
isc_dsql_free_statement: Tisc_dsql_free_statement;
```

C++

```
Tisc_dsql_free_statement isc_dsql_free_statement;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_free_statement.

25.2.27 IBIntf.isc_dsql_prepare Variable

Pascal

```
isc_dsql_prepare: Tisc_dsql_prepare;
```

C++

```
Tisc_dsql_prepare isc_dsql_prepare;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_prepare.

25.2.28 IBIntf.isc_dsql_set_cursor_name Variable

Pascal

```
isc_dsql_set_cursor_name: Tisc_dsql_set_cursor_name;
```

C++

```
Tisc_dsql_set_cursor_name isc_dsql_set_cursor_name;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_set_cursor_name.

25.2.29 IBIntf.isc_dsql_sql_info Variable

Pascal

```
isc_dsql_sql_info: Tisc_dsql_sql_info;
```

C++

```
Tisc_dsql_sql_info isc_dsql_sql_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_dsql_sql_info.

25.2.30 IBIntf.isc_encode_date Variable

Pascal

```
isc_encode_date: Tisc_encode_date;
```

C++

```
Tisc_encode_date isc_encode_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_date.

25.2.31 IBIntf.isc_encode_sql_date Variable

Pascal

```
isc_encode_sql_date: Tisc_encode_sql_date;
```

C++

```
Tisc_encode_sql_date isc_encode_sql_date;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_sql_date.

25.2.32 IBIntf.isc_encode_sql_time Variable

Pascal

```
isc_encode_sql_time: Tisc_encode_sql_time;
```

C++

```
Tisc_encode_sql_time isc_encode_sql_time;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_sql_time.

25.2.33 IBIntf.isc_encode_timestamp Variable

Pascal

```
isc_encode_timestamp: Tisc_encode_timestamp;
```

C++

```
Tisc_encode_timestamp isc_encode_timestamp;
```

File

IBIntf

Description

This is variable IBIntf.isc_encode_timestamp.

25.2.34 IBIntf.isc_event_block Variable

Pascal

```
isc_event_block: Tisc_event_block;
```

C++

```
Tisc_event_block isc_event_block;
```

File

IBIntf

Description

This is variable IBIntf.isc_event_block.

25.2.35 IBIntf.isc_event_counts Variable

Pascal

```
isc_event_counts: Tisc_event_counts;
```

C++

```
Tisc_event_counts isc_event_counts;
```

File

IBIntf

Description

This is variable IBIntf.isc_event_counts.

25.2.36 IBIntf.isc_free Variable

Pascal

```
isc_free: Tisc_free;
```

C++

```
Tisc_free isc_free;
```

File

IBIntf

Description

This is variable IBIntf.isc_free.

25.2.37 IBIntf.isc_get_segment Variable

Pascal

```
isc_get_segment: Tisc_get_segment;
```

C++

```
Tisc_get_segment isc_get_segment;
```

File

IBIntf

Description

This is variable IBIntf.isc_get_segment.

25.2.38 IBIntf.isc_install_clear_options Variable

Pascal

```
isc_install_clear_options: Tisc_install_clear_options;
```

C++

```
Tisc_install_clear_options isc_install_clear_options;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_clear_options.

25.2.39 IBIntf.isc_install_execute Variable

Pascal

```
isc_install_execute: Tisc_install_execute;
```

C++

```
Tisc_install_execute isc_install_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_execute.

25.2.40 IBIntf.isc_install_get_info Variable

Pascal

```
isc_install_get_info: Tisc_install_get_info;
```

C++

```
Tisc_install_get_info isc_install_get_info;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_get_info.

25.2.41 IBIntf.isc_install_get_message Variable

Pascal

```
isc_install_get_message: Tisc_install_get_message;
```

C++

```
Tisc_install_get_message isc_install_get_message;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_get_message.

25.2.42 IBIntf.isc_install_load_external_text Variable

Pascal

```
isc_install_load_external_text: Tisc_install_load_external_text;
```

C++

```
Tisc_install_load_external_text isc_install_load_external_text;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_load_external_text.

25.2.43 IBIntf.isc_install_precheck Variable

Pascal

```
isc_install_precheck: Tisc_install_precheck;
```

C++

```
Tisc_install_precheck isc_install_precheck;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_precheck.

25.2.44 IBIntf.isc_install_set_option Variable

Pascal

```
isc_install_set_option: Tisc_install_set_option;
```

C++

```
Tisc_install_set_option isc_install_set_option;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_set_option.

25.2.45 IBIntf.isc_install_unset_option Variable

Pascal

```
isc_install_unset_option: Tisc_install_unset_option;
```

C++

```
Tisc_install_unset_option isc_install_unset_option;
```

File

IBIntf

Description

This is variable IBIntf.isc_install_unset_option.

25.2.46 IBIntf.isc_interprete Variable

Pascal

```
isc_interprete: Tisc_interprete;
```

C++

```
Tisc_interprete isc_interprete;
```

File

IBIntf

Description

This is variable IBIntf.isc_interprete.

25.2.47 IBIntf.isc_modify_user Variable

Pascal

```
isc_modify_user: Tisc_modify_user;
```

C++

```
Tisc_modify_user isc_modify_user;
```

File

IBIntf

Description

This is variable IBIntf.isc_modify_user.

25.2.48 IBIntf.isc_open_blob2 Variable

Pascal

```
isc_open_blob2: Tisc_open_blob2;
```

C++

```
Tisc_open_blob2 isc_open_blob2;
```

File

IBIntf

Description

This is variable IBIntf.isc_open_blob2.

25.2.49 IBIntf.isc_prepare_transaction Variable

Pascal

```
isc_prepare_transaction: Tisc_prepare_transaction;
```

C++

```
Tisc_prepare_transaction isc_prepare_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_prepare_transaction.

25.2.50 IBIntf.isc_prepare_transaction2 Variable

Pascal

```
isc_prepare_transaction2: Tisc_prepare_transaction2;
```

C++

```
Tisc_prepare_transaction2 isc_prepare_transaction2;
```

File

IBIntf

Description

This is variable IBIntf.isc_prepare_transaction2.

25.2.51 IBIntf.isc_put_segment Variable

Pascal

```
isc_put_segment: Tisc_put_segment;
```

C++

```
Tisc_put_segment isc_put_segment;
```

File

IBIntf

Description

This is variable IBIntf.isc_put_segment.

25.2.52 IBIntf.isc_que_events Variable

Pascal

```
isc_que_events: Tisc_que_events;
```

C++

```
Tisc_que_events isc_que_events;
```

File

IBIntf

Description

This is variable IBIntf.isc_que_events.

25.2.53 IBIntf.isc_rollback_retaining Variable

Pascal

```
isc_rollback_retaining: Tisc_rollback_retaining;
```

C++

```
Tisc_rollback_retaining isc_rollback_retaining;
```

File

IBIntf

Description

This is variable IBIntf.isc_rollback_retaining.

25.2.54 IBIntf.isc_rollback_transaction Variable

Pascal

```
isc_rollback_transaction: Tisc_rollback_transaction;
```

C++

```
Tisc_rollback_transaction isc_rollback_transaction;
```

File

IBIntf

Description

This is variable IBIntf.isc_rollback_transaction.

25.2.55 IBIntf.isc_service_attach Variable

Pascal

```
isc_service_attach: Tisc_service_attach;
```

C++

```
Tisc_service_attach isc_service_attach;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_attach.

25.2.56 IBIntf.isc_service_detach Variable

Pascal

```
isc_service_detach: Tisc_service_detach;
```

C++

```
Tisc_service_detach isc_service_detach;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_detach.

25.2.57 IBIntf.isc_service_query Variable

Pascal

```
isc_service_query: Tisc_service_query;
```

C++

```
Tisc_service_query isc_service_query;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_query.

25.2.58 IBIntf.isc_service_start Variable

Pascal

```
isc_service_start: Tisc_service_start;
```

C++

```
Tisc_service_start isc_service_start;
```

File

IBIntf

Description

This is variable IBIntf.isc_service_start.

25.2.59 IBIntf.isc_sql_interprete Variable

Pascal

```
isc_sql_interprete: Tisc_sql_interprete;
```

C++

```
Tisc_sql_interprete isc_sql_interprete;
```

File

IBIntf

Description

This is variable IBIntf.isc_sql_interprete.

25.2.60 IBIntf.isc_sqlcode Variable

Pascal

```
isc_sqlcode: Tisc_sqlcode;
```

C++

```
Tisc_sqlcode isc_sqlcode;
```

File

IBIntf

Description

This is variable IBIntf.isc_sqlcode.

25.2.61 IBIntf.isc_start_multiple Variable

Pascal

```
isc_start_multiple: Tisc_start_multiple;
```

C++

```
Tisc_start_multiple isc_start_multiple;
```

File

IBIntf

Description

This is variable IBIntf.isc_start_multiple.

25.2.62 IBIntf.isc_uninstall_execute Variable

Pascal

```
isc_uninstall_execute: Tisc_uninstall_execute;
```

C++

```
Tisc_uninstall_execute isc_uninstall_execute;
```

File

IBIntf

Description

This is variable IBIntf.isc_uninstall_execute.

25.2.63 IBIntf.isc_uninstall_precheck Variable

Pascal

```
isc_uninstall_precheck: Tisc_uninstall_precheck;
```

C++

```
Tisc_uninstall_precheck isc_uninstall_precheck;
```

File

IBIntf

Description

This is variable IBIntf.isc_uninstall_precheck.

25.2.64 IBIntf.isc_vax_integer Variable

Pascal

```
isc_vax_integer: Tisc_vax_integer;
```

C++

```
Tisc_vax_integer isc_vax_integer;
```

File

IBIntf

Description

This is variable IBIntf.isc_vax_integer.

26 IBQuery Namespace

This is namespace IBQuery.

Topics

Name	Description
Classes (see page 3916)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBQuery (see page 3916)	TIBQuery executes an InterBase SQL (see page 3932) statement.

26.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBQuery (see page 3916)	TIBQuery executes an InterBase SQL (see page 3932) statement.

26.1.1 TIBQuery Class

TIBQuery executes an InterBase SQL (see page 3932) statement.

Class Hierarchy

Pascal

```
TIBQuery = class(TIBCustomDataSet);
```

C++

```
class TIBQuery : public TIBCustomDataSet;
```

File

IBQuery

Description

Use TIBQuery to access one or more tables in a database using SQL (see page 3932) statements. The TIBQuery component provides a read-only dataset, and adapts well to the InterBase client/server environment. To update the result set that TIBQuery represents, use this component in conjunction with a TIBUpdateSQL component.

Query components are useful because they can

- Access more than one table at a time (called a 'join' in SQL (see page 3932)).
- Automatically access a subset of rows and columns in its underlying table(s), rather than always returning all rows and columns.

Note: TIBQuery is of particular importance to the development of scalable database applications. If there is any chance that an application built to run against local databases will be scaled to a remote SQL (see page 3932) database server in the future, use TIBQuery components from the start to ensure easier scaling later.

Getting Started with InterBase Express

26.1.1.1 TIBQuery Members

The following tables list the members exposed by TIBQuery.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	DefineProperties (see page 3922)	This is DefineProperties, a member of class TIBQuery.
V	Disconnect (see page 3923)	This is Disconnect, a member of class TIBQuery.
V	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 3614)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GenerateQueryForLiveUpdate (see page 3923)	This is GenerateQueryForLiveUpdate, a member of class TIBQuery.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 3615)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 3616)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetParamsCount (see page 3924)	This is GetParamsCount, a member of class TIBQuery.
V	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitFieldDefs (see page 3924)	This is InitFieldDefs, a member of class TIBQuery.
V	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 3619)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 3924)	This is InternalOpen, a member of class TIBQuery.
V	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 3622)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 3622)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.

	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecute (see page 3925)	This is PSExecute, a member of class TIBQuery.
	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetParams (see page 3925)	This is PSGetParams, a member of class TIBQuery.
	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 3925)	This is PSGetTableName, a member of class TIBQuery.
	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 3926)	This is PSSetCommandText, a member of class TIBQuery.
	PSSetParams (see page 3926)	This is PSSetParams, a member of class TIBQuery.
	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 3926)	This is SetFiltered, a member of class TIBQuery.
	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	DeleteSQL (see page 3639)	Holds the SQL statement used to delete rows from the dataset.
	InsertSQL (see page 3640)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
	ModifySQL (see page 3641)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
R	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.
R	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
R	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
R	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
R	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	RefreshSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 3645)	Gets the handle for the SELECT statement.
R	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.

	BatchInput (see page 3922)	Executes the parameterized query in SQL (see page 3932) for input in the referenced input object.
	BatchOutput (see page 3922)	Outputs the selected query in SQL (see page 3932) to the referenced OutputObject.
V	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 3611)	Compares two bookmarks.
V	Create (see page 3921)	Creates an instance of a query component.
V	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
V	Destroy (see page 3921)	Destroys the instance of a query.
	ExecSQL (see page 3923)	Executes the SQL (see page 3932) statement for the query.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
V	GetDetailLinkFields (see page 3923)	Fills lists with the master and detail fields of the link.
V	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.
V	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 3624)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.
	ParamByName (see page 3924)	Accesses parameter information based on a specified parameter name.
V	Post (see page 3626)	Writes a modified record to the database server.
	Prepare (see page 3925)	Sends a query to the server for optimization prior to execution.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
	UnPrepare (see page 3926)	Frees the resources allocated for a previously prepared query.
V	UpdateStatus (see page 3632)	Reports the update status for the current record.

Public Properties

	Name	Description
R	DBHandle (see page 3639)	Specifies the database handle for the dataset.
	GenerateParamNames (see page 3929)	Generates a list of parameter names for the query.
	LiveMode (see page 3929)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	ParamCount (see page 3930)	Indicates the current number of parameters for the query.
R	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
	Prepared (see page 3931)	Determines whether or not a query is prepared for execution.
R	RowsAffected (see page 3931)	Returns the number of rows operated upon by the latest query execution.
	StatementType (see page 3932)	Returns the statement type of the QSelect query.
R	StmtHandle (see page 3932)	Identifies the statement handle for the query.
R	Text (see page 3932)	Points to the actual text of the SQL (see page 3932) query.
R	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 3934)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3934)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3934)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3935)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 3935)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 3935)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 3927)	This is Active, a member of class TIBQuery.
	AfterCancel (see page 3634)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 3634)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 3634)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 3634)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 3635)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 3635)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 3635)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3635)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 3636)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 3636)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 3636)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 3636)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 3637)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 3637)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 3637)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 3637)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3638)	This is BeforeScroll, a member of class TIBCustomDataSet.
	BufferChunks (see page 3927)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3928)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 3928)	This is Constraints, a member of class TIBQuery.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	DataSource (see page 3928)	This is DataSource, a member of class TIBQuery.
	Filtered (see page 3929)	Specifies whether filtering is active for a dataset.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	GeneratorField (see page 3929)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3641)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 3642)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 3642)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 3930)	This is OnFilterRecord, a member of class TIBQuery.
	OnNewRecord (see page 3642)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 3642)	This is OnPostError, a member of class TIBCustomDataSet.
	ParamCheck (see page 3930)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	Params (see page 3931)	Contains the parameters for a query's SQL (see page 3932) statement.
	SQL (see page 3932)	Contains the text of the SQL statement to execute for the query.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.

	UniDirectional (see page 3933)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 3933)	Specifies the update object component used to update a read-only result set.

26.1.1.2 TIBQuery.Create Constructor

Creates an instance of a query component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBQuery(TComponent * AOwner);
```

Description

Call Create to instantiate a query at runtime. Query components placed in forms or data modules at design time are created automatically.

Create calls its inherited Create constructor, creates an empty SQL (see page 3932) statement list, creates an empty parameter list, sets the OnChange event handler for the SQL (see page 3932) statement list, sets the ParamCheck (see page 3930) property to True, and sets the RowsAffected (see page 3931) property to -1.

26.1.1.3 TIBQuery.Destroy Destructor

Destroys the instance of a query.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBQuery();
```

Description

Do not call Destroy directly. Instead call Free to verify that the query is not already freed before calling Destroy. Destroy disconnects from the server, frees the SQL (see page 3932) statement list and the parameter list, and then calls its inherited destructor.

26.1.1.4 TIBQuery Methods

The methods of the TIBQuery class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 3922)	This is DefineProperties, a member of class TIBQuery.
	Disconnect (see page 3923)	This is Disconnect, a member of class TIBQuery.
	GenerateQueryForLiveUpdate (see page 3923)	This is GenerateQueryForLiveUpdate, a member of class TIBQuery.
	GetParamsCount (see page 3924)	This is GetParamsCount, a member of class TIBQuery.
	InitFieldDefs (see page 3924)	This is InitFieldDefs, a member of class TIBQuery.
	InternalOpen (see page 3924)	This is InternalOpen, a member of class TIBQuery.
	PSExecute (see page 3925)	This is PSExecute, a member of class TIBQuery.
	PSGetParams (see page 3925)	This is PSGetParams, a member of class TIBQuery.
	PSGetTableName (see page 3925)	This is PSGetTableName, a member of class TIBQuery.

	PSSetCommandText (see page 3926)	This is PSSetCommandText, a member of class TIBQuery.
	PSSetParams (see page 3926)	This is PSSetParams, a member of class TIBQuery.
	SetFiltered (see page 3926)	This is SetFiltered, a member of class TIBQuery.

Public Methods

	Name	Description
	BatchInput (see page 3922)	Executes the parameterized query in SQL (see page 3932) for input in the referenced input object.
	BatchOutput (see page 3922)	Outputs the selected query in SQL (see page 3932) to the referenced OutputObject.
	ExecSQL (see page 3923)	Executes the SQL (see page 3932) statement for the query.
	GetDetailLinkFields (see page 3923)	Fills lists with the master and detail fields of the link.
	ParamByName (see page 3924)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 3925)	Sends a query to the server for optimization prior to execution.
	UnPrepare (see page 3926)	Frees the resources allocated for a previously prepared query.

26.1.1.4.1 TIBQuery.BatchInput Method

Executes the parameterized query in SQL (see page 3932) for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call BatchInput to execute the parameterized query in SQL (see page 3932) for input in the referenced input object.

26.1.1.4.2 TIBQuery.BatchOutput Method

Outputs the selected query in SQL (see page 3932) to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call BatchOutput to output the selected query in SQL (see page 3932) to the referenced OutputObject.

26.1.1.4.3 TIBQuery.DefineProperties Method

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

This is DefineProperties, a member of class TIBQuery.

26.1.1.4.4 TIBQuery.Disconnect Method

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBQuery.

26.1.1.4.5 TIBQuery.ExecSQL Method

Executes the SQL (see page 3932) statement for the query.

Pascal

```
procedure ExecSQL;
```

C++

```
__fastcall ExecSQL();
```

Description

Call ExecSQL to execute the SQL (see page 3932) statement currently assigned to the SQL (see page 3932) property. Use ExecSQL to execute queries that do not return a cursor to data (such as INSERT, UPDATE, DELETE, and CREATE TABLE).

Note: For SELECT statements, call Open instead of ExecSQL.

ExecSQL prepares the statement in SQL (see page 3932) property for execution if it has not already been prepared. To speed performance, an application should ordinarily call Prepare (see page 3925) before calling ExecSQL for the first time.

26.1.1.4.6 TIBQuery.GenerateQueryForLiveUpdate Method

Pascal

```
function GenerateQueryForLiveUpdate: Boolean;
```

C++

```
__fastcall Boolean GenerateQueryForLiveUpdate();
```

Description

This is GenerateQueryForLiveUpdate, a member of class TIBQuery.

26.1.1.4.7 TIBQuery.GetDetailLinkFields Method

Fills lists with the master and detail fields of the link.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

Creates two lists of TFields from the master-detail relationship between two tables; one containing the master fields, and the

other containing the detail fields.

26.1.1.4.8 TIBQuery.GetParamsCount Method

Pascal

```
function GetParamsCount: Word;
```

C++

```
__fastcall Word GetParamsCount();
```

Description

This is GetParamsCount, a member of class TIBQuery.

26.1.1.4.9 TIBQuery.InitFieldDefs Method

Pascal

```
procedure InitFieldDefs; override;
```

C++

```
virtual __fastcall InitFieldDefs();
```

Description

This is InitFieldDefs, a member of class TIBQuery.

26.1.1.4.10 TIBQuery.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBQuery.

26.1.1.4.11 TIBQuery.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const UnicodeString Value);
```

Description

Call ParamByName to set or use parameter information for a specific parameter based on its name.

Value is the name of the parameter for which to retrieve information.

ParamByName is primarily used to set an parameter's value at runtime. For example, the following statement retrieves the current value of a parameter called 'Contact' into an edit box:

```
Edit1.Text := Query1.ParamByName('Contact').AsString;
```

```
Edit1->Text = Query1->ParamByName("Contact")->AsString;
```

26.1.1.4.12 TIBQuery.Prepare Method

Sends a query to the server for optimization prior to execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to have the remote database server allocate resources for the query and to perform additional optimizations. Calling Prepare before executing a query improves application performance.

A query is automatically prepared before being executed. A query that was automatically prepared will then be automatically unprepared after it executes. When a query will be executed a number of times, an application should always explicitly prepare the query to avoid multiple and unnecessary prepares and unprepares.

Preparing a query consumes some database resources, so it is good practice for an application to unprepare a query once it is done using it. The UnPrepare (see page 3926) method unprepares a query.

Note: When you change the text of a query at runtime, the query is automatically closed and unprepared.

26.1.1.4.13 TIBQuery.PSExecute Method

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

This is PSExecute, a member of class TIBQuery.

26.1.1.4.14 TIBQuery.PSGetParams Method

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

This is PSGetParams, a member of class TIBQuery.

26.1.1.4.15 TIBQuery.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBQuery.

26.1.1.4.16 TIBQuery.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBQuery.

26.1.1.4.17 TIBQuery.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBQuery.

26.1.1.4.18 TIBQuery.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBQuery.

26.1.1.4.19 TIBQuery.UnPrepare Method

Frees the resources allocated for a previously prepared query.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Call UnPrepare to free the resources allocated for a previously prepared query on the server and client sides.

Preparing a query consumes some database resources, so it is good practice for an application to unprepare a query once it is done using it. The UnPrepare method unprepares a query.

Note: When you change the text of a query at runtime, the query is automatically closed and unprepared.

26.1.1.5 TIBQuery Properties

The properties of the TIBQuery class are listed here.

Public Properties

	Name	Description
	GenerateParamNames (see page 3929)	Generates a list of parameter names for the query.
	LiveMode (see page 3929)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	ParamCount (see page 3930)	Indicates the current number of parameters for the query.
	Prepared (see page 3931)	Determines whether or not a query is prepared for execution.
R	RowsAffected (see page 3931)	Returns the number of rows operated upon by the latest query execution.
	StatementType (see page 3932)	Returns the statement type of the QSelect query.
R	StmtHandle (see page 3932)	Identifies the statement handle for the query.
R	Text (see page 3932)	Points to the actual text of the SQL (see page 3932) query.

Published Properties

	Name	Description
	Active (see page 3927)	This is Active, a member of class TIBQuery.
	BufferChunks (see page 3927)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3928)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 3928)	This is Constraints, a member of class TIBQuery.
	DataSource (see page 3928)	This is DataSource, a member of class TIBQuery.
	Filtered (see page 3929)	Specifies whether filtering is active for a dataset.
	GeneratorField (see page 3929)	Specifies whether the dataset should refresh its data every time it posts a record.
	OnFilterRecord (see page 3930)	This is OnFilterRecord, a member of class TIBQuery.
	ParamCheck (see page 3930)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
	Params (see page 3931)	Contains the parameters for a query's SQL (see page 3932) statement.
	SQL (see page 3932)	Contains the text of the SQL statement to execute for the query.
	UniDirectional (see page 3933)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 3933)	Specifies the update object component used to update a read-only result set.

26.1.1.5.1 TIBQuery.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBQuery.

26.1.1.5.2 TIBQuery.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When Unidirectional is true, BufferChunks has no meaning.

26.1.1.5.3 TIBQuery.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

26.1.1.5.4 TIBQuery.Constraints Property

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

This is Constraints, a member of class TIBQuery.

26.1.1.5.5 TIBQuery.DataSource Property

Pascal

```
property DataSource;
```

C++

```
__property DataSource;
```

Description

This is DataSource, a member of class TIBQuery.

26.1.1.5.6 TIBQuery.Filtered Property

Specifies whether filtering is active for a dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 3930) event handler, set Filtered to true. Filtered is set to false by default.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

26.1.1.5.7 TIBQuery.GenerateParamNames Property

Generates a list of parameter names for the query.

Pascal

```
property GenerateParamNames: Boolean;
```

C++

```
__property Boolean GenerateParamNames;
```

Description

Set GenerateParamNames to true to have the query generate a list of parameter names.

26.1.1.5.8 TIBQuery.GeneratorField Property

Specifies whether the dataset should refresh its data every time it posts a record.

Pascal

```
property GeneratorField: TIBGeneratorField;
```

C++

```
__property TIBGeneratorField GeneratorField;
```

Description

Use GeneratorField to specify a generator that automatically provides the value for one of the fields in the dataset. Use the properties of the TIBGeneratorField object to indicate which field's value should be set and how that value should be calculated.

Warning: Do not set the value of GeneratorField. To change the value of this property, change the properties of the TIBGeneratorField object that is the value of this property.

26.1.1.5.9 TIBQuery.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

26.1.1.5.10 TIBQuery.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBQuery.

26.1.1.5.11 TIBQuery.ParamCheck Property

Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether the Params property is cleared and regenerated if an application modifies the SQL in this dataset's query. By default ParamCheck is true, meaning that the Params property is automatically regenerated at runtime. When ParamCheck is true, the proper number of parameters is guaranteed to be generated for the current SQL statement.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement that are not parameters for the TIBCustomDataSet. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBCustomDataSet executing the DDL statement.

26.1.1.5.12 TIBQuery.ParamCount Property

Indicates the current number of parameters for the query.

Pascal

```
property ParamCount: Word;
```

C++

```
__property Word ParamCount;
```

Description

Inspect ParamCount to determine how many parameters are in the Params (see page 3931) property. If the ParamCheck (see page 3930) property is true, ParamCount always corresponds to the number of actual parameters in the SQL (see page 3932) statement for the query.

26.1.1.5.13 TIBQuery.Params Property

Contains the parameters for a query's SQL (see page 3932) statement.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Access Params at runtime to view and set parameter names, values, and data types dynamically (at design time use the collection editor for the Params property to set parameter information). Params is a zero-based array of TParams parameter records. Index specifies the array element to access.

Note: An easier way to set and retrieve parameter values when the name of each parameter is known is to call ParamByName (see page 3924). ParamByName (see page 3924) cannot, however, be used to change a parameter's data type or name.

26.1.1.5.14 TIBQuery.Prepared Property

Determines whether or not a query is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a query is already prepared for execution. If Prepared is true, the query is prepared, and if Prepared is false, the query is not prepared. While a query need not be prepared before execution, execution performance is enhanced if the query is prepared beforehand, particularly if it is a parameterized query that is executed more than once using the same parameter values.

Note: An application can change the current setting of Prepared to prepare or unprepare a query. If Prepared is true, setting it to false calls the UnPrepare (see page 3926) method to unprepare the query. If Prepared is false, setting it to true calls the Prepare (see page 3925) method to prepare the query. Generally, however, it is better programming practice to call Prepare (see page 3925) and UnPrepare (see page 3926) directly. These methods automatically update the Prepared property.

26.1.1.5.15 TIBQuery.RowsAffected Property

Returns the number of rows operated upon by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

Check RowsAffected to determine how many rows were updated or deleted by the last query operation. If RowsAffected is -1, the query did not update or delete any rows.

26.1.1.5.16 TIBQuery.SQL Property

Contains the text of the SQL statement to execute for the query.

Pascal

```
property SQL: TStrings;
```

C++

```
__property TStrings SQL;
```

Description

Use SQL to provide the SQL statement that a query component executes when its ExecSQL (see page 3923) or Open method is called. At design time the SQL property can be edited by invoking the String List editor in the Object Inspector.

The SQL property may contain only one complete SQL statement at a time.

26.1.1.5.17 TIBQuery.StatementType Property

Returns the statement type of the QSelect query.

Pascal

```
property StatementType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes StatementType;
```

Description

Use StatementType to determine the statement type of a QSelect query.

26.1.1.5.18 TIBQuery.StmtHandle Property

Identifies the statement handle for the query.

Pascal

```
property StmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE StmtHandle;
```

Description

Retrieve StmtHandle if an application makes a direct call to the InterBase server, bypassing the methods of TIBQuery (see page 3916). Some API calls require a statement handle as a parameter. Under all other circumstances an application does not need to access this property.

26.1.1.5.19 TIBQuery.Text Property

Points to the actual text of the SQL (see page 3932) query.

Pascal

```
property Text: string;
```

C++

```
__property UnicodeString Text;
```

Description

Text is a read-only property that can be examined to determine the actual contents of SQL (see page 3932) statement. For parameterized queries, Text contains the SQL (see page 3932) statement with parameters replaced by the parameter substitution symbol (?) in place of actual parameter values.

In general there should be no need to examine the Text property. To access or change the SQL (see page 3932) statement for the query, use the SQL (see page 3932) property. To examine or modify parameters, use the Params (see page 3931) property.

26.1.1.5.20 TIBQuery.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records. UniDirectional is only concerned with whether the cursor permits backward or random navigation.

26.1.1.5.21 TIBQuery.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

26.1.1.6 TIBQuery Events

The events of the TIBQuery class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 3934)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 3934)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 3934)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 3935)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 3935)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 3935)	Occurs when the transaction that includes this dataset's query is freed.

26.1.1.6.1 TIBQuery.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

26.1.1.6.2 TIBQuery.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

26.1.1.6.3 TIBQuery.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database

specified by the Database property.

26.1.1.6.4 TIBQuery.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

26.1.1.6.5 TIBQuery.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

26.1.1.6.6 TIBQuery.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

27 IBServices Namespace

This is namespace IBServices.

Topics

Name	Description
Classes (see page 3939)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4018)	The following table lists structs, records, enums in this documentation.
Types (see page 4027)	The following table lists types in this documentation.
Constants (see page 4032)	The following table lists constants in this documentation.

Classes

	Name	Description
	TConfigFileData (see page 3939)	This is class IBServices.TConfigFileData.
	TConfigParams (see page 3941)	TConfigFileData (see page 3939) and TConfigParams hold configuration information about an InterBase server
	TDatabaseInfo (see page 3944)	TDatabaseInfo stores information about an InterBase database.
	TIBBackupRestoreService (see page 3946)	TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 3948) and TIBRestoreService (see page 3979) are derived.
	TIBBackupService (see page 3948)	TIBBackupService allows you to back up your database.
	TIBConfigService (see page 3952)	TIBConfigService configures the database parameters
	TIBControlAndQueryService (see page 3957)	TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.
	TIBControlService (see page 3961)	TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.
	TIBCustomService (see page 3965)	TIBCustomService is the ancestor object from which all IBService components descend.
	TIBLicensingService (see page 3973)	TIBLicensingService configures the licensing parameters
	TIBLogService (see page 3977)	TIBLogService returns the contents of the interbase.log file from a server.
	TIBRestoreService (see page 3979)	TIBRestoreService allows you to restore your database.
	TIBSecurityService (see page 3983)	TIBSecurityService enables you to manage user access to the InterBase server.
	TIBServerProperties (see page 3992)	TIBServerProperties returns database server information.
	TIBStatisticalService (see page 3998)	TIBStatisticalService allows you to view database statistics.
	TIBValidationService (see page 4001)	TIBValidationService enables you to validate your database and reconcile your database transactions.
	TLicenseInfo (see page 4006)	TLicenseInfo stores information about licensed users.
	TLicenseMaskInfo (see page 4008)	TLicenseMaskInfo indicates the software activation certificate options enabled on the server.
	TLimboTransactionInfo (see page 4010)	TLimboTransactionInfo stores information about a limbo transaction.

	TUserInfo (see page 4013)	TUserInfo stores information about an InterBase user for the security service.
	TVersionInfo (see page 4015)	TVersionInfo represents version information about an InterBase server.

Constants

Name	Description
DefaultBufferSize (see page 4032)	This is constant IBServices.DefaultBufferSize.
SPBConstantNames (see page 4032)	This is constant IBServices.SPBConstantNames.
SPBConstantValues (see page 4033)	This is constant IBServices.SPBConstantValues.
SPBPrefix (see page 4033)	This is constant IBServices.SPBPrefix.

Structs, Records, Enums

	Name	Description
	TBackupOption (see page 4018)	This is record IBServices.TBackupOption.
	TLicensingAction (see page 4019)	TLicensingAction indicates whether to add or remove InterBase software activation certificates.
	TOutputBufferOption (see page 4019)	This is record IBServices.TOutputBufferOption.
	TPropertyOption (see page 4020)	This is record IBServices.TPropertyOption.
	TProtocol (see page 4020)	TProtocol identifies a network protocol.
	TRestoreOption (see page 4021)	This is record IBServices.TRestoreOption.
	TSecurityAction (see page 4021)	TSecurityAction indicates what operation the InterBase security service should perform.
	TSecurityModifyParam (see page 4022)	This is record IBServices.TSecurityModifyParam.
	TShutdownMode (see page 4022)	TShutdownMode indicates what steps to take when shutting down the InterBase database.
	TStatOption (see page 4023)	This is record IBServices.TStatOption.
	TTransactionAction (see page 4023)	TTransactionAction indicates the action a transaction can take when it times out.
	TTransactionAdvise (see page 4024)	This is record IBServices.TTransactionAdvise.
	TTransactionGlobalAction (see page 4024)	TTransactionGlobalAction indicates the action to take on a set of transactions.
	TTransactionState (see page 4025)	This is record IBServices.TTransactionState.
	TValidateOption (see page 4026)	This is record IBServices.TValidateOption.

Types

Name	Description
TBackupOptions (see page 4027)	TBackupOption (see page 4018) and TBackupOptions indicate how TIBBackupService (see page 3948) performs database backup.
TLoginEvent (see page 4028)	This is type IBServices.TLoginEvent.
TPropertyOptions (see page 4028)	TPropertyOption (see page 4020) and TPropertyOptions indicate groups of InterBase server properties.
TRestoreOptions (see page 4029)	TRestoreOption (see page 4021) and TRestoreOptions indicate what operations take place when restoring an InterBase database.
TSecurityModifyParams (see page 4030)	This is type IBServices.TSecurityModifyParams.
TStatOptions (see page 4030)	TStatOption (see page 4023) and TStatOptions indicate the different statistical information available about a database.
TValidateOptions (see page 4031)	TValidateOption (see page 4026) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

27.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TConfigFileData (see page 3939)	This is class IBServices.TConfigFileData.
	TConfigParams (see page 3941)	TConfigFileData (see page 3939) and TConfigParams hold configuration information about an InterBase server
	TDatabaseInfo (see page 3944)	TDatabaseInfo stores information about an InterBase database.
	TIBBackupRestoreService (see page 3946)	TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 3948) and TIBRestoreService (see page 3979) are derived.
	TIBBackupService (see page 3948)	TIBBackupService allows you to back up your database.
	TIBConfigService (see page 3952)	TIBConfigService configures the database parameters
	TIBControlAndQueryService (see page 3957)	TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.
	TIBControlService (see page 3961)	TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.
	TIBCustomService (see page 3965)	TIBCustomService is the ancestor object from which all IBService components descend.
	TIBLicensingService (see page 3973)	TIBLicensingService configures the licensing parameters
	TIBLogService (see page 3977)	TIBLogService returns the contents of the interbase.log file from a server.
	TIBRestoreService (see page 3979)	TIBRestoreService allows you to restore your database.
	TIBSecurityService (see page 3983)	TIBSecurityService enables you to manage user access to the InterBase server.
	TIBServerProperties (see page 3992)	TIBServerProperties returns database server information.
	TIBStatisticalService (see page 3998)	TIBStatisticalService allows you to view database statistics.
	TIBValidationService (see page 4001)	TIBValidationService enables you to validate your database and reconcile your database transactions.
	TLicenseInfo (see page 4006)	TLicenseInfo stores information about licensed users.
	TLicenseMaskInfo (see page 4008)	TLicenseMaskInfo indicates the software activation certificate options enabled on the server.
	TLimboTransactionInfo (see page 4010)	TLimboTransactionInfo stores information about a limbo transaction.
	TUserInfo (see page 4013)	TUserInfo stores information about an InterBase user for the security service.
	TVersionInfo (see page 4015)	TVersionInfo represents version information about an InterBase server.

27.1.1 TConfigFileData Class

Class Hierarchy

Pascal

```
TConfigFileData = class;
```

C++

```
class TConfigFileData;
```

File

IBServices

Description

This is class IBServices.TConfigFileData.

27.1.1.1 TConfigFileData Members

The following tables list the members exposed by TConfigFileData.

Public Fields

	Name	Description
	ConfigFileKey (see page 3941)	This is ConfigFileKey, a member of class TConfigFileData.
	ConfigFileValue (see page 3941)	This is ConfigFileValue, a member of class TConfigFileData.

Public Methods

	Name	Description
	Create (see page 3940)	This is Create, a member of class TConfigFileData.
	Destroy (see page 3940)	This is Destroy, a member of class TConfigFileData.

27.1.1.2 TConfigFileData.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TConfigFileData();
```

Description

This is Create, a member of class TConfigFileData.

27.1.1.3 TConfigFileData.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConfigFileData();
```

Description

This is Destroy, a member of class TConfigFileData.

27.1.1.4 TConfigFileData Fields

The fields of the TConfigFileData class are listed here.

Public Fields

	Name	Description
	ConfigFileKey (see page 3941)	This is ConfigFileKey, a member of class TConfigFileData.
	ConfigFileValue (see page 3941)	This is ConfigFileValue, a member of class TConfigFileData.

27.1.1.4.1 TConfigFileData.ConfigFileKey Field

Pascal

```
ConfigFileKey: array of integer;
```

C++

```
array of integer ConfigFileKey;
```

Description

This is ConfigFileKey, a member of class TConfigFileData.

27.1.1.4.2 TConfigFileData.ConfigFileValue Field

Pascal

```
ConfigFileValue: array of integer;
```

C++

```
array of integer ConfigFileValue;
```

Description

This is ConfigFileValue, a member of class TConfigFileData.

27.1.2 TConfigParams Class

TConfigFileData (see page 3939) and TConfigParams hold configuration information about an InterBase server

Class Hierarchy

Pascal

```
TConfigParams = class;
```

C++

```
class TConfigParams;
```

File

IBServices

Description

TConfigFileData (see page 3939) stored information about an InterBase configuration file. It is one of the parameters of the TConfigParams type, which stores server configuration settings.

27.1.2.1 TConfigParams Members

The following tables list the members exposed by TConfigParams.

Public Fields

	Name	Description
	BaseLocation (see page 3942)	This is BaseLocation, a member of class TConfigParams.

	ConfigFileData (see page 3943)	This is ConfigFileData, a member of class TConfigParams.
	ConfigFileParams (see page 3943)	This is ConfigFileParams, a member of class TConfigParams.
	LockFileLocation (see page 3943)	This is LockFileLocation, a member of class TConfigParams.
	MessageFileLocation (see page 3943)	This is MessageFileLocation, a member of class TConfigParams.
	SecurityDatabaseLocation (see page 3944)	This is SecurityDatabaseLocation, a member of class TConfigParams.

Public Methods

	Name	Description
	Create (see page 3942)	This is Create, a member of class TConfigParams.
V	Destroy (see page 3942)	This is Destroy, a member of class TConfigParams.

27.1.2.2 TConfigParams.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TConfigParams();
```

Description

This is Create, a member of class TConfigParams.

27.1.2.3 TConfigParams.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConfigParams();
```

Description

This is Destroy, a member of class TConfigParams.

27.1.2.4 TConfigParams Fields

The fields of the TConfigParams class are listed here.

Public Fields

	Name	Description
	BaseLocation (see page 3942)	This is BaseLocation, a member of class TConfigParams.
	ConfigFileData (see page 3943)	This is ConfigFileData, a member of class TConfigParams.
	ConfigFileParams (see page 3943)	This is ConfigFileParams, a member of class TConfigParams.
	LockFileLocation (see page 3943)	This is LockFileLocation, a member of class TConfigParams.
	MessageFileLocation (see page 3943)	This is MessageFileLocation, a member of class TConfigParams.
	SecurityDatabaseLocation (see page 3944)	This is SecurityDatabaseLocation, a member of class TConfigParams.

27.1.2.4.1 TConfigParams.BaseLocation Field

Pascal

```
BaseLocation: string;
```

C++

```
UnicodeString BaseLocation;
```

Description

This is BaseLocation, a member of class TConfigParams.

27.1.2.4.2 TConfigParams.ConfigFileData Field

Pascal

```
ConfigFileData: TConfigFileData;
```

C++

```
TConfigFileData ConfigFileData;
```

Description

This is ConfigFileData, a member of class TConfigParams.

27.1.2.4.3 TConfigParams.ConfigFileParams Field

Pascal

```
ConfigFileParams: array of string;
```

C++

```
array of string ConfigFileParams;
```

Description

This is ConfigFileParams, a member of class TConfigParams.

27.1.2.4.4 TConfigParams.LockFileLocation Field

Pascal

```
LockFileLocation: string;
```

C++

```
UnicodeString LockFileLocation;
```

Description

This is LockFileLocation, a member of class TConfigParams.

27.1.2.4.5 TConfigParams.MessageFileLocation Field

Pascal

```
MessageFileLocation: string;
```

C++

```
UnicodeString MessageFileLocation;
```

Description

This is MessageFileLocation, a member of class TConfigParams.

27.1.2.4.6 TConfigParams.SecurityDatabaseLocation Field

Pascal

```
SecurityDatabaseLocation: string;
```

C++

```
UnicodeString SecurityDatabaseLocation;
```

Description

This is SecurityDatabaseLocation, a member of class TConfigParams.

27.1.3 TDatabaseInfo Class

TDatabaseInfo stores information about an InterBase database.

Class Hierarchy

Pascal

```
TDatabaseInfo = class;
```

C++

```
class TDatabaseInfo;
```

File

IBServices

Description

TDatabaseInfo describes an InterBase database.

NoOfAttachments (see page 3945) is the number attachments.

NoOfDatabases (see page 3946) is the number of databases.

DbName (see page 3945) is the name of the database.

27.1.3.1 TDatabaseInfo Members

The following tables list the members exposed by TDatabaseInfo.

Public Fields

	Name	Description
	DbName (see page 3945)	This is DbName, a member of class TDatabaseInfo.
	NoOfAttachments (see page 3945)	This is NoOfAttachments, a member of class TDatabaseInfo.
	NoOfDatabases (see page 3946)	This is NoOfDatabases, a member of class TDatabaseInfo.

Public Methods

	Name	Description
	Create (see page 3945)	This is Create, a member of class TDatabaseInfo.
	Destroy (see page 3945)	This is Destroy, a member of class TDatabaseInfo.

27.1.3.2 TDatabaseInfo.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDatabaseInfo();
```

Description

This is Create, a member of class TDatabaseInfo.

27.1.3.3 TDatabaseInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDatabaseInfo();
```

Description

This is Destroy, a member of class TDatabaseInfo.

27.1.3.4 TDatabaseInfo Fields

The fields of the TDatabaseInfo class are listed here.

Public Fields

	Name	Description
	DbName (see page 3945)	This is DbName, a member of class TDatabaseInfo.
	NoOfAttachments (see page 3945)	This is NoOfAttachments, a member of class TDatabaseInfo.
	NoOfDatabases (see page 3946)	This is NoOfDatabases, a member of class TDatabaseInfo.

27.1.3.4.1 TDatabaseInfo.DbName Field

Pascal

```
DbName: array of string;
```

C++

```
array of string DbName;
```

Description

This is DbName, a member of class TDatabaseInfo.

27.1.3.4.2 TDatabaseInfo.NoOfAttachments Field

Pascal

```
NoOfAttachments: Integer;
```

C++

```
int NoOfAttachments;
```

Description

This is NoOfAttachments, a member of class TDatabaseInfo.

27.1.3.4.3 TDatabaseInfo.NoOfDatabases Field

Pascal

```
NoOfDatabases: Integer;
```

C++

```
int NoOfDatabases;
```

Description

This is NoOfDatabases, a member of class TDatabaseInfo.

27.1.4 TIBBackupRestoreService Class

TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 3948) and TIBRestoreService (see page 3979) are derived.

Class Hierarchy

Pascal

```
TIBBackupRestoreService = class(TIBControlAndQueryService);
```

C++

```
class TIBBackupRestoreService : public TIBControlAndQueryService;
```

File

IBServices

Description

TIBBackupRestoreService is the ancestor object from which TIBBackupService (see page 3948) and TIBRestoreService (see page 3979) are derived.

Note: You must install InterBase 6 to use this feature.

27.1.4.1 TIBBackupRestoreService Members

The following tables list the members exposed by TIBBackupRestoreService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.

	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3964)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3959)	Creates an instance of a TIBControlAndQueryService (see page 3957).
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 3948)	Sets or returns the backup or restore in verbose mode.

27.1.4.2 TIBBackupRestoreService Properties

The properties of the TIBBackupRestoreService class are listed here.

Published Properties

	Name	Description
	Verbose (see page 3948)	Sets or returns the backup or restore in verbose mode.

27.1.4.2.1 TIBBackupRestoreService.Verbose Property

Sets or returns the backup or restore in verbose mode.

Pascal

```
property Verbose: Boolean;
```

C++

```
__property Boolean Verbose;
```

Description

Use Verbose to set or return the backup or restore in verbose mode.

Note: You must install InterBase 6 to use this feature.

27.1.5 TIBBackupService Class

TIBBackupService allows you to back up your database.

Class Hierarchy

Pascal

```
TIBBackupService = class(TIBBackupRestoreService);
```

C++

```
class TIBBackupService : public TIBBackupRestoreService;
```

File

IBServices

Description

Use a TIBBackupService object to back up your database.

Getting Started with InterBase Express

27.1.5.1 TIBBackupService Members

The following tables list the members exposed by TIBBackupService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.

	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3950)	This is SetServiceStartOptions, a member of class TIBBackupService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3950)	Creates an instance of TIBBackupService (see page 3948)
V	Destroy (see page 3950)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BackupFile (see page 3951)	Sets or returns the backup file name.
	BlockingFactor (see page 3951)	Sets or returns the blocking factor for the tape device.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	DatabaseName (see page 3951)	Sets or returns the database name.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Options (see page 3951)	Sets the options for the database backup.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 3948)	Sets or returns the backup or restore in verbose mode.

27.1.5.2 TIBBackupService.Create Constructor

Creates an instance of TIBBackupService (see page 3948)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBBackupService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBBackupService (see page 3948).

27.1.5.3 TIBBackupService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBBackupService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

27.1.5.4 TIBBackupService Methods

The methods of the TIBBackupService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 3950)	This is SetServiceStartOptions, a member of class TIBBackupService.

27.1.5.4.1 TIBBackupService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBBackupService.

27.1.5.5 TIBBackupService Properties

The properties of the TIBBackupService class are listed here.

Published Properties

	Name	Description
	BackupFile (see page 3951)	Sets or returns the backup file name.
	BlockingFactor (see page 3951)	Sets or returns the blocking factor for the tape device.
	DatabaseName (see page 3951)	Sets or returns the database name.
	Options (see page 3951)	Sets the options for the database backup.

27.1.5.5.1 TIBBackupService.BackupFile Property

Sets or returns the backup file name.

Pascal

```
property BackupFile: TStrings;
```

C++

```
__property TStrings BackupFile;
```

Description

Use BackupFile to set or return the backup file name.

27.1.5.5.2 TIBBackupService.BlockingFactor Property

Sets or returns the blocking factor for the tape device.

Pascal

```
property BlockingFactor: Integer;
```

C++

```
__property int BlockingFactor;
```

Description

Use BlockingFactor to set the blocking factor for the tape device as an integer.

27.1.5.5.3 TIBBackupService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

27.1.5.5.4 TIBBackupService.Options Property

Sets the options for the database backup.

Pascal

```
property Options: TBackupOptions;
```

C++

```
__property TBackupOptions Options;
```

Description

Use Options to select the options for the database backup.

27.1.6 TIBConfigService Class

TIBConfigService configures the database parameters

Class Hierarchy

Pascal

```
TIBConfigService = class(TIBControlService);
```

C++

```
class TIBConfigService : public TIBControlService;
```

File

IBServices

Description

Use a TIBConfigService object to configure database parameters.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

27.1.6.1 TIBConfigService Members

The following tables list the members exposed by TIBConfigService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3964)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.

	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	ActivateShadow (see page 3954)	Activates the shadow file for database use.
	Attach (see page 3967)	Attaches to the database.
	BringDatabaseOnline (see page 3954)	Brings the database online.
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
V	ServiceStart (see page 3954)	Not used for TIBConfigService (see page 3952)
	SetAsyncMode (see page 3955)	Sets database writes to asynchronous mode.
	SetDBSqlDialect (see page 3955)	Sets the SQL dialect for the database.
	SetPageBuffers (see page 3955)	Sets the number of database page buffers.
	SetReadOnly (see page 3956)	Sets the database to read only.
	SetReserveSpace (see page 3956)	Sets reserve space on the data page for versioning.
	SetSweepInterval (see page 3956)	Sets the sweep interval.
	ShutdownDatabase (see page 3957)	Shuts down the database.

Public Properties

	Name	Description
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	DatabaseName (see page 3957)	Sets or returns the database name.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.6.2 TIBConfigService Methods

The methods of the TIBConfigService class are listed here.

Public Methods

	Name	Description
	ActivateShadow (see page 3954)	Activates the shadow file for database use.
	BringDatabaseOnline (see page 3954)	Brings the database online.
V	ServiceStart (see page 3954)	Not used for TIBConfigService (see page 3952)
	SetAsyncMode (see page 3955)	Sets database writes to asynchronous mode.
	SetDBSqlDialect (see page 3955)	Sets the SQL dialect for the database.
	SetPageBuffers (see page 3955)	Sets the number of database page buffers.

	SetReadOnly (see page 3956)	Sets the database to read only.
	SetReserveSpace (see page 3956)	Sets reserve space on the data page for versioning.
	SetSweepInterval (see page 3956)	Sets the sweep interval.
	ShutdownDatabase (see page 3957)	Shuts down the database.

27.1.6.2.1 TIBConfigService.ActivateShadow Method

Activates the shadow file for database use.

Pascal

```
procedure ActivateShadow;
```

C++

```
__fastcall ActivateShadow();
```

Description

Call ActivateShadow to activate the database shadow.

InterBase 6 lets you recover a database in case of disk failure, network failure, or accidental deletion of the database. This recovery method is known as disk shadowing, or simply shadowing. Before you can activate shadowing, you must first create a database shadow, as discussed in 'Shadowing' and 'Creating a shadow' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.2 TIBConfigService.BringDatabaseOnline Method

Brings the database online.

Pascal

```
procedure BringDatabaseOnline;
```

C++

```
__fastcall BringDatabaseOnline();
```

Description

Call BringDatabaseOnline to bring a database online.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.3 TIBConfigService.ServiceStart Method

Not used for TIBConfigService (see page 3952)

Pascal

```
procedure ServiceStart; override;
```

C++

```
virtual __fastcall ServiceStart();
```

Description

Do not use ServiceStart. TIBConfigService (see page 3952) does not currently use this method.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.4 TIBConfigService.SetAsyncMode Method

Sets database writes to asynchronous mode.

Pascal

```
procedure SetAsyncMode(Value: Boolean);
```

C++

```
__fastcall SetAsyncMode(Boolean Value);
```

Description

Set SetAsyncMode to true to change the database write mode to asynchronous (buffered writes).

InterBase 6 allows you to write to databases in both synchronous and asynchronous modes. In synchronous mode, the database writes are forced. In asynchronous mode, the database writes are buffered.

For more information, refer to 'Forced writes vs. buffered writes' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.5 TIBConfigService.SetDBSqlDialect Method

Sets the SQL dialect for the database.

Pascal

```
procedure SetDBSqlDialect(Value: Integer);
```

C++

```
__fastcall SetDBSqlDialect(int Value);
```

Description

Call SetDBSqlDialect to set the SQL dialect for the database. Valid integer values are 1, 2, and 3.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.6 TIBConfigService.SetPageBuffers Method

Sets the number of database page buffers.

Pascal

```
procedure SetPageBuffers(Value: Integer);
```

C++

```
__fastcall SetPageBuffers(int Value);
```

Description

Call SetPageBuffers to set the number of database page buffers.

When a program establishes a connection to a database, InterBase allocates system memory to use as a private buffer. The buffers are used to store accessed database pages to speed performance. The number of buffers assigned determines how many simultaneous database pages it can have access to in the memory pool. Buffers remain assigned until a program finishes with a database.

For more information on page buffers, refer to 'Setting database cache buffers' in the InterBase 6 Programmer's Guide.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.7 TIBConfigService.SetReadOnly Method

Sets the database to read only.

Pascal

```
procedure SetReadOnly(Value: Boolean);
```

C++

```
__fastcall SetReadOnly(Boolean Value);
```

Description

Call SetReadOnly to set the database to read only.

Access mode specifies the type of access a transaction has for the table it uses. There are two possible modes: read-only and read-write.

- Read-only specifies that a transaction can read data from a table, but cannot insert, update, or delete table data.
- Read-write specifies that a transaction can select, insert, update, and delete table data. This is the default setting if none is specified.

Tip: You should specify the transaction's access mode even if is read-write. It makes the application's source code easier to read and debug, because the program's intentions are clearly spelled out.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.8 TIBConfigService.SetReserveSpace Method

Sets reserve space on the data page for versioning.

Pascal

```
procedure SetReserveSpace(Value: Boolean);
```

C++

```
__fastcall SetReserveSpace(Boolean Value);
```

Description

Set SetReserveSpace to true to reserve space on the data page for versioning.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.9 TIBConfigService.SetSweepInterval Method

Sets the sweep interval.

Pascal

```
procedure SetSweepInterval(Value: Integer);
```

C++

```
__fastcall SetSweepInterval(int Value);
```

Description

Call SetSweepInterval set the sweep interval for the database. The sweep interval refers to the number of transactions between database sweeps.

To turn off database sweeps, set the sweep interval to 0.

Sweeping a database is a systematic way of removing outdated records from the database. Periodic sweeping keeps the database from getting too large. However, sweeping can also slow performance. For more information, refer to 'Setting the sweep interval' in the InterBase 6 Operations Guide.

Note: You must install InterBase 6 to use this feature.

27.1.6.2.10 TIBConfigService.ShutdownDatabase Method

Shuts down the database.

Pascal

```
procedure ShutdownDatabase(Options: TShutdownMode; Wait: Integer);
```

C++

```
__fastcall ShutdownDatabase(TShutdownMode Options, int Wait);
```

Description

Call ShutdownDatabase to shut down the database after a specified number of seconds.

Note: You must install InterBase 6 to use this feature.

27.1.6.3 TIBConfigService Properties

The properties of the TIBConfigService class are listed here.

Published Properties

	Name	Description
	DatabaseName (see page 3957)	Sets or returns the database name.

27.1.6.3.1 TIBConfigService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the database name to set properties on.

Note: You must install InterBase 6 to use this feature.

27.1.7 TIBControlAndQueryService Class

TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend.

Class Hierarchy

Pascal

```
TIBControlAndQueryService = class(TIBControlService);
```

C++

```
class TIBControlAndQueryService : public TIBControlService;
```

File

IBServices

Description

TIBControlAndQueryService is the ancestor object from which the log, statistical, validation, security, and backup and restore IBService components descend. The service is unstructured because the output is in an unformatted text file.

Note: You must install InterBase 6 to use this feature.

27.1.7.1 TIBControlAndQueryService Members

The following tables list the members exposed by TIBControlAndQueryService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3964)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3959)	Creates an instance of a TIBControlAndQueryService (see page 3957).
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
	Eof (see page 3961)	Indicates that the end of file has been reached.
	Handle (see page 3970)	Returns the database handle.
	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.7.2 TIBControlAndQueryService.Create Constructor

Creates an instance of a TIBControlAndQueryService (see page 3957).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBControlAndQueryService(TComponent * AOwner);
```

Description

Call Create to create an instance of a TIBControlAndQueryService (see page 3957) component.

Note: You must install InterBase 6 to use this feature.

27.1.7.3 TIBControlAndQueryService Methods

The methods of the TIBControlAndQueryService class are listed here.

Public Methods

	Name	Description
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.

27.1.7.3.1 TIBControlAndQueryService.GetNextChunk Method

Gets the next chunk of data.

Pascal

```
function GetNextChunk: String;
```

C++

```
__fastcall UnicodeString GetNextChunk();
```

Description

Call GetNextChunk to get the next chunk of data.

Note: You must install InterBase 6 to use this feature.

27.1.7.3.2 TIBControlAndQueryService.GetNextLine Method

Starts the service.

Pascal

```
function GetNextLine: String;
```

C++

```
__fastcall UnicodeString GetNextLine();
```

Description

Call GetNextLine to get the next line of data.

Note: You must install InterBase 6 to use this feature.

27.1.7.4 TIBControlAndQueryService Properties

The properties of the TIBControlAndQueryService class are listed here.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.

Published Properties

	Name	Description
	BufferSize (see page 3961)	Sets or returns the buffer size.

27.1.7.4.1 TIBControlAndQueryService.Action Property

Pascal

```
property Action: Integer;
```

C++

```
__property int Action;
```

Description

This is Action, a member of class TIBControlAndQueryService.

27.1.7.4.2 TIBControlAndQueryService.BufferSize Property

Sets or returns the buffer size.

Pascal

```
property BufferSize: Integer;
```

C++

```
__property int BufferSize;
```

Description

Use the BufferSize property to set or return the buffer size.

Note: You must install InterBase 6 to use this feature.

27.1.7.4.3 TIBControlAndQueryService.Eof Property

Indicates that the end of file has been reached.

Pascal

```
property Eof: boolean;
```

C++

```
__property boolean Eof;
```

Description

Use the Eof property to determine whether the end of the file has been reached.

Note: You must install InterBase 6 to use this feature.

27.1.8 TIBControlService Class

TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.

Class Hierarchy

Pascal

```
TIBControlService = class(TIBCustomService);
```

C++

```
class TIBControlService : public TIBCustomService;
```

File

IBServices

Description

TIBControlService is the ancestor object from which the structured and unstructured IBService components descend.

Note: You must install InterBase 6 to use this feature.

27.1.8.1 TIBControlService Members

The following tables list the members exposed by TIBControlService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3964)	This is SetServiceStartOptions, a member of class TIBControlService.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.8.2 TIBControlService.Create Constructor

Creates an instance of TIBControlService (see page 3961)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBControlService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBControlService (see page 3961).

Note: You must install InterBase 6 to use this feature.

27.1.8.3 TIBControlService Methods

The methods of the TIBControlService class are listed here.

Protected Methods

	Name	Description
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3964)	This is SetServiceStartOptions, a member of class TIBControlService.

Public Methods

	Name	Description
V	ServiceStart (see page 3963)	Starts the service.

27.1.8.3.1 TIBControlService.InternalServiceStart Method

Pascal

```
procedure InternalServiceStart;
```

C++

```
__fastcall InternalServiceStart();
```

Description

This is InternalServiceStart, a member of class TIBControlService.

27.1.8.3.2 TIBControlService.ServiceStart Method

Starts the service.

Pascal

```
procedure ServiceStart; virtual;
```

C++

```
virtual __fastcall ServiceStart();
```

Description

Call ServiceStart to start the service.

Note: You must install InterBase 6 to use this feature.

27.1.8.3.3 ServiceStartAddParam Method

This is the overview for the ServiceStartAddParam method overload.

Overload List

	Name	Description
	TIBControlService.ServiceStartAddParam (Integer, Integer) (see page 3964)	This is ServiceStartAddParam, a member of class TIBControlService.
	TIBControlService.ServiceStartAddParam (string, Integer) (see page 3964)	This is ServiceStartAddParam, a member of class TIBControlService.

27.1.8.3.3.1 TIBControlService.ServiceStartAddParam Method (Integer, Integer)

Pascal

```
procedure ServiceStartAddParam(Value: Integer; param: Integer); overload;
```

C++

```
__fastcall ServiceStartAddParam(int Value, int param);
```

Description

This is ServiceStartAddParam, a member of class TIBControlService.

27.1.8.3.3.2 TIBControlService.ServiceStartAddParam Method (string, Integer)

Pascal

```
procedure ServiceStartAddParam(Value: string; param: Integer); overload;
```

C++

```
__fastcall ServiceStartAddParam(UnicodeString Value, int param);
```

Description

This is ServiceStartAddParam, a member of class TIBControlService.

27.1.8.3.4 TIBControlService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; virtual;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBControlService.

27.1.8.4 TIBControlService Properties

The properties of the TIBControlService class are listed here.

Protected Properties

	Name	Description
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Properties

	Name	Description
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.

27.1.8.4.1 TIBControlService.IsServiceRunning Property

Indicates whether the service is running.

Pascal

```
property IsServiceRunning: Boolean;
```

C++

```
__property Boolean IsServiceRunning;
```

Description

Use the IsServiceRunning property to check whether the service is running.

Note: You must install InterBase 6 to use this feature.

27.1.8.4.2 TIBControlService.ServiceStartParams Property

Pascal

```
property ServiceStartParams: String;
```

C++

```
__property UnicodeString ServiceStartParams;
```

Description

This is ServiceStartParams, a member of class TIBControlService.

27.1.9 TIBCustomService Class

TIBCustomService is the ancestor object from which all IBService components descend.

Class Hierarchy

Pascal

```
TIBCustomService = class(TComponent);
```

C++

```
class TIBCustomService : public TComponent;
```

File

IBServices

Description

TIBCustomService is the ancestor object from which all IBService components descend.

27.1.9.1 TIBCustomService Members

The following tables list the members exposed by TIBCustomService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.

Public Properties

	Name	Description
R	Handle (see page 3970)	Returns the database handle.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.9.2 TIBCustomService.Create Constructor

Creates an instance of TIBCustomService (see page 3965)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBCustomService (see page 3965).

27.1.9.3 TIBCustomService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

27.1.9.4 TIBCustomService Methods

The methods of the TIBCustomService class are listed here.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
	Detach (see page 3968)	Detaches from the database.

27.1.9.4.1 TIBCustomService.Attach Method

Attaches to the database.

Pascal

```
procedure Attach;
```

C++

```
__fastcall Attach();
```

Description

Call Attach to attach to the database.

27.1.9.4.2 TIBCustomService.CheckActive Method

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

This is CheckActive, a member of class TIBCustomService.

27.1.9.4.3 TIBCustomService.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TIBCustomService.

27.1.9.4.4 TIBCustomService.Detach Method

Detaches from the database.

Pascal

```
procedure Detach;
```

C++

```
__fastcall Detach();
```

Description

Call Detach to detach from the database.

27.1.9.4.5 TIBCustomService.InternalServiceQuery Method

Pascal

```
procedure InternalServiceQuery;
```

C++

```
__fastcall InternalServiceQuery();
```

Description

This is InternalServiceQuery, a member of class TIBCustomService.

27.1.9.4.6 TIBCustomService.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

27.1.9.4.7 TIBCustomService.Login Method

Pascal

```
function Login: Boolean;
```

C++

```
__fastcall Boolean Login();
```

Description

This is Login, a member of class TIBCustomService.

27.1.9.5 TIBCustomService Properties

The properties of the TIBCustomService class are listed here.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Properties

	Name	Description
	Handle (see page 3970)	Returns the database handle.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.9.5.1 TIBCustomService.Active Property

Sets the active state of the service.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use the Active property to set the service to active (true) or the default, inactive (false).

27.1.9.5.2 TIBCustomService.BufferSize Property

Pascal

```
property BufferSize: Integer;
```

C++

```
__property int BufferSize;
```

Description

This is BufferSize, a member of class TIBCustomService.

27.1.9.5.3 TIBCustomService.Handle Property

Returns the database handle.

Pascal

```
property Handle: TISC_SVC_HANDLE;
```

C++

```
__property TISC_SVC_HANDLE Handle;
```

Description

Use the Handle property to return the database handle.

27.1.9.5.4 TIBCustomService.LoginPrompt Property

Turns on and off login prompt display.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Use the LoginPrompt**property to display (or not display) a login prompt before attaching to a database.**

27.1.9.5.5 TIBCustomService.OutputBuffer Property

Pascal

```
property OutputBuffer: PChar;
```

C++

```
__property const char * OutputBuffer;
```

Description

This is OutputBuffer, a member of class TIBCustomService.

27.1.9.5.6 TIBCustomService.OutputBufferOption Property

Pascal

```
property OutputBufferOption: TOutputBufferOption;
```

C++

```
__property TOutputBufferOption OutputBufferOption;
```

Description

This is OutputBufferOption, a member of class TIBCustomService.

27.1.9.5.7 TIBCustomService.Params Property

Sets or returns the database parameters

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Use the Params property to set or return database parameters.

27.1.9.5.8 TIBCustomService.Protocol Property

Sets or returns the network protocol.

Pascal

```
property Protocol: TProtocol;
```

C++

```
__property TProtocol Protocol;
```

Description

Use Protocol to select the network protocol.

27.1.9.5.9 TIBCustomService.ServerName Property

Sets the name of the server on which the services are to be run.

Pascal

```
property ServerName: string;
```

C++

```
__property UnicodeString ServerName;
```

Description

Use ServerName to set the name of the server on which the services are to be run.

27.1.9.5.10 TIBCustomService.ServiceParamBySPB Property

Returns and sets SPB parameters.

Pascal

```
property ServiceParamBySPB [const Idx: Integer]: String;
```

C++

```
__property UnicodeString ServiceParamBySPB[int const Idx];
```

Description

Use ParamBySPB to inspect and set SPB parameters.

For example DBParamBySPB[isc_SPB_user_name] sets and inspects the user name.

27.1.9.5.11 TIBCustomService.ServiceQueryParams Property

Pascal

```
property ServiceQueryParams: String;
```

C++

```
__property UnicodeString ServiceQueryParams;
```

Description

This is ServiceQueryParams, a member of class TIBCustomService.

27.1.9.5.12 TIBCustomService.TraceFlags Property

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

This is TraceFlags, a member of class TIBCustomService.

27.1.9.6 TIBCustomService Events

The events of the TIBCustomService class are listed here.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

27.1.9.6.1 TIBCustomService.OnAttach Event

Occurs when the database is attached.

Pascal

```
property OnAttach: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAttach;
```

Description

Write an OnAttach event handler to take specific actions when a database is attached. If an exception is raised in this event, the database is not attached.

27.1.9.6.2 TIBCustomService.OnLogin Event

Occurs during database login.

Pascal

```
property OnLogin: TLoginEvent;
```

C++

```
__property TLoginEvent OnLogin;
```

Description

Write an OnLogin event handler to take specific actions on database login.

27.1.10 TIBLicensingService Class

TIBLicensingService configures the licensing parameters

Class Hierarchy

Pascal

```
TIBLicensingService = class(TIBControlService);
```

C++

```
class TIBLicensingService : public TIBControlService;
```

File

IBServices

Description

Use a TIBLicensingService component to add or remove InterBase software activation certificates.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

27.1.10.1 TIBLicensingService Members

The following tables list the members exposed by TIBLicensingService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3976)	This is SetServiceStartOptions, a member of class TIBLicensingService.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	AddLicense (see page 3975)	Adds an InterBase software activation certificate.
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	RemoveLicense (see page 3976)	Removes an InterBase software activation certificate.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
	Handle (see page 3970)	Returns the database handle.
	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Action (see page 3976)	Indictes the licensing action.
	Active (see page 3970)	Sets the active state of the service.
	ID (see page 3977)	Sets or returns the license identification.
	Key (see page 3977)	Sets or returns the license key.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.10.2 TIBLicensingService Methods

The methods of the TIBLicensingService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 3976)	This is SetServiceStartOptions, a member of class TIBLicensingService.

Public Methods

	Name	Description
	AddLicense (see page 3975)	Adds an InterBase software activation certificate.
	RemoveLicense (see page 3976)	Removes an InterBase software activation certificate.

27.1.10.2.1 TIBLicensingService.AddLicense Method

Adds an InterBase software activation certificate.

Pascal

```
procedure AddLicense;
```

C++

```
__fastcall AddLicense();
```

Description

Call AddLicense along to add an InterBase software activation certificate. The Key (see page 3977) and ID (see page 3977) properties must be supplied.

Note: You must install InterBase 6 to use this feature.

27.1.10.2.2 TIBLicensingService.RemoveLicense Method

Removes an InterBase software activation certificate.

Pascal

```
procedure RemoveLicense;
```

C++

```
__fastcall RemoveLicense();
```

Description

Call RemoveLicense to remove an InterBase software activation certificate.

Note: You must install InterBase 6 to use this feature.

27.1.10.2.3 TIBLicensingService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBLicensingService.

27.1.10.3 TIBLicensingService Properties

The properties of the TIBLicensingService class are listed here.

Published Properties

	Name	Description
	Action (see page 3976)	Indictes the licensing action.
	ID (see page 3977)	Sets or returns the license identification.
	Key (see page 3977)	Sets or returns the license key.

27.1.10.3.1 TIBLicensingService.Action Property

Indictes the licensing action.

Pascal

```
property Action: TLicensingAction;
```

C++

```
__property TLicensingAction Action;
```

Description

Use Action to indicate what action the licensing service should take. This causes the service to call the AddLicense (see page 3975) or RemoveLicense (see page 3976) method, depending on whether the software activation certificate is added or removed.

Note: You must install InterBase 6 to use this feature.

27.1.10.3.2 TIBLicensingService.ID Property

Sets or returns the license identification.

Pascal

```
property ID: String;
```

C++

```
__property UnicodeString ID;
```

Description

Use ID to set or return the license identification.

Note: You must install InterBase 6 to use this feature.

27.1.10.3.3 TIBLicensingService.Key Property

Sets or returns the license key.

Pascal

```
property Key: String;
```

C++

```
__property UnicodeString Key;
```

Description

Use Key to set or return the license key.

Note: You must install InterBase 6 to use this feature.

27.1.11 TIBLogService Class

TIBLogService returns the contents of the interbase.log file from a server.

Class Hierarchy

Pascal

```
TIBLogService = class(TIBControlAndQueryService);
```

C++

```
class TIBLogService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBLogService object to return the contents of the interbase.log file from a server.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

27.1.11.1 TIBLogService Members

The following tables list the members exposed by TIBLogService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3979)	This is SetServiceStartOptions, a member of class TIBLogService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3959)	Creates an instance of a TIBControlAndQueryService (see page 3957).
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.11.2 TIBLogService Methods

The methods of the TIBLogService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 3979)	This is SetServiceStartOptions, a member of class TIBLogService.

27.1.11.2.1 TIBLogService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBLogService.

27.1.12 TIBRestoreService Class

TIBRestoreService allows you to restore your database.

Class Hierarchy

Pascal

```
TIBRestoreService = class(TIBBackupRestoreService);
```

C++

```
class TIBRestoreService : public TIBBackupRestoreService;
```

File

IBServices

Description

Use a TIBRestoreService object to restore your database.

Note: You must install InterBase 6 to use this feature.

See Also

Getting Started with InterBase Express

27.1.12.1 TIBRestoreService Members

The following tables list the members exposed by TIBRestoreService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3982)	This is SetServiceStartOptions, a member of class TIBRestoreService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3981)	Creates an instance of TIBRestoreService (see page 3979)
V	Destroy (see page 3981)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BackupFile (see page 3982)	Sets or returns the backup file name.

	BufferSize (see page 3961)	Sets or returns the buffer size.
	DatabaseName (see page 3982)	Sets or returns the database name.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Options (see page 3983)	Sets the options for the database restore.
	PageBuffers (see page 3983)	Sets or returns page buffer size.
	PageSize (see page 3983)	Sets or returns the page size.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.
	Verbose (see page 3948)	Sets or returns the backup or restore in verbose mode.

27.1.12.2 TIBRestoreService.Create Constructor

Creates an instance of TIBRestoreService (see page 3979)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBRestoreService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBRestoreService (see page 3979).

Note: You must install InterBase 6 to use this feature.

27.1.12.3 TIBRestoreService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBRestoreService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

27.1.12.4 TIBRestoreService Methods

The methods of the TIBRestoreService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 3982)	This is SetServiceStartOptions, a member of class TIBRestoreService.

27.1.12.4.1 TIBRestoreService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBRestoreService.

27.1.12.5 TIBRestoreService Properties

The properties of the TIBRestoreService class are listed here.

Published Properties

	Name	Description
	BackupFile (see page 3982)	Sets or returns the backup file name.
	DatabaseName (see page 3982)	Sets or returns the database name.
	Options (see page 3983)	Sets the options for the database restore.
	PageBuffers (see page 3983)	Sets or returns page buffer size.
	PageSize (see page 3983)	Sets or returns the page size.

27.1.12.5.1 TIBRestoreService.BackupFile Property

Sets or returns the backup file name.

Pascal

```
property BackupFile: TStrings;
```

C++

```
__property TStrings BackupFile;
```

Description

Use BackupFile to set or return the backup file name.

Note: You must install InterBase 6 to use this feature.

27.1.12.5.2 TIBRestoreService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: TStrings;
```

C++

```
__property TStrings DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

Note: You must install InterBase 6 to use this feature.

27.1.12.5.3 TIBRestoreService.Options Property

Sets the options for the database restore.

Pascal

```
property Options: TRestoreOptions;
```

C++

```
__property TRestoreOptions Options;
```

Description

Use Options to select the options for the database backup.

Note: You must install InterBase 6 to use this feature.

27.1.12.5.4 TIBRestoreService.PageBuffers Property

Sets or returns page buffer size.

Pascal

```
property PageBuffers: Integer;
```

C++

```
__property int PageBuffers;
```

Description

Use PageBuffers to set or return the page buffer size in kilobytes.

Note: You must install InterBase 6 to use this feature.

27.1.12.5.5 TIBRestoreService.PageSize Property

Sets or returns the page size.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

Use PageSize to set or return the page size in kilobytes.

Note: You must install InterBase 6 to use this feature.

27.1.13 TIBSecurityService Class

TIBSecurityService enables you to manage user access to the InterBase server.

Class Hierarchy

Pascal

```
TIBSecurityService = class(TIBControlAndQueryService);
```

C++

```
class TIBSecurityService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBSecurityService object to manage user access to the InterBase server.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

27.1.13.1 TIBSecurityService Members

The following tables list the members exposed by TIBSecurityService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3987)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 3988)	This is SetServiceStartOptions, a member of class TIBSecurityService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	AddUser (see page 3986)	Adds a user to the user table.
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3985)	Creates an instance of TIBSecurityService (see page 3983).
	DeleteUser (see page 3986)	Deletes a user from the user table.
V	Destroy (see page 3986)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	DisplayUser (see page 3987)	Fetches user information.
	DisplayUsers (see page 3987)	Fetches information for all users.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.

	ModifyUser (see page 3988)	Modifies user information.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.
R	UserInfo (see page 3991)	Provides information about a user.
R	UserInfoCount (see page 3991)	Returns the number of elements in the TUserInfo (see page 4013) array.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	FirstName (see page 3989)	Sets or returns the user's first name.
	GroupID (see page 3989)	Sets or returns the user's group ID number.
	LastName (see page 3989)	Sets or returns the user's last name.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	MiddleName (see page 3990)	Sets or returns the user's middle name.
	Params (see page 3971)	Sets or returns the database parameters
	Password (see page 3990)	Sets the user's password.
	Protocol (see page 3971)	Sets or returns the network protocol.
	SecurityAction (see page 3990)	Specifies the security action.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	SQlRole (see page 3991)	This is SQlRole, a member of class TIBSecurityService.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.
	UserID (see page 3991)	Sets or returns the user's ID number.
	UserName (see page 3992)	Sets or returns the user's login name.

27.1.13.2 TIBSecurityService.Create Constructor

Creates an instance of TIBSecurityService (see page 3983).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSecurityService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBSecurityService (see page 3983).

Note: You must install InterBase 6 to use this feature.

27.1.13.3 TIBSecurityService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBSecurityService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

27.1.13.4 TIBSecurityService Methods

The methods of the TIBSecurityService class are listed here.

Protected Methods

	Name	Description
	Loaded (see page 3987)	Initializes the component after the form file has been read into memory.
	SetServiceStartOptions (see page 3988)	This is SetServiceStartOptions, a member of class TIBSecurityService.

Public Methods

	Name	Description
	AddUser (see page 3986)	Adds a user to the user table.
	DeleteUser (see page 3986)	Deletes a user from the user table.
	DisplayUser (see page 3987)	Fetches user information.
	DisplayUsers (see page 3987)	Fetches information for all users.
	ModifyUser (see page 3988)	Modifies user information.

27.1.13.4.1 TIBSecurityService.AddUser Method

Adds a user to the user table.

Pascal

```
procedure AddUser;
```

C++

```
__fastcall AddUser();
```

Description

Call AddUser to add a user to the user table.

Note: You must install InterBase 6 to use this feature.

27.1.13.4.2 TIBSecurityService.DeleteUser Method

Deletes a user from the user table.

Pascal

```
procedure DeleteUser;
```

C++

```
__fastcall DeleteUser();
```

Description

Call DeleteUser to delete a user from the user table.

Note: You must install InterBase 6 to use this feature.

27.1.13.4.3 TIBSecurityService.DisplayUser Method

Fetches user information.

Pascal

```
procedure DisplayUser(UserName: string);
```

C++

```
__fastcall DisplayUser(UnicodeString UserName);
```

Description

Call DisplayUser to fetch user information and dump it into the TUserInfo (see page 4013) record, which can then be returned by the UserInfo (see page 3991) property.

Note: You must install InterBase 6 to use this feature.

27.1.13.4.4 TIBSecurityService.DisplayUsers Method

Fetches information for all users.

Pascal

```
procedure DisplayUsers;
```

C++

```
__fastcall DisplayUsers();
```

Description

Call DisplayUsers to fetch all valid user information, which can then be returned by the UserInfo (see page 3991) property.

Note: You must install InterBase 6 to use this feature.

27.1.13.4.5 TIBSecurityService.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

TReader

27.1.13.4.6 TIBSecurityService.ModifyUser Method

Modifies user information.

Pascal

```
procedure ModifyUser;
```

C++

```
__fastcall ModifyUser();
```

Description

Call ModifyUser to modify a user's information.

Note: You must install InterBase 6 to use this feature.

27.1.13.4.7 TIBSecurityService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBSecurityService.

27.1.13.5 TIBSecurityService Properties

The properties of the TIBSecurityService class are listed here.

Public Properties

	Name	Description
R	UserInfo (see page 3991)	Provides information about a user.
R	UserInfoCount (see page 3991)	Returns the number of elements in the TUserInfo (see page 4013) array.

Published Properties

	Name	Description
	FirstName (see page 3989)	Sets or returns the user's first name.
	GroupID (see page 3989)	Sets or returns the user's group ID number.
	LastName (see page 3989)	Sets or returns the user's last name.
	MiddleName (see page 3990)	Sets or returns the user's middle name.
	Password (see page 3990)	Sets the user's password.
	SecurityAction (see page 3990)	Specifies the security action.
	SQlRole (see page 3991)	This is SQlRole, a member of class TIBSecurityService.
	UserID (see page 3991)	Sets or returns the user's ID number.
	UserName (see page 3992)	Sets or returns the user's login name.

27.1.13.5.1 TIBSecurityService.FirstName Property

Sets or returns the user's first name.

Pascal

```
property FirstName: string;
```

C++

```
__property UnicodeString FirstName;
```

Description

Use FirstName to set or return the user's first name.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.2 TIBSecurityService.GroupID Property

Sets or returns the user's group ID number.

Pascal

```
property GroupID: Integer;
```

C++

```
__property int GroupID;
```

Description

Use GroupID to set or return the user's group identification number (GID).

Note: You must install InterBase 6 to use this feature.

27.1.13.5.3 TIBSecurityService.LastName Property

Sets or returns the user's last name.

Pascal

```
property LastName: string;
```

C++

```
__property UnicodeString LastName;
```

Description

Use LastName to set or return the user's last name.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.4 TIBSecurityService.MiddleName Property

Sets or returns the user's middle name.

Pascal

```
property MiddleName: string;
```

C++

```
__property UnicodeString MiddleName;
```

Description

Use MiddleName to set or return user's middle name.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.5 TIBSecurityService.Password Property

Sets the user's password.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

Use Password to indicate the user's password when adding or modifying a user's information.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.6 TIBSecurityService.SecurityAction Property

Specifies the security action.

Pascal

```
property SecurityAction: TSecurityAction;
```

C++

```
__property TSecurityAction SecurityAction;
```

Description

Use SecurityAction to indicate what operation the security server should perform.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.7 TIBSecurityService.SQlRole Property

Pascal

```
property SQlRole: string;
```

C++

```
__property UnicodeString SQlRole;
```

Description

This is SQlRole, a member of class TIBSecurityService.

27.1.13.5.8 TIBSecurityService.UserID Property

Sets or returns the user's ID number.

Pascal

```
property UserID: Integer;
```

C++

```
__property int UserID;
```

Description

Use UserID to set or return the user's identification number (UID).

Note: You must install InterBase 6 to use this feature.

27.1.13.5.9 TIBSecurityService.UserInfo Property

Provides information about a user.

Pascal

```
property UserInfo [Index: Integer]: TUserInfo;
```

C++

```
__property TUserInfo UserInfo[int Index];
```

Description

Use UserInfo to return the user's information as a TUserInfo (see page 4013) record, which contains the user name, groupID, UserID (see page 3991), and the user's first, middle, and last names.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.10 TIBSecurityService.UserInfoCount Property

Returns the number of elements in the TUserInfo (see page 4013) array.

Pascal

```
property UserInfoCount: Integer;
```

C++

```
__property int UserInfoCount;
```

Description

Use UserInfoCount to return the number of elements in the TUserInfo (see page 4013) array.

Note: You must install InterBase 6 to use this feature.

27.1.13.5.11 TIBSecurityService.UserName Property

Sets or returns the user's login name.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

Use UserName to set or return the user's login (user) name.

Note: You must install InterBase 6 to use this feature.

27.1.14 TIBServerProperties Class

TIBServerProperties returns database server information.

Class Hierarchy

Pascal

```
TIBServerProperties = class(TIBCustomService);
```

C++

```
class TIBServerProperties : public TIBCustomService;
```

File

IBServices

Description

TIBServerProperties returns database server information, including configuration parameters, and version and license information.

Note: You must install InterBase 6 to use this feature.

27.1.14.1 TIBServerProperties Members

The following tables list the members exposed by TIBServerProperties.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.

	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.

Protected Properties

	Name	Description
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3993)	Creates an instance of TIBServerProperties (see page 3992)
V	Destroy (see page 3994)	Destroys the instance of TIBServerProperties (see page 3992).
	Detach (see page 3968)	Detaches from the database.
	Fetch (see page 3994)	Fetches information from the server.
	FetchConfigParams (see page 3995)	Returns the database configuration parameters.
	FetchDatabaseInfo (see page 3995)	Returns database information.
	FetchLicenseInfo (see page 3995)	Returns license information.
	FetchLicenseMaskInfo (see page 3995)	Returns license mask information.
	FetchVersionInfo (see page 3996)	Returns the database version information.

Public Properties

	Name	Description
R	ConfigParams (see page 3996)	Returns the server configuration parameters.
R	DatabaseInfo (see page 3997)	Indicates database information.
R	Handle (see page 3970)	Returns the database handle.
R	LicenseInfo (see page 3997)	Indicates license information.
R	LicenseMaskInfo (see page 3997)	Returns license mask information.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.
R	VersionInfo (see page 3998)	Indicates version information.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Options (see page 3997)	Indicates the server properties.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.14.2 TIBServerProperties.Create Constructor

Creates an instance of TIBServerProperties (see page 3992)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBServerProperties(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBServerProperties (see page 3992).

Note: You must install InterBase 6 to use this feature.

27.1.14.3 TIBServerProperties.Destroy Destructor

Destroys the instance of TIBServerProperties (see page 3992).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBServerProperties();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

27.1.14.4 TIBServerProperties Methods

The methods of the TIBServerProperties class are listed here.

Public Methods

	Name	Description
	Fetch (see page 3994)	Fetches information from the server.
	FetchConfigParams (see page 3995)	Returns the database configuration parameters.
	FetchDatabaseInfo (see page 3995)	Returns database information.
	FetchLicenseInfo (see page 3995)	Returns license information.
	FetchLicenseMaskInfo (see page 3995)	Returns license mask information.
	FetchVersionInfo (see page 3996)	Returns the database version information.

27.1.14.4.1 TIBServerProperties.Fetch Method

Fetches information from the server.

Pascal

```
procedure Fetch;
```

C++

```
__fastcall Fetch();
```

Description

Call Fetch to get information from the server.

Note: You must install InterBase 6 to use this feature.

27.1.14.4.2 TIBServerProperties.FetchConfigParams Method

Returns the database configuration parameters.

Pascal

```
procedure FetchConfigParams;
```

C++

```
__fastcall FetchConfigParams();
```

Description

Call FetchConfigParams to return database configuration parameters.

Note: You must install InterBase 6 to use this feature.

27.1.14.4.3 TIBServerProperties.FetchDatabaseInfo Method

Returns database information.

Pascal

```
procedure FetchDatabaseInfo;
```

C++

```
__fastcall FetchDatabaseInfo();
```

Description

Call FetchDatabaseInfo to return database information.

Note: You must install InterBase 6 to use this feature.

27.1.14.4.4 TIBServerProperties.FetchLicenseInfo Method

Returns license information.

Pascal

```
procedure FetchLicenseInfo;
```

C++

```
__fastcall FetchLicenseInfo();
```

Description

Call FetchLicenseInfo to return database license information.

Note: You must install InterBase 6 to use this feature.

27.1.14.4.5 TIBServerProperties.FetchLicenseMaskInfo Method

Returns license mask information.

Pascal

```
procedure FetchLicenseMaskInfo;
```

C++

```
__fastcall FetchLicenseMaskInfo();
```

Description

Call FetchLicenseMaskInfo to return database license mask information.

Note: You must install InterBase 6 to use this feature.

27.1.14.4.6 TIBServerProperties.FetchVersionInfo Method

Returns the database version information.

Pascal

```
procedure FetchVersionInfo;
```

C++

```
__fastcall FetchVersionInfo();
```

Description

Call FetchVersionInfo to return the database version information.

Note: You must install InterBase 6 to use this feature.

27.1.14.5 TIBServerProperties Properties

The properties of the TIBServerProperties class are listed here.

Public Properties

	Name	Description
	ConfigParams (see page 3996)	Returns the server configuration parameters.
	DatabaseInfo (see page 3997)	Indicates database information.
	LicenseInfo (see page 3997)	Indicates license information.
	LicenseMaskInfo (see page 3997)	Returns license mask information.
	VersionInfo (see page 3998)	Indicates version information.

Published Properties

	Name	Description
	Options (see page 3997)	Indicates the server properties.

27.1.14.5.1 TIBServerProperties.ConfigParams Property

Returns the server configuration parameters.

Pascal

```
property ConfigParams: TConfigParams;
```

C++

```
__property TConfigParams ConfigParams;
```

Description

Use the ConfigParams property to return the server configuration parameters as a TConfigParams (see page 3941) record, which includes the configuration file data, base location, lock file location, message file location, and the security database location.

Note: You must install InterBase 6 to use this feature.

27.1.14.5.2 TIBServerProperties.DatabaseInfo Property

Indicates database information.

Pascal

```
property DatabaseInfo: TDatabaseInfo;
```

C++

```
__property TDatabaseInfo DatabaseInfo;
```

Description

Use the DatabaseInfo property to obtain database information, which includes the database name, number of attachments, and number of databases.

Note: You must install InterBase 6 to use this feature.

27.1.14.5.3 TIBServerProperties.LicenseInfo Property

Indicates license information.

Pascal

```
property LicenseInfo: TLicenseInfo;
```

C++

```
__property TLicenseInfo LicenseInfo;
```

Description

Use the LicenseInfo property to return licensing information as a TLicenseInfo (see page 4006) record, which includes the key, ID, and number of licensed users.

Note: You must install InterBase 6 to use this feature.

27.1.14.5.4 TIBServerProperties.LicenseMaskInfo Property

Returns license mask information.

Pascal

```
property LicenseMaskInfo: TLicenseMaskInfo;
```

C++

```
__property TLicenseMaskInfo LicenseMaskInfo;
```

Description

Use the LicenseMaskInfo property to return licensing information as a TLicenseMaskInfo (see page 4008) record, which includes the license mask and capability mask. A license mask is a bitmask representing the software activation certificate options currently enabled on the server. A capability mask is a bitmask representing the capabilities currently enabled on the server.

Note: You must install InterBase 6 to use this feature.

27.1.14.5.5 TIBServerProperties.Options Property

Indicates the server properties.

Pascal

```
property Options: TPropertyOptions;
```

C++

```
__property TPropertyOptions Options;
```

Description

Use the Options property to set and return server properties.

Note: You must install InterBase 6 to use this feature.

27.1.14.5.6 TIBServerProperties.VersionInfo Property

Indicates version information.

Pascal

```
property VersionInfo: TVersionInfo;
```

C++

```
__property TVersionInfo VersionInfo;
```

Description

Use the VersionInfo property to obtain the server configuration parameters as a TVersionInfo (see page 4015) type, which includes the service version, and server version and implementation.

Note: You must install InterBase 6 to use this feature.

27.1.15 TIBStatisticalService Class

TIBStatisticalService allows you to view database statistics.

Class Hierarchy

Pascal

```
TIBStatisticalService = class(TIBControlAndQueryService);
```

C++

```
class TIBStatisticalService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBStatisticalService object to view database statistics.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

27.1.15.1 TIBStatisticalService Members

The following tables list the members exposed by TIBStatisticalService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.
V	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
V	SetServiceStartOptions (see page 4000)	This is SetServiceStartOptions, a member of class TIBStatisticalService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
R	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
V	Create (see page 3959)	Creates an instance of a TIBControlAndQueryService (see page 3957).
V	Create (see page 3963)	Creates an instance of TIBControlService (see page 3961)
V	Create (see page 3966)	Creates an instance of TIBCustomService (see page 3965)
V	Destroy (see page 3967)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
V	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
R	Eof (see page 3961)	Indicates that the end of file has been reached.
R	Handle (see page 3970)	Returns the database handle.
R	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	DatabaseName (see page 4000)	Sets or returns the database name.

	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Options (see page 4001)	Indicates the desired statistical information.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.15.2 TIBStatisticalService Methods

The methods of the TIBStatisticalService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 4000)	This is SetServiceStartOptions, a member of class TIBStatisticalService.

27.1.15.2.1 TIBStatisticalService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBStatisticalService.

27.1.15.3 TIBStatisticalService Properties

The properties of the TIBStatisticalService class are listed here.

Published Properties

	Name	Description
	DatabaseName (see page 4000)	Sets or returns the database name.
	Options (see page 4001)	Indicates the desired statistical information.

27.1.15.3.1 TIBStatisticalService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the database name.

Note: You must install InterBase 6 to use this feature.

27.1.15.3.2 TIBStatisticalService.Options Property

Indicates the desired statistical information.

Pascal

```
property Options: TStatOptions;
```

C++

```
__property TStatOptions Options;
```

Description

Use the Options property to request database statistics. These options are incremental; that is, including DbLog also returns HeaderPages statistics, including IndexPages also returns DbLog and HeaderPages statistics, and so forth.

Note: You must install InterBase 6 to use this feature.

27.1.16 TIBValidationService Class

TIBValidationService enables you to validate your database and reconcile your database transactions.

Class Hierarchy

Pascal

```
TIBValidationService = class(TIBControlAndQueryService);
```

C++

```
class TIBValidationService : public TIBControlAndQueryService;
```

File

IBServices

Description

Use a TIBValidationService object to validate your database and reconcile your database transactions.

Note: You must install InterBase 6 to use this feature.

Getting Started with InterBase Express

27.1.16.1 TIBValidationService Members

The following tables list the members exposed by TIBValidationService.

Protected Methods

	Name	Description
	CheckActive (see page 3968)	This is CheckActive, a member of class TIBCustomService.
	CheckInactive (see page 3968)	This is CheckInactive, a member of class TIBCustomService.
	InternalServiceQuery (see page 3968)	This is InternalServiceQuery, a member of class TIBCustomService.
	InternalServiceStart (see page 3963)	This is InternalServiceStart, a member of class TIBControlService.

	Loaded (see page 3968)	Initializes the component after the form file has been read into memory.
	Login (see page 3969)	This is Login, a member of class TIBCustomService.
	ServiceStartAddParam (see page 3964)	This is the overview for the ServiceStartAddParam method overload.
	SetServiceStartOptions (see page 4004)	This is SetServiceStartOptions, a member of class TIBValidationService.

Protected Properties

	Name	Description
	Action (see page 3960)	This is Action, a member of class TIBControlAndQueryService.
	BufferSize (see page 3970)	This is BufferSize, a member of class TIBCustomService.
	OutputBuffer (see page 3971)	This is OutputBuffer, a member of class TIBCustomService.
	OutputBufferOption (see page 3971)	This is OutputBufferOption, a member of class TIBCustomService.
	ServiceQueryParams (see page 3972)	This is ServiceQueryParams, a member of class TIBCustomService.
	ServiceStartParams (see page 3965)	This is ServiceStartParams, a member of class TIBControlService.

Public Methods

	Name	Description
	Attach (see page 3967)	Attaches to the database.
	Create (see page 4003)	Creates an instance of TIBValidationService (see page 4001)
	Destroy (see page 4003)	Destroys the service.
	Detach (see page 3968)	Detaches from the database.
	FetchLimboTransactionInfo (see page 4003)	Gets limbo transaction information.
	FixLimboTransactionErrors (see page 4004)	Fixes limbo transaction errors.
	GetNextChunk (see page 3959)	Gets the next chunk of data.
	GetNextLine (see page 3960)	Starts the service.
	ServiceStart (see page 3963)	Starts the service.

Public Properties

	Name	Description
	Eof (see page 3961)	Indicates that the end of file has been reached.
	Handle (see page 3970)	Returns the database handle.
	IsServiceRunning (see page 3965)	Indicates whether the service is running.
	LimboTransactionInfo (see page 4005)	Returns the limbo transaction information.
	LimboTransactionInfoCount (see page 4005)	Returns the number of elements in the TLimboTransactionInfo (see page 4010) array.
	ServiceParamBySPB (see page 3972)	Returns and sets SPB parameters.

Published Events

	Name	Description
	OnAttach (see page 3973)	Occurs when the database is attached.
	OnLogin (see page 3973)	Occurs during database login.

Published Properties

	Name	Description
	Active (see page 3970)	Sets the active state of the service.
	BufferSize (see page 3961)	Sets or returns the buffer size.
	DatabaseName (see page 4005)	Sets or returns the database name.
	GlobalAction (see page 4005)	Indicates the global transaction action.
	LoginPrompt (see page 3971)	Turns on and off login prompt display.
	Options (see page 4006)	Indicates the options for the database restore.
	Params (see page 3971)	Sets or returns the database parameters
	Protocol (see page 3971)	Sets or returns the network protocol.
	ServerName (see page 3972)	Sets the name of the server on which the services are to be run.
	TraceFlags (see page 3972)	This is TraceFlags, a member of class TIBCustomService.

27.1.16.2 TIBValidationService.Create Constructor

Creates an instance of TIBValidationService (see page 4001)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBValidationService(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBValidationService (see page 4001).

Note: You must install InterBase 6 to use this feature.

27.1.16.3 TIBValidationService.Destroy Destructor

Destroys the service.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBValidationService();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Note: You must install InterBase 6 to use this feature.

27.1.16.4 TIBValidationService Methods

The methods of the TIBValidationService class are listed here.

Protected Methods

	Name	Description
	SetServiceStartOptions (see page 4004)	This is SetServiceStartOptions, a member of class TIBValidationService.

Public Methods

	Name	Description
	FetchLimboTransactionInfo (see page 4003)	Gets limbo transaction information.
	FixLimboTransactionErrors (see page 4004)	Fixes limbo transaction errors.

27.1.16.4.1 TIBValidationService.FetchLimboTransactionInfo Method

Gets limbo transaction information.

Pascal

```
procedure FetchLimboTransactionInfo;
```

C++

```
__fastcall FetchLimboTransactionInfo();
```

Description

Call FetchLimboTransactionInfo to get limbo transaction information from the LimboTransactionInfo (see page 4005) property.

Note: You must install InterBase 6 to use this feature.

27.1.16.4.2 TIBValidationService.FixLimboTransactionErrors Method

Fixes limbo transaction errors.

Pascal

```
procedure FixLimboTransactionErrors;
```

C++

```
__fastcall FixLimboTransactionErrors();
```

Description

Call FixLimboTransactionErrors to repair limbo transaction errors.

Note: You must install InterBase 6 to use this feature.

27.1.16.4.3 TIBValidationService.SetServiceStartOptions Method

Pascal

```
procedure SetServiceStartOptions; override;
```

C++

```
virtual __fastcall SetServiceStartOptions();
```

Description

This is SetServiceStartOptions, a member of class TIBValidationService.

27.1.16.5 TIBValidationService Properties

The properties of the TIBValidationService class are listed here.

Public Properties

	Name	Description
	LimboTransactionInfo (see page 4005)	Returns the limbo transaction information.
	LimboTransactionInfoCount (see page 4005)	Returns the number of elements in the TLimboTransactionInfo (see page 4010) array.

Published Properties

	Name	Description
	DatabaseName (see page 4005)	Sets or returns the database name.
	GlobalAction (see page 4005)	Indicates the global transaction action.
	Options (see page 4006)	Indicates the options for the database restore.

27.1.16.5.1 TIBValidationService.DatabaseName Property

Sets or returns the database name.

Pascal

```
property DatabaseName: string;
```

C++

```
__property UnicodeString DatabaseName;
```

Description

Use DatabaseName to set or return the name of the database to be repaired.

Note: You must install InterBase 6 to use this feature.

27.1.16.5.2 TIBValidationService.GlobalAction Property

Indicates the global transaction action.

Pascal

```
property GlobalAction: TTransactionGlobalAction;
```

C++

```
__property TTransactionGlobalAction GlobalAction;
```

Description

Use GlobalAction to set or return the global transaction action. This value indicates what action to take with the transactions that follow.

Note: You must install InterBase 6 to use this feature.

27.1.16.5.3 TIBValidationService.LimboTransactionInfo Property

Returns the limbo transaction information.

Pascal

```
property LimboTransactionInfo [Index: integer]: TLimboTransactionInfo;
```

C++

```
__property TLimboTransactionInfo LimboTransactionInfo[int Index];
```

Description

Use LimboTransactionInfo to return the limbo transaction information.

Note: You must install InterBase 6 to use this feature.

27.1.16.5.4 TIBValidationService.LimboTransactionInfoCount Property

Returns the number of elements in the TLimboTransactionInfo (see page 4010) array.

Pascal

```
property LimboTransactionInfoCount: Integer;
```

C++

```
__property int LimboTransactionInfoCount;
```

Description

Use LimboTransactionInfoCount to set or return the number of elements in the TLimboTransactionInfo (see page 4010) array.

Note: You must install InterBase 6 to use this feature.

27.1.16.5.5 TIBValidationService.Options Property

Indicates the options for the database restore.

Pascal

```
property Options: TValidateOptions;
```

C++

```
__property TValidateOptions Options;
```

Description

Use Options to select the options for the database restore.

Note: You must install InterBase 6 to use this feature.

27.1.17 TLicenseInfo Class

TLicenseInfo stores information about licensed users.

Class Hierarchy

Pascal

```
TLicenseInfo = class;
```

C++

```
class TLicenseInfo;
```

File

IBServices

Description

Key (see page 4008) lists the license key for each licensed user.

Id (see page 4008) lists the user Id (see page 4008) for each licensed user.

Desc (see page 4007) lists the description of each licensed user.

LicensedUsers (see page 4008) indicates the number of users (the number of entries in the lists).

27.1.17.1 TLicenseInfo Members

The following tables list the members exposed by TLicenseInfo.

Public Fields

	Name	Description
	Desc (see page 4007)	This is Desc, a member of class TLicenseInfo.
	Id (see page 4008)	This is Id, a member of class TLicenseInfo.
	Key (see page 4008)	This is Key, a member of class TLicenseInfo.
	LicensedUsers (see page 4008)	This is LicensedUsers, a member of class TLicenseInfo.

Public Methods

	Name	Description
	Create (see page 4007)	This is Create, a member of class TLicenseInfo.
	Destroy (see page 4007)	This is Destroy, a member of class TLicenseInfo.

27.1.17.2 TLicenseInfo.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TLicenseInfo();
```

Description

This is Create, a member of class TLicenseInfo.

27.1.17.3 TLicenseInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLicenseInfo();
```

Description

This is Destroy, a member of class TLicenseInfo.

27.1.17.4 TLicenseInfo Fields

The fields of the TLicenseInfo class are listed here.

Public Fields

	Name	Description
	Desc (see page 4007)	This is Desc, a member of class TLicenseInfo.
	Id (see page 4008)	This is Id, a member of class TLicenseInfo.
	Key (see page 4008)	This is Key, a member of class TLicenseInfo.
	LicensedUsers (see page 4008)	This is LicensedUsers, a member of class TLicenseInfo.

27.1.17.4.1 TLicenseInfo.Desc Field

Pascal

```
Desc: array of string;
```

C++

```
array of string Desc;
```

Description

This is Desc, a member of class TLicenseInfo.

27.1.17.4.2 TLicenseInfo.Id Field

Pascal

```
Id: array of string;
```

C++

```
array of string Id;
```

Description

This is Id, a member of class TLicenseInfo.

27.1.17.4.3 TLicenseInfo.Key Field

Pascal

```
Key: array of string;
```

C++

```
array of string Key;
```

Description

This is Key, a member of class TLicenseInfo.

27.1.17.4.4 TLicenseInfo.LicensedUsers Field

Pascal

```
LicensedUsers: Integer;
```

C++

```
int LicensedUsers;
```

Description

This is LicensedUsers, a member of class TLicenseInfo.

27.1.18 TLicenseMaskInfo Class

TLicenseMaskInfo indicates the software activation certificate options enabled on the server.

Class Hierarchy

IBServices.TLicenseMaskInfo

Pascal

```
TLicenseMaskInfo = class;
```

C++

```
class TLicenseMaskInfo;
```

File

IBServices

Description

LicenseMask (see page 4009) is a bitmask representing the software activation certificate options currently enabled on the server.

CapabilityMask (see page 4009) is a bitmask representing the capabilities currently enabled on the server.

27.1.18.1 TLicenseMaskInfo Members

The following tables list the members exposed by TLicenseMaskInfo.

Public Fields

	Name	Description
	CapabilityMask (see page 4009)	This is CapabilityMask, a member of class TLicenseMaskInfo.
	LicenseMask (see page 4009)	This is LicenseMask, a member of class TLicenseMaskInfo.

27.1.18.2 TLicenseMaskInfo Fields

The fields of the TLicenseMaskInfo class are listed here.

Public Fields

	Name	Description
	CapabilityMask (see page 4009)	This is CapabilityMask, a member of class TLicenseMaskInfo.
	LicenseMask (see page 4009)	This is LicenseMask, a member of class TLicenseMaskInfo.

27.1.18.2.1 TLicenseMaskInfo.CapabilityMask Field

Pascal

```
CapabilityMask: Integer;
```

C++

```
int CapabilityMask;
```

Description

This is CapabilityMask, a member of class TLicenseMaskInfo.

27.1.18.2.2 TLicenseMaskInfo.LicenseMask Field

Pascal

```
LicenseMask: Integer;
```

C++

```
int LicenseMask;
```

Description

This is LicenseMask, a member of class TLicenseMaskInfo.

27.1.19 TLimboTransactionInfo Class

TLimboTransactionInfo stores information about a limbo transaction.

Class Hierarchy

Pascal

```
TLimboTransactionInfo = class;
```

C++

```
class TLimboTransactionInfo;
```

File

IBServices

Description

TLimboTransactionInfo describes limbo transaction. Limbo transactions are usually caused by the failure of a two-phased commit. They can also exist due to system failure or when a single-database transaction is prepared..

MultiDatabase (see page 4012) indicates whether the limbo transaction involves multiple databases.

Transaction ID (see page 4012) is the identifier for the limbo transaction.

Host site is the host name for the server where the transaction was started.

RemoteSite (see page 4012) is the host name for a remote server involved in the transaction.

RemoteDatabasePath (see page 4012) is the path to the remote server.

State (see page 4012) is the current state of the limbo transaction.

Advise (see page 4011) is the suggested action for ending the transaction.

Action (see page 4011) is the action to take for ending the transaction.

27.1.19.1 TLimboTransactionInfo Members

The following tables list the members exposed by TLimboTransactionInfo.

Public Fields

	Name	Description
	Action (see page 4011)	This is Action, a member of class TLimboTransactionInfo.
	Advise (see page 4011)	This is Advise, a member of class TLimboTransactionInfo.
	HostSite (see page 4011)	This is HostSite, a member of class TLimboTransactionInfo.
	ID (see page 4012)	This is ID, a member of class TLimboTransactionInfo.
	MultiDatabase (see page 4012)	This is MultiDatabase, a member of class TLimboTransactionInfo.
	RemoteDatabasePath (see page 4012)	This is RemoteDatabasePath, a member of class TLimboTransactionInfo.
	RemoteSite (see page 4012)	This is RemoteSite, a member of class TLimboTransactionInfo.
	State (see page 4012)	This is State, a member of class TLimboTransactionInfo.

27.1.19.2 TLimboTransactionInfo Fields

The fields of the TLimboTransactionInfo class are listed here.

Public Fields

	Name	Description
	Action (see page 4011)	This is Action, a member of class TLimboTransactionInfo.
	Advise (see page 4011)	This is Advise, a member of class TLimboTransactionInfo.
	HostSite (see page 4011)	This is HostSite, a member of class TLimboTransactionInfo.
	ID (see page 4012)	This is ID, a member of class TLimboTransactionInfo.
	MultiDatabase (see page 4012)	This is MultiDatabase, a member of class TLimboTransactionInfo.
	RemoteDatabasePath (see page 4012)	This is RemoteDatabasePath, a member of class TLimboTransactionInfo.
	RemoteSite (see page 4012)	This is RemoteSite, a member of class TLimboTransactionInfo.
	State (see page 4012)	This is State, a member of class TLimboTransactionInfo.

27.1.19.2.1 TLimboTransactionInfo.Action Field

Pascal

```
Action: TTransactionAction;
```

C++

```
TTransactionAction Action;
```

Description

This is Action, a member of class TLimboTransactionInfo.

27.1.19.2.2 TLimboTransactionInfo.Advise Field

Pascal

```
Advise: TTransactionAdvise;
```

C++

```
TTransactionAdvise Advise;
```

Description

This is Advise, a member of class TLimboTransactionInfo.

27.1.19.2.3 TLimboTransactionInfo.HostSite Field

Pascal

```
HostSite: String;
```

C++

```
UnicodeString HostSite;
```

Description

This is HostSite, a member of class TLimboTransactionInfo.

27.1.19.2.4 TLimboTransactionInfo.ID Field

Pascal

```
ID: Integer;
```

C++

```
int ID;
```

Description

This is ID, a member of class TLimboTransactionInfo.

27.1.19.2.5 TLimboTransactionInfo.MultiDatabase Field

Pascal

```
MultiDatabase: Boolean;
```

C++

```
Boolean MultiDatabase;
```

Description

This is MultiDatabase, a member of class TLimboTransactionInfo.

27.1.19.2.6 TLimboTransactionInfo.RemoteDatabasePath Field

Pascal

```
RemoteDatabasePath: String;
```

C++

```
UnicodeString RemoteDatabasePath;
```

Description

This is RemoteDatabasePath, a member of class TLimboTransactionInfo.

27.1.19.2.7 TLimboTransactionInfo.RemoteSite Field

Pascal

```
RemoteSite: String;
```

C++

```
UnicodeString RemoteSite;
```

Description

This is RemoteSite, a member of class TLimboTransactionInfo.

27.1.19.2.8 TLimboTransactionInfo.State Field

Pascal

```
State: TTransactionState;
```

C++

```
TTransactionState State;
```

Description

This is State, a member of class TLimboTransactionInfo.

27.1.20 TUserInfo Class

TUserInfo stores information about an InterBase user for the security service.

Class Hierarchy

Pascal

```
TUserInfo = class;
```

C++

```
class TUserInfo;
```

File

IBServices

Description

TUserInfo is the user descriptor that the InterBase security service uses to describe a single user.

UserName (see page 4015) is the user's login name.

FirstName (see page 4014) is the user's first name.

MiddleName (see page 4014) is the user's middle name.

LastName (see page 4014) is the user's Last name.

GroupID (see page 4014) is the user's group ID.

UserID (see page 4015) is the user's individual ID.

27.1.20.1 TUserInfo Members

The following tables list the members exposed by TUserInfo.

Public Fields

	Name	Description
	FirstName (see page 4014)	This is FirstName, a member of class TUserInfo.
	GroupID (see page 4014)	This is GroupID, a member of class TUserInfo.
	LastName (see page 4014)	This is LastName, a member of class TUserInfo.
	MiddleName (see page 4014)	This is MiddleName, a member of class TUserInfo.
	UserID (see page 4015)	This is UserID, a member of class TUserInfo.
	UserName (see page 4015)	This is UserName, a member of class TUserInfo.

27.1.20.2 TUserInfo Fields

The fields of the TUserInfo class are listed here.

Public Fields

	Name	Description
	FirstName (see page 4014)	This is FirstName, a member of class TUserInfo.
	GroupID (see page 4014)	This is GroupID, a member of class TUserInfo.
	LastName (see page 4014)	This is LastName, a member of class TUserInfo.
	MiddleName (see page 4014)	This is MiddleName, a member of class TUserInfo.
	UserID (see page 4015)	This is UserID, a member of class TUserInfo.
	UserName (see page 4015)	This is UserName, a member of class TUserInfo.

27.1.20.2.1 TUserInfo.FirstName Field

Pascal

```
FirstName: string;
```

C++

```
UnicodeString FirstName;
```

Description

This is FirstName, a member of class TUserInfo.

27.1.20.2.2 TUserInfo.GroupID Field

Pascal

```
GroupID: Integer;
```

C++

```
int GroupID;
```

Description

This is GroupID, a member of class TUserInfo.

27.1.20.2.3 TUserInfo.LastName Field

Pascal

```
LastName: string;
```

C++

```
UnicodeString LastName;
```

Description

This is LastName, a member of class TUserInfo.

27.1.20.2.4 TUserInfo.MiddleName Field

Pascal

```
MiddleName: string;
```

C++

```
UnicodeString MiddleName;
```

Description

This is MiddleName, a member of class TUserInfo.

27.1.20.2.5 TUserInfo.UserID Field

Pascal

```
UserID: Integer;
```

C++

```
int UserID;
```

Description

This is UserID, a member of class TUserInfo.

27.1.20.2.6 TUserInfo.UserName Field

Pascal

```
UserName: string;
```

C++

```
UnicodeString UserName;
```

Description

This is UserName, a member of class TUserInfo.

27.1.21 TVersionInfo Class

TVersionInfo represents version information about an InterBase server.

Class Hierarchy

Pascal

```
TVersionInfo = class;
```

C++

```
class TVersionInfo;
```

File

IBServices

Description

TVersionInfo supplies the following version information:

ServerVersion (see page 4016) gives the version of the InterBase server.

ServerImplementation (see page 4016) gives the implementation string.

ServiceVersion (see page 4016) give the version number for the service that fetches the version information.

27.1.21.1 TVersionInfo Members

The following tables list the members exposed by TVersionInfo.

Public Fields

	Name	Description
	ServerImplementation (see page 4016)	This is ServerImplementation, a member of class TVersionInfo.
	ServerVersion (see page 4016)	This is ServerVersion, a member of class TVersionInfo.
	ServiceVersion (see page 4016)	This is ServiceVersion, a member of class TVersionInfo.

27.1.21.2 TVersionInfo Fields

The fields of the TVersionInfo class are listed here.

Public Fields

	Name	Description
	ServerImplementation (see page 4016)	This is ServerImplementation, a member of class TVersionInfo.
	ServerVersion (see page 4016)	This is ServerVersion, a member of class TVersionInfo.
	ServiceVersion (see page 4016)	This is ServiceVersion, a member of class TVersionInfo.

27.1.21.2.1 TVersionInfo.ServerImplementation Field

Pascal

```
ServerImplementation: string;
```

C++

```
UnicodeString ServerImplementation;
```

Description

This is ServerImplementation, a member of class TVersionInfo.

27.1.21.2.2 TVersionInfo.ServerVersion Field

Pascal

```
ServerVersion: String;
```

C++

```
UnicodeString ServerVersion;
```

Description

This is ServerVersion, a member of class TVersionInfo.

27.1.21.2.3 TVersionInfo.ServiceVersion Field

Pascal

```
ServiceVersion: Integer;
```

C++

```
int ServiceVersion;
```

Description

This is ServiceVersion, a member of class TVersionInfo.

27.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBackupOption (see page 4018)	This is record IBServices.TBackupOption.
	TLicensingAction (see page 4019)	TLicensingAction indicates whether to add or remove InterBase software activation certificates.
	TOutputBufferOption (see page 4019)	This is record IBServices.TOutputBufferOption.
	TPropertyOption (see page 4020)	This is record IBServices.TPropertyOption.
	TProtocol (see page 4020)	TProtocol identifies a network protocol.
	TRestoreOption (see page 4021)	This is record IBServices.TRestoreOption.
	TSecurityAction (see page 4021)	TSecurityAction indicates what operation the InterBase security service should perform.
	TSecurityModifyParam (see page 4022)	This is record IBServices.TSecurityModifyParam.
	TShutdownMode (see page 4022)	TShutdownMode indicates what steps to take when shutting down the InterBase database.
	TStatOption (see page 4023)	This is record IBServices.TStatOption.
	TTransactionAction (see page 4023)	TTransactionAction indicates the action a transaction can take when it times out.
	TTransactionAdvise (see page 4024)	This is record IBServices.TTransactionAdvise.
	TTransactionGlobalAction (see page 4024)	TTransactionGlobalAction indicates the action to take on a set of transactions.
	TTransactionState (see page 4025)	This is record IBServices.TTransactionState.
	TValidateOption (see page 4026)	This is record IBServices.TValidateOption.

27.2.1 IBServices.TBackupOption Enumeration

Pascal

```
TBackupOption = (
  IgnoreChecksums,
  IgnoreLimbo,
  MetadataOnly,
  NoGarbageCollection,
  OldMetadataDesc,
  NonTransportable,
  ConvertExtTables
);
```

C++

```
enum TBackupOption {
  IgnoreChecksums,
  IgnoreLimbo,
  MetadataOnly,
  NoGarbageCollection,
  OldMetadataDesc,
  NonTransportable,
  ConvertExtTables
};
```

File

IBServices

Description

This is record IBServices.TBackupOption.

27.2.2 IBServices.TLicensingAction Enumeration

TLicensingAction indicates whether to add or remove InterBase software activation certificates.

Pascal

```
TLicensingAction = (
  LicenseAdd,
  LicenseRemove
);
```

C++

```
enum TLicensingAction {
  LicenseAdd,
  LicenseRemove
};
```

File

IBServices

Description

TLicensingAction values are:

Value Meaning

LicenseAdd Add an InterBase software activation certificate.

LicenseRemove Remove an InterBase software activation certificate.

27.2.3 IBServices.TOutputBufferOption Enumeration

Pascal

```
TOutputBufferOption = (
  ByLine,
  ByChunk
);
```

C++

```
enum TOutputBufferOption {
  ByLine,
  ByChunk
};
```

File

IBServices

Description

This is record IBServices.TOutputBufferOption.

27.2.4 IBServices.TPropertyOption Enumeration

Pascal

```
TPropertyOption = (
  Database,
  License,
  LicenseMask,
  ConfigParameters,
  Version
);
```

C++

```
enum TPropertyOption {
  Database,
  License,
  LicenseMask,
  ConfigParameters,
  Version
};
```

File

IBServices

Description

This is record IBServices.TPropertyOption.

27.2.5 IBServices.TProtocol Enumeration

TProtocol identifies a network protocol.

Pascal

```
TProtocol = (
  TCP,
  SPX,
  NamedPipe,
  Local
);
```

C++

```
enum TProtocol {
  TCP,
  SPX,
  NamedPipe,
  Local
};
```

File

IBServices

Description

TProtocol values are:

Local	
NamedPipe	Named pipe (FIFO)
SPX	IPX/SPX
TCP	Transport control protocol

27.2.6 IBServices.TRestoreOption Enumeration

Pascal

```
TRestoreOption = (
  DeactivateIndexes,
  NoShadow,
  NoValidityCheck,
  OneRelationAtATime,
  Replace,
  CreateNewDB,
  UseAllSpace
);
```

C++

```
enum TRestoreOption {
  DeactivateIndexes,
  NoShadow,
  NoValidityCheck,
  OneRelationAtATime,
  Replace,
  CreateNewDB,
  UseAllSpace
};
```

File

IBServices

Description

This is record IBServices.TRestoreOption.

27.2.7 IBServices.TSecurityAction Enumeration

TSecurityAction indicates what operation the InterBase security service should perform.

Pascal

```
TSecurityAction = (
  ActionAddUser,
  ActionDeleteUser,
  ActionModifyUser,
  ActionDisplayUser
);
```

C++

```
enum TSecurityAction {
  ActionAddUser,
  ActionDeleteUser,
```

```
    ActionModifyUser,
    ActionDisplayUser
  };
```

File

IBServices

Description

TSecurityAction values are:

ActionAddUser	Add the user
ActionDeleteUser	Delete the user
ActionDisplayUser	Display the user's information
ActionModifyUser	Modify the user account

27.2.8 IBServices.TSecurityModifyParam Enumeration

Pascal

```
  TSecurityModifyParam = (
    ModifyFirstName,
    ModifyMiddleName,
    ModifyLastName,
    ModifyUserId,
    ModifyGroupId,
    ModifyPassword
  );
```

C++

```
  enum TSecurityModifyParam {
    ModifyFirstName,
    ModifyMiddleName,
    ModifyLastName,
    ModifyUserId,
    ModifyGroupId,
    ModifyPassword
  };
```

File

IBServices

Description

This is record IBServices.TSecurityModifyParam.

27.2.9 IBServices.TShutdownMode Enumeration

TShutdownMode indicates what steps to take when shutting down the InterBase database.

Pascal

```
  TShutdownMode = (
    Forced,
    DenyTransaction,
```

```
  DenyAttachment
);
```

C++

```
enum TShutdownMode {
  Forced,
  DenyTransaction,
  DenyAttachment
};
```

File

IBServices

Description

TShutdownMode values are:

Forced	Shut down the database after the specified number of seconds. To shut down the database immediately, set the number of seconds to 0.
DenyTransaction	Deny new transactions for the specified number of seconds and then shut down. The shutdown will fail if there are still active transactions to the database.
DenyAttachment	Deny new attachments for the specified number of seconds and then shut down. The shutdown will fail if there are still active attachments to the database.

27.2.10 IBServices.TStatOption Enumeration

Pascal

```
TStatOption = (
  DataPages,
  DbLog,
  HeaderPages,
  IndexPages,
  SystemRelations
);
```

C++

```
enum TStatOption {
  DataPages,
  DbLog,
  HeaderPages,
  IndexPages,
  SystemRelations
};
```

File

IBServices

Description

This is record IBServices.TStatOption.

27.2.11 IBServices.TTransactionAction Enumeration

TTransactionAction indicates the action a transaction can take when it times out.

Pascal

```
TTransactionAction = (
  CommitAction,
  RollbackAction
);
```

C++

```
enum TTransactionAction {
  CommitAction,
  RollbackAction
};
```

File

IBServices

Description

TTransactionAction values are:

Value Meaning

TARollback Roll back the transaction.

TACommit Commit the transaction.

TARollbackRetaining Roll back the transaction, but retain the current transaction context. (Requires InterBase 6.0 or later)

TACommitRetaining Commit the transaction, but retain the current transaction context.

27.2.12 IBServices.TTransactionAdvise Enumeration

Pascal

```
TTransactionAdvise = (
  CommitAdvise,
  RollbackAdvise,
  UnknownAdvise
);
```

C++

```
enum TTransactionAdvise {
  CommitAdvise,
  RollbackAdvise,
  UnknownAdvise
};
```

File

IBServices

Description

This is record IBServices.TTransactionAdvise.

27.2.13 IBServices.TTransactionGlobalAction Enumeration

TTransactionGlobalAction indicates the action to take on a set of transactions.

Pascal

```
TTransactionGlobalAction = (
  CommitGlobal,
  RollbackGlobal,
  RecoverTwoPhaseGlobal,
  NoGlobalAction
);
```

C++

```
enum TTransactionGlobalAction {
  CommitGlobal,
  RollbackGlobal,
  RecoverTwoPhaseGlobal,
  NoGlobalAction
};
```

File

IBServices

Description

TTransactionGlobalAction values are:

Value Meaning

CommitGlobal Commit the transactions.

RollbackGlobal Roll back the transactions.

RecoverTwoPhaseGlobal Perform automated two-phase commit recovery on the transactions.

NoGlobalAction Take no action.

27.2.14 IBServices.TTransactionState Enumeration

Pascal

```
TTransactionState = (
  LimboState,
  CommitState,
  RollbackState,
  UnknownState
);
```

C++

```
enum TTransactionState {
  LimboState,
  CommitState,
  RollbackState,
  UnknownState
};
```

File

IBServices

Description

This is record IBServices.TTransactionState.

27.2.15 IBServices.TValidateOption Enumeration

Pascal

```
TValidateOption = (
  LimboTransactions,
  CheckDB,
  IgnoreChecksum,
  KillShadows,
  MendDB,
  SweepDB,
  ValidateDB,
  ValidateFull
);
```

C++

```
enum TValidateOption {
  LimboTransactions,
  CheckDB,
  IgnoreChecksum,
  KillShadows,
  MendDB,
  SweepDB,
  ValidateDB,
  ValidateFull
};
```

File

IBServices

Description

This is record IBServices.TValidateOption.

27.3 Types

The following table lists types in this documentation.

Types

Name	Description
TBackupOptions (see page 4027)	TBackupOption (see page 4018) and TBackupOptions indicate how TIBBackupService (see page 3948) performs database backup.
TLoginEvent (see page 4028)	This is type IBServices.TLoginEvent.
TPropertyOptions (see page 4028)	TPropertyOption (see page 4020) and TPropertyOptions indicate groups of InterBase server properties.
TRestoreOptions (see page 4029)	TRestoreOption (see page 4021) and TRestoreOptions indicate what operations take place when restoring an InterBase database.
TSecurityModifyParams (see page 4030)	This is type IBServices.TSecurityModifyParams.
TStatOptions (see page 4030)	TStatOption (see page 4023) and TStatOptions indicate the different statistical information available about a database.
TValidateOptions (see page 4031)	TValidateOption (see page 4026) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

27.3.1 IBServices.TBackupOptions Type

TBackupOption (see page 4018) and TBackupOptions indicate how TIBBackupService (see page 3948) performs database backup.

Pascal

```
TBackupOptions = set of TBackupOption;
```

C++

```
TBackupOption TBackupOptions;
```

File

IBServices

Description

TBackupOptions is a set of TBackupOption (see page 4018) values. The following table lists the possible values:

IgnoreChecksums	A checksum is a page-by-page analysis of data to verify its integrity. A bad checksum means that a data page has been randomly overwritten, for example, due to a system crash. Checksum errors indicate data corruption, and InterBase normally prevents you from backing up a database if bad checksums are detected. Examine the data the next time you restore the database. To ignore checksums during backup, set IgnoreChecksums to true.
IgnoreLimbo	Limbo transactions are usually caused by the failure of a two-phased commit. They can also exist due to system failure or when a single-database transaction is prepared. To ignore limbo transactions during backup, set IgnoreLimbo to true. When your application ignores limbo transactions during backup, it ignores all records versions created by any limbo transaction, finds the most recently committed version of a record, and backs up that version.

MetadataOnly	When backing up a database, you can exclude its data, saving only the metadata. You might want to do this to: Retain a record of the metadata before it is modified. Create an empty copy of the database. The copy has the same metadata but can be populated with different data. Set MetaDataOnly to true to save only the metadata.
NoGarbageCollection	Garbage collections marks space used by old versions of data records as free for reuse. Generally, you want to perform garbage collection during backup. To disable garbage collection, set NoGarbageCollection to true.
OldMetadataDesc	Set OldMetadataDesc to true if you want to back up metadata in the old-style format.
NonTransportable	Set to NonTransportable to true if you do not want data to be moved to a machine with a different operating system than the one on which the backup was performed. If NonTransportable is set to false (the default), then data is saved in a generic format, enabling you to restore to any machine that supports InterBase.
ConvertExtTables	Set ConvertExtTables to true if you want to convert external files into internal tables during the backup

27.3.2 IBServices.TLoginEvent Type

Pascal

```
TLoginEvent = procedure (Database: TIBCustomService; LoginParams: TStrings) of object;
```

C++

```
(Database: TIBCustomService; LoginParams: TStrings) ( TLoginEvent)();
```

File

IBServices

Description

This is type IBServices.TLoginEvent.

27.3.3 IBServices.TPropertyOptions Type

TPropertyOption (see page 4020) and TPropertyOptions indicate groups of InterBase server properties.

Pascal

```
TPropertyOptions = set of TPropertyOption;
```

C++

```
TPropertyOption TPropertyOptions;
```

File

IBServices

Description

TPropertyOptions is a set of TPropertyOption (see page 4020) values. Each TPropertyOption (see page 4020) value indicates a type of server property you wish to see. Each type of sever property has a corresponding data structure that holds

the information, as indicated in the following table:

Database	TDatabaseInfo (see page 3944)
License	TLicenseInfo (see page 4006)
ConfigParameters	TConfigParams (see page 3941)
Version	TVersionInfo (see page 4015)

27.3.4 IBServices.TRestoreOptions Type

TRestoreOption (see page 4021) and TRestoreOptions indicate what operations take place when restoring an InterBase database.

Pascal

```
TRestoreOptions = set of TRestoreOption;
```

C++

```
TRestoreOption TRestoreOptions;
```

File

IBServices

Description

TRestoreOptions is a set of TRestoreOption (see page 4021) values. The following table lists the possible values:

DeactivateIndexes	Normally, InterBase rebuilds indexes when it restores a database. If the database contained duplicate entries in a unique index when it was backed up, restoration fails. Duplicate values can be introduced into a database if indexes were temporarily made inactive (for example, to allow insertion of many records or to re-balance an index). To enable restoration to succeed in this case, set DeactivateIndexes to true. This makes indexes inactive and prevents them from rebuilding.
NoShadow	Normally, InterBase rebuilds previously defined database shadows when it restores a database. To make sure the shadows are not built, set the NoShadow option to true.
NoValidityCheck	If you redefine validity constraints in a database where data is already entered, your data might no longer satisfy the validity constraints. You might not discover this until you try to restore the database, at which time an error about invalid data appears. To restore a database that contains invalid data, set NoValidity to true. This deletes validity constraints from the metadata. After the database is restored, change the data to make it valid according to the new integrity constraints. Then add back the constraints that were deleted. **Important:** Always make a copy of metadata before redefining it; for example with the MetadataOnly option of the Options property of TIBBackupService (see page 3948).
OneRelationAtATime	Set OneRelationATime to true to restore the metadata and data for each table together, one table at a time. This option is useful when you are having trouble restoring a backup file; for example, if the data is corrupt or invalid according to integrity constraints.
Replace	Your application cannot overwrite an existing database file unless you set Replace to true. If you attempt to restore to an existing database name and this option is not set, then the restore will not proceed. **Important:** Do not restore an existing database file when clients are operating on it. A safer approach is to rename the existing database file, restore the database, then drop or archive the old database as needed.

CreateNew	To restore a database to a new file, set the Create option to true.
UseAllSpace	When InterBase restores a database, it fills each data page to 80% of capacity by default. To set your application to restore a database with a 100% fill ratio on each data page, set the UseAllSpace option to true.

27.3.5 IBServices.TSecurityModifyParams Type

Pascal

```
TSecurityModifyParams = set of TSecurityModifyParam;
```

C++

```
TSecurityModifyParam TSecurityModifyParams;
```

File

IBServices

Description

This is type IBServices.TSecurityModifyParams.

27.3.6 IBServices.TStatOptions Type

TStatOption (see page 4023) and TStatOptions indicate the different statistical information available about a database.

Pascal

```
TStatOptions = set of TStatOption;
```

C++

```
TStatOption TStatOptions;
```

File

IBServices

Description

TStatOptions is a set of TStatOption (see page 4023) values. The following table lists the possible values:

Value Meaning

DataPages Request statistics for data tables in the database.

DbLog Stop reporting statistics after reporting information on the log pages.

HeaderPages Stop reporting statistics after reporting the information on the header page.

IndexPages Request statistics for the user indexes in the database.

SystemRelations Request statistics for system tables and indexes in addition to user tables and indexes.

27.3.7 IBServices.TValidateOptions Type

TValidateOption (see page 4026) and TValidateOptions indicate what operations the validation service should perform when restoring a database.

Pascal

```
TValidateOptions = set of TValidateOption;
```

C++

```
TValidateOption TValidateOptions;
```

File

IBServices

Description

TValidateOptions is a set of TValidateOption (see page 4026) values. The following table lists the possible values:

LimboTransactions	Return a list of limbo transactions
CheckDB	Validate the database, but don't repair it. Used in conjunction with ValidateDB.
IgnoreChecksum	Ignore all checksum errors
KillShadows	Kill all unavailable shadow files
MendDB	Prepare a corrupt database for backup
SweepDB	Perform a database sweep
ValidateDB	Validate the database structure
ValidateFull	Validate record fragments

27.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DefaultBufferSize (see page 4032)	This is constant IBServices.DefaultBufferSize.
SPBConstantNames (see page 4032)	This is constant IBServices.SPBConstantNames.
SPBConstantValues (see page 4033)	This is constant IBServices.SPBConstantValues.
SPBPrefix (see page 4033)	This is constant IBServices.SPBPrefix.

27.4.1 IBServices.DefaultBufferSize Constant

Pascal

```
DefaultBufferSize = 32000;
```

C++

```
DefaultBufferSize = 32000;
```

File

IBServices

Description

This is constant IBServices.DefaultBufferSize.

27.4.2 IBServices.SPBConstantNames Constant

Pascal

```
SPBConstantNames: array[1..isc_spb_last_spb_constant] of String = ( 'user_name',
'sys_user_name', 'sys_user_name_enc', 'password', 'password_enc', 'command_line', 'db_name',
'verbose', 'options', 'connect_timeout', 'dummy_packet_interval', 'sql_role_name' );
```

C++

```
array[1..isc_spb_last_spb_constant] of String SPBConstantNames = ( 'user_name',
'sys_user_name', 'sys_user_name_enc', 'password', 'password_enc', 'command_line', 'db_name',
'verbose', 'options', 'connect_timeout', 'dummy_packet_interval', 'sql_role_name' );
```

File

IBServices

Description

This is constant IBServices.SPBConstantNames.

27.4.3 IBServices.SPBConstantValues Constant

Pascal

```
SPBConstantValues: array[1..isc_spb_last_spb_constant] of Integer = (
isc_spb_user_name_mapped_to_server, isc_spb_sys_user_name_mapped_to_server,
isc_spb_sys_user_name_enc_mapped_to_server, isc_spb_password_mapped_to_server,
isc_spb_password_enc_mapped_to_server, isc_spb_command_line_mapped_to_server,
isc_spb_dbname_mapped_to_server, isc_spb_verbose_mapped_to_server,
isc_spb_options_mapped_to_server, isc_spb_connect_timeout_mapped_to_server,
isc_spb_dummy_packet_interval_mapped_to_server, isc_spb_sql_role_name_mapped_to_server );
```

C++

```
array[1..isc_spb_last_spb_constant] of Integer SPBConstantValues = (
isc_spb_user_name_mapped_to_server, isc_spb_sys_user_name_mapped_to_server,
isc_spb_sys_user_name_enc_mapped_to_server, isc_spb_password_mapped_to_server,
isc_spb_password_enc_mapped_to_server, isc_spb_command_line_mapped_to_server,
isc_spb_dbname_mapped_to_server, isc_spb_verbose_mapped_to_server,
isc_spb_options_mapped_to_server, isc_spb_connect_timeout_mapped_to_server,
isc_spb_dummy_packet_interval_mapped_to_server, isc_spb_sql_role_name_mapped_to_server );
```

File

IBServices

Description

This is constant IBServices.SPBConstantValues.

27.4.4 IBServices.SPBPrefix Constant

Pascal

```
SPBPrefix = 'isc_spb_';
```

C++

```
SPBPrefix = 'isc_spb_';
```

File

IBServices

Description

This is constant IBServices.SPBPrefix.

28 IBSQL Namespace

This is namespace IBSQL.

Topics

Name	Description
Classes (see page 4036)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4098)	The following table lists structs, records, enums in this documentation.
Types (see page 4100)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBBatch (see page 4036)	TIBBatch is the abstract base class for the TIBBatchInput (see page 4039) and TIBBatchOutput (see page 4040) objects.
	TIBBatchInput (see page 4039)	TIBBatchInput is the abstract class for performing all batch input.
	TIBBatchOutput (see page 4040)	TIBBatchOutput is the abstract class for performing all batch output.
	TIBInputDelimitedFile (see page 4042)	TIBInputDelimitedFile performs batch input of data from delimited files.
	TIBInputRawFile (see page 4047)	TIBInputRawFile inputs data from a raw file.
	TIBOutputDelimitedFile (see page 4049)	TIBOutputDelimitedFile performs batch output of data to delimited files.
	TIBOutputRawFile (see page 4053)	TIBOutputRawFile outputs data to a raw file format.
	TIBSQL (see page 4055)	TIBSQL provides an object for executing an InterBase SQL (see page 4076) statement with minimal overhead.
	TIBXSQLDA (see page 4078)	TIBXSQLDA provides properties and methods for use with the IBSQL component.
	TIBXSQLVAR (see page 4086)	TIBXSQLVAR provides properties and methods for use with the IBSQL component.

Structs, Records, Enums

	Name	Description
	TIBSQLTypes (see page 4098)	TIBSQLTypes indicates the type of an SQL query against an InterBase database.

Types

Name	Description
TIBXSQLVARArray (see page 4100)	This is type IBSQL.TIBXSQLVARArray.

28.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBBatch (see page 4036)	TIBBatch is the abstract base class for the TIBBatchInput (see page 4039) and TIBBatchOutput (see page 4040) objects.
	TIBBatchInput (see page 4039)	TIBBatchInput is the abstract class for performing all batch input.
	TIBBatchOutput (see page 4040)	TIBBatchOutput is the abstract class for performing all batch output.
	TIBInputDelimitedFile (see page 4042)	TIBInputDelimitedFile performs batch input of data from delimited files.
	TIBInputRawFile (see page 4047)	TIBInputRawFile inputs data from a raw file.
	TIBOutputDelimitedFile (see page 4049)	TIBOutputDelimitedFile performs batch output of data to delimited files.
	TIBOutputRawFile (see page 4053)	TIBOutputRawFile outputs data to a raw file format.
	TIBSQL (see page 4055)	TIBSQL provides an object for executing an InterBase SQL (see page 4076) statement with minimal overhead.
	TIBXSQLDA (see page 4078)	TIBXSQLDA provides properties and methods for use with the IBSQL (see page 4035) component.
	TIBXSQLVAR (see page 4086)	TIBXSQLVAR provides properties and methods for use with the IBSQL (see page 4035) component.

28.1.1 TIBBatch Class

TIBBatch is the abstract base class for the TIBBatchInput (see page 4039) and TIBBatchOutput (see page 4040) objects.

Class Hierarchy

Pascal

```
TIBBatch = class(TObject);
```

C++

```
class TIBBatch : public TObject;
```

File

IBSQL

Description

Use a TIBBatch object to provide properties and methods for use with the TIBBatchInput (see page 4039) and TIBBatchOutput (see page 4040) objects, which make it possible to input and output data in virtually any format.

Descendents of this class can specify a file name (for input or output), and a TIBXSQLDA (see page 4078) object representing a record or parameters. The ReadyFile (see page 4038) method is called right before performing the batch input or output.

28.1.1.1 TIBBatch Members

The following tables list the members exposed by TIBBatch.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadyFile (see page 4038)	Prepares the file.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.1.2 TIBBatch Fields

The fields of the TIBBatch class are listed here.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

28.1.1.2.1 TIBBatch.FColumns Field

Pascal

```
FColumns: TIBXSQLDA;
```

C++

```
TIBXSQLDA FColumns;
```

Description

This is FColumns, a member of class TIBBatch.

28.1.1.2.2 TIBBatch.FFilename Field

Pascal

```
FFilename: String;
```

C++

```
UnicodeString FFilename;
```

Description

This is FFilename, a member of class TIBBatch.

28.1.1.2.3 TIBBatch.FParams Field

Pascal

```
FParams: TIBXSQLDA;
```

C++

```
TIBXSQLDA FParams;
```

Description

This is FParams, a member of class TIBBatch.

28.1.1.3 TIBBatch Methods

The methods of the TIBBatch class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 4038)	Prepares the file.

28.1.1.3.1 TIBBatch.ReadyFile Method

Prepares the file.

Pascal

```
procedure ReadyFile; virtual; abstract;
```

C++

```
virtual __fastcall ReadyFile() = 0;
```

Description

Call ReadyFile to prepare the file for input or output.

28.1.1.4 TIBBatch Properties

The properties of the TIBBatch class are listed here.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.1.4.1 TIBBatch.Columns Property

Returns the XSQLDA columns.

Pascal

```
property Columns: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Columns;
```

Description

Use the Columns property to retrieve or set the XSQLDA columns.

28.1.1.4.2 TIBBatch.Filename Property

Sets or displays the name of the external file.

Pascal

```
property Filename: String;
```

C++

```
__property UnicodeString Filename;
```

Description

Use the Filename property to set or display the external file name.

28.1.1.4.3 TIBBatch.Params Property

Returns the XSQLDA parameters.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use the Params property to retrieve or set the XSQLDA parameters.

28.1.2 TIBBatchInput Class

TIBBatchInput is the abstract class for performing all batch input.

Class Hierarchy

Pascal

```
TIBBatchInput = class(TIBBatch);
```

C++

```
class TIBBatchInput : public TIBBatch;
```

File

IBSQL

Description

Use a TIBBatchInput object to provide properties and methods for performing all batch input.

28.1.2.1 TIBBatchInput Members

The following tables list the members exposed by TIBBatchInput.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadParameters (see page 4040)	Reads the XSQLDA input parameters.
	ReadyFile (see page 4038)	Prepares the file.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.2.2 TIBBatchInput Methods

The methods of the TIBBatchInput class are listed here.

Public Methods

	Name	Description
	ReadParameters (see page 4040)	Reads the XSQLDA input parameters.

28.1.2.2.1 TIBBatchInput.ReadParameters Method

Reads the XSQLDA input parameters.

Pascal

```
function ReadParameters: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean ReadParameters() = 0;
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA) from the specified file.

28.1.3 TIBBatchOutput Class

TIBBatchOutput is the abstract class for performing all batch output.

Class Hierarchy

Pascal

```
TIBBatchOutput = class(TIBBatch);
```

C++

```
class TIBBatchOutput : public TIBBatch;
```

File

IBSQL

Description

Use a TIBBatchOutput object to provide properties and methods for performing all batch output.

28.1.3.1 TIBBatchOutput Members

The following tables list the members exposed by TIBBatchOutput.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	ReadyFile (see page 4038)	Prepares the file.
	WriteColumns (see page 4041)	Outputs the data in columns in the XSQLDA to the specified file.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.3.2 TIBBatchOutput Methods

The methods of the TIBBatchOutput class are listed here.

Public Methods

	Name	Description
	WriteColumns (see page 4041)	Outputs the data in columns in the XSQLDA to the specified file.

28.1.3.2.1 TIBBatchOutput.WriteColumns Method

Outputs the data in columns in the XSQLDA to the specified file.

Pascal

```
function WriteColumns: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteColumns() = 0;
```

Description

Call WriteColumns to output data in columns in the extended SQL descriptor area (XSQLDA) to the specified file.

28.1.4 TIBInputDelimitedFile Class

TIBInputDelimitedFile performs batch input of data from delimited files.

Class Hierarchy

Pascal

```
TIBInputDelimitedFile = class(TIBBatchInput);
```

C++

```
class TIBInputDelimitedFile : public TIBBatchInput;
```

File

IBSQL

Description

Use a TIBInputDelimitedFile object to perform batch input of data from delimited files.

28.1.4.1 TIBInputDelimitedFile Members

The following tables list the members exposed by TIBInputDelimitedFile.

Protected Fields

	Name	Description
	FColDelimiter (see page 4043)	This is FColDelimiter, a member of class TIBInputDelimitedFile.
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FEOF (see page 4043)	This is FEOF, a member of class TIBInputDelimitedFile.
	FFile (see page 4044)	This is FFile, a member of class TIBInputDelimitedFile.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FLookAhead (see page 4044)	This is FLookAhead, a member of class TIBInputDelimitedFile.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.
	FReadBlanksAsNull (see page 4044)	This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.
	FRowDelimiter (see page 4044)	This is FRowDelimiter, a member of class TIBInputDelimitedFile.
	FSkipTitles (see page 4045)	This is FSkipTitles, a member of class TIBInputDelimitedFile.

Public Methods

	Name	Description
	Destroy (see page 4043)	Destroys the instance of TIBInputDelimitedFile (see page 4042).
	GetColumn (see page 4045)	Returns the contents of a column.
	ReadParameters (see page 4045)	Reads the input parameters of the XSQLDA.
	ReadyFile (see page 4045)	Prepares the output for the XSQLDA.

Public Properties

	Name	Description
	ColDelimiter (see page 4046)	Sets the column delimiter for the input file.
	Columns (see page 4038)	Returns the XSQLDA columns.

	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.
	ReadBlanksAsNull (see page 4046)	Reads blank spaces in the input file as null characters.
	RowDelimiter (see page 4046)	Sets the row delimiter for the input file.
	SkipTitles (see page 4047)	Skips the first record of a delimited file.

28.1.4.2 TIBInputDelimitedFile.Destroy Destructor

Destroys the instance of TIBInputDelimitedFile (see page 4042).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInputDelimitedFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBInputDelimitedFile (see page 4042) object is not already freed and only then calls Destroy.

28.1.4.3 TIBInputDelimitedFile Fields

The fields of the TIBInputDelimitedFile class are listed here.

Protected Fields

	Name	Description
	FColDelimiter (see page 4043)	This is FColDelimiter, a member of class TIBInputDelimitedFile.
	FEOF (see page 4043)	This is FEOF, a member of class TIBInputDelimitedFile.
	FFile (see page 4044)	This is FFile, a member of class TIBInputDelimitedFile.
	FLookAhead (see page 4044)	This is FLookAhead, a member of class TIBInputDelimitedFile.
	FReadBlanksAsNull (see page 4044)	This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.
	FRowDelimiter (see page 4044)	This is FRowDelimiter, a member of class TIBInputDelimitedFile.
	FSkipTitles (see page 4045)	This is FSkipTitles, a member of class TIBInputDelimitedFile.

28.1.4.3.1 TIBInputDelimitedFile.FColDelimiter Field

Pascal

```
FColDelimiter: string;
```

C++

```
UnicodeString FColDelimiter;
```

Description

This is FColDelimiter, a member of class TIBInputDelimitedFile.

28.1.4.3.2 TIBInputDelimitedFile.FEOF Field

Pascal

```
FEOF: Boolean;
```

C++

```
Boolean FEOF;
```

Description

This is FEOF, a member of class TIBInputDelimitedFile.

28.1.4.3.3 TIBInputDelimitedFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBInputDelimitedFile.

28.1.4.3.4 TIBInputDelimitedFile.FLookAhead Field

Pascal

```
FLookAhead: Char;
```

C++

```
Char FLookAhead;
```

Description

This is FLookAhead, a member of class TIBInputDelimitedFile.

28.1.4.3.5 TIBInputDelimitedFile.FReadBlanksAsNull Field

Pascal

```
FReadBlanksAsNull: Boolean;
```

C++

```
Boolean FReadBlanksAsNull;
```

Description

This is FReadBlanksAsNull, a member of class TIBInputDelimitedFile.

28.1.4.3.6 TIBInputDelimitedFile.FRowDelimiter Field

Pascal

```
FRowDelimiter: string;
```

C++

```
UnicodeString FRowDelimiter;
```

Description

This is FRowDelimiter, a member of class TIBInputDelimitedFile.

28.1.4.3.7 TIBInputDelimitedFile.FSkipTitles Field

Pascal

```
FSkipTitles: Boolean;
```

C++

```
Boolean FSkipTitles;
```

Description

This is FSkipTitles, a member of class TIBInputDelimitedFile.

28.1.4.4 TIBInputDelimitedFile Methods

The methods of the TIBInputDelimitedFile class are listed here.

Public Methods

	Name	Description
	GetColumn (see page 4045)	Returns the contents of a column.
V	ReadParameters (see page 4045)	Reads the input parameters of the XSQLDA.
V	ReadyFile (see page 4045)	Prepares the output for the XSQLDA.

28.1.4.4.1 TIBInputDelimitedFile.GetColumn Method

Returns the contents of a column.

Pascal

```
function GetColumn(var Col: string): Integer;
```

C++

```
__fastcall int GetColumn(UnicodeString Col);
```

Description

Call GetColumn to return the contents of a column in the extended SQL descriptor area (XSQLDA).

28.1.4.4.2 TIBInputDelimitedFile.ReadParameters Method

Reads the input parameters of the XSQLDA.

Pascal

```
function ReadParameters: Boolean; override;
```

C++

```
virtual __fastcall Boolean ReadParameters();
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA).

28.1.4.4.3 TIBInputDelimitedFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call ReadyFile to prepare the output for the extended SQL descriptor area (XSQLDA).

28.1.4.5 TIBInputDelimitedFile Properties

The properties of the TIBInputDelimitedFile class are listed here.

Public Properties

	Name	Description
	ColDelimiter (see page 4046)	Sets the column delimiter for the input file.
	ReadBlanksAsNull (see page 4046)	Reads blank spaces in the input file as null characters.
	RowDelimiter (see page 4046)	Sets the row delimiter for the input file.
	SkipTitles (see page 4047)	Skips the first record of a delimited file.

28.1.4.5.1 TIBInputDelimitedFile.ColDelimiter Property

Sets the column delimiter for the input file.

Pascal

```
property ColDelimiter: string;
```

C++

```
__property UnicodeString ColDelimiter;
```

Description

Use ColDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the input file.

28.1.4.5.2 TIBInputDelimitedFile.ReadBlanksAsNull Property

Reads blank spaces in the input file as null characters.

Pascal

```
property ReadBlanksAsNull: Boolean;
```

C++

```
__property Boolean ReadBlanksAsNull;
```

Description

Set ReadBlanksAsNull to true read blank spaces as null characters in the input file.

28.1.4.5.3 TIBInputDelimitedFile.RowDelimiter Property

Sets the row delimiter for the input file.

Pascal

```
property RowDelimiter: string;
```

C++

```
__property UnicodeString RowDelimiter;
```

Description

Use RowDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the input file.

28.1.4.5.4 TIBInputDelimitedFile.SkipTitles Property

Skips the first record of a delimited file.

Pascal

```
property SkipTitles: Boolean;
```

C++

```
__property Boolean SkipTitles;
```

Description

Set SkipTitles to true to treat the first record of a delimited file as titles and skip it. Field titles are not useful in batch inputs, and this property allows you to skip them.

28.1.5 TIBInputRawFile Class

TIBInputRawFile inputs data from a raw file.

Class Hierarchy

Pascal

```
TIBInputRawFile = class(TIBBatchInput);
```

C++

```
class TIBInputRawFile : public TIBBatchInput;
```

File

IBSQL

Description

Use a TIBInputRawFile object input data from a raw file. A raw file is the equivalent to InterBase external file output. Raw files are not limited to a straight character format.

28.1.5.1 TIBInputRawFile Members

The following tables list the members exposed by TIBInputRawFile.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFile (see page 4048)	This is FFile, a member of class TIBInputRawFile.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.

	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	Destroy (see page 4048)	Destroys the instance of TIBInputRawFile (see page 4047).
	ReadParameters (see page 4049)	Reads the XSQLDA input parameters.
	ReadyFile (see page 4049)	Prepares the output for the XSQLDA.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.5.2 TIBInputRawFile.Destroy Destructor

Destroys the instance of TIBInputRawFile (see page 4047).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBInputRawFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBInputRawFile (see page 4047) object is not already freed and only then calls Destroy.

28.1.5.3 TIBInputRawFile Fields

The fields of the TIBInputRawFile class are listed here.

Protected Fields

	Name	Description
	FFile (see page 4048)	This is FFile, a member of class TIBInputRawFile.

28.1.5.3.1 TIBInputRawFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBInputRawFile.

28.1.5.4 TIBInputRawFile Methods

The methods of the TIBInputRawFile class are listed here.

Public Methods

	Name	Description
	ReadParameters (see page 4049)	Reads the XSQLDA input parameters.
	ReadyFile (see page 4049)	Prepares the output for the XSQLDA.

28.1.5.4.1 TIBInputRawFile.ReadParameters Method

Reads the XSQLDA input parameters.

Pascal

```
function ReadParameters: Boolean; override;
```

C++

```
virtual __fastcall Boolean ReadParameters();
```

Description

Call ReadParameters to read the input parameters of the extended SQL descriptor area (XSQLDA).

28.1.5.4.2 TIBInputRawFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call ReadyFile to prepare the output for the extended SQL descriptor area (XSQLDA).

28.1.6 TIBOutputDelimitedFile Class

TIBOutputDelimitedFile performs batch output of data to delimited files.

Class Hierarchy

Pascal

```
TIBOutputDelimitedFile = class(TIBBatchOutput);
```

C++

```
class TIBOutputDelimitedFile : public TIBBatchOutput;
```

File

IBSQL

Description

Use a TIBOutputDelimitedFile object to perform batch output of data to delimited files.

28.1.6.1 TIBOutputDelimitedFile Members

The following tables list the members exposed by TIBOutputDelimitedFile.

Protected Fields

	Name	Description
	FColDelimiter (see page 4051)	This is FColDelimiter, a member of class TIBOutputDelimitedFile.
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFile (see page 4051)	This is FFile, a member of class TIBOutputDelimitedFile.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FOutputTitles (see page 4051)	This is FOutputTitles, a member of class TIBOutputDelimitedFile.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.
	FRowDelimiter (see page 4051)	This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

Public Methods

	Name	Description
	Destroy (see page 4050)	Destroys the instance of TIBOutputDelimitedFile (see page 4049).
	ReadyFile (see page 4052)	Prepares the output for the XSQLDA.
	WriteColumns (see page 4052)	Outputs the data in columns in the XSQLDA.

Public Properties

	Name	Description
	ColDelimiter (see page 4052)	Sets the column delimiter for the output file.
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	OutputTitles (see page 4053)	Outputs the titles at the top of the file.
	Params (see page 4039)	Returns the XSQLDA parameters.
	RowDelimiter (see page 4053)	Sets the row delimiter for the output file.

28.1.6.2 TIBOutputDelimitedFile.Destroy Destructor

Destroys the instance of TIBOutputDelimitedFile (see page 4049).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBOutputDelimitedFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBOutputDelimitedFile (see page 4049) object is not already freed and only then calls Destroy.

28.1.6.3 TIBOutputDelimitedFile Fields

The fields of the TIBOutputDelimitedFile class are listed here.

Protected Fields

	Name	Description
	FColDelimiter (see page 4051)	This is FColDelimiter, a member of class TIBOutputDelimitedFile.
	FFile (see page 4051)	This is FFile, a member of class TIBOutputDelimitedFile.

	FOutputTitles (see page 4051)	This is FOutputTitles, a member of class TIBOutputDelimitedFile.
	FRowDelimiter (see page 4051)	This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

28.1.6.3.1 TIBOutputDelimitedFile.FColDelimiter Field

Pascal

```
FColDelimiter: string;
```

C++

```
UnicodeString FColDelimiter;
```

Description

This is FColDelimiter, a member of class TIBOutputDelimitedFile.

28.1.6.3.2 TIBOutputDelimitedFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBOutputDelimitedFile.

28.1.6.3.3 TIBOutputDelimitedFile.FOutputTitles Field

Pascal

```
FOutputTitles: Boolean;
```

C++

```
Boolean FOutputTitles;
```

Description

This is FOutputTitles, a member of class TIBOutputDelimitedFile.

28.1.6.3.4 TIBOutputDelimitedFile.FRowDelimiter Field

Pascal

```
FRowDelimiter: string;
```

C++

```
UnicodeString FRowDelimiter;
```

Description

This is FRowDelimiter, a member of class TIBOutputDelimitedFile.

28.1.6.4 TIBOutputDelimitedFile Methods

The methods of the TIBOutputDelimitedFile class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 4052)	Prepares the output for the XSQLDA.
	WriteColumns (see page 4052)	Outputs the data in columns in the XSQLDA.

28.1.6.4.1 TIBOutputDelimitedFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call Ready file to prepare the output for the extended SQL descriptor area (XSQLDA).

28.1.6.4.2 TIBOutputDelimitedFile.WriteColumns Method

Outputs the data in columns in the XSQLDA.

Pascal

```
function WriteColumns: Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteColumns();
```

Description

Set WriteColumns to true to output data in columns in the extended SQL descriptor area (XSQLDA).

28.1.6.5 TIBOutputDelimitedFile Properties

The properties of the TIBOutputDelimitedFile class are listed here.

Public Properties

	Name	Description
	ColDelimiter (see page 4052)	Sets the column delimiter for the output file.
	OutputTitles (see page 4053)	Outputs the titles at the top of the file.
	RowDelimiter (see page 4053)	Sets the row delimiter for the output file.

28.1.6.5.1 TIBOutputDelimitedFile.ColDelimiter Property

Sets the column delimiter for the output file.

Pascal

```
property ColDelimiter: string;
```

C++

```
__property UnicodeString ColDelimiter;
```

Description

Use ColDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the output file.

28.1.6.5.2 TIBOutputDelimitedFile.OutputTitles Property

Outputs the titles at the top of the file.

Pascal

```
property OutputTitles: Boolean;
```

C++

```
__property Boolean OutputTitles;
```

Description

Set OutputTitles to true to output the titles at the top of the file.

28.1.6.5.3 TIBOutputDelimitedFile.RowDelimiter Property

Sets the row delimiter for the output file.

Pascal

```
property RowDelimiter: string;
```

C++

```
__property UnicodeString RowDelimiter;
```

Description

Use RowDelimiter to set the column delimiter (either Tab-Ctrl-F or |~) for the output file.

28.1.7 TIBOutputRawFile Class

TIBOutputRawFile outputs data to a raw file format.

Class Hierarchy

Pascal

```
TIBOutputRawFile = class(TIBBatchOutput);
```

C++

```
class TIBOutputRawFile : public TIBBatchOutput;
```

File

IBSQL

Description

Use a TIBOutputRawFile object to output data from a raw file. A raw file is the equivalent to InterBase external file output. Raw files are not limited to a straight character format.

28.1.7.1 TIBOutputRawFile Members

The following tables list the members exposed by TIBOutputRawFile.

Protected Fields

	Name	Description
	FColumns (see page 4037)	This is FColumns, a member of class TIBBatch.
	FFile (see page 4054)	This is FFile, a member of class TIBOutputRawFile.
	FFilename (see page 4037)	This is FFilename, a member of class TIBBatch.
	FParams (see page 4038)	This is FParams, a member of class TIBBatch.

Public Methods

	Name	Description
	Destroy (see page 4054)	Destroys the instance of TIBOutputRawFile (see page 4053).
	ReadyFile (see page 4055)	Prepares the output for the XSQLDA.
	WriteColumns (see page 4055)	Outputs the data in columns in the XSQLDA.

Public Properties

	Name	Description
	Columns (see page 4038)	Returns the XSQLDA columns.
	Filename (see page 4039)	Sets or displays the name of the external file.
	Params (see page 4039)	Returns the XSQLDA parameters.

28.1.7.2 TIBOutputRawFile.Destroy Destructor

Destroys the instance of TIBOutputRawFile (see page 4053).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBOutputRawFile();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TIBOutputRawFile (see page 4053) object is not already freed and only then calls Destroy.

28.1.7.3 TIBOutputRawFile Fields

The fields of the TIBOutputRawFile class are listed here.

Protected Fields

	Name	Description
	FFile (see page 4054)	This is FFile, a member of class TIBOutputRawFile.

28.1.7.3.1 TIBOutputRawFile.FFile Field

Pascal

```
FFile: TFileStream;
```

C++

```
TFileStream FFile;
```

Description

This is FFile, a member of class TIBOutputRawFile.

28.1.7.4 TIBOutputRawFile Methods

The methods of the TIBOutputRawFile class are listed here.

Public Methods

	Name	Description
	ReadyFile (see page 4055)	Prepares the output for the XSQLDA.
	WriteColumns (see page 4055)	Outputs the data in columns in the XSQLDA.

28.1.7.4.1 TIBOutputRawFile.ReadyFile Method

Prepares the output for the XSQLDA.

Pascal

```
procedure ReadyFile; override;
```

C++

```
virtual __fastcall ReadyFile();
```

Description

Call Ready file to prepare the output for the extended SQL descriptor area (XSQLDA).

28.1.7.4.2 TIBOutputRawFile.WriteColumns Method

Outputs the data in columns in the XSQLDA.

Pascal

```
function WriteColumns: Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteColumns();
```

Description

Call WriteColumns to output data in columns in the extended SQL descriptor area (XSQLDA).

28.1.8 TIBSQL Class

TIBSQL provides an object for executing an InterBase SQL (see page 4076) statement with minimal overhead.

Class Hierarchy

Pascal

```
TIBSQL = class(TComponent);
```

C++

```
class TIBSQL : public TComponent;
```

File

IBSQL

Description

Use a TIBSQL object to execute an InterBase SQL (see page 4076) statement with minimal overhead. TIBSQL has no standard interface to data-aware controls and is unidirectional.

Getting Started with InterBase Express

28.1.8.1 TIBSQL Members

The following tables list the members exposed by TIBSQL.

Protected Fields

	Name	Description
	FBase (see page 4059)	This is FBase, a member of class TIBSQL.
	FBOF (see page 4059)	This is FBOF, a member of class TIBSQL.
	FCursor (see page 4059)	This is FCursor, a member of class TIBSQL.
	FEOF (see page 4059)	This is FEOF, a member of class TIBSQL.
	FGenerateParamNames (see page 4060)	This is FGenerateParamNames, a member of class TIBSQL.
	FGoToFirstRecordOnExecute (see page 4060)	This is FGoToFirstRecordOnExecute, a member of class TIBSQL.
	FHandle (see page 4060)	This is FHandle, a member of class TIBSQL.
	FOnSQLChanging (see page 4060)	This is FOnSQLChanging, a member of class TIBSQL.
	FOpen (see page 4061)	This is FOpen, a member of class TIBSQL.
	FParamCheck (see page 4061)	This is FParamCheck, a member of class TIBSQL.
	FPrepared (see page 4061)	This is FPrepared, a member of class TIBSQL.
	FProcessedSQL (see page 4061)	This is FProcessedSQL, a member of class TIBSQL.
	FRecordCount (see page 4061)	This is FRecordCount, a member of class TIBSQL.
	FSQL (see page 4062)	This is FSQL, a member of class TIBSQL.
	FSQLParams (see page 4062)	This is FSQLParams, a member of class TIBSQL.
	FSQLRecord (see page 4062)	This is FSQLRecord, a member of class TIBSQL.
	FSQLType (see page 4062)	This is FSQLType, a member of class TIBSQL.

Protected Methods

	Name	Description
	BeforeTransactionEnd (see page 4064)	This is BeforeTransactionEnd, a member of class TIBSQL.
	DoBeforeDatabaseDisconnect (see page 4066)	This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.
	GetDatabase (see page 4067)	This is GetDatabase, a member of class TIBSQL.
	GetDBHandle (see page 4067)	This is GetDBHandle, a member of class TIBSQL.
	GetEOF (see page 4067)	This is GetEOF, a member of class TIBSQL.
	GetFieldIndex (see page 4067)	This is GetFieldIndex, a member of class TIBSQL.
	GetFields (see page 4067)	This is GetFields, a member of class TIBSQL.
	GetPlan (see page 4068)	This is GetPlan, a member of class TIBSQL.
	GetRecordCount (see page 4068)	This is GetRecordCount, a member of class TIBSQL.
	GetRowsAffected (see page 4068)	This is GetRowsAffected, a member of class TIBSQL.
	GetSQLParams (see page 4068)	This is GetSQLParams, a member of class TIBSQL.

	GetTransaction (see page 4069)	This is GetTransaction, a member of class TIBSQL.
	GetTRHandle (see page 4069)	This is GetTRHandle, a member of class TIBSQL.
	PreprocessSQL (see page 4070)	This is PreprocessSQL, a member of class TIBSQL.
	SetDatabase (see page 4070)	This is SetDatabase, a member of class TIBSQL.
	SetSQL (see page 4070)	This is SetSQL, a member of class TIBSQL.
	SetTransaction (see page 4071)	This is SetTransaction, a member of class TIBSQL.
	SQLChanging (see page 4071)	This is SQLChanging, a member of class TIBSQL.

Public Methods

	Name	Description
	BatchInput (see page 4063)	Executes the parameterized query in SQL (see page 4076) for input in the referenced input object.
	BatchOutput (see page 4064)	Outputs the selected query in SQL (see page 4076) to the referenced OutputObject.
	Call (see page 4064)	Returns an error message based on the error code.
	CheckClosed (see page 4064)	raises an exception if the query is not closed.
	CheckOpen (see page 4065)	raises an exception if the query is not open.
	CheckValidStatement (see page 4065)	raises an exception if the query does not have a valid statement.
	Close (see page 4065)	Closes the query.
V	Create (see page 4058)	Creates an instance of a TIBSQL (see page 4055) component.
	Current (see page 4065)	Returns an extended SQL (see page 4076) descriptor for the current record.
V	Destroy (see page 4058)	Frees all resources associated with this instance.
	ExecQuery (see page 4066)	Executes an SQL (see page 4076) query.
	FieldByName (see page 4066)	Returns the XSQLVAR fields by name.
	FreeHandle (see page 4066)	Frees InterBase resources associated with the query.
	GetUniqueRelationName (see page 4069)	Gets the unique relation name.
	Next (see page 4069)	Returns an extended SQL (see page 4076) descriptor for the next record.
	ParamByName (see page 4069)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 4070)	Prepares a query for execution.

Public Properties

	Name	Description
R	Bof (see page 4072)	Indicates whether or not a query is at the beginning of the dataset.
R	DBHandle (see page 4072)	Specifies the database handle for the query.
R	Eof (see page 4072)	Indicates whether or not a query is at the end of the dataset.
R	FieldIndex (see page 4073)	Returns the index of the named field.
R	Fields (see page 4073)	Returns the XSQLVAR fields.
	GenerateParamNames (see page 4073)	Generates a list of parameter names for the query.
R	Handle (see page 4074)	Specifies the handle for the query.
R	Open (see page 4074)	Determines if the dataset is open.
R	Params (see page 4075)	Returns the XSQLDA parameters.
R	Plan (see page 4075)	Returns the plan for the query.
R	Prepared (see page 4075)	Indicates whether or not the query has been prepared.
R	RecordCount (see page 4075)	Returns the current count of records from the query.
R	RowsAffected (see page 4076)	Returns the number of rows affected.
R	SQLType (see page 4076)	Returns the type of query to be executed.
R	TRHandle (see page 4077)	Specifies the transaction handle for the query.
R	UniqueRelationName (see page 4077)	Indicates the unique relation name.

Published Events

	Name	Description
	OnSQLChanging (see page 4077)	Occurs when the SQL (see page 4076) query is being modified.

Published Properties

	Name	Description
	Database (see page 4072)	Sets or returns the database associated with the query.
	GoToFirstRecordOnExecute (see page 4074)	Goes to the first record in the result set upon opening it.
	ParamCheck (see page 4074)	Specifies whether the parameter list for an SQL (see page 4076) query is regenerated if the SQL (see page 4076) property changes at runtime.
	SQL (see page 4076)	Sets the SQL query to be executed.
	Transaction (see page 4077)	Sets or returns the transaction to be used by the query.

28.1.8.2 TIBSQL.Create Constructor

Creates an instance of a TIBSQL (see page 4055) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBSQL(TComponent * AOwner);
```

Description

Call (see page 4064) Create to create an instance of a TIBSQL (see page 4055) component.

28.1.8.3 TIBSQL.Destroy Destructor

Frees all resources associated with this instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBSQL();
```

Description

Do not call Destroy directly in an application. Usually destruction of objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

28.1.8.4 TIBSQL Fields

The fields of the TIBSQL class are listed here.

Protected Fields

	Name	Description
	FBase (see page 4059)	This is FBase, a member of class TIBSQL.
	FBOF (see page 4059)	This is FBOF, a member of class TIBSQL.
	FCursor (see page 4059)	This is FCursor, a member of class TIBSQL.
	FEOF (see page 4059)	This is FEOF, a member of class TIBSQL.
	FGenerateParamNames (see page 4060)	This is FGenerateParamNames, a member of class TIBSQL.
	FGoToFirstRecordOnExecute (see page 4060)	This is FGoToFirstRecordOnExecute, a member of class TIBSQL.
	FHandle (see page 4060)	This is FHandle, a member of class TIBSQL.
	FOnSQLChanging (see page 4060)	This is FOnSQLChanging, a member of class TIBSQL.

	FOpen (see page 4061)	This is FOpen, a member of class TIBSQL.
	FParamCheck (see page 4061)	This is FParamCheck, a member of class TIBSQL.
	FPrepared (see page 4061)	This is FPrepared, a member of class TIBSQL.
	FProcessedSQL (see page 4061)	This is FProcessedSQL, a member of class TIBSQL.
	FRecordCount (see page 4061)	This is FRecordCount, a member of class TIBSQL.
	FSQL (see page 4062)	This is FSQL, a member of class TIBSQL.
	FSQLParams (see page 4062)	This is FSQLParams, a member of class TIBSQL.
	FSQLRecord (see page 4062)	This is FSQLRecord, a member of class TIBSQL.
	FSQLType (see page 4062)	This is FSQLType, a member of class TIBSQL.

28.1.8.4.1 TIBSQL.FBase Field

Pascal

```
FBase: TIBBase;
```

C++

```
TIBBase FBase;
```

Description

This is FBase, a member of class TIBSQL.

28.1.8.4.2 TIBSQL.FBOF Field

Pascal

```
FBOF: Boolean;
```

C++

```
Boolean FBOF;
```

Description

This is FBOF, a member of class TIBSQL.

28.1.8.4.3 TIBSQL.FCursor Field

Pascal

```
FCursor: String;
```

C++

```
UnicodeString FCursor;
```

Description

This is FCursor, a member of class TIBSQL.

28.1.8.4.4 TIBSQL.FEOF Field

Pascal

```
FEOF: Boolean;
```

C++

```
Boolean FEOF;
```

Description

This is FEOF, a member of class TIBSQL.

28.1.8.4.5 TIBSQL.FGenerateParamNames Field

Pascal

```
FGenerateParamNames: Boolean;
```

C++

```
Boolean FGenerateParamNames;
```

Description

This is FGenerateParamNames, a member of class TIBSQL.

28.1.8.4.6 TIBSQL.FGoToFirstRecordOnExecute Field

Pascal

```
FGoToFirstRecordOnExecute: Boolean;
```

C++

```
Boolean FGoToFirstRecordOnExecute;
```

Description

This is FGoToFirstRecordOnExecute, a member of class TIBSQL.

28.1.8.4.7 TIBSQL.FHandle Field

Pascal

```
FHandle: TISC_STMT_HANDLE;
```

C++

```
TISC_STMT_HANDLE FHandle;
```

Description

This is FHandle, a member of class TIBSQL.

28.1.8.4.8 TIBSQL.FOnSQLChanging Field

Pascal

```
FOnSQLChanging: TNotifyEvent;
```

C++

```
TNotifyEvent FOnSQLChanging;
```

Description

This is FOnSQLChanging, a member of class TIBSQL.

28.1.8.4.9 TIBSQL.FOpen Field

Pascal

```
FOpen: Boolean;
```

C++

```
Boolean FOpen;
```

Description

This is FOpen, a member of class TIBSQL.

28.1.8.4.10 TIBSQL.FParamCheck Field

Pascal

```
FParamCheck: Boolean;
```

C++

```
Boolean FParamCheck;
```

Description

This is FParamCheck, a member of class TIBSQL.

28.1.8.4.11 TIBSQL.FPrepared Field

Pascal

```
FPrepared: Boolean;
```

C++

```
Boolean FPrepared;
```

Description

This is FPrepared, a member of class TIBSQL.

28.1.8.4.12 TIBSQL.FProcessedSQL Field

Pascal

```
FProcessedSQL: TStrings;
```

C++

```
TStrings FProcessedSQL;
```

Description

This is FProcessedSQL, a member of class TIBSQL.

28.1.8.4.13 TIBSQL.FRecordCount Field

Pascal

```
FRecordCount: Integer;
```

C++

```
int FRecordCount;
```

Description

This is FRecordCount, a member of class TIBSQL.

28.1.8.4.14 TIBSQL.FSQL Field

Pascal

```
FSQL: TStrings;
```

C++

```
TStrings FSQL;
```

Description

This is FSQL, a member of class TIBSQL.

28.1.8.4.15 TIBSQL.FSQLParams Field

Pascal

```
FSQLParams: TIBXSQLDA;
```

C++

```
TIBXSQLDA FSQLParams;
```

Description

This is FSQLParams, a member of class TIBSQL.

28.1.8.4.16 TIBSQL.FSQLRecord Field

Pascal

```
FSQLRecord: TIBXSQLDA;
```

C++

```
TIBXSQLDA FSQLRecord;
```

Description

This is FSQLRecord, a member of class TIBSQL.

28.1.8.4.17 TIBSQL.FSQLType Field

Pascal

```
FSQLType: TIBSQLTypes;
```

C++

```
TIBSQLTypes FSQLType;
```

Description

This is FSQLType, a member of class TIBSQL.

28.1.8.5 TIBSQL Methods

The methods of the TIBSQL class are listed here.

Protected Methods

	Name	Description
	BeforeTransactionEnd (see page 4064)	This is BeforeTransactionEnd, a member of class TIBSQL.
	DoBeforeDatabaseDisconnect (see page 4066)	This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.
	GetDatabase (see page 4067)	This is GetDatabase, a member of class TIBSQL.
	GetDBHandle (see page 4067)	This is GetDBHandle, a member of class TIBSQL.
	GetEOF (see page 4067)	This is GetEOF, a member of class TIBSQL.
	GetFieldIndex (see page 4067)	This is GetFieldIndex, a member of class TIBSQL.
	GetFields (see page 4067)	This is GetFields, a member of class TIBSQL.
	GetPlan (see page 4068)	This is GetPlan, a member of class TIBSQL.
	GetRecordCount (see page 4068)	This is GetRecordCount, a member of class TIBSQL.
	GetRowsAffected (see page 4068)	This is GetRowsAffected, a member of class TIBSQL.
	GetSQLParams (see page 4068)	This is GetSQLParams, a member of class TIBSQL.
	GetTransaction (see page 4069)	This is GetTransaction, a member of class TIBSQL.
	GetTRHandle (see page 4069)	This is GetTRHandle, a member of class TIBSQL.
	PreprocessSQL (see page 4070)	This is PreprocessSQL, a member of class TIBSQL.
	SetDatabase (see page 4070)	This is SetDatabase, a member of class TIBSQL.
	SetSQL (see page 4070)	This is SetSQL, a member of class TIBSQL.
	SetTransaction (see page 4071)	This is SetTransaction, a member of class TIBSQL.
	SQLChanging (see page 4071)	This is SQLChanging, a member of class TIBSQL.

Public Methods

	Name	Description
	BatchInput (see page 4063)	Executes the parameterized query in SQL (see page 4076) for input in the referenced input object.
	BatchOutput (see page 4064)	Outputs the selected query in SQL (see page 4076) to the referenced OutputObject.
	Call (see page 4064)	Returns an error message based on the error code.
	CheckClosed (see page 4064)	raises an exception if the query is not closed.
	CheckOpen (see page 4065)	raises an exception if the query is not open.
	CheckValidStatement (see page 4065)	raises an exception if the query does not have a valid statement.
	Close (see page 4065)	Closes the query.
	Current (see page 4065)	Returns an extended SQL (see page 4076) descriptor for the current record.
	ExecQuery (see page 4066)	Executes an SQL (see page 4076) query.
	FieldByName (see page 4066)	Returns the XSQLVAR fields by name.
	FreeHandle (see page 4066)	Frees InterBase resources associated with the query.
	GetUniqueRelationName (see page 4069)	Gets the unique relation name.
	Next (see page 4069)	Returns an extended SQL (see page 4076) descriptor for the next record.
	ParamByName (see page 4069)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 4070)	Prepares a query for execution.

28.1.8.5.1 TIBSQL.BatchInput Method

Executes the parameterized query in SQL (see page 4076) for input in the referenced input object.

Pascal

```
procedure BatchInput(InputObject: TIBBatchInput);
```

C++

```
__fastcall BatchInput(TIBBatchInput InputObject);
```

Description

Call (see page 4064) BatchInput to execute the parameterized query in SQL (see page 4076) for input in the referenced input object.

28.1.8.5.2 TIBSQL.BatchOutput Method

Outputs the selected query in SQL (see page 4076) to the referenced OutputObject.

Pascal

```
procedure BatchOutput(OutputObject: TIBBatchOutput);
```

C++

```
__fastcall BatchOutput(TIBBatchOutput OutputObject);
```

Description

Call (see page 4064) BatchOutput to output the selected query in SQL (see page 4076) to the referenced OutputObject.

28.1.8.5.3 TIBSQL.BeforeTransactionEnd Method

Pascal

```
procedure BeforeTransactionEnd(Sender: TObject);
```

C++

```
__fastcall BeforeTransactionEnd(TObject * Sender);
```

Description

This is BeforeTransactionEnd, a member of class TIBSQL.

28.1.8.5.4 TIBSQL.Call Method

Returns an error message based on the error code.

Pascal

```
function Call(ErrCode: ISC_STATUS; RaiseError: Boolean): ISC_STATUS;
```

C++

```
__fastcall ISC_STATUS Call(ISC_STATUS ErrCode, Boolean RaiseError);
```

Description

Call is an internal method used to make calls to the InterBase API, and gives you the option of raising an exception or returning an error based on the value of RaiseError.

28.1.8.5.5 TIBSQL.CheckClosed Method

raises an exception if the query is not closed.

Pascal

```
procedure CheckClosed;
```

C++

```
__fastcall CheckClosed();
```

Description

Call (see page 4064) CheckClosed to raise an exception if the query is not closed.

28.1.8.5.6 TIBSQL.CheckOpen Method

raises an exception if the query is not open.

Pascal

```
procedure CheckOpen;
```

C++

```
__fastcall CheckOpen();
```

Description

Call (see page 4064) CheckOpen to raise an exception if the query is closed.

28.1.8.5.7 TIBSQL.CheckValidStatement Method

raises an exception if the query does not have a valid statement.

Pascal

```
procedure CheckValidStatement;
```

C++

```
__fastcall CheckValidStatement();
```

Description

Call (see page 4064) CheckValidStatement to raise an exception if the query does not have a valid statement.

28.1.8.5.8 TIBSQL.Close Method

Closes the query.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call (see page 4064) Close to close the query.

28.1.8.5.9 TIBSQL.Current Method

Returns an extended SQL (see page 4076) descriptor for the current record.

Pascal

```
function Current: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Current();
```

Description

Call (see page 4064) Current to get an extended SQL (see page 4076) descriptor for the current record.

28.1.8.5.10 TIBSQL.DoBeforeDatabaseDisconnect Method

Pascal

```
procedure DoBeforeDatabaseDisconnect(Sender: TObject);
```

C++

```
__fastcall DoBeforeDatabaseDisconnect(TObject * Sender);
```

Description

This is DoBeforeDatabaseDisconnect, a member of class TIBSQL.

28.1.8.5.11 TIBSQL.ExecQuery Method

Executes an SQL (see page 4076) query.

Pascal

```
procedure ExecQuery;
```

C++

```
__fastcall ExecQuery();
```

Description

Note: Call (see page 4064) ExecQuery to execute the SQL (see page 4076) query.

28.1.8.5.12 TIBSQL.FieldByName Method

Returns the XSQLVAR fields by name.

Pascal

```
function FieldByName(FieldName: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR FieldByName(UnicodeString FieldName);
```

Description

Use the FieldByName method to return the XSQLVAR fields by name.

28.1.8.5.13 TIBSQL.FreeHandle Method

Frees InterBase resources associated with the query.

Pascal

```
procedure FreeHandle;
```

C++

```
__fastcall FreeHandle();
```

Description

Call (see page 4064) FreeHandle to free the InterBase resources associated with the query.

28.1.8.5.14 TIBSQL.GetDatabase Method

Pascal

```
function GetDatabase: TIBDatabase;
```

C++

```
__fastcall TIBDatabase GetDatabase();
```

Description

This is GetDatabase, a member of class TIBSQL.

28.1.8.5.15 TIBSQL.GetDBHandle Method

Pascal

```
function GetDBHandle: PISC_DB_HANDLE;
```

C++

```
__fastcall PISC_DB_HANDLE GetDBHandle();
```

Description

This is GetDBHandle, a member of class TIBSQL.

28.1.8.5.16 TIBSQL.GetEOF Method

Pascal

```
function GetEOF: Boolean;
```

C++

```
__fastcall Boolean GetEOF();
```

Description

This is GetEOF, a member of class TIBSQL.

28.1.8.5.17 TIBSQL.GetFieldIndex Method

Pascal

```
function GetFieldIndex(FieldName: String): Integer;
```

C++

```
__fastcall int GetFieldIndex(UnicodeString FieldName);
```

Description

This is GetFieldIndex, a member of class TIBSQL.

28.1.8.5.18 TIBSQL.GetFields Method

Pascal

```
function GetFields(const Idx: Integer): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetFields(const int Idx);
```

Description

This is GetFields, a member of class TIBSQL.

28.1.8.5.19 TIBSQL.GetPlan Method

Pascal

```
function GetPlan: String;
```

C++

```
__fastcall UnicodeString GetPlan();
```

Description

This is GetPlan, a member of class TIBSQL.

28.1.8.5.20 TIBSQL.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer;
```

C++

```
__fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TIBSQL.

28.1.8.5.21 TIBSQL.GetRowsAffected Method

Pascal

```
function GetRowsAffected: Integer;
```

C++

```
__fastcall int GetRowsAffected();
```

Description

This is GetRowsAffected, a member of class TIBSQL.

28.1.8.5.22 TIBSQL.GetSQLParams Method

Pascal

```
function GetSQLParams: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA GetSQLParams();
```

Description

This is GetSQLParams, a member of class TIBSQL.

28.1.8.5.23 TIBSQL.GetTransaction Method

Pascal

```
function GetTransaction: TIBTransaction;
```

C++

```
__fastcall TIBTransaction GetTransaction();
```

Description

This is GetTransaction, a member of class TIBSQL.

28.1.8.5.24 TIBSQL.GetTRHandle Method

Pascal

```
function GetTRHandle: PISC_TR_HANDLE;
```

C++

```
__fastcall PISC_TR_HANDLE GetTRHandle();
```

Description

This is GetTRHandle, a member of class TIBSQL.

28.1.8.5.25 TIBSQL.GetUniqueRelationName Method

Gets the unique relation name.

Pascal

```
function GetUniqueRelationName: String;
```

C++

```
__fastcall UnicodeString GetUniqueRelationName();
```

Description

Note: Call (see page 4064) GetUniqueRelationName to get the unique relation name of the query.

28.1.8.5.26 TIBSQL.Next Method

Returns an extended SQL (see page 4076) descriptor for the next record.

Pascal

```
function Next: TIBXSQLDA;
```

C++

```
__fastcall TIBXSQLDA Next();
```

Description

Call (see page 4064) Next to get an extended SQL (see page 4076) descriptor for the next record.

28.1.8.5.27 TIBSQL.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ParamByName(UnicodeString Idx);
```

Description

Call (see page 4064) ParamByName to set or use parameter information for a specific parameter based on its name.

Idx is the name of the parameter for which to retrieve information.

28.1.8.5.28 TIBSQL.Prepare Method

Prepares a query for execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call (see page 4064) Prepare to prepare a query for execution.

28.1.8.5.29 TIBSQL.PreprocessSQL Method

Pascal

```
procedure PreprocessSQL;
```

C++

```
__fastcall PreprocessSQL();
```

Description

This is PreprocessSQL, a member of class TIBSQL.

28.1.8.5.30 TIBSQL.SetDatabase Method

Pascal

```
procedure SetDatabase(Value: TIBDatabase);
```

C++

```
__fastcall SetDatabase(TIBDatabase Value);
```

Description

This is SetDatabase, a member of class TIBSQL.

28.1.8.5.31 TIBSQL.SetSQL Method

Pascal

```
procedure SetSQL(Value: TStrings);
```

C++

```
__fastcall SetSQL(TStrings Value);
```

Description

This is SetSQL, a member of class TIBSQL.

28.1.8.5.32 TIBSQL.SetTransaction Method

Pascal

```
procedure SetTransaction(Value: TIBTransaction);
```

C++

```
__fastcall SetTransaction(TIBTransaction Value);
```

Description

This is SetTransaction, a member of class TIBSQL.

28.1.8.5.33 TIBSQL.SQLChanging Method

Pascal

```
procedure SQLChanging(Sender: TObject);
```

C++

```
__fastcall SQLChanging(TObject * Sender);
```

Description

This is SQLChanging, a member of class TIBSQL.

28.1.8.6 TIBSQL Properties

The properties of the TIBSQL class are listed here.

Public Properties

	Name	Description
R	Bof (see page 4072)	Indicates whether or not a query is at the beginning of the dataset.
R	DBHandle (see page 4072)	Specifies the database handle for the query.
R	Eof (see page 4072)	Indicates whether or not a query is at the end of the dataset.
R	FieldIndex (see page 4073)	Returns the index of the named field.
R	Fields (see page 4073)	Returns the XSQLVAR fields.
	GenerateParamNames (see page 4073)	Generates a list of parameter names for the query.
R	Handle (see page 4074)	Specifies the handle for the query.
R	Open (see page 4074)	Determines if the dataset is open.
R	Params (see page 4075)	Returns the XSQLDA parameters.
R	Plan (see page 4075)	Returns the plan for the query.
R	Prepared (see page 4075)	Indicates whether or not the query has been prepared.
R	RecordCount (see page 4075)	Returns the current count of records from the query.
R	RowsAffected (see page 4076)	Returns the number of rows affected.
R	SQLType (see page 4076)	Returns the type of query to be executed.
R	TRHandle (see page 4077)	Specifies the transaction handle for the query.
R	UniqueRelationName (see page 4077)	Indicates the unique relation name.

Published Properties

	Name	Description
	Database (see page 4072)	Sets or returns the database associated with the query.
	GoToFirstRecordOnExecute (see page 4074)	Goes to the first record in the result set upon opening it.
	ParamCheck (see page 4074)	Specifies whether the parameter list for an SQL (see page 4076) query is regenerated if the SQL (see page 4076) property changes at runtime.
	SQL (see page 4076)	Sets the SQL query to be executed.
	Transaction (see page 4077)	Sets or returns the transaction to be used by the query.

28.1.8.6.1 TIBSQL.Bof Property

Indicates whether or not a query is at the beginning of the dataset.

Pascal

```
property Bof: Boolean;
```

C++

```
__property Boolean Bof;
```

Description

Use the BOF property to determine whether or not a query is at the beginning of the dataset.

28.1.8.6.2 TIBSQL.Database Property

Sets or returns the database associated with the query.

Pascal

```
property Database: TIBDatabase;
```

C++

```
__property TIBDatabase Database;
```

Description

Use the Database property to set or return the database associated with the query.

28.1.8.6.3 TIBSQL.DBHandle Property

Specifies the database handle for the query.

Pascal

```
property DBHandle: PISC_DB_HANDLE;
```

C++

```
__property PISC_DB_HANDLE DBHandle;
```

Description

Use the DBHandle property to return the database handle for the query.

28.1.8.6.4 TIBSQL.Eof Property

Indicates whether or not a query is at the end of the dataset.

Pascal

```
property Eof: Boolean;
```

C++

```
__property Boolean Eof;
```

Description

Use the EOF property to determine whether or not a query is at the end of the dataset and whether or not the query returned any result rows.

In addition, if this property is true immediately after the query is opened, then it means that the dataset is empty.

28.1.8.6.5 TIBSQL.FieldIndex Property

Returns the index of the named field.

Pascal

```
property FieldIndex [FieldName: String]: Integer;
```

C++

```
__property int FieldIndex[UnicodeString FieldName];
```

Description

Use the FieldIndex property to return the index of the name field.

28.1.8.6.6 TIBSQL.Fields Property

Returns the XSQLVAR fields.

Pascal

```
property Fields [const Idx: Integer]: TIBXSQLVAR;
```

C++

```
__property TIBXSQLVAR Fields[int const Idx];
```

Description

Use the Fields property to return the XSQLVAR fields.

28.1.8.6.7 TIBSQL.GenerateParamNames Property

Generates a list of parameter names for the query.

Pascal

```
property GenerateParamNames: Boolean;
```

C++

```
__property Boolean GenerateParamNames;
```

Description

Set GenerateParamNames to true to have the query generate a list of parameter names.

28.1.8.6.8 TIBSQL.GoToFirstRecordOnExecute Property

Goes to the first record in the result set upon opening it.

Pascal

```
property GoToFirstRecordOnExecute: Boolean;
```

C++

```
__property Boolean GoToFirstRecordOnExecute;
```

Description

Use the GoToFirstRecordOnExecute property to go to the first record in a result set upon opening it. By default, this property is set to true. GoToFirstRecordOnExecute exists primarily for use in TIBDataSet, which sets this value to false for its internal TIBSQLs.

28.1.8.6.9 TIBSQL.Handle Property

Specifies the handle for the query.

Pascal

```
property Handle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE Handle;
```

Description

Use the Handle property to get the query handle.

28.1.8.6.10 TIBSQL.Open Property

Determines if the dataset is open.

Pascal

```
property Open: Boolean;
```

C++

```
__property Boolean Open;
```

Description

Use the Open property to determine if the dataset is open.

28.1.8.6.11 TIBSQL.ParamCheck Property

Specifies whether the parameter list for an SQL (see page 4076) query is regenerated if the SQL (see page 4076) property changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the TIBSQL (see page 4055) query. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the TIBSQL (see page 4055) query executing the DDL statement.

An application that does not use parameterized queries may choose to set ParamCheck to false, but otherwise ParamCheck should be true.

28.1.8.6.12 TIBSQL.Params Property

Returns the XSQLDA parameters.

Pascal

```
property Params: TIBXSQLDA;
```

C++

```
__property TIBXSQLDA Params;
```

Description

Use the Params property to return the XSQLDA parameters.

28.1.8.6.13 TIBSQL.Plan Property

Returns the plan for the query.

Pascal

```
property Plan: String;
```

C++

```
__property UnicodeString Plan;
```

Description

Use the Plan property to view the query plan once the query has been prepared.

28.1.8.6.14 TIBSQL.Prepared Property

Indicates whether or not the query has been prepared.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Use the Prepared property to determine whether or not a query has yet been prepared.

28.1.8.6.15 TIBSQL.RecordCount Property

Returns the current count of records from the query.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

Use the RecordCount property to see how many records are returned by a query. If the result set is to return 100 rows, RecordCount will only be 100 after all the records have been visited. That is, after looking at the first record, RecordCount is 1, and so forth.

28.1.8.6.16 TIBSQL.RowsAffected Property

Returns the number of rows affected.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

Use the RowsAffected property to return the number of rows affected by the query. This property is useful for INSERT, DELETE, and UPDATE statements.

28.1.8.6.17 TIBSQL.SQL Property

Sets the SQL query to be executed.

Pascal

```
property SQL: TStrings;
```

C++

```
__property TStrings SQL;
```

Description

Use the SQL property to write or view the SQL query to be executed.

28.1.8.6.18 TIBSQL.SQLType Property

Returns the type of query to be executed.

Pascal

```
property SQLType: TIBSQLTypes;
```

C++

```
__property TIBSQLTypes SQLType;
```

Description

Use the SQLType to determine the type of query to be executed.

28.1.8.6.19 TIBSQL.Transaction Property

Sets or returns the transaction to be used by the query.

Pascal

```
property Transaction: TIBTransaction;
```

C++

```
__property TIBTransaction Transaction;
```

Description

Use the Transaction property to set or return the transaction to be used by the query.

28.1.8.6.20 TIBSQL.TRHandle Property

Specifies the transaction handle for the query.

Pascal

```
property TRHandle: PISC_TR_HANDLE;
```

C++

```
__property PISC_TR_HANDLE TRHandle;
```

Description

Use the TRHandle property to return the transaction handle for the query.

28.1.8.6.21 TIBSQL.UniqueRelationName Property

Indicates the unique relation name.

Pascal

```
property UniqueRelationName: String;
```

C++

```
__property UnicodeString UniqueRelationName;
```

Description

Use the UniqueRelationName property to indicate the unique relation name for a query that involves only one base table.

28.1.8.7 TIBSQL Events

The events of the TIBSQL class are listed here.

Published Events

	Name	Description
	OnSQLChanging (see page 4077)	Occurs when the SQL (see page 4076) query is being modified.

28.1.8.7.1 TIBSQL.OnSQLChanging Event

Occurs when the SQL (see page 4076) query is being modified.

Pascal

```
property OnSQLChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSQLChanging;
```

Description

Write an OnSQLChanging event handler to take specific actions when a query is being modified. If an exception is raised in this event, the query is not changed.

28.1.9 TIBXSQLDA Class

TIBXSQLDA provides properties and methods for use with the IBSQL (see page 4035) component.

Class Hierarchy

Pascal

```
TIBXSQLDA = class(TObject);
```

C++

```
class TIBXSQLDA : public TObject;
```

File

IBSQL

Description

Use a TIBXSQLDA object to provide properties and methods for use with the IBSQL (see page 4035) component.

All Dynamic SQL (DSQL) applications must declare one or more extended descriptor areas (XSQLDAs). The XSQLDA is a host language data structure that DSQL uses to transport data to or from a database when processing an SQL statement string. There are two types of XSQLDAs: input descriptors and output descriptors. Both input and output descriptors are implemented using the XSQLDA structure.

28.1.9.1 TIBXSQLDA Members

The following tables list the members exposed by TIBXSQLDA.

Protected Fields

	Name	Description
	FCount (see page 4080)	This is FCount, a member of class TIBXSQLDA.
	FNames (see page 4080)	This is FNames, a member of class TIBXSQLDA.
	FSize (see page 4080)	This is FSize, a member of class TIBXSQLDA.
	FSQL (see page 4081)	This is FSQL, a member of class TIBXSQLDA.
	FUniqueRelationName (see page 4081)	This is FUniqueRelationName, a member of class TIBXSQLDA.
	FXSQLDA (see page 4081)	This is FXSQLDA, a member of class TIBXSQLDA.
	FXSQLVARs (see page 4081)	This is FXSQLVARs, a member of class TIBXSQLDA.

Protected Methods

	Name	Description
	GetModified (see page 4082)	This is GetModified, a member of class TIBXSQLDA.
	GetNames (see page 4083)	This is GetNames, a member of class TIBXSQLDA.
	GetRecordSize (see page 4083)	This is GetRecordSize, a member of class TIBXSQLDA.
	GetXSQLDA (see page 4083)	This is GetXSQLDA, a member of class TIBXSQLDA.
	GetXSQLVAR (see page 4083)	This is GetXSQLVAR, a member of class TIBXSQLDA.
	GetXSQLVARByName (see page 4083)	This is GetXSQLVARByName, a member of class TIBXSQLDA.
	Initialize (see page 4084)	This is Initialize, a member of class TIBXSQLDA.
	SetCount (see page 4084)	This is SetCount, a member of class TIBXSQLDA.

Public Methods

	Name	Description
	AddName (see page 4082)	Adds a name to the XSQLDA structure.
	ByName (see page 4082)	Returns the XSQLVAR fields by name.
	Create (see page 4079)	Creates an instance of an XSQLDA structure.
V	Destroy (see page 4079)	Destroys the XSQLDA structure.

Public Properties

	Name	Description
R	AsXSQLDA (see page 4084)	Represents the XSQLDA field's value as an XSQLDA value.
	Count (see page 4085)	Returns the number of XSQLDA fields.
R	Modified (see page 4085)	Indicates whether a field has been modified.
R	Names (see page 4085)	Returns the XSQLDA field names.
R	RecordSize (see page 4085)	Returns the size of the XSQLDA record.
R	UniqueRelationName (see page 4086)	Returns the name of the unique relation.
R	Vars (see page 4086)	Returns the XSQLVAR defined for the XSQLDA parameter.

28.1.9.2 TIBXSQLDA.Create Constructor

Creates an instance of an XSQLDA structure.

Pascal

```
constructor Create(Query: TIBSQL);
```

C++

```
__fastcall TIBXSQLDA(TIBSQL Query);
```

Description

Call Create to create an instance of an XSQLDA structure. Create queries the DynamicSQL component for the structure members.

28.1.9.3 TIBXSQLDA.Destroy Destructor

Destroys the XSQLDA structure.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBXSQLDA();
```

Description

Do not call Destroy directly. Call Free instead. Free checks to ensure that the object instance is not nil before calling Destroy.

28.1.9.4 TIBXSQLDA Fields

The fields of the TIBXSQLDA class are listed here.

Protected Fields

	Name	Description
	FCount (see page 4080)	This is FCount, a member of class TIBXSQLDA.
	FNames (see page 4080)	This is FNames, a member of class TIBXSQLDA.
	FSize (see page 4080)	This is FSize, a member of class TIBXSQLDA.
	FSQL (see page 4081)	This is FSQL, a member of class TIBXSQLDA.
	FUniqueRelationName (see page 4081)	This is FUniqueRelationName, a member of class TIBXSQLDA.
	FXSQLDA (see page 4081)	This is FXSQLDA, a member of class TIBXSQLDA.
	FXSQLVARs (see page 4081)	This is FXSQLVARs, a member of class TIBXSQLDA.

28.1.9.4.1 TIBXSQLDA.FCount Field

Pascal

```
FCount: Integer;
```

C++

```
int FCount;
```

Description

This is FCount, a member of class TIBXSQLDA.

28.1.9.4.2 TIBXSQLDA.FNames Field

Pascal

```
FNames: TStrings;
```

C++

```
TStrings FNames;
```

Description

This is FNames, a member of class TIBXSQLDA.

28.1.9.4.3 TIBXSQLDA.FSize Field

Pascal

```
FSize: Integer;
```

C++

```
int FSize;
```

Description

This is FSize, a member of class TIBXSQLDA.

28.1.9.4.4 TIBXSQLDA.FSQL Field

Pascal

```
FSQL: TIBSQL;
```

C++

```
TIBSQL FSQL;
```

Description

This is FSQL, a member of class TIBXSQLDA.

28.1.9.4.5 TIBXSQLDA.FUniqueRelationName Field

Pascal

```
FUniqueRelationName: String;
```

C++

```
UnicodeString FUniqueRelationName;
```

Description

This is FUniqueRelationName, a member of class TIBXSQLDA.

28.1.9.4.6 TIBXSQLDA.FXSQLDA Field

Pascal

```
FXSQLDA: PXSQLDA;
```

C++

```
PXSQLDA FXSQLDA;
```

Description

This is FXSQLDA, a member of class TIBXSQLDA.

28.1.9.4.7 TIBXSQLDA.FXSQLVARs Field

Pascal

```
FXSQLVARs: TIBXSQLVARArray;
```

C++

```
TIBXSQLVARArray FXSQLVARs;
```

Description

This is FXSQLVARs, a member of class TIBXSQLDA.

28.1.9.5 TIBXSQLDA Methods

The methods of the TIBXSQLDA class are listed here.

Protected Methods

	Name	Description
	GetModified (see page 4082)	This is GetModified, a member of class TIBXSQLDA.
	GetNames (see page 4083)	This is GetNames, a member of class TIBXSQLDA.
	GetRecordSize (see page 4083)	This is GetRecordSize, a member of class TIBXSQLDA.
	GetXSQLDA (see page 4083)	This is GetXSQLDA, a member of class TIBXSQLDA.
	GetXSQLVAR (see page 4083)	This is GetXSQLVAR, a member of class TIBXSQLDA.
	GetXSQLVARByName (see page 4083)	This is GetXSQLVARByName, a member of class TIBXSQLDA.
	Initialize (see page 4084)	This is Initialize, a member of class TIBXSQLDA.
	SetCount (see page 4084)	This is SetCount, a member of class TIBXSQLDA.

Public Methods

	Name	Description
	AddName (see page 4082)	Adds a name to the XSQLDA structure.
	ByName (see page 4082)	Returns the XSQLVAR fields by name.

28.1.9.5.1 TIBXSQLDA.AddName Method

Adds a name to the XSQLDA structure.

Pascal

```
procedure AddName(FieldName: String; Idx: Integer);
```

C++

```
__fastcall AddName(UnicodeString FieldName, int Idx);
```

Description

Call AddName to add a name to the XSQLDA structure.

28.1.9.5.2 TIBXSQLDA.ByName Method

Returns the XSQLVAR fields by name.

Pascal

```
function ByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR ByName(UnicodeString Idx);
```

Description

Use the ByName method to return the XSQLVAR fields by name.

28.1.9.5.3 TIBXSQLDA.GetModified Method

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

This is GetModified, a member of class TIBXSQLDA.

28.1.9.5.4 TIBXSQLDA.GetNames Method

Pascal

```
function GetNames: String;
```

C++

```
__fastcall UnicodeString GetNames();
```

Description

This is GetNames, a member of class TIBXSQLDA.

28.1.9.5.5 TIBXSQLDA.GetRecordSize Method

Pascal

```
function GetRecordSize: Integer;
```

C++

```
__fastcall int GetRecordSize();
```

Description

This is GetRecordSize, a member of class TIBXSQLDA.

28.1.9.5.6 TIBXSQLDA.GetXSQLDA Method

Pascal

```
function GetXSQLDA: PXSQLDA;
```

C++

```
__fastcall PXSQLDA GetXSQLDA();
```

Description

This is GetXSQLDA, a member of class TIBXSQLDA.

28.1.9.5.7 TIBXSQLDA.GetXSQLVAR Method

Pascal

```
function GetXSQLVAR(Idx: Integer): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetXSQLVAR(int Idx);
```

Description

This is GetXSQLVAR, a member of class TIBXSQLDA.

28.1.9.5.8 TIBXSQLDA.GetXSQLVARByName Method

Pascal

```
function GetXSQLVARByName(Idx: String): TIBXSQLVAR;
```

C++

```
__fastcall TIBXSQLVAR GetXSQLVARByName(UnicodeString Idx);
```

Description

This is GetXSQLVARByName, a member of class TIBXSQLDA.

28.1.9.5.9 TIBXSQLDA.Initialize Method

Pascal

```
procedure Initialize;
```

C++

```
__fastcall Initialize();
```

Description

This is Initialize, a member of class TIBXSQLDA.

28.1.9.5.10 TIBXSQLDA.SetCount Method

Pascal

```
procedure SetCount(Value: Integer);
```

C++

```
__fastcall SetCount(int Value);
```

Description

This is SetCount, a member of class TIBXSQLDA.

28.1.9.6 TIBXSQLDA Properties

The properties of the TIBXSQLDA class are listed here.

Public Properties

	Name	Description
R	AsXSQLDA (see page 4084)	Represents the XSQLDA field's value as an XSQLDA value.
	Count (see page 4085)	Returns the number of XSQLDA fields.
R	Modified (see page 4085)	Indicates whether a field has been modified.
R	Names (see page 4085)	Returns the XSQLDA field names.
R	RecordSize (see page 4085)	Returns the size of the XSQLDA record.
R	UniqueRelationName (see page 4086)	Returns the name of the unique relation.
R	Vars (see page 4086)	Returns the XSQLVAR defined for the XSQLDA parameter.

28.1.9.6.1 TIBXSQLDA.AsXSQLDA Property

Represents the XSQLDA field's value as an XSQLDA value.

Pascal

```
property AsXSQLDA: PXSQLDA;
```

C++

```
__property PXSQLDA AsXSQLDA;
```

Description

Use the AsXSQLDA property to read the value of the field's data into an object or variable of type XSQLDA, or to assign an

XSQLDA value to the contents of the field.

28.1.9.6.2 TIBXSQLDA.Count Property

Returns the number of XSQLDA fields.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use the Count property to return the number of XSQLDA fields.

28.1.9.6.3 TIBXSQLDA.Modified Property

Indicates whether a field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use the Modified property to determine whether a field has been modified.

28.1.9.6.4 TIBXSQLDA.Names Property

Returns the XSQLDA field names.

Pascal

```
property Names: String;
```

C++

```
__property UnicodeString Names;
```

Description

Use the Names property to return the XSQLDA field names.

28.1.9.6.5 TIBXSQLDA.RecordSize Property

Returns the size of the XSQLDA record.

Pascal

```
property RecordSize: Integer;
```

C++

```
__property int RecordSize;
```

Description

Use the RecordSize property to return the XSQLDA record size.

28.1.9.6.6 TIBXSQLDA.UniqueRelationName Property

Returns the name of the unique relation.

Pascal

```
property UniqueRelationName: String;
```

C++

```
__property UnicodeString UniqueRelationName;
```

Description

Use the UniqueRelationName property to return the name of the relation if only one relation is involved in the query. Otherwise, it returns nil (Delphi) or NULL (C++). This property is primarily used for internal purposes.

28.1.9.6.7 TIBXSQLDA.Vars Property

Returns the XSQLVAR defined for the XSQLDA parameter.

Pascal

```
property Vars [Idx: Integer]: TIBXSQLVAR;
```

C++

```
__property TIBXSQLVAR Vars[int Idx];
```

Description

Use Vars to return the XSQLVAR defined for the XSQLDA parameter.

Vars is the default property for TIBXSQLDSA, which means that the name of the Vars property can be omitted when the TIBXSQLDA (see page 4078) object implements a property in another object.

28.1.10 TIBXSQLVAR Class

TIBXSQLVAR provides properties and methods for use with the IBSQL (see page 4035) component.

Class Hierarchy

Pascal

```
TIBXSQLVAR = class(TObject);
```

C++

```
class TIBXSQLVAR : public TObject;
```

File

IBSQL

Description

Use a TIBXSQLVAR object to provide properties and methods for use with the IBSQL (see page 4035) component.

The XSQLVAR structure is a field, sqlvar, in the XSQLDA. The sqlvar is especially important, because one XSQLVAR must be defined for each input parameter or column returned.

Applications do not declare instances of the XSQLVAR ahead of time, but must, instead, dynamically allocate storage for the proper number of XSQLVAR structures required for each DSQL statement before it is executed, then deallocate it, as appropriate, after statement execution.

28.1.10.1 TIBXSQLVAR Members

The following tables list the members exposed by TIBXSQLVAR.

Public Methods

	Name	Description
	Assign (see page 4088)	Assigns another XSQLVAR to the XSQLVAR component.
	Clear (see page 4088)	Clears the value of this TIBXSQLVAR (see page 4086) object.
	Create (see page 4087)	Creates an instance of an XSQLVAR structure.
	LoadFromFile (see page 4089)	Loads the contents of a file to a Blob field.
	LoadFromStream (see page 4089)	Loads a stream into a Blob field.
	SaveToFile (see page 4089)	Saves the contents of a Blob field to a file.
	SaveToStream (see page 4089)	Saves the contents of a Blob field to a stream.

Public Properties

	Name	Description
	AsCurrency (see page 4090)	Represents the XSQLVAR field's value as a Currency value.
	AsDate (see page 4090)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDateTime (see page 4091)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDouble (see page 4091)	Represents the XSQLVAR field's value as a Double value.
	AsFloat (see page 4091)	Represents the XSQLVAR field's value as a Float value.
	AsInt64 (see page 4092)	Represents the XSQLVAR field's value as a 64-bit integer.
	AsInteger (see page 4092)	Represents the XSQLVAR field's value as a 32-bit integer value.
	AsLong (see page 4092)	Represents the XSQLVAR field's value as a Long integer value.
	AsPointer (see page 4092)	Represents the XSQLVAR field's value as a Pointer value.
	AsQuad (see page 4093)	Represents the XSQLVAR field's value as a Quad value.
	AsShort (see page 4093)	Represents the XSQLVAR field's value as a Short integer value.
	AsString (see page 4093)	Represents the XSQLVAR field's value as a string.
	AsTime (see page 4093)	Represents the XSQLVAR field's value as a TDateTime value.
	AsTrimString (see page 4094)	Represents the XSQLVAR field's value as a string with any trailing spaces removed.
	AsVariant (see page 4094)	Represents the XSQLVAR field's value as type Variant.
	AsXSQLVAR (see page 4094)	Represents the XSQLVAR field's value as an XSQLVAR value.
	Data (see page 4095)	Accesses the underlying InterBase XSQLVAR structure.
R	Index (see page 4095)	Indicates the position of the XSQLVAR in the XSQLDA.
	IsNull (see page 4095)	Indicates whether the field has a value assigned to it.
	IsNullable (see page 4095)	Indicates whether the field can have a value assigned to it.
	Modified (see page 4096)	Indicates whether a field has been modified.
R	Name (see page 4096)	Returns the name of the XSQLVAR.
R	Size (see page 4096)	Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.
R	SQLType (see page 4096)	Indicates the SQL datatype of parameters or select list items.
	Value (see page 4097)	Returns the value of the XSQLVAR field component.

28.1.10.2 TIBXSQLVAR.Create Constructor

Creates an instance of an XSQLVAR structure.

Pascal

```
constructor Create(Parent: TIBXSQLDA; Query: TIBSQL);
```

C++

```
__fastcall TIBXSQLVAR(TIBXSQLDA Parent, TIBSQL Query);
```

Description

Call Create to create an instance of TIBXSQLVAR (see page 4086).

Parent is an extended descriptor area that defines the namespace to use for processing the variable name.

Query identifies the query that includes this variable.

28.1.10.3 TIBXSQLVAR Methods

The methods of the TIBXSQLVAR class are listed here.

Public Methods

	Name	Description
	Assign (see page 4088)	Assigns another XSQLVAR to the XSQLVAR component.
	Clear (see page 4088)	Clears the value of this TIBXSQLVAR (see page 4086) object.
	LoadFromFile (see page 4089)	Loads the contents of a file to a Blob field.
	LoadFromStream (see page 4089)	Loads a stream into a Blob field.
	SaveToFile (see page 4089)	Saves the contents of a Blob field to a file.
	SaveToStream (see page 4089)	Saves the contents of a Blob field to a stream.

28.1.10.3.1 TIBXSQLVAR.Assign Method

Assigns another XSQLVAR to the XSQLVAR component.

Pascal

```
procedure Assign(Source: TIBXSQLVAR);
```

C++

```
__fastcall Assign(TIBXSQLVAR Source);
```

Description

Use Assign to assign another XSQLVAR to the XSQLVAR component. The fields must have compatible data types.

28.1.10.3.2 TIBXSQLVAR.Clear Method

Clears the value of this TIBXSQLVAR (see page 4086) object.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to assign a Null value to this TIBXSQLVAR (see page 4086) object.

28.1.10.3.3 TIBXSQLVAR.LoadFromFile Method

Loads the contents of a file to a Blob field.

Pascal

```
procedure LoadFromFile(const FileName: String);
```

C++

```
__fastcall LoadFromFile(const UnicodeString FileName);
```

Description

Call LoadFromFile to load the contents of a file to a Blob field.

28.1.10.3.4 TIBXSQLVAR.LoadFromStream Method

Loads a stream into a Blob field.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load a stream into a Blob field.

28.1.10.3.5 TIBXSQLVAR.SaveToFile Method

Saves the contents of a Blob field to a file.

Pascal

```
procedure SaveToFile(const FileName: String);
```

C++

```
__fastcall SaveToFile(const UnicodeString FileName);
```

Description

Call SaveToFile to save the contents of a Blob field to a file.

28.1.10.3.6 TIBXSQLVAR.SaveToStream Method

Saves the contents of a Blob field to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the contents of a Blob field to a stream.

28.1.10.4 TIBXSQLVAR Properties

The properties of the TIBXSQLVAR class are listed here.

Public Properties

	Name	Description
	AsCurrency (see page 4090)	Represents the XSQLVAR field's value as a Currency value.
	AsDate (see page 4090)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDateTime (see page 4091)	Represents the XSQLVAR field's value as a TDateTime value.
	AsDouble (see page 4091)	Represents the XSQLVAR field's value as a Double value.
	AsFloat (see page 4091)	Represents the XSQLVAR field's value as a Float value.
	AsInt64 (see page 4092)	Represents the XSQLVAR field's value as a 64-bit integer.
	AsInteger (see page 4092)	Represents the XSQLVAR field's value as a 32-bit integer value.
	AsLong (see page 4092)	Represents the XSQLVAR field's value as a Long integer value.
	AsPointer (see page 4092)	Represents the XSQLVAR field's value as a Pointer value.
	AsQuad (see page 4093)	Represents the XSQLVAR field's value as a Quad value.
	AsShort (see page 4093)	Represents the XSQLVAR field's value as a Short integer value.
	AsString (see page 4093)	Represents the XSQLVAR field's value as a string.
	AsTime (see page 4093)	Represents the XSQLVAR field's value as a TDateTime value.
	AsTrimString (see page 4094)	Represents the XSQLVAR field's value as a string with any trailing spaces removed.
	AsVariant (see page 4094)	Represents the XSQLVAR field's value as type Variant.
	AsXSQLVAR (see page 4094)	Represents the XSQLVAR field's value as an XSQLVAR value.
	Data (see page 4095)	Accesses the underlying InterBase XSQLVAR structure.
R	Index (see page 4095)	Indicates the position of the XSQLVAR in the XSQLDA.
	IsNull (see page 4095)	Indicates whether the field has a value assigned to it.
	IsNullable (see page 4095)	Indicates whether the field can have a value assigned to it.
	Modified (see page 4096)	Indicates whether a field has been modified.
R	Name (see page 4096)	Returns the name of the XSQLVAR.
R	Size (see page 4096)	Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.
R	SQLType (see page 4096)	Indicates the SQL datatype of parameters or select list items.
	Value (see page 4097)	Returns the value of the XSQLVAR field component.

28.1.10.4.1 TIBXSQLVAR.AsCurrency Property

Represents the XSQLVAR field's value as a Currency value.

Pascal

```
property AsCurrency: Currency;
```

C++

```
__property Currency AsCurrency;
```

Description

Use the AsCurrency property to read the value of the XSQLVAR field's data into an object or variable of type Currency, or to assign a Currency value to the contents of the field.

28.1.10.4.2 TIBXSQLVAR.AsDate Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsDate: TDateTime;
```

C++

```
__property TDateTime AsDate;
```

Description

Use the AsDate property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field. The Time portion of the TDateTime value is set to zero.

28.1.10.4.3 TIBXSQLVAR.AsDateTime Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Use the AsDateTime property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field.

28.1.10.4.4 TIBXSQLVAR.AsDouble Property

Represents the XSQLVAR field's value as a Double value.

Pascal

```
property AsDouble: Double;
```

C++

```
__property Double AsDouble;
```

Description

Use the AsDouble property to read the value of the field's data into an object or variable of type Double, or to assign a Double value to the contents of the field.

28.1.10.4.5 TIBXSQLVAR.AsFloat Property

Represents the XSQLVAR field's value as a Float value.

Pascal

```
property AsFloat: Float;
```

C++

```
__property Float AsFloat;
```

Description

Use the AsDouble (see page 4091) property to read the value of the field's data into an object or variable of type Float, or to assign a Float value to the contents of the field.

28.1.10.4.6 TIBXSQLVAR.AsInt64 Property

Represents the XSQLVAR field's value as a 64-bit integer.

Pascal

```
property AsInt64: Int64;
```

C++

```
__property Int64 AsInt64;
```

Description

Use the AsInt64 property to read the value of the field's data into a 64-bit integer, or to assign an 64-bit integer value to the contents of the field.

28.1.10.4.7 TIBXSQLVAR.AsInteger Property

Represents the XSQLVAR field's value as a 32-bit integer value.

Pascal

```
property AsInteger: Integer;
```

C++

```
__property int AsInteger;
```

Description

Use the AsInteger property to read the value of the field's data into an integer, or to assign an integer value to the contents of the field.

28.1.10.4.8 TIBXSQLVAR.AsLong Property

Represents the XSQLVAR field's value as a Long integer value.

Pascal

```
property AsLong: Long;
```

C++

```
__property Long AsLong;
```

Description

Use the AsLong property to read the value of the field's data into a Long integer, or to assign a Long integer value to the contents of the field.

28.1.10.4.9 TIBXSQLVAR.AsPointer Property

Represents the XSQLVAR field's value as a Pointer value.

Pascal

```
property AsPointer: Pointer;
```

C++

```
__property void * AsPointer;
```

Description

Use the AsPointer property to read the value of the field's data into an object or variable of type Pointer, or to assign a Pointer value to the contents of the field.

28.1.10.4.10 TIBXSQLVAR.AsQuad Property

Represents the XSQLVAR field's value as a Quad value.

Pascal

```
property AsQuad: TISC_QUAD;
```

C++

```
__property TISC_QUAD AsQuad;
```

Description

Use the AsQuad property to read the value of the field's data into an object or variable of type Quad, or to assign a Quad value to the contents of the field.

28.1.10.4.11 TIBXSQLVAR.AsShort Property

Represents the XSQLVAR field's value as a Short integer value.

Pascal

```
property AsShort: Short;
```

C++

```
__property Short AsShort;
```

Description

Use the AsShort property to to read the value of the field's data into a Short integer, or to assign a Short integer value to the contents of the field.

28.1.10.4.12 TIBXSQLVAR.AsString Property

Represents the XSQLVAR field's value as a string.

Pascal

```
property AsString: String;
```

C++

```
__property UnicodeString AsString;
```

Description

Use the AsString property to read the value of the field's data into a string, or to assign a String value to the contents of the field.

28.1.10.4.13 TIBXSQLVAR.AsTime Property

Represents the XSQLVAR field's value as a TDateTime value.

Pascal

```
property AsTime: TDateTime;
```

C++

```
__property TDateTime AsTime;
```

Description

Use the AsTime property to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field. The Date portion of the field is set to zero.

28.1.10.4.14 TIBXSQLVAR.AsTrimString Property

Represents the XSQLVAR field's value as a string with any trailing spaces removed.

Pascal

```
property AsTrimString: String;
```

C++

```
__property UnicodeString AsTrimString;
```

Description

Use the AsTrimString property to read the value of the field's data into a string, removing any trailing spaces from the value.

When assigning AsTrimString, any trailing spaces in the assigned string are removed before assigning the value. The spaces do not become part of the underlying value.

28.1.10.4.15 TIBXSQLVAR.AsVariant Property

Represents the XSQLVAR field's value as type Variant.

Pascal

```
property AsVariant: Variant;
```

C++

```
__property Variant AsVariant;
```

Description

Use the AsVariant property to read the value of the field's data into a Variant, or to assign a Variant value to the contents of the field.

28.1.10.4.16 TIBXSQLVAR.AsXSQLVAR Property

Represents the XSQLVAR field's value as an XSQLVAR value.

Pascal

```
property AsXSQLVAR: PXSQLVAR;
```

C++

```
__property PXSQLVAR AsXSQLVAR;
```

Description

Use the AsXSQLVAR property to read the value of the field's data into an object or variable of type XSQLVAR, or to assign an XSQLVAR value to the contents of the field.

28.1.10.4.17 TIBXSQLVAR.Data Property

Accesses the underlying InterBase XSQLVAR structure.

Pascal

```
property Data: PXSQLVAR;
```

C++

```
__property PXSQLVAR Data;
```

Description

Use the Data property to access the underlying InterBase XSQLVAR structure.

28.1.10.4.18 TIBXSQLVAR.Index Property

Indicates the position of the XSQLVAR in the XSQLDA.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

Use the Index property to obtain the position of the XSQLVAR in the XSQLDA.

28.1.10.4.19 TIBXSQLVAR.IsNull Property

Indicates whether the field has a value assigned to it.

Pascal

```
property IsNull: Boolean;
```

C++

```
__property Boolean IsNull;
```

Description

Use the IsNull property to determine if the field contains a value. If IsNull is true, the field is blank. If IsNull is false, the field has a value.

28.1.10.4.20 TIBXSQLVAR.IsNullable Property

Indicates whether the field can have a value assigned to it.

Pascal

```
property IsNullable: Boolean;
```

C++

```
__property Boolean IsNullable;
```

Description

Use the IsNullable property to determine if the field can contain a value. If IsNullable is true, the field can contain a value. If IsNullable is false, the field cannot contain a value.

28.1.10.4.21 TIBXSQLVAR.Modified Property

Indicates whether a field has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use the Modified property to determine whether a field has been modified.

28.1.10.4.22 TIBXSQLVAR.Name Property

Returns the name of the XSQLVAR.

Pascal

```
property Name: String;
```

C++

```
__property UnicodeString Name;
```

Description

Use the Name property to return the name of the XSQLVAR.

28.1.10.4.23 TIBXSQLVAR.Size Property

Indicates the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Use the Size property to return the maximum size, in bytes, of data in the sqldata field of the XSQLVAR.

28.1.10.4.24 TIBXSQLVAR.SQLType Property

Indicates the SQL datatype of parameters or select list items.

Pascal

```
property SQLType: Integer;
```

C++

```
__property int SQLType;
```

Description

Read the SQLType property to indicate the SQL datatype of parameters or select list items.

28.1.10.4.25 TIBXSQLVAR.Value Property

Returns the value of the XSQLVAR field component.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

Use Value to return the value of the XSQLVAR field component as a Variant.

28.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBSQLTypes (see page 4098)	TIBSQLTypes indicates the type of an SQL query against an InterBase database.

28.2.1 IBSQL.TIBSQLTypes Enumeration

TIBSQLTypes indicates the type of an SQL query against an InterBase database.

Pascal

```
TIBSQLTypes = (
  SQLUnknown,
  SQLSelect,
  SQLInsert,
  SQLUpdate,
  SQLDelete,
  SQLDDL,
  SQLGetSegment,
  SQLPutSegment,
  SQLExecProcedure,
  SQLStartTransaction,
  SQLCommit,
  SQLRollback,
  SQLSelectForUpdate,
  SQLSetGenerator
);
```

C++

```
enum TIBSQLTypes {
  SQLUnknown,
  SQLSelect,
  SQLInsert,
  SQLUpdate,
  SQLDelete,
  SQLDDL,
  SQLGetSegment,
  SQLPutSegment,
  SQLExecProcedure,
  SQLStartTransaction,
  SQLCommit,
  SQLRollback,
  SQLSelectForUpdate,
  SQLSetGenerator
};
```

File

IBSQL

Description

TIBSQLTypes values are:

SQLCommit	Commits an active transaction
SQLDDL	Executes a DDL statement
SQLDelete	Removes rows in a table or in the active set of a cursor
SQLExecProcedure	Calls a stored procedure
SQLGetSegment	Reads a segment from an open Blob
SQLInsert	Adds one or more new rows to a specified table
SQLPutSegment	Writes a Blob segment
SQLRollback	Restores the database to its state prior to the start of the current transaction
SQLSetForUpdate	Stored procedure is set for updating
SQLSetGenerator	Sets a new value for an existing generator
SQLSelect	Retrieves data from one or more tables
SQLStartTransaction	Starts a new transaction against one or more databases
SQLUnknown	Unknown SQL type
SQLUpdate	Changes data in all or part of an existing row in a table, view, or active set of a cursor

28.3 Types

The following table lists types in this documentation.

Types

Name	Description
TIBXSQLVARArray (see page 4100)	This is type IBSQL.TIBXSQLVARArray.

28.3.1 IBSQL.TIBXSQLVARArray Type

Pascal

```
TIBXSQLVARArray = Array of TIBXSQLVAR;
```

C++

```
Array of TIBXSQLVAR TIBXSQLVARArray;
```

File

IBSQL

Description

This is type IBSQL.TIBXSQLVARArray.

29 IBSQLMonitor Namespace

This is namespace IBSQLMonitor.

Topics

Name	Description
Classes (see page 4103)	The following table lists classes in this documentation.
Interfaces (see page 4109)	The following table lists interfaces in this documentation.
Functions (see page 4117)	The following table lists functions in this documentation.
Types (see page 4119)	The following table lists types in this documentation.
Constants (see page 4120)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIBCustomSQLMonitor (see page 4103)	TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 4106).
	TIBSQLMonitor (see page 4106)	TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

Constants

Name	Description
WM_IBSQL_SQL_EVENT (see page 4120)	This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.
WM_MAX_IBSQL_MONITOR (see page 4120)	This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.
WM_MIN_IBSQL_MONITOR (see page 4120)	This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

Functions

	Name	Description
	DisableMonitoring (see page 4117)	Disables SQL monitoring.
	EnableMonitoring (see page 4117)	This is function IBSQLMonitor.EnableMonitoring.
	MonitorHook (see page 4118)	This is function IBSQLMonitor.MonitorHook.
	MonitoringEnabled (see page 4118)	This is function IBSQLMonitor.MonitoringEnabled.

Interfaces

	Name	Description
	IIBSQLMonitorHook (see page 4109)	This is class IBSQLMonitor.IIBSQLMonitorHook.

Types

Name	Description
TSQLEvent (see page 4119)	TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

29.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBCustomSQLMonitor (see page 4103)	TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 4106).
	TIBSQLMonitor (see page 4106)	TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

29.1.1 TIBCustomSQLMonitor Class

TIBCustomSQLMonitor is the ancestor for TIBSQLMonitor (see page 4106).

Class Hierarchy

Pascal

```
TIBCustomSQLMonitor = class(TComponent);
```

C++

```
class TIBCustomSQLMonitor : public TComponent;
```

File

IBSQLMonitor

Description

TIBCustomSQLMonitor is the ancestor object from which TIBSQLMonitor (see page 4106) is derived.

29.1.1.1 TIBCustomSQLMonitor Members

The following tables list the members exposed by TIBCustomSQLMonitor.

Protected Events

	Name	Description
	OnSQL (see page 4106)	Reports dynamic SQL activity on InterBase applications.

Protected Properties

	Name	Description
	Enabled (see page 4105)	Indicates whether the IB (see page 3541) SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 4106)	Indicates which database operations are tracked.

Public Methods

	Name	Description
	Create (see page 4104)	Creates an instance of TIBCustomSQLMonitor (see page 4103).
	Destroy (see page 4104)	Destroys the instance of TIBCustomSQLMonitor (see page 4103).
	Release (see page 4104)	Frees the helper objects that intercept database commands.

Public Properties

	Name	Description
	Handle (see page 4105)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

29.1.1.2 TIBCustomSQLMonitor.Create Constructor

Creates an instance of TIBCustomSQLMonitor (see page 4103).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBCustomSQLMonitor(TComponent * AOwner);
```

Description

Call Create to create an instance of TIBCustomSQLMonitor (see page 4103). Create also:

Creates the window

Registers the event

Fires the Monitor thread

29.1.1.3 TIBCustomSQLMonitor.Destroy Destructor

Destroys the instance of TIBCustomSQLMonitor (see page 4103).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBCustomSQLMonitor();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free verifies that the service object has not already been freed before it calls Destroy.

Destroy unregisters the event, destroys the window, and kills the Monitor thread.

29.1.1.4 TIBCustomSQLMonitor Methods

The methods of the TIBCustomSQLMonitor class are listed here.

Public Methods

	Name	Description
	Release (see page 4104)	Frees the helper objects that intercept database commands.

29.1.1.4.1 TIBCustomSQLMonitor.Release Method

Frees the helper objects that intercept database commands.

Pascal

```
procedure Release;
```

C++

```
__fastcall Release();
```

Description

Call Release when the SQL monitor will not be monitoring any more messages. Release sends a message to the object that intercepts database commands, telling it to free itself.

To temporarily disable the monitor, use the Enabled (see page 4105) property instead.

29.1.1.5 TIBCustomSQLMonitor Properties

The properties of the TIBCustomSQLMonitor class are listed here.

Protected Properties

	Name	Description
	Enabled (see page 4105)	Indicates whether the IB (see page 3541) SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 4106)	Indicates which database operations are tracked.

Public Properties

	Name	Description
R	Handle (see page 4105)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

29.1.1.5.1 TIBCustomSQLMonitor.Enabled Property

Indicates whether the IB (see page 3541) SQL monitor is actively monitoring communication with the server.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to turn the SQL monitor on and off. When Enabled is true, the SQL monitor receives an OnSQL (see page 4106) event for every database operation specified by the TraceFlags (see page 4106) property. When Enabled is false, the SQL monitor does not receive any events.

29.1.1.5.2 TIBCustomSQLMonitor.Handle Property

Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

Pascal

```
property Handle: HWND;
```

C++

```
__property HWND Handle;
```

Description

A separate thread of execution monitors the database operations that trigger OnSQL (see page 4106) events. When that

thread detects a relevant database operation, it sends a Windows message to the window identified by this Handle.

29.1.1.5.3 TIBCustomSQLMonitor.TraceFlags Property

Indicates which database operations are tracked.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags enables performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

29.1.1.6 TIBCustomSQLMonitor Events

The events of the TIBCustomSQLMonitor class are listed here.

Protected Events

	Name	Description
	OnSQL (see page 4106)	Reports dynamic SQL activity on InterBase applications.

29.1.1.6.1 TIBCustomSQLMonitor.OnSQL Event

Reports dynamic SQL activity on InterBase applications.

Pascal

```
property OnSQL: TSQLEvent;
```

C++

```
__property TSQLEvent OnSQL;
```

Description

Write an OnSQL event handler to report dynamic SQL activity on InterBase applications.

Note: You must enable the TraceFlags (see page 4106) in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

29.1.2 TIBSQLMonitor Class

TIBSQLMonitor monitors dynamic SQL passed to the InterBase server.

Class Hierarchy

Pascal

```
TIBSQLMonitor = class(TIBCustomSQLMonitor);
```

C++

```
class TIBSQLMonitor : public TIBCustomSQLMonitor;
```

File

IBSQLMonitor

Description

Use TIBSQLMonitor to monitor dynamic SQL taking place in InterBase applications. Enable TraceFlags (see page 4108) in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

See Also

Getting Started with InterBase Express

29.1.2.1 TIBSQLMonitor Members

The following tables list the members exposed by TIBSQLMonitor.

Public Methods

	Name	Description
	Create (see page 4104)	Creates an instance of TIBCustomSQLMonitor (see page 4103).
	Destroy (see page 4104)	Destroys the instance of TIBCustomSQLMonitor (see page 4103).
	Release (see page 4104)	Frees the helper objects that intercept database commands.

Public Properties

	Name	Description
	Handle (see page 4105)	Specifies the window handle that the SQL monitor uses to receive asynchronous messages.

Published Events

	Name	Description
	OnSQL (see page 4108)	Reports dynamic SQL activity on InterBase applications.

Published Properties

	Name	Description
	Enabled (see page 4107)	Indicates whether the IB SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 4108)	Indicates which database operations are tracked.

29.1.2.2 TIBSQLMonitor Properties

The properties of the TIBSQLMonitor class are listed here.

Published Properties

	Name	Description
	Enabled (see page 4107)	Indicates whether the IB SQL monitor is actively monitoring communication with the server.
	TraceFlags (see page 4108)	Indicates which database operations are tracked.

29.1.2.2.1 TIBSQLMonitor.Enabled Property

Indicates whether the IB SQL monitor is actively monitoring communication with the server.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to turn the SQL monitor on and off. When Enabled is true, the SQL monitor receives an OnSQL event for every database operation specified by the TraceFlags property. When Enabled is false, the SQL monitor does not receive any events.

29.1.2.2.2 TIBSQLMonitor.TraceFlags Property

Indicates which database operations are tracked.

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

Use TraceFlags to specify which database operations the SQL Monitor should track in an application at runtime. TraceFlags enables performance tuning and SQL debugging when working with remote SQL database servers.

Note: Normally trace options are set from the SQL Monitor rather than setting TraceFlags in application code.

29.1.2.3 TIBSQLMonitor Events

The events of the TIBSQLMonitor class are listed here.

Published Events

	Name	Description
	OnSQL (see page 4108)	Reports dynamic SQL activity on InterBase applications.

29.1.2.3.1 TIBSQLMonitor.OnSQL Event

Reports dynamic SQL activity on InterBase applications.

Pascal

```
property OnSQL: TSQLEvent;
```

C++

```
__property TSQLEvent OnSQL;
```

Description

Write an OnSQL event handler to report dynamic SQL activity on InterBase applications.

Note: You must enable the TraceFlags in each TIBDatabase component in order for the SQL monitor to receive status information from each database connection.

29.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IIBSQLMonitorHook (see page 4109)	This is class IBSQLMonitor.IIBSQLMonitorHook.

29.2.1 IIBSQLMonitorHook Interface

Class Hierarchy

IBSQLMonitor.IIBSQLMonitorHook

Pascal

```
IIBSQLMonitorHook = interface;
```

C++

```
__interface IIBSQLMonitorHook;
```

File

IBSQLMonitor

Description

This is class IBSQLMonitor.IIBSQLMonitorHook.

29.2.1.1 IIBSQLMonitorHook Members

The following tables list the members exposed by IIBSQLMonitorHook.

Public Methods

	Name	Description
	DBConnect (see page 4110)	This is DBConnect, a member of class IIBSQLMonitorHook.
	DBDisconnect (see page 4111)	This is DBDisconnect, a member of class IIBSQLMonitorHook.
	GetEnabled (see page 4111)	This is GetEnabled, a member of class IIBSQLMonitorHook.
	GetMonitorCount (see page 4111)	This is GetMonitorCount, a member of class IIBSQLMonitorHook.
	GetTraceFlags (see page 4111)	This is GetTraceFlags, a member of class IIBSQLMonitorHook.
	RegisterMonitor (see page 4112)	This is RegisterMonitor, a member of class IIBSQLMonitorHook.
	ReleaseMonitor (see page 4112)	This is ReleaseMonitor, a member of class IIBSQLMonitorHook.
	SendMisc (see page 4112)	This is SendMisc, a member of class IIBSQLMonitorHook.
	ServiceAttach (see page 4112)	This is ServiceAttach, a member of class IIBSQLMonitorHook.
	ServiceDetach (see page 4112)	This is ServiceDetach, a member of class IIBSQLMonitorHook.
	ServiceQuery (see page 4113)	This is ServiceQuery, a member of class IIBSQLMonitorHook.
	ServiceStart (see page 4113)	This is ServiceStart, a member of class IIBSQLMonitorHook.
	SetEnabled (see page 4113)	This is SetEnabled, a member of class IIBSQLMonitorHook.
	SetTraceFlags (see page 4113)	This is SetTraceFlags, a member of class IIBSQLMonitorHook.
	SQLExecute (see page 4114)	This is SQLExecute, a member of class IIBSQLMonitorHook.

	SQLFetch (see page 4114)	This is SQLFetch, a member of class IIBSQLMonitorHook.
	SQLPrepare (see page 4114)	This is SQLPrepare, a member of class IIBSQLMonitorHook.
	TRCommit (see page 4114)	This is TRCommit, a member of class IIBSQLMonitorHook.
	TRCommitRetaining (see page 4114)	This is TRCommitRetaining, a member of class IIBSQLMonitorHook.
	TRRollback (see page 4115)	This is TRRollback, a member of class IIBSQLMonitorHook.
	TRRollbackRetaining (see page 4115)	This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.
	TRStart (see page 4115)	This is TRStart, a member of class IIBSQLMonitorHook.
	UnregisterMonitor (see page 4115)	This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

Public Properties

	Name	Description
	Enabled (see page 4116)	This is Enabled, a member of class IIBSQLMonitorHook.
	TraceFlags (see page 4116)	This is TraceFlags, a member of class IIBSQLMonitorHook.

29.2.1.2 IIBSQLMonitorHook Methods

The methods of the IIBSQLMonitorHook class are listed here.

Public Methods

	Name	Description
	DBConnect (see page 4110)	This is DBConnect, a member of class IIBSQLMonitorHook.
	DBDisconnect (see page 4111)	This is DBDisconnect, a member of class IIBSQLMonitorHook.
	GetEnabled (see page 4111)	This is GetEnabled, a member of class IIBSQLMonitorHook.
	GetMonitorCount (see page 4111)	This is GetMonitorCount, a member of class IIBSQLMonitorHook.
	GetTraceFlags (see page 4111)	This is GetTraceFlags, a member of class IIBSQLMonitorHook.
	RegisterMonitor (see page 4112)	This is RegisterMonitor, a member of class IIBSQLMonitorHook.
	ReleaseMonitor (see page 4112)	This is ReleaseMonitor, a member of class IIBSQLMonitorHook.
	SendMisc (see page 4112)	This is SendMisc, a member of class IIBSQLMonitorHook.
	ServiceAttach (see page 4112)	This is ServiceAttach, a member of class IIBSQLMonitorHook.
	ServiceDetach (see page 4112)	This is ServiceDetach, a member of class IIBSQLMonitorHook.
	ServiceQuery (see page 4113)	This is ServiceQuery, a member of class IIBSQLMonitorHook.
	ServiceStart (see page 4113)	This is ServiceStart, a member of class IIBSQLMonitorHook.
	SetEnabled (see page 4113)	This is SetEnabled, a member of class IIBSQLMonitorHook.
	SetTraceFlags (see page 4113)	This is SetTraceFlags, a member of class IIBSQLMonitorHook.
	SQLExecute (see page 4114)	This is SQLExecute, a member of class IIBSQLMonitorHook.
	SQLFetch (see page 4114)	This is SQLFetch, a member of class IIBSQLMonitorHook.
	SQLPrepare (see page 4114)	This is SQLPrepare, a member of class IIBSQLMonitorHook.
	TRCommit (see page 4114)	This is TRCommit, a member of class IIBSQLMonitorHook.
	TRCommitRetaining (see page 4114)	This is TRCommitRetaining, a member of class IIBSQLMonitorHook.
	TRRollback (see page 4115)	This is TRRollback, a member of class IIBSQLMonitorHook.
	TRRollbackRetaining (see page 4115)	This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.
	TRStart (see page 4115)	This is TRStart, a member of class IIBSQLMonitorHook.
	UnregisterMonitor (see page 4115)	This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

29.2.1.2.1 IIBSQLMonitorHook.DBConnect Method

Pascal

```
procedure DBConnect(db: TIBDatabase);
```

C++

```
__fastcall DBConnect(TIBDatabase db);
```

Description

This is DBConnect, a member of class IIBSQLMonitorHook.

29.2.1.2.2 IIBSQLMonitorHook.DBDisconnect Method

Pascal

```
procedure DBDisconnect(db: TIBDatabase);
```

C++

```
__fastcall DBDisconnect(TIBDatabase db);
```

Description

This is DBDisconnect, a member of class IIBSQLMonitorHook.

29.2.1.2.3 IIBSQLMonitorHook.GetEnabled Method

Pascal

```
function GetEnabled: boolean;
```

C++

```
__fastcall boolean GetEnabled();
```

Description

This is GetEnabled, a member of class IIBSQLMonitorHook.

29.2.1.2.4 IIBSQLMonitorHook.GetMonitorCount Method

Pascal

```
function GetMonitorCount: Integer;
```

C++

```
__fastcall int GetMonitorCount();
```

Description

This is GetMonitorCount, a member of class IIBSQLMonitorHook.

29.2.1.2.5 IIBSQLMonitorHook.GetTraceFlags Method

Pascal

```
function GetTraceFlags: TTraceFlags;
```

C++

```
__fastcall TTraceFlags GetTraceFlags();
```

Description

This is GetTraceFlags, a member of class IIBSQLMonitorHook.

29.2.1.2.6 IIBSQLMonitorHook.RegisterMonitor Method

Pascal

```
procedure RegisterMonitor(SQLMonitor: TIBCustomSQLMonitor);
```

C++

```
__fastcall RegisterMonitor(TIBCustomSQLMonitor SQLMonitor);
```

Description

This is RegisterMonitor, a member of class IIBSQLMonitorHook.

29.2.1.2.7 IIBSQLMonitorHook.ReleaseMonitor Method

Pascal

```
procedure ReleaseMonitor(Arg: TIBCustomSQLMonitor);
```

C++

```
__fastcall ReleaseMonitor(TIBCustomSQLMonitor Arg);
```

Description

This is ReleaseMonitor, a member of class IIBSQLMonitorHook.

29.2.1.2.8 IIBSQLMonitorHook.SendMisc Method

Pascal

```
procedure SendMisc(Msg: String);
```

C++

```
__fastcall SendMisc(UnicodeString Msg);
```

Description

This is SendMisc, a member of class IIBSQLMonitorHook.

29.2.1.2.9 IIBSQLMonitorHook.ServiceAttach Method

Pascal

```
procedure ServiceAttach(service: TIBCustomService);
```

C++

```
__fastcall ServiceAttach(TIBCustomService service);
```

Description

This is ServiceAttach, a member of class IIBSQLMonitorHook.

29.2.1.2.10 IIBSQLMonitorHook.ServiceDetach Method

Pascal

```
procedure ServiceDetach(service: TIBCustomService);
```

C++

```
__fastcall ServiceDetach(TIBCustomService service);
```

Description

This is ServiceDetach, a member of class IIBSQLMonitorHook.

29.2.1.2.11 IIBSQLMonitorHook.ServiceQuery Method

Pascal

```
procedure ServiceQuery(service: TIBCustomService);
```

C++

```
__fastcall ServiceQuery(TIBCustomService service);
```

Description

This is ServiceQuery, a member of class IIBSQLMonitorHook.

29.2.1.2.12 IIBSQLMonitorHook.ServiceStart Method

Pascal

```
procedure ServiceStart(service: TIBCustomService);
```

C++

```
__fastcall ServiceStart(TIBCustomService service);
```

Description

This is ServiceStart, a member of class IIBSQLMonitorHook.

29.2.1.2.13 IIBSQLMonitorHook.SetEnabled Method

Pascal

```
procedure SetEnabled(const Value: Boolean);
```

C++

```
__fastcall SetEnabled(const Boolean Value);
```

Description

This is SetEnabled, a member of class IIBSQLMonitorHook.

29.2.1.2.14 IIBSQLMonitorHook.SetTraceFlags Method

Pascal

```
procedure SetTraceFlags(const Value: TTraceFlags);
```

C++

```
__fastcall SetTraceFlags(const TTraceFlags Value);
```

Description

This is SetTraceFlags, a member of class IIBSQLMonitorHook.

29.2.1.2.15 IIBSQLMonitorHook.SQLExecute Method

Pascal

```
procedure SQLExecute(qry: TIBSQL);
```

C++

```
__fastcall SQLExecute(TIBSQL qry);
```

Description

This is SQLExecute, a member of class IIBSQLMonitorHook.

29.2.1.2.16 IIBSQLMonitorHook.SQLFetch Method

Pascal

```
procedure SQLFetch(qry: TIBSQL);
```

C++

```
__fastcall SQLFetch(TIBSQL qry);
```

Description

This is SQLFetch, a member of class IIBSQLMonitorHook.

29.2.1.2.17 IIBSQLMonitorHook.SQLPrepare Method

Pascal

```
procedure SQLPrepare(qry: TIBSQL);
```

C++

```
__fastcall SQLPrepare(TIBSQL qry);
```

Description

This is SQLPrepare, a member of class IIBSQLMonitorHook.

29.2.1.2.18 IIBSQLMonitorHook.TRCommit Method

Pascal

```
procedure TRCommit(tr: TIBTransaction);
```

C++

```
__fastcall TRCommit(TIBTransaction tr);
```

Description

This is TRCommit, a member of class IIBSQLMonitorHook.

29.2.1.2.19 IIBSQLMonitorHook.TRCommitRetaining Method

Pascal

```
procedure TRCommitRetaining(tr: TIBTransaction);
```

C++

```
__fastcall TRCommitRetaining(TIBTransaction tr);
```

Description

This is TRCommitRetaining, a member of class IIBSQLMonitorHook.

29.2.1.2.20 IIBSQLMonitorHook.TRRollback Method

Pascal

```
procedure TRRollback(tr: TIBTransaction);
```

C++

```
__fastcall TRRollback(TIBTransaction tr);
```

Description

This is TRRollback, a member of class IIBSQLMonitorHook.

29.2.1.2.21 IIBSQLMonitorHook.TRRollbackRetaining Method

Pascal

```
procedure TRRollbackRetaining(tr: TIBTransaction);
```

C++

```
__fastcall TRRollbackRetaining(TIBTransaction tr);
```

Description

This is TRRollbackRetaining, a member of class IIBSQLMonitorHook.

29.2.1.2.22 IIBSQLMonitorHook.TRStart Method

Pascal

```
procedure TRStart(tr: TIBTransaction);
```

C++

```
__fastcall TRStart(TIBTransaction tr);
```

Description

This is TRStart, a member of class IIBSQLMonitorHook.

29.2.1.2.23 IIBSQLMonitorHook.UnregisterMonitor Method

Pascal

```
procedure UnregisterMonitor(SQLMonitor: TIBCustomSQLMonitor);
```

C++

```
__fastcall UnregisterMonitor(TIBCustomSQLMonitor SQLMonitor);
```

Description

This is UnregisterMonitor, a member of class IIBSQLMonitorHook.

29.2.1.3 IIBSQLMonitorHook Properties

The properties of the IIBSQLMonitorHook class are listed here.

Public Properties

	Name	Description
	Enabled (see page 4116)	This is Enabled, a member of class IIBSQLMonitorHook.
	TraceFlags (see page 4116)	This is TraceFlags, a member of class IIBSQLMonitorHook.

29.2.1.3.1 IIBSQLMonitorHook.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

This is Enabled, a member of class IIBSQLMonitorHook.

29.2.1.3.2 IIBSQLMonitorHook.TraceFlags Property

Pascal

```
property TraceFlags: TTraceFlags;
```

C++

```
__property TTraceFlags TraceFlags;
```

Description

This is TraceFlags, a member of class IIBSQLMonitorHook.

29.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DisableMonitoring (see page 4117)	Disables SQL monitoring.
	EnableMonitoring (see page 4117)	This is function IBSQLMonitor.EnableMonitoring.
	MonitorHook (see page 4118)	This is function IBSQLMonitor.MonitorHook.
	MonitoringEnabled (see page 4118)	This is function IBSQLMonitor.MonitoringEnabled.

29.3.1 IBSQLMonitor.DisableMonitoring Function

Disables SQL monitoring.

Pascal

```
procedure DisableMonitoring;
```

C++

```
DisableMonitoring();
```

File

IBSQLMonitor

Description

Use the DisableMonitoring procedure to disable SQL monitoring.

29.3.2 IBSQLMonitor.EnableMonitoring Function

Pascal

```
procedure EnableMonitoring;
```

C++

```
EnableMonitoring();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.EnableMonitoring.

29.3.3 IBSQLMonitor.MonitorHook Function

Pascal

```
function MonitorHook: IIBSQLMonitorHook;
```

C++

```
IIBSQLMonitorHook MonitorHook();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.MonitorHook.

29.3.4 IBSQLMonitor.MonitoringEnabled Function

Pascal

```
function MonitoringEnabled: Boolean;
```

C++

```
Boolean MonitoringEnabled();
```

File

IBSQLMonitor

Description

This is function IBSQLMonitor.MonitoringEnabled.

29.4 Types

The following table lists types in this documentation.

Types

Name	Description
TSQLEvent (see page 4119)	TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

29.4.1 IBSQLMonitor.TSQLEvent Type

TSQLEvent is the type of event handlers that respond to activity on an InterBase server.

Pascal

```
TSQLEvent = procedure (EventText: String; EventTime : TDateTime) of object;
```

C++

```
(EventText: String; EventTime : TDateTime) ( TSQLEvent)();
```

File

IBSQLMonitor

Description

EventText is the text of the SQL command that triggered the event.

EventTime indicates the time when the command passed to or from the InterBase server.

29.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
WM_IBSQL_SQL_EVENT (see page 4120)	This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.
WM_MAX_IBSQL_MONITOR (see page 4120)	This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.
WM_MIN_IBSQL_MONITOR (see page 4120)	This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

29.5.1 IBSQLMonitor.WM_IBSQL_SQL_EVENT Constant

Pascal

```
WM_IBSQL_SQL_EVENT = WM_MIN_IBSQL_MONITOR + 1;
```

C++

```
WM_IBSQL_SQL_EVENT = WM_MIN_IBSQL_MONITOR + 1;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_IBSQL_SQL_EVENT.

29.5.2 IBSQLMonitor.WM_MAX_IBSQL_MONITOR Constant

Pascal

```
WM_MAX_IBSQL_MONITOR = WM_USER + 512;
```

C++

```
WM_MAX_IBSQL_MONITOR = WM_USER + 512;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_MAX_IBSQL_MONITOR.

29.5.3 IBSQLMonitor.WM_MIN_IBSQL_MONITOR Constant

Pascal

```
WM_MIN_IBSQL_MONITOR = WM_USER;
```

C++

```
WM_MIN_IBSQL_MONITOR = WM_USER;
```

File

IBSQLMonitor

Description

This is constant IBSQLMonitor.WM_MIN_IBSQL_MONITOR.

30 IBStoredProc Namespace

This is namespace IBStoredProc.

Topics

Name	Description
Classes (see page 4124)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBStoredProc (see page 4124)	TIBStoredProc encapsulates a stored procedure on a database server.

30.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBStoredProc (see page 4124)	TIBStoredProc encapsulates a stored procedure on a database server.

30.1.1 TIBStoredProc Class

TIBStoredProc encapsulates a stored procedure on a database server.

Class Hierarchy

Pascal

```
TIBStoredProc = class(TIBCustomDataSet);
```

C++

```
class TIBStoredProc : public TIBCustomDataSet;
```

File

IBStoredProc

Description

Use a TIBStoredProc object when a client application must use a stored procedure on a database server. A stored procedure is a grouped set of statements, stored as part of a database server's metadata (just like tables, indexes, and domains), that performs a frequently repeated, database-related task on the server and passes results to the client.

Many stored procedures require a series of input arguments, or parameters, that are used during processing. TIBStoredProc provides a Params (see page 4135) property that enables an application to set these parameters before executing the stored procedure.

TIBStoredProc reuses the Params (see page 4135) property to hold the results returned by a stored procedure. Params (see page 4135) is an array of values. A stored procedure will return a single set of values, or none at all.

Note: TIBStoredProc components should be used with InterBase Execute stored procedures only. To use InterBase Select procedures, use TIBQuery or TIBDataSet (see page 3654). Since Execute stored procedures do not return result sets, never use Open or Active on the TIBStoredProc component. Use ExecProc (see page 4130) instead.

Getting Started with InterBase Express

30.1.1.1 TIBStoredProc Members

The following tables list the members exposed by TIBStoredProc.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.
V	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
V	DefineProperties (see page 4130)	This is DefineProperties, a member of class TIBStoredProc.
V	Disconnect (see page 4130)	This is Disconnect, a member of class TIBStoredProc.
V	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
V	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
V	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
V	DoOnNewRecord (see page 3614)	This is DoOnNewRecord, a member of class TIBCustomDataSet.
V	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
V	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
V	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
V	GetCanModify (see page 3615)	This is GetCanModify, a member of class TIBCustomDataSet.
V	GetDataSource (see page 3616)	This is GetDataSource, a member of class TIBCustomDataSet.
V	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetParamsCount (see page 4131)	This is GetParamsCount, a member of class TIBStoredProc.
V	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
V	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
V	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
V	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
V	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
V	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
V	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
V	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
V	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
V	InternalClose (see page 3619)	This is InternalClose, a member of class TIBCustomDataSet.
V	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
V	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
V	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
V	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
V	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
V	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
V	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
V	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
V	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
V	InternalOpen (see page 4131)	This is InternalOpen, a member of class TIBStoredProc.
V	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
V	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
V	InternalRefresh (see page 3622)	This is InternalRefresh, a member of class TIBCustomDataSet.
V	InternalRefreshRow (see page 3622)	This is InternalRefreshRow, a member of class TIBCustomDataSet.
V	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
V	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
V	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
V	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.

	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecute (see page 4132)	This is PSExecute, a member of class TIBStoredProc.
	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetParams (see page 4132)	This is PSGetParams, a member of class TIBStoredProc.
	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 4132)	This is PSGetTableName, a member of class TIBStoredProc.
	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
	PSSetCommandText (see page 4133)	This is PSSetCommandText, a member of class TIBStoredProc.
	PSSetParams (see page 4133)	This is PSSetParams, a member of class TIBStoredProc.
	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 4133)	This is SetFiltered, a member of class TIBStoredProc.
	SetPrepare (see page 4133)	This is SetPrepare, a member of class TIBStoredProc.
	SetPrepared (see page 4133)	This is SetPrepared, a member of class TIBStoredProc.
	SetProcName (see page 4134)	This is SetProcName, a member of class TIBStoredProc.
	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.

Protected Properties

	Name	Description
	BufferChunks (see page 3638)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 3638)	Specifies whether cached updates are enabled for a dataset.
	DeleteSQL (see page 3639)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 3640)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3640)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
R	LiveMode (see page 3641)	Indicates what types of edits, if any, can be made to the data in the dataset.
	ModifySQL (see page 3641)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 3642)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.
R	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
R	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
R	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
R	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	RefreshSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 3645)	Gets the handle for the SELECT statement.

	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
	StatementType (see page 3646)	Returns the statement type of the QSelect (see page 3644) query.
	UniDirectional (see page 3647)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.
	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.
	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
	CompareBookmarks (see page 3611)	Compares two bookmarks.
	CopyParams (see page 4130)	Copies a stored procedure's parameters into another parameter list.
	Create (see page 4128)	Creates an instance of a stored procedure component.
	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
	Destroy (see page 4129)	Destroys the instance of a stored procedure.
	ExecProc (see page 4130)	Executes the stored procedure on the server.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.
	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
	Locate (see page 3624)	Searches the dataset for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.
	ParamByName (see page 4131)	Accesses parameter information based on a specified parameter name.
	Post (see page 3626)	Writes a modified record to the database server.
	Prepare (see page 4132)	Prepares a stored procedure for execution.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
	UnPrepare (see page 4134)	Frees the resources allocated for a previously prepared stored procedure.
	UpdateStatus (see page 3632)	Reports the update status for the current record.

Public Properties

	Name	Description
	DBHandle (see page 3639)	Specifies the database handle for the dataset.
	ParamCount (see page 4135)	Indicates the number of parameters for the stored procedure component.
	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
	Prepared (see page 4136)	Determines whether or not a stored procedure is prepared for execution.
	RowsAffected (see page 3645)	Indicates the number of rows operated on by the latest query execution.
	StmtHandle (see page 4136)	Identifies the statement handle for the stored procedure.
	StoredProcedureNames (see page 4136)	Returns a list of stored procedures in the database.
	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateObject (see page 3647)	Specifies the update object component used to update a read-only result set.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 4137)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 4137)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 4138)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 4138)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 4138)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 4138)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	AfterCancel (see page 3634)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 3634)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 3634)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 3634)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 3635)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 3635)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 3635)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3635)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 3636)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 3636)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 3636)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 3636)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 3637)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 3637)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 3637)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 3637)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3638)	This is BeforeScroll, a member of class TIBCustomDataSet.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	Filtered (see page 4134)	Specifies whether filtering is active for a dataset.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3641)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 3642)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 3642)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 4135)	This is OnFilterRecord, a member of class TIBStoredProc.
	OnNewRecord (see page 3642)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 3642)	This is OnPostError, a member of class TIBCustomDataSet.
	Params (see page 4135)	Stores the input and output parameters for a stored procedure.
	StoredProcName (see page 4137)	Identifies the name of the stored procedure on the server for which this object is an encapsulation.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.

30.1.1.2 TIBStoredProc.Create Constructor

Creates an instance of a stored procedure component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBStoredProc(TComponent * AOwner);
```

Description

Call Create to instantiate a stored procedure declared in an application. Create calls its inherited Create constructor, creates an empty parameter list for the newly instantiated stored procedure, and initializes its parameter, server, and record buffers to nil.

30.1.1.3 TIBStoredProc.Destroy Destructor

Destroys the instance of a stored procedure.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBStoredProc();
```

Description

Do not call Destroy directly. Instead call Free to verify that the stored procedure is not already freed before calling Destroy. Destroy disconnects from the server, frees the parameter list, and calls its inherited Destroy destructor.

30.1.1.4 TIBStoredProc Methods

The methods of the TIBStoredProc class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 4130)	This is DefineProperties, a member of class TIBStoredProc.
	Disconnect (see page 4130)	This is Disconnect, a member of class TIBStoredProc.
	GetParamsCount (see page 4131)	This is GetParamsCount, a member of class TIBStoredProc.
	InternalOpen (see page 4131)	This is InternalOpen, a member of class TIBStoredProc.
	PSExecute (see page 4132)	This is PSExecute, a member of class TIBStoredProc.
	PSGetParams (see page 4132)	This is PSGetParams, a member of class TIBStoredProc.
	PSGetTableName (see page 4132)	This is PSGetTableName, a member of class TIBStoredProc.
	PSSetCommandText (see page 4133)	This is PSSetCommandText, a member of class TIBStoredProc.
	PSSetParams (see page 4133)	This is PSSetParams, a member of class TIBStoredProc.
	SetFiltered (see page 4133)	This is SetFiltered, a member of class TIBStoredProc.
	SetPrepare (see page 4133)	This is SetPrepare, a member of class TIBStoredProc.
	SetPrepared (see page 4133)	This is SetPrepared, a member of class TIBStoredProc.
	SetProcName (see page 4134)	This is SetProcName, a member of class TIBStoredProc.

Public Methods

	Name	Description
	CopyParams (see page 4130)	Copies a stored procedure's parameters into another parameter list.
	ExecProc (see page 4130)	Executes the stored procedure on the server.
	ParamByName (see page 4131)	Accesses parameter information based on a specified parameter name.
	Prepare (see page 4132)	Prepares a stored procedure for execution.
	UnPrepare (see page 4134)	Frees the resources allocated for a previously prepared stored procedure.

30.1.1.4.1 TIBStoredProc.CopyParams Method

Copies a stored procedure's parameters into another parameter list.

Pascal

```
procedure CopyParams(Value: TParams);
```

C++

```
__fastcall CopyParams(TParams Value);
```

Description

Call CopyParams to copy this stored procedure's parameters into a separate parameter list object. Value is the parameter list into which to assign this stored procedure's parameters. Value can be the parameter list of another stored procedure. For example:

```
TIBStoredProc1.CopyParams(TIBStoredProc2.Params);
    TIBStoredProc1->CopyParams(TIBStoredProc2->Params);
```

If the stored procedure is not prepared when an application calls CopyParams, CopyParams calls Prepare (see page 4132) before assigning the parameters to the target parameters list, and then calls UnPrepare (see page 4134) to return the stored procedure to its previous state.

30.1.1.4.2 TIBStoredProc.DefineProperties Method

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

This is DefineProperties, a member of class TIBStoredProc.

30.1.1.4.3 TIBStoredProc.Disconnect Method

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

This is Disconnect, a member of class TIBStoredProc.

30.1.1.4.4 TIBStoredProc.ExecProc Method

Executes the stored procedure on the server.

Pascal

```
procedure ExecProc;
```

C++

```
__fastcall ExecProc();
```

Description

Call ExecProc to execute a stored procedure on the server. Before calling ExecProc:

1. **1** Provide any input parameters in the Params (see page 4135) property. At design time, a developer can provide parameters using the Parameters editor. At runtime an application must access Params (see page 4135) directly.
2. **2** Call Prepare (see page 4132) to bind the parameters.

If a stored procedure returns output parameters, they are stored in the Params (see page 4135) property when ExecProc returns control to the application. An application can access the output parameters by indexing into the Params (see page 4135) list, or by using the ParamByName (see page 4131) method.

30.1.1.4.5 TIBStoredProc.GetParamsCount Method

Pascal

```
function GetParamsCount: Word;
```

C++

```
__fastcall Word GetParamsCount();
```

Description

This is GetParamsCount, a member of class TIBStoredProc.

30.1.1.4.6 TIBStoredProc.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBStoredProc.

30.1.1.4.7 TIBStoredProc.ParamByName Method

Accesses parameter information based on a specified parameter name.

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const UnicodeString Value);
```

Description

Call ParamByName to return parameter information for a specific parameter based on its name. Value is the name of the parameter for which to retrieve information. Typically ParamByName is used to set an input parameter's value at runtime, or to retrieve the value of an output parameter. The following command line assigns the value "Jane Smith" as the value for the parameter named Contact:

```
StoredProc1.ParamByName('Contact').AsString := 'Jane Smith';
    StoredProc1->ParamByName("Contact")->AsString = "Jane Smith";
```

30.1.1.4.8 TIBStoredProc.Prepare Method

Prepares a stored procedure for execution.

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

Call Prepare to bind a stored procedure's parameters before calling ExecProc (see page 4130) to execute the procedure. Prepare readies a stored procedure's parameters and informs the server of the stored procedure's readiness. These steps allocate system resources and optimize the query for server performance.

Note: A stored procedure is automatically prepared if it is unprepared when the application calls ExecProc (see page 4130). After execution, the stored procedure is then automatically unprepared. If a stored procedure will be executed more than once, it is more efficient for an application to call Prepare explicitly once to avoid repeated and unnecessary preparing and unpreparing of the stored procedure, and then call UnPrepare (see page 4134) when the stored procedure is no longer needed.

30.1.1.4.9 TIBStoredProc.PSExecute Method

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

This is PSExecute, a member of class TIBStoredProc.

30.1.1.4.10 TIBStoredProc.PSGetParams Method

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

This is PSGetParams, a member of class TIBStoredProc.

30.1.1.4.11 TIBStoredProc.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBStoredProc.

30.1.1.4.12 TIBStoredProc.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBStoredProc.

30.1.1.4.13 TIBStoredProc.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBStoredProc.

30.1.1.4.14 TIBStoredProc.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBStoredProc.

30.1.1.4.15 TIBStoredProc.SetPrepare Method

Pascal

```
procedure SetPrepare(Value: Boolean);
```

C++

```
__fastcall SetPrepare(Boolean Value);
```

Description

This is SetPrepare, a member of class TIBStoredProc.

30.1.1.4.16 TIBStoredProc.SetPrepared Method

Pascal

```
procedure SetPrepared(Value: Boolean);
```

C++

```
__fastcall SetPrepared(Boolean Value);
```

Description

This is SetPrepared, a member of class TIBStoredProc.

30.1.1.4.17 TIBStoredProc.SetProcName Method

Pascal

```
procedure SetProcName(Value: string);
```

C++

```
__fastcall SetProcName(UnicodeString Value);
```

Description

This is SetProcName, a member of class TIBStoredProc.

30.1.1.4.18 TIBStoredProc.UnPrepare Method

Frees the resources allocated for a previously prepared stored procedure.

Pascal

```
procedure UnPrepare;
```

C++

```
__fastcall UnPrepare();
```

Description

Call UnPrepare to free the resources allocated for a previously prepared stored procedure on the server and client sides.

30.1.1.5 TIBStoredProc Properties

The properties of the TIBStoredProc class are listed here.

Public Properties

	Name	Description
R	ParamCount (see page 4135)	Indicates the number of parameters for the stored procedure component.
	Prepared (see page 4136)	Determines whether or not a stored procedure is prepared for execution.
R	StmtHandle (see page 4136)	Identifies the statement handle for the stored procedure.
R	StoredProcedureNames (see page 4136)	Returns a list of stored procedures in the database.

Published Properties

	Name	Description
	Filtered (see page 4134)	Specifies whether filtering is active for a dataset.
	OnFilterRecord (see page 4135)	This is OnFilterRecord, a member of class TIBStoredProc.
	Params (see page 4135)	Stores the input and output parameters for a stored procedure.
	StoredProcName (see page 4137)	Identifies the name of the stored procedure on the server for which this object is an encapsulation.

30.1.1.5.1 TIBStoredProc.Filtered Property

Specifies whether filtering is active for a dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether dataset filtering is in effect. If Filtered is true, then filtering is active. Otherwise Filtered is false. To apply filter conditions specified in the Filter property or the OnFilterRecord (see page 4135) event handler, set Filtered to true. Filtered is set to false by default.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time the record is retrieved from the dataset while the filter is in effect, the record may seem to disappear. If that happens, the next record that passes the filter condition becomes the current record.

30.1.1.5.2 TIBStoredProc.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBStoredProc.

30.1.1.5.3 TIBStoredProc.ParamCount Property

Indicates the number of parameters for the stored procedure component.

Pascal

```
property ParamCount: Word;
```

C++

```
__property Word ParamCount;
```

Description

Examine ParamCount to determine the number of parameters currently stored in the Params (see page 4135) property.

30.1.1.5.4 TIBStoredProc.Params Property

Stores the input and output parameters for a stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Access Params at runtime to set input parameter names, values, and data types dynamically (at design time use the Parameters editor to set parameter information). Params is an array of parameter values.

An application can also access Params after executing a stored procedure to retrieve the output parameters returned to the

procedure by the server.

30.1.1.5.5 TIBStoredProc.Prepared Property

Determines whether or not a stored procedure is prepared for execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Examine Prepared to determine if a stored procedure is already prepared for execution. If Prepared is true, the stored procedure is prepared, and if Prepared is false, the procedure is not prepared. A stored procedure must be prepared before it can be executed.

Note: A stored procedure is automatically prepared if it is unprepared when the application calls ExecProc (see page 4130). After execution, the stored procedure is then automatically unprepared. If a procedure will be executed a number of times, it is more efficient for the application to prepare the stored procedure once, and unprepare it when it is no longer needed.

An application can change the current setting of Prepared to prepare or unprepare a stored procedure. If Prepared is true, setting it to false calls the Unprepare method to unprepare the stored procedure. If Prepared is false, setting it to true calls the Prepare (see page 4132) method to prepare the procedure. Generally, however, it is better programming practice to call Prepare (see page 4132) and Unprepare directly. These methods automatically update the Prepared property.

30.1.1.5.6 TIBStoredProc.StmtHandle Property

Identifies the statement handle for the stored procedure.

Pascal

```
property StmtHandle: TISC_STMT_HANDLE;
```

C++

```
__property TISC_STMT_HANDLE StmtHandle;
```

Description

Retrieve StmtHandle if an application makes a direct call to the InterBase server, bypassing the methods of TIBStoredProc (see page 4124). Some API calls require a statement handle as a parameter. Under all other circumstances an application does not need to access this property.

30.1.1.5.7 TIBStoredProc.StoredProcedureNames Property

Returns a list of stored procedures in the database.

Pascal

```
property StoredProcedureNames: TStrings;
```

C++

```
__property TStrings StoredProcedureNames;
```

Description

StoredProcedureNames is an internal property used to list the stored procedures available in the database.

30.1.1.5.8 TIBStoredProc.StoredProcName Property

Identifies the name of the stored procedure on the server for which this object is an encapsulation.

Pascal

```
property StoredProcName: string;
```

C++

```
__property UnicodeString StoredProcName;
```

Description

Set StoredProcName to specify the name of the stored procedure to call on the server. If StoredProcName does not match the name of an existing stored procedure on the server, then when the application attempts to prepare the procedure prior to execution, an exception is raised.

30.1.1.6 TIBStoredProc Events

The events of the TIBStoredProc class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 4137)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 4137)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 4138)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 4138)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 4138)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 4138)	Occurs when the transaction that includes this dataset's query is freed.

30.1.1.6.1 TIBStoredProc.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

30.1.1.6.2 TIBStoredProc.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

30.1.1.6.3 TIBStoredProc.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database property.

30.1.1.6.4 TIBStoredProc.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

30.1.1.6.5 TIBStoredProc.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

30.1.1.6.6 TIBStoredProc.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

31 IBTable Namespace

This is namespace IBTable.

Topics

Name	Description
Classes (see page 4142)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4168)	The following table lists structs, records, enums in this documentation.
Types (see page 4169)	The following table lists types in this documentation.

Classes

	Name	Description
	TIBTable (see page 4142)	TIBTable is a dataset component that encapsulates a database table.

Structs, Records, Enums

	Name	Description
	TIBTableType (see page 4168)	This is record IBTable.TIBTableType.

Types

Name	Description
TIBTableTypes (see page 4169)	TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.
TIndexName (see page 4169)	This is type IBTable.TIndexName.

31.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBTable (see page 4142)	TIBTable is a dataset component that encapsulates a database table.

31.1.1 TIBTable Class

TIBTable is a dataset component that encapsulates a database table.

Class Hierarchy

Pascal

```
TIBTable = class(TIBCustomDataSet);
```

C++

```
class TIBTable : public TIBCustomDataSet;
```

File

IBTable

Description

Use TIBTable to access data in a single table or view. TIBTable provides direct access to every record and field in an underlying InterBase database table. A table component can also work with a subset of records within a database table using filters.

31.1.1.1 TIBTable Members

The following tables list the members exposed by TIBTable.

Protected Methods

	Name	Description
	ActivateConnection (see page 3609)	This is ActivateConnection, a member of class TIBCustomDataSet.
	ActivateTransaction (see page 3609)	This is ActivateTransaction, a member of class TIBCustomDataSet.
V	AllocRecordBuffer (see page 3609)	This is AllocRecordBuffer, a member of class TIBCustomDataSet.
	CheckDatasetClosed (see page 3611)	This is CheckDatasetClosed, a member of class TIBCustomDataSet.
	CheckDatasetOpen (see page 3611)	This is CheckDatasetOpen, a member of class TIBCustomDataSet.
	CheckNotUniDirectional (see page 3611)	This is CheckNotUniDirectional, a member of class TIBCustomDataSet.
V	ClearCalcFields (see page 3611)	This is ClearCalcFields, a member of class TIBCustomDataSet.
	ConstraintsStored (see page 3612)	This is ConstraintsStored, a member of class TIBCustomDataSet.

	CreateFields (see page 3612)	This is CreateFields, a member of class TIBCustomDataSet.
	DataEvent (see page 4149)	This is DataEvent, a member of class TIBTable.
	DeactivateTransaction (see page 3613)	This is DeactivateTransaction, a member of class TIBCustomDataSet.
	DefChanged (see page 4149)	This is DefChanged, a member of class TIBTable.
	Disconnect (see page 3613)	This is Disconnect, a member of class TIBCustomDataSet.
	DoBeforeDelete (see page 3613)	This is DoBeforeDelete, a member of class TIBCustomDataSet.
	DoBeforeEdit (see page 3613)	This is DoBeforeEdit, a member of class TIBCustomDataSet.
	DoBeforeInsert (see page 3614)	This is DoBeforeInsert, a member of class TIBCustomDataSet.
	DoOnNewRecord (see page 4150)	This is DoOnNewRecord, a member of class TIBTable.
	FreeRecordBuffer (see page 3615)	This is FreeRecordBuffer, a member of class TIBCustomDataSet.
	GetActiveBuf (see page 3615)	This is GetActiveBuf, a member of class TIBCustomDataSet.
	GetBookmarkData (see page 3615)	This is GetBookmarkData, a member of class TIBCustomDataSet.
	GetBookmarkFlag (see page 3615)	This is GetBookmarkFlag, a member of class TIBCustomDataSet.
	GetCanModify (see page 4150)	This is GetCanModify, a member of class TIBTable.
	GetDataSource (see page 4151)	This is GetDataSource, a member of class TIBTable.
	GetFieldClass (see page 3616)	This is GetFieldClass, a member of class TIBCustomDataSet.
	GetIndexParams (see page 4151)	This is GetIndexParams, a member of class TIBTable.
	GetRecNo (see page 3617)	This is GetRecNo, a member of class TIBCustomDataSet.
	GetRecord (see page 3617)	This is GetRecord, a member of class TIBCustomDataSet.
	GetRecordCount (see page 3618)	This is GetRecordCount, a member of class TIBCustomDataSet.
	GetRecordSize (see page 3618)	This is GetRecordSize, a member of class TIBCustomDataSet.
	InitFieldDefs (see page 4152)	This is InitFieldDefs, a member of class TIBTable.
	InitRecord (see page 3618)	This is InitRecord, a member of class TIBCustomDataSet.
	InternalAddRecord (see page 3618)	This is InternalAddRecord, a member of class TIBCustomDataSet.
	InternalBatchInput (see page 3619)	This is InternalBatchInput, a member of class TIBCustomDataSet.
	InternalBatchOutput (see page 3619)	This is InternalBatchOutput, a member of class TIBCustomDataSet.
	InternalCancel (see page 3619)	This is InternalCancel, a member of class TIBCustomDataSet.
	InternalClose (see page 4152)	This is InternalClose, a member of class TIBTable.
	InternalDelete (see page 3619)	This is InternalDelete, a member of class TIBCustomDataSet.
	InternalExecQuery (see page 3620)	This is InternalExecQuery, a member of class TIBCustomDataSet.
	InternalFirst (see page 3620)	This is InternalFirst, a member of class TIBCustomDataSet.
	InternalGotoBookmark (see page 3620)	This is InternalGotoBookmark, a member of class TIBCustomDataSet.
	InternalHandleException (see page 3620)	This is InternalHandleException, a member of class TIBCustomDataSet.
	InternalInitFieldDefs (see page 3621)	This is InternalInitFieldDefs, a member of class TIBCustomDataSet.
	InternalInitRecord (see page 3621)	This is InternalInitRecord, a member of class TIBCustomDataSet.
	InternalInsert (see page 3621)	This is InternalInsert, a member of class TIBCustomDataSet.
	InternalLast (see page 3621)	This is InternalLast, a member of class TIBCustomDataSet.
	InternalOpen (see page 4152)	This is InternalOpen, a member of class TIBTable.
	InternalPost (see page 3622)	This is InternalPost, a member of class TIBCustomDataSet.
	InternalPrepare (see page 3622)	This is InternalPrepare, a member of class TIBCustomDataSet.
	InternalRefresh (see page 4153)	This is InternalRefresh, a member of class TIBTable.
	InternalRefreshRow (see page 4153)	This is InternalRefreshRow, a member of class TIBTable.
	InternalSetParamsFromCursor (see page 3623)	This is InternalSetParamsFromCursor, a member of class TIBCustomDataSet.
	InternalSetToRecord (see page 3623)	This is InternalSetToRecord, a member of class TIBCustomDataSet.
	InternalUnPrepare (see page 3623)	This is InternalUnPrepare, a member of class TIBCustomDataSet.
	IsCursorOpen (see page 3623)	This is IsCursorOpen, a member of class TIBCustomDataSet.
	Loaded (see page 3624)	This is Loaded, a member of class TIBCustomDataSet.
	PSEndTransaction (see page 3626)	This is PSEndTransaction, a member of class TIBCustomDataSet.
	PSExecuteStatement (see page 3626)	This is PSExecuteStatement, a member of class TIBCustomDataSet.
	PSGetDefaultOrder (see page 4154)	This is PSGetDefaultOrder, a member of class TIBTable.
	PSGetIndexDefs (see page 4154)	This is PSGetIndexDefs, a member of class TIBTable.
	PSGetKeyFields (see page 4154)	This is PSGetKeyFields, a member of class TIBTable.
	PSGetQuoteChar (see page 3627)	This is PSGetQuoteChar, a member of class TIBCustomDataSet.
	PSGetTableName (see page 4154)	This is PSGetTableName, a member of class TIBTable.

V	PSGetUpdateException (see page 3627)	This is PSGetUpdateException, a member of class TIBCustomDataSet.
V	PSInTransaction (see page 3627)	This is PSInTransaction, a member of class TIBCustomDataSet.
V	PSIsSQLBased (see page 3628)	This is PSIsSQLBased, a member of class TIBCustomDataSet.
V	PSIsSQLSupported (see page 3628)	This is PSIsSQLSupported, a member of class TIBCustomDataSet.
V	PSReset (see page 3628)	This is PSReset, a member of class TIBCustomDataSet.
V	PSSetCommandText (see page 4155)	This is PSSetCommandText, a member of class TIBTable.
V	PSSetParams (see page 4155)	This is PSSetParams, a member of class TIBTable.
V	PSStartTransaction (see page 3628)	This is PSStartTransaction, a member of class TIBCustomDataSet.
V	PSUpdateRecord (see page 3628)	This is PSUpdateRecord, a member of class TIBCustomDataSet.
	ReQuery (see page 3629)	This is ReQuery, a member of class TIBCustomDataSet.
V	SetActive (see page 3629)	This is SetActive, a member of class TIBCustomDataSet.
V	SetBookmarkData (see page 3630)	This is SetBookmarkData, a member of class TIBCustomDataSet.
V	SetBookmarkFlag (see page 3630)	This is SetBookmarkFlag, a member of class TIBCustomDataSet.
	SetCachedUpdates (see page 3630)	This is SetCachedUpdates, a member of class TIBCustomDataSet.
	SetDataSource (see page 3630)	This is SetDataSource, a member of class TIBCustomDataSet.
V	SetFieldData (see page 3630)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 4155)	This is SetFiltered, a member of class TIBTable.
V	SetFilterOptions (see page 4155)	This is SetFilterOptions, a member of class TIBTable.
V	SetFilterText (see page 4156)	This is SetFilterText, a member of class TIBTable.
V	SetRecNo (see page 3631)	This is SetRecNo, a member of class TIBCustomDataSet.
V	UpdateIndexDefs (see page 4156)	This is UpdateIndexDefs, a member of class TIBTable.

Protected Properties

	Name	Description
	DeleteSQL (see page 3639)	Holds the SQL statement used to delete rows from the dataset.
	GeneratorField (see page 3640)	Specifies whether the dataset should refresh its data every time it posts a record.
	InsertSQL (see page 3640)	Holds the SQL statement used to insert rows into the dataset.
R	InternalPrepared (see page 3640)	Indicates whether the dataset has prepared its queries for execution.
	ModifySQL (see page 3641)	Provides the ability to access the SQL object encapsulating the ModifySQL statement.
	ParamCheck (see page 3642)	Specifies whether the parameter list for a query is regenerated if the SQL property changes at runtime.
R	Params (see page 3643)	Specifies the parameters to use for any parameterized queries.
R	QDelete (see page 3643)	Provides the ability to directly access the SQL object encapsulating the DeleteSQL (see page 3639) statement.
R	QInsert (see page 3644)	Provides the ability to directly access the SQL object encapsulating the InsertSQL (see page 3640) statement.
R	QModify (see page 3644)	Provides the ability to directly access the SQL object encapsulating the ModifySQL (see page 3641) statement.
R	QRefresh (see page 3644)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL (see page 3645) statement.
R	QSelect (see page 3644)	Provides the ability to directly access the SQL object encapsulating the SelectSQL (see page 3645) statement.
	RefreshSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.
	SelectSQL (see page 3645)	Provides the ability to directly access the SQL object encapsulating the SelectSQL statement.
R	SelectStmtHandle (see page 3645)	Gets the handle for the SELECT statement.
R	SQLParams (see page 3646)	Specifies the parameters to use for any parameterized queries.
R	StatementType (see page 3646)	Returns the statement type of the QSelect (see page 3644) query.
	UpdateMode (see page 3647)	Indicates how records are located when updating records.

Public Methods

	Name	Description
	AddIndex (see page 4148)	Creates a new index for the table.
	ApplyUpdates (see page 3609)	Writes a dataset's pending cached updates to the database.
V	BookmarkValid (see page 3610)	Indicates the validity of a specified bookmark.

	CachedUpdateStatus (see page 3610)	Returns the status of the cached updates.
	CancelUpdates (see page 3610)	Clears all pending cached updates from the cache.
V	CompareBookmarks (see page 3611)	Compares two bookmarks.
V	Create (see page 4147)	Creates an instance of a table component.
V	CreateBlobStream (see page 3612)	Returns a TIBDSBlobStream (see page 3678) object for reading or writing the data in a specified blob field.
	CreateTable (see page 4148)	Builds a new table using new structure information.
	Current (see page 3613)	Returns the descriptor area that holds information about the current query.
	DeleteIndex (see page 4149)	Deletes an index for the table.
	DeleteTable (see page 4150)	Deletes an existing database table.
V	Destroy (see page 4147)	Destroys the instance of a table.
	EmptyTable (see page 4150)	Deletes all records from the table.
	FetchAll (see page 3614)	Retrieves all records from the current cursor position to the end of the file and stores them locally.
V	GetCurrentRecord (see page 3616)	Retrieves the current record into a buffer.
V	GetDetailLinkFields (see page 4151)	Lists the field components that link this dataset as a detail of a master dataset.
V	GetFieldData (see page 3616)	This is the overview for the GetFieldData method overload.
	GetIndexNames (see page 4151)	Retrieves a list of available indexes for a table.
	GotoCurrent (see page 4152)	Synchronizes the current record for this table with the current record of a specified table component.
V	IsSequenced (see page 3623)	IsSequenced indicates whether sequence numbers are available for database records.
V	Locate (see page 4153)	Searches the table for a specified record and makes that record the current record.
	LocateNext (see page 3625)	Searches the dataset for the record after a specified record and makes that record the current record.
V	Lookup (see page 3625)	Retrieves field values from a record that matches specified search values.
V	Post (see page 3626)	Writes a modified record to the database server.
	RecordModified (see page 3629)	Sets the record to modified or unmodified.
	RevertRecord (see page 3629)	Restores the current record in the dataset to an unmodified state when cached updates are enabled.
	SQLType (see page 3631)	Returns the type of query to be executed.
	Undelete (see page 3632)	Restores a record deleted from the dataset.
V	UpdateStatus (see page 3632)	Reports the update status for the current record.

Public Properties

	Name	Description
R	CurrentDBKey (see page 4158)	Returns the DBKey for the current row in the table.
R	DBHandle (see page 3639)	Specifies the database handle for the dataset.
R	Exists (see page 4158)	Indicates whether the underlying database table exists.
R	IndexFieldCount (see page 4160)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 4161)	Retrieves or sets a field for an index.
	LiveMode (see page 4161)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	Plan (see page 3643)	Indicates the PLAN portion of the dataset's SELECT query.
R	RowsAffected (see page 3645)	Indicates the number of rows operated on by the latest query execution.
R	TableNames (see page 4164)	Returns a list of table names.
R	TRHandle (see page 3646)	Specifies the transaction handle for the dataset.
	UpdateRecordTypes (see page 3648)	Specifies the type of records visible in a dataset when cached updates are enabled.
R	UpdatesPending (see page 3648)	Indicates whether the cached updates buffer contains records that are not yet applied.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 4165)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 4165)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 4166)	Occurs immediately before the connection to the associated database is closed.

	BeforeTransactionEnd (see page 4166)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 4166)	Occurs when the database associated with this dataset is freed.
	OnUpdateError (see page 3650)	Occurs if an exception is generated when cached updates are applied to a database.
	OnUpdateRecord (see page 3651)	Occurs when cached updates are applied to a record.
	TransactionFree (see page 4166)	Occurs when the transaction that includes this dataset's query is freed.

Published Properties

	Name	Description
	Active (see page 4157)	This is Active, a member of class TIBTable.
	AfterCancel (see page 3634)	This is AfterCancel, a member of class TIBCustomDataSet.
	AfterClose (see page 3634)	This is AfterClose, a member of class TIBCustomDataSet.
	AfterDelete (see page 3634)	This is AfterDelete, a member of class TIBCustomDataSet.
	AfterEdit (see page 3634)	This is AfterEdit, a member of class TIBCustomDataSet.
	AfterInsert (see page 3635)	This is AfterInsert, a member of class TIBCustomDataSet.
	AfterOpen (see page 3635)	This is AfterOpen, a member of class TIBCustomDataSet.
	AfterPost (see page 3635)	This is AfterPost, a member of class TIBCustomDataSet.
	AfterRefresh (see page 3635)	This is AfterRefresh, a member of class TIBCustomDataSet.
	AfterScroll (see page 3635)	This is AfterScroll, a member of class TIBCustomDataSet.
	AutoCalcFields (see page 3636)	This is AutoCalcFields, a member of class TIBCustomDataSet.
	BeforeCancel (see page 3636)	This is BeforeCancel, a member of class TIBCustomDataSet.
	BeforeClose (see page 3636)	This is BeforeClose, a member of class TIBCustomDataSet.
	BeforeDelete (see page 3636)	This is BeforeDelete, a member of class TIBCustomDataSet.
	BeforeEdit (see page 3637)	This is BeforeEdit, a member of class TIBCustomDataSet.
	BeforeInsert (see page 3637)	This is BeforeInsert, a member of class TIBCustomDataSet.
	BeforeOpen (see page 3637)	This is BeforeOpen, a member of class TIBCustomDataSet.
	BeforePost (see page 3637)	This is BeforePost, a member of class TIBCustomDataSet.
	BeforeRefresh (see page 3637)	This is BeforeRefresh, a member of class TIBCustomDataSet.
	BeforeScroll (see page 3638)	This is BeforeScroll, a member of class TIBCustomDataSet.
	BufferChunks (see page 4157)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 4157)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 4158)	This is Constraints, a member of class TIBTable.
	Database (see page 3639)	Identifies the database component for which this dataset represents one or more tables.
	DefaultIndex (see page 4158)	Specifies if the data in the table should be ordered on a default index when opened.
	FieldDefs (see page 4159)	This is FieldDefs, a member of class TIBTable.
	Filter (see page 4159)	Specifies rows in a dataset that meet the filter conditions.
	Filtered (see page 4159)	Specifies whether or not filtering is active for a table.
	ForcedRefresh (see page 3639)	Specifies whether the dataset should refresh its data every time it posts a record.
	IndexDefs (see page 4160)	Contains information about the indexes for a table.
	IndexFieldNames (see page 4160)	Lists the columns to use as an index for a table.
	IndexName (see page 4161)	Identifies an index for the table.
	MasterFields (see page 4162)	Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.
	MasterSource (see page 4162)	Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.
	ObjectView (see page 3641)	This is ObjectView, a member of class TIBCustomDataSet.
	OnCalcFields (see page 3641)	This is OnCalcFields, a member of class TIBCustomDataSet.
	OnDeleteError (see page 3642)	This is OnDeleteError, a member of class TIBCustomDataSet.
	OnEditError (see page 3642)	This is OnEditError, a member of class TIBCustomDataSet.
	OnFilterRecord (see page 4162)	This is OnFilterRecord, a member of class TIBTable.
	OnNewRecord (see page 3642)	This is OnNewRecord, a member of class TIBCustomDataSet.
	OnPostError (see page 3642)	This is OnPostError, a member of class TIBCustomDataSet.
	ReadOnly (see page 4163)	Specifies whether a table is read-only for this application.

	StoreDefs (see page 4163)	Indicates whether the table's field and index definitions persist with the data module or form.
	TableName (see page 4163)	Indicates the name of the database table or view that this component encapsulates.
	TableTypes (see page 4164)	Sets the types of relations displayed in the TableName (see page 4163) drop-down list.
	Transaction (see page 3646)	Identifies the transaction under which the query executes.
	UniDirectional (see page 4164)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 4165)	Specifies the update object component used to update a read-only result set.

31.1.1.2 TIBTable.Create Constructor

Creates an instance of a table component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBTable(TComponent * AOwner);
```

Description

Call Create to instantiate a table declared in an application if it was not placed on a form at design time. Create calls its inherited Create constructor, creates an empty index definitions list, creates an empty data link, and creates an empty list of index files.

31.1.1.3 TIBTable.Destroy Destructor

Destroys the instance of a table.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBTable();
```

Description

Do not call Destroy directly. Instead call Free to verify that the table is not already freed before calling Destroy. Destroy frees the index files list for the table, frees its data link, frees its index definitions, and then calls its inherited Destroy destructor.

31.1.1.4 TIBTable Methods

The methods of the TIBTable class are listed here.

Protected Methods

	Name	Description
	DataEvent (see page 4149)	This is DataEvent, a member of class TIBTable.
	DefChanged (see page 4149)	This is DefChanged, a member of class TIBTable.
	DoOnNewRecord (see page 4150)	This is DoOnNewRecord, a member of class TIBTable.
	GetCanModify (see page 4150)	This is GetCanModify, a member of class TIBTable.
	GetDataSource (see page 4151)	This is GetDataSource, a member of class TIBTable.
	GetIndexParams (see page 4151)	This is GetIndexParams, a member of class TIBTable.
	InitFieldDefs (see page 4152)	This is InitFieldDefs, a member of class TIBTable.
	InternalClose (see page 4152)	This is InternalClose, a member of class TIBTable.

	InternalOpen (see page 4152)	This is InternalOpen, a member of class TIBTable.
	InternalRefresh (see page 4153)	This is InternalRefresh, a member of class TIBTable.
	InternalRefreshRow (see page 4153)	This is InternalRefreshRow, a member of class TIBTable.
	PSGetDefaultOrder (see page 4154)	This is PSGetDefaultOrder, a member of class TIBTable.
	PSGetIndexDefs (see page 4154)	This is PSGetIndexDefs, a member of class TIBTable.
	PSGetKeyFields (see page 4154)	This is PSGetKeyFields, a member of class TIBTable.
	PSGetTableName (see page 4154)	This is PSGetTableName, a member of class TIBTable.
	PSSetCommandText (see page 4155)	This is PSSetCommandText, a member of class TIBTable.
	PSSetParams (see page 4155)	This is PSSetParams, a member of class TIBTable.
	SetFiltered (see page 4155)	This is SetFiltered, a member of class TIBTable.
	SetFilterOptions (see page 4155)	This is SetFilterOptions, a member of class TIBTable.
	SetFilterText (see page 4156)	This is SetFilterText, a member of class TIBTable.
	UpdateIndexDefs (see page 4156)	This is UpdateIndexDefs, a member of class TIBTable.

Public Methods

	Name	Description
	AddIndex (see page 4148)	Creates a new index for the table.
	CreateTable (see page 4148)	Builds a new table using new structure information.
	DeleteIndex (see page 4149)	Deletes an index for the table.
	DeleteTable (see page 4150)	Deletes an existing database table.
	EmptyTable (see page 4150)	Deletes all records from the table.
	GetDetailLinkFields (see page 4151)	Lists the field components that link this dataset as a detail of a master dataset.
	GetIndexNames (see page 4151)	Retrieves a list of available indexes for a table.
	GotoCurrent (see page 4152)	Synchronizes the current record for this table with the current record of a specified table component.
	Locate (see page 4153)	Searches the table for a specified record and makes that record the current record.

31.1.1.4.1 TIBTable.AddIndex Method

Creates a new index for the table.

Pascal

```
procedure AddIndex(const Name: string; const Fields: string; Options: TIndexOptions; const
DescFields: string = '');
```

C++

```
__fastcall AddIndex(const UnicodeString Name, const UnicodeString Fields, TIndexOptions
Options, const UnicodeString DescFields = '');
```

Description

Call AddIndex to create a new index for the table associated with a dataset. The index created with this procedure is added to the database table underlying the dataset. Name is the name of the new index. Fields is a semicolon-delimited list of the fields to include in the index. Options is a potentially restricted set attributes for the index. It can specify that an index

- Represents the primary index for a dataset. (ixPrimary)
- Contains no duplicate values (ixUnique).
- Sorts records in descending order (isDescending).

Warning: Attempting to create an index using options that are not applicable to the table raises an exception.

31.1.1.4.2 TIBTable.CreateTable Method

Builds a new table using new structure information.

Pascal

```
procedure CreateTable;
```

C++

```
__fastcall CreateTable();
```

Description

Call CreateTable at runtime to create a table using this dataset's current definition. CreateTable overwrites an existing table's structure and data; to avoid overwriting an existing table, check Exists (see page 4158) before calling CreateTable.

If the FieldDefs (see page 4159) property contains values, these values are used to create field definitions. Otherwise the Fields property is used. One or both of these properties must contain values in order to recreate a dataset.

If the IndexDefs (see page 4160) property contain values, these values are used to create index definitions for the dataset.

31.1.1.4.3 TIBTable.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TIBTable.

31.1.1.4.4 TIBTable.DefChanged Method

Pascal

```
procedure DefChanged(Sender: TObject); override;
```

C++

```
virtual __fastcall DefChanged(TObject * Sender);
```

Description

This is DefChanged, a member of class TIBTable.

31.1.1.4.5 TIBTable.DeleteIndex Method

Deletes an index for the table.

Pascal

```
procedure DeleteIndex(const Name: string);
```

C++

```
__fastcall DeleteIndex(const UnicodeString Name);
```

Description

Call DeleteIndex to remove an index for a table. Name is the name of the index to delete. DeleteIndex cannot remove an index used by a constraint.

31.1.1.4.6 TIBTable.DeleteTable Method

Deletes an existing database table.

Pascal

```
procedure DeleteTable;
```

C++

```
__fastcall DeleteTable();
```

Description

Call DeleteTable to delete an existing database table associated with the table component through its Database and TableName (see page 4163) properties. A table must be closed before it can be deleted.

Warning: Deleting a table erases any data the table contains and destroys the table's structure information.

31.1.1.4.7 TIBTable.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TIBTable.

31.1.1.4.8 TIBTable.EmptyTable Method

Deletes all records from the table.

Pascal

```
procedure EmptyTable;
```

C++

```
__fastcall EmptyTable();
```

Description

The EmptyTable method deletes all records from the database table specified by the Database and TableName (see page 4163) properties.

Note: Deletion of records can fail if the user lacks sufficient privileges to perform the delete operation.

31.1.1.4.9 TIBTable.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TIBTable.

31.1.1.4.10 TIBTable.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TIBTable.

31.1.1.4.11 TIBTable.GetDetailLinkFields Method

Lists the field components that link this dataset as a detail of a master dataset.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

GetDetailLinkFields fills two lists of TFields that define a master-detail relationship between this table and another (master) dataset. The MasterFields (see page 4162) list is filled with fields from the master table whose values must equal the values of the fields in the DetailFields list. The DetailFields list is filled with fields from the calling dataset.

31.1.1.4.12 TIBTable.GetIndexNames Method

Retrieves a list of available indexes for a table.

Pascal

```
procedure GetIndexNames(List: TStrings);
```

C++

```
__fastcall GetIndexNames(TStrings List);
```

Description

Call GetIndexNames to retrieve a list of all available indexes for a table. List is a string list object, created and maintained by the application, into which to retrieve the index names.

See Also

Obtaining Information About Indexes

31.1.1.4.13 TIBTable.GetIndexParams Method

Pascal

```
procedure GetIndexParams(const IndexName: string; FieldsIndex: Boolean; var IndexedName:
string);
```

C++

```
__fastcall GetIndexParams(const UnicodeString IndexName, Boolean FieldsIndex, UnicodeString
IndexedName);
```

Description

This is GetIndexParams, a member of class TIBTable.

31.1.1.4.14 TIBTable.GotoCurrent Method

Synchronizes the current record for this table with the current record of a specified table component.

Pascal

```
procedure GotoCurrent(Table: TIBTable);
```

C++

```
__fastcall GotoCurrent(TIBTable Table);
```

Description

Call GotoCurrent to synchronize the cursor position for this table based on the cursor position in another dataset that uses a different data source component, but which is connected to the same underlying database table. Table is the name of the table component whose cursor position to use for synchronizing.

Note: This procedure works only for table components that have the same Database and TableName (see page 4163) properties. Otherwise an exception is raised.

GotoCurrent is mainly for use in applications that have two table components that are linked to the same underlying database table through different data source components. It enables an application to ensure that separate views of the data appear to be linked.

31.1.1.4.15 TIBTable.InitFieldDefs Method

Pascal

```
procedure InitFieldDefs; override;
```

C++

```
virtual __fastcall InitFieldDefs();
```

Description

This is InitFieldDefs, a member of class TIBTable.

31.1.1.4.16 TIBTable.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TIBTable.

31.1.1.4.17 TIBTable.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TIBTable.

31.1.1.4.18 TIBTable.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TIBTable.

31.1.1.4.19 TIBTable.InternalRefreshRow Method

Pascal

```
procedure InternalRefreshRow; override;
```

C++

```
virtual __fastcall InternalRefreshRow();
```

Description

This is InternalRefreshRow, a member of class TIBTable.

31.1.1.4.20 TIBTable.Locate Method

Searches the table for a specified record and makes that record the current record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const UnicodeString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific record and position the cursor on it.

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired record. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine. For example:

```
        with CustTable do
    Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '408-431-1000']),
[loPartialKey]);
       TLocateOptions Opts;
    Opts.Clear();
    Opts << loPartialKey;
```

```
Variant locvalues[3];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
locvalues[2] = Variant("408-431-1000");
CustTable->Locate("Company;Contact;Phone", VarArrayOf(locvalues, 2), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then Locate allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

Locate returns true if it finds a matching record, and makes that record the current one. Otherwise Locate returns false.

Locate uses the fastest possible method to locate matching records. If the search fields in KeyFields are indexed and the index is compatible with the specified search options, Locate uses the index. Otherwise Locate creates a filter for the search.

31.1.1.4.21 TIBTable.PSGetDefaultOrder Method

Pascal

```
function PSGetDefaultOrder: TIndexDef; override;
```

C++

```
virtual __fastcall TIndexDef PSGetDefaultOrder();
```

Description

This is PSGetDefaultOrder, a member of class TIBTable.

31.1.1.4.22 TIBTable.PSGetIndexDefs Method

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions): TIndexDefs; override;
```

C++

```
virtual __fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes);
```

Description

This is PSGetIndexDefs, a member of class TIBTable.

31.1.1.4.23 TIBTable.PSGetKeyFields Method

Pascal

```
function PSGetKeyFields: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetKeyFields();
```

Description

This is PSGetKeyFields, a member of class TIBTable.

31.1.1.4.24 TIBTable.PSGetTableName Method

Pascal

```
function PSGetTableName: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetTableName();
```

Description

This is PSGetTableName, a member of class TIBTable.

31.1.1.4.25 TIBTable.PSSetCommandText Method

Pascal

```
procedure PSSetCommandText(const CommandText: string); override;
```

C++

```
virtual __fastcall PSSetCommandText(const UnicodeString CommandText);
```

Description

This is PSSetCommandText, a member of class TIBTable.

31.1.1.4.26 TIBTable.PSSetParams Method

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

This is PSSetParams, a member of class TIBTable.

31.1.1.4.27 TIBTable.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TIBTable.

31.1.1.4.28 TIBTable.SetFilterOptions Method

Pascal

```
procedure SetFilterOptions(Value: TFilterOptions); override;
```

C++

```
virtual __fastcall SetFilterOptions(TFilterOptions Value);
```

Description

This is SetFilterOptions, a member of class TIBTable.

31.1.1.4.29 TIBTable.SetFilterText Method

Pascal

```
procedure SetFilterText(const Value: string); override;
```

C++

```
virtual __fastcall SetFilterText(const UnicodeString Value);
```

Description

This is SetFilterText, a member of class TIBTable.

31.1.1.4.30 TIBTable.UpdateIndexDefs Method

Pascal

```
procedure UpdateIndexDefs; override;
```

C++

```
virtual __fastcall UpdateIndexDefs();
```

Description

This is UpdateIndexDefs, a member of class TIBTable.

31.1.1.5 TIBTable Properties

The properties of the TIBTable class are listed here.

Public Properties

	Name	Description
R	CurrentDBKey (see page 4158)	Returns the DBKey for the current row in the table.
R	Exists (see page 4158)	Indicates whether the underlying database table exists.
R	IndexFieldCount (see page 4160)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 4161)	Retrieves or sets a field for an index.
	LiveMode (see page 4161)	Indicates what types of edits, if any, can be made to the data in the dataset.
R	TableNames (see page 4164)	Returns a list of table names.

Published Properties

	Name	Description
	Active (see page 4157)	This is Active, a member of class TIBTable.
	BufferChunks (see page 4157)	Specifies the dataset buffer chunk size.
	CachedUpdates (see page 4157)	Specifies whether cached updates are enabled for a dataset.
	Constraints (see page 4158)	This is Constraints, a member of class TIBTable.
	DefaultIndex (see page 4158)	Specifies if the data in the table should be ordered on a default index when opened.
	FieldDefs (see page 4159)	This is FieldDefs, a member of class TIBTable.
	Filter (see page 4159)	Specifies rows in a dataset that meet the filter conditions.
	Filtered (see page 4159)	Specifies whether or not filtering is active for a table.
	IndexDefs (see page 4160)	Contains information about the indexes for a table.
	IndexFieldNames (see page 4160)	Lists the columns to use as an index for a table.
	IndexName (see page 4161)	Identifies an index for the table.
	MasterFields (see page 4162)	Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.

	MasterSource (see page 4162)	Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.
	OnFilterRecord (see page 4162)	This is OnFilterRecord, a member of class TIBTable.
	ReadOnly (see page 4163)	Specifies whether a table is read-only for this application.
	StoreDefs (see page 4163)	Indicates whether the table's field and index definitions persist with the data module or form.
	TableName (see page 4163)	Indicates the name of the database table or view that this component encapsulates.
	TableTypes (see page 4164)	Sets the types of relations displayed in the TableName (see page 4163) drop-down list.
	UniDirectional (see page 4164)	Determines whether bidirectional cursors are enabled for the dataset.
	UpdateObject (see page 4165)	Specifies the update object component used to update a read-only result set.

31.1.1.5.1 TIBTable.Active Property

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

This is Active, a member of class TIBTable.

31.1.1.5.2 TIBTable.BufferChunks Property

Specifies the dataset buffer chunk size.

Pascal

```
property BufferChunks: Integer;
```

C++

```
__property int BufferChunks;
```

Description

Use BufferChunks to get or set the number of records for which the dataset allocates buffer space at any time. When the dataset's buffer is full, trying to fetch an additional record causes the dataset to reallocate the buffer so that it has enough memory to hold an additional BufferChunks records.

Note: When Unidirectional is true, BufferChunks has no meaning.

31.1.1.5.3 TIBTable.CachedUpdates Property

Specifies whether cached updates are enabled for a dataset.

Pascal

```
property CachedUpdates: Boolean;
```

C++

```
__property Boolean CachedUpdates;
```

Description

CachedUpdates enables or disables the use of cached updates for a dataset. If CachedUpdates is true, cached updates are enabled. If CachedUpdates is false, cached updates are disabled.

When cached updates are enabled, updates to a dataset (such as posting changes, inserting new records, or deleting records), are stored in an internal cache on the client machine instead of being written directly to the dataset's underlying database tables. When changes are complete, an application writes all cached changes to the database in the context of a single transaction.

Note: **Note**: Instead of using cached updates, applications can obtain the same benefits with greater control by using a client dataset.

31.1.1.5.4 TIBTable.Constraints Property

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

This is Constraints, a member of class TIBTable.

31.1.1.5.5 TIBTable.CurrentDBKey Property

Returns the DBKey for the current row in the table.

Pascal

```
property CurrentDBKey: TIBDBKey;
```

C++

```
__property TIBDBKey CurrentDBKey;
```

Description

Use CurrentDBKey to return the DBKey for the current row in the table. A DBKey is a unique row identifier for the duration of the current transaction. This property is primarily for internal use.

31.1.1.5.6 TIBTable.DefaultIndex Property

Specifies if the data in the table should be ordered on a default index when opened.

Pascal

```
property DefaultIndex: Boolean;
```

C++

```
__property Boolean DefaultIndex;
```

Description

When this property is set to false, an ORDER BY clause is not used when opening a table on the server. When DefaultIndex is true, the data is ordered based on the primary key or a unique index when opening the table. DefaultIndex defaults to true.

31.1.1.5.7 TIBTable.Exists Property

Indicates whether the underlying database table exists.

Pascal

```
property Exists: Boolean;
```

C++

```
__property Boolean Exists;
```

Description

Read Exists at runtime to determine whether a database table exists. If the table does not exist, you can create a table from the field definitions and index definitions using the CreateTable (see page 4148) method. This property is read-only.

31.1.1.5.8 TIBTable.FieldDefs Property

Pascal

```
property FieldDefs;
```

C++

```
__property FieldDefs;
```

Description

This is FieldDefs, a member of class TIBTable.

31.1.1.5.9 TIBTable.Filter Property

Specifies rows in a dataset that meet the filter conditions.

Pascal

```
property Filter;
```

C++

```
__property Filter;
```

Description

Use the Filter property to restrict the rows in the dataset to those that meet the filter conditions. The syntax for Filter is the same as the search condition that appears after a WHERE clause in a Select statement. For example, to view only those records where the value in the Country field contains 'France' or 'Fiji':

Country = 'France' or Country = 'Fiji'

You can use standard SQL wildcards such as percent (%) and underscore (_) in the condition when you use the LIKE operator. The following filter condition retrieves all Countries beginning with 'F':

```
Country LIKE 'F%'
```

To view rows that have a NULL value in the Country column and Contact_Name is not NULL, use the IS operator:

```
Country is NULL and Contact_Name is not NULL
```

You can also use complex expressions in filter clauses. The following example retrieves rows containing Country values that use Francs as currency.

```
Country IN (SELECT Country from Country where Currency = '_Franc')
```

31.1.1.5.10 TIBTable.Filtered Property

Specifies whether or not filtering is active for a table.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter (see page 4159) property or the OnFilterRecord (see page 4162) event handler, set Filtered to true.

31.1.1.5.11 TIBTable.IndexDefs Property

Contains information about the indexes for a table.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

IndexDefs is an array of index items, each of which describes an available index for the table. Ordinarily an application accesses or specifies indexes through the IndexFieldNames (see page 4160) or IndexFields (see page 4161) properties. If IndexDefs is updated or manually edited, the StoreDefs (see page 4163) property becomes true.

Note: The index items in IndexDefs may not always reflect the current indexes available for a table. Before examining IndexDefs, call its Update method to refresh the item list.

31.1.1.5.12 TIBTable.IndexFieldCount Property

Indicates the number of fields that comprise the current key.

Pascal

```
property IndexFieldCount: Integer;
```

C++

```
__property int IndexFieldCount;
```

Description

Examine IndexFieldCount to determine the number of fields that comprise the current key. For indexes based on a single column, IndexFieldCount returns 1. For multi-column indexes, IndexFieldCount indicates the number of fields upon which the index is based.

31.1.1.5.13 TIBTable.IndexFieldNames Property

Lists the columns to use as an index for a table.

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property UnicodeString IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a table. In IndexFieldNames specify the name

of each column to use as an index for a table. Ordering of column names is significant. Separate names with semicolon.

Note: The IndexFieldNames and IndexName (see page 4161) properties are mutually exclusive. Setting one clears the other.

See Also

Creating an Index with IndexFieldNames

31.1.1.5.14 TIBTable.IndexFields Property

Retrieves or sets a field for an index.

Pascal

```
property IndexFields [Index: Integer]: TField;
```

C++

```
__property TField IndexFields[int Index];
```

Description

IndexFields provides a zero-based array of field objects, each of which corresponds to a field in the current index. Index is an ordinal value indicating the position of a field in the index. The first field in the index is IndexFields[0], the second is IndexFields[1], and so on.

Note: Do not set IndexFields directly. Instead use the IndexFieldNames (see page 4160) property to order datasets on the fly at runtime.

31.1.1.5.15 TIBTable.IndexName Property

Identifies an index for the table.

Pascal

```
property IndexName: string;
```

C++

```
__property UnicodeString IndexName;
```

Description

Use IndexName to specify an index for a table. If IndexName is empty, a table's sort order is based on its primary index.

If IndexName contains a valid index name, then that index is used to determine the order of records.

Note: IndexFieldNames (see page 4160) and IndexName are mutually exclusive. Setting one clears the other.

31.1.1.5.16 TIBTable.LiveMode Property

Indicates what types of edits, if any, can be made to the data in the dataset.

Pascal

```
property LiveMode: TLiveModes;
```

C++

```
__property TLiveModes LiveMode;
```

Description

Read LiveMode to determine what types of edits should be allowed. LiveMode is set automatically to restrict the capabilities of the dataset to reflect the user's rights.

Note: For read-only datasets, such as TIBQuery, LiveMode is always an empty set.

31.1.1.5.17 TIBTable.MasterFields Property

Specifies one or more fields in a master table to link with corresponding fields in this table in order to establish a master-detail relationship between the tables.

Pascal

```
property MasterFields: string;
```

C++

```
__property UnicodeString MasterFields;
```

Description

Use MasterFields after setting the MasterSource (see page 4162) property to specify the names of one or more fields to use in establishing a detail-master relationship between this table and the one specified in MasterSource (see page 4162).

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this table for display.

See Also

Making the Table a Detail of Another Dataset

31.1.1.5.18 TIBTable.MasterSource Property

Specifies the name of the data source for a dataset to use as a master table in establishing a detail-master relationship between this table and another one.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this table and another one.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields (see page 4162) property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this table for display.

See Also

Making the Table a Detail of Another Dataset

31.1.1.5.19 TIBTable.OnFilterRecord Property

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

This is OnFilterRecord, a member of class TIBTable.

31.1.1.5.20 TIBTable.ReadOnly Property

Specifies whether a table is read-only for this application.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the table. By default, ReadOnly is false, meaning users can potentially alter a table's data.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a table. Other factors, such as insufficient SQL privileges for the application or its current user may prevent successful alterations.

To guarantee that users cannot modify or add data to a table,

1. **1** Set the Active (see page 4157) property to false.
2. **2** Set ReadOnly to true.

31.1.1.5.21 TIBTable.StoreDefs Property

Indicates whether the table's field and index definitions persist with the data module or form.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

If StoreDefs is true, the table's index and field definitions are stored with the data module or form. Setting StoreDefs to true makes the CreateTable (see page 4148) method into a one-step procedure that creates fields, indexes, and validity checks at runtime.

StoreDefs is false by default. It becomes true whenever FieldDefs (see page 4159) or IndexDefs (see page 4160) is updated or edited manually; to prevent edited (or imported) definitions from being stored, reset StoreDefs to false.

31.1.1.5.22 TIBTable.TableName Property

Indicates the name of the database table or view that this component encapsulates.

Pascal

```
property TableName: String;
```

C++

```
__property UnicodeString TableName;
```

Description

Use TableName to specify the name of the database relation this component encapsulates. To set TableName to a meaningful value, the Database property should already be set. If Database is set at design time, then select a valid table name from the TableName drop-down list in the Object Inspector.

Note: To set TableName, the Active (see page 4157) property must be false.

Tip: Setting TableName clears the FieldDefs (see page 4159) property. Therefore, if you are using TIBTable (see page 4142) to create a new table, set the value of TableName before you assign any field definitions.

31.1.1.5.23 TIBTable.TableNames Property

Returns a list of table names.

Pascal

```
property TableNames: TStrings;
```

C++

```
__property TStrings TableNames;
```

Description

The TableNames property is an internal property used to display a list of the table and view names in the database.

31.1.1.5.24 TIBTable.TableTypes Property

Sets the types of relations displayed in the TableName (see page 4163) drop-down list.

Pascal

```
property TableTypes: TIBTableTypes;
```

C++

```
__property TIBTableTypes TableTypes;
```

Description

Use TableTypes to change which types of relations are displayed in the TableName (see page 4163) drop-down list, in addition to user tables.

31.1.1.5.25 TIBTable.UniDirectional Property

Determines whether bidirectional cursors are enabled for the dataset.

Pascal

```
property UniDirectional: Boolean;
```

C++

```
__property Boolean UniDirectional;
```

Description

Use UniDirectional to determine whether bidirectional cursors are enabled for this dataset.

Note: Do not confuse the UniDirectional property with the IsUniDirectional property inherited from TDataSet. IsUniDirectional indicates whether the dataset is a dbExpress dataset, which, in addition to using a unidirectional cursor, does not buffer records.

UniDirectional is only concerned with whether the cursor permits backward or random navigation.

31.1.1.5.26 TIBTable.UpdateObject Property

Specifies the update object component used to update a read-only result set.

Pascal

```
property UpdateObject: TIBDataSetUpdateObject;
```

C++

```
__property TIBDataSetUpdateObject UpdateObject;
```

Description

Use UpdateObject to specify the TIBDataSetUpdateObject component to use in an application that must be able to update a read-only result set.

In some cases, such as when using TIBQuery, the dataset does not automatically update records. In these cases, UpdateObject can be used to specify a TIBUpdateSQL component that performs updates as a separate transaction that is transparent to the application.

TIBDataSetUpdateObject is especially useful for complicated updates from an OnUpdateRecord event.

31.1.1.6 TIBTable Events

The events of the TIBTable class are listed here.

Published Events

	Name	Description
	AfterDatabaseDisconnect (see page 4165)	Occurs immediately after the connection to the associated database is closed.
	AfterTransactionEnd (see page 4165)	Occurs immediately after a transaction that includes this dataset's query ends.
	BeforeDatabaseDisconnect (see page 4166)	Occurs immediately before the connection to the associated database is closed.
	BeforeTransactionEnd (see page 4166)	Occurs immediately before a transaction that includes this dataset's query ends.
	DatabaseFree (see page 4166)	Occurs when the database associated with this dataset is freed.
	TransactionFree (see page 4166)	Occurs when the transaction that includes this dataset's query is freed.

31.1.1.6.1 TIBTable.AfterDatabaseDisconnect Event

Occurs immediately after the connection to the associated database is closed.

Pascal

```
property AfterDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDatabaseDisconnect;
```

Description

Write an AfterDatabaseDisconnect event handler to respond when the dataset closes its connection to the database specified by the Database property.

31.1.1.6.2 TIBTable.AfterTransactionEnd Event

Occurs immediately after a transaction that includes this dataset's query ends.

Pascal

```
property AfterTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTransactionEnd;
```

Description

Write an AfterTransactionEnd event handler to respond when the transaction specified by the Transaction property ends.

31.1.1.6.3 TIBTable.BeforeDatabaseDisconnect Event

Occurs immediately before the connection to the associated database is closed.

Pascal

```
property BeforeDatabaseDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDatabaseDisconnect;
```

Description

Write a BeforeDatabaseDisconnect event handler to respond when the dataset is about to close its connection to the database specified by the Database property.

31.1.1.6.4 TIBTable.BeforeTransactionEnd Event

Occurs immediately before a transaction that includes this dataset's query ends.

Pascal

```
property BeforeTransactionEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTransactionEnd;
```

Description

Write a BeforeTransactionEnd event handler to respond when the transaction specified by the Transaction property is about to end.

31.1.1.6.5 TIBTable.DatabaseFree Event

Occurs when the database associated with this dataset is freed.

Pascal

```
property DatabaseFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent DatabaseFree;
```

Description

Write a DatabaseFree event handler to respond when the database specified by the Database property is freed.

31.1.1.6.6 TIBTable.TransactionFree Event

Occurs when the transaction that includes this dataset's query is freed.

Pascal

```
property TransactionFree: TNotifyEvent;
```

C++

```
__property TNotifyEvent TransactionFree;
```

Description

Write a TransactionFree event handler to respond when the transaction specified by the Transaction property is freed.

31.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TIBTableType (see page 4168)	This is record IBTable.TIBTableType.

31.2.1 IBTable.TIBTableType Enumeration

Pascal

```
TIBTableType = (
  ttSystem,
  ttView
);
```

C++

```
enum TIBTableType {
  ttSystem,
  ttView
};
```

File

IBTable

Description

This is record IBTable.TIBTableType.

31.3 Types

The following table lists types in this documentation.

Types

Name	Description
TIBTableTypes (see page 4169)	TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.
TIndexName (see page 4169)	This is type IBTable.TIndexName.

31.3.1 IBTable.TIBTableTypes Type

TIBTableTypes and TIBTableTypes indicate the types of InterBase tables and views other than user tables.

Pascal

```
TIBTableTypes = set of TIBTableType;
```

C++

```
TIBTableType TIBTableTypes;
```

File

IBTable

Description

TIBTableTypes is a set of TIBTableType (see page 4168) values. The following table lists the possible values:

Value Meaning

ttSystem System tables and views.

ttView User views.

31.3.2 IBTable.TIndexName Type

Pascal

```
TIndexName = String;
```

C++

```
UnicodeString TIndexName;
```

File

IBTable

Description

This is type IBTable.TIndexName.

32 IBUpdateSQL Namespace

This is namespace IBUpdateSQL.

Topics

Name	Description
Classes (see page 4172)	The following table lists classes in this documentation.

Classes

	Name	Description
	TIBUpdateSQL (see page 4172)	TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

32.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIBUpdateSQL (see page 4172)	TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

32.1.1 TIBUpdateSQL Class

TIBUpdateSQL provides an object for updating read-only datasets when cached updates are enabled.

Class Hierarchy

Pascal

```
TIBUpdateSQL = class(TIBDataSetUpdateObject);
```

C++

```
class TIBUpdateSQL : public TIBDataSetUpdateObject;
```

File

IBUpdateSQL

Description

Use a TIBUpdateSQL object to provide SQL (see page 4179) statements used to update read-only datasets represented by TIBQuery (see page 3916) components when cached updates are enabled. A dataset is read-only either by design or circumstance. If a dataset is read-only by design, the application itself does not provide a user interface for updating data, but may institute a programmatic scheme behind the scenes.

TIBUpdateSQL provides a mechanism for circumventing what some developers consider an SQL (see page 4179)-92 limitation. It enables a developer to provide INSERT, UPDATE, DELETE, and REFRESH statements for performing separate update queries on otherwise read-only result sets in such a manner that the separate update queries are transparent to the end user.

In practical application, a TIBUpdateSQL object is placed on a data module or form, and linked to a TIBQuery (see page 3916) component through that component's UpdateObject property. If the UpdateObject property points to a valid TIBUpdateSQL object, the SQL (see page 4179) statements belonging to the update object are automatically applied when cached updates are applied.

Getting Started with InterBase Express

32.1.1.1 TIBUpdateSQL Members

The following tables list the members exposed by TIBUpdateSQL.

Protected Methods

	Name	Description
	GetDataSet (see page 4175)	This is GetDataSet, a member of class TIBUpdateSQL.
	GetSQL (see page 4175)	This is GetSQL, a member of class TIBUpdateSQL.
	SetDataSet (see page 4176)	This is SetDataSet, a member of class TIBUpdateSQL.
	SQLChanged (see page 4176)	This is SQLChanged, a member of class TIBUpdateSQL.

Public Methods

	Name	Description
	Apply (see page 4174)	Sets the parameters for a specified SQL (see page 4179) statement type, and executes the resulting statement.
	Create (see page 4173)	Creates an instance of an update object.
	Destroy (see page 4173)	Frees an instance of an update object.
	ExecSQL (see page 4175)	Executes a specified type of SQL (see page 4179) statement to perform an update for an otherwise read-only results set when cached updates is enabled.
	SetParams (see page 4176)	Binds parameters in an SQL (see page 4179) statement prior to statement execution.

Public Properties

	Name	Description
	DataSet (see page 4177)	Identifies the dataset to which a TIBUpdateSQL (see page 4172) component belongs.
	Query (see page 4178)	Returns the query object used to perform a specified kind of update.
	SQL (see page 4179)	Returns a specified SQL statement used when applying cached updates.

Published Properties

	Name	Description
	DeleteSQL (see page 4177)	Specifies the SQL (see page 4179) DELETE statement to use when applying a cached deletion of a record.
	InsertSQL (see page 4178)	Specifies the SQL (see page 4179) INSERT statement to use when applying a cached insertion of a record.
	ModifySQL (see page 4178)	Specifies the SQL (see page 4179) UPDATE statement to use when applying an update to a record and cached updates is enabled.
	RefreshSQL (see page 3677)	Provides the ability to directly access the SQL object encapsulating the RefreshSQL statement.

32.1.1.2 TIBUpdateSQL.Create Constructor

Creates an instance of an update object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIBUpdateSQL(TComponent * AOwner);
```

Description

Call Create to instantiate an update object at run time. You do not need to call Create for update objects placed in a data module or form at design time. Delphi automatically handles these objects.

32.1.1.3 TIBUpdateSQL.Destroy Destructor

Frees an instance of an update object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIBUpdateSQL();
```

Description

Do not call Destroy directly in an application. Usually destruction of update objects is handled automatically by Delphi. If an application creates its own instance of an update object, however, the application should call Free, which verifies that the update object is not already freed before calling Destroy.

32.1.1.4 TIBUpdateSQL Methods

The methods of the TIBUpdateSQL class are listed here.

Protected Methods

	Name	Description
	GetDataSet (see page 4175)	This is GetDataSet, a member of class TIBUpdateSQL.
	GetSQL (see page 4175)	This is GetSQL, a member of class TIBUpdateSQL.
	SetDataSet (see page 4176)	This is SetDataSet, a member of class TIBUpdateSQL.
	SQLChanged (see page 4176)	This is SQLChanged, a member of class TIBUpdateSQL.

Public Methods

	Name	Description
	Apply (see page 4174)	Sets the parameters for a specified SQL (see page 4179) statement type, and executes the resulting statement.
	ExecSQL (see page 4175)	Executes a specified type of SQL (see page 4179) statement to perform an update for an otherwise read-only results set when cached updates is enabled.
	SetParams (see page 4176)	Binds parameters in an SQL (see page 4179) statement prior to statement execution.

32.1.1.4.1 TIBUpdateSQL.Apply Method

Sets the parameters for a specified SQL (see page 4179) statement type, and executes the resulting statement.

Pascal

```
procedure Apply(UpdateKind: TUpdateKind); override;
```

C++

```
virtual __fastcall Apply(TUpdateKind UpdateKind);
```

Description

Call Apply to set parameters for an SQL (see page 4179) statement and execute it to update a record. UpdateKind indicates which SQL (see page 4179) statement to bind and execute, and can be one of the following values:

Value Meaning

ukModify Bind and execute the SQL (see page 4179) statement in the ModifySQL (see page 4178) property

ukInsert Bind and execute the SQL (see page 4179) statement in the InsertSQL (see page 4178) property

ukDelete Bind and execute the SQL (see page 4179) statement in the DeleteSQL (see page 4177) property

Apply is primarily intended for manually executing update statements from an OnUpdateRecord event handler.

Note: If an SQL (see page 4179) statement does not contain parameters, it is more efficient to call ExecSQL (see page

4175) instead of Apply.

32.1.1.4.2 TIBUpdateSQL.ExecSQL Method

Executes a specified type of SQL (see page 4179) statement to perform an update for an otherwise read-only results set when cached updates is enabled.

Pascal

```
procedure ExecSQL(UpdateKind: TUpdateKind);
```

C++

```
__fastcall ExecSQL(TUpdateKind UpdateKind);
```

Description

Call ExecSQL to execute the SQL (see page 4179) statement necessary for updating the records belonging to a read-only result set when cached updates is enabled. UpdateKind specifies the statement to execute, and can be one of the following values:

Value Meaning

ukModify Execute the SQL (see page 4179) statement used to update records in the dataset

ukInsert Execute the SQL (see page 4179) statement used to insert new records into the dataset

ukDelete Execute the SQL (see page 4179) statement used to delete records in the dataset.

If the statement to execute contains any parameters, an application must call SetParams (see page 4176) to bind the parameters before calling ExecSQL. To determine if a statement contains parameters, examine the appropriate ModifySQL (see page 4178), InsertSQL (see page 4178), or DeleteSQL (see page 4177) property, depending on the statement type intended for execution.

Note: To both bind parameters and execute a statement, call Apply (see page 4174).

32.1.1.4.3 TIBUpdateSQL.GetDataSet Method

Pascal

```
function GetDataSet: TIBCustomDataSet; override;
```

C++

```
virtual __fastcall TIBCustomDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TIBUpdateSQL.

32.1.1.4.4 TIBUpdateSQL.GetSQL Method

Pascal

```
function GetSQL(UpdateKind: TUpdateKind): TStrings; override;
```

C++

```
virtual __fastcall TStrings GetSQL(TUpdateKind UpdateKind);
```

Description

This is GetSQL, a member of class TIBUpdateSQL.

32.1.1.4.5 TIBUpdateSQL.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TIBCustomDataSet); override;
```

C++

```
virtual __fastcall SetDataSet(TIBCustomDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TIBUpdateSQL.

32.1.1.4.6 TIBUpdateSQL.SetParams Method

Binds parameters in an SQL (see page 4179) statement prior to statement execution.

Pascal

```
procedure SetParams(UpdateKind: TUpdateKind);
```

C++

```
__fastcall SetParams(TUpdateKind UpdateKind);
```

Description

Call SetParams to bind parameters in an SQL (see page 4179) statement associated with the update object prior to executing the statement. UpdateKind indicates the type of statement for which to bind parameters, and can be one of the following values:

Value Meaning

ukModify Bind parameters for the SQL (see page 4179) statement used to update records

ukInsert Bind parameters for the SQL (see page 4179) statement used to insert new records

ukDelete Bind parameters for the SQL (see page 4179) statement used to delete records

Parameters are indicated in an SQL (see page 4179) statement by a colon. Except for the leading colon in the parameter name, the parameter name must exactly match the name of an existing field name for the dataset.

Note: Parameter names can be prefaced by the 'OLD_' indicator. If so, the old value of the field is used to perform the update instead of any updates in the cache.

32.1.1.4.7 TIBUpdateSQL.SQLChanged Method

Pascal

```
procedure SQLChanged(Sender: TObject);
```

C++

```
__fastcall SQLChanged(TObject * Sender);
```

Description

This is SQLChanged, a member of class TIBUpdateSQL.

32.1.1.5 TIBUpdateSQL Properties

The properties of the TIBUpdateSQL class are listed here.

Public Properties

	Name	Description
	DataSet (see page 4177)	Identifies the dataset to which a TIBUpdateSQL (see page 4172) component belongs.
R	Query (see page 4178)	Returns the query object used to perform a specified kind of update.
	SQL (see page 4179)	Returns a specified SQL statement used when applying cached updates.

Published Properties

	Name	Description
	DeleteSQL (see page 4177)	Specifies the SQL (see page 4179) DELETE statement to use when applying a cached deletion of a record.
	InsertSQL (see page 4178)	Specifies the SQL (see page 4179) INSERT statement to use when applying a cached insertion of a record.
	ModifySQL (see page 4178)	Specifies the SQL (see page 4179) UPDATE statement to use when applying an update to a record and cached updates is enabled.

32.1.1.5.1 TIBUpdateSQL.DataSet Property

Identifies the dataset to which a TIBUpdateSQL (see page 4172) component belongs.

Pascal

```
property DataSet: TIBCustomDataSet;
```

C++

```
__property TIBCustomDataSet DataSet;
```

Description

At design time, setting the dataset object's UpdateObject property automatically sets the DataSet property of the specified TIBUpdateSQL (see page 4172) object. An application should only need to set this property if it creates a new update component at run time.

32.1.1.5.2 TIBUpdateSQL.DeleteSQL Property

Specifies the SQL (see page 4179) DELETE statement to use when applying a cached deletion of a record.

Pascal

```
property DeleteSQL: TStrings;
```

C++

```
__property TStrings DeleteSQL;
```

Description

Set DeleteSQL to the SQL (see page 4179) DELETE statement to use when applying a deletion to a record. Statements can be parameterized queries. To create a DELETE statement at design time, use the UpdateSQL editor to create statements, such as:

```
delete from Employee
    where
    Emp_No = :OLD_Emp_No
```

At run time, an application can write a statement directly to this property to set or change the DELETE statement.

Note: As the example illustrates, DeleteSQL supports an extension to normal parameter binding. To retrieve the value of a field as it exists prior to application of cached updates, use the field name with the prefix 'OLD_'. This is especially useful when doing field comparisons in the WHERE clause of the statement.

32.1.1.5.3 TIBUpdateSQL.InsertSQL Property

Specifies the SQL (see page 4179) INSERT statement to use when applying a cached insertion of a record.

Pascal

```
property InsertSQL: TStrings;
```

C++

```
__property TStrings InsertSQL;
```

Description

Set InsertSQL to the SQL (see page 4179) INSERT statement to use when applying an insertion to a dataset. Statements can be parameterized queries. To create a INSERT statement at design time, use the UpdateSQL editor to create statements, such as:

```
insert into Country
    (Country, Currency)
    values (:Country, :Currency)
```

At run time, an application can write a statement directly to this property to set or change the INSERT statement.

32.1.1.5.4 TIBUpdateSQL.ModifySQL Property

Specifies the SQL (see page 4179) UPDATE statement to use when applying an update to a record and cached updates is enabled.

Pascal

```
property ModifySQL: TStrings;
```

C++

```
__property TStrings ModifySQL;
```

Description

Set ModifySQL to the SQL (see page 4179) UPDATE statement to use when applying an updated record to a dataset. Statements can be parameterized queries. To create a UPDATE statement at design time, use the UpdateSQL editor to create statements, such as:

```
update Employee
    set Last_Name = :Last_Name
    where Emp_No = :OLD_Emp_No
```

At run time, an application can write a statement directly to this property to set or change the UPDATE statement.

Note: As the example illustrates, ModifySQL supports an extension to normal parameter binding. To retrieve the value of a field as it exists prior to application of cached updates, the field name with 'OLD_'. This is especially useful when doing field comparisons in the WHERE clause of the statement.

32.1.1.5.5 TIBUpdateSQL.Query Property

Returns the query object used to perform a specified kind of update.

Pascal

```
property Query [UpdateKind: TUpdateKind]: TIBQuery;
```

C++

```
__property TIBQuery Query[TUpdateKind UpdateKind];
```

Description

Query returns the TIBQuery (see page 3916) object used to perform a particular form of SQL (see page 4179) update. UpdateKind specifies which query object to retrieve. UpdateKind can be one of the following:

Value Meaning

ukModify Return the query object used to execute UPDATE statements

ukInsert Return the query object used to execute INSERT statements

ukDelete Return the query object used to execute DELETE statements

Each query object executes a particular kind of SQL (see page 4179) statement. The contents of the SQL (see page 4179) statements executed by these objects can be accessed directly using the ModifySQL (see page 4178), InsertSQL (see page 4178), and DeleteSQL (see page 4177) properties.

The main purpose of Query is to provide a way for an application to set the properties for an update query object or to call the query object's methods.

Note: If a particular kind of update statement is not provided, then its corresponding query object is nil (Delphi) or NULL (C++). For example, if an application does not provide an SQL (see page 4179) statement for the DeleteSQL (see page 4177) property, then Query[ukDelete] returns nil or NULL.

32.1.1.5.6 TIBUpdateSQL.SQL Property

Returns a specified SQL statement used when applying cached updates.

Pascal

```
property SQL [UpdateKind: TUpdateKind]: TStrings;
```

C++

```
__property TStrings SQL[TUpdateKind UpdateKind];
```

Description

Returns the SQL statement in the ModifySQL (see page 4178), InsertSQL (see page 4178), or DeleteSQL (see page 4177) property, depending on the setting of UpdateKind. UpdateKind can be any of the following:

Value Meaning

ukModify Return the SQL statement used to update records in the dataset

ukInsert Return the SQL statement used to insert new records into the dataset

ukDelete Return the SQL statement used to delete records in the dataset

33 IBUtils Namespace

This is namespace IBUtils.

Topics

Name	Description
Functions (see page 4182)	The following table lists functions in this documentation.
Constants (see page 4186)	The following table lists constants in this documentation.

Constants

Name	Description
CR (see page 4186)	This is constant IBUtils.CR.
CRLF (see page 4186)	This is constant IBUtils.CRLF.
LF (see page 4187)	This is constant IBUtils.LF.
NULL_TERMINATOR (see page 4187)	This is constant IBUtils.NULL_TERMINATOR.
TAB (see page 4187)	This is constant IBUtils.TAB.

Functions

	Name	Description
	AddIBParamSQLForDetail (see page 4182)	This is function IBUtils.AddIBParamSQLForDetail.
	ExtractIdentifier (see page 4182)	This is function IBUtils.ExtractIdentifier.
	FormatIdentifier (see page 4183)	This is function IBUtils.FormatIdentifier.
	FormatIdentifierValue (see page 4183)	This is function IBUtils.FormatIdentifierValue.
	Max (see page 4183)	Returns the greater of two numeric values (Delphi only).
	Min (see page 4184)	Returns the lesser of two numeric values (Delphi only).
	QuoteIdentifier (see page 4184)	This is function IBUtils.QuoteIdentifier.
	RandomInteger (see page 4184)	This is function IBUtils.RandomInteger.
	RandomString (see page 4185)	This is function IBUtils.RandomString.
	StripString (see page 4185)	This is function IBUtils.StripString.

33.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddIBParamSQLForDetail (see page 4182)	This is function IBUtils.AddIBParamSQLForDetail.
	ExtractIdentifier (see page 4182)	This is function IBUtils.ExtractIdentifier.
	FormatIdentifier (see page 4183)	This is function IBUtils.FormatIdentifier.
	FormatIdentifierValue (see page 4183)	This is function IBUtils.FormatIdentifierValue.
	Max (see page 4183)	Returns the greater of two numeric values (Delphi only).
	Min (see page 4184)	Returns the lesser of two numeric values (Delphi only).
	QuoteIdentifier (see page 4184)	This is function IBUtils.QuoteIdentifier.
	RandomInteger (see page 4184)	This is function IBUtils.RandomInteger.
	RandomString (see page 4185)	This is function IBUtils.RandomString.
	StripString (see page 4185)	This is function IBUtils.StripString.

33.1.1 IBUtils.AddIBParamSQLForDetail Function

Pascal

```
function AddIBParamSQLForDetail(Params: TParams; SQL: string; Native: Boolean; Dialect:
Integer): string;
```

C++

```
UnicodeString AddIBParamSQLForDetail(TParams Params, UnicodeString SQL, Boolean Native, int
Dialect);
```

File

IBUtils

Description

This is function IBUtils.AddIBParamSQLForDetail.

33.1.2 IBUtils.ExtractIdentifier Function

Pascal

```
function ExtractIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString ExtractIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.ExtractIdentifier.

33.1.3 IBUtils.FormatIdentifier Function

Pascal

```
function FormatIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString FormatIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.FormatIdentifier.

33.1.4 IBUtils.FormatIdentifierValue Function

Pascal

```
function FormatIdentifierValue(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString FormatIdentifierValue(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.FormatIdentifierValue.

33.1.5 IBUtils.Max Function

Returns the greater of two numeric values (Delphi only).

Pascal

```
function Max(n1: Integer; n2: Integer): Integer;
```

C++

```
int Max(int n1, int n2);
```

File

IBUtils

Description

In Delphi, call Max to compare two numeric values. Max returns the greater value of the two.

See Also

MaxValue (see page 4746)

Min (see page 4747)

MaxIntValue (see page 4745)

33.1.6 IBUtils.Min Function

Returns the lesser of two numeric values (Delphi only).

Pascal

```
function Min(n1: Integer; n2: Integer): Integer;
```

C++

```
int Min(int n1, int n2);
```

File

IBUtils

Description

Call Min to compare two numeric values in Delphi. Min returns the smaller value of the two.

See Also

MinValue (see page 4748)

Max (see page 4745)

MinIntValue (see page 4748)

33.1.7 IBUtils.QuoteIdentifier Function

Pascal

```
function QuoteIdentifier(Dialect: Integer; Value: String): String;
```

C++

```
UnicodeString QuoteIdentifier(int Dialect, UnicodeString Value);
```

File

IBUtils

Description

This is function IBUtils.QuoteIdentifier.

33.1.8 IBUtils.RandomInteger Function

Pascal

```
function RandomInteger(iLow: Integer; iHigh: Integer): Integer;
```

C++

```
int RandomInteger(int iLow, int iHigh);
```

File

IBUtils

Description

This is function IBUtils.RandomInteger.

33.1.9 IBUtils.RandomString Function

Pascal

```
function RandomString(iLength: Integer): String;
```

C++

```
UnicodeString RandomString(int iLength);
```

File

IBUtils

Description

This is function IBUtils.RandomString.

33.1.10 IBUtils.StripString Function

Pascal

```
function StripString(st: String; CharsToStrip: String): String;
```

C++

```
UnicodeString StripString(UnicodeString st, UnicodeString CharsToStrip);
```

File

IBUtils

Description

This is function IBUtils.StripString.

33.2 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CR (see page 4186)	This is constant IBUtils.CR.
CRLF (see page 4186)	This is constant IBUtils.CRLF.
LF (see page 4187)	This is constant IBUtils.LF.
NULL_TERMINATOR (see page 4187)	This is constant IBUtils.NULL_TERMINATOR.
TAB (see page 4187)	This is constant IBUtils.TAB.

33.2.1 IBUtils.CR Constant

Pascal

```
CR = #13;
```

C++

```
CR = #13;
```

File

IBUtils

Description

This is constant IBUtils.CR.

33.2.2 IBUtils.CRLF Constant

Pascal

```
CRLF = #13 + #10;
```

C++

```
CRLF = #13 + #10;
```

File

IBUtils

Description

This is constant IBUtils.CRLF.

33.2.3 IBUtils.LF Constant

Pascal

```
LF = #10;
```

C++

```
LF = #10;
```

File

IBUtils

Description

This is constant IBUtils.LF.

33.2.4 IBUtils.NULL_TERMINATOR Constant

Pascal

```
NULL_TERMINATOR = #0;
```

C++

```
NULL_TERMINATOR = #0;
```

File

IBUtils

Description

This is constant IBUtils.NULL_TERMINATOR.

33.2.5 IBUtils.TAB Constant

Pascal

```
TAB = #9;
```

C++

```
TAB = #9;
```

File

IBUtils

Description

This is constant IBUtils.TAB.

34 ImgList Namespace

This is namespace ImgList.

Topics

Name	Description
Classes (see page 4190)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4227)	The following table lists structs, records, enums in this documentation.
Types (see page 4231)	The following table lists types in this documentation.

Classes

	Name	Description
	TChangeLink (see page 4190)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 4193)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Structs, Records, Enums

	Name	Description
	TColorDepth (see page 4227)	Color depth of list images.
	TDrawingStyle (see page 4228)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 4229)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 4229)	TLoadResource and TLoadResources (see page 4232) determine how a resource is loaded into an image list.
	TResType (see page 4230)	TResType identifies a type of graphical resource to an image list.

Types

Name	Description
TImageIndex (see page 4231)	This is type ImgList.TImageIndex.
TImageListHandle (see page 4231)	This is type ImgList.TImageListHandle.
TLoadResources (see page 4232)	This is type ImgList.TLoadResources.
TOverlay (see page 4232)	This is type ImgList.TOverlay.

34.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TChangeLink (see page 4190)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 4193)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

34.1.1 TChangeLink Class

The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.

Class Hierarchy

Pascal

```
TChangeLink = class(TObject);
```

C++

```
class TChangeLink : public TObject;
```

File

ImgList

Description

A TImageList keeps a list of its TChangeLink objects. Each is associated with a particular component, such as a tree view or list view control. A component can register its change link with an image list by calling the image list's RegisterChanges method. Before destruction, the component should then call the UnRegisterChanges method.

Component writers can use the change link object to receive notification when changes are made to an image list that a control uses. Use the OnChange (see page 4192) event of the change link to execute some code when the image list changes. For example, the tree view control uses a change link object to know when its image list has changed.

See Also

TImageList

TTreeView

TListView

TCustomImageList (see page 4193)

34.1.1.1 TChangeLink Members

The following tables list the members exposed by TChangeLink.

Public Events

	Name	Description
	OnChange (see page 4192)	Occurs when there's a change in any of the images stored in the associated image list.

Public Methods

	Name	Description
	Change (see page 4191)	Generates an OnChange (see page 4192) event.
	Destroy (see page 4191)	Destroys the change link object and releases the memory allocated to it.

Public Properties

	Name	Description
	Sender (see page 4192)	Specifies which image list component notifies the change link object of changes.

34.1.1.2 TChangeLink.Destroy Destructor

Destroys the change link object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TChangeLink();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the change link is not nil before calling Destroy.

Before freeing the memory for the change link, Destroy first calls the image list's UnRegisterChanges method to unregister itself from receiving notification when the image list changes.

See Also

System::TObject::Free

UnRegisterChanges (see page 4216)

34.1.1.3 TChangeLink Methods

The methods of the TChangeLink class are listed here.

Public Methods

	Name	Description
	Change (see page 4191)	Generates an OnChange (see page 4192) event.

34.1.1.3.1 TChangeLink.Change Method

Generates an OnChange (see page 4192) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Use the Change method to trigger the OnChange (see page 4192) event handler of the change link object.

See Also

OnChange (see page 4192)

34.1.1.4 TChangeLink Properties

The properties of the TChangeLink class are listed here.

Public Properties

	Name	Description
	Sender (see page 4192)	Specifies which image list component notifies the change link object of changes.

34.1.1.4.1 TChangeLink.Sender Property

Specifies which image list component notifies the change link object of changes.

Pascal

```
property Sender: TCustomImageList;
```

C++

```
__property TCustomImageList Sender;
```

Description

Use Sender to access the image list that has changed. The TImageList automatically sets this property when a call to RegisterChanges is made.

See Also

RegisterChanges (see page 4214)

34.1.1.5 TChangeLink Events

The events of the TChangeLink class are listed here.

Public Events

	Name	Description
	OnChange (see page 4192)	Occurs when there's a change in any of the images stored in the associated image list.

34.1.1.5.1 TChangeLink.OnChange Event

Occurs when there's a change in any of the images stored in the associated image list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use the OnChange event to notify a control when the image list that it's using changes. Specify any special processing to occur at that time in the OnChange event handler.

See Also

Change (see page 4191)

34.1.2 TCustomImageList Class

TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TCustomImageList = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TCustomImageList : public TComponent;
```

File

ImgList

Description

Image lists manage large sets of icons or bitmaps. All images in an image list are contained in a single, wide bitmap in screen device format. An image list may also include a monochrome bitmap that contains masks that are combined with the images to produce a transparent effect such as is common in icons.

See Also

TPicture (see page 2812)

TImage (see page 1048)

34.1.2.1 TCustomImageList Members

The following tables list the members exposed by TCustomImageList.

Protected Methods

	Name	Description
	AssignTo (see page 4200)	Copies the image list's properties to another image list.
	Change (see page 4200)	Generates an OnChange (see page 4226) event.
	DefineProperties (see page 4201)	Allows bitmap data to be saved and loaded.
	DoDraw (see page 4201)	Draws the specified image onto the provided Canvas in the indicated style.
	GetImages (see page 4208)	Returns a specified image and its mask as bitmaps.
	HandleNeeded (see page 4211)	This is HandleNeeded, a member of class TCustomImageList.
	Initialize (see page 4211)	Initializes a newly allocated image list.
	ReadData (see page 4213)	This is ReadData, a member of class TCustomImageList.
	WriteData (see page 4217)	This is WriteData, a member of class TCustomImageList.

Public Events

	Name	Description
	OnChange (see page 4226)	Occurs when the image list changes.

Public Methods

	Name	Description
	Add (see page 4197)	Adds an Image and its Mask (see page 4591) to the image list object.
	AddIcon (see page 4197)	Adds an icon to the image list object.
	AddImage (see page 4198)	Adds single image from another image list.
	AddImages (see page 4198)	Adds all images from another image list.
	AddMasked (see page 4199)	Adds an image to the image list along with a color which is used to generate the transparent mask.
V	Assign (see page 4199)	Copies the information from one image list to another.
	Clear (see page 4200)	Clears all images from the image list.
V	Create (see page 4195)	Creates an empty image list.
	CreateSize (see page 4195)	Creates an empty image list of a specified size.
	Delete (see page 4201)	Deletes a particular image from the image list.
V	Destroy (see page 4196)	Destroys the image list and releases the memory allocated to it.
	Draw (see page 4202)	This is the overview for the Draw method overload.
	DrawOverlay (see page 4205)	This is the overview for the DrawOverlay method overload.
	FileLoad (see page 4206)	Loads a resourced image into the image list.
	GetBitmap (see page 4206)	Retrieves a specified image as a bitmap.
V	GetHotSpot (see page 4207)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 4207)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 4208)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 4209)	This is the overview for the GetInstRes method overload.
	GetMaskBitmap (see page 4210)	Returns a handle to a bitmap containing all masks for images in the image list.
	GetResource (see page 4210)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 4211)	Indicates whether a window handle exists for the image list.
	Insert (see page 4212)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertIcon (see page 4212)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 4212)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	Move (see page 4213)	Moves a specified image to another position.
	Overlay (see page 4213)	Identifies an image in the list as an image that can be used as an overlay mask.
	RegisterChanges (see page 4214)	Registers an object to be notified when changes occur in the image list.
	Replace (see page 4214)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 4214)	Replaces an image in the image list with an icon.
	ReplaceMasked (see page 4215)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 4215)	Loads a resource into the image list.
	ResourceLoad (see page 4216)	Loads a resource into the image list.
	SetSize (see page 4216)	This is SetSize, a member of class TCustomImageList.
	UnRegisterChanges (see page 4216)	Removes an object from the list of objects to be notified when the image list changes.

Public Properties

	Name	Description
	AllocBy (see page 4217)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 4218)	Determines which background color to use when drawing an image.
	BlendColor (see page 4218)	Determines which foreground color to use when drawing an image.
R	Count (see page 4219)	Indicates the number of images in the image list.
	DrawingStyle (see page 4223)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 4224)	Designates the handle for the image list.

	Height (see page 4224)	Specifies the height of images within the image list.
	ImageType (see page 4224)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 4225)	Specifies whether the image list includes masks that can be combined with the images.
	ShareImages (see page 4225)	Specifies whether the image list destroys its handle when the image list is destroyed.
	Width (see page 4225)	Specifies the width of all images within the image list.

Published Properties

	Name	Description
	ColorDepth (see page 4218)	Color depth of images in list.

34.1.2.2 TCustomImageList.Create Constructor

Creates an empty image list.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomImageList(TComponent * AOwner);
```

Description

Call Create to instantiate an image list at runtime. ImageLists placed on forms or data modules at design time are created automatically. Specify the owner of the new imagelist using the AOwner parameter.

The new image list contains no images and has a default size of 16 by 16 pixels.

See Also

CreateSize (see page 4195)

34.1.2.3 TCustomImageList.CreateSize Constructor

Creates an empty image list of a specified size.

Pascal

```
constructor CreateSize(AWidth: Integer; AHeight: Integer);
```

C++

```
__fastcall TCustomImageList(int AWidth, int AHeight);
```

Description

Use CreateSize to create an image list object at runtime with an image size other than the default of 16 x 16 pixels. The initial size of the image list is determined by the AHeight and AWidth parameters. The height and width can be altered after the image list has been created using the Width (see page 4225) and Height (see page 4224) properties.

See Also

Create (see page 4195)

Height (see page 4224)

Width (see page 4225)

34.1.2.4 TCustomImageList.Destroy Destructor

Destroys the image list and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomImageList();
```

Description

Destroy first calls UnRegisterChanges (see page 4216) to unregister any objects registered to receive notification when the image list changed, and frees all helper objects associated with the image list.

Destroy seldom needs to be called. However, when an image list is constructed without an owner by the Create (see page 4195) or CreateSize (see page 4195) method, call Free to release memory and dispose of the object. Free checks to see if the pointer is nil before calling Destroy.

See Also

System::TObject::Free

UnRegisterChanges (see page 4216)

34.1.2.5 TCustomImageList Methods

The methods of the TCustomImageList class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 4200)	Copies the image list's properties to another image list.
	Change (see page 4200)	Generates an OnChange (see page 4226) event.
	DefineProperties (see page 4201)	Allows bitmap data to be saved and loaded.
	DoDraw (see page 4201)	Draws the specified image onto the provided Canvas in the indicated style.
	GetImages (see page 4208)	Returns a specified image and its mask as bitmaps.
	HandleNeeded (see page 4211)	This is HandleNeeded, a member of class TCustomImageList.
	Initialize (see page 4211)	Initializes a newly allocated image list.
	ReadData (see page 4213)	This is ReadData, a member of class TCustomImageList.
	WriteData (see page 4217)	This is WriteData, a member of class TCustomImageList.

Public Methods

	Name	Description
	Add (see page 4197)	Adds an Image and its Mask (see page 4591) to the image list object.
	AddIcon (see page 4197)	Adds an icon to the image list object.
	AddImage (see page 4198)	Adds single image from another image list.
	AddImages (see page 4198)	Adds all images from another image list.
	AddMasked (see page 4199)	Adds an image to the image list along with a color which is used to generate the transparent mask.
	Assign (see page 4199)	Copies the information from one image list to another.
	Clear (see page 4200)	Clears all images from the image list.
	Delete (see page 4201)	Deletes a particular image from the image list.
	Draw (see page 4202)	This is the overview for the Draw method overload.
	DrawOverlay (see page 4205)	This is the overview for the DrawOverlay method overload.
	FileLoad (see page 4206)	Loads a resourced image into the image list.

	GetBitmap (see page 4206)	Retrieves a specified image as a bitmap.
	GetHotSpot (see page 4207)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 4207)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 4208)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 4209)	This is the overview for the GetInstRes method overload.
	GetMaskBitmap (see page 4210)	Returns a handle to a bitmap containing all masks for images in the image list.
	GetResource (see page 4210)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 4211)	Indicates whether a window handle exists for the image list.
	Insert (see page 4212)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertIcon (see page 4212)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 4212)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	Move (see page 4213)	Moves a specified image to another position.
	Overlay (see page 4213)	Identifies an image in the list as an image that can be used as an overlay mask.
	RegisterChanges (see page 4214)	Registers an object to be notified when changes occur in the image list.
	Replace (see page 4214)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 4214)	Replaces an image in the image list with an icon.
	ReplaceMasked (see page 4215)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 4215)	Loads a resource into the image list.
	ResourceLoad (see page 4216)	Loads a resource into the image list.
	SetSize (see page 4216)	This is SetSize, a member of class TCustomImageList.
	UnRegisterChanges (see page 4216)	Removes an object from the list of objects to be notified when the image list changes.

34.1.2.5.1 TCustomImageList.Add Method

Adds an Image and its Mask (see page 4591) to the image list object.

Pascal

```
function Add(Image: TBitmap; Mask: TBitmap): Integer;
```

C++

```
__fastcall int Add(TBitmap Image, TBitmap Mask);
```

Description

Use the Add method to add images with their masks to an image list. It returns the index of the added image, or -1 if it fails. When the Masked (see page 4225) property of the image list is false, the second bitmap is ignored; it can be set to nil (Delphi) or NULL (C++).

See Also

AddIcon (see page 4197)

AddImages (see page 4198)

AddMasked (see page 4199)

Masked (see page 4225)

34.1.2.5.2 TCustomImageList.AddIcon Method

Adds an icon to the image list object.

Pascal

```
function AddIcon(Image: TIcon): Integer;
```

C++

```
__fastcall int AddIcon(TIcon Image);
```

Description

Use the AddIcon method to add the icon specified by the Image parameter to an image list. AddIcon returns the index of the added image, or -1 if it fails.

See Also

Add (see page 4197)

AddImages (see page 4198)

AddMasked (see page 4199)

34.1.2.5.3 TCustomImageList.AddImage Method

Adds single image from another image list.

Pascal

```
function AddImage(Value: TCustomImageList; Index: Integer): Integer;
```

C++

```
__fastcall int AddImage(TCustomImageList Value, int Index);
```

Description

Use AddImage to add a single image from another image list. Values specifies the source image list. Index indicates the specific image, where images are numbered from 0.

AddImage returns the new size of the image list.

See Also

Add (see page 4197)

AddIcon (see page 4197)

AddMasked (see page 4199)

AddImages (see page 4198)

34.1.2.5.4 TCustomImageList.AddImages Method

Adds all images from another image list.

Pascal

```
procedure AddImages(Value: TCustomImageList);
```

C++

```
__fastcall AddImages(TCustomImageList Value);
```

Description

Use AddImages to add all the images from another image list. Value specifies the source image list.

See Also

Add (see page 4197)

AddIcon (see page 4197)

AddMasked (see page 4199)

AddImage (see page 4198)

34.1.2.5.5 TCustomImageList.AddMasked Method

Adds an image to the image list along with a color which is used to generate the transparent mask.

Pascal

```
function AddMasked(Image: TBitmap; MaskColor: TColor): Integer;
```

C++

```
__fastcall int AddMasked(TBitmap Image, TColor MaskColor);
```

Description

AddMasked is similar to Add (see page 4197) except that a mask bitmap is not specified. Instead, a color that can be used to automatically generate the masks is specified. Each pixel of the specified color in the image bitmap is changed to black, and the corresponding bit in the mask is set to one. As a result, any pixel in the image that matches the specified color is transparent when the image is drawn. AddMasked returns -1 if it fails, 0 if it's successful.

See Also

Add (see page 4197)

AddIcon (see page 4197)

AddImages (see page 4198)

Masked (see page 4225)

34.1.2.5.6 TCustomImageList.Assign Method

Copies the information from one image list to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use this method to copy another object's information to the image list.

If Source is another image list (TCustomImageList (see page 4193) descendant), Assign discards any current image information and replaces it with the information from Source.

If Source is nil (Delphi) or NULL (C++), Assign clears the image list.

If Source is any other type of object, Assign calls its inherited method, which can copy from any source object that implements a way to copy to an image list in its AssignTo (see page 4200) method.

See Also

AddImages (see page 4198)

Add (see page 4197)

AssignTo

34.1.2.5.7 TCustomImageList.AssignTo Method

Copies the image list's properties to another image list.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications do not call the protected AssignTo method. Instead, call the public Assign (see page 4199) method of the destination image list. AssignTo is called when the image list is passed as the Source parameter of another object's Assign (see page 4199) method and that Assign (see page 4199) method can't copy information to the image list. The object whose Assign (see page 4199) method was called is passed as the Dest parameter. AssignTo gives the image list an opportunity to copy properties to objects that were not created with the image list in mind.

See Also

AddImages (see page 4198)

Add (see page 4197)

Assign (see page 4199)

34.1.2.5.8 TCustomImageList.Change Method

Generates an OnChange (see page 4226) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Change calls the OnChange (see page 4226) event handler if it is assigned. Override Change to block this event or provide additional responses to changes in the image list.

See Also

RegisterChanges (see page 4214)

OnChange (see page 4226)

34.1.2.5.9 TCustomImageList.Clear Method

Clears all images from the image list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use the Clear method to remove all images from the image list. Use the Delete (see page 4201) method to delete one image from the image list.

See Also

Delete (see page 4201)

34.1.2.5.10 TCustomImageList.DefineProperties Method

Allows bitmap data to be saved and loaded.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties allows the image list to create pseudo properties that are loaded and saved with the image list. TCustomImageList (see page 4193) overrides the inherited method to save or load the bitmap image in addition to the other published properties.

See Also

DefineBinaryProperty

DefineProperties

34.1.2.5.11 TCustomImageList.Delete Method

Deletes a particular image from the image list.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Use the Delete method to delete an image specified by Index in the image list. Use the Clear (see page 4200) method to delete all images in the image list.

See Also

Clear (see page 4200)

34.1.2.5.12 TCustomImageList.DoDraw Method

Draws the specified image onto the provided Canvas in the indicated style.

Pascal

```
procedure DoDraw(Index: Integer; Canvas: TCanvas; X: Integer; Y: Integer; Style: Cardinal;
Enabled: Boolean = True); virtual;
```

C++

```
virtual __fastcall DoDraw(int Index, TCanvas Canvas, int X, int Y, unsigned Style, Boolean
Enabled = True);
```

Description

Applications can't call the protected DoDraw method. It provides the underlying implementation of the public Draw (see page 4202) method.

Index specifies an image to draw.

Canvas indicates the drawing surface on which the image is rendered.

X and Y specify the top-left corner of the image on Canvas.

Style encodes how the image blends color or uses a mask (the DrawingStyle (see page 4223) and ImageType (see page 4224)).

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw renders a gray-mapped version of the image.

See Also

Draw (see page 4202)

DrawingStyle (see page 4223)

ImageType (see page 4224)

34.1.2.5.13 Draw Method

This is the overview for the Draw method overload.

Overload List

	Name	Description
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, Boolean) (see page 4202)	Draws the image specified by the Index parameter onto the provided Canvas.
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, TDrawingStyle, TImageType, Boolean) (see page 4202)	Draws the image specified by the Index parameter onto the provided Canvas.

34.1.2.5.13.1 TCustomImageList.Draw Method (TCanvas, Integer, Integer, Integer, Boolean)

Draws the image specified by the Index parameter onto the provided Canvas.

Pascal

```
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; Enabled: Boolean =
True); overload;
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; ADrawingStyle:
TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True); overload;
```

C++

```
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, Boolean Enabled = True);
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, TDrawingStyle ADrawingStyle,
TImageType AImageType, Boolean Enabled = True);
```

Description

Use the Draw method to draw one of the images in the image list onto a specified canvas.

Canvas is the drawing surface on which to render the image.

X and Y specify the location where the top-left corner should appear on Canvas.

Index indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw uses the value of the DrawingStyle (see page 4223) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw uses the value of the ImageType (see page 4224) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, Draw renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
}
procedure TForm1.StatusBar1DrawPanel(StatusBar: TStatusBar;
  Panel: TStatusPanel; const Rect: TRect);
begin
with StatusBar1.Canvas do
  begin
    Brush.Color := clRed;
    FillRect(Rect);
    Font.Color := clYellow;
    ImageList1.Draw(StatusBar1.Canvas,Rect.Left,Rect.Top,Panel.Index);
    TextOut(Rect.left + 30, Rect.top + 2, 'Panel' + IntToStr(Panel.Index));
  end;
end;
```

34.1.2.5.14 DrawOverlay Method

This is the overview for the DrawOverlay method overload.

Overload List

	Name	Description
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, Boolean) (see page 4205)	Draws an image and an overlay onto the provided Canvas.
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, TDrawingStyle, TImageType, Boolean) (see page 4205)	Draws an image and an overlay onto the provided Canvas.

34.1.2.5.14.1 TCustomImageList.DrawOverlay Method (TCanvas, Integer, Integer, Integer, TOverlay, Boolean)

Draws an image and an overlay onto the provided Canvas.

Pascal

```
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; Enabled: Boolean = True); overload;
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; ADrawingStyle: TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True);
overload;
```

C++

```
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay, Boolean
Enabled = True);
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay,
TDrawingStyle ADrawingStyle, TImageType AImageType, Boolean Enabled = True);
```

Description

An overlay mask is an image drawn transparently over another image. Any image can be used as an overlay mask. To draw an overlay mask over an image use the DrawOverlay method with the index of the overlay mask.

Canvas is the drawing surface on which to draw the overlay.

X and Y specify the location where the top-left corner should appear on Canvas.

ImageIndex indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

Overlay (see page 4213) specifies the index of the overlay mask to use. This index is assigned to the image that is used as an overlay mask by calling the Overlay (see page 4213) method.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw (see page 4202) uses the value of the DrawingStyle (see page 4223) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw (see page 4202) uses the value of the ImageType (see page 4224) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw (see page 4201) renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

See Also

Overlay (see page 4213)

Draw (see page 4202)

SetDragImage

34.1.2.5.15 TCustomImageList.FileLoad Method

Loads a resourced image into the image list.

Pascal

```
function FileLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean FileLoad(TResType ResType, const UnicodeString Name, TColor MaskColor);
```

Description

Use the FileLoad method to load a bitmap, cursor, or icon from a resource file. Use ResType to specify the type of resource. Use Name to identify the resource by name. Use MaskColor to set the transparent color for the images. FileLoad returns true if successful.

Note: Within a package, FileLoad returns an error. GetInstRes (see page 4209) must be used to load a resource from within a package.

See Also

GetResource (see page 4210)

ResourceLoad (see page 4216)

GetInstRes (see page 4209)

34.1.2.5.16 TCustomImageList.GetBitmap Method

Retrieves a specified image as a bitmap.

Pascal

```
function GetBitmap(Index: Integer; Image: TBitmap): Boolean;
```

C++

```
__fastcall Boolean GetBitmap(int Index, TBitmap Image);
```

Description

Use the GetBitmap method to obtain a particular image in the image list as a bitmap object. Index denotes the index of the image. GetBitmap assigns the image to the TBitmap (see page 2628) object passed in as the Image parameter.

C++ Examples:

```
/*
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ImageList1->GetBitmap(0, Image1->Picture->Bitmap);
  Image1->Stretch = True;
```

```
}
```

Delphi Examples:

```
{
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   ImageList1.GetBitmap(2,Image1.Picture.Bitmap);
   Image1.Stretch := True;
end;
```

See Also

GetMaskBitmap (see page 4210)

34.1.2.5.17 TCustomImageList.GetHotSpot Method

Returns the hot spot location associated with the current drag image.

Pascal

```
function GetHotSpot: TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetHotSpot();
```

Description

Use the GetHotSpot method to obtain the position of the hot spot of the current drag image.

See Also

DragMove

SetDragImage

34.1.2.5.18 GetIcon Method

This is the overview for the GetIcon method overload.

Overload List

	Name	Description
	TCustomImageList.GetIcon (Integer, TIcon) (see page 4207)	Returns the image specified by Index as an icon into the Image parameter.
	TCustomImageList.GetIcon (Integer, TIcon, TDrawingStyle, TImageType) (see page 4207)	Returns the image specified by Index as an icon into the Image parameter.

34.1.2.5.18.1 TCustomImageList.GetIcon Method (Integer, TIcon)

Returns the image specified by Index as an icon into the Image parameter.

Pascal

```
procedure GetIcon(Index: Integer; Image: TIcon); overload;
procedure GetIcon(Index: Integer; Image: TIcon; ADrawingStyle: TDrawingStyle; AImageType:
TImageType); overload;
```

C++

```
__fastcall GetIcon(int Index, TIcon Image);
__fastcall GetIcon(int Index, TIcon Image, TDrawingStyle ADrawingStyle, TImageType AImageType);
```

Description

Call GetIcon to obtain a particular image in the image list as an icon.

Index identifies the desired image, where 0 specifies the first image, 1 specifies the second image, and so on.

Image is a TIcon (see page 2768) object that receives the new image.

ADrawingStyle specifies the amount of color that is blended with the image to achieve various affects. When GetIcon is called using the version that does not take an ADrawingStyle parameter, it uses the value of the DrawingStyle (see page 4223) property.

AImageType specifies whether the image is rendered using a mask. When GetIcon is called using the version that does not take an AImageType parameter, it uses the value of the ImageType (see page 4224) property.

See Also

GetImageBitmap (see page 4208)

DrawingStyle (see page 4223)

ImageType (see page 4224)

34.1.2.5.19 TCustomImageList.GetImageBitmap Method

Returns a handle to a bitmap containing all of the images in the image list.

Pascal

```
function GetImageBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetImageBitmap();
```

Description

Use the GetImageBitmap method to obtain a Windows handle for the bitmap that contains all images in the image list. GetImageBitmap returns 0 if unsuccessful.

See Also

GetImages (see page 4208)

GetBitmap (see page 4206)

34.1.2.5.20 TCustomImageList.GetImages Method

Returns a specified image and its mask as bitmaps.

Pascal

```
procedure GetImages(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall GetImages(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use GetImages to obtain the image (and its mask) identified by the Index parameter.

Index specifies the image (and mask) to return, where 0 identifies the first image, 1 the second image, and so on.

Image is a TBitmap (see page 2628) object that receives the image of the bitmap.

Mask (see page 4591) is a TBitmap (see page 2628) object that receives the image of the mask.

See Also

GetImageBitmap (see page 4208)

GetMaskBitmap (see page 4210)

GetBitmap (see page 4206)

34.1.2.5.21 GetInstRes Method

This is the overview for the GetInstRes method overload.

Overload List

	Name	Description
	TCustomImageList.GetInstRes (THandle, TResType, DWORD, Integer, TLoadResources, TColor) (see page 4209)	Loads a specified bitmap, cursor, or icon resource into the image list.
	TCustomImageList.GetInstRes (THandle, TResType, string, Integer, TLoadResources, TColor) (see page 4209)	Loads a specified bitmap, cursor, or icon resource into the image list.

34.1.2.5.21.1 TCustomImageList.GetInstRes Method (THandle, TResType, DWORD, Integer, TLoadResources, TColor)

Loads a specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetInstRes(Instance: THandle; ResType: TResType; const Name: string; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
function GetInstRes(Instance: THandle; ResType: TResType; ResID: DWORD; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
```

C++

```
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, const UnicodeString Name,
int Width, TLoadResources LoadFlags, TColor MaskColor);
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, DWORD ResID, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetInstRes method to load bitmap, cursor, or icon resource into an image list.

Instance is the instance handle of the resource module.

ResType indicates the type of resource (rtBitmap, rtCursor or rtIcon).

Name or ResID identifies the resource by name or ID, respectively.

Width (see page 4225) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the image.

Note: GetInstRes must be used to load a resource from within a package. Within a package, GetResource (see page 4210) or FileLoad (see page 4206) returns an error.

See Also

ResInstLoad (see page 4215)

ResourceLoad (see page 4216)

FileLoad (see page 4206)

GetResource (see page 4210)

34.1.2.5.22 TCustomImageList.GetMaskBitmap Method

Returns a handle to a bitmap containing all masks for images in the image list.

Pascal

```
function GetMaskBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetMaskBitmap();
```

Description

Use the GetMaskBitmap to obtain a bitmap that contains all masks in the image list. GetMaskBitmap returns 0 if unsuccessful.

See Also

GetImageBitmap (see page 4208)

GetImages (see page 4208)

34.1.2.5.23 TCustomImageList.GetResource Method

Loads the specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetResource(ResType: TResType; const Name: string; Width: Integer; LoadFlags:
TLoadResources; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean GetResource(TResType ResType, const UnicodeString Name, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetResource method to load bitmap, cursor, or icon resource into an image list.

Note: Within a package, GetResource returns an error. GetInstRes (see page 4209) must be used to load a resource from within a package.

ResType specifies the type of graphical resource that is to be loaded into the image list and can be rtBitmap, rtCursor or rtIcon.

Name identifies the resource by name.

Width (see page 4225) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the images in the file.

See Also

ResourceLoad (see page 4216)

FileLoad (see page 4206)

GetInstRes (see page 4209)

34.1.2.5.24 TCustomImageList.HandleAllocated Method

Indicates whether a window handle exists for the image list.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine if a handle exists for the image list. HandleAllocated returns true if the Windows image list has been created and a handle is available, false otherwise. HandleAllocated doesn't create a handle if it doesn't already exist.

Note: Getting the Handle (see page 4224) property of creates the Windows image list automatically if it didn't previously exist, and returns the resulting handle.

See Also

Handle (see page 4224)

34.1.2.5.25 TCustomImageList.HandleNeeded Method

Pascal

```
procedure HandleNeeded;
```

C++

```
__fastcall HandleNeeded();
```

Description

This is HandleNeeded, a member of class TCustomImageList.

34.1.2.5.26 TCustomImageList.Initialize Method

Initializes a newly allocated image list.

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

Initialize is called from the constructor of the image list. It sets numerous image list properties to their default values and creates instances of helper objects used internally.

See Also

Create (see page 4195)

CreateSize (see page 4195)

34.1.2.5.27 TCustomImageList.Insert Method

Inserts a bitmap and its mask into the image list following a specified image.

Pascal

```
procedure Insert(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Insert(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Insert method to insert a bitmap and its mask into the image list. The image is inserted following the image specified by Index.

See Also

Add (see page 4197)

AddMasked (see page 4199)

34.1.2.5.28 TCustomImageList.InsertIcon Method

Inserts an icon at a specified position in the image list.

Pascal

```
procedure InsertIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall InsertIcon(int Index, TIcon Image);
```

Description

Use the InsertIcon method to insert an icon into the image list. The icon is inserted following the image specified by Index.

See Also

AddIcon (see page 4197)

34.1.2.5.29 TCustomImageList.InsertMasked Method

Inserts a bitmap at a specified position, creating the mask from a specified transparent color.

Pascal

```
procedure InsertMasked(Index: Integer; Image: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall InsertMasked(int Index, TBitmap Image, TColor MaskColor);
```

Description

Use the InsertMasked method to insert a masked image into the image list. The new image is inserted following the image specified by Index. Use MaskColor to identify the color in the image used to generate the Mask (see page 4591).

See Also

AddMasked (see page 4199)

Insert (see page 4212)

34.1.2.5.30 TCustomImageList.Move Method

Moves a specified image to another position.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer);
```

C++

```
__fastcall Move(int CurIndex, int NewIndex);
```

Description

Use the Move method to move an image to another position in the image list. Specify the current position using CurIndex, and the new position using NewIndex.

See Also

Insert (see page 4212)

34.1.2.5.31 TCustomImageList.Overlay Method

Identifies an image in the list as an image that can be used as an overlay mask.

Pascal

```
function Overlay(ImageIndex: Integer; Overlay: TOverlay): Boolean;
```

C++

```
__fastcall Boolean Overlay(int ImageIndex, TOverlay Overlay);
```

Description

Use Overlay to assign an overlay index to one of the images in the list. Once an image has an overlay index, it can be used as an overlay mask. An overlay mask is an image drawn transparently over another image.

ImageIndex identifies the image that can act as an overlay mask.

Overlay is the overlay index to assign to that image. It must be a value between 0 and 3 (inclusive). Note that this means at most four images can be used as overlay masks.

If successful, Overlay returns true.

To draw an overlay mask over an image use the DrawOverlaymethodwith the index of the overlay mask.

See Also

DrawOverlay (see page 4205)

34.1.2.5.32 TCustomImageList.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TCustomImageList.

34.1.2.5.33 TCustomImageList.RegisterChanges Method

Registers an object to be notified when changes occur in the image list.

Pascal

```
procedure RegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall RegisterChanges(TChangeLink Value);
```

Description

Use the RegisterChanges method to have an object notified whenever changes occur in the image list. The TChangeLink (see page 4190)'s OnChange (see page 4226) event is called whenever a change in the image list occurs.

Create (see page 4195) a change link object for each object that should be notified of changes. Register each object by calling RegisterChanges and passing its change link object as the Value parameter. The OnChange (see page 4226) event of all registered change link objects is then triggered when a change occurs in the image list. Any code assigned to the OnChange (see page 4226) event handlers will execute.

See Also

UnRegisterChanges (see page 4216)

OnChange (see page 4192)

34.1.2.5.34 TCustomImageList.Replace Method

Replaces an image in the image list with a new image and mask.

Pascal

```
procedure Replace(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Replace(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Replace method to replace the image at the Index position in the image list with a new Image and overlay Mask (see page 4591).

See Also

Insert (see page 4212)

ReplaceIcon (see page 4214)

ReplaceMasked (see page 4215)

34.1.2.5.35 TCustomImageList.ReplaceIcon Method

Replaces an image in the image list with an icon.

Pascal

```
procedure ReplaceIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall ReplaceIcon(int Index, TIcon Image);
```

Description

Use the ReplaceIcon method to replace the Image at the Index position in the image list with a new icon.

See Also

Replace (see page 4214)

InsertIcon (see page 4212)

34.1.2.5.36 TCustomImageList.ReplaceMasked Method

Replaces an image in the image list with a new image and automatically-generated mask.

Pascal

```
procedure ReplaceMasked(Index: Integer; NewImage: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall ReplaceMasked(int Index, TBitmap NewImage, TColor MaskColor);
```

Description

Use the ReplaceMasked method to replace the image at Index position within the image list specified by NewImage and the mask generated from NewImage by masking out all pixels of the color specified by MaskColor.

See Also

Replace (see page 4214)

InsertMasked (see page 4212)

34.1.2.5.37 TCustomImageList.ResInstLoad Method

Loads a resource into the image list.

Pascal

```
function ResInstLoad(Instance: THandle; ResType: TResType; const Name: string; MaskColor:
TColor): Boolean;
```

C++

```
__fastcall Boolean ResInstLoad(THandle Instance, TResType ResType, const UnicodeString Name,
TColor MaskColor);
```

Description

Use the ResoInstLoad method to load a resource of type TResType (see page 4230) into the image list. Use Instance to specify the instance handle of the resource module, and Name to identify the resource within that module. MaskColor is used to create the mask for the resulting image. ResInstLoad should be used rather than ResourceLoad (see page 4216) to load a resource from within a package.

ResInstLoad returns true if it is successful, false otherwise.

See Also

GetInstRes (see page 4209)

GetResource (see page 4210)

34.1.2.5.38 TCustomImageList.ResourceLoad Method

Loads a resource into the image list.

Pascal

```
function ResourceLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean ResourceLoad(TResType ResType, const UnicodeString Name, TColor MaskColor);
```

Description

Use the ResourceLoad method to load a resource of type TResType (see page 4230) into the image list. Use Name to identify the resource. MaskColor is used to create the mask for the resulting image. ResourceLoad returns true if successful, false otherwise.

Note: Within a package, use ResInstLoad (see page 4215) instead of ResourceLoad. ResourceLoad returns an error when called from within a package.

See Also

GetResource (see page 4210)

ResInstLoad (see page 4215)

34.1.2.5.39 TCustomImageList.SetSize Method

Pascal

```
procedure SetSize(AWidth: Integer; AHeight: Integer);
```

C++

```
__fastcall SetSize(int AWidth, int AHeight);
```

Description

This is SetSize, a member of class TCustomImageList.

34.1.2.5.40 TCustomImageList.UnRegisterChanges Method

Removes an object from the list of objects to be notified when the image list changes.

Pascal

```
procedure UnRegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall UnRegisterChanges(TChangeLink Value);
```

Description

Use the UnRegisterChanges method to unregister a TChangeLink (see page 4190) object. The object will no longer receive notification when the image list changes.

See Also

RegisterChanges (see page 4214)

34.1.2.5.41 TCustomImageList.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TCustomImageList.

34.1.2.6 TCustomImageList Properties

The properties of the TCustomImageList class are listed here.

Public Properties

	Name	Description
	AllocBy (see page 4217)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 4218)	Determines which background color to use when drawing an image.
	BlendColor (see page 4218)	Determines which foreground color to use when drawing an image.
R	Count (see page 4219)	Indicates the number of images in the image list.
	DrawingStyle (see page 4223)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 4224)	Designates the handle for the image list.
	Height (see page 4224)	Specifies the height of images within the image list.
	ImageType (see page 4224)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 4225)	Specifies whether the image list includes masks that can be combined with the images.
	ShareImages (see page 4225)	Specifies whether the image list destroys its handle when the image list is destroyed.
	Width (see page 4225)	Specifies the width of all images within the image list.

Published Properties

	Name	Description
	ColorDepth (see page 4218)	Color depth of images in list.

34.1.2.6.1 TCustomImageList.AllocBy Property

Sets the number of images by which the image list grows when it needs to make room for new images.

Pascal

```
property AllocBy: Integer;
```

C++

```
__property int AllocBy;
```

Description

Use the AllocBy method to specify the number of new images that can be added to the resized image list.

See Also

Count (see page 4219)

Add (see page 4197)

AddIcon (see page 4197)

AddImages (see page 4198)

AddMasked (see page 4199)

34.1.2.6.2 TCustomImageList.BkColor Property

Determines which background color to use when drawing an image.

Pascal

```
property BkColor: TColor;
```

C++

```
__property TColor BkColor;
```

Description

Use BkColor to specify the color used for the masked regions of the images in the list. When BkColor is clNone (see page 2914), the image is drawn transparently using the mask to define the transparent areas. Otherwise, the value of BkColor appears in the masked out portions.

Note: BkColor has no effect when the Masked (see page 4225) property is false.

See Also

BlendColor (see page 4218)

Masked (see page 4225)

ImageType (see page 4224)

34.1.2.6.3 TCustomImageList.BlendColor Property

Determines which foreground color to use when drawing an image.

Pascal

```
property BlendColor: TColor;
```

C++

```
__property TColor BlendColor;
```

Description

Set BlendColor to cause the images in the list to be combined with the specified color when the DrawingStyle (see page 4223) is dsFocus or dsSelected. More of BlendColor is combined with the images when DrawingStyle (see page 4223) is dsSelected. clNone (see page 2914) specifies no blend color while clDefault (see page 2903) specifies the system highlight .

See Also

BkColor (see page 4218)

DrawingStyle (see page 4223)

34.1.2.6.4 TCustomImageList.ColorDepth Property

Color depth of images in list.

Pascal

```
property ColorDepth: TColorDepth;
```

C++

```
__property TColorDepth ColorDepth;
```

Description

ColorDepth is the color depth type TColorDepth (see page 4227) of images in the list.

See Also

BkColor (see page 4218)

BlendColor (see page 4218)

Height (see page 4224)

Width (see page 4225)

TColorDepth (see page 4227)

34.1.2.6.5 TCustomImageList.Count Property

Indicates the number of images in the image list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count when iterating through the images in the image list. Retrieve the individual images using the GetBitmap (see page 4206) method. Draw (see page 4202) individual images using the Draw (see page 4202) method.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
```

```
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", reinterpret_cast<TObject *>(vsIcon));
  ComboBox1->Items->AddObject("vsList", reinterpret_cast<TObject *>(vsList));
  ComboBox1->Items->AddObject("vsReport", reinterpret_cast<TObject *>(vsReport));
  ComboBox1->Items->AddObject("vsSmallIcon", reinterpret_cast<TObject *>(vsSmallIcon));
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
/*
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {
    "C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {
    "Documentation for the C++ icon.",
    "Borland icon.", "Delphi icon."
    };
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  ListView1->ViewStyle = vsReport;
}

int ColumnToSort = 0;

/*
```

```
The OnColumnClick event handler sets the global variable to
indicate the column to sort and calls AlphaSort:
*/

void __fastcall TForm1::ListView1ColumnClick(TObject *Sender,
      TListColumn *Column)
{
  ColumnToSort = Column->Index;
  dynamic_cast<TCustomListView *>(Sender)->AlphaSort();
}

/*
The OnCompare event handler causes the list view to sort on
the selected column:
*/

void __fastcall TForm1::ListView1Compare(TObject *Sender, TListItem *Item1,
      TListItem *Item2, int Data, int &Compare)
{
  if (ColumnToSort == 0)
    Compare = CompareText(Item1->Caption,Item2->Caption);
  else
  {
    int ix = ColumnToSort - 1;
    Compare =
      CompareText(Item1->SubItems->Strings[ix], Item2->SubItems->Strings[ix]);
  }
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
```

```
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
  end;
end;

procedure TComboForm.ComboBox1Click(Sender: TObject);
begin
  with ComboBox1 do
    ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

end;
{
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
}
var ColumnToSort: Integer;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
const
  imagenames: Array[0..2] of string = ('C++ Image', 'Borland Image', 'Delphi Image');
begin
  Col2Array[0]:= 'Documentation for the C++ icon.';
  Col2Array[1]:= 'Borland icon.';
  Col2Array[2]:= 'Delphi icon.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := imagenames[I];
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
```

```
      NewColumn.Width := 200;
      ListView1.ViewStyle := vsReport;
    end;
  end;

  procedure TForm1.ListView1ColumnClick(Sender: TObject; Column: TListColumn);
  begin
    ColumnToSort := Column.Index;
    (Sender as TCustomListView).AlphaSort;
  end;

  {
  The OnCompare event handler causes the list view to sort on
  the selected column:
  }
  procedure TForm1.ListView1Compare(Sender: TObject; Item1, Item2: TListItem; Data: Integer; var
  Compare: Integer);
  var
    ix: Integer;
  begin
    if ColumnToSort = 0 then
      Compare := CompareText(Item1.Caption,Item2.Caption)
    else begin
     ix := ColumnToSort - 1;
     Compare := CompareText(Item1.SubItems[ix],Item2.SubItems[ix]);
    end;
  end;
  {
  Note:   This OnCompare event handler uses the global
  CompareText function. An application may want to use
  AnsiCompareText, CompareStr, or AnsiCompareStr instead,
  depending on whether the comparison should be case-sensitive
  and whether the locale should be considered.
  }
```

See Also

AllocBy (see page 4217)

GetBitmap (see page 4206)

Draw (see page 4202)

34.1.2.6.6 TCustomImageList.DrawingStyle Property

Specifies the style to be used when the image list is drawing an image.

Pascal

```
property DrawingStyle: TDrawingStyle;
```

C++

```
__property TDrawingStyle DrawingStyle;
```

Description

Use the DrawingStyle property to control how the image is to appear. DrawingStyle controls how much of the blend color specified by BlendColor (see page 4218) is combined with the foreground, or what background color to use.

See Also

Draw (see page 4202)

DrawOverlay (see page 4205)

ImageType (see page 4224)

BlendColor (see page 4218)

BkColor (see page 4218)

34.1.2.6.7 TCustomImageList.Handle Property

Designates the handle for the image list.

Pascal

```
property Handle: HImageList;
```

C++

```
__property HImageList Handle;
```

Description

Handle is the Windows image list object handle. Use this handle when calling Windows API functions that require it.

See Also

HandleAllocated (see page 4211)

34.1.2.6.8 TCustomImageList.Height Property

Specifies the height of images within the image list.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to specify the height of images before any are added to the image list. The image list is cleared when this value changes.

See Also

Width (see page 4225)

CreateSize (see page 4195)

Create (see page 4195)

34.1.2.6.9 TCustomImageList.ImageType Property

Determines whether the image list uses the associated mask when drawing.

Pascal

```
property ImageType: TImageType;
```

C++

```
__property TImageType ImageType;
```

Description

Use the ImageType property to control whether the images are drawn using the image mask (itMask), or without the mask (itImage).

See Also

DrawingStyle (see page 4223)

Draw (see page 4202)

Masked (see page 4225)

DrawOverlay (see page 4205)

34.1.2.6.10 TCustomImageList.Masked Property

Specifies whether the image list includes masks that can be combined with the images.

Pascal

```
property Masked: Boolean;
```

C++

```
__property Boolean Masked;
```

Description

Set the Masked property to true to combine the images with masks. The masked portion of the bitmap is drawn transparently, or replaced by the color specified by the BkColor (see page 4218) property.

Masked indicates whether the image list stores masks to combine with the images. To use those masks, the ImageType (see page 4224) property indicates whether to draw the image or the mask.

See Also

AddMasked (see page 4199)

InsertMasked (see page 4212)

BkColor (see page 4218)

ImageType (see page 4224)

34.1.2.6.11 TCustomImageList.ShareImages Property

Specifies whether the image list destroys its handle when the image list is destroyed.

Pascal

```
property ShareImages: Boolean;
```

C++

```
__property Boolean ShareImages;
```

Description

Set the ShareImages property to false to ensure that the handle to the image list is freed when the image list is destroyed.

See Also

Destroy (see page 4196)

Handle (see page 4224)

34.1.2.6.12 TCustomImageList.Width Property

Specifies the width of all images within the image list.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to specify the width of images before any are added to the image list. The image list is cleared when this value changes.

See Also

Height (see page 4224)

Create (see page 4195)

CreateSize (see page 4195)

34.1.2.7 TCustomImageList Events

The events of the TCustomImageList class are listed here.

Public Events

	Name	Description
	OnChange (see page 4226)	Occurs when the image list changes.

34.1.2.7.1 TCustomImageList.OnChange Event

Occurs when the image list changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to execute code when the image list changes. Any objects registered with the RegisterChanges (see page 4214) method will also be notified.

See Also

RegisterChanges (see page 4214)

34.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TColorDepth (see page 4227)	Color depth of list images.
	TDrawingStyle (see page 4228)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 4229)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 4229)	TLoadResource and TLoadResources (see page 4232) determine how a resource is loaded into an image list.
	TResType (see page 4230)	TResType identifies a type of graphical resource to an image list.

34.2.1 ImgList.TColorDepth Enumeration

Color depth of list images.

Pascal

```
TColorDepth = (
  cdDefault,
  cdDeviceDependent,
  cd4Bit,
  cd8Bit,
  cd16Bit,
  cd24Bit,
  cd32Bit
);
```

C++

```
enum TColorDepth {
  cdDefault,
  cdDeviceDependent,
  cd4Bit,
  cd8Bit,
  cd16Bit,
  cd24Bit,
  cd32Bit
};
```

File

ImgList

Description

TColorDepth is the color depth of images in the list. This is the number of bits to represent color for each pixel. The following table describes the possible values:

Value	Meaning
cdDefault	Default color depth.
cdDeviceDependent	Device dependent color depth.

cd4Bit	4 bit color depth.
cd8Bit	8 bit color depth.
cd16Bit	16 bit color depth.
cd24Bit	24 bit color depth.
cd32Bit	32 bit color depth.

See Also

ColorDepth (see page 4218)

34.2.2 ImgList.TDrawingStyle Enumeration

TDrawingStyle indicates the style to use when rendering an image from an image list.

Pascal

```
TDrawingStyle = (
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
);
```

C++

```
enum TDrawingStyle {
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
};
```

File

ImgList

Description

TDrawingStyle describes how to render an image from an image list component. The following table describes the possible values:

Value	Meaning
dsFocus	Draws the image blending 25% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsSelected	Draws the image blending 50% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsNormal	Draws the image using the color specified in the BkColor property. If the BkColor is clNone (see page 2914), the image is drawn transparently using the mask.
dsTransparent	Draws using the mask regardless of the BkColor setting.

34.2.3 ImgList.TImageType Enumeration

TImageType indicates whether to use a mask when rendering an image from an image list.

Pascal

```
TImageType = (
  itImage,
  itMask
);
```

C++

```
enum TImageType {
  itImage,
  itMask
};
```

File

ImgList

Description

TImageType indicates whether to use a mask when rendering an image in an image list. It includes the following values:

Value	Meaning
itImage	Image does not include a mask.
itMask	Image uses a mask.

34.2.4 ImgList.TLoadResource Enumeration

TLoadResource and TLoadResources (see page 4232) determine how a resource is loaded into an image list.

Pascal

```
TLoadResource = (
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
);
```

C++

```
enum TLoadResource {
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
};
```

File

ImgList

Description

TLoadResources (see page 4232) is a set of flags (TLoadResource values) the govern the way an image list loads image resources. The following table lists the possible TLoadResource values:

Value	Meaning
lrDefaultColor	Use the color format of the display.
lrDefaultSize	Use system metrics for Height and Width if the Width parameter to GetResource is 0. If the Width parameter is 0 and this option is not specified for cursors and icons, the resources width and height will be used.
lrFromFile	Loads the resource from a specified file.
lrMap3DColors	Replaces the images' gray shades with the 3D windows colors.
lrTransparent	Replaces the color table entry for the first pixel of the resource with the default window color (COLOR_WINDOW). This applies only to images with color tables.
lrMonoChrome	Loads the resource as black and white.

See Also

SelectDirectory (see page 1881)

34.2.5 ImgList.TResType Enumeration

TResType identifies a type of graphical resource to an image list.

Pascal

```
TResType = (
  rtBitmap,
  rtCursor,
  rtIcon
);
```

C++

```
enum TResType {
  rtBitmap,
  rtCursor,
  rtIcon
};
```

File

ImgList

Description

TResTypes is used by the image list methods ResourceLoad, GetResource and FileLoad to specify the type of graphical resource that is to be loaded or retrieved from an image list.

Value	Meaning
rtBitmap	Loads or retrieves a bitmap
rtCursor	Loads or retrieves a cursor
rtIcon	Loads or retrieves an icon

34.3 Types

The following table lists types in this documentation.

Types

Name	Description
TImageIndex (see page 4231)	This is type ImgList.TImageIndex.
TImageListHandle (see page 4231)	This is type ImgList.TImageListHandle.
TLoadResources (see page 4232)	This is type ImgList.TLoadResources.
TOverlay (see page 4232)	This is type ImgList.TOverlay.

34.3.1 ImgList.TImageIndex Type

Pascal

```
TImageIndex = type Integer;
```

C++

```
type Integer TImageIndex;
```

File

ImgList

Description

This is type ImgList.TImageIndex.

34.3.2 ImgList.TImageListHandle Type

Pascal

```
TImageListHandle = HImageList;
```

C++

```
HImageList TImageListHandle;
```

File

ImgList

Description

This is type ImgList.TImageListHandle.

34.3.3 ImgList.TLoadResources Type

Pascal

```
TLoadResources = set of TLoadResource;
```

C++

```
TLoadResource TLoadResources;
```

File

ImgList

Description

This is type ImgList.TLoadResources.

34.3.4 ImgList.TOverlay Type

Pascal

```
TOverlay = 0..3;
```

C++

```
0..3 TOverlay;
```

File

ImgList

Description

This is type ImgList.TOverlay.

35 IMouse Namespace

This is namespace IMouse.

Topics

Name	Description
Classes (see page 4235)	The following table lists classes in this documentation.
Functions (see page 4247)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4248)	The following table lists structs, records, enums in this documentation.
Types (see page 4250)	The following table lists types in this documentation.
Constants (see page 4252)	The following table lists constants in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 4235)	This is a class of TCustomPanningWindow.

Constants

Name	Description
crPanAll (see page 4252)	This is constant IMouse.crPanAll.
crPanDown (see page 4252)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 4253)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 4253)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 4253)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 4254)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 4254)	This is constant IMouse.crPanRight.
crPanUp (see page 4254)	This is constant IMouse.crPanUp.
crPanUpDown (see page 4255)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 4255)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 4255)	This is constant IMouse.crPanUpRight.

Functions

	Name	Description
	StartPan (see page 4247)	This is function IMouse.StartPan.

Structs, Records, Enums

	Name	Description
	TPanDirection (see page 4248)	The type describes the panning direction.

	TPanOption (see page 4248)	This is record IMouse.TPanOption.

Types

Name	Description
TPanDirections (see page 4250)	Set of TPanDirection (see page 4248). .
TPanOptions (see page 4250)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 4250)	Initiates the cursor update.

35.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 4235)	This is a class of TCustomPanningWindow.

35.1.1 TPanningWindow Class

This is a class of TCustomPanningWindow.

Class Hierarchy

Pascal

```
TPanningWindow = class(TCustomPanningWindow);
```

C++

```
class TPanningWindow : public TCustomPanningWindow;
```

File

IMouse

Description

Use this type if you are creating a specialized version of TPanningWindowClass.

35.1.1.1 TPanningWindow Members

The following tables list the members exposed by TPanningWindow.

Protected Methods

	Name	Description
	CreateParams (see page 4237)	Initializes a window-creation parameter data structure.
	DoUpdate (see page 4238)	This is DoUpdate, a member of class TPanningWindow.
	GetPanOptions (see page 4238)	This is GetPanOptions, a member of class TPanningWindow.
	MouseMove (see page 4239)	Respond to mouse moving over control area..
	Paint (see page 4239)	Renders the image of a custom control.
	SetPanCursor (see page 4240)	This is SetPanCursor, a member of class TPanningWindow.
	UpdateScroll (see page 4240)	This is UpdateScroll, a member of class TPanningWindow.
	WndProc (see page 4241)	Provides specific message responses for the control.

Public Events

	Name	Description
	OnUpdate (see page 4246)	This is OnUpdate, a member of class TPanningWindow.

Public Methods

	Name	Description
	Create (see page 4236)	Creates an instance of TCustomControl.
	Destroy (see page 4236)	Destroys an instance of TCustomControl.
	GetIsPanning (see page 4238)	Returns whether or not the mouse is actively panning.
	StartPanning (see page 4240)	Tells the panning window to start the panning operation.
	StopPanning (see page 4240)	Tells the panning window to stop the panning operation.

Public Properties

	Name	Description
	IsPanning (see page 4245)	This is IsPanning, a member of class TPanningWindow.
	PanControl (see page 4245)	This is PanControl, a member of class TPanningWindow.
	PanInterval (see page 4246)	This is PanInterval, a member of class TPanningWindow.
	PanOptions (see page 4246)	This is PanOptions, a member of class TPanningWindow.

35.1.1.2 TPanningWindow.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPanningWindow(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

Canvas

Owner

35.1.1.3 TPanningWindow.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPanningWindow();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create

35.1.1.4 TPanningWindow Methods

The methods of the TPanningWindow class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 4237)	Initializes a window-creation parameter data structure.
	DoUpdate (see page 4238)	This is DoUpdate, a member of class TPanningWindow.
	GetPanOptions (see page 4238)	This is GetPanOptions, a member of class TPanningWindow.
	MouseMove (see page 4239)	Respond to mouse moving over control area..
	Paint (see page 4239)	Renders the image of a custom control.
	SetPanCursor (see page 4240)	This is SetPanCursor, a member of class TPanningWindow.
	UpdateScroll (see page 4240)	This is UpdateScroll, a member of class TPanningWindow.
	WndProc (see page 4241)	Provides specific message responses for the control.

Public Methods

	Name	Description
	GetIsPanning (see page 4238)	Returns whether or not the mouse is actively panning.
	StartPanning (see page 4240)	Tells the panning window to start the panning operation.
	StopPanning (see page 4240)	Tells the panning window to stop the panning operation.

35.1.1.4.1 TPanningWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

35.1.1.4.2 TPanningWindow.DoUpdate Method

Pascal

```
procedure DoUpdate(var Delta: TPoint; var CursorDirection: TPanDirections); dynamic;
```

C++

```
__fastcall DoUpdate(TPoint Delta, TPanDirections CursorDirection);
```

Description

This is DoUpdate, a member of class TPanningWindow.

35.1.1.4.3 TPanningWindow.GetIsPanning Method

Returns whether or not the mouse is actively panning.

Pascal

```
function GetIsPanning: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsPanning();
```

Description

This method brings back a boolean value. True means that the mouse is actively panning; False indicates that no panning is occurring.

35.1.1.4.4 TPanningWindow.GetPanOptions Method

Pascal

```
function GetPanOptions: TPanOptions; virtual;
```

C++

```
virtual __fastcall TPanOptions GetPanOptions();
```

Description

This is GetPanOptions, a member of class TPanningWindow.

35.1.1.4.5 TPanningWindow.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

MouseUp

OnMouseMove

35.1.1.4.6 TPanningWindow.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

Canvas

PaintWindow

GetDeviceContext

ClipRect (see page 2718)

35.1.1.4.7 TPanningWindow.SetPanCursor Method

Pascal

```
procedure SetPanCursor(ADirection: TPanDirections); virtual;
```

C++

```
virtual __fastcall SetPanCursor(TPanDirections ADirection);
```

Description

This is SetPanCursor, a member of class TPanningWindow.

35.1.1.4.8 TPanningWindow.StartPanning Method

Tells the panning window to start the panning operation.

Pascal

```
function StartPanning(AHandle: THandle; AControl: TControl): Boolean; override;
```

C++

```
virtual __fastcall Boolean StartPanning(THandle AHandle, TControl * AControl);
```

Description

Include this method in your code where you want the panning window to start the panning operation.

35.1.1.4.9 TPanningWindow.StopPanning Method

Tells the panning window to stop the panning operation.

Pascal

```
procedure StopPanning; override;
```

C++

```
virtual __fastcall StopPanning();
```

Description

Add this method to your code where you want the panning window to stop the panning operation.

35.1.1.4.10 TPanningWindow.UpdateScroll Method

Pascal

```
procedure UpdateScroll(Pt: TPoint); virtual;
```

C++

```
virtual __fastcall UpdateScroll(TPoint Pt);
```

Description

This is UpdateScroll, a member of class TPanningWindow.

35.1.1.4.11 TPanningWindow.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Msg: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Msg);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/

35.1.1.5 TPanningWindow Properties

The properties of the TPanningWindow class are listed here.

Public Properties

	Name	Description
	IsPanning (see page 4245)	This is IsPanning, a member of class TPanningWindow.
	PanControl (see page 4245)	This is PanControl, a member of class TPanningWindow.
	PanInterval (see page 4246)	This is PanInterval, a member of class TPanningWindow.
	PanOptions (see page 4246)	This is PanOptions, a member of class TPanningWindow.

35.1.1.5.1 TPanningWindow.IsPanning Property

Pascal

```
property IsPanning: Boolean;
```

C++

```
__property Boolean IsPanning;
```

Description

This is IsPanning, a member of class TPanningWindow.

35.1.1.5.2 TPanningWindow.PanControl Property

Pascal

```
property PanControl: TControl;
```

C++

```
__property TControl * PanControl;
```

Description

This is PanControl, a member of class TPanningWindow.

35.1.1.5.3 TPanningWindow.PanInterval Property

Pascal

```
property PanInterval: Integer;
```

C++

```
__property int PanInterval;
```

Description

This is PanInterval, a member of class TPanningWindow.

35.1.1.5.4 TPanningWindow.PanOptions Property

Pascal

```
property PanOptions: TPanOptions;
```

C++

```
__property TPanOptions PanOptions;
```

Description

This is PanOptions, a member of class TPanningWindow.

35.1.1.6 TPanningWindow Events

The events of the TPanningWindow class are listed here.

Public Events

	Name	Description
	OnUpdate (see page 4246)	This is OnUpdate, a member of class TPanningWindow.

35.1.1.6.1 TPanningWindow.OnUpdate Event

Pascal

```
property OnUpdate: TUpdateEvent;
```

C++

```
__property TUpdateEvent OnUpdate;
```

Description

This is OnUpdate, a member of class TPanningWindow.

35.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	StartPan (see page 4247)	This is function IMouse.StartPan.

35.2.1 IMouse.StartPan Function

Pascal

```
function StartPan(WndHandle: THandle; AControl: TControl): Boolean;
```

C++

```
Boolean StartPan(THandle WndHandle, TControl * AControl);
```

File

IMouse

Description

This is function IMouse.StartPan.

35.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPanDirection (see page 4248)	The type describes the panning direction.
	TPanOption (see page 4248)	This is record IMouse.TPanOption.

35.3.1 IMouse.TPanDirection Enumeration

The type describes the panning direction.

Pascal

```
TPanDirection = (
  pdUp,
  pdDown,
  pdLeft,
  pdRight
);
```

C++

```
enum TPanDirection {
  pdUp,
  pdDown,
  pdLeft,
  pdRight
};
```

File

IMouse

Description

The possible panning values are: pdUp, pdDown, pdLeft, pdRight.

35.3.2 IMouse.TPanOption Enumeration

Pascal

```
TPanOption = (
  poVertical,
  poHorizontal
);
```

C++

```
enum TPanOption {
  poVertical,
  poHorizontal
};
```

File

IMouse

Description

This is record IMouse.TPanOption.

35.4 Types

The following table lists types in this documentation.

Types

Name	Description
TPanDirections (see page 4250)	Set of TPanDirection (see page 4248). .
TPanOptions (see page 4250)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 4250)	Initiates the cursor update.

35.4.1 IMouse.TPanDirections Type

Set of TPanDirection (see page 4248). .

Pascal

```
TPanDirections = set of TPanDirection;
```

C++

```
TPanDirection TPanDirections;
```

File

IMouse

Description

Set of TPanDirection (see page 4248).

35.4.2 IMouse.TPanOptions Type

Pascal

```
TPanOptions = set of TPanOption;
```

C++

```
TPanOption TPanOptions;
```

File

IMouse

Description

This is type IMouse.TPanOptions.

35.4.3 IMouse.TUpdateEvent Type

Initiates the cursor update.

Pascal

```
TUpdateEvent = procedure (Sender: TObject; var Delta: TPoint; var CursorDirection:
TPanDirections) of object;
```

C++

```
(Sender: TObject; var Delta: TPoint; var CursorDirection: TPanDirections) ( TUpdateEvent)();
```

File

IMouse

Description

This event is called when the cursor is to be updated.

35.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
crPanAll (see page 4252)	This is constant IMouse.crPanAll.
crPanDown (see page 4252)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 4253)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 4253)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 4253)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 4254)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 4254)	This is constant IMouse.crPanRight.
crPanUp (see page 4254)	This is constant IMouse.crPanUp.
crPanUpDown (see page 4255)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 4255)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 4255)	This is constant IMouse.crPanUpRight.

35.5.1 IMouse.crPanAll Constant

Pascal

```
crPanAll = TCursor(-50);
```

C++

```
crPanAll = TCursor(-50);
```

File

IMouse

Description

This is constant IMouse.crPanAll.

35.5.2 IMouse.crPanDown Constant

Pascal

```
crPanDown = TCursor(-51);
```

C++

```
crPanDown = TCursor(-51);
```

File

IMouse

Description

This is constant IMouse.crPanDown.

35.5.3 IMouse.crPanDownLeft Constant

Pascal

```
crPanDownLeft = TCursor(-52);
```

C++

```
crPanDownLeft = TCursor(-52);
```

File

IMouse

Description

This is constant IMouse.crPanDownLeft.

35.5.4 IMouse.crPanDownRight Constant

Pascal

```
crPanDownRight = TCursor(-53);
```

C++

```
crPanDownRight = TCursor(-53);
```

File

IMouse

Description

This is constant IMouse.crPanDownRight.

35.5.5 IMouse.crPanLeft Constant

Pascal

```
crPanLeft = TCursor(-54);
```

C++

```
crPanLeft = TCursor(-54);
```

File

IMouse

Description

This is constant IMouse.crPanLeft.

35.5.6 IMouse.crPanLeftRight Constant

Pascal

```
crPanLeftRight = TCursor(-55);
```

C++

```
crPanLeftRight = TCursor(-55);
```

File

IMouse

Description

This is constant IMouse.crPanLeftRight.

35.5.7 IMouse.crPanRight Constant

Pascal

```
crPanRight = TCursor(-56);
```

C++

```
crPanRight = TCursor(-56);
```

File

IMouse

Description

This is constant IMouse.crPanRight.

35.5.8 IMouse.crPanUp Constant

Pascal

```
crPanUp = TCursor(-57);
```

C++

```
crPanUp = TCursor(-57);
```

File

IMouse

Description

This is constant IMouse.crPanUp.

35.5.9 IMouse.crPanUpDown Constant

Pascal

```
crPanUpDown = TCursor(-58);
```

C++

```
crPanUpDown = TCursor(-58);
```

File

IMouse

Description

This is constant IMouse.crPanUpDown.

35.5.10 IMouse.crPanUpLeft Constant

Pascal

```
crPanUpLeft = TCursor(-59);
```

C++

```
crPanUpLeft = TCursor(-59);
```

File

IMouse

Description

This is constant IMouse.crPanUpLeft.

35.5.11 IMouse.crPanUpRight Constant

Pascal

```
crPanUpRight = TCursor(-60);
```

C++

```
crPanUpRight = TCursor(-60);
```

File

IMouse

Description

This is constant IMouse.crPanUpRight.

36 IniFiles Namespace

This is namespace IniFiles.

Topics

Name	Description
Classes (see page 4258)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4328)	The following table lists structs, records, enums in this documentation.
Types (see page 4329)	The following table lists types in this documentation.

Classes

	Name	Description
	EIniFileException (see page 4258)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 4294).
	TCustomIniFile (see page 4258)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 4291)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 4294)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 4307)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 4324)	This is class IniFiles.TStringHash.

Structs, Records, Enums

	Name	Description
	THashItem (see page 4328)	This is record IniFiles.THashItem.

Types

Name	Description
PHashItem (see page 4329)	This is type IniFiles.PHashItem.
PPHashItem (see page 4329)	This is type IniFiles.PPHashItem.

36.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIniFileException (see page 4258)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 4294).
	TCustomIniFile (see page 4258)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 4291)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 4294)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 4307)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 4324)	This is class IniFiles.TStringHash.

36.1.1 EIniFileException Class

EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 4294).

Class Hierarchy

Pascal

```
EIniFileException = class(Exception);
```

C++

```
class EIniFileException : public Exception;
```

File

IniFiles

Description

EIniFileException is raised when TIniFile (see page 4294) fails in an attempt to modify its associated INI file.

See Also

TIniFile (see page 4294)

36.1.2 TCustomIniFile Class

TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.

Class Hierarchy

Pascal

```
TCustomIniFile = class(TObject);
```

C++

```
class TCustomIniFile : public TObject;
```

File

IniFiles

Description

Note: Use TCustomIniFile as a base class when defining components that access ini files. Ini files are text files that are divided into sections with variable assignments in each section. TCustomIniFile introduces properties and methods to handle storage and retrieval of application-specific information and settings in a standard ini file.

Note: On Windows, TCustomIniFile is also the base class for TRegistryIniFile, which allows applications that use both ini files and the system registry to handle both media in a unified manner. This differs from the features of TRegistry, which corresponds more directly to Windows system registry native semantics.

Do not create instances of TCustomIniFile. Instead, use or create descendants of TCustomIniFile, such as TIniFile (see page 4294), TRegistryIniFile, and TMemIniFile (see page 4307).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
```

```
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
```

```
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

36.1.2.1 TCustomIniFile Members

The following tables list the members exposed by TCustomIniFile.

Public Methods

	Name	Description
	Create (see page 4262)	Creates a TCustomIniFile (see page 4258) object for an application.
	DeleteKey (see page 4263)	Erases the data value associated with an ini file entry.
	EraseSection (see page 4264)	Erases an entire section of an ini file.
	ReadBinaryStream (see page 4264)	Retrieves a binary value from the ini file.
	ReadBool (see page 4265)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 4268)	Retrieves a date value from an ini file.
	ReadDateTime (see page 4268)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 4269)	Retrieves a float value from an ini file.
	ReadInteger (see page 4269)	Retrieves an integer value from an ini file.
	ReadSection (see page 4272)	Reads all the key names from a specified section of an ini file into a string list.
	ReadSections (see page 4273)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 4274)	Reads the values from all keys in a section of an ini file into a string list.
	ReadString (see page 4274)	Retrieves a string value from an ini file.
	ReadTime (see page 4277)	Retrieves a time value from an ini file.
	SectionExists (see page 4278)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 4278)	Flushes buffered ini file data to disk.
	ValueExists (see page 4278)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 4279)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 4279)	Writes a Boolean value to an ini file.
	WriteDate (see page 4282)	Writes a date value to an ini file.
	WriteDateTime (see page 4283)	Writes a date-time value to an ini file.
	WriteFloat (see page 4283)	Writes a float value to an ini file.
	WriteInteger (see page 4284)	Writes an integer value to an ini file.
	WriteString (see page 4287)	Writes a string value to an ini file.
	WriteTime (see page 4290)	Writes a time value to an ini file.

Public Properties

	Name	Description
	FileName (see page 4291)	Contains the name of the ini file from which to read and to which to write information.

36.1.2.2 TCustomIniFile.Create Constructor

Creates a TCustomIniFile (see page 4258) object for an application.

Pascal

```
constructor Create(const FileName: string);
```

C++

```
__fastcall TCustomIniFile(const UnicodeString FileName);
```

Description

Create constructs a TCustomIniFile (see page 4258) object for an application. Create assigns the FileName (see page 4291) parameter to the FileName (see page 4291) property, which is used to specify the name of the ini file to use.

See Also

FileName (see page 4291)

System::TObject::Create

36.1.2.3 TCustomIniFile Methods

The methods of the TCustomIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 4263)	Erases the data value associated with an ini file entry.
	EraseSection (see page 4264)	Erases an entire section of an ini file.
	ReadBinaryStream (see page 4264)	Retrieves a binary value from the ini file.
	ReadBool (see page 4265)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 4268)	Retrieves a date value from an ini file.
	ReadDateTime (see page 4268)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 4269)	Retrieves a float value from an ini file.
	ReadInteger (see page 4269)	Retrieves an integer value from an ini file.
	ReadSection (see page 4272)	Reads all the key names from a specified section of an ini file into a string list.
	ReadSections (see page 4273)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 4274)	Reads the values from all keys in a section of an ini file into a string list.
	ReadString (see page 4274)	Retrieves a string value from an ini file.
	ReadTime (see page 4277)	Retrieves a time value from an ini file.
	SectionExists (see page 4278)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 4278)	Flushes buffered ini file data to disk.
	ValueExists (see page 4278)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 4279)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 4279)	Writes a Boolean value to an ini file.
	WriteDate (see page 4282)	Writes a date value to an ini file.
	WriteDateTime (see page 4283)	Writes a date-time value to an ini file.
	WriteFloat (see page 4283)	Writes a float value to an ini file.
	WriteInteger (see page 4284)	Writes an integer value to an ini file.
	WriteString (see page 4287)	Writes a string value to an ini file.
	WriteTime (see page 4290)	Writes a time value to an ini file.

36.1.2.3.1 TCustomIniFile.DeleteKey Method

Erases the data value associated with an ini file entry.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); virtual; abstract;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident) = 0;
```

Description

Call DeleteKey to erase a data value associated with an ini file entry. Section is string containing the name of an ini file section, and Ident is a string containing the name of the key for which to set a nil (Delphi) or NULL (C++) value.

Note: Attempting to erase a data value in a nonexistent section or attempting to erase data from a nonexistent key are not errors. In these cases, DeleteKey creates the section and key and sets its initial value to an empty value.

See Also

EraseSection (see page 4264)

36.1.2.3.2 TCustomIniFile.EraseSection Method

Erases an entire section of an ini file.

Pascal

```
procedure EraseSection(const Section: string); virtual; abstract;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section) = 0;
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an ini file. Section identifies the ini file section to remove. If a section cannot be removed, an exception is raised.

See Also

SectionExists (see page 4278)

DeleteKey (see page 4263)

36.1.2.3.3 TCustomIniFile.ReadBinaryStream Method

Retrieves a binary value from the ini file.

Pascal

```
function ReadBinaryStream(const Section: string; const Name: string; Value: TStream): Integer;
virtual;
```

C++

```
virtual __fastcall int ReadBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

Call ReadBinaryStream to read a binary value into a specified stream. After reading the binary value, which it converts from a series of hexadecimal characters, from the ini file into the current position of the stream, ReadBinaryStream returns the number of bytes written to the stream. If the stream is a memory stream (TMemoryStream or one of its descendants), the stream is left positioned to the same byte as it was before the call to ReadBinaryStream (immediately before the new binary value).

Section is the section that contains the desired key.

Name is the key under which the binary data is stored.

Value is a stream to which the binary value is written.

Note: When used with a Windows .ini file, ReadBinaryStream is limited to 1023 characters,

See Also

ReadString (see page 4274)

writebinarystream (see page 4279)

36.1.2.3.4 TCustomIniFile.ReadBool Method

Retrieves a Boolean value from an ini file.

Pascal

```
function ReadBool(const Section: string; const Ident: string; Default: Boolean): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ReadBool(const UnicodeString Section, const UnicodeString Ident,
Boolean Default);
```

Description

Call ReadBool to read a Boolean value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the Boolean value. Default is the Boolean value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
```

```
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
```

```
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var

36.1.2.3.5 TCustomIniFile.ReadDate Method

Retrieves a date value from an ini file.

Pascal

```
function ReadDate(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadDate(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadDate to read a date value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date value. Default is the date value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadString (see page 4274)

ReadTime (see page 4277)

36.1.2.3.6 TCustomIniFile.ReadDateTime Method

Retrieves a date-time value from an ini file.

Pascal

```
function ReadDateTime(const Section: string; const Name: string; Default: TDateTime):
TDateTime; virtual;
```

C++

```
virtual __fastcall TDateTime ReadDateTime(const UnicodeString Section, const UnicodeString
Name, TDateTime Default);
```

Description

Call ReadDateTime to read a date-time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date-time value. Default is the date-time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

36.1.2.3.7 TCustomIniFile.ReadFloat Method

Retrieves a float value from an ini file.

Pascal

```
function ReadFloat(const Section: string; const Name: string; Default: Double): Double;
virtual;
```

C++

```
virtual __fastcall Double ReadFloat(const UnicodeString Section, const UnicodeString Name,
Double Default);
```

Description

Call ReadFloat to read a float value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the float value. Default is the float value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

ReadTime (see page 4277)

36.1.2.3.8 TCustomIniFile.ReadInteger Method

Retrieves an integer value from an ini file.

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
virtual;
```

C++

```
virtual __fastcall Longint ReadInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Default);
```

Description

Call ReadInteger to read an integer value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the integer value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
```

```
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
```

```
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin

36.1.2.3.9 TCustomIniFile.ReadSection Method

Reads all the key names from a specified section of an ini file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings) = 0;
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an ini file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

ReadSectionValues (see page 4274)

36.1.2.3.10 ReadSections Method

This is the overview for the ReadSections method overload.

Overload List

	Name	Description
	TCustomIniFile.ReadSections (string, TStrings) (see page 4273)	Reads the names of all sections in an ini file into a string list.
	TCustomIniFile.ReadSections (TStrings) (see page 4273)	Reads the names of all sections in an ini file into a string list.

36.1.2.3.10.1 TCustomIniFile.ReadSections Method (TStrings)

Reads the names of all sections in an ini file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); virtual; abstract; overload;
procedure ReadSections(const Section: string; Strings: TStrings); virtual; overload;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings) = 0;
virtual __fastcall ReadSections(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an ini file into a string list.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Section identifies the section from which to retrieve a list of key names.

See Also

ReadSection (see page 4272)

ReadSectionValues (see page 4274)

36.1.2.3.11 TCustomIniFile.ReadSectionValues Method

Reads the values from all keys in a section of an ini file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings) = 0;
```

Description

Call ReadSectionValues to read the values from all keys in a specified section of an ini file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

See Also

SectionExists (see page 4278)

ReadSection (see page 4272)

ReadSections (see page 4273)

36.1.2.3.12 TCustomIniFile.ReadString Method

Retrieves a string value from an ini file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default) = 0;
```

Description

Call ReadString to read a string value from a .ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

Note: On Windows, if the string in the .ini file is surrounded by quotation marks, the return value has those marks stripped away. On Linux, the quotation marks are preserved.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
```

```
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
```

```
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;
```

```
function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

ReadTime (see page 4277)

ReadBinaryStream (see page 4264)

36.1.2.3.13 TCustomIniFile.ReadTime Method

Retrieves a time value from an ini file.

Pascal

```
function ReadTime(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Default);
```

Description

Call ReadTime to read a time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the time value. Default is the time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 4265)

ReadDate (see page 4268)

ReadDateTime (see page 4268)

ReadFloat (see page 4269)

ReadInteger (see page 4269)

ReadString (see page 4274)

36.1.2.3.14 TCustomIniFile.SectionExists Method

Indicates whether a section exists in the ini file.

Pascal

```
function SectionExists(const Section: string): Boolean;
```

C++

```
__fastcall Boolean SectionExists(const UnicodeString Section);
```

Description

Use SectionExists to determine whether a section exists within the ini file specified in FileName (see page 4291).

Section is the ini file section SectionExists determines the existence of.

SectionExists returns a Boolean value that indicates whether the section in question exists.

See Also

FileName (see page 4291)

ValueExists (see page 4278)

36.1.2.3.15 TCustomIniFile.UpdateFile Method

Flushes buffered ini file data to disk.

Pascal

```
procedure UpdateFile; virtual; abstract;
```

C++

```
virtual __fastcall UpdateFile() = 0;
```

Description

Call UpdateFile to flush buffered reads from and writes to the ini file to disk. [SK comment -- UpdateFile is useful under Windows95but has no effect under Windows NT as NT does not buffer ini file reads and writes. do not delete!]

See Also

FileName (see page 4291)

36.1.2.3.16 TCustomIniFile.ValueExists Method

Indicates whether a key exists in the ini file.

Pascal

```
function ValueExists(const Section: string; const Ident: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ValueExists(const UnicodeString Section, const UnicodeString Ident);
```

Description

Use ValueExists to determine whether a key exists in the ini file specified in FileName (see page 4291).

Section is the section in the ini file in which to search for the key.

Ident is the name of the key to search for.

ValueExists returns a boolean value that indicates whether the key exists in the specified section.

See Also

FileName (see page 4291)

SectionExists (see page 4278)

36.1.2.3.17 TCustomIniFile.WriteBinaryStream Method

Pascal

```
procedure WriteBinaryStream(const Section: string; const Name: string; Value: TStream);
virtual;
```

C++

```
virtual __fastcall WriteBinaryStream(const UnicodeString Section, const UnicodeString Name,
TStream Value);
```

Description

This is WriteBinaryStream, a member of class TCustomIniFile.

36.1.2.3.18 TCustomIniFile.WriteBool Method

Writes a Boolean value to an ini file.

Pascal

```
procedure WriteBool(const Section: string; const Ident: string; Value: Boolean); virtual;
```

C++

```
virtual __fastcall WriteBool(const UnicodeString Section, const UnicodeString Ident, Boolean
Value);
```

Description

Call WriteBool to write a Boolean value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the Boolean value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBool creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
```

```
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);

36.1.2.3.19 TCustomIniFile.WriteDate Method

Writes a date value to an ini file.

Pascal

```
procedure WriteDate(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDate(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteDate to write a date value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDate creates the section and key and sets its initial value to Value.

WriteInteger (see page 4284)

WriteString (see page 4287)

WriteTime (see page 4290)

36.1.2.3.20 TCustomIniFile.WriteDateTime Method

Writes a date-time value to an ini file.

Pascal

```
procedure WriteDateTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDateTime(const UnicodeString Section, const UnicodeString Name,
TDateTime Value);
```

Description

Call WriteDateTime to write a date-time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date-time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDateTime creates the section and key and sets its initial value to Value.

36.1.2.3.21 TCustomIniFile.WriteFloat Method

Writes a float value to an ini file.

Pascal

```
procedure WriteFloat(const Section: string; const Name: string; Value: Double); virtual;
```

C++

```
virtual __fastcall WriteFloat(const UnicodeString Section, const UnicodeString Name, Double
Value);
```

Description

Call WriteFloat to write a float value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the float value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteFloat creates the section and key and sets its initial value to Value.

36.1.2.3.22 TCustomIniFile.WriteInteger Method

Writes an integer value to an ini file.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint); virtual;
```

C++

```
virtual __fastcall WriteInteger(const UnicodeString Section, const UnicodeString Ident,
Longint Value);
```

Description

Call WriteInteger to write an integer value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the integer value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteInteger creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store

36.1.2.3.23 TCustomIniFile.WriteString Method

Writes a string value to an ini file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
virtual; abstract;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value) = 0;
```

Description

Call WriteString to write a string value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }
```

```
    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
```

```
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:

WriteFloat (see page 4283)

WriteInteger (see page 4284)

WriteTime (see page 4290)

36.1.2.3.24 TCustomIniFile.WriteTime Method

Writes a time value to an ini file.

Pascal

```
procedure WriteTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteTime(const UnicodeString Section, const UnicodeString Name, TDateTime
Value);
```

Description

Call WriteTime to write a time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteTime creates the section and key and sets its initial value to Value.

36.1.2.4 TCustomIniFile Properties

The properties of the TCustomIniFile class are listed here.

Public Properties

	Name	Description
	FileName (see page 4291)	Contains the name of the ini file from which to read and to which to write information.

36.1.2.4.1 TCustomIniFile.FileName Property

Contains the name of the ini file from which to read and to which to write information.

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

Read FileName to retrieve the name of the ini file that this object can be used to access. The methods that read and write ini file information automatically handle opening and closing the file specified by FileName.

FileName is read-only. The name of the ini file the object uses is supplied as the parameter for the constructor.

Create (see page 4262)

36.1.3 THashedStringList Class

THashedStringList maintains a list of strings using an internal hash table.

Class Hierarchy

Pascal

```
THashedStringList = class(TStringList);
```

C++

```
class THashedStringList : public TStringList;
```

File

IniFiles

Description

THashedStringList is a string list that uses a hash table internally to speed the process of locating strings. It is used internally by TMemIniFile (see page 4307) to manage the strings from an INI file, but can be used in the same way as any other string list. By using THashedStringList instead of TStringList, you can improve performance when the list contains a large number of strings.

See Also

TStringList

TMemIniFile (see page 4307)

Working with Lists

36.1.3.1 THashedStringList Members

The following tables list the members exposed by THashedStringList.

Protected Methods

	Name	Description
	Changed (see page 4292)	This is Changed, a member of class THashedStringList.

Public Methods

	Name	Description
	Destroy (see page 4292)	Destroys an instance of THashedStringList (see page 4291).
	IndexOf (see page 4293)	Returns the position of a string in the list.
	IndexOfName (see page 4293)	Returns the position of the first string with the form Name=Value with the specified name part.

36.1.3.2 THashedStringList.Destroy Destructor

Destroys an instance of THashedStringList (see page 4291).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THashedStringList();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the THashedStringList (see page 4291) reference is not nil and only then calls Destroy.

System::TObject::Free

36.1.3.3 THashedStringList Methods

The methods of the THashedStringList class are listed here.

Protected Methods

	Name	Description
	Changed (see page 4292)	This is Changed, a member of class THashedStringList.

Public Methods

	Name	Description
	IndexOf (see page 4293)	Returns the position of a string in the list.
	IndexOfName (see page 4293)	Returns the position of the first string with the form Name=Value with the specified name part.

36.1.3.3.1 THashedStringList.Changed Method

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class THashedStringList.

36.1.3.3.2 THashedStringList.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const UnicodeString S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. A string matches S if it is identical to S or differs only in case.

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

IndexOfName (see page 4293)

IndexOfObject

Strings

36.1.3.3.3 THashedStringList.IndexOfName Method

Returns the position of the first string with the form Name=Value with the specified name part.

Pascal

```
function IndexOfName(const Name: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOfName(const UnicodeString Name);
```

Description

Call IndexOfName to locate the first occurrence of a string with the form Name=Value where the name part is equal to the Name parameter or differs only in case. IndexOfName returns the 0-based index of the string. If no string in the list has the indicated name, IndexOfName returns -1.

The Name that identifies the string is to the left of the equal sign (=), and the current Value of the Name identifier is on the right side. There should be no spaces present before or after the equal sign.

Note: If there is more than one string with a name portion matching the Name parameter, IndexOfName returns the position of the first such string.

36.1.4 TIniFile Class

TIniFile stores and retrieves application-specific information and settings from INI files.

Class Hierarchy

Pascal

```
TIniFile = class(TCustomIniFile);
```

C++

```
class TIniFile : public TCustomIniFile;
```

File

IniFiles

Description

TIniFile enables handling the storage and retrieval of application-specific information and settings in a standard INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

A FileName (see page 4291) is passed to the TIniFile constructor and identifies the INI file that the object accesses.

Note: On Windows, a related object, TMemIniFile (see page 4307), works the same way as TIniFile, but buffers writes in memory to minimize disk access.

Note: On Linux, TIniFile is the same as TMemIniFile (see page 4307).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
```

```
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
```

```
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
```

```
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

36.1.4.1 TIniFile Members

The following tables list the members exposed by TIniFile.

Public Methods

	Name	Description
	Create (see page 4262)	Creates a TCustomIniFile (see page 4258) object for an application.
	DeleteKey (see page 4299)	Removes an INI file entry for a specified key value.
	Destroy (see page 4298)	Disposes of an object instance.
	EraseSection (see page 4299)	Erases an entire section of an INI file.
	ReadBinaryStream (see page 4264)	Retrieves a binary value from the ini file.
	ReadBool (see page 4265)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 4268)	Retrieves a date value from an ini file.
	ReadDateTime (see page 4268)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 4269)	Retrieves a float value from an ini file.
	ReadInteger (see page 4269)	Retrieves an integer value from an ini file.
	ReadSection (see page 4299)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 4300)	Reads the names of all sections in an INI file into a string list.
	ReadSections (see page 4273)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 4300)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 4301)	Retrieves a string value from an INI file.
	ReadTime (see page 4277)	Retrieves a time value from an ini file.
	SectionExists (see page 4278)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 4304)	Flushes buffered INI file data to disk.
	ValueExists (see page 4278)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 4279)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 4279)	Writes a Boolean value to an ini file.
	WriteDate (see page 4282)	Writes a date value to an ini file.
	WriteDateTime (see page 4283)	Writes a date-time value to an ini file.
	WriteFloat (see page 4283)	Writes a float value to an ini file.
	WriteInteger (see page 4284)	Writes an integer value to an ini file.
	WriteString (see page 4304)	Writes a string value to an INI file.
	WriteTime (see page 4290)	Writes a time value to an ini file.

Public Properties

	Name	Description
	FileName (see page 4291)	Contains the name of the ini file from which to read and to which to write information.

36.1.4.2 TIniFile.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIniFile();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free

36.1.4.3 TIniFile Methods

The methods of the TIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 4299)	Removes an INI file entry for a specified key value.
	EraseSection (see page 4299)	Erases an entire section of an INI file.
	ReadSection (see page 4299)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 4300)	Reads the names of all sections in an INI file into a string list.
	ReadSectionValues (see page 4300)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 4301)	Retrieves a string value from an INI file.
	UpdateFile (see page 4304)	Flushes buffered INI file data to disk.
	WriteString (see page 4304)	Writes a string value to an INI file.

36.1.4.3.1 TIniFile.DeleteKey Method

Removes an INI file entry for a specified key value.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase an INI file entry. Section is string containing the name of an INI file section, and Ident is a string containing the name of the key from for which to set a nil (Delphi) or NULL (C++) value.

This version of DeleteKey is only available if the application is compiled for Windows. On Linux, DeleteKey is inherited from TMemIniFile (see page 4307).

Note: Attempting to delete a key in a nonexistent section or attempting to delete a nonexistent key are not errors. In these cases, DeleteKey does nothing.

See Also

EraseSection (see page 4299)

36.1.4.3.2 TIniFile.EraseSection Method

Erases an entire section of an INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

This version of EraseSection is only available if the application is compiled for Windows. On Linux, EraseSection is inherited from TMemIniFile (see page 4307).

See Also

DeleteKey (see page 4299)

36.1.4.3.3 TIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the TStrings descendant to hold the retrieved names. Strings can point to a TStrings descendant such as a string list (TStringList), or to a component property that is of type TStrings, such as the Items property of TListBox.

This version of ReadSection is only available if the application is compiled for Windows. On Linux, ReadSection is inherited from TMemIniFile (see page 4307).

See Also

ReadSections (see page 4300)

ReadSectionValues (see page 4300)

36.1.4.3.4 TIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list object.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

This version of ReadSections is only available if the application is compiled for Windows. On Linux, ReadSections is inherited from TMemIniFile (see page 4307).

See Also

ReadSection (see page 4299)

ReadSectionValues (see page 4300)

36.1.4.3.5 TIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the keys, and the values from all keys, within a specified section of an INI file into a string list object (TStrings descendant). The key names and values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

This version of ReadSectionValues is only available if the application is compiled for Windows. On Linux, ReadSectionValues is inherited from TMemIniFile (see page 4307).

See Also

ReadSection (see page 4299)

ReadSections (see page 4300)

36.1.4.3.6 TIniFile.ReadString Method

Retrieves a string value from an INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

This version of ReadString is only available if the application is compiled for Windows. On Linux, ReadString is inherited from TMemIniFile (see page 4307).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }
```

```
    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();
```

```
  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
```

```
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

See Also

ReadBool (see page 4265)

ReadInteger (see page 4269)

36.1.4.3.7 TIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to flush buffered reads from and writes to the INI file to disk. UpdateFile is useful under Windows9x, but has no effect under Windows NT because NT does not buffer INI file reads and writes.

This version of UpdateFile is only available if the application is compiled for Windows. On Linux, Update is inherited from TMemIniFile (see page 4307).

See Also

FileName (see page 4291)

TMemIniFile (see page 4307)

36.1.4.3.8 TIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

This version of WriteString is only available if the application is compiled for Windows. On Linux, WriteString is inherited from TMemIniFile (see page 4307).

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
```

```
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
  Store current form properties to be used in later sessions.
  }
  try
    SettingsFile.WriteInteger (Name, 'Top', Top);
    SettingsFile.WriteInteger (Name, 'Left', Left);
    SettingsFile.WriteInteger (Name, 'Width', Width);
    SettingsFile.WriteInteger (Name, 'Height', Height);
    SettingsFile.WriteString  (Name, 'Caption', Caption);
    SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
    SettingsFile.WriteDateTime(Name, 'LastRun', Now);
  finally
```

```
    SettingsFile.Free;
  end;

end;

function TForm2.OpenIniFileInstance: TCustomIniFile;
begin
  {
  Open/create a new INI file that has the same name as our executable
  only with the INI extension.
  }

  case RadioGroup1.ItemIndex of
    0:
      begin
        { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
        Result := TRegistryIniFile.Create('Software\' + Application.Title);
      end;
    1:
      begin
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

36.1.5 TMemIniFile Class

TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.

Class Hierarchy

Pascal

```
TMemIniFile = class(TCustomIniFile);
```

C++

```
class TMemIniFile : public TCustomIniFile;
```

File

IniFiles

Description

Use TMemIniFile to store and retrieve application-specific information and settings in a Windows INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

TMemIniFile buffers all changes to the INI file. The INI file is read once, when the object is first created. Data from the INI file is stored in nested string lists. Each section in the INI file occupies one element in the top-most string list, and each element in this may itself contain a string list. Each element in each of the contained string list represents a key within the section. After the data is read, any changes to the data are stored in memory. To write the data from memory back to the associated INI file, call the UpdateFile (see page 4320) method.

All TMemIniFile methods to read, write, and erase sections, keys, and values operate on the in-memory copy of the INI file.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
```

```
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  {
```

```
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

36.1.5.1 TMemIniFile Members

The following tables list the members exposed by TMemIniFile.

Public Methods

	Name	Description
	Clear (see page 4313)	Erases all data from the INI file in memory.
	Create (see page 4311)	This is the overview for the Create constructor overload.
	DeleteKey (see page 4313)	Deletes a specified entry from the .ini file.

	Destroy (see page 4312)	Frees the memory associated with the TMemIniFile (see page 4307) object.
	EraseSection (see page 4314)	Erases an entire section of the INI file.
	GetStrings (see page 4314)	Populates a string list with INI file data.
	ReadBinaryStream (see page 4264)	Retrieves a binary value from the ini file.
	ReadBool (see page 4265)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 4268)	Retrieves a date value from an ini file.
	ReadDateTime (see page 4268)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 4269)	Retrieves a float value from an ini file.
	ReadInteger (see page 4269)	Retrieves an integer value from an ini file.
	ReadSection (see page 4314)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 4315)	Reads the names of all sections in an INI file into a string list.
	ReadSections (see page 4273)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 4315)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 4316)	Retrieves a string value from the INI file.
	ReadTime (see page 4277)	Retrieves a time value from an ini file.
	Rename (see page 4319)	Associates the TMemIniFile (see page 4307) with a different INI file.
	SectionExists (see page 4278)	Indicates whether a section exists in the ini file.
	SetStrings (see page 4319)	Populates the memory buffer with contents of a string list.
	UpdateFile (see page 4320)	Flushes buffered INI file data to disk.
	ValueExists (see page 4278)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 4279)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 4279)	Writes a Boolean value to an ini file.
	WriteDate (see page 4282)	Writes a date value to an ini file.
	WriteDateTime (see page 4283)	Writes a date-time value to an ini file.
	WriteFloat (see page 4283)	Writes a float value to an ini file.
	WriteInteger (see page 4284)	Writes an integer value to an ini file.
	WriteString (see page 4320)	Writes a string value to an INI file.
	WriteTime (see page 4290)	Writes a time value to an ini file.

Public Properties

	Name	Description
	CaseSensitive (see page 4324)	Controls whether section and key names are handled in a case-sensitive manner.
	Encoding (see page 4324)	This is Encoding, a member of class TMemIniFile.
	FileName (see page 4291)	Contains the name of the ini file from which to read and to which to write information.

36.1.5.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TMemIniFile.Create (string) (see page 4311)	Creates a TMemIniFile (see page 4307) object for an application.
	TMemIniFile.Create (string, TEncoding) (see page 4311)	Creates a TMemIniFile (see page 4307) object for an application.

36.1.5.2.1 TMemIniFile.Create Constructor (string)

Creates a TMemIniFile (see page 4307) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
constructor Create(const FileName: string; Encoding: TEncoding); overload;
```

C++

```
__fastcall TMemIniFile(const UnicodeString FileName);
__fastcall TMemIniFile(const UnicodeString FileName, TEncoding Encoding);
```

Description

Call Create to instantiate a TMemIniFile (see page 4307) object for an application. Create sets the FileName (see page 4291) property, and loads a copy of the INI file into memory, in an internal string list.

FileName (see page 4291) is the name of the INI file the TMemIniFile (see page 4307) uses.

Note: On Windows, INI files are meant to be stored in the \WINDOWS directory or the application's directory. To work with an INI file in another location, specify the full path name of the file in FileName (see page 4291).

See Also

FileName (see page 4291)

System::TObject::Create

36.1.5.3 TMemIniFile.Destroy Destructor

Frees the memory associated with the TMemIniFile (see page 4307) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMemIniFile();
```

Description

Do not call Destroy directly; instead call Free.

Warning: The destructor does not write the current memory image to disk. Be sure to save changes made to TMemIniFile (see page 4307) by calling UpdateFile (see page 4320) before destroying a TMemIniFile (see page 4307) instance.

System::TObject::Free

UpdateFile (see page 4320)

Create (see page 4311)

36.1.5.4 TMemIniFile Methods

The methods of the TMemIniFile class are listed here.

Public Methods

	Name	Description
	Clear (see page 4313)	Erases all data from the INI file in memory.
	DeleteKey (see page 4313)	Deletes a specified entry from the .ini file.
	EraseSection (see page 4314)	Erases an entire section of the INI file.

	GetStrings (see page 4314)	Populates a string list with INI file data.
V	ReadSection (see page 4314)	Reads all the key names from a specified section of an INI file into a string list.
V	ReadSections (see page 4315)	Reads the names of all sections in an INI file into a string list.
V	ReadSectionValues (see page 4315)	Reads the values from all keys within a section of an INI file into a string list.
V	ReadString (see page 4316)	Retrieves a string value from the INI file.
	Rename (see page 4319)	Associates the TMemIniFile (see page 4307) with a different INI file.
	SetStrings (see page 4319)	Populates the memory buffer with contents of a string list.
V	UpdateFile (see page 4320)	Flushes buffered INI file data to disk.
V	WriteString (see page 4320)	Writes a string value to an INI file.

36.1.5.4.1 TMemIniFile.Clear Method

Erases all data from the INI file in memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to erase all data from the INI file that is currently buffered in memory. All sections, keys, and values are erased.

Warning: No exception is generated when using Clear and the data has not been saved to the INI file with the UpdateFile (see page 4320) method.

See Also

UpdateFile (see page 4320)

SetStrings (see page 4319)

36.1.5.4.2 TMemIniFile.DeleteKey Method

Deletes a specified entry from the .ini file.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const UnicodeString Section, const UnicodeString Ident);
```

Description

Call DeleteKey to erase .ini file entry. Section is string containing the name of a .ini file section, and Ident is a string containing the name of the key to remove.

Note: Attempting to erase a key in a nonexistent section or attempting to erase a nonexistent key are not errors. In these cases, DeleteKey does nothing.

DeleteKey only affects the in-memory copy of the .ini file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 4320).

See Also

SectionExists (see page 4278)

ValueExists (see page 4278)

EraseSection (see page 4314)

UpdateFile (see page 4278)

CaseSensitive (see page 4324)

36.1.5.4.3 TMemIniFile.EraseSection Method

Erases an entire section of the INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const UnicodeString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

EraseSection only affects the in-memory copy of the INI file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 4320).

See Also

SectionExists (see page 4278)

DeleteKey (see page 4313)

UpdateFile (see page 4320)

CaseSensitive (see page 4324)

36.1.5.4.4 TMemIniFile.GetStrings Method

Populates a string list with INI file data.

Pascal

```
procedure GetStrings(List: TStrings);
```

C++

```
__fastcall GetStrings(TStrings List);
```

Description

Call GetStrings to copy the INI file data currently stored in memory into a pre-existing string list.

List is a string list object, created and maintained by the application, into which the INI file data is copied.

See Also

SetStrings (see page 4319)

36.1.5.4.5 TMemIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

Data read by ReadSection comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 4278)

ReadSections (see page 4315)

ReadSectionValues (see page 4315)

CaseSensitive (see page 4324)

36.1.5.4.6 TMemIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSections comes from the in-memory copy of the INI file, not the copy on disk.

See Also

ReadSection (see page 4314)

ReadSectionValues (see page 4315)

36.1.5.4.7 TMemIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const UnicodeString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the values from all keys within a specified section of an INI file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSectionValues comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 4278)

ReadSection (see page 4314)

ReadSections (see page 4315)

CaseSensitive (see page 4324)

36.1.5.4.8 TMemIniFile.ReadString Method

Retrieves a string value from the INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall UnicodeString ReadString(const UnicodeString Section, const UnicodeString
Ident, const UnicodeString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

The ReadString method inherited from TCustomIniFile (see page 4258) is modified to operate on the in-memory copy of the INI file data. The read methods for all other data types use ReadString internally and then translate to the appropriate data type.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
```

```
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
```

```
    SettingsFile : TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    try
      {
      Read all saved values from the last session. The section name
      is the name of the form. Also use form's properties as defaults
      }
      Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
      Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
      Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
      Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
      Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

      { Load last window state }
      case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
        true : WindowState := wsMaximized;
        false: WindowState := wsNormal;
      end;

    finally
      SettingsFile.Free;
    end;
  end;

  procedure TForm2.btStoreClick(Sender: TObject);
  var
    SettingsFile: TCustomIniFile;
  begin
    { Open an instance }
    SettingsFile := OpenIniFileInstance();

    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
```

```
        { Ini file mode selected }
        Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
    2:
      begin
        { Memory based Ini file mode selected }
        Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
      end;
  end;
end;
```

36.1.5.4.9 TMemIniFile.Rename Method

Associates the TMemIniFile (see page 4307) with a different INI file.

Pascal

```
procedure Rename(const FileName: string; Reload: Boolean);
```

C++

```
__fastcall Rename(const UnicodeString FileName, Boolean Reload);
```

Description

Call Rename to change the INI file used by the TMemIniFile (see page 4307) object to a file other than the one specified when the object was created.

FileName (see page 4291) is name of the new INI file to use.

Reload determines whether data is immediately loaded into memory from the INI file specified in FileName (see page 4291). When Reload is true, the TMemIniFile (see page 4307) object is repopulated with the data from the specified file. When Reload is false, the in-memory image is unchanged. This is useful, for example, when copying the data from one INI file to another file.

FileName (see page 4291)

Create (see page 4311)

36.1.5.4.10 TMemIniFile.SetStrings Method

Populates the memory buffer with contents of a string list.

Pascal

```
procedure SetStrings(List: TStrings);
```

C++

```
__fastcall SetStrings(TStrings List);
```

Description

Call SetStrings to populate the in-memory copy of the INI file data with the contents of a string list.

List is a string list object, created and maintained by the application, from which the INI file data is copied.

SetStrings uses the Clear (see page 4313) method to erase any existing INI file data prior to copying the new data.

SetStrings can be used to reread data from the INI file from disk after it is erased with the Clear (see page 4313) method. The LoadFromFile method of a string list can be used to retrieve the contents of the INI file and then SetStrings can copy the data into the memory buffer.

See Also

LoadFromFile

Clear (see page 4313)

GetStrings (see page 4314)

36.1.5.4.11 TMemIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to copy INI file data stored in memory to the copy of the INI file on disk UpdateFile overwrites all data in the disk copy of the INI file with the INI file data stored in memory.

If the Rename (see page 4319) method is used to change the INI file the TMemIniFile (see page 4307) uses, UpdateFile copies the INI file data in memory to a file of the new name. If the file does not already exist, it is created. If the new file already exists, it is overwritten.

See Also

FileName (see page 4291)

36.1.5.4.12 TMemIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const UnicodeString Section, const UnicodeString Ident, const
UnicodeString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write.

Ident is the name of the key for which to set a value. Value is the string value to write.

The WriteString method inherited from TCustomIniFile (see page 4258) is modified to operate on the in-memory copy of the INI file data. The write methods for all other data types use WriteString internally after data values are translated from the original data type.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

C++ Examples:

```
/*
This example demonstrates the usage of Ini files in order to store
and load form configuration between sessions. Example assumes
a RadioGroup and two buttons are present on the main form.
*/
void __fastcall TForm2::btStoreClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    // Store current form properties to be used in later sessions.
    try
    {
        SettingsFile->WriteInteger (Name, "Top", Top);
        SettingsFile->WriteInteger (Name, "Left", Left);
        SettingsFile->WriteInteger (Name, "Width", Width);
        SettingsFile->WriteInteger (Name, "Height", Height);
        SettingsFile->WriteString  (Name, "Caption", Caption);
        SettingsFile->WriteBool    (Name, "InitMax", WindowState == wsMaximized );
    }
    catch(Exception* e)
    {
    }

    delete SettingsFile;
}

void __fastcall TForm2::btLoadClick(TObject *Sender)
{
    /* Open an instance */
    TCustomIniFile* SettingsFile = OpenIniFileInstance();

    try
    {
        /*
        Read all saved values from the last session. The section name
        is the name of the form. Also use form's properties as defaults
        */
        Top     = SettingsFile->ReadInteger(Name, "Top", Top );
        Left    = SettingsFile->ReadInteger(Name, "Left", Left );
        Width   = SettingsFile->ReadInteger(Name, "Width", Width );
        Height  = SettingsFile->ReadInteger(Name, "Height", Height );
        Caption = SettingsFile->ReadString (Name, "Caption", Caption);

        // Load last window state
        if (SettingsFile->ReadBool(Name, "InitMax", WindowState == wsMaximized))
            WindowState = wsMaximized;
        else
            WindowState = wsNormal;
    }
    catch(Exception* e)
    {
    }
```

```
    delete SettingsFile;
}

TCustomIniFile* __fastcall TForm2::OpenIniFileInstance()
{
    /*
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    */

    switch (RadioGroup1->ItemIndex)
    {
        case 0:
            /* Registry mode selected: in HKEY_CURRENT_USER\Software\... */
            return new TRegistryIniFile(String("Software\\") + Application->Title);
        case 1:
            /* Ini file mode selected */
            return new TIniFile(ChangeFileExt(Application->ExeName, ".INI"));
        case 2:
            /* Memory based Ini file mode selected */
            return new TMemIniFile(ChangeFileExt(Application->ExeName, ".INI"));
      }
}
```

Delphi Examples:

```
{
This example demonstrates the use of Ini files in order to store
and load form configurations between sessions. This example requires
a RadioGroup and two buttons.
}
procedure TForm2.btLoadClick(Sender: TObject);
var
  SettingsFile : TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();

  try
    {
    Read all saved values from the last session. The section name
    is the name of the form. Also use form's properties as defaults
    }
    Top     := SettingsFile.ReadInteger(Name, 'Top', Top );
    Left    := SettingsFile.ReadInteger(Name, 'Left', Left );
    Width   := SettingsFile.ReadInteger(Name, 'Width', Width );
    Height  := SettingsFile.ReadInteger(Name, 'Height', Height );
    Caption := SettingsFile.ReadString (Name, 'Caption', Caption);

    { Load last window state }
    case SettingsFile.ReadBool(Name, 'InitMax', WindowState = wsMaximized) of
      true : WindowState := wsMaximized;
      false: WindowState := wsNormal;
    end;

  finally
    SettingsFile.Free;
  end;
end;

procedure TForm2.btStoreClick(Sender: TObject);
var
  SettingsFile: TCustomIniFile;
begin
  { Open an instance }
  SettingsFile := OpenIniFileInstance();
```

```
    {
    Store current form properties to be used in later sessions.
    }
    try
      SettingsFile.WriteInteger (Name, 'Top', Top);
      SettingsFile.WriteInteger (Name, 'Left', Left);
      SettingsFile.WriteInteger (Name, 'Width', Width);
      SettingsFile.WriteInteger (Name, 'Height', Height);
      SettingsFile.WriteString  (Name, 'Caption', Caption);
      SettingsFile.WriteBool    (Name, 'InitMax', WindowState = wsMaximized );
      SettingsFile.WriteDateTime(Name, 'LastRun', Now);
    finally
      SettingsFile.Free;
    end;

  end;

  function TForm2.OpenIniFileInstance: TCustomIniFile;
  begin
    {
    Open/create a new INI file that has the same name as our executable
    only with the INI extension.
    }

    case RadioGroup1.ItemIndex of
      0:
        begin
          { Registry mode selected: in HKEY_CURRENT_USER\Software\... }
          Result := TRegistryIniFile.Create('Software\' + Application.Title);
        end;
      1:
        begin
          { Ini file mode selected }
          Result := TIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
      2:
        begin
          { Memory based Ini file mode selected }
          Result := TMemIniFile.Create(ChangeFileExt(Application.ExeName, '.INI'));
        end;
    end;
  end;
```

36.1.5.5 TMemIniFile Properties

The properties of the TMemIniFile class are listed here.

Public Properties

	Name	Description
	CaseSensitive (see page 4324)	Controls whether section and key names are handled in a case-sensitive manner.
	Encoding (see page 4324)	This is Encoding, a member of class TMemIniFile.

36.1.5.5.1 TMemIniFile.CaseSensitive Property

Controls whether section and key names are handled in a case-sensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the names of sections and keys should be treated in a case-sensitive or case-insensitive manner. Set CaseSensitive to true to allow multiple sections or keys that differ only based on case. Set CaseSensitive to false to treat names that differ only by case as the same.

ReadSection (see page 4314)

ReadString (see page 4316)

SectionExists (see page 4278)

ValueExists (see page 4278)

36.1.5.5.2 TMemIniFile.Encoding Property

Pascal

```
property Encoding: TEncoding;
```

C++

```
__property TEncoding Encoding;
```

Description

This is Encoding, a member of class TMemIniFile.

36.1.6 TStringHash Class

Class Hierarchy

IniFiles.TStringHash

Pascal

```
TStringHash = class;
```

C++

```
class TStringHash;
```

File

IniFiles

Description

This is class IniFiles.TStringHash.

36.1.6.1 TStringHash Members

The following tables list the members exposed by TStringHash.

Protected Methods

	Name	Description
	Find (see page 4326)	This is Find, a member of class TStringHash.
	HashOf (see page 4327)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 4326)	This is Add, a member of class TStringHash.
	Clear (see page 4326)	This is Clear, a member of class TStringHash.
	Create (see page 4325)	This is Create, a member of class TStringHash.
	Destroy (see page 4325)	This is Destroy, a member of class TStringHash.
	Modify (see page 4327)	This is Modify, a member of class TStringHash.
	Remove (see page 4327)	This is Remove, a member of class TStringHash.
	ValueOf (see page 4327)	This is ValueOf, a member of class TStringHash.

36.1.6.2 TStringHash.Create Constructor

Pascal

```
constructor Create(Size: Cardinal = 256);
```

C++

```
__fastcall TStringHash(unsigned Size = 256);
```

Description

This is Create, a member of class TStringHash.

36.1.6.3 TStringHash.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStringHash();
```

Description

This is Destroy, a member of class TStringHash.

36.1.6.4 TStringHash Methods

The methods of the TStringHash class are listed here.

Protected Methods

	Name	Description
	Find (see page 4326)	This is Find, a member of class TStringHash.
	HashOf (see page 4327)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 4326)	This is Add, a member of class TStringHash.
	Clear (see page 4326)	This is Clear, a member of class TStringHash.
	Modify (see page 4327)	This is Modify, a member of class TStringHash.
	Remove (see page 4327)	This is Remove, a member of class TStringHash.
	ValueOf (see page 4327)	This is ValueOf, a member of class TStringHash.

36.1.6.4.1 TStringHash.Add Method

Pascal

```
procedure Add(const Key: string; Value: Integer);
```

C++

```
__fastcall Add(const UnicodeString Key, int Value);
```

Description

This is Add, a member of class TStringHash.

36.1.6.4.2 TStringHash.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TStringHash.

36.1.6.4.3 TStringHash.Find Method

Pascal

```
function Find(const Key: string): PPHashItem;
```

C++

```
__fastcall PPHashItem Find(const UnicodeString Key);
```

Description

This is Find, a member of class TStringHash.

36.1.6.4.4 TStringHash.HashOf Method

Pascal

```
function HashOf(const Key: string): Cardinal; virtual;
```

C++

```
virtual __fastcall unsigned HashOf(const UnicodeString Key);
```

Description

This is HashOf, a member of class TStringHash.

36.1.6.4.5 TStringHash.Modify Method

Pascal

```
function Modify(const Key: string; Value: Integer): Boolean;
```

C++

```
__fastcall Boolean Modify(const UnicodeString Key, int Value);
```

Description

This is Modify, a member of class TStringHash.

36.1.6.4.6 TStringHash.Remove Method

Pascal

```
procedure Remove(const Key: string);
```

C++

```
__fastcall Remove(const UnicodeString Key);
```

Description

This is Remove, a member of class TStringHash.

36.1.6.4.7 TStringHash.ValueOf Method

Pascal

```
function ValueOf(const Key: string): Integer;
```

C++

```
__fastcall int ValueOf(const UnicodeString Key);
```

Description

This is ValueOf, a member of class TStringHash.

36.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	THashItem (see page 4328)	This is record IniFiles.THashItem.

36.2.1 IniFiles.THashItem Record

Pascal

```
THashItem = record
  Next: PHashItem;
  Key: string;
  Value: Integer;
end;
```

C++

```
struct THashItem {
  PHashItem Next;
  UnicodeString Key;
  int Value;
};
```

File

IniFiles

Description

This is record IniFiles.THashItem.

36.3 Types

The following table lists types in this documentation.

Types

Name	Description
PHashItem (see page 4329)	This is type IniFiles.PHashItem.
PPHashItem (see page 4329)	This is type IniFiles.PPHashItem.

36.3.1 IniFiles.PHashItem Type

Pascal

```
PHashItem = ^THashItem;
```

C++

```
^THashItem PHashItem;
```

File

IniFiles

Description

This is type IniFiles.PHashItem.

36.3.2 IniFiles.PPHashItem Type

Pascal

```
PPHashItem = ^PHashItem;
```

C++

```
^PHashItem PPHashItem;
```

File

IniFiles

Description

This is type IniFiles.PPHashItem.

37 IntfInfo Namespace

This is namespace IntfInfo.

	Name	Description
	TCallConv (see page 4339)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 4339)	This is record IntfInfo.TFillMethodArrayOpt.
	TIntfMetaData (see page 4340)	This is record IntfInfo.TIntfMetaData.
	TIntfMethEntry (see page 4340)	This is record IntfInfo.TIntfMethEntry.
	TIntfParamEntry (see page 4341)	This is record IntfInfo.TIntfParamEntry.

Types

Name	Description
PIntfMetaData (see page 4342)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 4342)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 4343)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 4343)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 4343)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 4344)	This is type IntfInfo.TPIntfMethEntryArray.

37.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInterfaceRTTIException (see page 4333)	EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

37.1.1 EInterfaceRTTIException Class

EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

Class Hierarchy

Pascal

```
EInterfaceRTTIException = class(Exception);
```

C++

```
class EInterfaceRTTIException : public Exception;
```

File

IntfInfo

Description

EInterfaceRTTIException is thrown when an application expects an interface to be invokable but discovers that it does not include any runtime type information (RTTI). For example, the invocation registry raises an EInterfaceRTTIException exception when an application tries to register an interface that is not compiled with RTTI. Invoker components raise an EInterfaceRTTIException exception when an incoming request includes a call to an interface that does not include RTTI.

37.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetClsMemberTypeInfo (see page 4334)	This is function IntfInfo.GetClsMemberTypeInfo.
	GetDynArrayElTypeInfo (see page 4334)	This is function IntfInfo.GetDynArrayElTypeInfo.
	GetDynArrayNextInfo (see page 4335)	This is function IntfInfo.GetDynArrayNextInfo.
	GetDynArrayNextInfo2 (see page 4335)	This is function IntfInfo.GetDynArrayNextInfo2.
	GetIntfMetaData (see page 4335)	This is function IntfInfo.GetIntfMetaData.
	GetIntfMetaData (see page 4336)	This is function IntfInfo.GetIntfMetaData.
	GetMethNum (see page 4336)	This is function IntfInfo.GetMethNum.
	GetPropListFlat (see page 4336)	This is function IntfInfo.GetPropListFlat.
	IsStoredPropConst (see page 4337)	This is function IntfInfo.IsStoredPropConst.
	OtherTypeName (see page 4337)	This is function IntfInfo.OtherTypeName.
	SameTypeInfo (see page 4337)	This is function IntfInfo.SameTypeInfo.
	TypeNamesMatch (see page 4338)	This is function IntfInfo.TypeNamesMatch.

37.2.1 IntfInfo.GetClsMemberTypeInfo Function

Pascal

```
function GetClsMemberTypeInfo(const ObjectTypeInfo: PTypeInfo; const MemberName: string = ''):
PTypeInfo;
```

C++

```
PTypeInfo GetClsMemberTypeInfo(const PTypeInfo ObjectTypeInfo, const UnicodeString MemberName
= '');
```

File

IntfInfo

Description

This is function IntfInfo.GetClsMemberTypeInfo.

37.2.2 IntfInfo.GetDynArrayElTypeInfo Function

Pascal

```
procedure GetDynArrayElTypeInfo(typeInfo: PTypeInfo; var EltInfo: PTypeInfo; var Dims:
Integer);
```

C++

```
GetDynArrayElTypeInfo(PTypeInfo typeInfo, PTypeInfo EltInfo, int Dims);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayElTypeInfo.

37.2.3 IntfInfo.GetDynArrayNextInfo Function

Pascal

```
function GetDynArrayNextInfo(typeInfo: PTypeInfo): PTypeInfo;
```

C++

```
PTypeInfo GetDynArrayNextInfo(PTypeInfo typeInfo);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo.

37.2.4 IntfInfo.GetDynArrayNextInfo2 Function

Pascal

```
function GetDynArrayNextInfo2(typeInfo: PTypeInfo; var Name: string): PTypeInfo;
```

C++

```
PTypeInfo GetDynArrayNextInfo2(PTypeInfo typeInfo, UnicodeString Name);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo2.

37.2.5 IntfInfo.GetIntfMetaData Function

Pascal

```
procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; IncludeAllAncMethods:
Boolean = False); overload;
```

C++

```
GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, Boolean IncludeAllAncMethods = False);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

37.2.6 IntfInfo.GetIntfMetaData Function

Pascal

```
procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; MethodArrayOpt:
TFillMethodArrayOpt); overload;
```

C++

```
GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, TFillMethodArrayOpt MethodArrayOpt);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

37.2.7 IntfInfo.GetMethNum Function

Pascal

```
function GetMethNum(const IntfMD: TIntfMetaData; const MethName: string; ParamCount: Integer =
-1): Integer;
```

C++

```
int GetMethNum(const TIntfMetaData IntfMD, const UnicodeString MethName, int ParamCount = -1);
```

File

IntfInfo

Description

This is function IntfInfo.GetMethNum.

37.2.8 IntfInfo.GetPropListFlat Function

Pascal

```
function GetPropListFlat(TypeInfo: PTypeInfo; out PropList: PPropList): Integer;
```

C++

```
int GetPropListFlat(PTypeInfo TypeInfo, PPropList PropList);
```

File

IntfInfo

Description

This is function IntfInfo.GetPropListFlat.

37.2.9 IntfInfo.IsStoredPropConst Function

Pascal

```
function IsStoredPropConst(Instance: TObject; PropInfo: PPropInfo): Boolean;
```

C++

```
Boolean IsStoredPropConst(TObject * Instance, PPropInfo PropInfo);
```

File

IntfInfo

Description

This is function IntfInfo.IsStoredPropConst.

37.2.10 IntfInfo.OtherTypeName Function

Pascal

```
function OtherTypeName(const TypeName: string): string;
```

C++

```
UnicodeString OtherTypeName(const UnicodeString TypeName);
```

File

IntfInfo

Description

This is function IntfInfo.OtherTypeName.

37.2.11 IntfInfo.SameTypeInfo Function

Pascal

```
function SameTypeInfo(const RegInfo: PTypeInfo; const OtherInfo: PTypeInfo): boolean;
```

C++

```
boolean SameTypeInfo(const PTypeInfo RegInfo, const PTypeInfo OtherInfo);
```

File

IntfInfo

Description

This is function IntfInfo.SameTypeInfo.

37.2.12 IntfInfo.TypeNamesMatch Function

Pascal

```
function TypeNamesMatch(const RegName: string; const OtherName: string): boolean;
```

C++

```
boolean TypeNamesMatch(const UnicodeString RegName, const UnicodeString OtherName);
```

File

IntfInfo

Description

This is function IntfInfo.TypeNamesMatch.

37.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCallConv (see page 4339)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 4339)	This is record IntfInfo.TFillMethodArrayOpt.

Records

	Name	Description
	TIntfMetaData (see page 4340)	This is record IntfInfo.TIntfMetaData.
	TIntfMethEntry (see page 4340)	This is record IntfInfo.TIntfMethEntry.
	TIntfParamEntry (see page 4341)	This is record IntfInfo.TIntfParamEntry.

37.3.1 IntfInfo.TCallConv Enumeration

Pascal

```
TCallConv = (
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
);
```

C++

```
enum TCallConv {
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
};
```

File

IntfInfo

Description

This is record IntfInfo.TCallConv.

37.3.2 IntfInfo.TFillMethodArrayOpt Enumeration

Pascal

```
TFillMethodArrayOpt = (
  fmoAllBaseMethods,
  fmoRTTIBaseMethods,
```

```
    fmoNoBaseMethods
  );
```

C++

```
  enum TFillMethodArrayOpt {
    fmoAllBaseMethods,
    fmoRTTIBaseMethods,
    fmoNoBaseMethods
  };
```

File

IntfInfo

Description

This is record IntfInfo.TFillMethodArrayOpt.

37.3.3 IntfInfo.TIntfMetaData Record

Pascal

```
  TIntfMetaData = record
    Name: string;
    UnitName: string;
    MDA: TIntfMethEntryArray;
    IID: TGUID;
    Info: PTypeInfo;
    AncInfo: PTypeInfo;
    NumAnc: Integer;
  end;
```

C++

```
  struct TIntfMetaData {
    UnicodeString Name;
    UnicodeString UnitName;
    TIntfMethEntryArray MDA;
    TGUID IID;
    PTypeInfo Info;
    PTypeInfo AncInfo;
    int NumAnc;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfMetaData.

37.3.4 IntfInfo.TIntfMethEntry Record

Pascal

```
  TIntfMethEntry = record
    Name: string;
    CC: TCallConv;
    Pos: Integer;
    ParamCount: Integer;
```

```
    ResultInfo: PTypeInfo;
    SelfInfo: PTypeInfo;
    Params: TIntfParamEntryArray;
    HasRTTI: Boolean;
  end;
```

C++

```
  struct TIntfMethEntry {
    UnicodeString Name;
    TCallConv CC;
    int Pos;
    int ParamCount;
    PTypeInfo ResultInfo;
    PTypeInfo SelfInfo;
    TIntfParamEntryArray Params;
    Boolean HasRTTI;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfMethEntry.

37.3.5 IntfInfo.TIntfParamEntry Record

Pascal

```
  TIntfParamEntry = record
    Flags: TParamFlags;
    Name: string;
    Info: PTypeInfo;
  end;
```

C++

```
  struct TIntfParamEntry {
    TParamFlags Flags;
    UnicodeString Name;
    PTypeInfo Info;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfParamEntry.

37.4 Types

The following table lists types in this documentation.

Types

Name	Description
PIntfMetaData (see page 4342)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 4342)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 4343)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 4343)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 4343)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 4344)	This is type IntfInfo.TPIntfMethEntryArray.

37.4.1 IntfInfo.PIntfMetaData Type

Pascal

```
